BLOK ZİNCİRİ VE IPFS DESTEKLİ IOT VERİ YÖNETİMİ

Dr. Mansur BEŞTAŞ (0000-0002-8192-2044)

Siirt University, Siirt

E-mail: mansur@siirt.edu.tr

ÖZET

Endüstriyel alanda teknolojinin kullanımı ve beraberinde internet teknolojilerinin desteğinin alınması üretim süreçlerinde iş yapış şeklini değiştirmiştir. Nesnelerin interneti'nin (IoT) bir çok alanda uygulanmaya başlanması, Endüstri 4.0'ın genel kabulünün artmasını sağlamıştır. Endüstriyel üretim, beraberinde her an her yerde kontrolün ve veri akışının düzenli sağlanması ihtiyacını ortaya çıkarmış ve üretimde IoT kullanımını desteklemiştir. Endüstriyel IoT (IIoT), üretim sürecinin takibi ve verimliliğinin devamı için gerekli temel taşlarından biridir. IIoT, ürettiği veri aracılığıyla veri temelli operasyonel süreç mekanizmalarının altyapısını oluşturmaktadır. Mevcut uygulamalar değerlendirildiğinde IIoT verilerinin kayda değer büyük bir kısmının güvenlik ve gizlilik gibi çekincelerden dolayı atıl bir şekilde bekletilmektedir. Klasik veri yönetim sistemlerinin değişimi için ademi merkezîyetçilikten uzak ve üçüncü taraf güvenine ihtiyaç duymayan yeni yaklaşımların benimsenmesi gerekmektedir. Blok zinciri teknolojisi, ademi merkezîyetçilik, değişmezlik, izlenebilirlik özellikleri nedeniyle yeni çözümün bir parçası olmaya adaydır. Blok zinciri teknolojisi, blok hacimlerinin sınırlı oluşu ve mutabakat protokollerinin ölçeklenmesi ile ilgili problemleri olduğundan dolayı büyük veri alışverişi ile ilgili olarak yetersiz kalmaktadır. Ancak merkezi olmayan depolama çözümlerinden Gezegeçenler Arası Dosya Sistemi (IPFS), blok zincirinde yetersiz kalan yönlerinin tamamlayıcısı olarak değerlendirilmektedir. Bu amaçla, blok zinciri ve IPFS teknolojisinin bir arada kullanıldığı merkezi olmayan bir IIoT veri yönetim modeli önermektedir. Yapılan çalışmada, önerilen modelin mimarisi ve kullanılan teknolojiler hakkında bilgi verilmiş ardından uygulaması gerçekleştirilmiştir. Gerçekleştirilen uygulamanın sonuçları önerilen modelin gerçek hayatta kullanılabilir olduğunu göstermiştir.

Anahtar kelimeler: Blok zinciri, IPFS, veri yönetimi, nesnelerin interneti, Endüstri 4.0

Giriş

Dördüncü Sanayi Devrimi olarak da bilinen Endüstri 4.0, dijital teknolojilerin ve otomasyonun entegrasyonunu vurgulayan imalat ve üretimde bir paradigma değişikliğidir. Endüstri 4.0'ı mümkün kılan en önemli teknolojilerden biri, fiziksel cihazların, araçların, binaların ve sensörler, yazılımlar ve bu nesnelerin toplanıp değiş tokuş edilmesini sağlayan bağlantılarla gömülü diğer nesnelerin ağını ifade eden Nesnelerin İnterneti'dir (IoT) (Wang ve Onori, 2015).

IoT, Endüstri 4.0'ın akıllı fabrikalarının belkemiğini oluşturduğundan, Endüstri 4.0 ile IoT arasındaki ilişki ayrılmaz bir bütündür. IoT, bir fabrikadaki makinelerin, cihazların ve diğer nesnelerin birbirleriyle ve merkezi sistemlerle iletişim kurmasını sağlayarak üretim süreçlerini optimize etmek, arıza süresini azaltmak ve ürün kalitesini iyileştirmek için kullanılacak gerçek zamanlı veriler sağlar (Ordieres-Meré, Villalba-Díez ve Zheng, 2019).

IoT sensörleri, makine performansı, çevre koşulları ve envanter seviyeleri gibi üretim sürecinin çeşitli yönleri hakkında veri toplamak için kullanılabilir. Bu veriler daha sonra kalıpları ve anormallikleri belirlemek için gelişmiş analitik ve makine öğrenimi algoritmaları kullanılarak analiz edilebilir ve üreticilerin süreçlerini optimize etmelerine ve potansiyel sorunları ortaya çıkmadan önce tahmin etmelerine olanak tanır (Lee, Bagheri ve Kao, 2015).

Verimliliği ve üretkenliği artırmanın yanı sıra IoT, üreticiler için yeni iş modelleri ve gelir akışları da sağlar. Örneğin, IoT verileri, müşterilere katma değerli teklifler olarak satılabilecek önceden tahmin edilmiş bakım hizmetleri veya uzaktan izleme çözümleri gibi yeni hizmetler ve ürünler geliştirmek için kullanılabilir (Mohamed ve Al-Jaroodi, 2019).

Genel olarak, IoT'nin Endüstri 4.0'a entegrasyonu, imalat ve üretimde büyük bir değişimi temsil ederek üreticilerin yeni verimlilik, üretkenlik ve yenilik seviyelerine ulaşmak için veri ve otomasyondan yararlanmasını sağlıyor (Frické, 2009).

Blockchain, bankalar veya hükümetler gibi araçlara ihtiyaç duymadan güvenli ve şeffaf veri işlemlerini mümkün kılan dağıtılmış bir defter teknolojisidir (Wood, 2014). Verilerin ve işlemlerin bütünlüğünü sağlayan kurcalamaya dayanıklı ve merkezi olmayan bir sistem sağlar. Öte yandan, Nesnelerin İnterneti (IoT), bu nesnelerin veri toplamasını ve değiş tokuş etmesini sağlayan sensörler, yazılımlar ve bağlantılarla gömülü fiziksel cihazlar, araçlar, binalar ve diğer nesnelere ağını ifade eder (Brogan, Baskaran ve Ramachandran, 2018).

Blok zinciri ve IoT entegrasyonu, özellikle güvenlik, gizlilik ve şeffaflık açısından sayısız fayda sağlayabilir. IoT cihazları, blockchain teknolojisini kullanarak verileri güvenli bir şekilde paylaşabilir ve araçlara ihtiyaç duymadan birbirleriyle iletişim kurabilir, bu da veri ihlalleri ve

siber saldırı riskini azaltabilir (Dorri, Kanhere ve Jurdak, 2017). Bu, hasta verilerinin gizli ve güvenli tutulması gereken sağlık hizmetleri gibi sektörlerde özellikle önemli olabilmektedir.

Blok zinciri, tüm işlemlerin ve veri alışverişlerinin değişmez bir kaydını oluşturarak IoT ağında güven ve hesap verebilirlik oluşturmaya da yardımcı olabilir (Atlam ve Wills, 2019). Bu, malların menşei ve hareketinin blockchain teknolojisi kullanılarak izlenebildiği ve doğrulanabildiği tedarik zinciri yönetiminde faydalı olabilir.

Ayrıca blok zinciri, IoT ekosisteminde yeni iş modelleri ve gelir akışları sağlayabilir. Örneğin, IoT cihazları, blockchain tabanlı akıllı sözleşmeler kullanarak insan müdahalesine ihtiyaç duymadan sözleşmeleri ve işlemleri otomatik olarak yürütebilir, bu da maliyetleri azaltabilir ve verimliliği artırabilir (Pranto, Noman, Mahmud ve Haque, 2021).

Blok zinciri ve IoT'yi entegre etmenin potansiyel faydalarına rağmen, ele alınması gereken zorluklar da var. Bunlar, özellikle IoT cihazlarının ve işlemlerinin sayısı arttıkça, birlikte çalışabilirlik standartlarına olan ihtiyacı ve blockchain teknolojisinin ölçeklenebilirliğini içerir (Huh, Cho ve Kim, 2017).

Genel olarak, blockchain ve IoT entegrasyonu, veri işlemlerinde güvenliği, gizliliği ve şeffaflığı artırarak bir dizi endüstriyi ve uygulamayı dönüştürme potansiyeline sahip, heyecan verici bir araştırma ve geliştirme alanını temsil eder.

Dağıtılmış Defter Teknolojisi (DLT), bir bilgisayar ağında güvenli ve şeffaf veri işlemlerini mümkün kılan merkezi olmayan bir sistemdir. Popüler DLT yapıları arasında, her ikisi de veri işlemleri için kurcalamaya dayanıklı ve merkezi olmayan bir sistem sağlamak üzere tasarlanmış blok zincir ve yönlendirilmiş döngüsel olmayan hat (DAG - Directed Acyclic Graph) bulunur (Wang, Yu, Chen ve Xiang, 2023).

Blockchain, veri işlemlerini kaydetmek ve doğrulamak için bir blok zinciri kullanan bir DLT yapısıdır. Her blok, bir işlem listesi ve onu önceki bloğa bağlayan, güvenli ve şeffaf bir veri işlemleri zinciri oluşturan bir kriptografik hash içerir. Blockchain teknolojisi, kripto para birimi, tedarik zinciri yönetimi ve dijital kimlik doğrulama gibi uygulamalarda yaygın olarak kullanılmaktadır (Pervez, Muneeb, Irfan ve Haq, 2018).

DAG, veri işlemlerini kaydetmek ve doğrulamak için farklı bir yaklaşım kullanan başka bir DLT yapısıdır. DAG yapıları, bir blok zinciri kullanmak yerine, her işlemin yönlendirilmiş döngüsel olmayan bir grafikte önceki işlemlere bağlandığı grafik tabanlı bir yaklaşım kullanır. İşlemler paralel olarak işlenebildiği için bu daha esnek ve ölçeklenebilir bir sistem oluşturur ve daha yüksek verim ve daha hızlı işlem süreleri sağlar. DAG yapıları IoT, tedarik zinciri

yönetimi ve merkezi olmayan sosyal ağlar gibi uygulamalarda kullanılmaktadır (Zhao, Yu, 2019).

Hem blockchain hem de DAG'ın avantajları ve sınırlamaları vardır ve DLT yapısının seçimi, uygulamanın özel gereksinimlerine bağlı olacaktır. Blockchain, sağlam güvenliği ve şeffaflığıyla bilinir, ancak ölçeklenebilirlik sorunları ve yüksek enerji tüketimi sorunları yaşayabilir. DAG yapıları daha ölçeklenebilir ve enerji açısından verimlidir, ancak güvenlik ve işlem kesinliği açısından sınırlamaları olabilir (Li, Huang ve Zhang, 2022).

Genel olarak, DLT yapısının seçimi, uygulamanın özel ihtiyaçlarına ve hedeflerine bağlı olacaktır ve bu alanda daha fazla araştırma ve geliştirme, DLT teknolojisindeki yeniliği ve ilerlemeyi yönlendirmeye devam edecektir.

Son yıllarda, Blok zinciri teknolojisi, üretim süreçlerinde Endüstri 4.0 ile birlikte kullanılmaya başlanmış ve teknoloji geliştiricileri tarafından benimsenmiştir. Üretim süreçlerinin, veri ve veri yönetimi alternatif olarak dağıtık defter teknolojileri ile desteklenebilmektedir. Enerji dağıtımı ve ticareti, bilgi yönetimi, endüstriyel üretim ve tedarik zinciri DLT için en çok araştırılan ve avantajlı oldukları düşünülen alanlardır. Blok zinciri teknolojileri veri güvenliği ve otonom çalışmasında avantajlara sahip olsa dahi işlem hızı ve ölçeklendirmesi açısından kısıtlara sahiptir (Wang, Wang Shen, Jia ve Shao, 2021).

DAG tabanlı projeler, blok zinciri teknolojisine alternatif olarak işlem ölçeklendirme problemlerinin üstesinden gelebilmek amacıyla alternatif DLT yöntemleri önermişlerdir. Önerilen alternatif DLT olarak DAG tabanlı çalışan IOTA projesi verilebilir. IOTA projesi, teorik olarak, büyüyen bir yapıda artan ölçeklendirme kapasitesi sunmaktadır. Artan kapasite ile yüksek veri aktarımı ve düşük işlem ücreti sağlamaktadır (Gangwani, Perez-pons, Bhardwaj ve Upadhyay, 2021).

DLT, her ne kadar veri kaydı tutma için belli bir kapasitesi olsa dahi büyük ölçekte veri için uygun değildir. DLT, veri depolama ve yönetimi için destekleyici ve tamamlayıcı olarak IPFS kullanılmaktadır. IPFS, eşler arası dosya depolama imkânı getiren, merkezi olmayan depolama çözümüdür. IPFS üzerinde saklanan her dosyanın hash bilgisi alınmakta ve dosya üzerinde değişiklik gerçekleşmesi durumunda hash bilgisi de değişmektedir (Ali, Dolui ve Antonelli, 2017).

MİMARİ

Bu çalışmada önerilen mimari temel olarak üç bölümden oluşmaktadır. İlk bölüm verinin üretildiği IIoT tarafıdır. Endüstriyel üretimin yapıldığı alanlarda bulunan IoT cihazları, veri

ürettikten sonra bu verileri IPFS üzerinde kayıt için gönderilmesi amacıyla veri toplayan ara bir katman ile iletişim halindedir. IoT cihazları, veri toplama katmanına verileri gönderir.

İkinci bölüm, depolama ve yayınlama bölümüdür. Bu bölüm IPFS ve IOTA'yı kapsamaktadır. Veri toplama katmanında bulunan cihazlar verileri IPFS üzerinde kayıt altına alırlar. IPFS üzerinde kayıt altına alınan her veri özet bilgisi (Hash) üretmektedir. Bu hash ile veriye geri erişim sağlanabilmekte ve verinin değiştirilmediğinin bir nişanesidir. Elde edilen hash bilgileri, verinin ilgili kişiler tarafından direkt olarak eriminin sağlanması amacıyla yayınlanması gerekmektedir. Hash bilgisinin, yayın alanı olarak DLT kullanılmaktadır. DLT içinde, bu probleme uygun olarak en umut vaat eden protokol DAG'dır. DAG içerisinde IOTA projesi bulunmaktadır. Hash bilgileri, IOTA üzerinde yayına alınır. Böylelikle veriye erişim sağlanmış olur.

Üçüncü bölümde, veri tüketimi bulunmaktadır. IIoT tarafından üretilen, IPFS ile kayda alınan ardından IOTA ile erişime açılan veriler, tüketilmek için kndileri ile ilgili verilere erişimi sağlayabilmektedir. Erişim sağlanan veriler ihtiyaca ve gizliliğe göre veri erişim parolasına ihtiyaç duyabilmektedir.

SONUÇLAR

Sonuç olarak bu makale, yenilikçi bir IIoT veri depolama ve paylaşma yaklaşımı önererek Endüstri 4.0 ve akıllı üretim alanına zamanında ve önemli bir katkı sunmaktadır. Veri entegrasyonuna ve farklı kaynaklardan paylaşma yönelik artan ihtiyaçlar, böyle bir yaklaşımın önemini vurgulamaktadır. Önerilen yaklaşım, IIoT tarafından üretilen büyük miktardaki verileri işleme konusunda karşılaştıkları zorluklara kapsamlı bir çözüm sunmaktadır. Blockchain, IOTA Tangle ve IPFS teknolojilerinin entegrasyonu, yüksek ölçeklenebilirlik, düşük maliyet, kurcalamaya karşı dirençli veri paylaşımı ve büyük hacimli veri depolama sağlar. Kavram kanıtı uygulaması ve deney sonuçları, önerilen yaklaşımın fizibilitesini ve potansiyelini göstererek, onu akıllı üretim için veriye dayalı stratejileri desteklemek için değerli bir varlık haline getiriyor. Önerilen yaklaşımın semantik modelleme ve makine öğrenimi ile birleşimi, daha gelişmiş veri işleme çözümleri sağlamak için yeteneklerini daha da geliştirebilir ve Endüstri 4.0'ın gelişimini hızlandırabilmektedir. Genel olarak, bu makale, önerilen yaklaşımın faydaları, zorlukları ve potansiyel uygulamaları hakkında kapsamlı bir genel bakış sunarak, onu akıllı üretim ve Endüstri 4.0 alanındaki araştırmacılar ve uygulayıcılar için değerli bir referans haline getiriyor. Önerilen yaklaşım, üreticilerin süreçlerini optimize etmelerine, üretkenliği artırmalarına ve daha iyi müşteri memnuniyeti elde etmelerine olanak tanıyarak verilerin depolanma, paylaşılma ve analiz edilme biçiminde devrim yaratma potansiyeline sahiptir.

ABSTRACT

Purpose: This study was conducted to determine peer bullying and the state of being victim of bullying in adolescents and investigate the affecting factors. **Method:** Sample of the study was composed of 542 students in 14-18 age group studying at a state high school in Karaman province in 2022-2023 academic year. In the study “Personal Information Form” was used to assess descriptive characteristics of the students and “Peer Bullying Determination Scale Adolescent Form” was used to determine their levels of victimization and practicing bullying.

Findings: It was determined that 60.5% of the students were females, 39.1% were attending the 11th grade, level of education of mothers of 39.7% was primary education and that of fathers of 35.1% was high school, mothers of 67.5% were unemployed, fathers of 88.7% were employed, 86.2% had a group of friends, 38.2% had an academic grade point average of 70-84. The total victimization score average of students of was 83.30 ± 27.47 , and their total score average of being a bully was 73.23 ± 26.31 . A statistically significant relationship was determined between the students’ total victimization score and their grade, father’s level of education, and having a group of friends ($p < 0.05$). No statistically significant relationship was found between the total victimization scores of students and their sex, mother’s level of education, mother-father employment status, academic status, and academic grade point average ($p > 0.05$). A statistically significant relationship was determined between the students’ state of being a bully and their grade, sex, economic status, and state of having a group of friends ($p < 0.05$). No statistically significant relationship was found between the total score of students’ being a bully and mother-father level of education, mother-father employment status, and academic grade point average ($p > 0.05$). **Result:** Total victimization score was higher among those in the first grade, with father having an undergraduate degree, with no group of friends. Total being a bully score was higher among those in the eleventh grade, males, those with expenses exceeding income, and those with groups of friends. It is recommended that monitoring and follow-up is conducted towards these risk groups by nurses in the scope of school health, effective intervention programs to reduce the state of victimization and bullying behaviour in adolescents.

Keywords: adolescent, peer bullying, victim

1. INTRODUCTION

The world is based on balance and harmony. The problem of aggressive behaviour and inability to control behaviour arises in human beings who cannot achieve this harmony (Yelboğa & Koçak, 2019b). Incompatibilities in the school environment have been the subject of many international studies under the name of school bullying (Slee & Skrzypiec, 2016). The subject of peer bullying has been included in many school studies on adolescents (Cross et al., 2018; Karmaliani et al., 2020; Singla et al., 2021). Bullying is a special form of aggressive behaviour. Bullying, as a subset of violent or aggressive behaviour, is a behaviour that intentionally causes psychological or physical harm to another individual (Tedeschi & Felson, 1994). In our age, bullying causes negative changes in the health of young people and is recognised as an important public health problem. The changes experienced by the person associated with bullying and the resulting physiological changes have prompted public health authorities to address the subject of bullying. Victims of bullying feel that they cannot easily defend themselves against a bully due to an imbalance of physical or social power (Gaffney et al., 2019). Studies report that young people face health problems such as depression, anxiety and insomnia as a result of bullying behaviour (Copeland et al., 2015; Holt et al., 2015).

When the studies on the subject are evaluated, it is stated that one out of every 5 adolescents in the United States is exposed to bullying at school (CDC, 2019). In a study conducted in China, it was reported that 20.83 per cent of students were exposed to bullying (Wang et al., 2012). In a study comparing Korean students living in Korea and Germany, 21.0% of Korean children living in Germany were bullied and 18.1% bullied their peers; 33.7% of Korean children living in Korea were bullied and 35.8% were involved in bullying (Bae, 2016). In a prevalence study conducted in Turkey, it was reported that 34.2% of students were victims of bullying and 13.9% bullied someone (Kilicaslan et al., 2022). In another study, it was reported that 47.0% of the students were victims and 31.42% were bullies (Gür et al., 2020). In addition, a meta-analysis study conducted in Turkey shows that an adolescent has been exposed to peer bullying at least twice during the academic year and has been bullied twice (Talu & Gümüş, 2022). Age, gender, personal characteristics, family characteristics (authoritarian-parental attitude), socio-economic status, psychological characteristics, behavioural characteristics, ethnic and racial characteristics are the factors that affect being a bully and a victim (Çelenk & Yıldızlar, 2019; Yelboğa & Koçak, 2019a).

Bullying incidents affect children physically, socially and psychologically and have been increasing recently as an important public health problem. For this reason, it is important to

continue studies on peer bullying in the field of public health, to better understand bullying and to develop appropriate intervention programmes for healthy generations. Therefore, this study was conducted to determine the status of peer bullying and victimisation in adolescents and to examine the factors affecting them.

Study questions;

1. What are the identifying characteristics of adolescents?
2. What is the mean score of adolescents being bully and victim?
3. Do the mean scores of being a bully and victim change according to the identifying characteristics of adolescents?

2. METHOD

Study design and setting

This is a descriptive study. This study was conducted in a state high school in Karaman province.

Study sampling

In the school where the study was conducted, 574 students were studying. Sample size was calculated with G-power 3.1.9.2 programme (Faul et al., 2007). The sample size of the study was calculated as 542 students with an effect size of 0.1552422 at 95% power and 95% confidence interval, taking into account the total average score of being a bully (247.49 ± 35.10) in the study of Mercan and Yıldırım Sarı (2018). The students in the sample were selected by random sampling method. The inclusion criteria of the study were the students studying in the 9th, 10th, 11th, 12th grades, and the exclusion criteria were the students being absent during the study.

Data Collection Tools

Two data collection tools were used in this study; "Personal Information Form" and "Peer Bullying Determination Scale Adolescent Form"

Personal Information Form: This form includes 15 questions (age, grade, gender, parents' education level, parents' occupation, family type, income level, number of siblings, number of friends) about the descriptive characteristics of the students who participated in the study determined by the researcher. The questions in the Personal Information Form were prepared based on the literature (Gür et al., 2020; Mercan & Sarı, 2018).

Peer Bullying Determination Scale Adolescent Form

Peer Bullying Determination Scale Adolescent Form was developed by Pişkin and Ayas (2015) to determine the levels of bullying and being bullied. The scale consisted of two scales, one

called "bully scale" and the other called "victim scale", which included a total of 53 items consisting of the same items asked in different ways. Cronbach α internal consistency reliability coefficient is 0.93 for the total victimisation scale and 0.92 for the total bullying scale. There are six factors in the scale. These factors are physical bully and victim, verbal bully and victim, isolation bully and victim, rumour spreading bully and victim, property damage bully and victim, sexual bully and victim. The scale is 5-point Likert type. The lowest score that can be obtained from the bully and victim dimensions of the scale is 53 and the highest score is 265. The higher the scores, the higher the status of being a bully and victim (Ayas & Pişkin, 2015). The data were collected by the researcher in the classroom environment between 27.02.2023 and 03.03.2023. The data were collected within the time periods determined by the school administration so as not to disrupt the course programme of the students.

Data Analysis

SPSS package programme was used in the analysis of the study data. Descriptive statistics were evaluated with number, percentage, mean and standard deviation. The conformity of the data to normal distribution was evaluated by using Kolmogorov Smirnov test and Q-Q plot graphs. Mann Whitney U and Kruskal-Wallis analyses were used because the data did not fit the normal distribution. $p < 0.05$ was considered statistically significant.

Ethical Approval

In order to conduct the study, permission was obtained from Konya Selcuk University Faculty of Nursing, Non-Interventional Clinical Research Ethics Committee (Date:29.12.2022 Issue: 2022/70). In order to collect the study data, the researcher obtained permission from Karaman Provincial Directorate of National Education and Karaman Province Governorship (Date: 20.01.2023 Issue: 450059). Written consent was obtained from the families and adolescents with an informed consent form.

3. RESULTS

It was found that 60.5% of the students were female, 39.1% were in the 11th grade, 39.7% had a primary school mother, 35.1% had a high school father, 67.5% had a non-working mother, 88.7% had a working father, 86.2% had a group of friends, and 38.2% had an academic grade point average of 70-84 (Table 1).

When the status of being a victim according to the descriptive characteristics of the students was analysed, it was found that there was a statistically significant difference between the total score of being a victim and the class, father's education level and having a group of friends ($p < 0.05$). 11. Those who were in the classroom, whose fathers were undergraduate graduates,

and who did not have a group of friends had higher total victimisation scores. There was no statistically significant difference ($p>0.05$) between the students' total score of victimisation and gender, mother's education status, parents' employment status, academic status and academic grade point average (Table 1).

When the status of being a bully according to the descriptive characteristics of the students was analysed, it was found that there was a statistically significant difference between the class, gender, economic status and having a group of friends ($p<0.05$). 11th graders, males, those whose income is higher than expenses and those who have a group of friends have higher total score of being a bully. There was no statistically significant difference ($p>0.05$) between the total score of being a bully and parental education level, parental employment status and academic grade point average (Table 1).

Table 1. Distribution of students' descriptive characteristics and mean scores of being victim and bully according to their descriptive characteristics

Features	n (%)	Total points for victimisation	Test and p value	Total points for being a bully	Test and p value

The mean total score of the students' victimisation was 83.30±27.47. When the sub-dimensions of the victimisation scale of the students were examined, it was found that the physical (25.46±9.92), verbal (14.36±6.09) and sexual bullying scores (13.69±6.09) of the students were higher than the other sub-dimensions. The students' total mean score of being a bully was 73.23±26.31. When the sub-dimensions of the bullying scale of the students were analysed, it was found that the physical (23.29±10.17), sexual (12.30±5.09) and verbal bullying scores (12.75±5.97) were higher than the other bullying types (Table 2).

Table 2. Mean scores of total and sub-dimensions of bully and victimisation of students

	Mean (standard deviation)	Minimum-maximum
Total score for victimisation	83.30±27.47	53-213
Physical bullying	25.46±9.92	14-62
Verbal bullying	14.36±6.09	8-36
Exclusion	9.32±4.86	6-30
Creating and spreading rumours	7.20±3.53	5-25
Damaging their belongings	11.98±4.30	9-34
Sexual bullying	13.69±6.09	10-46
Total score for being a bully	73.23±26.31	52-219
Physical bullying	23.29±10.17	14-70
Verbal bullying	12.75±5.97	8-36
Exclusion	7.79±3.48	6-30
Creating and spreading rumours	5.81±2.35	5-25
Damaging their belongings	12.19±4.70	10-43
Sexual bullying	12.30±5.09	10-42

4. DISCUSSION

Bullying is an important public health problem. The increasing continuation of peer bullying, which leads to negative changes in the health of young people, in the school environment we trust, creates disharmony at school and disrupts the healthy school environment. For this reason, this study was conducted to determine the status of peer bullying and victimisation in adolescents aged 14-18 years and to examine the factors affecting them.

In this study, the total mean score of victimisation is 83.30 ± 27.47 . The mean total score of being a bully is 73.23 ± 26.31 . In the study of Mercan and Sarı (2018), the mean score of being a victim was reported as 231.25 ± 46.3 , and the mean score of being a bully was reported as 247.49 ± 35.1 . In another study, the mean victim score was 65.25 ± 15.86 and the mean bully score was 74.61 ± 23.22 (Kılıç and Uzun 2020). In this study, physical, verbal and sexual bullying scores in the sub-dimensions of the victimisation scale were found to be higher than the other sub-dimensions. In the sub-dimensions of the bullying scale, physical, sexual and verbal bullying were found to be higher than the other subtypes. In the study conducted by Mercan and Sarı (2018), the scores of physical bullying, property damage and sexual bullying in the sub-dimensions of victimisation and bullying scale were found to be higher than other sub-dimensions (Mercan & Sarı, 2018). In another study, physical bullying was found to be higher in the sub-dimensions of victimisation and bullying compared to other sub-types (Çelenk & Yıldızlar, 2019). It is thought that this difference in the results of the study may be due to the province, school type and sample characteristics.

In this study, boys' total score of being a bully was found to be higher than that of girls. However, in this study, no significant difference was found between victimisation and gender. In the study conducted by Çelenk and Yıldızlar (2019), it was reported that the total score of being victim and bully did not show a significant difference according to gender. In another study conducted on high school students, it was stated that gender was a determinant in both being a victim and a bully (Mohseny et al., 2019). In some studies, similar to this study, it was stated that the mean scores of boys being bullies were higher (Gkatsa et al., 2015; Yelboğa & Koçak, 2019b).

In this study, the mean scores of 11th grade students being both victim and bully are higher than other grade types. The fact that the 10th and 11th grade mean scores were higher than the 9th grade scores indicates that the bully and victim status increases with increasing age. The 12th grade average score is low in terms of being both victim and bully. The 12th graders' low average scores in both types can be attributed to their anxiety about the future, exam stress,

established friendships, and age-appropriate physical and mental maturation. In a study, similar to the findings of this research, the mean scores of 10th and 11th grade bullying were higher than 9th grade (Burnukara & Uçanok, 2012). In the study conducted by Çelenk and Yıldız (2019), 9th grade victim and bully mean scores were found to be higher than other class types. In this study, no significant difference was found between the mother's education level and the mean score of victimisation. However, in terms of father's education level, the mean victimisation score of adolescents with high school and university graduate parents was found to be higher than the other education levels. This difference may be associated with the fact that the adolescent spends less time with the parent, the parent therefore tends to increase the control over the child and the adolescent's burnout at this point. In a study, it was stated that as family-related burnout increases, being a victim of relational and verbal bullying increases (Yöndem & Totan, 2007). In a study different from this study, it was stated that there was no significant relationship between parents' education level and bullying behaviours (Yelboğa & Koçak, 2019b). Unlike the findings of this study, in the study conducted by Mercan and Sarı (2018), a significant difference was found between the mother's education level and the mean scores of being a victim (Mercan & Sarı, 2018).

In this study, it was determined that the mean victim score of those who did not have a group of friends was higher than those who had a group of friends, and the mean bully score of those who had a group of friends was higher than those who did not. In a study, it was determined that as the number of friends increases, the bullying status of the person increases, and in the same direction, the victimisation experienced as a result of being a victim increases with the increase in bullying behaviours and the number of friends.(Yılmaz & Çağlayan, 2018). In another study, similar to this study, adolescents with friendship problems were found to have a high risk of being victimised.(Ehrhardt et al., 2022). The victimisation experienced by a person who feels lonely and does not feel belonging to any group and the situation experienced by a person who has a group of friends who bullies and tries to be at the forefront can be associated with anxiety.

In this study, no significant difference was found between economic status and the mean score of victimisation. However, when the economic status variable was analysed, it was found that the mean bullying score of the student group whose income was higher than the expenses was higher than the other income groups. There are study findings in the literature that support this study (Gkatsa et al., 2015). In our study, the number of people with middle income is higher and the number of people with income more than expenditure is lower than this group. Based

on this, it is predicted that the group that thinks that they have the financial power may be applying bullying behaviour to the victims who remain timid by attracting more people to them. In addition, contrary to the findings of this study, some studies have reported that students with low socioeconomic status are more involved in bullying (Dietrich & Ferguson, 2020; Tippett & Wolke, 2014).

5. CONCLUSION

As a result, those who were in the eleventh grade, whose fathers were undergraduate graduates, and who did not have a group of friends had higher total victimisation scores. Those who are in the eleventh grade, males, those whose income is higher than expenses and those who have a group of friends have higher total scores of being a bully. It is recommended that screening and follow-ups for peer bullying should be carried out by nurses within the scope of school health for these risk groups, and effective intervention programmes should be implemented to reduce victim status and bullying behaviour in adolescents in line with the literature.

Abstract

Organizational culture, both small and large organizations, is an important thing in an organization because it can affect everyone's behaviour. The organizational culture built in this study is a clan organizational culture. Organizational culture is formed by the owner and followed by employees and everyone in the organization. The purpose of this research is to find out whether there is a relationship between clan culture and company SME performance. This research is analyzed using Structural Equation Modeling (SEM) analysis tools. This study uses primary data and secondary data. Secondary data is obtained from data from the cooperative service of small and medium enterprises and the Bandung city trade industry. On the other hand, primary data is obtained from distributing questionnaires to SME entrepreneurs. This research was conducted in West Java (Bandung Regency, North Bandung, South Bandung, East Bandung and Bandung City) by distributing questionnaires randomly with simple random sampling. About 500 questionnaires were distributed, and 241 were received. The object of research was small and medium business actors engaged in the culinary business. The SME players' educational background, the majority of whom are graduates, are between 30 and 40 years old. The company ages of these SME actors range from 1 year to 10 years. The results showed that clan culture did not directly affect SMEs' performance but was moderated by covenantal knowledge sharing. Clan culture does not directly affect the performance of SMEs but is moderated by covenantal knowledge sharing. Covenantal knowledge sharing is a process of disseminating knowledge to everyone, whether employees, consumers, or suppliers, underpinned by a confident attitude, closeness, voluntary attitude, patience, comfort and humility.

Kata kunci : Clan Culture, Covenantal knowledge sharing, SME's Performance

BACKGROUND

Organizational culture, both small and large organizations, is an important thing in an organization because it can affect everyone's behaviour. Organizational culture is not formed quickly but formed over a long time. People usually form organizational culture within the organization. Organizational culture is formed by the owner and followed by employees and everyone in the organization. It is in line with what was conveyed by Lok and Crawford (2004), which states that organizational culture can influence everyone in the organization in regulating behaviour and performing tasks and managing resources to achieve. Organizational culture can also be considered a resource because it provides information for members of the organization to create, acquire, share, and manage knowledge. (Jones et al., 2006).

In developing SME, organizational culture is needed to support small and medium enterprises' development and growth. Every organization has a unique culture that distinguishes one organization from another. SME is an organization that has a different organizational culture from large companies. The organizational culture built in this study is a clan organizational culture. Clan culture can be built in partnership and kinship. This family-like culture is the culture prevailing in Indonesia so far. A partnership is a culture where everyone can build a relationship, be it an employee, a supplier or a customer.

Partnerships must be well built to benefit all parties both as owners of SMEs and as users of SMEs. It aligns with Sadigli's (2017) opinion, which states that clan culture is similar to a family-like culture whose main focus is on the organization's goals and values. Clan cultures tend to be more internally focused, smaller, and have a higher degree of specialization. (Jacobs et al, 2013). Clan culture consists of a warm and friendly workplace where people can freely share knowledge. The form of clan organizational culture emphasizes organic values that are internally focused. Tseng (2010) argues that clan culture emphasizes the long-term benefits of developing human resources with high unity or cohesion and morals but wise and conservative.

Clan culture is characterized by cohesiveness, participation, trust, cooperation, teamwork, and a sense of unity, commitment and morale. Sadiglih (2017) states that clans' cultural characteristics in the workplace tend to positively impact performance. Meanwhile, Tseng (2010) states that clan culture highlights the long-term benefits of developing human resources with high cohesion and morale, though it is prudent and conservative related to company performance. Clan culture represents a welcoming place to work where people can share. This condition shows a family atmosphere. The leader of the organization is considered

a mentor and possibly even a figure from the organization. In this culture, a high level of loyalty or commitment is needed. Clan culture is one of the dimensions expressed by Cameron and Quinn (1999), who develop an organizational culture framework built on a theoretical model known as competitive value framework. Martin (2005) asserts that diverse organizational cultures, lack of trust, lack of time, ineffective communication and poor knowledge can hinder knowledge sharing. Knowledge sharing is the act of making knowledge available to others in the organization.

Research results by Supeno and Laksmana (2015); Castro (2016); S Sadighi (2017); Maelah (2018) shows that clan culture has a significant effect on organizational performance. While the results of research by Zhu (2012), Kayab (2013) show that clan culture has no significant effect on organizational performance. Based on the previous elaboration, we can observe a research gap between organizational culture and organizational performance. The authors try to add a new construct that can support organizational culture on small and medium enterprises' performance. The new construct in this research is covenantal knowledge sharing. Covenantal knowledge sharing is different from other knowledge sharing because it is formed from an organizational culture with a clan culture and serving leadership. Covenantal knowledge sharing is a process of disseminating knowledge to everyone, whether employees, consumers, or suppliers, underpinned by a confident attitude, closeness, voluntary attitude, patience, comfort and humility.

Covenantal knowledge sharing is shared with everyone where all those people are considered partners. In line with the opinion of Lee and Al-Hawamdeh (2002) that knowledge sharing can occur in one direction or two ways, vertically (between superiors and subordinates) or horizontally, which occurs to people outside the organization such as customers, suppliers, partners. Strategic alliances, collaborators and regulators. SME owners must be able to conduct covenantal knowledge sharing to improve the performance of SMEs.

Covenantal knowledge sharing as a mediated variable is in line with the research results by Song et al. (2015) and Li et al. (2019), which show that knowledge sharing is a mediated variable. Covenantal knowledge sharing must be done correctly to be of great advantage to the continuity of a business. SME owners have the potential to conduct covenantal knowledge sharing. It needs to be a concern considering that conventional SMEs with local contexts are also unique, so a knowledge-sharing process is needed to enhance SMEs' performance. SME owners only keep their tacit knowledge without performing knowledge sharing. So that there is a loss of knowledge in the organization because knowledge sharing is not implemented.

Mcdermott and O'Dell (2001) showed that doing knowledge sharing can add value to the company. Members of the company will share their knowledge and accept other people's ideas because they believe in its core values. Each individual will participate in the community to share or exchange knowledge if the personal benefits outweigh the disadvantages (Chang, 2011). Yang (2004) states that knowledge sharing is disseminating information and knowledge through all departments and or organizations. Van Den Hooff and Ridder (2004) states that knowledge sharing is the process of exchanging knowledge and creating new knowledge together. Thus, we can see that this knowledge sharing must occur within the organization to create new knowledge.

The process of implementing knowledge sharing refers to social interaction activities that involve the exchange of employee knowledge, experience and skills through all departments or organizations (Kim and Lee, 2012). Relevant knowledge sharing has the potential to reduce costs and optimize processes, while deficiencies in doing knowledge sharing can endanger the organization and even make the process of activities in the organization ineffective (Rutten et al., 2016). Knowledge sharing can increase employee creativity, create new knowledge, complement individual shortcomings, and maximize knowledge's benefits through better individual and organizational performance. SME owners must create a family-friendly work atmosphere, which allows everyone to do knowledge sharing well. SME owners have a significant role in doing knowledge sharing. Knowledge sharing must be done correctly to be of great benefit to the continuity of a business. Every organization must be able to utilize knowledge effectively depending on people who can create knowledge sharing and use that knowledge. Increasing knowledge is only possible when that person can do the knowledge sharing they have and can help increase others' knowledge.

Knowledge sharing is the act of making knowledge available to others in the organization. Akhavan et al. (2012) stated that knowledge sharing in an organization could be viewed as a behaviour used by each individual voluntarily to provide knowledge and experience to organization members. In conducting covenantal knowledge sharing, a serving leadership is needed. Serving leadership is sensitive to all organizational stakeholders' needs and desires, including those who have no direct influence on the organization (Graham, 1991). Serving leadership emphasize trust, respect, and empowerment (Russell, 2001). Servicing leadership is based on the premise that in order to bring out the best in their followers, leaders rely on communication to understand the abilities, needs, wants, goals, and potential of that individual (Liden et al., 2008). Serving leadership can provide influence and motivation that can produce

a shared vision dedicated to helping others, building a loving community, and creating freedom and resources for followers (Boerner and Gebert, 2012).

Kaul (2014) states that serving leadership is created based on respect and compassion, where power and authority are used to provide benefits to the entire organization. The characteristic of serving leadership is humility, and a leader cares about followers by receiving recognition for follower achievements rather than receiving awards for their success. Servant leadership begins with an attitude of wanting to serve everyone's needs. A leader must set a good example so that their followers can follow him without feeling a burden and compulsion. Leaders are followed not because they are feared for their power but because they respect and respect them because they show a good example of both words and behaviour. A leader's presence is needed, and many are looking for a leader figure who is needed for the organization. Servant leadership must seek to transform their followers into individuals who grow better, wiser, freer, more autonomous, and more likely to serve. The essence of serving leadership is someone who must surrender individualist desires for the collective good (Joseph and Winston, 2003).

In SMEs, leadership is needed where the leader must serve every need of his followers. Serving leadership can demonstrate their moral responsibility for the organization's success and its stakeholders' success, especially employees and customers. Small and medium enterprises are one type of business that has great potential and opportunities for economic growth in Indonesia. West Java is one of the regions where SMEs are growing and developing rapidly. SMEs have a prominent role in propelling the West Java economy. The organizational culture that belongs to the West Java region is very supportive of economic growth, especially in SMEs' growth. The culture of creativity, kinship, friendliness, innovation owned by the people of West Java is very helpful in the growth of SMEs. SMEs' current challenges, especially in facing industry 4.0, are the numerous overseas products that offer lower prices with better quality. It can cause a shortage of demand for the domestic market. Based on this, the SME owner must manage the company culture entirely to face the existing challenges.

LITERATURE REVIEW

Organizational Culture

The concept of organizational culture originates from research in the field of organizational behaviour characterized by qualitative methods (Balthazard et al., 2006). Organizational researchers tend to focus separately on cultural elements such as symbols, myths, or stories that appear to be important in analytical studies. Organizational culture is one

of the most popular concepts in management and organizational theory. Organizational culture is the belief of top management, who can create, maintain, and change an organization's culture. Organizational culture shapes their perceptions and behaviour, and one way is by building a context for social interaction within the organization (De Long and Fahey, 2000).

Rayees Farooq (2018) says that organizational culture is a set of shared beliefs, values and assumptions that direct how people behave in an organization. Based on the above opinion, organizational culture is very important in an organization that can regulate and become a reference or standard for everyone in the organization, both as a leader and employee. The organizational culture of SMEs is different compared to other organizational cultures. The organizational culture that will be developed in this study is the clan culture. This model, which was first described by Quinn and Rohrbaugh (1983), is based on an empirical analysis of individual values that impact organizational performance. Cameron and Quinn's organizational culture framework is based on a theoretical model known as the Competing Values Framework. This model shows whether an organization focuses internally and externally, predominantly or not. It also states whether an organization strives for flexibility and independence or constancy and regulation. CVF is an idea that allows imagining various management theories such as internal processes, open systems, rational goals and human relations (Sadighi, 2017). The cultural viewpoint of CVF provides four types of cultural orientation, namely group (clan) culture, developmental/adhocratic culture, rational culture and hierarchical culture.

Knowledge Sharing

Knowledge sharing has been described as an essential component of knowledge management practice (Alavi and Leidner, 2001; Earl, 2001; Hendriks, 1999; Hickins, 1999; Sohail and Daud, 2009). Knowledge sharing is the act of making knowledge available to others in the organization (Ipe, 2003). Wang et al., (2006) said that knowledge sharing could improve work and help a team develop strong knowledge. Knowledge sharing as part of knowledge production occurs in the form of discussion, working together to solve problems (Bakker, 2006).

Knowledge sharing provides all skills and knowledge for individuals to work or achieve goals more efficiently (Le, 2006). Knowledge sharing explicitly includes almost all forms of knowledge sharing, which institutionalized in organizations. The practice of explicit knowledge sharing appears to be more common in the workplace because explicit knowledge can be easily captured, codified and transmitted. Knowledge sharing can assist in creating shared models and the development of transactive memory, thereby enabling better

coordination among team members (Srivastava, 2006). Huysman and Wulf (2006) stated two things that motivate people to do knowledge sharing: first, people do knowledge sharing because they expect recognition and appreciation for their work (knowledge), promotion opportunities, or a sense of responsibility. Second, they expect something in return, such as other people will also share the knowledge that might be of use to them. Knowledge sharing is perceived as a knowledge transaction process in which knowledge buyers and sellers must reciprocally benefit from the exchange. Mutual benefits, reputation benefits, and trust are considered incentives for knowledge sharing (Hsu & Lin, 2008). McAdam et al, (2012) say that knowledge sharing refers to activities through various transfer forms starting from one person, group, or organization to another.

Wang and Wang (2012) said that knowledge sharing is more focused on knowledge gathering and diffusion and contributes to exchanging knowledge-based applications and creations in organizations. Knowledge sharing is an activity, experience, skill information, and expertise which exchanged, shared, and transferred between organizational members (Kim, Lee, Paek, & Lee, 2013). Eze et al., (2013) said that knowledge sharing refers to how team members share ideas related to tasks, information, and improvements to one another. Knowledge sharing in an organization is an act of transmitting organizational knowledge among employees to take action and engage in innovation (Islam et al., 2015). Lin (2015) says that knowledge sharing refers to collective beliefs or behavioral routines related to exchanging employees' knowledge, experiences, and skills across departments or organizations.

Knowledge sharing refers to the communication of all types of knowledge, namely explicit knowledge and tacit knowledge, through an attitude of socialization, interaction, and training. Knowledge sharing occurs between two individuals, one who has the knowledge and the other who acquires knowledge. This process includes sharing information, ideas, suggestions, and experiences related to an organization. (Obeidat et al., 2017). From the above statement, it can conclude that knowledge sharing is important in an organization's growth and development. Knowledge sharing in an organization must be managed properly to provide positive benefits for an organization. Knowledge sharing in SMEs is very important and is usually done informally. Knowledge sharing is one of the main ways to increase organizational employees' knowledge, which leads to increased organizational performance (Tuan, 2016). The results show that knowledge sharing that occurs in organizations can improve performance (Oyemomi, 2018). Kim et al., (2018) results of their research show that knowledge sharing is a mediated variable.

Organizational Performance

Venkantraman and Ramanujam (1986) view the performance of a company as having a multidimensional nature. Firm performance reflects the achievement of goals in terms of labor, capital, marketing, and fiscal issues (Marcoulides & Heck, 1993). Zhang & Zhu (2012) said that organizational performance is the achievement of specific goals, usually consisting of several indicators to measure the organization's efficiency and effectiveness to understand whether its operating processes conform with the goals set.

HYPOTHESIS

Suppiah and Sandhu (2011) stated a relationship between clan organizational culture and knowledge sharing. Wiewiora et al., (2014) asserted that a clan culture in the organization could increase trust in conducting knowledge sharing in the organization. From the literature review conducted and empirical evidence that supports the relationship between the two variables, the hypothesis for the above statement is:

Hypothesis 1 : Clan culture has impact on covenantal knowledge sharing.

Wang and Noe, (2010) showed that knowledge sharing has many positive effects such as sales and revenue growth, company innovation ability, team performance, faster completion of new product development, and reduced production costs. Qammach (2016) states that knowledge sharing can positively affect innovation performance and that organizations must prioritize knowledge sharing. From the literature review conducted and empirical evidence that supports the relationship between the two variables, the hypothesis for the above statement is:

Hypothesis 2 : Covenantal knowledge sharing has impact on the performance of SMEs.

Organizations strive to improve company performance, and organizational culture is recognized as one of the important drivers of company performance (Uzkurt, Kumar, Kimzan, & Eminoğlu, 2013). Kaya (2012) states that clan organizations' cultural dimensions are positively related to financial performance. Jacobs et al. (2013) stated that clan culture is more dominant in influencing performance. Sadighi's research results (2017a) show that organizational culture influences the performance of SMEs. From the literature review conducted and empirical evidence that supports the relationship between the two variables, the hypothesis for the above statement is:

Hypothesis 3: Clan culture has impact on the performance of SMEs.

METHODS

The primary data is obtained from distributing questionnaires to SME entrepreneurs. This research was conducted in West Java (Bandung Regency, North Bandung, South Bandung,

East Bandung, and Bandung City). The distribution of questionnaires was carried out randomly with simple random sampling. The research object was micro and medium business actors engaged in the culinary business. The educational background of the SME owner is mostly bachelors. This research is analyzed using Structural Equation Modeling (SEM) analysis tools.

RESULTS

This research is analyzed using Structural Equation Modeling (SEM) analysis tools. The selection of analysis tools is based on the fact that SEM can simultaneously test several dependent and independent variables with direct and indirect relationships (Ferdinand, 2005). The explanation of the output with this method is divided into three parts: the fit instrument model test, the goodness of fit criteria, and the output of the hypothesis test.

Validity and Reliability

The first thing to do is assess whether the research model built meets the instrument testing criteria, namely the measurement construct, to assess the unidimensionality and construct reliability. Unidimensionality is a basis for calculating reliability which is intended when indicators of a construct are accepted. The approach used to assess the model's unidimensionality is to measure composite reliability (Cronbach, 1951) and average variance extracted (AVE) for each construct. Reliability is a construct measurement through consistent internal indicators. High-reliability results provide confidence that each variable's indicators have consistency with their measurements (Vaske, Beaman, & Sponarski, 2017).

The accepted level of reliability (CR) must be ≥ 0.70 , and the reliability is ≤ 0.70 to be accepted in the research. The approach used to assess the model's unidimensionality is to measure composite reliability (Cronbach, 1951) and average variance extracted (AVE) for each construct. Reliability is a construct measurement through consistent internal indicators. High-reliability results provide confidence that each variable's indicators have consistency with their measurements (Vaske, Beaman, & Sponarski, 2017).

The level of reliability (CR) accepted must be ≥ 0.70 , and reliability \leq of 0.70 can be accepted for research that is still exploratory (Kaplan and Sacuzzo, 2001). However, reliability cannot guarantee validity. Validity can measure the extent to which an indicator describes the accuracy in measuring what the study wants to measure. Another measure of validity is the variance extracted as a complement to the AVE size with a cut off value \geq of 0.50 (Gerbing & Anderson, 1988; Fornell & Larcker, 1981), explaining that the AVE value must be greater than 0.5 and if the AVE value <0.4 then the construct is still accepted. If the value of composite reliability

(CR) is > 0.7 , then the convergent validity is still accepted. Due to the loading factor value > 0.5 but still < 0.6 , it results in a relatively small AVE value. The SEM AMOS output is as follows:

Tabel 1. Validity and Reliability Test

Variable	Indicator	Loading Factor	Standar Loading2	1-Std. Loading	CR	AVE			
Clan Culture	BC1	0.676	0.457	0.543	0.858	0.355			
	BC2	0.598	0.358	0.642					
	BC3	0.631	0.398	0.602					
	BC5	0.595	0.354	0.646					
	BC6	0.541	0.293	0.707					
	BC7	0.586	0.343	0.657					
	BC8	0.621	0.386	0.614					
	BC9	0.567	0.321	0.679					
	BC11	0.56	0.314	0.686					
	BC12	0.576	0.332	0.668					
	BC13	0.587	0.345	0.655					
	Covenantal Knowledge Sharing	CKS1	0.602	0.362			0.638	0.856	0.316
		CKS2	0.506	0.256			0.744		
CKS3		0.535	0.286	0.714					
CKS4		0.543	0.295	0.705					
CKS5		0.548	0.300	0.700					
CKS6		0.61	0.372	0.628					
CKS7		0.645	0.416	0.584					
CKS8		0.52	0.270	0.730					
CKS9		0.549	0.301	0.699					
CKS10		0.653	0.426	0.574					
CKS11		0.565	0.565	0.681					
CKS12		0.513	0.513	0.737					
CKS13		0.487	0.487	0.763					
SME Performance	KU1	0.653	0.426	0.574	0.789	0.429			
	KU2	0.612	0.375	0.625					
	KU3	0.656	0.430	0.570					
	KU4	0.75	0.563	0.438					
	KU5	0.592	0.350	0.650					

Values with a loading factor <0.5 are eliminated from the model, namely BC4, BC10, CKS12. Estimated parameter test results explicate that the model has passed the reliability and validity instrument testing. The validity value measured using construct reliability (CR) were ≥ 0.70 (Kaplan and Sacuzzo, 2001) and AVE <0.40 (Fornell & Lacker, 1981).

Outlier Normality Assumption Test

Outliers are observational data with different characteristics and appear in extreme forms (Hair et al., 1995). Outlier data appears in univariate and multivariate forms. Testing univariate outliers can be done by looking at the standard score (Z-Score) conversion data which has an average value of 0 and a standard deviation of 1. The model is said to have univariate outliers if the minimum and maximum values are \pm four or \pm five (Ferdinand, 2014). The following is the univariate outlier test data using construct reliability (CR) which is ≥ 0.70 (Kaplan and Sacuzzo, 2001) and AVE <0.40 (Fornell & Lacker, 1981).

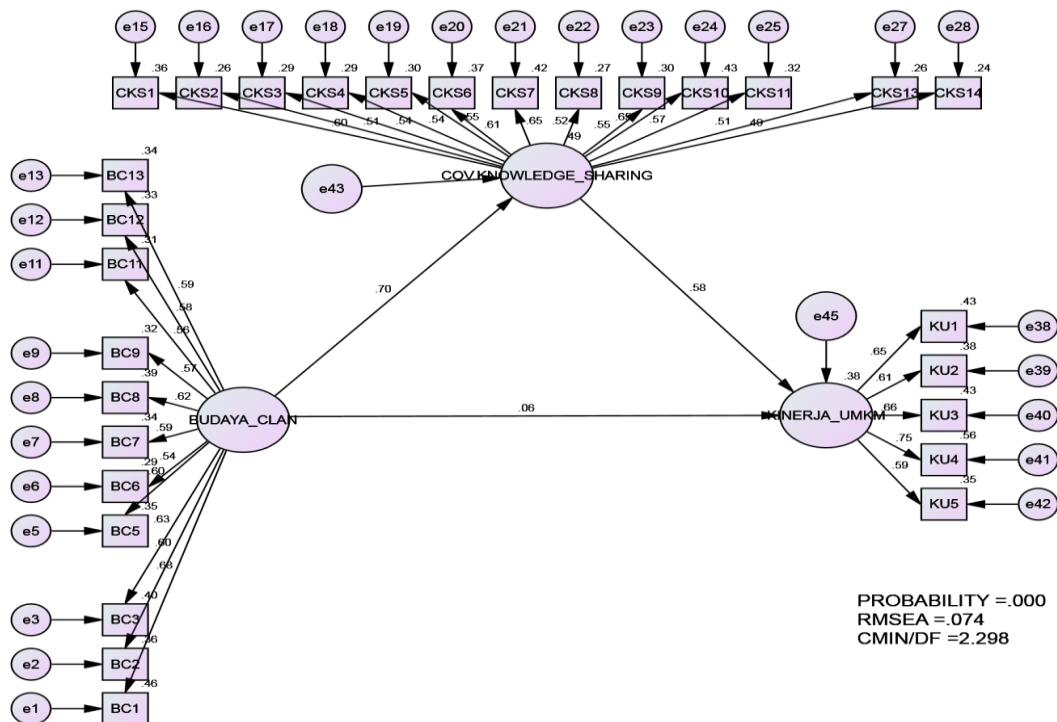

Figure 1. Model Evaluation

The image shows the model construct of the research. However, a construct cannot be considered good if it does not meet the goodness of fit criteria. The goodness of fit measures the suitability of the actual or observed input (covariance or correlation matrix) with the proposed model's predictions. The basic goodness of fit is the primary measurement indicator model, namely Chi-square (X^2) and Degrees of freedom. Absolute fit measurement estimate the overall fit model (both structural models and joint measurement models), which consisting of chi-square (X^2), the goodness of fit indices (GFI), and root mean square error of approximation (RMSE). Incremental fit indices are a measure used to compare the proposed model with other models specified by researchers. It consists of the adjusted goodness of fit index (AGFI), norm fit index (NFI), comparative fit index (CFI), incremental fit index (IFI), relative fit index (RFI), and the Tucker Lewis Index (TLI). Parsimonious fit indices provide adjustments to fit measurements to be compared between models with a different number of coefficients. It consisting of Akaike's Information Criterion (AIC), Consistent Akaike Information Index (CAII), Expected Cross Validation Index (ECVI), Parsimonious Normal Fit Index (PNFI), and Parsimonious Goodness of Fit Index (PGFI).

In empirical research practice, a researcher does not have to suffice all the goodness of fit criteria. The use of 3 to 4 goodness of fit criteria is considered sufficient to assess the feasibility of a model with the condition that each of the goodness of fit groups, namely absolute fit indices, incremental fit indices, and parsimonious fit indices, are represented (Hair *et al.*, 2014). Based on chi-square (X^2), the goodness of fit indices (GFI), and root mean square error of approximation (RMSE), incremental fit indices are a measure to compare the proposed model with other models specified by the researcher. It consists of adjusted goodness of fit index (AGFI), norm fit index (NFI), comparative fit index (CFI), incremental fit index (IFI), and relative fit index (RFI), and the Tucker Lewis Index (TLI). Parsimonious fit indices perform adjustments to fit measurements to be comparable between models with different number of coefficients, which consists of Akaike's Information Criterion (AIC), Consistent Akaike Information Index (CAII), Expected Cross Validation Index (ECVI), Parsimonious Normal Fit Index (PNFI) and Parsimonious Goodness of Fit Index (PGFI). Based on data processing in the model, the following results were obtained:

Table 2. Goodness of Fit Evaluation

Criteria	Cut-off value	Result	Classification
Chisquare	Expected Low	859.332	Fit
RMSEA	$\leq 0,09$ (Hatcher, 1994)	.074	Fit
CMIN/DF	≤ 2 (Byrne, 1998) ≤ 5 (Wheaton, 1977)	2.298	Fit
TLI (Tucker Lewis Index)	≥ 0.90 (Arbuckle, 1997) $\geq 0,95$ (Hair et al, 1995)	.757	Marginal Fit
IFI	$\geq 0,80$ (Browne and Cudeck, 1993; Garson, 2006)	.796	Marginal Fit
CFI	$\geq 0,80$ (Browne & Cudeck, 1993; Garson, 2006)	.791	Marginal Fit
PRATIO	The higher the better, the utility of PRATIO shows a limited parsimonious fit 0-1	.860	Fit
	The higher the better, the utility of PRATIO shows a limited parsimonious fit	> 0.7 (Folnell & Larcker, 1981)	Fit

Hypothesis Test Output Analysis

The first hypothesis in this study is that clan culture affects covenantal knowledge sharing. Based on the results of the AMOS analysis, it shows that there is an influence of clan culture on social capital where the value of $T = .672$ $P = 0.00 < 0.05$, so H_0 is rejected and H_a is accepted, meaning that there is a positive influence between clan culture and covenantal knowledge sharing. It conforms to S. Wang and Noe (2010), which show that knowledge sharing positively affects sales and revenue growth, company innovation ability, team performance, new product development effectiveness, and reduction of production costs.

The second hypothesis in this study is that covenantal knowledge sharing affects the performance of SMEs. Based on the results of the AMOS analysis, it shows that there is an effect of covenantal knowledge sharing on the performance of SMEs where the value of $T =$

.711 and $P = .000 < 0.05$ then H_0 is rejected and H_a is accepted, meaning that there is a positive influence between covenantal knowledge sharing and the performance of SMEs. The result of the path coefficient of .546 positive shows that there is a unidirectional relationship, meaning that every time there is an increase in covenantal knowledge sharing activities, the performance of SMEs increases. Qammach, (2016) states that knowledge sharing can positively affect innovation performance and that organizations must prioritize knowledge sharing.

The third hypothesis in this study is that clan culture affects performance of SMEs. Based on the results of the AMOS analysis, it shows that the influence of clan culture on the performance of SMEs shows that the value of $T = -1.44$ and $P = .586 > 0.05$ then H_0 is accepted and H_a is rejected, meaning that there is a value that is not significant between clan culture and the performance of SMEs. The result of the path coefficient -.018 means that there is no unidirectional relationship. Clan culture does not directly affect the performance of SMEs but is moderated by covenantal knowledge sharing. It conforms to Kayab's (2013) research outcomes, pointing that clan culture has no significant effect on organizational performance.

CONCLUSIONS

The relationship between clan culture and covenantal knowledge sharing is unidirectional, meaning that every time there is an increase in the implementation of clan culture, covenantal knowledge sharing activities also increase. The dimensions of the clan culture here are kinship, teamwork, a friendly and comfortable working atmosphere. The dimensions used by covenantal knowledge sharing in this study are self-confidence, volunteerism, honesty, and humility. Covenantal knowledge sharing has a significant effect on the performance of SMEs.

**DYNAMIC MODELLING AND CONTROL OF TWO LINK FLEXIBLE ARM
ROBOTIC MANIPULATOR**

Abstract

Robots are used in various fields now-a-days. The major application of robots is in industries. Increased rate of production within stipulated period of time along with high quality of products are the prime requirements of the industry. This is achieved by increasing the speed of operation. This increase in operation speed of robots causes problems of vibrations of *links* which are the major cause of positional inaccuracies at the end-effector. Furthermore, less power consumption is another area of concern. This may be achieved by decreasing the inertia of robots. But this results in lightweight *links* which are prone to vibrations. This further decreases the accuracy of robots. The present work is based on minimizing the vibrations of these lightweight robots also known as *flexible* robots. The thesis focuses upon the dynamic modeling and control of a Two-Link Flexible robot having two revolute *joints*. For this, firstly a mathematical model of the *flexible* robot is prepared using Lagrangian dynamics. The mathematical model thus obtained involves coupling between the *rigid* and *flexible* motions exhibited by the *flexible* robot. The *rigid* motion is due to the motion of *joints* and is responsible for change in configuration of the robot while the *flexible* motion is due to the vibration of *links*. The *links* undergo two types of vibrations: flexural/ bending vibrations and torsional vibrations. The vibration analysis of the *flexible links* is done using both *assumed modes method* and *finite elements method*. A robotic system is an inertia-variant system because its configuration changes with time. As a result, the natural frequencies of the system change with time. The effect of this time-dependency of natural frequencies of *links* on Joint and Tip responses is taken care of during mathematical modeling. While using *assumed modes method*, the governing equations of the system are obtained to include this effect. Exact boundary conditions for the *flexible links* are obtained while using this method. On the other hand, while using *finite elements method* this effect of time-dependency of natural frequencies is taken care of by continuously updating the mass and stiffness matrices of the system. Furthermore, it is also easy to take care of boundary conditions during 'finite element analyses'. Two different types of shape functions for a three-node frame element are proposed during the finite element formulation. Mass matrix, stiffness matrix and load vector are also derived for the same. Besides that, stiffness matrix for a one-dimensional torsional finite element under the influence of bending is also provided. Validation of the mathematical model of the Two-Link Flexible manipulator is done with the results available in literature and also through experiments. The control of vibrations of *flexible links* is achieved by using passive damping technique using viscoelastic material and active damping technique using piezoceramics. While using passive damping technique, the phenomenon of viscoelasticity is modeled using Kelvin-Voigt elements. The active vibration control of *flexible links* is achieved with the help of piezoelectric sensors and actuators applied in segmented fashion on the *links*. Direct velocity feedback is

used. A hypothesis is presented for active vibration control of torsional vibrations. Results are also presented. Proportional-derivative gains are used during active vibration control and it is shown that good results are obtained at low values of control gains. To significantly reduce the vibration of *flexible links*, both the vibration control techniques are used together to achieve hybrid damping. Since, a robot is to be used for the performance of specified tasks, trajectory planning is must. In the present work, trajectory planning is done using both ‘point-to-point’ and ‘continuous path’ trajectories. It is shown that through proper planning of trajectory, tip vibrations, initial jerk and *joint* torque requirements can be reduced significantly. While making a robot follow a certain trajectory with minimum deviation from the desired path, control techniques are required. Computed-torque control and robust control techniques are used for this. Another control technique: Coupled-error dynamics control technique is also used in the present work. This is an innovative control technique discovered during the research work. It is based upon *independent modal space control* proposed by Meirovitch. The performance of this control technique is compared with computed-torque and robust control schemes in terms of error in path followed, effect of uncertainties within the system like mass uncertainty and *link* flexibility and control torque output. It is found that the performance of newly developed control scheme is better than computed-torque control and close to robust control.

Keywords: Flexible manipulator, dynamic analysis, vibration control

1. Introduction

Most of the robots used for industrial applications like welding, have two *links*. These robots are not perfectly rigid and hence possess some vibrations due to which the accuracy at the tip gets affected. The requirement of high performance in robotics asks for high speed of operation and good accuracy. Space applications demand for construction of large space structures by using lightweight space robot manipulator. All these requirements make it necessary to consider the structural flexibility in robotic arms during design stage. When compared with conventional *rigid* robots, elastic *link* manipulators have special potential advantages of higher operational speed and greater payload-to-manipulator weight ratio but, the flexibility of the arms leads to deformation and vibrations at the tips of the *links* during the motion. As a consequence, the dynamics behaviour becomes extremely complicated. Appearance of oscillations also makes the control problems really difficult. The present work is an attempt towards accurate modelling of a Two-Link Flexible manipulator as well as implementing different control strategies for the *flexible* manipulator. Mathematical model is prepared using Lagrangian dynamics to predict the behaviour of the manipulator. The *links* are modelled as Euler-Bernoulli beams. Discretization is done using assumed modes method (AMM) with variable frequency equation and Lagrangian-finite elements method (FEM) including torsional vibration modes. The control problem is divided into two parts, *viz.*, *joint* position control and vibration control of *links*. The *joint* position control is achieved using the actuators at the *joints*. For vibration control of *links*, both passive and active damping methods are used. Thus, damping is of hybrid nature. Few new proposals have also been made.

The aim of the research work is to achieve the position control of the end effector of a Two-Link Flexible robot using active and passive vibration control methods. The following objectives are established to realize this goal.

1. To prepare a dynamic model of a Two-Link Flexible manipulator considering both flexural and torsional vibrations of the *links*.
2. To control the position of the tip of the Two-Link Flexible manipulator using passive and active vibration control techniques
3. To perform the trajectory control of the Two-Link Flexible manipulator

1.1 Organization of the chapter

The complete work is divided into six sections. The **first section** gives a brief **introduction** of the present work. The **second section** provides the **literature review** of research in the area of *flexible* robotics. It highlights the different design and control concepts used by various

researchers in the field of *flexible* robotics. The **third section** presents **mathematical modelling of Two-Link Flexible manipulator** using the approaches of Lagrangian-AMM and Lagrangian-FEM. In the **fourth section**, the **vibration control of *flexible links*** is described using viscoelastic, active and hybrid damping methods. In the **fifth section**, **trajectory control of Two-Link Flexible manipulator** is discussed. The trajectory control is achieved using both continuous path (CP) planning and point-to-point (PTP) planning methods. The position control of tip of *flexible* manipulator is achieved using the approaches of computed-torque control (CTC), robust control and coupled-error dynamics (CED). A comparison of these different approaches is made. The **sixth section** presents the **conclusions and recommendations** based on the present work.

2. Literature review

A comprehensive literature review was conducted to accomplish the aim and objectives of the present work. The literature review includes the survey on work done by various authors in the area of *flexible* robotics.

2.1 Literature survey on *flexible* robotics

The research on *flexible* manipulators started way back in year 1975 and is still going on. Dwivedy and Eberhard [1] have provided a comprehensive literature review on modelling and control of *flexible* manipulators. Table 2.1 highlights the major breakthroughs in this area in a chronological fashion.

Table 2.1: Major breakthroughs in the field of *flexible* robotics since 1975

S. No.	Year	Breakthroughs
1	1975- 1980	Starting years of research on <i>flexible</i> robots; Focus on single <i>flexible link</i> ; Dynamic modelling of <i>flexible</i> robots; Frequency-domain and time-domain analyses; Use of Lagrangian approach; Use of feedback control schemes
2	1981-1986	Dynamic modelling using Finite element method; Feedback control of vibrations; Inverse and Forward dynamics; Consideration of <i>joint</i> flexibility, Development of other control methods- singular perturbation, composite control, etc., Consideration of effect of gravity, Use of Newton-Euler approach in dynamic modelling

3	1986-1993	Use of nonlinear beam theory, Work started on nonlinear controller, Implementation of damping in dynamic modeling, Development of control strategy using Input shaping, Dynamic modelling of multilink <i>flexible</i> manipulators, Consideration of active damping using Linear quadratic regulator, Consideration of dynamic boundary conditions, Research on stability conditions, Feedforward control for gravity compensation
4	1994-2000	Hybrid force and position control, Adaptive control, Bending-torsion vibrations of a single <i>flexible</i> link, Comparison of AMM-FEM, Introduction of <i>flexible link</i> with prismatic joint, Stability characteristics considering effect of damping and tip mass, Adaptive nonlinear control, Effect of payload variations, Effect of geometric nonlinearities, Concept of Equivalent rigid-link system for dynamic modeling
5	2001-2008	Nonlinear Lyapunov control, Robustness and stability issues in model based control, Use of smart materials for active vibration damping, Fractional order controllers, Optimization techniques for controllers for vibration reduction, Redundant manipulators, Integral resonant control
6	2009 onwards	Control strategy based on intelligent techniques, Sliding mode control, Nonlinear observer, Intelligent control techniques, Robust input shaping, Spring-damper based mathematical model, Study of transient response, Study of effect of actuator on vibration modes

From the literature survey, it was found that different design methods have been used by various researchers for preparing the mathematical model of the *flexible* manipulators. Table 2.2 highlights the various design methods.

9	Hamilton's principle	Gaultier et.al.,1992 [21], etc.
10	Newton-Euler dynamics and FEM	Nagnathan and Soni, 1986 [10]; Mohan and Saha [75]; etc.
11	Decoupled Natural Orthogonal Compliment	Mohan and Saha [75]

In order to achieve the tip position control of *flexible* manipulators, various control approaches have been used by the researchers. These are- Feed-forward control [56], [63], [71]; Integral resonant control [45], [53]; Input shaping [43], [58]; Sliding mode control [51], [55]; Model predictive control [66]; PD control [42], [74] and Lyapunov control [22], [39]. From the literature review it is observed that the most of the papers deal with planar single *link flexible* robotic arms with small 3D motions. For such *links*, a linear model is sufficient to describe the dynamic characteristics. A lot of research is going on, for non-linear models of *flexible* arms. The simple case of non-linearity in *flexible* arms is that of a *two-link* case which have been described in a few papers. Furthermore, *links* having revolute *joints* have been studied a lot. Most of the authors have focussed on the design of controllers according to the accurate dynamic model of the *flexible* arm. Both AMM and FEM have been used to model the *flexible* arm without compromising the accuracy. Some recent researchers have tried to use intelligent control techniques like fuzzy logic [59], [74], neural networks [31], [50], [71] and genetic algorithm [59], [74] for designing robust controllers as these do not require complicated mathematical modelling. There are two types of vibration control schemes: feed-forward and feedback. Trajectory control using *forward* and *inverse* dynamics methods [6], [7] and effect of gravity [24] on the motion of *flexible links* have been studied in a limited manner. Few authors recommend the use of nonlinear beam theory [14], [25] to account for geometric nonlinearities and a nonlinear controller [9], [31] for effective vibration control of *flexible* manipulators. In order to improve the dynamic performance of *flexible* manipulators, few optimization techniques have also been proposed. But, the most attractive one is the use of kinematic redundancy feature for minimizing *joint* torques and vibration suppression. The literature also gives a comparison between AMM and FEM [30], [32] and stability analysis of *flexible* manipulators. The proper placement of actuators made of smart materials on *flexible* links plays a crucial role in damping the vibrations [40]. The control approaches found in the literature apply well for the *single-link* planar case with small *elastic* displacements. For *multi-link* case, Feed-forward based and other advanced techniques might be suitable.

2.2 Research gaps identified in the existing knowledge

Following gaps are found in the literature review presented in this chapter:

1. Use of internal damping is considered in very few papers. Most of the papers do not consider damping during dynamic modelling of the *flexible* manipulator system. This important parameter affecting the response needs to be included.

2. Combined bending-torsion vibrations of Two-Link Flexible manipulator become very important and needs to be analyzed. In fact, this coupling increases a lot in *multi-link* situation.
3. There is ample scope of research on optimal placement of actuators according to the mode shapes for active damping. Although one paper presents a study on this area for bending vibrations, but is silent about the effect of *rigid* body motion on mode shapes.
4. Consideration of centrifugal and Coriolis' forces/ torques and gravity terms need to be considered while forming the equation of motion.
5. The control approaches used by various researchers are suitable for *single-link flexible* planar manipulator only and that too for small *elastic* displacements. For *multi-link flexible* manipulators, either feed-forward based techniques might be suitable or some different technique should be developed/ used.
6. A robotic arm as a plant is a time-varying system. Use of Adaptive Neural controllers or intelligent controllers is very limited. There exists scope for improvement using these.
7. Stability analysis of intelligent controllers is also another area of research on which hardly any literature is available.

3. Mathematical modelling of Two-Link Flexible manipulator

The mathematical modelling is done using both Lagrangian dynamics. Discretization is done using both AMM and FEM. For the AMM approach, the frequency equation is time-variant and this equation is evaluated at every time step.

3.1 Lagrangian dynamics for *flexible* manipulator

An accurate dynamic model of a Two-link Flexible manipulator having two revolute *joints* undergoing both small bending and small torsional deformations was prepared. Fig. 3.1 shows a Two-Link Flexible manipulator undergoing both bending and torsional deformations along with *rigid* revolutions at the *joints*.

Fig. 3.1: Dynamic analysis of Two-Link Flexible manipulator undergoing both bending and torsional deformations.

In figure 3.1, plane X-Y is the plane of bending while plane Y-Z is the plane of torsion. X-Y-Z is the reference/ ground frame while X_1 - Y_1 - Z_1 and X_2 - Y_2 - Z_2 are the local frames attached to Link-1 and Link-2 respectively. Axis X_1 is aligned along the un-deformed neutral axis (N.A.) of Link-1 while axis X_2 is aligned along the un-deformed neutral axis of Link-2. The origins of these local frames are located at Joint-1 and Joint-2 respectively. Joint-1 is given a *rigid* rotation of θ_1 and Joint-2 is given a *rigid* rotation of θ_2 . The position of any point on Link-1 with respect to ground is given by:

$$\{p_1\} = [T_1][T_{1T}]\{r_{1T}\} + [T_1]\{r_1\} \quad (3.1)$$

Similarly, the position of any point on Link-2 with respect to ground is given by:

$$\{p_2\} = [T_1]\{r_1^*\} + [T_1][T_{1T}^*]\{r_{1T}^*\} + [T_A^*][T_1][T_2]\{r_2\} + [T_1][T_2][T_{2T}]\{r_{2T}\} \quad (3.2)$$

In above expressions,

$$T_1 = \begin{bmatrix} \cos \theta_1 & -\sin \theta_1 & 0 \\ \sin \theta_1 & \cos \theta_1 & 0 \\ 0 & 0 & 1 \end{bmatrix}; T_2 = \begin{bmatrix} \cos \theta_2 & -\sin \theta_2 & 0 \\ \sin \theta_2 & \cos \theta_2 & 0 \\ 0 & 0 & 1 \end{bmatrix}; \{r_1\} = \begin{Bmatrix} x_1 \\ w_1(x_1, t) \\ 0 \end{Bmatrix};$$

$$\{r_1^*\} = \begin{Bmatrix} L_1 \\ w_1(L_1, t) \\ 0 \end{Bmatrix}; \{r_2\} = \begin{Bmatrix} x_2 \\ w_2(x_2, t) \\ 0 \end{Bmatrix}; T_A^* = \begin{bmatrix} \cos(w_1^*) & -\sin(w_1^*) & 0 \\ \sin(w_1^*) & \cos(w_1^*) & 0 \\ 0 & 0 & 1 \end{bmatrix};$$

$$\{r_{iT}\} = \{0 \quad b_i \phi_i \quad b_i\}' ; \{r_{iT}^*\} = \{0 \quad b_i \phi_i^* \quad b_i\}' ; \{g\}' = \{0 \quad g \quad 0\}' ;$$

$$[T_{iT}] = \begin{bmatrix} 1 & 0 & 0 \\ 0 & \cos \phi_i & -\sin \phi_i \\ 0 & \sin \phi_i & \cos \phi_i \end{bmatrix} ; [T_{iT}^*] = \begin{bmatrix} 1 & 0 & 0 \\ 0 & \cos \phi_i^* & -\sin \phi_i^* \\ 0 & \sin \phi_i^* & \cos \phi_i^* \end{bmatrix} ; \quad (3.3)$$

L_1 and L_2 = lengths of Link-1 and Link-2 respectively,

θ_1 and θ_2 = *joint* rotations (rigid) of Joint-1 and Joint-2 respectively,

x_1 and x_2 = distances measured along un-deformed Link-1 and Link-2 axes, i.e. X_1 and X_2 respectively,

$w_1(x_1, t)$ and $w_2(x_2, t)$ = *elastic* displacements of Link-1 and Link-2 respectively undergoing bending vibrations

w_1^* = bending angle at end point of Link-1 = $\frac{dw_1^*}{dx_1}$

$\{r_1\}$ = position coordinates of any point on Link-1 w.r.t to un-deformed Link-1 axis i.e., X_1 in plane X_1 - Y_1

$\{r_2\}$ = position coordinates of any point on Link-2 w.r.t to un-deformed Link-2 axis i.e., X_2 in plane X_2 - Y_2

$\{r_1^*\}$ = position coordinates of end point of Link-1 w.r.t. un-deformed beam-1 axis X_1 in plane X_1 - Y_1

$\{r_{iT}\}$ = position coordinates of any point on Link- i in plane Y_i - Z_i

$\phi_i = \phi_i(x_i, t)$ = torsional deformation of any point on Link- i

$\phi_i^* = \phi_i(L_i, t)$ = torsional displacement of end point of Link- i ; i represents the *link* number ($i = 1$ and 2)

The total kinetic energy of the manipulator system is given by:

$$K.E. = \frac{1}{2} \rho_1 A_1 \int_0^{L_1} \{p_1\}' \{p_1\} dx_1 + \frac{1}{2} \rho_2 A_2 \int_0^{L_2} \{p_2\}' \{p_2\} dx_2 \quad (3.4)$$

Total potential energy of the manipulator system is given by:

$$P.E. = \frac{E_1 I_1}{2} \int_0^{L_1} \left(\frac{\partial^2 w_1^2}{\partial x_1^2} \right)^2 dx_1 + \frac{G_1 J_1}{2} \int_0^{L_1} \left(\frac{\partial \phi_1}{\partial x_1} \right)^2 dx_1 + \rho_1 A_1 \int_0^{L_1} \{g\}' \{p_1\} dx_1 +$$

$$\frac{E_2 I_2}{2} \int_0^{L_2} \left(\frac{\partial^2 w_2^2}{\partial x_2^2} \right)^2 dx_2 + \frac{G_2 J_2}{2} \int_0^{L_2} \left(\frac{\partial \phi_2}{\partial x_2} \right)^2 dx_2 + \rho_2 A_2 \int_0^{L_2} \{g\}' \{p_2\} dx_2$$

(3.5)

In equation 3.5, J_1 and J_2 are the polar moment of inertias of Link-1 and Link-2 respectively.

The *joint* torques can be obtained using Lagrangian dynamics as follows:

$$\frac{d}{dt} \left(\frac{\partial \mathcal{L}}{\partial \dot{q}} \right) - \frac{\partial \mathcal{L}}{\partial q} = F \quad (3.6)$$

In above expression, \mathcal{L} represents Lagrangian of the system and is obtained by taking the difference of total kinetic energy and total potential energy of the system; q represents generalized coordinates and F represents generalized torque/force.

$$q = \{\theta_1 \quad \theta_2 \quad w_1 \quad w_1^* \quad w_2 \quad w_2^* \quad \phi_1 \quad \phi_1^* \quad \phi_2 \quad \phi_2^*\}' \quad (3.7a)$$

$$F = \{\tau_1 \quad \tau_2 \quad 0 \quad 0 \quad 0 \quad 0 \quad 0 \quad 0 \quad 0 \quad 0\}' \quad (3.7b)$$

where, τ_1 and τ_2 are the external torques applied at *joint-1* and *joint-2* respectively.

3.2 Assumed modes method

While using assumed modes method (AMM), only bending vibrations of *flexible links* are considered. The term ‘ $w_i(x_i, t)$ ’ for any Link- i can be found out by the solution of equation of motion of Euler-Bernoulli beam. The equation is as follows.

$$\frac{\partial^2 w_i}{\partial t^2} + \left(\frac{E_i I_i}{\rho_i A_i} \right) \frac{\partial^4 w_i}{\partial x_i^4} = f(x_i, t) \quad (3.8a)$$

The transient solution of above equation is given as follows.

$$w_i(x_i, t) = \sum_{n=1}^{\infty} W_n(x_i) T_n(t) \quad (3.8b)$$

In equation 3.8, n = number of modes ($n = 1, 2, \dots, \infty$); $W_n(x_i)$ = n th mode shape and is a function of distance ‘ x ’ measured along un-deformed beam axis for Link- i ; $T_n(t)$ = time-dependent function of n th mode. Since it is impossible to include all the infinite number of modes of the system, hence it is modeled with reduced number of modes by assuming some definite number of modes which best describe the behavior of the system. Thus, we can rewrite the above equation with reduced number of modes say m , as follows:

$$w_i(x_i, t) = \sum_{n=1}^m W_n(x_i) T_n(t) \quad (3.9a)$$

In equation 3.9a, m = number of assumed modes. The boundary conditions used for the *flexible links* are time-dependent and given as follows:

$$i) \quad E_i I_i \frac{\partial^2 w_i(0,t)}{\partial x_i^2} = -J_{pi_left} \left[\frac{\partial^2}{\partial t^2} \left(\frac{\partial w_i(0,t)}{\partial x_i} \right) \right] \quad (3.10a)$$

$$ii) \quad E_i I_i \frac{\partial^3 w_i(0,t)}{\partial x_i^3} = M_{pi_left} \left[\frac{\partial^2 w_i(0,t)}{\partial t^2} \right] \quad (3.10b)$$

$$iii) \quad E_i I_i \frac{\partial^2 w_i(L_i,t)}{\partial x_i^2} = -J_{pi_right} \left[\frac{\partial^2}{\partial t^2} \left(\frac{\partial w_i(L_i,t)}{\partial x_i} \right) \right] \quad (3.10c)$$

$$iv) \quad E_i I_i \frac{\partial^3 w_i(L_i,t)}{\partial x_i^3} = M_{pi_right} \left[\frac{\partial^2 w_i(L_i,t)}{\partial t^2} \right] \quad (3.10d)$$

In equations 3.10, the symbols have their usual meanings. The word ‘left’ means the left end of *link* and the word ‘right’ means the right end of the *link*. The frequency equation (equation 3.11) of any Link- i undergoing flexural vibrations is also derived and found to be varying with time.

$$\begin{aligned} & (1 + \cosh(z_{ni}) \cos(z_{ni}) + a_i z_{ni} (\cos(z_{ni}) \sinh(z_{ni}) \\ & \quad - \cosh(z_{ni}) \sin(z_{ni})) \\ & \quad - b_i z_{ni}^3 (\cosh(z_{ni}) \sin(z_{ni}) \\ & \quad + \cos(z_{ni}) \sinh(z_{ni})) - a_i b_i z_{ni}^4 (\cosh(z_{ni}) \cos(z_{ni}) - 1) = 0 \end{aligned}$$

(3.11)

In equation 3.11, $z_{ni} = \beta_{ni} L_i$; $a_i = \frac{M_{pi}}{\rho_i A_i L_i}$; $b_i = \frac{J_{pi}}{\rho_i A_i L_i^3}$. The expression for mode shape can be found out as follows:

$$W_n(x_i, t) = C_{1n}[\cosh(\beta_n x_i) - \cos(\beta_n x_i) + \alpha_n\{\sin(\beta_n x_i) - \sinh(\beta_n x_i)\}] \quad (3.12)$$

where, $\alpha_n = \left(\frac{\sinh(\beta_n L_i) - \sin(\beta_n L_i) + a_i \beta_n L_i (\cosh(\beta_n L_i) - \cos(\beta_n L_i))}{\cos(\beta_n L_i) + \cosh(\beta_n L_i) + a_i \beta_n L_i (\sinh(\beta_n L_i) - \sin(\beta_n L_i))} \right)$; $\beta_n^4 = \left(\frac{\rho_i A_i}{E_i I_i} \right) \omega_n^2$; $\omega_n = n$ th

mode natural angular frequency of the Link- i ; C_{1n} = arbitrary normalization constant. The time-dependent term- ‘ $T_n(t)$ ’ in equation (3.8b) is given by equation 3.13 as follows.

$$T_n(t) = e^{-\xi_n \omega_n t} \{A_n \cos(\omega_{dn} t) + B_n \sin(\omega_{dn} t)\} + \frac{1}{\rho_i A_i b_i \omega_{ni}} \int_0^t Q_{ni}(\tau) \sin \omega_n(t - \tau) d\tau$$

(3.13)

where, $Q_{ni}(\tau) = \int_0^\tau f(x_i, \tau) W_n(x_i) dx_i$

$\xi_n = n$ th mode damping ratio,

$\omega_n = n$ th mode natural angular frequency,

$\omega_{dn} = n$ th mode damped angular frequency = $\omega_n \sqrt{1 - \xi_n^2}$.

The complete equation of motion of the Two-Link Flexible manipulator after considering the effect of payload is given as follows:

$$[M(q)]_{6 \times 6} \{\ddot{q}\}_{6 \times 1} + [H(q, \dot{q})]_{6 \times 6} \{\dot{q}\}_{6 \times 1} + [G(q)]_{6 \times 1} + [C(q)]_{6 \times 6} \{\dot{q}\}_{6 \times 1} + [K(q)]_{6 \times 6} \{q\}_{6 \times 1} + [K(q)]_{6 \times 1}^\# = \{Q(t)\}_{6 \times 1} \quad (3.14)$$

In equation 3.14, M stands for mass matrix, H stands for Coriolis and centrifugal torque vector, G stands for gravity torque vector, C stands for damping and gyroscopic couple matrix, K stands for stiffness matrix, $K^\#$ is the miscellaneous matrix that includes unmodelled dynamics and Q stands for torque vector. The vector q in equation 3.14 contains first six variables mentioned in equation 3.7a.

3.3 Finite element method

The finite element method (FEM) is used to model the vibratory motions of the *flexible links*. This involves division of *flexible links* into some finite number of elements and finding the inertia and stiffness matrices that govern the dynamics of the system under consideration. Figure 3.2 shows the discretization of *flexible links* using two Space-frame elements [76].

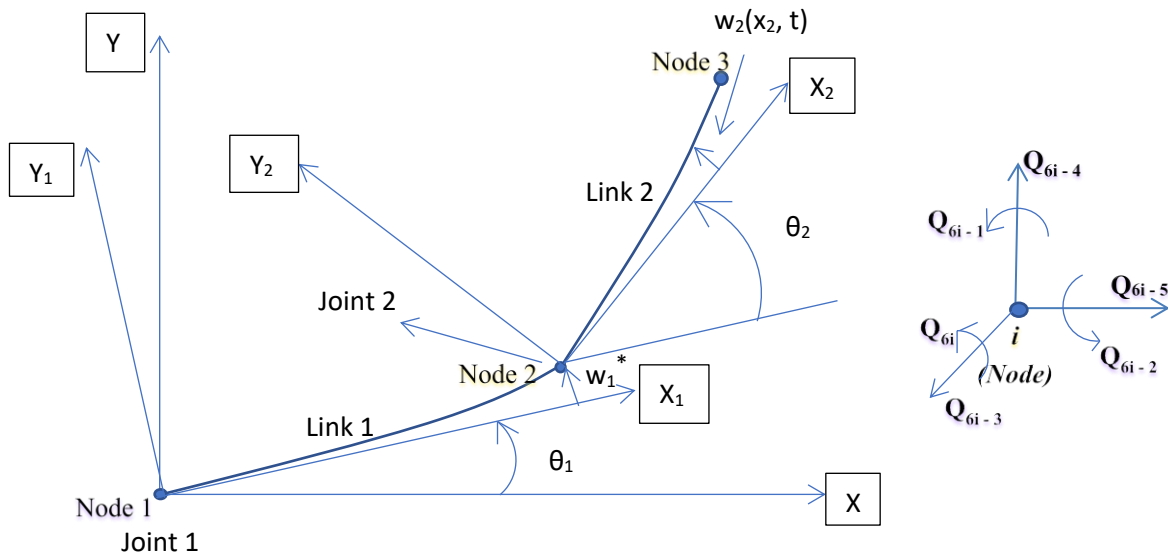

Fig. 3.2: Dynamics modelling of a Two-Link Flexible manipulator using two Space-frame finite elements.

A ‘space-frame element’ has two nodes with each node having six degrees of freedom: three translational (Q_{6i-5} , Q_{6i-4} and Q_{6i-3}) and three rotational (Q_{6i-2} , Q_{6i-1} and Q_{6i}) (refer to Fig. 3.2). The complete equation of motion of the *flexible* manipulator is given by equation 3.15a. The symbols have their usual meanings.

$$\begin{bmatrix} M_{rr} & M_{rf} \\ M_{fr} & M_{ff} \end{bmatrix}_{(n+N) \times (n+N)} \begin{Bmatrix} \dot{q}_r \\ \dot{q}_f \end{Bmatrix}_{(n+N) \times 1} + \begin{bmatrix} C_{rr} & 0 \\ 0 & C_{ff} \end{bmatrix}_{(n+N) \times (n+N)} \begin{Bmatrix} \dot{q}_r \\ \dot{q}_f \end{Bmatrix}_{(n+N) \times (n+N)} + \begin{bmatrix} 0 & 0 \\ 0 & K_{ff} \end{bmatrix}_{(n+N) \times (n+N)} \begin{Bmatrix} q_r \\ q_f \end{Bmatrix}_{(n+N) \times (n+N)} + \begin{bmatrix} H \\ 0 \end{bmatrix}_{(n+N) \times 1} + \begin{bmatrix} G \\ 0 \end{bmatrix}_{(n+N) \times 1} = \begin{Bmatrix} F_r \\ F_f \end{Bmatrix}_{(n+N) \times 1} \tag{3.15a}$$

In equation 3.15a, subscripts- *r* and *f* stand for *rigid* and *flexible* respectively. *N* represents the *rigid* degrees of freedom present in the system and *n* represents the *flexible* degrees of freedom obtained from finite element formulation. For the present case, since there are two *flexible links*, we have $N = 2$. Hence, M_{rr} consists of two diagonal elements- M_{11} and M_{22} . M_{rf} and M_{fr} represent the coupling between *rigid* and *flexible* motions. It is also seen that

$$M_{fr} = M'_{rf} \tag{3.15b}$$

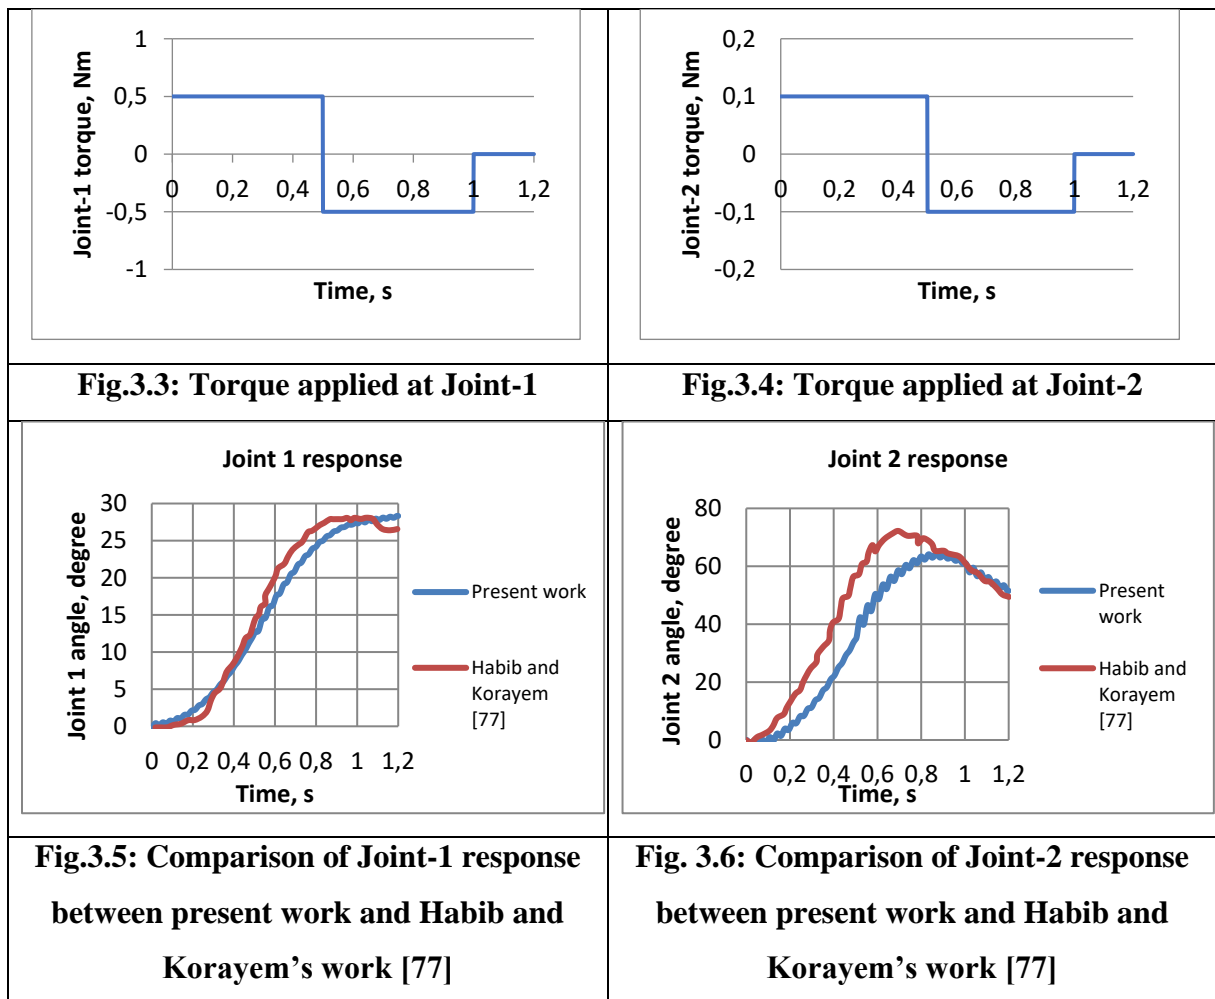

3.4 Simulation results

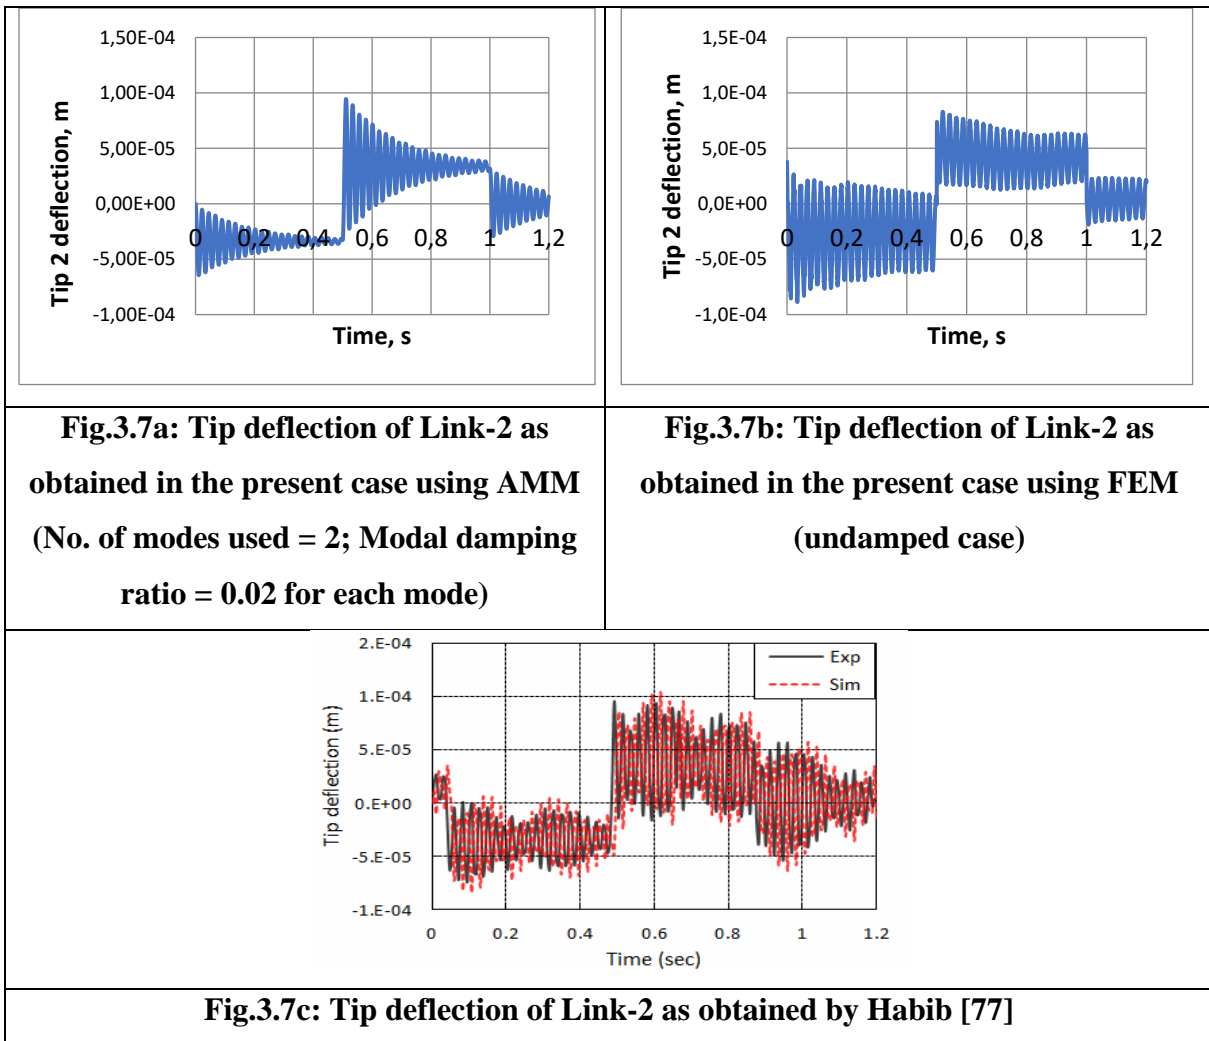

Some typical simulation results based on models described earlier have been presented. Table 3.1 describes the physical and simulation parameters used for a Two-Link Flexible manipulator used by Habib and Korayem [77].

Table 3.1: Physical and simulation parameters for Two-Link Flexible manipulator [77]

Link parameters	Value
Length of links	$L_1 = L_2 = 0.5$ m
Width of links	$b_1 = 4$ cm; $b_2 = 5.17$ cm
Thickness of the links	$t_1 = 4$ mm; $t_2 = 1.5$ mm
Flexural rigidity of links	$EI_1 = 14.93$ Nm ² ; $EI_2 = 1.017$ Nm ²
Mass per unit length of links	$\mu_1 = 0.504$ kg/m; $\mu_2 = 0.2442$ kg/m
Joint 1 torque (Fig. 3.3)	Square wave of amplitude 0.5 Nm and time-period 1 s
Joint 2 torque (Fig. 3.4)	Square wave of amplitude 0.1 Nm and time-period 1 s

The simulation results are shown in Fig. 3.5 to Fig. 3.7b. The natural frequencies and the general nature of response level matches with the predictions by Habib and Korayem [77].

4. Vibration control of *flexible links*

The vibration control of *flexible links* can be achieved in three ways: by passive viscoelastic damping, by active damping using piezoceramics and by hybrid damping. In viscoelastic damping method, a viscoelastic material (e.g., rubber) is pasted upon either throughout the *flexible link* or in the form of patches. Tzou and Wan [16] and Alberts et al [20] have used viscoelastic damping for controlling the vibrations of a *flexible* manipulator. In active damping, piezoelectric sensors and actuators are used for minimizing the vibrations of *flexible links*. The sensor-actuator pairs are applied in segmented fashion over the *flexible link*. In the third method of hybrid damping, both the viscoelastic damping and active damping are used together.

4.1 Vibration control using viscoelastic damping

The vibration control using viscoelastic damping involves the use of some viscoelastic material that is pasted over the *links*. Significant work has been done by Grootenhuis [78], Kapur et al [79], Dutt and Roy [80], etc. in the area of vibration control using viscoelastic materials. Adhikari and Woodhouse [81] tried to model the damping present within the structures. A prime

contributor to viscoelastic damping is the shear strain within the viscoelastic material. The physical properties of these materials are found out to be frequency-dependent. These materials can be applied on the structure either in a constrained or unconstrained manner. Once applied, they become an integral part of the structure and provide a fixed damping behaviour. The mathematical modelling of viscoelastic damping is done using Kelvin-Voigt elements. For the Kelvin-Voigt element used for modelling the phenomenon of viscoelasticity, the stored energy and rate of dissipation in differential forms are given as follows [82]:

$$\text{Stored energy, } dU_e = \int_0^A \frac{1}{2} \sigma^T \epsilon \, dx \, dA \quad (4.1a)$$

$$\text{Rate of dissipation, } d\phi_e = \int_0^A \eta (D\epsilon)^2 \, dx \, dA \quad (4.1b)$$

In equations-4.1, σ = stress within the viscoelastic element of length dx and area dA , ϵ = strain within the viscoelastic element, η = dynamic viscosity of the viscoelastic material and A = total cross-sectional area of the viscoelastic patch pasted on the *flexible link*. The mass, stiffness and damping matrices for the viscoelastic material were found using FEM. The mass and stiffness matrices thus obtained were assembled with the mass and stiffness matrices of equation 3.15f. Damping matrix, \mathbf{c}^e for the viscoelastic material was derived and is as follows (equation 4.2):

$$\mathbf{c}^{e'} = \begin{bmatrix} \mathbf{c}_{11}^e & \mathbf{c}_{12}^e \\ \mathbf{c}_{21}^e & \mathbf{c}_{22}^e \end{bmatrix} \quad (4.2a)$$

$$\mathbf{c}_{11}^e = \begin{bmatrix} \frac{\eta A_e}{l_e} & 0 & 0 \\ 0 & \frac{12\eta l_e}{l_e^3} & \frac{6\eta l_e}{l_e^2} \\ 0 & \frac{6\eta l_e}{l_e^2} & \frac{4\eta l_e}{l_e} \end{bmatrix}; \quad \mathbf{c}_{12}^e = \begin{bmatrix} \frac{-\eta A_e}{l_e} & 0 & 0 \\ 0 & \frac{-12\eta l_e}{l_e^3} & \frac{6\eta l_e}{l_e^2} \\ 0 & \frac{-6\eta l_e}{l_e^2} & \frac{2\eta l_e}{l_e} \end{bmatrix};$$

$$\mathbf{c}_{21}^e = \begin{bmatrix} \frac{-\eta A_e}{l_e} & 0 & 0 \\ 0 & \frac{-12\eta l_e}{l_e^3} & \frac{-6\eta l_e}{l_e^2} \\ 0 & \frac{6\eta l_e}{l_e^2} & \frac{2\eta l_e}{l_e} \end{bmatrix}; \quad \mathbf{c}_{22}^e = \begin{bmatrix} \frac{\eta A_e}{l_e} & 0 & 0 \\ 0 & \frac{12\eta l_e}{l_e^3} & \frac{-6\eta l_e}{l_e^2} \\ 0 & \frac{-6\eta l_e}{l_e^2} & \frac{4\eta l_e}{l_e} \end{bmatrix}$$

The damping matrix described in equation 4.2a is for a Plane-frame element. In case of torsion, the damping matrix was derived as follows:

$$\mathbf{c}^{e'} = \frac{\eta J_e}{l_e} \begin{bmatrix} 1 & -1 \\ -1 & 1 \end{bmatrix} \quad (4.2b)$$

Using matrices 4.2a and 4.2b, damping matrix C_{ff} for Space-frame element was formulated. In equations- 4.2a and 4.2b, A_e = area of cross-section of the element, l_e = length of the element, I_e = area moment of inertia of the element, J_e = polar area moment of inertia of the element and η = dynamic viscosity of the element.

4.2 Active vibration control using piezoceramics

A huge body of literature exists for vibration control of structures using piezoceramics, e.g., Cannon and Schmitz [83], Sakawa, Matsuno and Fukushima [84], Goh and Caughey [85], Chen et al [86], Sun et al [40], Preumont [88], etc. In active vibration control using piezoceramics, sensors and actuators are applied at suitable locations over the *flexible links*. When the sensor and actuator are at the same location, it is referred to as collocated arrangement and when the sensor and actuator are at different locations, it is known as non-collocated arrangement. Most of the researchers have used the approach of modal sensor and modal actuator [88] for active vibration control but in the present work, the vibration control is achieved by using direct feedback of velocity variables. Fig. 4.1 shows a smart beam having piezo-sensor and piezo-actuator applied on it. FEM is used to model the smart beam.

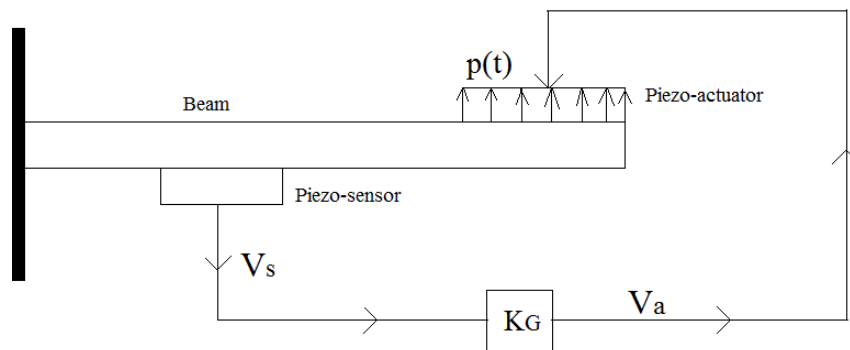

Fig.4.1: Schematic diagram for active vibration control of a smart beam/ link. The piezo-actuator is modelled as a source of time-dependent uniformly distributed load, $p(t)$. K_G is feedback gain.

The time-dependent uniformly distributed load, $p(t)$ is added to the load vector F_f given by equation 3.15f. This is responsible for vibration damping of the *flexible links*. The voltage generated by piezo-sensor (considering it as a current amplifier) is given as follows:

$$v_s(t) = -R_f E_p h d_{31} \int_a^b \dot{w}'' b_p(x) dx \quad (4.3)$$

where, R_f = piezo-resistance, w represents the deflection of any point on the beam and w' represents the slope at that point, $b_p(x)$ = width of the piezo-sensor, a and b represent the initial and final coordinates of the points on the beam/link between which the piezo-sensor is located. These coordinates are measured along the beam axis, such that, ' $(b-a)$ ' represents the length of the piezo-sensor. Taking $b_p''(x) = \text{constant}$, the voltage generated by the piezo-sensor will be expressed as follows.

$$v_s(t) = -R_f E_p h d_{31} \cdot [b_p(x) \{ \dot{w}'(b) - \dot{w}'(a) \} - b_p'(x) \cdot \{ \dot{w}(b) - \dot{w}(a) \}] \quad (4.3b)$$

where, $\dot{w}'(b)$ = rate of change of slope at point b , $\dot{w}'(a)$ = rate of change of slope w.r.t. time at point a on the beam, $\dot{w}(b)$ = rate of change of deflection at point b and $\dot{w}(a)$ = rate of change of deflection at point a on the beam. The equation of motion for the beam with piezo-actuator is given by equation 4.4 as follows.

$$m\ddot{w} + (EIw'')'' = -E_p d_{31} v_a(t) b_p''(x) h \quad (4.4)$$

In equation 4.4, m = mass per unit length of the beam, EI = flexural rigidity of the beam, E_p = Young's modulus of the piezo-ceramic, h = thickness of the beam, w = deflection of the beam, v_a = voltage applied at the actuator and d_{31} = piezoelectric constant. Equation 4.4 is valid only when the thickness of the piezo-ceramic is negligible in comparison to the beam thickness. Fig. 4.2 shows the relative placement of sensors and actuators on the *flexible links* of the Two-Link Flexible manipulator.

Fig. 4.2: Diagram showing the relative placements of sensors and actuators on the flexible links of the Two-Link Flexible manipulator. (In the figure, S_1 = Sensor on Link-1; S_2 = Sensor on Link-2; A_1 = Actuator on Link-1 and A_2 = Actuator on Link-2.)

As described before, we can have collocated and non-collocated arrangement for active vibration control of the *flexible links*. In Fig. 4.2, collocated arrangement of sensors and actuators are shown.

4.2.1 Use of piezoceramics for controlling torsional vibrations

In this section, mathematical models for piezo-sensor and piezo-actuator in torsion will be presented based upon the theory of piezoactuation provided by Preumont [88]. Using torsion equation we can write:

$$\tau = \frac{Tr}{J} \text{ and } T = GJ \frac{\partial \phi}{\partial x} = GJ \phi' \quad (4.5a)$$

$$\text{Thus, } \tau = Gr \phi' = G\gamma \quad (4.5b)$$

In above equations, τ = shear stress, T = twisting torque, J = polar moment of inertia, G = modulus of rigidity, ϕ = twist, γ = shear strain and r = radius (refer to Fig. 4.3). Taking the torsional piezo-sensor as current amplifier, the voltage, v generated by it can be expressed as:

$$v = R d_{24} G_p r \int_a^b b_p(x) \dot{\phi}'(x) . dx \quad (4.6a)$$

where, R = resistance of piezo-sensor, d_{24} = piezoelectric constant, G_p = modulus of rigidity of piezo-sensor and b_p = width of piezo-sensor. If $b_p(x) = b_p = \text{constant}$ then,

$$v = R d_{24} G_p r b_p [\dot{\phi}'(b) - \dot{\phi}'(a)] \quad (4.6b)$$

For torsional piezo-actuator we can write,

$$T = \int \left(2E_{44}\epsilon_{23} - \frac{d_{24}v}{b_p} E_{44} \right) r . dA = GJ\phi' - \frac{d_{24}vE_{44}}{b_p} \int r . dA \quad (4.7)$$

where, E_{44} = Young's modulus of piezo-actuator, ϵ_{23} = shear strain in piezo-actuator and A = area of cross-section of piezo-actuator.

Fig.4.3: Development of mathematical model of torsional piezo-actuator

From Fig. 4.3 we can write,

$$\int r . dA = A \sqrt{(0.5h + h_p)^2 + 0.25b_p^2} \quad (4.8)$$

where, $A = h_p L_p$, h = beam thickness, h_p = thickness of piezo-actuator and L_p = length of piezo-actuator. Using above equation, we can write:

$$T = GJ\phi' - \frac{d_{24}vE_{44}h_pL_p}{b_p} \cdot \frac{b_p}{2} \cdot \left[1 + \left(\frac{0.5h+h_p}{0.5b_p} \right)^2 \right]^{1/2} \quad (4.9)$$

$$\text{For } (0.5h+h_p) \ll b_p, \left(\frac{0.5h+h_p}{0.5b_p} \right)^2 \ll 1$$

$$\text{So, } T = GJ\phi' - \frac{1}{2} (d_{24}vE_{44}h_pL_p) \quad (4.10)$$

Now, inertia torque is represented as: $I_m \ddot{\phi} = -T$

Therefore we get,

$$I_m \ddot{\phi} + GJ\phi' = \frac{1}{2}(d_{24}vE_{44}h_pL_p) \quad (4.11)$$

where, I_m = mass moment of inertia of beam. It is known that shear stress is always complimentary. So, in order to control the torsional vibrations, two piezo-actuators should be attached on the opposite faces of the beam at the same location. Thus, above equation will get modified as follows.

$$I_m \ddot{\phi} + GJ\phi' = (d_{24}vE_{44}h_pL_p) \quad (4.12)$$

4.3 Simulation results on vibration damping of *flexible links*

In this section, typical simulation results using viscoelastic damping, active damping and hybrid damping are discussed. Table 4.1 enlists the physical and simulation parameters used during simulation.

Table 4.1: Physical and simulation parameters for vibration damping of *flexible links* of Two-Link Flexible manipulator

Link parameter	Value
Length of <i>links</i>	$L_1 = L_2 = 0.5$ m
Width of <i>links</i>	$b_1 = 4$ cm; $b_2 = 5.17$ cm
Thickness of <i>links</i>	$t_1 = 4$ mm; $t_2 = 1.5$ mm
Flexural rigidity of <i>links</i>	$EI_1 = 14.93$ Nm ² ; $EI_2 = 1.017$ Nm ²
Density of <i>links</i>	7850 kg/m ³
Joint 1 torque, tau1	A square wave of amplitude 0.5 Nm and frequency 100 Hz for Fig. 4.4, Fig. 4.6 and Fig. 4.7 50 Hz for Fig. 4.5 and Fig. 4.8
Joint 2 torque, tau2	tau1 + A square wave of amplitude 0.1 Nm and frequency 100 Hz for Fig. 4.4, Fig. 4.6 and Fig. 4.7 50 Hz for Fig. 4.5 and Fig. 4.8
Type of finite element used	Frame element/ Space-frame element
Dynamic viscosity of viscoelastic material (rubber)	1.8 Ns/m ²
Density of viscoelastic material (rubber)	1200 kg/m ³
Physical parameters of piezoceramic	$R_f = 1$; $E_p = E_{44} = 1$; $d_{31} = d_{44} = 1$

Simulation results are shown in Fig. 4.4 to Fig. 4.8. In figure 4.4, the undamped response and viscoelastically damped response of the tip of second *flexible link* are compared with each other.

Fig. 4.4: Comparison of tip slope rates (rate of change of slope) of tip of second *flexible link* of Two-Link Flexible manipulator between viscoelastically damped and undamped cases

In Fig. 4.4, the rates of change of slope of tip of second *flexible link* for damped and undamped cases are compared. From the figure, it is clear that due to the presence of viscoelastic damping, the amplitude of vibration decreases. In Fig. 4.5, comparison of tip responses is shown for collocated and non-collocated arrangements. Descriptions about collocated and non-collocated control are already found within the literature [88].

Fig. 4.5: Comparison of slopes of tip of second *flexible link* of Two-Link Flexible manipulator for collocated and non-collocated sensor-actuator pairs.

In Fig. 4.5, the slope rates of tip of second *flexible link* are compared at different arrangements of sensor-actuator pair. The values of proportional (K_p) and derivative (K_v) gains are taken as 4 for the both *links*. It is observed positional accuracy of collocated arrangement is the best. In

figure 4.6, a comparison is done between the tip responses obtained by active damping and hybrid damping. During hybrid damping, both viscoelastic damping and active damping are used. In order to introduce viscoelastic damping, one thousand Kelvin-Voigt (K-V) elements are used.

Fig. 4.6: Comparison of bending deflections of tip of second flexible link of Two-Link Flexible manipulator between active damping control and hybrid damping control.

From Fig. 4.6, it can be inferred that hybrid damping results in better vibration control. The positional accuracy described by zero vibration of the tips can be further increased by increasing the proportional gains- K_p . Fig. 4.7 shows the torsional deformations of tip of second flexible link under actively damped case and undamped case. Space-frame elements were used for obtaining this result.

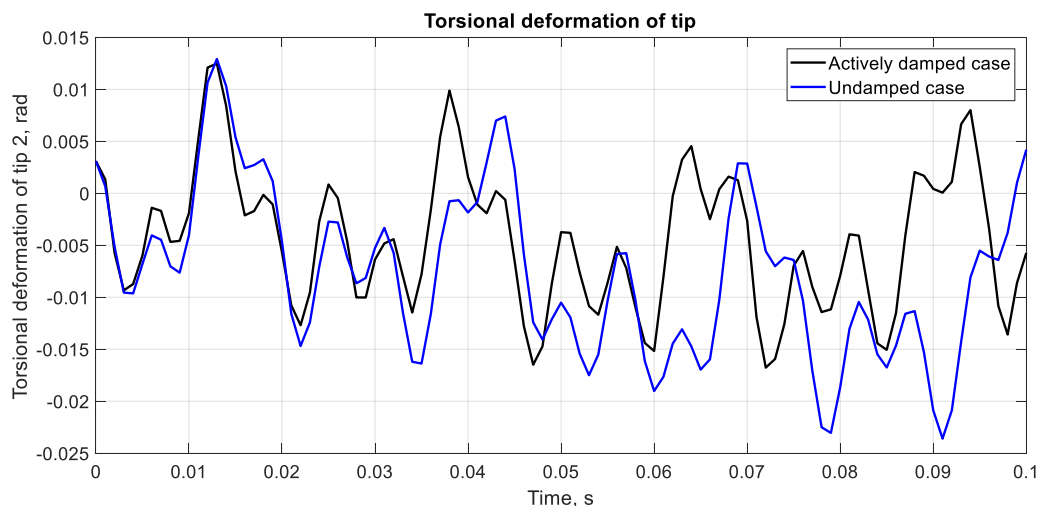

Fig. 4.7: Comparison of torsional deformations of tip of second flexible link of Two-Link Flexible manipulator between active damping control case and undamped case.

From Fig. 4.7, it can be observed that, the response of ‘actively damped case’ is closer to the zero line of reference than the response of ‘undamped case’. The effect of vibrations on positional accuracy of tip of Two-Link Flexible manipulator is shown in Fig. 4.8.

Fig. 4.8: Effect of vibration on positional accuracy of tip of Two-Link Flexible manipulator

In Fig. 4.8, the blue-coloured curve corresponds to the tip position of *flexible* manipulator when only bending vibration is considered. It can be seen that the curve lies in X-Y plane. The red-coloured curve corresponds to the tip position of *flexible* manipulator when both bending and torsional vibrations are considered. The curve does not remain in plain and the positional accuracy of the tip is also deteriorated.

5. Trajectory control of Two-Link Flexible manipulator

In this chapter, the position of tip of the *flexible* manipulator will be controlled by controlling the torque provided by the motors at the *joints*. For this purpose, it is required to perform the trajectory planning. A *flexible* manipulator exhibits two kinds of motion- ‘rigid motion’ and ‘elastic motion’. Trajectory planning makes use of the ‘rigid motion’. It can be done in two ways- continuous path (CP) planning and point-to-point (PTP) path planning. Trajectory can be defined either by using Joint-space trajectory or by using Cartesian-space trajectory. This trajectory planning forms the basis of manipulator control problem [90] which is stated as:

To find the joint actuator torques required to produce a planned trajectory, i.e., location, velocity and acceleration, for the entire work cycle such that planned task is performed as specified.

Even though the trajectory is planned properly, still there will be positional inaccuracy at the tip of the *flexible* manipulator. This is due to the ‘elastic motion’ exhibited by the *flexible links*. In the present case, the ‘elastic motion’ is modelled as a non-linearity and its effect is minimized

by using three control techniques: computed torque control (CTC) [91], robust control [91] and a newly developed scheme called as coupled-error dynamics (CED).

5.1 Coupled-error dynamics

In this technique developed, the dynamics of the system is described in terms of *joint*-angle errors. Fig. 5.1 shows a Two-Link Rigid manipulator having a payload at its end. The dynamics equation of such a manipulator is given as follows:

$$\begin{Bmatrix} \tau_1 \\ \tau_2 \end{Bmatrix} = \begin{bmatrix} M_{11} & M_{12} \\ M_{21} & M_{22} \end{bmatrix} \begin{Bmatrix} \ddot{\theta}_1 \\ \ddot{\theta}_2 \end{Bmatrix} + \begin{bmatrix} N_1 \\ N_2 \end{bmatrix} + \begin{bmatrix} G_1 \\ G_2 \end{bmatrix} \quad (5.1)$$

where, τ_1 and τ_2 are *joint* torques, θ_1 and θ_2 are *joint* angles and

$$M_{11} = (m_1 + m_2)L_1^2 + m_2L_2^2 + 2m_2L_1L_2 \cos \theta_2 + I_{h1} + M_p(L_1^2 + L_2^2 + 2L_1L_2 \cos \theta_2) + m_{h2}L_1^2$$

$$M_{12} = M_{21} = m_2L_2^2 + m_2L_1L_2 \cos \theta_2 + M_p(L_1L_2 \cos \theta_2 + L_2^2)$$

$$M_{22} = m_2L_2^2 + I_{h2} + M_pL_2^2$$

$$N_1 = -m_2L_1L_2(2\dot{\theta}_1\dot{\theta}_2 + \dot{\theta}_2^2) \sin \theta_2 + M_pL_1L_2(2\dot{\theta}_1\dot{\theta}_2 - \dot{\theta}_2^2) \sin \theta_2$$

$$N_2 = m_2L_1L_2\dot{\theta}_1^2 \sin \theta_2 - 2M_pL_1L_2 \sin \theta_2 \cdot \dot{\theta}_1\dot{\theta}_2$$

$$G_1 = (m_1 + m_{h2} + m_2 + M_p)gL_1 \cos \theta_1 + (m_2 + M_p)gL_2 \cos(\theta_1 + \theta_2)$$

$$G_2 = (m_2 + M_p)gL_2 \cos(\theta_1 + \theta_2)$$

Fig.5.1: A Two-Link Rigid serial robot having two Revolute Joints in X-Y plane.

In equation 1, m_1 and m_2 are masses of Link-1 and Link-2 respectively, L_1 and L_2 are lengths of Link-1 and Link-2 respectively, I_{h1} and I_{h2} are *joint/hub* mass moment of inertias at Joint-1 and Joint-2 respectively, m_{h2} is the mass of hub of Joint-2 and M_p is mass of payload attached at the end of Link 2, i.e., at the end-effector. It can be seen from equation 5.1 that the mass matrix is coupled and depends upon configuration of the manipulator. This makes the control problem difficult. Now, a robot is designed to move along a desired trajectory for performing an assigned task. Thus, the desired *joint* angles are: θ_{1d} for Joint 1 and θ_{2d} for Joint 2. The *joint* errors will be defined as follows.

$$\theta_{je} = \theta_{jd} - \theta_j \quad (5.2)$$

where, j represents joint number ($=1, 2$), subscript- 'e' stands for 'error' and subscript- 'd' stands for 'desired'. After substituting for θ_1, θ_2 and their derivatives from equation 5.2 into equation 5.1 and performing necessary mathematical operations, following equations are obtained:

$$\begin{Bmatrix} \tau_{1d} - \tau_1 \\ \tau_{2d} - \tau_2 \end{Bmatrix} = \begin{bmatrix} M_{e11} & M_{e12} \\ M_{e21} & M_{e22} \end{bmatrix} \begin{Bmatrix} \ddot{\theta}_{1e} \\ \ddot{\theta}_{2e} \end{Bmatrix} - \begin{bmatrix} C_{e11} & C_{e12} \\ C_{e21} & C_{e22} \end{bmatrix} \begin{Bmatrix} \dot{\theta}_{1e} \\ \dot{\theta}_{2e} \end{Bmatrix} - \begin{bmatrix} G_{11e} & G_{12e} \\ G_{21e} & G_{22e} \end{bmatrix} \begin{Bmatrix} \theta_{1e} \\ \theta_{2e} \end{Bmatrix} \quad (5.3a)$$

Defining the control torque as:

$$u = \tau = K_v \dot{\theta}_e + K_p \theta_e \quad (5.4)$$

for each *joint* of the manipulator and substituting in eq. (5.3a), we get

$$\mathbf{M}_e \ddot{\theta}_e + (\mathbf{K}_v - \mathbf{C}_e) \dot{\theta}_e + (\mathbf{K}_p - \mathbf{G}_e) \theta_e = \tau_d \quad (5.3b)$$

In eq. (5.3b), the matrices- \mathbf{M}_e , \mathbf{C}_e and \mathbf{G}_e are time-varying and also involve non-linear terms. It refers to the case of *coupled control* [92]. The values of gains- \mathbf{K}_v and \mathbf{K}_p must lie within certain range so that the controller performance may not deteriorate even though the coefficients in (5.3b) change with time. The ranges for \mathbf{K}_v and \mathbf{K}_p can be found out by designing the controller for minimum and maximum values of θ_d and $\dot{\theta}_d$. After applying the concept of *independent modal-space control* (IMSC) [92] on equation 5.3b, the relationship between \mathbf{K}_v and \mathbf{K}_p for critically damped response of the controller can be found out as follows:

$$(\mathbf{K}_v - \mathbf{C}_e) = \alpha_1 \mathbf{M}_e + \alpha_2 (\mathbf{K}_p - \mathbf{G}_e) \quad (5.5)$$

where, α_1 and α_2 are some constants that depend upon the inertial and elastic properties of the manipulator system. In case of CTC, each joint is controlled separately and the relationship between controller gains is given as follows:

$$\mathbf{K}_v = 2\sqrt{\mathbf{K}_p} \quad (5.6)$$

5.2 Simulation results for trajectory control

Performances of three types of controllers based on CTC, robust control and CED are compared through the simulation results. The control task is that the tip of the *flexible* manipulator should trace a straight line in X-Y plane described below:

$$y = 0.268x + 0.5 \quad (5.7)$$

The *joints* of the manipulator follow a five-degree polynomial trajectory. The simulation results are presented below. Same values of controller gains were used during simulation for comparing the performances of the three controllers. Fig. 5.2 compares between the tip

positions of the *flexible* manipulator as obtained by using controller based upon CTC scheme and CED scheme. Fig. 5.3 compares between the tip positions of the *flexible* manipulator as obtained by using controller based upon robust control scheme and CED scheme. The control torque requirement at Joint 1 is shown and compared with each other for the three controllers in Fig. 5.4.

Fig. 5.2: Comparison between the tip positions of *flexible* manipulator as obtained by using CTC and CED for same PD gains

Fig. 5.3: Comparison between the tip positions of *flexible* manipulator as obtained by using robust control and CED for same PD gains

Fig. 5.4: Comparison of control torque requirements at Joint 1 as provided by controller based upon CTC, robust control and CED for same PD gains (The control torque in ‘CED’ case lies between -0.7 units to 0.1 units.)

After looking at Fig. 5.2 and Fig. 5.3, it can be concluded that the performance of CED-based controller lies between that of the CTC and the robust controller for same values of controller (PD) gains. When Fig. 5.4 is viewed, it can be inferred that the CED-based controller gives the output comparable to the other controllers at minimum control torque.

6. Conclusions and recommendations

In this chapter, conclusions based upon the present work are made and new proposals are suggested.

6.1 Conclusions

The objectives of dynamics modelling, vibration control and trajectory control of a Two-Link Flexible robot have been accomplished in this work. While preparing the dynamic model, internal damping using the phenomenon of viscoelasticity has been considered. Combined bending and torsional vibrations of the *flexible links* were considered during mathematical modelling. Both AMM and FEM were used for mathematical modelling. The boundary conditions are easily addressed by using the FEM approach. In the present case, the differential equations obtained as a result of finite element (FE) formulation were solved directly to find out the responses at each node. The uniqueness lies in solving the equations of *rigid* and *elastic* motions for the *flexible links* simultaneously using a single computer program. During mathematical modelling, it was observed that the Two-Link Flexible manipulator exhibits time-varying boundary conditions. As a result, the frequency equation and hence the mode shapes also become time-dependent. This time-variance is due to the change in variables representing

'rigid motion' of the *flexible* manipulator with time. The non-linear effects due to the presence of centrifugal and Coriolis terms and gravity are also included in the formulation.

The process of active vibration control is based on direct feedback control using PD controller. The effect of relative position of sensors and actuators located on *flexible links* has been observed. It was found that collocated arrangement provides better positional accuracy than the non-collocated arrangement. The latter may provide better response when there is high internal damping within the system. The trajectory control of the *flexible* manipulator was achieved using three techniques, *viz.* CTC, robust control and CED. Out of these, the first two are well established techniques while the third one was developed during the research work. The mathematical model for active control of torsional vibrations has already been described.

6.2 Future recommendations

Literature provides three methods of mathematical modelling of a mechanical system- Lagrangian dynamics, Newton-Euler approach and Kane's method. The computational efficiencies of the computer programs based on these three methods can be checked. The conventional approach of active vibration control makes use of modal sensors and actuators. Literature describes the control problems associated with these, like residual modes and spillover effects. In the present work, direct feedback is used and the concept of modal sensor and actuator is not used. There is need of finding the control problems associated with this approach. Use of intelligent controllers and stability analysis of various controllers need to be done.

ÖZET

Bilişim Teknolojilerinin gelişmesiyle web 2.0 teknolojileri, eğitimin her alanında olduğu gibi uzaktan eğitimde yaygın bir şekilde kullanılan öğretim materyallerinden olmuştur. Bu materyaller, öğrencilerin etkileşim halinde olabileceği, katılımcı bir öğrenme deneyimi sunar. Covid-19 salgınıyla birlikte uzaktan eğitim daha da önem kazanmıştır. Ülkemizde bu süreçte uzaktan eğitime geçilmiştir. Bu çalışmada uzaktan eğitimde öğretmenlerin dijital yeterliliklerini farklı değişkenler açısından incelenmesi amaçlanmıştır. İlişkisel tarama modeli kullanan bu çalışma, öğretmenlerin dijital öğretim materyalleri geliştirme konusundaki yeterliliklerini belirlemeyi amaçlamaktadır. Bu çalışmaya 262 öğretmen çevrimiçi olarak katılmıştır. Öğretmenlerin öz yeterliliklerini, cinsiyetlerini, yaşlarını, eğitim kurumu düzeylerini, dijital ders kitabı kullanıp kullanmadıklarını ve dijital içerik geliştirme eğitimi ve Web 2.0 teknolojisi alıp almadıklarını incelemek için ilişkisel tarama modeli kullanılmaktadır. Araştırma sonuçlarına göre; öğretmenlerin tasarım alanında öz yeterlilik algısı daha yüksek, 18-31 yaş arası genç öğretmenlerin tasarım becerisi 31 yaş üstü öğretmenlere göre daha yüksek, okul öncesi öğretmenlerinin web 2.0 geliştirme becerisi ve tasarım becerisi diğer öğretmenlere göre daha düşüktür. Dijital öğretim materyallerinin kullanılıp kullanılmamasının, öğretmenlerin dijital materyal geliştirme öz-yeterliliği üzerinde bir etkisinin olmadığı ve web 2.0 araçlarını kullanan öğretmenlerin, diğer araçları kullanan öğretmenlere göre daha yüksek web 2.0 geliştirme becerilerine sahip olduğunu bulmuştur. Dijital içerik geliştirme konusunda eğitim almış öğretmenlerin, eğitim almamış öğretmenlere göre web 2.0 geliştirme ve tasarım becerilerinin daha yüksek olduğu, web 2.0 teknolojileri konusunda bilgi sahibi olan öğretmenlerin ise web 2.0 geliştirme ve tasarım becerilerine daha fazla sahip olduğu görülmüştür. Bu araştırma ve yapılan diğer araştırmaların sonuçları incelendiğinde, öğretmenlerin uzaktan ve örgün eğitimde dijital yeterliliklerinin geliştirmede öğretmenlerin daha öncesindeki aldıkları eğitimin önemli olduğu anlaşılmaktadır. Öğretmenlerin dijital yeterliliklerini geliştirmek için düzenlenen hizmet içi eğitimlerin yanı sıra, eğitim kurumları ve hükümetlerin dijital eğitim alanında politikalar ve stratejiler geliştirmesi gerekmektedir. Bu, öğretmenlerin ve öğrencilerin dijital dünyaya daha iyi adapte olmalarını ve daha etkili bir şekilde öğrenmelerini sağlayabilir. **Anahtar Kelimeler:** Dijital materyal geliştirme öz yeterliliği, Uzaktan eğitim

GİRİŞ

Bilişim teknolojileri günümüzde hızla gelişim göstermektedir ve bu gelişmelerin içinde web teknolojileri de öne çıkmaktadır. Web, internetin ortaya çıkışından sonra bilgiye erişim için geliştirilmiş bir sistem olarak tanımlanabilir. (Deperlioğlu & Köse, 2010). Bilginin paylaşılması ve anlamlandırılması, bilişim teknolojilerinin ve web teknolojisi standartlarının gelişmesine sebep olmuştur. Bu gelişmelerin sonucunda O'Reilly Media, Web 2.0 kavramını ilk olarak 2003 yılında tanıttı. (Karaman, Yıldırım ve Kaban, 2008). Web 2.0 standart HTML yapısına sahip klasik web ortamlarından sonra ortaya çıkan, etkileşim düzeyi yüksek, işbirliği ve paylaşımı içeren, kullanıcı merkezli, yeni web ortamı olarak tanımlanmaktadır (Deperlioğlu & Köse, 2010). Horzum'a (2010) göre, Web 2.0 teknolojilerinin temel amacı, İnternet'in sosyal etkileşim ve işbirliği potansiyelinden yararlanmak, kullanıcıların herhangi bir teknik bilgiye ihtiyaç duymadan içeriği kolayca paylaşmasına olanak sağlamaktır.

Web 2.0 teknolojileri, eğitimin her alanında olduğu gibi uzaktan eğitimde de yaygın bir şekilde kullanılan öğretim materyallerindedir. Uzaktan eğitim, elektronik veya elektronik olmayan teknolojik sistemler aracılığıyla kendine özgü iletişim yöntemleri kullanarak zaman ve mekân sınırlarını ortadan kaldıran birçok öğrenme faaliyetini öğrencilere sunan planlı ve kapsamlı bir öğrenme faaliyetidir. Web 2.0 teknolojileri, uzaktan eğitimde kullanılan etkileşimli materyallerin geliştirilmesine yardımcı olur. Bu materyaller, öğrencilerin etkileşim halinde olabileceği, katılımcı bir öğrenme deneyimi sunar. Bu sayede öğrenciler, sadece kendi hızlarında ilerlemekle kalmaz, aynı zamanda farklı öğrencilerle ve öğretmenlerle etkileşimde bulunarak, birbirlerinden öğrenirler. (Altıparmak, 2011). 1990'ların sonu ve 2000'li yılların başından itibaren bilişim teknolojilerinin hızla gelişmesi, uzaktan eğitim yoluyla sunulan eğitim fırsatlarının artmasına ve uzaktan eğitim yönteminin ülkemizdeki eğitim sisteminin ana akımı haline gelmesine neden olmuştur. Bugün milyonlarca öğrenci, uzaktan eğitim yoluyla eğitim almaktadır. Uzaktan eğitim, öğrencilere daha geniş bir eğitim yelpazesi sunarken, aynı zamanda öğrenme sürecinde daha fazla özgürlük ve esneklik sağlar. Bu nedenle, uzaktan eğitim, geleneksel sınıf ortamında mümkün olmayan birçok öğrenme fırsatı sunar ve her geçen gün daha da yaygınlaşmaktadır. (Kırık,2014).

Son yıllarda bilişim teknolojilerinin hızlı gelişimi, uzaktan eğitim fırsatlarını arttırmış ve bu yöntem milyonlarca öğrenci tarafından tercih edilmeye başlamıştır. Ancak Covid-19 salgınıyla birlikte, uzaktan eğitim daha da önem kazanmıştır. Bu küresel salgın, Türkiye'de ve dünya genelinde birçok alanda değişikliklere neden olmuştur. Eğitim alanı da bu değişimlerden etkilenmiştir. Ülkemizde ilk vakanın görülmesiyle birlikte, ulusal önlemler alınmak zorunda

kalmış ve yüz yüze eğitime ara verilerek uzaktan eğitime geçilmiştir. Bu sayede, eğitim süreci kesintiye uğramadan devam etmiştir. (Arslan vd.,2021)

Uzaktan eğitimde etkili bir eğitim ve öğretimin sağlanabilmesi için diğer dünya ülkelerinde olduğu gibi Türkiye de dijital teknolojileri kullanarak uzaktan eğitimle bu süreci yürütülmüştür. Perienen (2020), tüm yaşam alanlarını etkileyen teknolojinin Covid-19 sürecinde eğitim sektörünün de yönünü değiştirdiğini ifade etmiştir. Türkiye’de uzaktan eğitim sürecinde öğretmenler ve öğrenciler eğitim ve öğretim sürecinde hâlihazırda kullandıkları teknoloji ile daha yakından meşgul olmak durumunda kalmışlardır. Covid-19 döneminde uygulanan uzaktan eğitim sebebiyle, öğretmenler ve akademisyenler, öğrencilere ilgili içerikleri öğretmek ve ders içeriklerini dağıtmak için dijital öğretim yöntemlerini öğrenmek ve geliştirmek zorunda kalmıştır. Covid-19 sürecinde, dijital cihazlar, çevrimiçi kaynaklar, sosyal medya, ve dijital materyallerinin daha etkin ve fazla kullanımını artıran bir etmen olmuştur.(Mulenga ve Marban, 2020). Uzaktan eğitimde dijital öğretim materyalleri aktif şekilde kullanılmaktadır. Dijital öğretim kullanılan uzaktan eğitiminde öğrenmenin ana bileşeni dijital içerik ve materyallerdir. (Kumar & Kushwaha, 2010). Howell ve O'Donnell'e (2017) göre dijital materyaller; internet kaynakları, projektörler, bilgisayarlar vb. farklı medya kaynaklarının bir araya gelmesi ve elektronik ortamda sunulmasıdır.

Öğrenme ve öğretme sürecinde kullanılan materyaller, öğrencilerin derse olan ilgi ve öğrenmeleri üzerinde önemli bir etkiye sahiptir. Öğretmenlerin böylesine etkili bir sınıf ortamı yaratmak için öğretim araçlarını nasıl geliştireceklerini bilmeleri gerektiğini belirtilmektedir. (Bakaç, Özen, 2015). Korkmaz, Arıkaya ve Altıntaş (2019), öğretmenlerin bu becerilere sahip olma düzeyini belirlemenin yollarından birinin de bu becerilere ilişkin öz yeterlik düzeylerini, diğer bir deyişle öz yeterlik algılarını belirlemek olduğunu belirtmektedir.

İlgili alan yazında öğretmenlerin veya akademisyenlerin dijital yeterliklerinin farklı bağlamlarda değerlendirildiği çalışmalar mevcuttur. Bazı araştırmalarda öğretmenlerin orta düzeyde dijital yeterliğe sahip olduğu (Gökbulut, Keserci ve Akyüz, 2021; Ocak ve Karakuş, 2019; Yontar, 2019), bazılarının ise düşük düzeyde olduğu görülmüştür (Napal Fraile, Penalva-Velez ve Mendioroz Lacambra, 2018). Öğretmenler arasında yüksek düzeyde dijital yeterlik olduğunu gösteren araştırmalar da bulunmaktadır (Arslan, 2019; Demirdağ, 2021). Araştırma sonuçları incelendiğinde sonuçların birbirinden farklı olduğu görülmekte olup öğretmenlerin çeşitli değişkenlere göre dijital yeterlikleri üzerinde önemli etkisi olduğu söylenebilir. Alan yazındaki çalışmalara bakıldığında öğretmenlerin dijital yeterliliklerinin çeşitli değişkenlere göre değiştiği gözlenmiştir. Bu sebeple çalışmamızda; öğretmenlerin cinsiyet, yaş eğitim

kurumu, öğretim materyali kullanıp kullanmama durumu, kullanılan dijital eğitim platformu, eğitim alma durumu ve Web 2.0 hakkında bilgi sahibi olma durumu değişkenlerine göre bir farklılaşma durumu olup olmadığı araştırılmıştır.

Problem Durumu

Alinyazındaki çalışmalar incelendiğinde öğretmenlerin uzaktan eğitimde daha etkin bir şekilde öğretim faaliyetlerini yerine getirebilmesi için öğretmenlerin dijital yeterliliklerini daha aktif bir şekilde kullanması gerektiği ve daha da geliştirmesi gerektiği söylenebilir. Bu durumdan dolayı bu araştırmayla öğretmenlerin dijital yeterliliklerini incelemek amaçlanmıştır.

Çalışmanın Amacı

Bu çalışmayla, uzaktan eğitimde öğretmenlerin dijital yeterliliklerini farklı değişkenler açısından incelenmesi amaçlanmıştır. Bunun için öğretmenlerin; dijital öğretim materyali geliştirme öz-yeterliliklerinin düzeylerini ölçmek amaçlanmıştır. Diğer bir amaç ise dijital öğretim materyalleri geliştirmedeki yeterliliklerinin cinsiyete, yaşa, çalıştıkları eğitim kurumu düzeyi, dijital öğretim materyallerini kullanıp kullanmama durumu, kullanılan dijital öğretim platformları, dijital içerik geliştirme üzerine her hangi bir eğitim alma durumu ve web 2.0 teknolojisi hakkında bilgi sahibi olma durumuna göre farklılığını bulmak amaçlanmıştır.

YÖNTEM

Bu bölümde araştırmanın modeli, katılımcıları, veri toplama aracı ve verilerin analizi ile ilgili bilgilere yer verilmiştir.

Araştırma Modeli

İlişkisel tarama modeli kullanan bu çalışma, öğretmenlerin dijital öğretim materyalleri geliştirme konusundaki yeterliliklerini belirlemeyi amaçlamaktadır. İlişki araştırması, iki veya daha fazla değişken arasındaki varyasyon miktarını bulmayı amaçlayan bir yöntemdir (Karasar, 2016). Bu çalışma, öğretmenlerin öz yeterliliklerini, cinsiyetlerini, yaşlarını, eğitim kurumu düzeylerini, dijital ders kitabı kullanıp kullanmadıklarını, dijital öğretim platformlarını kullanıp kullanmadıklarını ve dijital içerik geliştirme eğitimi ve Web 2.0 teknolojisi alıp almadıklarını incelemek için ilişkisel tarama modeli kullanmaktadır. Dijital öğretim materyali geliştirme. Durumunu bilen bir değişkene göre değişip değişmediğini kontrol edilmiştir.

Çalışma Grubu

Çalışma grubu araştırmaya çevrimiçi anketle katılan 262 öğretmenden oluşmaktadır. Tablo 1'de anketin geçerli olduğu düşünülen katılımcı verilerinin demografik özellikleri verilmiştir.

Tablo-1 Ankete Katılan Öğretmenlerin Demografik Özellikleri

Özellik		Sayı	Yüzde
Cinsiyet	Erkek	97	37
	Kadın	165	63
Yaş	18-30	87	33,2
	30-41	137	52,3
	41 ve Üstü	38	14,5
Çalışılan Eğitim Kurumu Düzeyi	Okul Öncesi	11	4,2
	İlkokul	31	11,8
	Ortaokul	102	38,9
Dijital Öğrenme Metaryelleri Kullanma	Lise	118	45
	Evet	257	98,1
Kullanılan Dijital Öğretim Metaryelleri	Hayır	5	1,9
	Office Programları(Word,PowerPoint vb.)	141	53,8
Dijital içerik geliştirme eğitimi alma	Web 2.0 Araçları(E-Kitap,Animasyon Araçları,Kavram Haritası Araçları vb)	87	33,2
	Görüntü İşleme Programları(Paint,Adobe Photoshop,Picasa vb.)	34	13
	Hayır	168	64,1
Web 2.0 teknolojisi hakkında bilgi	Evet	94	35,9
	Hayır	136	51,9
Toplam	Hayır	126	48,1

Tablo-1 de görüldüğü gibi ankete katılan öğretmenlerin 165(%63)'i kadın 97(%37) si erkektir. 18-30 yaş arası 87(%33,2), 30-41 yaş arası 137(52,3) , 41 ve üstü 38(%14,5) yaş aralığındadır.

Veri Toplama Aracı

Bu araştırmada, veri toplamak için Korkmaz, Arıkaya ve Altıntaş (2019) tarafından geliştirilen "Öğretmenlerin Dijital Öğretim Materyali Geliştirme Öz-Yeterlik Ölçeği" kullanılmıştır. Ölçek, 38 maddeden ve 3 faktörden oluşmaktadır ve maddeler, pozitif ifadeler için "kesinlikle katılmıyorum" ile "kesinlikle katılıyorum" arasında, negatif ifadeler için ise "kesinlikle katılıyorum" ile "kesinlikle katılmıyorum" arasında yer alan 5 puanlık bir ölçekte

değerlendirilir. Pozitif ifadeler için ölçek 1 ("kesinlikle katılmıyorum") ile 5 ("kesinlikle katılıyorum") arasında, negatif ifadeler için ise puanlama ters çevrilir. Ölçek, Web 2.0 Geliştirme faktörü için 14, Tasarım faktörü için 18 ve Olumsuz Bakış faktörü için 6 madde içermektedir. Ölçekten alınabilecek en yüksek puan 190 en düşük puan ise 38 dir. Bu çalışmada öğretmen adaylarına uygulanan ölçeğin Cronbach Alpha iç güvenilirlik katsayısı; Web 2.0 Geliştirme faktörü için .970, Tasarım faktörü için .945, olumsuz Bakış faktörü için .869 güvenilirlik değerine sahip olduğu görülmüştür. Ölçeğin toplam Cronbach Alpha güvenilirlik katsayısını .961 olarak bulmuştur. Bu çalışmada da öğretmenlere uygulanan öz-yeterlilik ölçeği iç tutarlılık katsayısı .974 olarak hesaplanmıştır.

Verilerin Analizi

Verilerin analizi öncesinde normal dağılımın sağlanıp sağlanmadığı kontrol edilmiştir. Bu amaçla, verilerin çarpıklık ve basıklık değerleri incelenmiştir. Alt boyutlara ait bu değerler Tablo-2'de görüldüğü gibi çarpıklık değerleri ± 2 arasında olduğundan, normal dağılımın sağlandığı kabul edilmiştir. George ve Mallery (2010), çarpıklık ve basıklık değerlerinin ± 2 arasında olması halinde normal dağılımın sağlandığını belirtmektedir. Bu araştırmada, anket verilerinin analizi için bağımsız örneklem için t-testi ve tek yönlü varyans analizi (one way ANOVA) kullanılmıştır.

Tablo-2 Çarpıklık ve Basıklık Değerleri

Boyutlar	Çarpıklık	Basıklık
Web 2.0 Geliştirme	-.593	.152
Tasarım	-1,037	1,646
Olumsuz Bakış	-.130	-.054

BULGULAR

Öğretmenlerin dijital öğretim materyali geliştirme öz yeterliklerinin cinsiyet, yaş, çalıştıkları eğitim kurumu düzeyi, dijital öğretim materyalleri kullanıp kullanmama durumu, kullanılan dijital öğretim platformları, dijital içerik geliştirme üzerine her hangi bir eğitim alma durumu ve Web 2.0 teknolojisi hakkında bilgi sahibi olma durumuna göre anlamlı farklılık gösterip göstermediği analiz edilmiştir. Belirlenen alt problemlere göre bulgular aşağıda verilmiştir.

Araştırmaya katılan öğretmenlerin 38 maddeden oluşan ankete verdikleri yanıtlara göre dijital materyal geliştirme öz yeterlik düzeyleri Tablo 3'te gösterilmektedir.

Tablo-3 Alt Boyutların Betimsel Analizleri

Boyutlar	N	Min.	Max.	\bar{X}	SS
Web 2.0 Geliştirme	262	1	5	3.4299	.96223
Tasarım	262	1	5	3.8444	.78057
Olumsuz Bakış	262	1	5	3.2239	.88077
Toplam	262				

Tablo-3 e göre yapılan analizler incelendiğinde göre en yüksek ortalama puanı Tasarım alt boyutunda (\bar{X} =3.84 en düşük ortalama puanı ise Olumsuz Bakış (\bar{X} =3.22) alt boyutunda olduğu görülmektedir. Diğer alt boyutu olan web 2.0 geliştirme alt boyutunda ise (\bar{X} =3.42) olduğu görülmektedir. Başka bir ifadeyle araştırmaya katılan öğretmenlerin tasarım alanında öz yeterliliklerinin daha fazla olduğu şeklinde yorumlanabilir.

Öğretmenlerin öz-yeterliğinin cinsiyete göre anlamlı fark gösterip göstermediğini saptamak için Bağımsız Örneklem t Testi ile analizler yapılmıştır ve analiz sonuçları Tablo-4' de verilmiştir.

Tablo-4 Cinsiyet Değişkenine Göre Analiz Sonuçları

Boyutlar		N	\bar{X}	SS	t	p
Web 2.0 Geliştirme	Erkek	97	3.7069	.85878	3.21	.443
	Kadın	160	3.3362	.91752		
Tasarım	Erkek	97	3.9404	.69190	.826	.889
	Kadın	160	3.8660	.70635		
Olumsuz	Erkek	97	3.2784	.90066	.960	.225
	Kadın	160	3.1719	.83812		

Tablo-3 e göre yapılan analizler incelendiğinde cinsiyet değişkeninin öğretmenlerin dijital materyal geliştirme öz yeterlilik alt boyutlarında anlamlı bir farklılık göstermediği görülmüştür ($p>.05$).

Öğretmenlerin dijital materyal geliştirme öz-yeterliliklerinin yaşla anlamlı farklılık gösterip göstermediğini belirlemek için Tukey'nin post hoc testi ile tek yönlü ANOVA

yapılmıştır. Analiz sonuçları Tablo 5'te gösterilmektedir. Analiz yapılırken ortalama ve standart sapma değerleri dikkate alınmış ve tabloda belirtilmiştir.

Tablo-5 Yaş Değişkenine Göre Analiz Sonuçları

Boyutlar	Yaş	N	\bar{X}	Ss	Sd	F	p	Anlamlı Fark
Web 2.0 Geliştirme	18-31	86	3.6154	.7978	2	1,528	,219	Yok
	31-41	134	3.4120	.97183	254			
	41 ve Üstü	37	3.3842	.92771	256			
Tasarım	18-31	86	4.0633	.54093	2	5,718	,004	1-2
	31-41	134	3.8615	.72152	254			
	41 ve Üstü	37	3.8941	.85147	256			
Olumsuz Bakış	18-31	86	3.2791	.92935	2	1,163	,314	Yok
	31-41	134	3.2214	.83064	254			
	41 ve Üstü	37	3.0225	.80523	256			

Tablo-5'e göre öğretmenlerin yaşları Tasarım alt boyutunda anlamlı bir farklılık olduğu bulunmuştur ($p < .05$). Tukey Post-hoc test sonuçları incelendiğinde ortalama ve standart sapma değerlerine göre 18-31 yaş grubu ($\bar{X}=4.06$), 31-41 yaş grubu ($\bar{X}= 3.86$) ve 41 yaş üstü ($\bar{X}= 3.89$) arasında 18-31 yaş grubu lehine anlamlı bir farklılık görülmüştür. Diğer bir ifadeyle 18-31 yaş aralığında olan genç öğretmenlerin tasarım becerileri yaşları 31 den büyük olan öğretmenlerden daha yüksek olduğu anlaşılmaktadır.

Öğretmenlerin dijital materyal geliştirme öz-yeterliklerinin eğitim kurumu düzeyleri arasında anlamlı farklılık gösterip göstermediğini belirlemek için Tukey'nin post hoc testi ile tek yönlü ANOVA yapılmıştır. Analiz sonuçları Tablo 7'de verilmiştir.

Tablo-7 Çalışılan Eğitim Kurumu Düzeyine Göre Analiz Sonuçları

Boyutlar	Kurum	N	\bar{X}	Ss	Sd	F	p	Anlamlı Fark
Web 2.0 Geliştirme	Okul Öncesi	11	2,5455	,94937	3	3,656	,013	
	İlkokul	31	3,4171	,78811	258			
	Ortaokul	102	3,5399	1,03405	261			
	Lise	118	3,4207	,90658				
Tasarım	Okul Öncesi	11	3,1818	1,16801	3	3,273	,022	
	İlkokul	31	3,8835	,78493	258			
	Ortaokul	102	3,9363	,72732	261			
	Lise	118	3,8164	,76034				
Olumsuz	Okul Öncesi	11	3,5606	,94066	3	,822	,483	Yok
	İlkokul	31	3,3333	,89132	258			
	Ortaokul	102	3,2108	,95265	261			
	Lise	118	3,1751	,80709				

Tablo-7 incelendiğinde öğretmenlerin çalıştıkları kurumlara göre Web 2.0 geliştirme alt boyutunda anlamlı bir farklılık bulunmuştur($p < .05$). Ortalama ve standart sapma istatistikleri incelendiğinde bu anlamlı farklılığın okul öncesi öğretmenlerinin aleyhine anlamlı bir farklılık olduğu tespit edilmiştir. Tasarım alt boyutunda anlamlı bir farklılık bulunmuştur($p < .05$). Tasarım alt boyutunda da anlamlı farklılığın okul öncesi öğretmenlerinin aleyhine anlamlı bir farklılık olduğu tespit edilmiştir. Bir başka ifadeyle okul öncesi öğretmenlerinin web 2.0 geliştirme becerileri ve Tasarım becerileri diğer kurumlarda çalışan öğretmenlere göre daha düşük olduğu anlaşılmaktadır.

Öğretmenlerin dijital öğretim materyallerini kullanma öz-yeterliklerinde anlamlı bir fark olup olmadığını belirlemek için bağımsız örneklem t testi analiz için kullanılmış ve analiz sonuçları Tablo 8'de gösterilmiştir.

Tablo-8 Dijital Öğretim Materyalleri Kullanma Durumu Değişkenine Göre Analiz Sonuçları

Boyutlar		N	\bar{X}	SS	t	p
Web 2.0 Geliştirme	Evet	257	3,4327	,96751	.338	.459
	Hayır	5	3,2857	,69253		
Tasarım	Evet	257	3,8415	,78477	-.417	.645
	Hayır	5	3,9889	,56026		
Olumsuz	Evet	257	3,2419	,87299	2.390	.990
	Hayır	5	2,3000	,86923		

Tablo-8 incelendiğinde öğretmenlerin öğretim materyalleri kullanma durumunun ($p>.05$) Üç alt boyutlardan web 2.0 geliştirme, tasarım ve olumsuz arasında anlamlı bir fark olmadığı anlaşılmaktadır. Bulunan sonuçlara göre dijital öğretim materyali kullanıp kullanmama durumunun öğretmenlerin dijital materyal geliştirme öz yeterlilikleri üzerinde bir etkisinin olmadığı söylenebilir. Öğretmenlerin dijital materyal geliştirme konusundaki öz-yeterliğinin kullanılan dijital öğretim materyalleri bakımından anlamlı fark gösterip göstermediğini saptamak için Tek Yönlü ANOVA ve Tukey Post-hoc testleri yapılmıştır. Analiz sonuçları Tablo 9’de verilmiştir. Analiz yapılırken ortalama ve standart sapma değerleri kontrol edilerek bakılmıştır.

Tablo-9 Dijital Öğretim Materyalleri Değişkenine Göre Analiz Sonuçları

Boyutlar	Yaş	N	\bar{X}	Ss	Sd	F	p	Anlamlı Fark
Web 2.0 Geliştirme	Office Programları(Word,PowerPoint vb.)	139	3,3099	,88914	2	5,209	,006	2-1
	Web 2.0 Araçları(E-Kitap,Animasyon Araçları,Kavram Haritası Araçları vb.)	87	3,6806	,89120	254			
	Görüntü İşleme Programları(Paint,Adobe Photoshop,Picasa vb.)	31	3,6475	,95154	256			
Tasarım	Office Programları(Word,PowerPoint vb.)	139	3,8177	,78251	2	1,841	,161	Yok
	Web 2.0 Araçları(E-Kitap,Animasyon Araçları,Kavram Haritası Araçları vb.)	87	3,9936	,60778	254			
	Görüntü İşleme Programları(Paint,Adobe Photoshop,Picasa vb.)	31	3,9570	,50199	256			

	Office Programları(Word,PowerPoint vb.)	139	3,1295	,78097	2			
Olumsuz	Web 2.0 Araçları(E-Kitap,Animasyon Araçları,Kavram Haritası Araçları vb.)	87	3,3793	,97172	254	2,509	,083	Yok
	Görüntü İşleme Programları(Paint,Adobe Photoshop,Picasa vb.)	31	3,1129	,84040	256			

Tablo-9 incelendiğinde Web 2.0 Geliştirme alt boyutunda anlamlı bir farklılık görülmüştür.($p<.05$). Web 2.0 Geliştirme alt boyutundaki istatistikler incelenmiştir. Web 2.0 araçları kullanan öğretmenlerin ($\bar{X}=3.68$ $SS=.89$) lehine anlamlı bir farklılık görülmüştür. Bir başka ifadeyle web 2.0 araçlarını kullanan öğretmenlerin web 2.0 geliştirme becerileri diğer araçları kullanan öğretmenlere göre daha yüksek olduğu anlaşılmaktadır.

Öğretmenlerin öz-yeterliklerinin herhangi bir dijital içerik geliştirme eğitimi alma durumuna göre anlamlı bir farklılık gösterip göstermediğini belirlemek için Tablo 10'da gösterilen sonuçların analizinde bağımsız örneklem t-testi kullanılmıştır.

Tablo-10 Öğretmen Dijital Materyal Geliştirme Öz-Yeterliklerinin Dijital İçerik Geliştirme Üzerine Herhangi Bir Eğitim Alma Değişkenine Göre Analiz Sonuçları

Boyutlar		N	\bar{X}	SS	t	p
Web 2.0 Geliştirme	Evet	94	4,0403	,65746	8.518	.008
	Hayır	163	3,1507	,88045		
Tasarım	Evet	94	4,1998	,53507	5.621	.034
	Hayır	163	3,7178	,72499		
Olumsuz	Evet	94	3,5585	,90818	5.129	.052
	Hayır	163	3,0123	,76881		

Tablo-10 incelendiğinde öğretmenlerin dijital içerik geliştirme üzerine herhangi bir eğitim alma durumu öz yeterlilik alt boyutlarının Web 2.0 Geliştirme alt boyutunda anlamlı bir farklılık görülmüştür ($p<.05$). Dijital içerik geliştirme üzerine herhangi bir eğitim alan öğretmenlerin lehine anlamlı bir farklılık görülmüştür. Tasarım alt boyutunda da dijital içerik geliştirme üzerine herhangi bir eğitim alan öğretmenlerin lehine anlamlı bir farklılık görülmüştür($p<.05$). Bir başka ifadeyle dijital içerik geliştirme eğitimi alan öğretmenlerin eğitim almayan öğretmenlere göre web 2.0 geliştirme ve Tasarım becerilerinin daha yüksek olduğu anlaşılmaktadır.

Öğretmenlerin öz-yeterliklerinin Web 2.0 teknolojilerine ilişkin bilgilerine göre anlamlı bir şekilde farklılaşıp farklılaşmadığını belirlemek amacıyla analiz için bağımsız örneklem t-testi kullanılmış ve analiz sonuçları Tablo 11'de gösterilmiştir.

Tablo-11 Öğretmen Dijital Materyal Geliştirme Öz-Yeterliklerinin Web 2.0 Teknolojisi Hakkında Bilgisi Olma Durumu Değişkenine Göre Analiz Sonuçları

Boyutlar		N	\bar{X}	SS	t	p
Web 2.0	Evet	136	3,9900	,64472	11.931	.027
	Hayır	121	2,8985	,81929		
Tasarım	Evet	136	4,1593	,53526	7.015	.002
	Hayır	121	3,5960	,74511		
Olumsuz	Evet	136	3,4767	,90998	5.509	.008
	Hayır	121	2,9146	,69659		

Tablo-11 incelendiğinde dijital öğretim materyali geliştirme öz yeterliklerinden olan web 2.0 geliştirme, tasarım ve olumsuz öz yeterliliklerinde web 2.0 teknolojisi hakkında bilgisi olan öğretmenlerin lehine anlamlı bir farklılık görülmüştür ($p < .05$). Bir başka ifade ile web 2.0 teknolojisi hakkında bilgisi olan öğretmenlerin web 2.0 geliştirme ve tasarım becerilerinin bilgisi olmayanlara göre daha yüksek olduğu anlaşılmaktadır. Bunun yanında olumsuz bakışın ise bilgisi olanların daha fazla olduğu anlaşılmıştır.

SONUÇ VE ÖNERİLER

Bu çalışmada öğretmenlerin uzaktan eğitimde görev yapan öğretmenlerinin dijital öğretim materyalleri geliştirmedeki yeterliliklerinin farklı değişkenler açısından incelenmiştir.

Araştırmanın sonuçlarına göre, öğretmenlerin öz yeterlilik alt boyutlarından Tasarım alt boyutu en yüksek ortalamaya sahiptir. Bu durum, öğretmen adaylarının kendilerini Tasarım konusunda daha yeterli gördüklerini göstermektedir. Ancak, Web 2.0 geliştirme alt boyutuna göre dijital materyal geliştirme konusunda öğretmenlerin olumsuz bir bakış açısına sahip oldukları sonucuna varılmıştır. Bu bulgular, öğretmenlerin dijital materyal geliştirme konusunda daha fazla eğitim ve desteğe ihtiyaç duyduklarını göstermektedir.

Öğretmenlerin öz yeterlilikleri cinsiyete göre anlamlı bir farklılaşma görülmemekle beraber erkek öğretmenlerin kadın öğretmenlere göre ortalamalarının yüksek olduğu tespit edilmiştir. Aynı şekilde Gökbulut, Keserci ve Akyüz (2021) tarafından yapılan çalışmada da

cinsiyet deęişkenleri ile öz yeterlik arasında anlamlı bir fark bulunmamıştır. Başka çalışmalarda da Arslan, 2021; Ata ve Yıldırım, 2019 benzer şekilde anlamlı bir farklılık bulamamıştır. Bazı araştırmalarda erkeklerin kadınlara göre dijital yeterliliklerinin daha fazla olduęu görülmüştür. (Cabezas-Gonzalez, Casillas-Martín, Sanches-Ferreira ve Teixeira Diogo, 2017; Korkmaz, 2020; Lucas ve dię., 2020; Yontar, 2019).

Öğretmenlerin öz yeterlilikleri yaş deęişkenine göre sadece tasarım alt boyutunda anlamlı bir farklılaşma görülmüştür dięer alt boyutlarda anlamlı bir farklılık görülmemiştir. Genç öğretmenlerin genel anlamda Tasarım alt boyutunda dięer yaş gruplarına kıyasla daha fazla Tasarım öz yeterlilięine sahip oldukları yorumlanabilir. Benzer bir çalışmada da genç öğretmenlerin dijital becerilerinin daha fazla olduęu tespit edilmiştir(Aksoy N ve dię., 2021).Çalışılan kurum düzeyine göre öz yeterlilikleri Web 2.0 Geliştirme ve Tasarım alt boyutunda anlamlı bir farklılık görülmüştür. Olumsuz alt boyutunda anlamlı bir farklılık görülmemiştir. Web 2.0 ve tasarım alt boyutunda ortaokulda görev yapan öğretmenlerin dięer kurumlarda görev yapan öğretmenlere kıyasla daha fazla öz yeterlilięe sahip olduęu söylenebilir. Benzer bir çalışmada kurum düzeyinin anlamlı bir farklılık olduęu görülmüş ve ortaokulda görev yapan öğretmenlerinin dijital yeterliklerinin yüksek olduęu tespit edilmiştir (Gümüş, 2021)

Dijital materyalleri kullanma durumu öğretmenlerin öz yeterliliklerine göre anlamlı bir farklılık göstermemiştir. Fakat kullanılan dijital öğretim materyalleri deęişkenine göre Web 2.0 Geliştirme alt boyutunda anlamlı bir farklılık görülmüştür. Web 2.0 araçları kullanan öğretmenlerin Web 2.0 geliştirme öz yeterlilięine daha fazla sahip olduęu anlaşılabilir. Öğretmenlerin daha önceden dijital içerik geliştirme üzerine herhangi bir eğitim almaları Web 2.0 Geliştirme ve Tasarım alt boyutunda anlamlı bir farklılık görülmüştür. Eğitim almayan öğretmenlere göre daha fazla Web 2.0 geliştirme öz yeterlilięine sahip olduęu görülmektedir. İçerik geliştirme eğitimi alan öğretmenlerin Tasarım öz yeterlilięi eğitim almayan öğretmenlere göre daha yüksek olduęu söylenebilir. Benzer bir çalışmada öğretmenlerin dijital materyal geliştirmeye yönelik öz yeterliklerinin, ders içerięi geliştirmek için web 2.0'ı önceki kullanımlarına göre anlamlı düzeyde farklı olduęu belirlenmiştir (Bediroęlu, 2021).

Web 2.0 hakkında daha önceden bilgisi olma durumu öğretmenlerin öz yeterliliklerine göre anlamlı bir farklılık görülmektedir. Daha önceden bilgisi olan öğretmenin dijital öz yeterlilikleri bilgisi olmayana göre daha yüksektir şeklinde yorumlanabilir. Bunun yanında daha önceden bilgisi olan öğretmenlerin dijital materyal geliştirmeye yönelik olumsuz bakış yüksektir. Bunun sebebi dijital materyal geliştirirken yaşadığı zorluklardan kaynaklanabilir.

Atalmış ve Şimşek tarafından 2022 yılında yapılan çalışmada WEB 2.0 eğitimi alıp almama değişkenine göre eğitim almayanlara göre anlamlı farklılık tespit edilmiştir.

Kavak ve Yıldırım 2017 yılında 203 öğretmen adayı ile yaptıkları çalışmalarında öğretmen adaylarının dijital öğretim materyali geliştirme yeterliliklerinin orta düzeyde olduğu belirlenmiştir. Öğretmen adaylarının dijital öğretim materyali geliştirme yeterliliklerini artırmak için en önemli yol olarak, öğretmen adaylarına öğrenme fırsatları sağlanması gerektiği vurgulanmıştır. Ayrıca, öğretmen adaylarının dijital öğretim materyali geliştirme yeterliliklerinin artırılması için eğitim programlarının ve müfredatlarının yeniden düzenlenmesi gerektiği de çalışmanın sonuçları arasında yer almaktadır.

Gökbulut tarafından 2018 yılında yapılan çalışmada da en ve teknoloji öğretmenlerinin dijital öğretim materyali geliştirme yeterlilikleri incelenmiştir. Çalışmanın sonucuna göre, öğretmenlerin dijital öğretim materyali geliştirme yeterliliklerinin orta düzeyde olduğu tespit edilmiştir. Öğretmenlerin dijital öğretim materyalleri oluşturma sürecinde karşılaştıkları zorluklar arasında zaman yetersizliği, teknoloji araçlarının kullanımında yetersizlikler ve materyallerin kalitesi gibi faktörler yer almıştır. Ayrıca öğretmenlerin dijital öğretim materyalleri geliştirme konusunda yeterliliklerini artırmak için özellikle teknoloji araçlarının kullanımı, materyal Tasarımı ve materyal değerlendirme konularında hizmet içi eğitimlere ihtiyaçları olduğu vurgulanmıştır.

Çalışmadan alınan sonuçların yanında sınırlılıklarında mevcuttur. Çalışmanın örneklem sayısı çevrimiçi ankete katılan öğretmenlerden oluşmakta birlikte küçük olmasından kaynaklı ortaya çıkan sonuçların genelleyebilir olmamasıdır. Bu sebeple benzer bir çalışma ilerleyen zamanlarda akademisyenlerin ve diğer eğitim kurumlarında bulunan eğitimcilerin de içinde bulunduğu daha geniş daha kapsamlı ölçekli bir örneklem grubu üzerinde tekrarlanabilir. Bu çalışmada sınırlı değişkenler kullanılmıştır. İlerleyen zamanlarda yapılacak çalışmada daha kapsamlı değişkenler incelenebilirler.

Bu araştırma ve yapılan araştırmaların sonuçları incelendiğinde, öğretmenlerin uzaktan ve örgün eğitimde dijital yeterliklerinin geliştirmede öğretmenlerin daha öncesindeki aldıkları eğitimin önemli olduğu anlaşılmaktadır. Öğretmenlerin dijital yeterliliklerini geliştirmek için düzenlenen hizmet içi eğitimlerin yanı sıra, eğitim kurumları ve hükümetlerin dijital eğitim alanında politikalar ve stratejiler geliştirmesi gerekmektedir. Bu, öğretmenlerin ve öğrencilerin dijital dünyaya daha iyi adapte olmalarını ve daha etkili bir şekilde öğrenmelerini sağlayabilir.

ÖZET

Bu çalışmada ilkokul 4. sınıf matematik dersi kesirler ünitesinin öğretiminde Milli Eğitim Talim Terbiye Kurulunun (TTKB) yöntem teknikleri ve Colorado Üniversitesinin geliştirmiş olduğu simülasyonla (benzetim) öğretim yönteminin öğrenci başarısına etkileri incelenmiştir. Araştırmanın modeli öntest–sontest kontrol gruplu deneysel desen olarak tasarlanmıştır. Araştırmanın evreni, 2022-2023 Eğitim-Öğretim yılında Van ili merkez İpekyolu ilçesinde bulunan ilkokullardaki 4. sınıf öğrencileri oluşturmaktadır. Çalışma grubunu 2022-2023 Eğitim-Öğretim yılında Van ili merkez İpekyolu ilçesinde bulunan ve kolay ulaşılabilir örnekleme yöntemiyle belirlenen bir ilkokuldaki 4. sınıfta bulunan 52 öğrenci oluşturmaktadır. Çalışma, Milli Eğitim Talim Terbiye Kurulu tarafından hazırlanan müfredata uygun yöntem ve tekniklerin kullanıldığı kontrol grubu, simülasyonla (benzetim) öğretimin uygulandığı deney grubu olmak üzere 2 sınıftan oluşan 2 grup ile yürütülmüştür. 2 hafta süreyle devam eden çalışmada deney gruplarına araştırmacı tarafından hazırlanan ve Milli Eğitim Bakanlığı'nın güvenilirlik geçerliliği test edilmiş bir açık uçlu ve on adet çoktan seçmeli sorulardan oluşan bir test uygulanmıştır. Araştırma sonucunda, simülasyon (benzetim) ile öğretimin matematik dersi kesirler ünitesinin öğretiminde ilkokul 4. sınıf düzeyinde öğrencilerin başarı sağlamasında etkili olduğu saptanmıştır. Bu yöntemin öğrenci başarısı üzerine etkilerine bakıldığında istatistiki olarak anlamlı bir fark çıkmıştır ($p < .05$). Elde edilen bulgulara göre simülasyon ile öğretimin öğrenci başarı puanları ortalamalarında olumlu yönde katkı sağladığı söylenebilir. Matematik dersi kesirler ünitesinin öğretilmesinde simülasyon yönteminin daha fazla kullanılması önerilebilir.

Anahtar Kelimeler: Matematik öğretimi, kesirler, teknolojik materyal, simülasyon.

**THE EFFECT OF USING TECHNOLOGICAL MATERIALS IN 4TH GRADE
FRACTION TEACHING ON STUDENTS' ACHIEVEMENT LEVEL**

ABSTRACT

In this study, the effects of the method techniques of the National Education Board (TTKB) and the simulation teaching method developed by the University of Colorado on the success of the students in the teaching of the fractions unit of the 4th-grade mathematics lesson were examined. The model of the research was designed as an experimental design with the pretest-posttest control group. The universe of the research consists of 4th-grade students in primary schools in the central Ipekyolu district of Van province in the 2022-2023 academic year. The study group consists of 52 students in the 4th grade of a primary school located in the central Ipekyolu district of Van province in the 2022-2023 academic year and determined by the easily accessible sampling method. The study was carried out with 2 groups consisting of 2 classes, the control group, in which methods and techniques suitable for the curriculum prepared by the National Education Board of Education and Discipline were used, and the experimental group, in which simulation teaching was applied. In the study, which lasted for 2 weeks, a test consisting of open-ended and ten multiple-choice questions prepared by the researcher and tested by the Ministry of National Education was applied to the experimental groups. As a result of the research, it has been determined that teaching with simulation (simulation) is effective in the achievement of 4th-grade students in the teaching of the fractions unit in the mathematics lesson. Considering the effects of this method on student achievement, there was a statistically significant difference ($p < .05$). According to the findings, it can be said that teaching with simulation contributes positively to the average student achievement scores. It can be suggested that the simulation method should be used more in teaching the fractions unit in the mathematics lesson.

Keywords: Teaching mathematics, fractions, technological material, simulation.

Giriş

Matematik eğitimi, eğitimin her kademesinde var olan en önemli disiplinlerdendir. Matematik, çeşitli soyut modeller ve bunlar arasındaki ilişkiler dersidir, bilimin bir parçasıdır, bir düşünme sürecidir, özünde bir düzen ve kararlılık vardır, dikkatlice özenle terim ve sembollerden oluşan bir dil ve araçtır (Yıldırım, C. 1996). Bu da öğrencinin temel matematik konularını öğrenmesinin ilk basamağı olan ilkökul kademesinde kalıcı öğrenmeler son derece önemlidir. Eğitim teknolojisinin doğrudan faydalarını incelendiğinde; aktif öğrenme, somutlaştırma, kademeli öğrenmeyi basamaklandırma, düşüncede kalıcılığı sağlama, özel bireylerde özel hedefler gerçekleştirme vb. öğrencilerin özgün ürün çıkarmaya sevk etme, öğretmenin rolünü geliştirme, motivasyon oluşturma, öğrencilerin eğlenerek öğrenmesini kolaylaştırmada ve birinci elden kaynak sağlamaktır (Yaylacı, 1999; Yüksel, Yılmaz & Yeşilyurt 2022). Yeterli bir matematik eğitimi için temel matematik kavram ve kazanımlar ilkökul eğitim sürecinde tam ve doğru olarak öğretilmesi son derece önemlidir. Öğrencilerin kazanımları anlamaları ve zihinlerinde bu kazanımları kalıcılığını sağlamak için farklı yöntem ve teknikleri kullanmak gerekmektedir. Öğrencilerin çoğu günlük hayatta paylaşma kavramını sık sık kullanmasına rağmen kesirlerin soyut kavram olarak düşünmesinden zor olarak görmektedir (McLeod ve Newmarch). Sayılarla ilgili bir çokluğu belirtmek ve istenilen kadarını ayırmak zor olmamaktadır, fakat kesirler arasındaki soyut kavram ilişkilerinin varlığı birçok öğrencinin bu konuda sorun yaşamasına sebep olmaktadır (ESRC, 2006). Tüm derslerde olduğu gibi matematik dersinde de bazı kavramları öğretirken zorlanabiliriz. Özellikle öğretmen, soyut kavramları öğrenci zihninde kolayca yerleşmeyen kavram ve konuları öğretirken farklı yöntem ve tekniklerden sık sık yararlanmalıdır. Gelişen teknoloji ile birlikte bu tür soyut kavramları öğretmek ve kalıcılığı sağlamak daha da kolaylaşmıştır. Teknolojilerin faydaları düşünüldüğünde kesirler konusunun bilgisayar destekli simülasyonlar aracılığı ile öğretilmesinde büyük fayda vardır. Kesir kavramını somutlaştırmada kesir ve sayılar arasındaki ilişkilerin görsellerle desteklenmesi açısından son derece önemlidir.

Literatür çalışmalarına baktığımızda da teknoloji kullanımının oldukça faydalı olduğu görülmektedir (Yeşilyurt, 2021). Eğitimcilerin ve araştırmacıların çoğu etkin kullanılan öğretim teknolojilerinin eğitim sisteminin kalitesini iyileştirecek potansiyele sahip olduğu fikrinde ortak kaniya varmışlardır. (Jonassen & Reeves, 1996; Means, 1994; Çağiltay, Çakıroğlu, Çağiltay & Çakıroğlu, 2001). Eğitimcilerin ve Araştırmacıların teknolojinin eğitim-öğretimde kullanılmasını bir amaç olmaktan öte bir araç olarak kullanılması gerektiği konusunda hem fikirdirler (Strudler & Wetzel,1999; Loucks-Horsley, Hewson, Love, & Stiles, 1998; Turhan &

Yeşilyurt, 2020). Bulut ve Yüksel (2011) çalışmalarında ortaokul 8. sınıf düzeyinde 28 öğrenciyle çalışmışlar ve matematik dersi desenler konusunda bilgisayar animasyonları ve etkinlikler kullanılmıştır. Öntest-sontest çalışması sonucunda öğrencilerin akademik başarı puanlarında istatistiki olarak anlamlı bir fark oluşmuştur.

Yapılan bu araştırmadaki temel amaç, 4. Sınıf kesirleri ünitesinin öğretiminde simülasyonla öğretim uygulamasının öğrenci başarısı üzerindeki etkilerini ortaya çıkarmaktır. Bu araştırmayla sınıf öğretmenlerinin kesir ünitesiyle ilgili öğretim süreçlerinde kullanabileceği farklı yöntem ve teknikler ortaya konulabilecektir. Alanyazında simülasyon yöntemi kullanılarak kesirler ünitesinin öğretimine yönelik herhangi bir çalışma olmaması bu araştırmayı özgün ve önemli kılmaktadır.

Problem

İlkokul 4. sınıf kesirler ünitesinin öğretiminde simülasyonla öğretimin öğrencilerin başarı düzeylerine etkisi ne düzeydedir?

Alt problemler

1. Simülasyonla ile öğrenen öğrencilerin öntest ve sontest puanları arasında anlamlı bir fark var mıdır?
2. TTKB yöntem ve teknikleri ile öğrenen öğrencilerin öntest ve sontest puanları arasında anlamlı fark var mıdır?
3. Kesirler ünitesinin öğretiminde simülasyonla öğretim yapılan öğrenciler ile TTKB yöntem ve teknikleri ile öğretim yapılan öğrencilerin öntest ve son test puanları arasında anlamlı bir fark var mıdır?

Araştırmanın Sınırlılıkları

1. Bu araştırma Van ili İpekyolu İlçesi bir devlet okulunda 4. Sınıfta bulunan 56 öğrenci ile sınırlıdır.
2. Bu araştırma 'Basit, bileşik ve tam sayılı kesri tanıy ve modellerle gösterir.' kazanımıyla sınırlıdır.
3. Bu araştırma ön test ve son test uygulaması ile sınırlıdır.

Yöntem

Araştırmanın Modeli

Araştırma nicel araştırma yöntemlerinden tarama modeli (ön test-son test) modeli kullanılarak

yürütülmüştür. Bu çalışma ilkokul 4. sınıf düzeyinde 52 öğrencinin 2 hafta süreyle Simülasyonla ile kesirler ünitesinin öğretiminde öğrenci başarısı üzerindeki etkilerini inceleyen öntest-sontest ve kontrol gruplu yarı deneysel desenli bir çalışmadır.

Evren ve Çalışma Grubu

Araştırmanın evreni, Van Merkez İpekyolu ilçesinde bulunan 46 devlet ilkokulundan oluşmaktadır. Çalışma grubu ise, kolay ulaşılabilir örnekleme yöntemi ile belirlenen bir devlet ilkokulunda yer alan 2 tane 4. sınıf ile yürütülmüştür. Araştırmanın çalışma grubunu, deney ve kontrol grupları olmak üzere 52 öğrenci ile oluşturmuştur. Deney grubunda, simülasyonla öğretim uygulaması, kontrol grubunda ise, TTKB yöntem ve teknikleri ders işleyişinde kullanılmıştır.

Veri Toplama Aracı

Araştırmanın verileri çoktan seçmeli 10 soru, 1 tane açık uçlu soru içeren bir kavram başarı testiyle elde edilmiştir. Araştırma sürecinde toplam 2 tane test kullanılmıştır. Bunlar Kesir Kavrayış Ön testi (KKÖT), Kesir Kavrayış Son testi (KKST), oluşmaktadır. Sorular araştırmacılar tarafından incelenerek, Milli Eğitim Bakanlığının yayınlamış olduğu kazanım kavrama sorularından hazırlanmıştır.

Eğitim yazılımı.

Konu. Matematik Dersi Kesirler Ünitesi

Hedef kitle. İlköğretim dördünü sınıf öğrencileri

Kazanımlar. Milli Eğitim Bakanlığı (MEB) İlköğretim dördüncü sınıf öğretim programına göre;

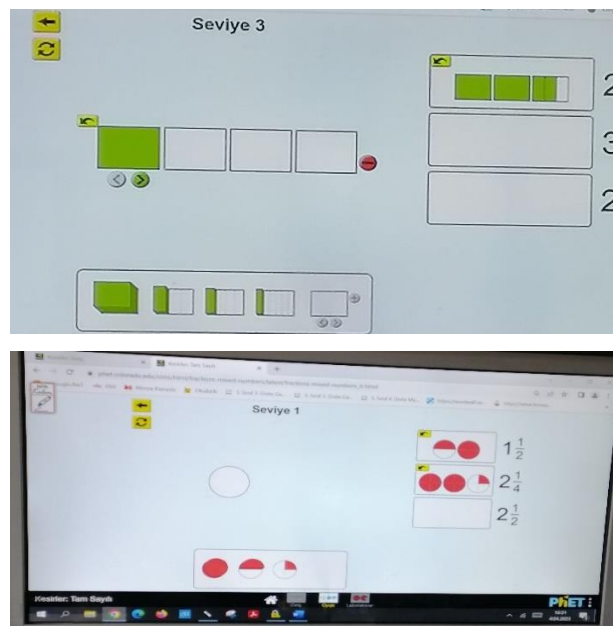

- Payı ve paydası en çok iki basamaklı doğal sayı olan kesirleri, kesrin birimlerinden elde ederek isimlendirir.
- Kesirleri karşılaştırır.
- Tam sayılı kesirleri kavrar.
- Payları eşit, paydaları birbirinden farklı en çok dört kesri, büyükten küçüğe veyaküçükten büyüğe doğru sıralar.
- Bir çokluğun belirtilen bir basit kesir kadarını belirler.

İçerik. İçerik geliştirme ve öğretimin planlanması konusunda alan uzmanı ile birlikte çalışılmıştır. Öğretim materyali programlı öğretim modeli ilkeleri dikkate alınarak, doğrusal

olmayan program modeline göre hazırlanmıştır. MEB'in matematik programı incelenmiş ve kazanımlar göz önünde bulundurularak içerikte neler olması gerektiği belirlenmiştir. Kazanımlara göre konuların başlıkları çıkarılmıştır ve sorularda müfredata uygun hazırlanmıştır. Konular küçük bilgi birimlerine bölünerek hazırlanmıştır. Animasyonlara ve sesli anlatımlara yer verilmiştir. Öğrenci istediği konuya tıklayarak öğretimi başlatabilir. Öğretimin sunumunda MEB İlköğretim 4. sınıf matematik kitabı temel kaynak olarak kullanılmıştır. Bu nedenle, bilgiler hazır olarak verilmemiş örneklerden yola çıkılarak, kavramlara doğru gidilmiştir. Ayrıca anlatımlarda genel olarak gerçek yaşam problemlerine yer verilmiştir. Anlatımlar süresince yer yer alıştırmalar konulmuştur. Öğrenciler cevaplarına göre anında pekiştireç almışlardır. Yanlış cevapladıklarında soruya tekrar dönebilme ya da soruyu geçme esnekliği sağlanmıştır. Yanlış cevaplayan öğrencilere ek açıklamalarla sorunun çözümü hakkında anlatımlar sunulmuştur. Öğrenciler anlatımlar arasında gezinebilmektedirler, birini bitirmeden diğerine geçme esnekliği sağlanmıştır. Bunun nedeni öğrencinin yazılımla etkileşimini sağlamak ve bildiği ya da daha önceden Simülasyonlardan izlediği anlatımları geçmesini sağlamaktır. İleri geri düğmeleri, sürükle bırak yöntemi sorular, boşluk doldurma soruları, “cevabı kontrol et”, “ses açma- kapama” gibi düğmelerle öğrencinin etkin olarak öğrenme sağlanmıştır. Ayrıca, öğrencilerin özellikleri dikkate alınarak, canlı renkler kullanılmış, sevebilecekleri karakterlere ve ders anlatımları sırasında animasyonlara yer verilmiştir.

Uygulanan öğretim modeli

Bu araştırmada bilgisayar destekli öğretim kullanılmıştır. <https://phet.colorado.edu/tr> web sitesindeki kazanıma uygun benzetimler kullanılmıştır.

Şekil 1: Etkinlik örnekleri

Verilerin Toplanması

Araştırmanın verileri toplanırken, öncelikle konu ile ilgili ders kitapları incelenmiş, literatür araştırması yapılmış ve bir soru havuzu hazırlanmıştır. Bu soru havuzundan test hazırlanırken 2 sınıf öğretmenin görüşleri alınmıştır. 10 tane çoktan seçmeli, 1 tane açık uçlu soru yer almaktadır. Mili Eğitim Yardımcı kaynaklarından hazırlanan test ile belirlenen okulda bulunan 2 tane 4. Sınıf öğretmenine araştırmanın genel amacı ve hangi sınıfta nasıl bir uygulama yapılacağı anlatılmıştır. Öntest ve sontestler hakkında bilgiler verilmiştir. Kontrol grubu öğretmenine derslere normal şekilde devam edeceği TTKB yöntem ve teknikleri kullanılarak ders anlatımının yapılacağı, sonrasında da yalnızca öntest ve sontestleri uygulayacağı söylenmiştir. Deney grubunda ise, simülasyonla öğretimin nasıl yapılacağı, nasıl çalıştırılacağına ilişkin bilgiler verilmiştir. Öğretmen simülasyonları incelemiş ve ders planına dâhil etmiştir. Çalışmanın örneklendirilmesi amacıyla, öğretmen gözetiminde ilk derse araştırmacı girerek dersi işlemiş ve daha sonraki dersler öğretmen tarafından benzer şekilde işlenmiştir.

2022-2023 Eğitim Öğretim Yılı 4. Sınıf Kesirler Konusu Kazanım Değerlendirme Soruları.

1- Aşağıdaki şekillerin boyalı kısımları ifade eden kesirleri yazınız.

 \rightarrow

 \rightarrow

 \rightarrow

2- Aşağıdakilerden hangisi basit kesirdir?

A. $\frac{8}{9}$ B. $\frac{7}{5}$ C. $\frac{5}{2}$ D. $\frac{4}{3}$

3- Aşağıdaki şeklin kesirle ifadesi hangi seçenekte verilmiştir?

A. $\frac{3}{8}$ B. $\frac{3}{5}$ C. $1\frac{5}{8}$ D. $\frac{5}{8}$

4- Üç tam yedi de ikisi şeklinde okunan kesir sayısı aşağıdakilerden hangisidir?

A. $1\frac{7}{2}$ B. $3\frac{3}{7}$ C. $3\frac{2}{7}$ D. $2\frac{7}{2}$

5- Aşağıdaki taralı şeklin kesir olarak okunuşu hangisidir?

A. üç bölü dört B. bir bölü dört
C. dört bölü dört D. iki bölü dört

6- Aşağıdakilerden hangisi birim kesirdir?

a) $\frac{3}{8}$ b) $\frac{5}{1}$ c) $\frac{1}{11}$ d) $\frac{2}{7}$

7- $\frac{12}{4}$ basit kesir statümesi için en fazla kaç yazılabilir?

A. 2 B. 3
C. 4 D. 5

8- Şekildeki boyalı bölgeye karşılık gelen kesir sayısı aşağıdakilerden hangisidir?

A) $\frac{16}{10}$ B) $\frac{15}{10}$ C) $\frac{10}{16}$ D) $\frac{6}{10}$

9- $\frac{8+2}{7}$ büyük basit kesir olduğuna göre B doğal sayısı kaçtır?

A. 6 B. 4 C. 3 D. 2

10- Yukarıdaki modellenen kesir aşağıdakilerden hangisidir?

A. $3\frac{1}{4}$ B. $2\frac{2}{4}$ C. $\frac{9}{10}$ D. $\frac{2}{10}$

11- $\frac{11+1}{7}$ kesri basit kesir olduğuna göre 'a' yerine aşağıdakilerden hangisi yazılabilir?

A) 2 B) 3 C) 5 D) 8

Şekil 2: Kazanım Değerlendirme Soruları

Verilerin Analizi

Kontrol ve deney gruplarının tek başına yöntemsel olarak başarılarına bakmak için, öntest ve sontest değerlendirmelerinde bağımsız gruplar *t* testi kullanılmıştır. Grupların karşılaştırmalarında kullanılacak test çeşidine karar vermeden önce, levne testi ile varyans eşitlikleri kontrol edilmiştir. Varyans eşitliğine göre karşılaştırma testi seçilmiştir. Varyanslar eşit çıktığı için tek yönlü varyans analizinde, *t* testi kullanılmıştır. Öntestler denk çıkmadığı için, sontest öntest puan farkları farkına bakılmıştır.

Deney grubu ve kontrol grubu öntest ve sontest karşılaştırmalarında, bağımsız gruplar *t* testi kullanılmıştır. Öntest değerleri denk çıktığı için, sontest farkları ile başarıları kıyaslanmıştır.

Verilerin analizinde SPSS 25.0 paket programı kullanılmıştır. Sonuçlar uzmanlarla birlikte yorumlanmış ve tablolandırılmıştır. Analiz sonuçlarında $p < .05$ için gruplar arasında istatistiki olarak bir fark olduğu kabul edilmiştir.

Tablo 1. Deney Grubu Ve Kontrol Grubu Öntest ve Sontest Karşılaştırmaları (*t testi*)

	Yöntem	n	X	ss	t	p
Ön test	Kontrol Grubu	23	55,60	7,24	,24	,80
	Deney Grubu	23	54,52	20,04		
Son test	Kontrol Grubu	23	59,60	18,93	-2,21	,03*
	Deney Grubu	23	71,04	16,03		

* $p < .05$

Tablo 1 incelendiğinde, ön test kontrol grubunun ortalaması 55,60. Deney grubunun ortalaması 54,52. Ön testlerin sonucu incelediğinde iki grup arasında anlamlı bir fark olmadığı bulunmuştur. $p = ,80$ ($p < .05$). Son test incelendiğinde kontrol grubu ile deney grubu arasında anlamlı bir fark olduğu bulunmuştur $p = ,03$ ($p < .05$). Yine son test verileri incelediğinde iki grubun da ortalamaları artış göstermiştir.

BULGULAR

1. TTKB yöntem ve teknikleri İle Öğrenen Öğrencilerin Öntest ve Sontest Puanları Arasında Anlamlı Bir Fark Var mıdır? Alt Problemine Yönelik Bulgular

TTKB yöntem ve teknikleri u y g u l a n a n kontrol grubunun öntest-sontest başarı puanları farkına bakılmıştır. Bağımsız gruplar *t* testi sonuçları incelendiğinde $p = .03$ ($p < .05$) çıkmıştır. Buna göre öğrenme gerçekleşmeden önce uygulanan Simülasyonla öğrenme gerçekleştikten sonra uygulanan Sontest başarı puanları farklarına göre öğrenci başarısında bir miktar artış

meydana geldiği söylenebilir. Sonuçlar TTKB yöntem ve teknikleri öğretimin, kesir ünitesinin öğretiminde öğrencilerin başarısını artırdığı ve öğrencilerin ilerlemesine katkı sağladığı yönündedir.

2. Simülasyon İle Öğrenen Öğrencilerin Öntest ve Sontest Puanları Arasında Anlamlı Bir Fark Varmıdır? Alt Problemine Yönelik Bulgular.

Simülasyonla öğretim uygulanan Deney grubunun öntest-sontest başarı puanları farkına bakılmıştır. Bağımsız gruplar *t* testi sonuçlarında $p = .03$ ($p < .05$) olarak hesaplanmıştır. Buna göre öğrenme gerçeğlemeden önce uygulanan öntest(KKÖT) ve öğrenme gerçeğleştikten sonra uygulanan sontest(KKST) başarı puanları farklarına göre öğrenci başarısında artış meydana geldiği söylenebilir. Sonuçlar Simülasyonla öğretimin kesirlerin öğretiminde öğrencilerin başarısını artırdığı ve öğrencilerin ilerlemesine katkı sağladığı yönündedir.

Her iki yönteminden sontest sonuçları incelendiğinde ortalamasının yükseldiği görülmektedir.

SONUÇ ve ÖNERİLER

Eğitim ve öğretimin farklı uygulamaları olan TTKB ve Simülasyonla öğretim yöntemlerinin öğrenci başarısı üzerindeki etkiliğini araştıran bu çalışma öntest-sontest ve kontrol gruplu yarı deneysel bir çalışmadır. Kontrol grubunda Mili Eğitim Bakanlığının yöntem teknikleri ile, Deney grubunda simülasyonla öğretim yapılmıştır.

TTKB ve Simülasyonla öğretim yöntemleri ilkökul dördüncü sınıf kesirler ünitesinin öğretiminde başarılı yöntemlerdir. Ortalama farklarına bakıldığında Simülasyonla öğretim tam olarak uygulayan grubun sontest sonuçlarına göre ve akademik başarı puan ortalamalarına göre üst düzey öğrenmeyi gerçekleştirdiği söylenebilir. Bu sonuçlar literatürde yer alan bir kısım Bilgisayar Destekli Öğretim çalışmalarının sonuçlarıyla paralellik göstermektedir. Camnalbur ve Özdenler (2007) çalışmasında sınıf tabanlı Bilgisayar Destekli Öğretim ile matematik öğretimi gerçekleştirmiştir. Çalışması sonucunda kontrol grubu ile deney grubu arasında istatistiki olarak ($p < .05$) anlamlı bir fark ortaya çıkmamıştır. Ancak deney grubunun başarı ortalaması kontrol grubundan daha fazla çıkmıştır. Ancak bulgular sonucunda simülasyonla öğretim yöntemi bireysel uygulamaların matematik öğretiminde öğrenci başarısını ve öğrenmenin kalıcılığını daha iyi destekleyeceğini belirtmiştir.

Deney grubu sınıf öğretmenin simülasyonla öğretim ile ilgili olumlu görüşlere sahip olduğu ortaya çıkmıştır. Öğretmenin simülasyonla öğretim yöntemi ile başarılı bir öğretim yapacağını düşünmektedir. Simülasyonla öğretim yönteminin kazanımlarla tutarlı, kolay kullanım, açık ve net anlatımı barındırdığını belirtmiştir. Özellikle öğrencilerin dikkatini çektiğini, kavramayı

kolaylaştırdığını, zamanı daha verimli kullanabileceklerini, bilginin hafızada daha uzun süre kalmasını sağlayacağı yönünde görüş bildirmiştir. Çalışma sonuçları ışığında aşağıdaki önerilerde bulunulmuştur.

ÖNERİLER

1. Simülasyonla öğretim yöntemi ilköğretim dördüncü sınıf matematik dersi kesirler ünitesinin öğretilmesinde yapılan bu araştırma diğer sınıf seviyelerinin derslerinde de kullanılmalıdır.
2. Simülasyonla öğretim yönteminin öğrenci başarısını etkileyen faktörleri ortaya çıkarmaya yönelik çalışmalar yapılmalıdır.
3. Simülasyonla öğretim yönteminin uygulanmasında, başarısını anlamlı anlamda artıran olan öğretmen ve öğrenciler ile diğer yöntemin(TTKB) kullanıldığı sınıftaki öğrenci ve öğretmen özelliklerinin neler olduğu nitel araştırma yöntemi ile araştırma yapılarak ortaya çıkarılmalıdır.
4. Simülasyonla öğretim yönteminin başarısının önemini tam olarak ortaya çıkarmak için farklı konu ve sınıf düzeylerine uygulamalar yapılarak, bu yöntemin güçlü yönlerinin neler olduğunu ortaya çıkaran araştırma ve uygulamalar yapılmalıdır.
5. Simülasyonla öğretim yönteminin uygulamaları çalışmanın gerçeği yansıtması ve ihtiyaçların neler olduğunu ortaya çıkarması amacıyla diğer derslerinin kazanımları için de çalışmalar yapılmalıdır.
6. Simülasyonla öğretim yönteminin, etkili bir şekilde yürütülmesi için okulda mutlaka akıllı tahta ve internet altyapısının olması gerekmektedir.
7. Öğretmenlerin Simülasyonla öğretim yönteminin etkin kullanabilmesi ve bu yöntemin öğrenci başarısını artırmadaki önemini kavramaları için hizmet içi eğitim kursları düzenlenmelidir.
8. Eğitim ve öğretimde kullanılan her türlü teknolojik materyal çalışmaları öğretmenlerin yanı sıra öğrenci ve teknolojik materyal geliştirenler ile birlikte inceletilerek nitel araştırma yöntemleri ile değerlendirilmelidir.

ÖZET

Bilindiği gibi İslami gelenekte öngörülen farklı sakıncalardan ötürü gerçekçi tabloların çizimine izin verilmemiştir. Bu nedenle İslam toplumlarında Batı'da olduğu gibi üç boyutlu gerçekçi bir resim sanatı görülmez. Batı'da özellikle göz, ağız, burun, el, ayak gibi vücut kısımlarının tüm ayrıntılarıyla resmedildiği neredeyse anatomik olarak kusursuz çizimler karşımıza çıkarken İslami gelenekte ana hatları verilen gösterme maksatlı resimlere denk geliriz. Bunun yanı sıra resim ve heykele getirilen sınırlamanın tam aksine İslam tarihinde söze dayalı sanatlara rağbet artmıştır. Özellikle şiire gösterilen yoğun ilgiyle birlikte bir beyte dünyalar kadar kültür malzemesi sıkıştıran şairlerimiz görülür. Şairlerimiz günümüz araştırmalarında kısaca “sevgili” olarak tanımlanan mutlak güzelliği sayısız beyitte ince çağrışımlar, türlü hayaller, çeşitli söz ve zekâ oyunları, nüanslar, gündelik yaşam unsurları gibi kültürel malzemelerle zenginleştirerek anlatageldiler. Sevgilinin aşkınlığı, güzelliği, cazibesi genel olarak anlatıldığı gibi güzellik unsurları olarak bilinen göz, kirpik, saç, boy ve bel gibi unsurlarla ayrıntılı olarak da aktarılır. Bu beyitlerin zaman zaman tıpkı bir tablo gibi detaylarla dolu olduğu ve hayal gücünü besleyen renkli anlatılarla bezendiği görülür. Klasik Türk edebiyatının seçkin şairlerinden olan Emrî'nin (ö. 1575) öne çıkan yönlerinden biri de bu bahsettiğimiz tasvir gücüdür. Hayal gücünün zenginliğiyle, detaylara dikkat ederek yaptığı tasvirlerle dikkat çeker. Bu bildiride Emrî'nin şiir geleneğinde sevgilinin güzellik unsurları arasında en az yer verilenlerden biri diyebileceğimiz ele yönelik yazmış olduğu bir gazel ele alınacak. Gazelde yer verilen tasvirler klasik şiir geleneği bakımından değerlendirilecek; kelimelerin yaptığı çağrışımlar ve sosyal yaşam unsurları ortaya konarak şairin bir gazele neler sıkıştırabildiği araştırmacıların ilgisine sunulacaktır.

Anahtar Kelimeler: Emrî, sevgili, güzellik unsurları, el, tasvir, gazel.

AN ORIGINAL GHAZAL OF EMRI (d. 1575) DEPICTING HAND

ABSTRACT

As known, realistic paintings are not allowed to be drawn due to the different drawbacks envisaged in the Islamic tradition. For this reason, a three-dimensional realistic art of painting is not seen in Islamic societies as in the West. While we come across almost anatomically perfect drawings in the West, in which parts of the body such as eyes, mouth, nose, hands, and feet are depicted in all details, we come across illustrations for illustrative purposes outlined in the Islamic tradition. In addition to this, contrary to the restrictions imposed on painting and sculpture, the demand for verbal arts has increased in the history of Islam. Especially with the intense interest in poetry, we see our poets who squeeze as much cultural material into a couplet as the world. Our poets have come to describe the absolute beauty, which is briefly defined as "beloved" in today's research, by enriching it with cultural materials such as subtle associations, various dreams, various word and mind games, nuances, everyday life elements in countless couplets. The transcendence, beauty and charm of the lover are explained in detail with elements such as eyes, eyelashes, hair, height and waist, which are known as beauty elements. It is seen that these couplets are full of details like a painting from time to time and are adorned with colourful narratives that feed the imagination. Emri, one of the distinguished poets of classical Turkish literature (d. 1575) is one of the prominent aspects of this descriptive power. He draws attention with the richness of his imagination and the depictions he made with attention to detail. In this paper, a ghazal written by Emrî for the hand, which we can say is one of the least included among the beauty elements of the beloved in the poetry tradition, will be discussed. The depictions in the ghazal will be evaluated in terms of classical poetry tradition; By revealing the connotations of the words and the elements of social life, what the poet can squeeze into a ghazal will be presented to the attention of the researchers.

Keywords: Emrî, lover, elements of beauty, hand, description, ghazal.

GİRİŞ

Çalışmamızın daha iyi anlaşılması için tasvir üzerine konuya giriş mahiyetinde bir iki söz söylemek icap etmektedir. Zira edebiyatta teşbih, istiare gibi sanatlarla yapılan anlatımlar bir bakıma tasvir olarak nitelenmektedir. Yazımızın başlığında tasvir ifadesini tercih edişimizin nedeni de budur. Tasvir, bir varlığı resmetmek veya şekillendirmek, edebi tasvir ise bir varlığı okuyanın ve dinleyenin zihninde onda estetik duygular uyandırarak tarif etmektir. İnsanlık duygu ve düşüncelerini bilinen en eski zamanlardan beri tasvir yoluyla anlatagelmiştir. Mağara duvarlarına veya kayaların üzerine çizilen resimler hiyerogliflerin ve daha sonra alfabelerin ortaya çıkmasına ön ayak olmuş; böylelikle sözlü ve yazılı anlatım paralel olarak gelişme göstermiştir. İnsanlar bu gelişme aşamasında tarif etmek istedikleri bir varlığı başka varlıklarla kıyaslama yoluna yönelmişlerdir. Önce teşbihin daha sonra istiarenin temelini oluşturan bu kıyaslamalar zamanla estetiğin zirvelerine ulaşan edebî tasvirleri ortaya çıkarmıştır. Aslında tamamen farklı sanat dalları olup kullandıkları malzemelerin tamamıyla farklı olmasına karşın şairler ve ressamlar arasında tasvir çizme ve edebî tasvir ortaya koyma bakımından dikkate değer bir benzerlik bulunur. Bir ressam nasıl ki çizdiği bir tabloyu iki üç fırça darbesiyle güldürüp yine birkaç fırça darbesiyle ağlatabiliyorsa söz sanatçısı olan şair de bir iki kelime oyunu, benzetmeler ve imgelemelerle benzer görüntüleri zihinlerde oluşturmakta mahirdirler (Şentürk 2002: 21-22).

İslam tarihinde resme karşı mesafeli bir duruş söz konusu olduğu söylenebilir. Heykel ve resim; tapınma veya saygı gösterilme amacıyla yapılması, başka bir dinin sembolü olması, çıplaklık unsuru taşıması gibi öngörülen kimi sakıncalar sebebiyle haram kılınmıştır (Başoğlu 2007: 579-582). Bunun kaçınılmaz bir sonucu olarak İslam inancı dairesinde oluşan kültür muhitlerinde plastik sanatlara karşı mesafeli durulmuş; buna karşın söz sanatlarına özellikle de şiire önem verilmiştir.

Günümüzde Divan edebiyatı, Klasik Türk edebiyatı gibi çeşitli adlandırmalarla araştırma konusu olan edebiyat geleneği de plastik sanatlar yerine şiire yöneltilen ilginin bir semeresi olarak varolagelmiştir. Bu edebiyat geleneğinin en önemli özelliklerinden biri içinde doğduğu toplum yapısına uygun olarak belli kurallara ve teşrifata bağlı kalmasıdır. Nasıl ki bir derviş bir tarikate intisap ettiğinde oranın adap ve erkanına göre davranıyorsa bir şair de şiir için kalemi eline aldığı anda gerek duygu gerekse tavır olarak o şiir geleneğinin gereklerine uygun davranmak zorundaydı. Hayatında ağzına bir damla içki sürmemiş bir kişi şiir yazdığı anda kadehi elden düşürmeyen, meyhaneden dışarı adım atmayan bir kişi

hüviyetine bürünür. Şeyhulislam veya padişah bile olsa bu geleneği sürdürür. Bu geleneğe uyan kişi aşkını dile getirecekse gerçek kişiliğiyle değil duygularını kalıp ifadelerle uydurarak söylecek; sevdiği kişiden söz edecekse bunu şiirdeki sevgili tipine uydurmak suretiyle yapacaktır (Akün 1994: 414).

Bu edebiyatta şair geleneğin belirlediği estetiğin kendisine sunduğu hazır malzeme ve unsurlardan hareket etmek durumundadır. Bu estetiğe göre şairin söz edeceği her varlık geleneğin önceden belirlediği kurallarla işlenir. Edebiyatın en temel konularından biri olan sevgili için bu kuralların daha da sıkı olduğunu söylemek mümkündür. Öyle ki yüz dendiğinde gül, ateş, su, bahar; boy dendiğinde selvi, elif, kıyamet gibi kelimeler hemen zihinde belirlemektedir.

Gazel, kaside ve mesnevi gibi bir çok şiirde anlatılagelen bu yüce ve aşkın sevgili, eskilerin tabiriyle “esbab-ı hüsn” günümüzdeki yaygın tanımlama ile “güzellik unsurları” çerçevesinde ele alınır. Bu güzellik unsurları arasından insanın en belirgin yeri yüz olduğu için yanak, dudak, göz, kirpik, kaş vb. yüzle ilgili unsurlar daha çok öne çıkar. Binlerce beyitte işlenen bu güzellik unsurlarına dair müstakil çalışmalar da günümüz klasik edebiyat araştırmalarının önemli bir yekununu oluşturur. Bu çalışmamızda ele aldığımız Emrî *Dîvân*'ında yer alan 254. gazeli (Saraç 2002: 153) de güzellik unsurlarından ele yönelik yazılmış bir gazeldir.

EMRÎ VE ŞAIRLİĞİ

Gazelini araştırma konusu olarak seçtiğimiz Emrî'nin biyografisi ve şairliği hakkında çok söz söylenmiştir. Biz burada bu bilgileri uzun uzadıya tekrar etmek yerine çalışmanın daha iyi anlaşılması için birkaç söz söylemekle yetineceğiz.

Ailesi hakkında pek bir bilgi bulunmayan Emrî'nin Edirne'de dünyada geldiğine dair tezkireler ittifak halindedir. Önceleri bazı imaretlerin kitâbet vazifesiyle meşgul olurken Kınalızâde Ali Çelebi'nin Edirne kadısı olmasından sonra onun himayesiyle Yıldırım Bayezid Medresesi'nin tevliyeti hizmetinde bulunmuş, daha sonra buradan azledilmiştir. Kaynaklar ömrünü tevliyet hizmetleriyle geçirdiğini, Edirne ve İstanbul dışında herhangi bir yerde bulunmadığını ifade ederler (Saraç 2014).

Şuara tezkireleri Emrî'nin şairlik kudretinden övgüyle bahsederler. Onun şiir ilmini bir kuyumcu titizliğiyle işlediğini ve şiire kılı kırk yararcasına hassas yaklaştığını övgülerini dile getiren Aşık Çelebi şairin hayal gücü konusunda hayal Boğa burcuna bile çıkmış olsa şiirin büyüyle ona ulaşmış inekten süt sağır gibi sağabileceğini der (Kılıç 2018: 148). Latîfi

ise onun devrin şairleri arasına kendine özel bir hayal dünyasına sahip olduğunu (hayâl-i hâssa kâdir) ve orijinallik (îcâd) konusunda benzerinin pek olmadığı söyleyerek bu konuda onu över (Canım 2018: 137). Mustafa Âlî ise onun teşbihlerini şairlik yeteneğinin güçlü oluşuna bir kanıt olarak gösterir ve hayal hükümlerine söz tuğrasını vurduğunu söyler (İsen 2017: 112). Görüldüğü gibi Emrî'nin şiirinde öne çıkan onun eşsiz hayal gücü ve teşbihleridir.

EMRÎ'NİN EL TASVİRİ YAPTIĞI GAZELİNİN İNCELENMESİ

El, biyolojide insanların da dahil edildiği primatlar takımında birden fazla parmağı barındıran, kolun bilekten parmak uçlarına kadar olan bölümünü tanımlar. Başparmağın diğer parmaklarla karşılıklı iş görmesi, ufak nesnelere ele alabilme yeteneğini sağlar. Bu özellik sayesinde el, alet kullanımı gibi hassas ve karışık işleri görebilir. Primatların beyininde eli temsil eden alan, diğer hayvanlarınkinden çok daha geniştir ("El" 2022). Sadece bu bilgilerden bile elin insanlık için ne kadar önemli olduğunu anlamak mümkündür.

El tasvirleri tarih öncesi çağlardan beri kazıma ve boyama gibi yöntemlerle mağara duvarlarının yüzeylerinde işlenmiştir (Dobrez 2013: 298-310; aktaran Gital 2017: 625). İlk Türkler tarafından Orta Asya ve Sibirya'da gerek bağımsız olarak gerekse kamların esrime durumlarını göstermek için vücuda göre oldukça büyük şekilde el çizimleri yapılmıştır (Hoppál 2015: 55-57). Gital, çalışmasında bu dönemden günümüze kadar elin sembolik, dini, kültürel anlamlarını özetler (Gital 2017: 625-627).

İnsan için bu kadar önemli olan ve ilk çağlardan beri tasvir edilen elleri elbette divan şairleri görmezden gelmez. Binlerce beyitte tasvir edilen sevgilinin güzellik unsurlarından biri de kuşkusuz eldir. Eller için ay, dal, kâfur merhemi, kanat, kılıç, Musa'nın eli, (yed-i beyzâ), pençe-i mercân, perde, sedef, şafak vakti, yelpaze, levha, yasemin, ay ve güneş, gül-i ra'nâ, kadeh gibi teşbihler yer alırken parmaklar için dal, unnab, masura, gümüş, güneş ışığı, hilal, kakum kuyruğu, kalem, kamaş, külçe, nâme, ok ve zambak goncasına benzetilir (Erdoğan 2013: 438-450).

İnceleme konusu ettiğimiz aldığımız Emrî Divân'ında yer alan 254. gazelde (Saraç 2002: 153) işlenen teşbihleri hilal, kalem, tomar, mum, zambak goncası, dal, levha, boğumlar için hat levhası (kıta), güneş, ay, yed-i beyzâ şeklinde sıralayabiliriz. Görüldüğü gibi Emrî'nin teşbihleri yukarıda sayılan teşbihlerden farklı değildir. Bununla birlikte boğumlar için kıta ve parmaklar için tomar teşbihi bu teşbihler arasında yer almaz. Ayrıca şairin bu yaygın benzetmeleri hayal gücünün sınırlarında gezerek işlediğini de belirtelim.

Şair gazelin matla beytinde parmaklar için teşbih unsuru olan beş unsur (hilal, kalem, tomar, mum, zambak goncası) sayar ve ardından “Beş parmağın beşi bir olmaz” atasözünü aktararak bu unsurların sevgilinin ellerine benzemesinin mümkün olmadığını söyler. Daha sonra bu unsurların her birini bir beyitte işler makta beytinde ise hilal benzetmesini tekrarlayarak toplam yedi beyitte gazelini tamamlar. Şimdi bu teşbih unsurlarını gazeldeki sıraya göre inceleyelim.

Hilal

Sürûrî'nin *Bahrü'l-Ma'ârif* adlı eserinin sevgili ve sevgilin güzellik unsurları ilgili benzetmeleri ele aldığı "Teşbihât ve Mesâil-i Enîsü'l-'Uşşâk Beyânındadır" başlıklı üçüncü bölümünün 22. babı parmak hakkındadır. Burada parmağın hilale benzetildiği aktarıldıktan sonra benzetme yönü de açıklanmıştır. Buna göre parmağın hilale benzetilmesi parmakların hilal gibi çoğu zaman eğri durması nedeniyledir (Şafak 1991: 274).

Pençe-i hurşîd ifadesi ise bire bir çevrildiğinde ‘güneşin eli’ anlamındadır. Onay, bu ifadenin ‘güneş alınlı’ anlamında olduğunu söyler ve şairlerin bunu daha çok sevgili anlamında kullandığı bilgisini verir (1992: 331). Ancak ‘alın’ anlamına gelen kelimenin punçe şeklinde olduğunu belirtelim (Steingass 1892: 257). Anlaşılan şairler güneş ışınlarının yayılışını bir elin açık parmaklarına benzetmişler ve bununla ilgili çeşitli hayaller geliştirmişlerdir.

Beyitte sevgilinin ışıltılı eli önce güneşin etrafa saçılmış ışıklarına benzetilmiş ardından bu benzetme bir ayın yakınındaki beş hilal benzetmesine taşınarak hayal gücünün sınırları zorlanmıştır. Günümüzde bilim-kurgu filmlerinde farklı evrenlerde yer alan gezegenlerin semalarında birden fazla ay (uydu) görülebilmektedir ancak XVI. yüzyılda yaşamış biri için bir ayın etrafındaki beş hilal hayalinin sıradışı olduğunu kabul etmek gerekir. Bu hayal, tezkirelerin onun hayal gücünü neden övdüğünü anlamamız için bir örnektir. Şair bunu yaparken Türkçenin imkanlarından faydalanmayı da ihmal etmiyor. Aya kelimesinin “elin iç tarafında bilekle parmaklar arasında kalan düz kısım, avuç içi” anlamı düşünüldüğünde şairin yeteneği daha da iyi anlaşılacaktır:

Ben anuñ pençesini pençe-i hurşîde beñzetdüm

Görüp dil didi bir aya mukârin beş hilâl ancak

“Ben onun elini güneş ve etrafa saçılmış ışıklarına benzettim. Gönül görüp dedi ki “Bu olsa olsa bir ayın yakınındaki beş hilaldir.”

Tomar ve Kita

Yukarıda sıraladığımız el ve parmakların benzetilenleri arasında tomarın geçmediğini söylemiştik. *Bahrü'l-ma'ârif*'te tomar (tûmâr) kakül ve zülfün benzetilene olarak verilmiştir (Şafak 1991: 408).

Tomar kelimesi iki farklı anlama gelmektedir. Arapça tûmâr kelimesinden gelen tomar yazı için kullanılan deri ve kağıtların uzunlmasına ve eni az olarak kesilip yuvarlanmış şekline denir. Yazılmış ve tezhip ile süslenmiş kağıt ve derilerin kıvrılmamasını ve güneşten etkilenmemesini sağlar. Cilt bulunmadan önce eserler böyle saklanıyordu (Özönder 2003: 23). Mesela aşağıdaki görselini paylaştığımız antlaşma metni tomar şeklindedir (Şekil 1).

Şekil 1. (Rizaei 2022: 404)

Tomarın diğerk anlamı ise şudur: Dikdörtgen biçimindeki mukavvaya yapıştırılmamış kıtaların üstten ve alttan birbirine yapıştırılıp tutturulması ile oluşan ve tomar (rulo) halinde sarıldıktan sonra buna bağılı bir deri mahfazayla korunan hat eserleridir. Tomar XVI. yüzyıldan sonra yerini murakkaa bırakmıştır. Kıta, orta boydaki bir kitap ebadındaki bir kağıda yazılan hat sanatı eserine denir. Kıta mukavvaya yapıştırıldıktan sonra ebru veya tezhiple bezenirdi. Murakka ise çeşitli yöntemlerle süslenmiş kıtaların ciltlenmesiyle hazırlanan albüme denir (Derman 1997: 434-435). Bilindiğı gibi baş parmakta iki diğerk parmaklarda üç boğum vardır. Yukarıda belirttiğimiz gibi baş parmağının diğerk parmakları kavrama yeteneğı insan eline benzersiz bir yetenek sunmaktadır. Hatta Newton'un "Diğerk tüm kanıtları bir yana bırakırsak baş parmak bile benim Tanrı'nın varlığına inanmam için yeterlidir." dediğı iddia edilir.¹³ Eldeki parmakların bu farklı yapısı şairin de dikkatini çekmiş ve bu durumla ilgili şairane bir yorum geliştirmiştir. Parmaktaki boğumlar uzunlamasına olduğı için hat kıtalarında olduğı gibi dikdörtgenimsi bir şekil arz etmektedir ve hat tomarlarındaki gibi uç uca eklenmiştir (Şekil 2). Şair her bir boğumu bir hat kıtasına benzetmiş ve parmakları birinde iki (baş parmak) dördünde üçer kıta bulunan beş tomara benzetmiştir. Bu kıtalardaki yazılar ise hilali anlatmaktadır. Hilal parmaklar için teşbih unsuru olmasından öte dini ve kültürel yönden derin anlamlar içermektedir (Kurnaz 1998: 13-15). Tüm bu bilgiler göz önünde tutulduğunda şairin eldeki parmakları ilahi bir sanat örneğı olarak yorumladığı ortaya çıkmaktadır. Ayrıca beytin sonundaki *el-hak* ifadesi de bunu pekiştirmektedir. El-hak 'doğrusu, gerçekten, hakikaten' anlamındadır. Böylece şair geliştirdiğı teşbihin mecazdan öte hakikati ifade ettiğini ima etmiştir. İfadedeki elif lam takısı (el-) gazelin konusu olan el ile ses benzerliğı (cinas) taşımaktadır. Bu şekilde bakıldığında elin hakikatine vurgu yapılmış olur.

Birisinde iki dördünde üçer kıt'a derc itmiş

Benânuñ mâh-i nev vafında beş tûmârdur el-hak

"Doğrusu parmakların her biri hilali anlatan birisinde iki dördünde üçer kıta derlenmiş beş tomardır."

¹³ Newton'a atfedilen bu söz birçok yerde geçse de bu sözü muteber bir kaynaktan tespit edemedik.

Şekil 2: Hat kıtaları ihtiva eden bir tomar (© Sabancı Üniversitesi Sakıp Sabancı Müzesi Obj. No: 102-0396-X)

Zambak Goncası, Gül ve Ağaç Dalı

Beyazlığı ve zarafetiyle öne çıkan zambak çağrışım alanı olarak zengin olmakla birlikte divan şiirinde nisbeten az kullanılmış çiçeklerden biridir (Açıl 2015: 22). Orta Çağlar boyunca iffetin ve namusun simgesi olan zambak (Madonna Lily) (Kandeler & Ullrich 2009: 1894) divan edebiyatında parmakları simgeler. Zambak goncalarının parmağa benzeyen yapısını (Şekil 3) şairlerimiz türlü hayallerle zenginleştirerek işlemiştir (Demir 2021: 137-141).

Şairin yine bu yaygın teşbihleri alıp sıra dışı bir hayal oluşturduğu görülüyor. Şair önce boy için yaygın bir teşbih olan Tûba teşbihine başvurur. Aşağı doğru ilerleyen dallarının tüm cenneti kapladığına inanılan Tûbâ ağacı Arap, Fars şair ve yazarlarının değişik algılayış biçimleri yanında hayal dünyalarının da katkısıyla zenginleşerek abartılı biçimde anlatılan dinî-edebî bir kavram haline gelmiştir. Bu şekliyle Türk edebiyatında özellikle divan şiiri ve nesrine intikal etmiş, divan edebiyatı mazmun ve remizleri arasına girmiştir (Uzun 2012: 317). Şair geleneğe uygun olarak boyu Tûbâ'ya ve selviye benzetmiş, böylece kolları da dallara benzetmiştir. Ancak teninin güzelliğini övmek için bu dalların gümüşten olduğunu ve dalların ucunda gül bulunduğunu söylemiştir. Avuç için gül gibi kırmızımsı renkte oluşu ve avuç çizgilerinin gülün kıvrımlarını andırması bu teşbihin çıkış noktasıdır. Güle benzeyen avuçların ucunda ise beş beyaz zambağa benzeyen parmaklar yer almaktadır. Bu haliyle beyitteki teşbihin orijinal hâle geldiğini söylemek mümkündür.

Ne tûbâ servdür kaddüñ ki sîmîn şâhlar salmış

Bitürmiş her birinde bir gül ü beş gonçe-i zanbak

“Tuba ağacına benzeyen boyun nasıl bir selvidir ki gümüştan dallar sarkıtmış her bir dalında bir gül ve beş zambak goncası bitirmiş.”

Şekil 3. Zambak goncaları.

Levha ve Kalem

Divan edebiyatında kalem türleri arasında daha çok söz konusu edilen kamış kalemdir (Sefercioğlu 2012: 2). Sevgilinin güzellik unsurları bakımından değerlendirildiğinde kalem parmaklara benzetilir. Günümüzde bile bu teşbih devam etmekte ‘parmakları güzel, düzgün, buruşuksuz ve uzunca olan kimse’ anlamında kalem parmaklı ifadesi kullanılmaktadır (Eyüpoğlu 1973: 273). Kalemin parmaklara benzetilmesi şekil benzerliğinin yanı sıra kalemin parmakla tutulmasından olsa gerektir. Emrî aşağıdaki beytinde avuç içini bir levhaya parmakları kaleme benzettikten sonra oraya kendi gönlünün yazılmasını istiyor. Burada şair bir kelime oyununa başvurmuştur. “Gönül yazmak” ifadesi gönül eğlendirmek anlamındadır (Dilçin 1983: 98). Burada bu ifade hem kalemlerle gönül yazmak anlamında hem de gönlü eğlendirmek, mutlu etmek anlamında kullanılmıştır. Divanı deyim kullanımını yönünden zengin olan şair (Kaya 2011: 129) bu deyim başarıyla işlemiştir.

Elinde bir gümüş levh ile beş sîmîn kalem gördüm

Didüm bu levha yaz gönlüm didi bilmem gönül yazmak

“Elinde bir gümüş sayfa ile beş gümüş kalem gördüm. ‘Bu sayfaya gönlümü yaz.’ dedim. ‘Ben gönül almak nedir bilmem.’ dedi.”

Mum

Elektiriğin icadından önce temel aydınlatma araçlarından mum bu yönüyle gündelik hayatın vazgeçilmezleri arasındaydı. Gündelik hayatı tüm ayrıntılarıyla şiire aktaran divan şairleri haliyle onu şiirlerine sıkça dâhil etmişlerdir. Sevgili mum olarak vasfedilirken yüzü de ışıltısından hareketle muma benzetilir. Burada parmakların kalem ve tomar örneklerinde olduğu gibi uzunca silindirik yapısından ötürü muma benzetildiğini görüyoruz. Beyitte yine Emrî’nin hayal gücüne tanık oluyoruz. Sevgilinin parmakları bulunduğu ortamı ateş olmadan aydınlatan beş muma benzetilmiştir. Beyitteki şem’-i kudret ifadesi yukarıda olduğu gibi bu durumun Allah’ın kudretinin bir eseri olarak yorumlandığını göstermektedir. Sevgili tasvirlerinde kelime oyunlarına sıkça yer veren şair (Alvan 2015: 368) burada bir kelime oyuna başvurur. Beytin sonundaki *elyak* ifadesi ‘layıktır’ anlamında olsa da kelimenin ilk hecesi gazelin konusu olan el ile ikinci hecesi ise beytin üzerinde kurulduğu mum teşbihiyle ilişkili olarak yakmak fiiliyle ses benzerliği taşımaktadır.

Fürûğ-i nârsuz rûşen iderler meclis-i şevki

Ben anuñ pençesin beş şem’-i kudretdür disem elyak

“Ateş parıltısı olmaksızın şevk meclisini aydınlatırlar. Ben onun eline beş kudret mumu desem layıktır.”

Yed-i Beyzâ

‘Beyaz el’ anlamına gelen yed-i beyzâ Hz. Musa’nın mucizelerinden biridir. Hz. Musa ellerini koynuna sokup geri çıkardığında bembeyaz ve ışıltılı bir hâl alır.¹⁴ Arap, Fars ve Türk edebiyatlarıyla Türk halk inanışlarında yer alan yed-i beyzâ Hz. Mûsâ’nın mucizeleriyle beraber şahsı etrafında gelişen ve şairlerin farklı yorumlarıyla zenginleşen bir edebî unsur, remiz ve mazmun haline gelmiş, ayrıca teşbih, telmih, iktibas, istiare, kinaye, tenâsüp gibi edebî sanatlara malzeme teşkil etmiştir. Sevgilinin elleri de bu bağlamda yed-i beyzâyâ benzetilegelmiştir (Uzun 2013: 377-378).

¹⁴ “Ve elini çıkardığı zaman, eli bakanlar için bembeyaz parlayıverdi.” (Kur’ân-ı Kerim, Araf: 7/108).

Şiirin makta beytinde şair elleri hem yed-i beyzâya hem de güneşe benzetmiştir. Yine hayal gücüne başvurarak bu güneşin her ışını bir dolunaya bitişik hilal olarak yorumlar. Böylece teşbihler iç içe geçmiş olur.

Ne mihr olur yed-i beyzâsı k'olmuş her şu'â'ınuñ

Ucı bir mâh-ı bedr Emrî aña bir mâh-ı nev mülhak

“Emrî, onun mucizeler gösteren eli nasıl bir güneştir ki her ışını bir dolunaya bitişmiş bir hilal gibidir.”

SONUÇ

Divan edebiyatının öne çıkan şairlerinden olan Emrî'nin en belirgin özelliği orijinalliği ve hayal gücündeki zenginliğidir. Ele aldığımız gazelinde Emrî sevgilinin baştan sona güzellik unsurlarından eli işlemiştir. Şairin diğer güzellik unsurlarına kıyasla biraz daha geri planda kalan el hakkında bir gazel yazması dikkate değer bir durumdur.

Eşair tespitlerimize göre kalem, mum, hilal, yed-i beyzâ gibi el ve parmaklar hakkındaki yaygın benzetmelerden faydalanmıştır. Ancak bu benzetmeleri hayal gücüyle zenginleştirerek orijinal denebilecek bir hüviyete kavuşturmuş; bunun yanı sıra elin ilahi kudretin bir eseri olduğunu dile getirmiştir. Şair bu tasvirleri yaparken kelime oyunları deyimlerden de istifade ederek gazelin anlam çerçevesini zenginleştirmiştir. Bu çalışmamızın ileride Emrî'nin sanatı hakkında yapılacak geniş çaplı incelemelere veya sevgilinin güzellik unsurlarına dair çalışmalara katkı sağlayacağını umuyoruz.

Abstract

Digital leaders have a clear understanding of how digital technologies can help their organization achieve its goals and are able to articulate this vision to their team and they recognize the importance of collaboration and are able to bring together diverse teams to work towards a common goal. In this paper we focus on digital leaders as promoters of learning and development within the organization and how essential is for the organizations looking to stay competitive and innovative in a rapidly changing digital landscape. Digital leaders understand the importance of continuous learning and development in today's rapidly evolving digital landscape. They recognize that technology is constantly changing, and they need to stay up-to-date with the latest trends and best practices to remain competitive. Continuous learning and development can take many forms, including attending conferences, taking online courses, participating in webinars, reading industry publications, and collaborating with colleagues. By prioritizing continuous learning and development, digital leaders are able to stay ahead of the curve and ensure that their organization is well-positioned to succeed in the digital age. We conclude that digital leaders empower their teams by providing them with the necessary tools and resources to succeed in a digital environment. This includes providing access to the latest technology, investing in training and development programs, and fostering a culture of innovation and collaboration.

Keywords: leaders, digital, learning, development, change

INTRODUCTION

Politics and digitalization are closely intertwined in today's world. Digitalization has transformed the way politics is conducted, from election campaigns and public opinion polling to governance and public service delivery.

One of the most significant impacts of digitalization on politics is the rise of social media. Social media platforms such as Twitter, Facebook, and Instagram have become essential tools for political campaigns, allowing politicians to reach out to voters directly and engage with them in real-time. Social media has also given rise to a new form of political activism, enabling citizens to organize and mobilize around issues and causes they care about.

Digitalization has also enabled new forms of citizen participation in politics, such as e-petitions, online consultations, and crowdsourcing. These tools have the potential to increase citizen engagement and participation in political decision-making processes.

In addition, digitalization has facilitated the creation of digital government services and e-government platforms, which enable citizens to access public services online, including filing taxes, applying for permits, and accessing public records. These platforms can help to improve the efficiency and transparency of government services and reduce bureaucracy and corruption.

However, the use of digital tools in politics also poses challenges, such as the spread of disinformation and fake news, cybersecurity threats, and concerns over privacy and data protection. Politicians and policymakers need to address these challenges to ensure that digitalization is used in a way that supports democratic processes and protects citizens' rights and freedoms.

Overall, digitalization has transformed politics in significant ways, and it will continue to shape the future of democracy and governance. It is crucial that policymakers and citizens work together to ensure that digitalization is used in a way that promotes transparency, accountability, and citizen participation in politics.

LITERATURE REVIEW

There are numerous authors who have written about digital leadership, including academics, practitioners, and consultants.

Kouzes and Posner's research focuses on identifying the behaviors and practices of effective leaders (Kouzes. J, Posner. B, 2022). They have developed a model of leadership called the Five Practices of Exemplary Leadership, which includes the following:

1. Model the Way
2. Inspire a Shared Vision
3. Challenge the Process
4. Enable Others to Act
5. Encourage the Heart

Ronald Heifetz and Marty Linsky are both scholars and practitioners in the field of leadership studies. They are best known for their work on adaptive leadership, which is a model of leadership that emphasizes the importance of adapting to changing circumstances and taking on difficult challenges. Together, Heifetz and Linsky have developed a powerful model of leadership that emphasizes the importance of adaptive work and the need for leaders to take risks, experiment, and learn from their mistakes. Their work has had a significant impact on the field of leadership studies and has helped to shape the way that many people think about leadership and its role in driving social and organizational change. (Heifetz A. R, Linsky M, 2014)

In her book "The Engaged Leader: A Strategy for Your Digital Transformation," Li argues that leaders need to embrace digital technologies and social media to engage with their employees, customers, and stakeholders. She provides a roadmap for leaders to become more digitally engaged, including developing a digital mindset, building a social media presence, and using social technologies to communicate and collaborate. (Li, 2014)

In his work, Kotter emphasizes the importance of leadership in driving successful change and the need for organizations to be agile and adaptable in today's rapidly changing business environment. He has developed a proven eight-step model for leading change, which has been widely adopted by organizations around the world. In "Accelerate," he expands on this model and introduces a new approach to building strategic agility that is designed to help organizations stay ahead of the curve in a world where change is constant and disruption is the norm. (Kotter, 2014)

Digital leaders are individuals who possess the skills, knowledge, and expertise to lead their organizations through the complexities of the digital landscape. The following literature review provides an overview of the key concepts, theories, and practices associated with digital leadership.

These scholars and many others have contributed to our understanding of political leadership and the challenges and opportunities of leading in today's complex and rapidly changing world.

PROMOTING LEARNING AND DEVELOPMENT

Digital leadership is a term used to describe the ability of leaders to leverage digital technologies to achieve strategic objectives (Heifetz A. R, Linsky M, 2014). Digital leaders possess a range of skills, including technical knowledge, data analysis, and communication skills. They must also be able to understand the impact of digital technologies on business models, customer experiences, and organizational culture and play a critical role in guiding their organizations through digital transformation. They are must be able to assess the digital maturity of their organizations, identify areas for improvement, and develop strategies to implement digital technologies. They must also be able to manage the cultural and organizational changes that come with digital transformation. As they possess a range of skills and competencies to be effective like technical knowledge, strategic thinking, data analysis, communication skills, and leadership abilities they must also be able to adapt to rapidly changing technology and business environments (Kouzes. J, Posner. B, 2022).

Digital leadership is not without its challenges. Digital leaders are be able to navigate the complexities of digital technologies, manage organizational resistance to change, and overcome cultural barriers to digital transformation (Li, 2014). They can also be able to balance the need for innovation with the need for security and compliance. There are several best practices associated with digital leadership. These include creating a digital culture, investing in digital skills development, fostering innovation and experimentation, and using data-driven decision-making. Digital leaders must also be able to communicate effectively with stakeholders, build cross-functional teams, and be agile in their approach to digital transformation.

The future of digital leadership is likely to be shaped by emerging technologies such as artificial intelligence, blockchain, and the internet of things. Digital leaders must be able to understand the potential impact of these technologies on their organizations and develop

strategies to leverage them. They must also be able to balance the need for with ethical considerations and societal impacts.

Promoting development refers to the deliberate efforts made to improve the economic, social, and political conditions of a community, region, or country. It involves a wide range of activities and interventions that are aimed at enhancing the well-being of individuals and communities (Kotter, 2014).

Promoting development can take various forms, including economic development, social development, and sustainable development. Economic development focuses on improving the economic conditions of a community, such as increasing employment opportunities, expanding access to markets, and attracting investment. Social development, on the other hand, focuses on improving the social conditions of a community, such as enhancing access to education, health care, and social services. Sustainable development aims to improve the economic, social, and environmental conditions of a community in a way that is sustainable over the long term. It requires collaboration and partnerships among different actors, including government, civil society organizations, private sector, and local communities.

Promoting learning refers to the deliberate efforts made to facilitate the acquisition of knowledge, skills, and attitudes by individuals or groups. It involves creating an environment that supports and encourages learning, providing resources and opportunities for learning, and ensuring that learners have access to quality education and training. Promoting learning can take various forms, including formal education, informal learning, and lifelong learning. Formal education refers to structured learning experiences that take place within educational institutions, such as schools, colleges, and universities. Informal learning, on the other hand, refers to learning that takes place outside of formal educational settings, such as through work experience, volunteering, or self-directed learning. Lifelong learning refers to the continuous acquisition of knowledge, skills, and attitudes throughout one's life.

Promoting learning is essential for personal and professional development, as well as for the development of societies and economies. It can help individuals to acquire the knowledge and skills they need to succeed in their careers and contribute to society. It can also help to promote innovation, creativity, and social cohesion, and contribute to economic growth and development.

Political leaders need to be digitalized because digitalization has transformed the way politics is conducted, and leaders need to be able to navigate this new terrain effectively to lead and govern effectively. Digitalization has had a significant impact on political communication, citizen engagement, and public service delivery, among other areas.

CONCLUSIONS

Digital Political leaders have a critical role to play in promoting learning and development, both at the individual level and at the societal level. They can invest *in education* by increasing funding for schools and universities, supporting programs that provide access to education for marginalized communities, and promoting innovative approaches to teaching and learning. By investing in education, political leaders can help individuals acquire the knowledge and skills they need to succeed in life and contribute to society.

Political leaders can *support lifelong learning* by promoting adult education and training programs, providing incentives for employers to invest in employee training and development, and creating opportunities for individuals to acquire new skills and knowledge throughout their lives. By supporting lifelong learning, political leaders can help individuals adapt to changing economic and technological conditions and remain competitive in the workforce. They can *encourage innovation and creativity* by supporting research and development, promoting entrepreneurship, and investing in science and technology. By fostering an environment that encourages innovation and creativity, political leaders can help to drive economic growth and development.

Digital leaders can lead by example by engaging in their own learning and development and by promoting a culture of continuous learning within their organizations and communities. By demonstrating a commitment to learning and development, political leaders can inspire others to do the same.

faribushi1@hotmail.com

Abstract

Through the studies, the variables of the role of social media marketing and consumer behavior have been analyzed. The purpose of this case study is to better inform and understand the importance of social media in the tourism industry and consumer activity. From the results it appears that 88% of businesses actively use social media and 70% can trust the opinion given by social networks. Social media and tourism are linked together because they both focus on their sharing. As highlighted by the statistics of the global tourism industry, the influence of social media on tourism is likely to be dangerous for the younger demographic 46%. Effective social media marketing can focus not only on inspiring content about their travels but also on highlighting the truly amazing aspects of your particular corner of the world. Finally, our study provides relevant information that will help the readers of the field to understand more about the role of marketing and social media in consumer changes in the tourism industry.

Keywords: marketing, social media, consumers, the tourism industry

1. Introduction

Over the last few years we have seen a huge growth in social media which is due to the increase in the number of internet users and different platforms around the world. Social media marketing has made a huge difference in consumer behavior in the tourism industry. Nowadays, many consumers use social networks to search for information and advice on tourist destinations, hotels, and restaurants. Social media marketing helps tourism companies connect with consumers in new ways and create long-term relationships with them.

As a consequence of this, social media marketing is essential for success and greater inclusiveness of clients or consumers, as well as the most innovative way of influencing contemporary global tourism.

The purpose of this case study is to inform and understand the importance of social media in the tourism industry and consumer behavior. This paper contains and elaborates on the concepts of social media marketing, consumer behavior, the tourism industry, statistics of their users, the impact of social media on tourism, disadvantages, etc.

The data has been provided through the use of contemporary literature and existing scientific works in the field of marketing through social media, statistical data, international empirical works and verified websites.

Literature review

Social media marketing, consumer behavior, and the tourism industry

Social media marketing has fundamentally changed the way many companies communicate and advertise to their target demographic. The growing spread of the Internet and social media, on the other hand, transformed the marketing paradigm with multiple perspectives and newly created horizons in the tourism and hospitality industries. (Md Yusuf Hossein Khan and Tanvir Abir, 2022).

The 'social' part: refers to interacting with other people by sharing information with them and receiving information from them. The 'media' part: refers to a communication instrument, such as the Internet. From these two separate terms, we can derive a basic definition:

"Social media are web-based communication tools that enable people to interact with each other by sharing and consuming information." (Nations, 2021).

Social media marketing is in many ways a precursor to social business. Social media marketing is most effective when the entire business is responsible for marketing

experiences, operations, and communication, and everyone within the organization is accountable for the overall product or service (Dave Evans with Jake McKee, 2010).

Social media is best understood as a group of new types of Internet media that share most or all of the following characteristics:

- Participation
- Opening
- Conversation
- Community
- Connection

(Mayfield, 2008)

A definition of consumer behavior would be that it studies individuals, groups, or organizations, and the processes they use to select, secure, use, and purchase products, services, experiences, or ideas to satisfy needs, and the effects these processes have on the consumer and society, including their causes and motives, of individuals and groups about the orientation, purchase, use, maintenance, disposal, and self-production (Foldrejt, 2019).

The tourism industry includes all the activities that take place during the movement of people during their tour. These tours don't just cover leisure travel; but also business trips and additional trips for social reasons. The tourism industry includes all businesses and organizations that provide services to tourists and visitors. This industry covers several businesses such as hotels, restaurants, accommodation, food and beverage, transport, and travel agencies. From buying a flight ticket to staying at a hotel, exploring the destination, and buying food, all activities are involved in the tourism industry (Pcweb, 2022).

Statistics of social media users

Table 1: Statistics of social media users in the world
(Statistics, Jan 2023)

According to statistics, the number of people who use social media in their daily life is observed. As a consequence of this, the role of social media in everyday life is always growing.

According to the International Tourism Research Centers, 88% of tourism business representatives actively use social media and 70% of consumers trust recommendations from social networks (Jashi, 2013).

2. How does social media affect tourism?

Social media and tourism fit beautifully together because they both focus on sharing experiences. As highlighted by global tourism industry statistics, the impact of social media on tourism can be particularly powerful for the younger 46% demographic (Tjoe, 2022). Effective social media marketing can focus not only on inspiring content about your travels or activities but also on highlighting the truly amazing aspects of your particular corner of the world.

Every social post can contribute to building awareness, trust, and anticipation. Social media marketing has been highly influential in the way companies communicate with their

customers and market products. This has been particularly felt in the hospitality and tourism industry.

Moreover, the introduction of the Internet has also helped the trending nature of these social media networks:

- Transforming the travel search- They can check the possible hotels, restaurants, and accommodations they can use. These social media channels help with good pictures, ratings, and reviews of places where tourists and travelers can stay.
- Facilitate the booking process - Online bookings can come from various sources: from social networks to Large Online Travel Agents - so it helps to direct and dedicate the booking or program.
- Share the experience - The importance of social media in the tourism industry becomes clear when you consider how people want to share and share their tourism experiences online. Social posts can be very important.
- Increase in social sharing- What various social media marketing sites have done is to make it easy and amplify people's choice to share travel experiences. This helps in building good content. This trend has been noticed by some hotels and resorts that have started to run online campaigns that ensure they are compensated for displaying their activities online.
- Improves customer support- Social media has helped transform customer service and satisfaction at various companies. Many brands have a unique social media presence that they use to get customer feedback. These social media channels are avenues where they can ask their customers about their experiences and get instant feedback.
- Restructuring of travel agencies - Social media has had a positive impact on the restructuring of large travel agencies. With the easy flow of information and smooth booking, these travel agencies have undergone some restructuring. There are now many self-booking features that can eliminate the use of agents for future travel bookings.
- Loyalty Rewards System-Many markets know that keeping new customers is much more expensive than keeping old ones. This has made offering loyalty rewards to customers very important in the travel sector. Social media has played a major role in how various hotel loyalty promotions are designed to retain existing customers (Hosts, 2023).
- Increase brand awareness and exposure- Social media marketing helps increase brand awareness and exposure. Tourism companies can use social media to share photos and videos of tourist destinations and to share stories and experiences from previous customers.

- Increase customer involvement and engagement - Social media marketing can help increase customer involvement and engagement. Tourism companies can use social media to share different stories and experiences from previous consumers and to encourage consumer participation in discussions and debates about tourist destinations and their experiences.
- Driving bookings and sales- Social media marketing can help drive bookings and sales. Tourism companies can use social media to share special offers and vacation packages with consumers and help drive ticket purchases and hotel reservations.
- Reputation monitoring and crisis management - Social media marketing can help with reputation monitoring and crisis management. Tourism companies can use social media to track customer comments and feedback and react in time to resolve any problems or concerns the customer may have.

The impact of social media on the tourism industry cannot be quantified. It has increased the visibility of various tourism brands and attracted more customers to their services. More people online can now easily search for information on the most fun places with just a click of a button (Hosts, 2023).

Social media marketing helps tourism companies connect with consumers in new ways and create long-term relationships with them. If a tourism company has a good social media marketing strategy, it can have a positive impact on consumer behavior in the tourism sector. The mobile travel industry's presence has exploded compared to where it was even a few years ago. Social media are opening the way for people from different corners of the world to plan their trips and share their experiences abroad. No matter where you are in the world, social media has an impact on tourism, so you should include it in your digital marketing strategy.

**Advantages and disadvantages of using social media marketing in the
tourism industry**

Advantages	Disadvantages
The biggest audience reach	You may get negative feedback
Faster dissemination of information	It can be abusive
You have a direct connection with your audience	You have to spend a lot of time on your campaigns
You build your brand	You open up the potential for mistakes in higher transparency
You can create viral content	Confidential information may be disclosed
You can join social media networks for free	Only social media users are accessible
You can rate your performance	Fake information can also be distributed
Reduction of time cost	Addicted to the Internet
It's global	Transparency can cause confusion among consumers

Table 2: Advantages and disadvantages of using social media in the tourism industry

3. Conclusions

Social media is becoming more and more popular. It is experiencing a significant effect on a variety of social and economic issues. In the tourism industry, social networks are vital. The tourism industry deals with potential tourists, vacationers, and tourists who wish to share their experiences.

According to the report and those mentioned above in the paper, social media can be used to increase awareness of the destination, reach the masses, encourage travelers to plan their trip, strengthen the image of the destination as a destination favorite, target new or specific markets, increase the number of visitors, create buzz around the goal and increase the number of likes on social networks.

As a result, leading destination marketing companies have started using social media to promote tourism destinations and products. It would be a failure for any destination in today's corporate world to ignore the demands of social media marketing as it serves as a means to connect with consumers and share details about updates, purchases, and rewards.

At this point, the links between social media and the tourism industry have become inseparable. The impact of social media on tourism and hospitality is huge. Today we have tourism businesses of all sizes leveraging social media to raise awareness, engage with potential guests and improve bookings (Truyols).

**MIGRATION AND UNIMPLEMENTED HUMAN RIGHTS: CASE OF EASTERN
OF THE DEMOCRATIC REPUBLIC OF CONGO**

Bosse Omar Ndahetwa (Orcid: 0000-0002-7647-0952)
Kocaeli University / Department of International Relations
E-mail: bossomari2@gmail.com

ABSTRACT

Migration and human rights are usually connected each other due to the contexts of war conflicts in the Democratic Republic of Congo. Different analyses reveal a big number of Congolese who flee their homes because of gradual conflicts that exist from more than two decades. The reality is that Democratic Republic of the Congo is one of the most underlined country holding rebels and insurgents in East Africa. This situation gives result on violation of human right and uncontrollable trafficking due to human migration. This study analyzes the fundamental causes of migration in the Democratic Republic of Congo's eastern region, as well as the application of human right violation. In addition, it emphasizes the importance of regional and international actors in assisting in finding concrete solutions to problems. This research is conducted through qualitative research method which examines some documents related with migration and human rights as focus of data collection. The research results confirm that Congolese decide to leave from homeland due on the scarcity of peace and prevention of human right. From that perspective, war conflicts are increased under various reasons which have been analyzed. As there is lack of official judiciary instruments about human rights, migration is gradually increasing in Eastern of the Democratic Republic of Congo. Therefore, the existence of many rebels and army groups in the region contributes the violation of human right whose impacts are based on inciting migration to neighboring countries and other countries.

Keywords: Eastern Africa, Migration, Human Right, RDC, Impunity

INTRODUCTION

One of the key causes leading to the current deadlock in the violence in eastern DRC is poor mining governance. Hundreds of thousands of Congolese artisanal miners rely on minerals found in South Kivu and Ituri, but their trade and exploitation are plagued by largescale corruption and human rights atrocities done by armed groups, including undisciplined parts of the national army (Brier, 2021). Even if the level of the ferocity of the armed conflict that has plagued the Democratic Republic of Congo (DRC) for the past two decades has gradually decreased.

The situation of violence and instability in the east of the country, which began with Laurent Desiré Kabila's 1996 coup d'état against Mobutu Sese Seko and culminated in his surrender of power in 1997, persists. Following that, in 1998, the so-called 1st African World War began, in which Burundi, Rwanda, and Uganda, along with various armed groups, attempted to depose Kabila, who had received support from Angola, Chad, Namibia, Sudan, and Zimbabwe. This war was a result of deaths of nearly five million people, including at least 200.000 women, forced displacement of hundreds of thousands, and a long-term humanitarian disaster. The signing of a ceasefire in 1999, as well as various peace agreements between 2002 and 2003, resulted in the withdrawal of foreign troops and the formation of a transitional government led by Joseph Kabila, followed by an elected government in 2006, which was approved by referendum in 2011 elections amid allegations of fraud (Rufanges & Royo Aspa, 2016).

Nonetheless, due to Rwanda's role and the presence of non-demobilized militias like Les Forces Démocratiques pour la Libération du Rwanda (FDLR), which was responsible for the Rwandan genocide in 1994, this approach, did not end bloodshed in eastern DRC. Non-compliance with the peace agreements in 2009 prompted militants from the former CNDP to abandon the Congolese Army, which they had joined in 2012. According to Beswick, those who deserted formed the Mouvement du 23-Mars, which was sponsored by Rwanda (BESWICK, 2012). The insurrection was put down in 2013. At the same time, armed actors operating in the DRC, ranging from armed groups to the Armed Forces and other governmental agencies, have committed and continue to commit rapes and other acts of sexual violence as a war weapon. As a result, they contribute to the pervasive climate of insecurity and impunity that exists in the area. In the east of the country, there is ongoing instability and bloodshed, and the control and exploitation of natural resources has led to the

continuation of the DRC war and the deployment of foreign armed forces. As reported by the United Nations for the first time in April 2001, the Congolese Armed Forces (FARDC), local and international armed groups, local enterprises, several bordering countries, and Western and Asian multinationals have all been involved in this business. Even while considerable progress has been made in terms of the application of due diligence requirements to ensure that supply chains do not promote the mining of minerals from conflict-affected and high-risk areas, the mineral sector continues to ignore them, demonstrating the relevance of smuggling (Rufanges & Royo Aspa, 2016). According to the UN Group of Experts, Rwanda is where the majority of unlawfully exported resources are laundered and labeled (OCHA Services, 2001). However, there are a number of measures in place at the federal level.

In the end, the fact that the country experienced increased political instability, as Kabila's second presidential term draws to a close had to be emphasized. Political violence, suppression of the opposition, and the use of disproportionate force in mobilizations had all increased. Non-compliance with the electoral calendar had become a reality, which might lead to the postponement of elections and the extension of Joseph Kabila's presidential mandate, which was set to expire at the end of 2016, an issue that could spark a new cycle of instability (Rufanges & Royo Aspa, 2016). Finally, it is crucial to mention that the DRC has embarked on a new path of democratization following the arrival of new President Felix Tshisekedi. Soft-Power strategy has been seen as advocating for the construction of a new Eastern DRC devoid of war and turmoil. Felix Tshisekedi followed the same strategy with of the Burundian President Evariste Ndayishimiye as he presented his foreign policy to the international audience, inviting various leaders from other countries to discuss bilateral relations with the once-dubbed "enemy of the state" (Bigirimana, 2022). He made the decision to change DRC's fate in a different way than his fore fathers. He outlines the Congolese focus while dealing with other countries and ensures that Africa as a whole is liberalized in his foreign policy.

The main question of this study is how does Congolese government deal with regional actors and human right defenders in case of promoting security of people and decreasing the number of regional migration?. The design of this study of giving a brief presentation of region challenges on migration followed by the case of Eastern Congolese migration and rule of law in protecting people. After the brief introduction, the study will display the

conceptual framework and go around with analyzing the unimplemented human right in DRC and finally, searching and devotement of the solution to mixed migration challenges.

1.1. Brief Overview of Congolese refugees

1.1.1. Congolese Refugees: A Portrait

Congolese refugees in Burundi are mostly from Katanga and South Kivu Provinces, but Congolese refugees in Rwanda are virtually entirely from North Kivu. The majority of people in Tanzania come from South Kivu, while the majority of people in Uganda come from North Kivu. The majority of the refugees in Rwanda and Tanzania today left in 1996, with a second peak in 1999 in Tanzania (UNHCR, 2022). Between 2002 and 2005, there was a steady but significant increase in immigration in all four countries, with Uganda seeing the most growth Banyarwanda people make up the majority of Congolese refugees. The remaining Congolese refugee populations come from a wide range of ethnic groups. The bulk of the refugees in the DRC are under the age of 18. For the prolonged population, the average household size is expected to be five people. A large majority of Congolese refugees do not have access to formal schooling. They speak a variety of languages, the most common of which are Kinyarwanda and Kiswahili (UNHCR, 2022). Although French is more widely spoken than English, French skills are vanishing in English-speaking host nations. Moreover, agriculture is where the bulk of Congolese refugees labor.

The majority of Congolese refugees from eastern DRC live in camps or settlements in the Great Lakes and Southern Africa region, most of who have been there for many years. The 45,124 Congolese refugees registered in Burundi as of January 1, 2014 reside in the city of Bujumbura. The 72,988 Congolese refugees registered in Rwanda dwell in different camps of the country (Ibid). In addition, the 64,569 Congolese refugees in Tanzania are housed in Nyarugusu camp; eighty-eight percent of Uganda's 155,742 Congolese refugees live in settlements, while twelve percent live in Kampala. The goal of this research is to better understand the fundamental causes of migration in the Democratic Republic of Congo's eastern region, as well as the application and violation of human rights against Congolese residing there. This research will also reveal how these infractions affect the country's sociopolitical and economic circumstances, as well as what may be done to improve things. To do this, the focus of this research will be on other researchers and articles on the subject. The following are the research objectives, which have been designed to achieve the above-mentioned goal: Understanding the causes and consequences of migration and human rights

violations in the Eastern region of the DRC, to address the underlying cause of relocation in this socially polarized region of the DRC. Demonstrating how education and democratic values may be utilized to combat all forms of evil in the global environment and finally, to emphasize the importance of regional and international actors in assisting in the development of concrete solutions to problems.

CONCEPTUAL FRAMEWORK

The humanitarian, human rights, and security situation in the DRC have been deteriorating, its effects have been disastrous for the Congolese people, with 4.5 million people uprooted from their homes, the highest number in Africa, and 2 million children facing famine. In recent months, tens of thousands of refugees have fled to Uganda, Angola, Tanzania, and Zambia (Sewenet, 2019). The 2006 general elections, which saw incumbent president Joseph Kabila win re-election, signaled the end of the transition phase and solidified the control of the national institutions by a democratically elected president and his patronage network (ibid). As the affirmation of Kabila's power hampered the chances of significant changes in the national power balance, numerous factions that had already expressed dissatisfaction with the transitional process refused to integrate their men into the national army (Verweijen & Vlanssenroot, 2017). Since 2015, security forces have killed nearly 300 individuals amid mostly peaceful rallies. As a result, since August 2016, an outbreak of violence between Congolese security forces, government-backed militias, and local armed groups has killed up to 5,000 people in the country's central Kasi area.

Furthermore, government officials and security forces perpetrated widespread repression and grave human rights crimes against political opposition leaders and sympathizers, pro-democracy and human rights activists, journalists, and peaceful protestors throughout 2018. Widespread irregularities, voter suppression, and violence marred the December 30 elections. When voting in three pro-opposition districts was postponed until March 2019, more than a million Congolese were unable to vote (World Report, 2019). Several armed groups, as well as government security personnel, attacked residents in central and eastern Congo, murdering and injuring many innocent people. With 4.5 million people uprooted from their homes and over 130,000 refugees fleeing to neighboring nations, the humanitarian situation remained dire (World Report).

1.2. Driver of Displacement in Eastern DRC

Large numbers of people have been displaced from their homes in the DRC for nearly two decades, frequently repeatedly, because of ongoing war. Over the years, the waves of violence have become so common that they have developed a culture of displacement that has affected practically every resident of the eastern provinces. In September 2014, the DRC had an estimated 2.7 million internally displaced persons (OCHA Services, 2014). The number of internally displaced persons (IDPs) has generally remained around two million for over a decade, despite fluctuations. The highest number of internally displaced persons (IDPs) ever reported in Congo was 3.4 million at the end of 2003 (IDMC, 2022), the number of internally displaced persons (IDPs) increased again at the end of 2013 (to 2.9 million), but has since decreased to 2.6 million. To put the enormity of the crisis in context, the DRC has the world's fifth biggest IDP population, behind Syria (7.6 million), Colombia (5.7 million), Sudan (3.4 million), and Nigeria (3.4 million) (Médecins Sans Frontières, 2014). Inter-ethnic tensions, power battles over natural resources and territory, the development of armed organizations, many of which are foreign, and the meddling of DRC's neighbors in the situation in the east have all contributed to the ongoing war in eastern Congo. Multiple armed groups and militias operating in the eastern provinces, including FARDC, have never made a clear difference between civilians and combatants during the DRC conflict. Furthermore, they have preyed on civilian communities on a regular basis, carrying out arbitrary killings, rapping and kidnapping women, pillaging villages, and forcibly recruiting youngsters into their army. Abuse and harassment of civilians is a common occurrence. People are forced to carry supplies for armed groups and are billed for protection and transportation (Médecins Sans Frontières, 2014).

UNIMPLEMENTED HUMAN RIGHTS

1.1. Human Rights Violation Patterns

In eastern DRC, human rights violations can be classified into three categories:

A. Abuse of human rights by state and non-state actors in the pursuit of physical control over resource-rich areas, as well as trade routes, border checkpoints, and economic hubs. These atrocities were most serious in places touched by the armed conflict in eastern DRC, although they also happened elsewhere;

B. These groups perpetrated human rights violations after conquering these areas in order to maintain control. Most of these were done by fighting sides in the midst of an armed conflict;

C. Systematic violations of economic rights resulting from large-scale looting, theft, and corruption, both in conflict and non-conflict areas, were a motivation for these parties to keep fighting; a major source of finance that sustained their activities and enabled them to continue perpetrating acts of violence against civilians; and a factor that prolonged the conflict (Global Witness, 2009).

Perpetrators and Protection from Discrimination

The Congolese government and security forces, as well as a variety of Congolese non-state armed groups, including the Rassemblement congolais pour la démocratie (RCD) and its three factions RCD-Goma, RCD-Mouvement de libération (RCD-ML), and RCD National, and the Mouvement de la libération du Congo (MLC), have all been perpetrators of all three categories of abuses (MLC) according to many sources. The Union des patriotes congolais (UPC), the Front des nationalistes et intégrationnistes (FNI), the Forces armées du peuple congolais (FAPC), the Forces de résistance patriotique d'Ituri (FRPI), and a host of mai-mai and other groups have all brought chaos to this part of DR Congo (Global Witness, 2009). In addition, companies and individual traders who were willing to trade in natural resources produced under these conditions, or with communities with a history of poor human rights, can be deemed to have contributed to these unfortunate circumstances.

The DRC continues to be plagued by conflict-related sexual and gender-based violence (UN Team of Experts, 2017). Ongoing insecurity, internal displacement, and political tensions pose a threat to progress in combating sexual violence as a weapon of conflict (UN Security Council, 2018). Sexual assault is on the rise in conflict-affected provinces, perpetrated by both armed groups and security officials (UN Security Council, 2018). Moreover, violence against women and girls is on the rise in both social and domestic settings (United States Department of State, 2017). Women and girls have experienced an increase in sexual and gender-based violence in conflict-affected areas as a result of this climate.

The United Nations Population Fund (UNFPA) reported 5,783 occurrences of sexual violence in conflict-affected provinces in 2017, more than double the number in 2016 (UN Team of Experts, 2017). In 2017, conflict-related sexual violence spread to the three Kasai

provinces in the center of the DRC, but the eastern provinces of Tanganyika and Ituri accounted for 72 percent of the instances (Stearns & Vogel, 2015). Armed groups have also been responsible for conflict-related sexual violence in North and South Kivu, with the number of armed organizations increasing from around 70 in 2015¹⁸ to up to 120 in late 2017 (Stearns & Vogel, 2017). This surge in Sexual and Gender based violence (SGBV) incidents in conflict-affected areas is not just due to armed groups, but also to Congolese security forces. In 2017, the number of sexual violence occurrences ascribed to the Congolese army (FARDC) and the Congolese National Police (PNC) increased by 28% and 109%, respectively, when compared to 2016 (UN Peace Keeping, 2018). The victim was in police custody for more than a third of the events (Ibid).

According to the Demographic Health Survey conducted in 2013-2014, 27 percent of women in the DRC had experienced sexual violence at some time in their life, up from 22 percent in 2007 (United States Department of State, 2017); (Promundo, 2014). According to a survey done in North Kivu region in 2013, roughly 65 percent of male participants thought, "Women should accept partner violence to keep the family together." Around 27% of men agreed with the statement "a male can force a woman to have sex, and she may love it" in the same study, indicating a significant level of discriminating views among men (Ibid).

Legal Framework

According the article 8, 12 and 13 of the 2015 Democratic Republic of the Congo Constitution: *The human person is sacred and has the right to life*. The State has the obligation to respect it and to protect it. Each citizen has the right to the full development of his person within respect for the rights of others, of the public order, of ethics and of morals.

The penalty of death is abolished (Article 8)

War crimes, crimes against humanity, the crime of genocide, are punished within the conditions determined by the law, as they are imprescriptible (Article 12). Any propaganda or any incitement to ethnic hatred, to insurrection, to violence or to civil war constitutes a crime punished by the law (Article 13).

1.2. Regional and International Actors

Eastern Neighbors of the DRC

Uganda, Rwanda, and Burundi's rivalries, as well as their internal difficulties, pose a threat to the DRC. These countries have used militias in the DRC to fight proxy wars between themselves. The FDLR, for example, is tied to Uganda and Burundi in their fight against Rwanda. 64 In exchange, Rwanda is linked to assisting rebel organizations fighting Burundi in South Kivu and rebels like the ADF fighting Ugandan President Yoweri Museveni (French, 2009). President Tshisekedi intends to settle this dynamic diplomatically, hence the quadrature framework for rapprochement between Rwanda, Uganda, and Burundi.

The UN Mission in the Democratic Republic of the Congo (MONUSCO)

Since the creation of MONUC in 1999, the United Nations (UN) has been the dominant Inter Governmental Institution (IGI) in the DRC war. The United Nations Security Council (UNSC) established MONUSCO in 2010 as an upgrade to MONUC, with two strategic priorities: civilian protection and support for the stabilization and strengthening of state institutions in the DRC, as well as key governance and security reforms. The United Nations contributes 57 personnel from various member states (UN). Because of MONUSCO's poor response to reported attacks against civilians, the inhabitants of Beni demanded its departure in February 2020. The lack of success was attributed to a lack of financial, people, and logistical capabilities, as well as engagement rules that do not allow for quick involvement when needed (Minani, 2020). Despite these setbacks, MONUSCO's collaboration with the FARDC and the Congolese National Police (PNC) allowed for the safe return of displaced people. The situation of late October 2020 in Pinga, Walikale territory of North Kivu, is a recent example (MAGURU & BA, 2022).

Civil Society

The Catholic Church in the DRC is the most powerful civil society organization with a membership that exceeds 50% of the population. It participates in the DRC's peace process as a neutral party (mediator), facilitating political involvement (mobiliser) (Berkley Center for Religion, 2020). The postponed election and repression sparked actions that went beyond mediation (The Africa Center for Strategic Studies, 2027). Under Kabila's administration, human rights breaches and democratic inadequacies shaped his mobilizer's role, while

Tshisekedi's administration takes a different approach. Furthermore, Actions et Initiatives de Développement Pour la Protection de la Femme et de l'Enfant (AIDPROFEN), which focuses on women and children and receives support from INGOs and the US Embassy, among others, focuses on women and children. In Goma, North Kivu, an equal education initiative for abandoned girls and boys has managed to prevent many from joining armed organizations (AIDPROFEN, 2022).

SOLUTION TO MIXED MIGRATION CHALLENGES

The Government of the DRC has difficulties in central, and the national government that pushed on the lacks of dynamism to fill the void. As a result, the government should lead a structural shift away from overburdening the central government and toward empowering provinces to manage their own affairs. In terms of the economy and security, this entails decentralization. As a result, legitimate authorities at the local level will lead to conflict prevention and resolution. This will inspire grassroots ownership of governance, peace, and security infrastructures. The load on the central government will be decreased as a result of this decentralization process. This will help to strengthen institutions, which is one of the African Charter on Democracy, Elections, and Governance's top priorities (ACDEG) (African Union, 2007). In this vein, more initiatives with political will to work, such as the Inter-provincial Commission to Support the Awareness, Disarmament, Demobilization, and Community Reintegration Process (CIAP-DDRC), which was launched in South Kivu in 2019, are needed in eastern DRC, and the context specificity of the CIAP-DDRC should be emphasized.

This would facilitate the following: the transition of armed groups with ties to local communities into provincial security forces capable of receiving adequate professional training; political participation by focusing citizens' and civil society's attention on appointing suitable leaders to manage the affairs of the provinces. Furthermore, the formulation, implementation, monitoring, and evaluation of policies tailored to the realities of each province rather than the national average. It would also create a climate in which inter-provincial competitiveness might be shifted away from violent confrontation and toward development.

1.3. To Interstate Organization

The timely restructuring of FIB requires the support and facilitation of UN member states (ISS, 2020). Following its triumph over the M-23 movement, it has shown to be the only effective force against armed groups, necessitating SADC's call for FIB reorganization. However, the focus should be on improving its ability to defend civilians. There is also a need to concentrate on local grievances and ties with local communities, which are exploited by armed organizations. These criticisms might readily be construed to MOUNUSCO's harm, jeopardizing the much-needed public trust and support in local communities. As a result, managing and avoiding further attacks would include UN MONUSCO finding a mechanism to avert retaliation and increasing public diplomacy operations. To the ICGLR, the AU, and the RECs to begin, technical and capacity-building assistance for institutions at the grassroots level is needed to help them develop a sense of ownership of governance, peace, and security infrastructures. This is important for peacebuilding because broken institutions are one of the reasons why the conflict in eastern DRC has lasted so long. In addition, the African Union needs to strengthen its presence in the DRC in order to comply with UNSCR 2250, the African Youth Charter, the African Union Continental Framework on Youth Peace and Security, and other similar normative frameworks (s). This is important for conflict prevention and peacebuilding because it will help to occupy and distract the attention of the young population, allowing them to see beyond the use of violence as a means of survival.

The AU PSC may also be required to intervene in international terrorism and violent extremism, establish measures to prevent genocide and other crimes, and become more involved in human rights concerns, particularly to rein in the FARDC's excesses (African Union, 1993). On the youth agenda in the DRC, RECs and the International Conference of the Great Lakes Region (ICGLR) should collaborate with the AU. RECs and member states must also expand their support for President Tshisekedi and his diplomatic strategy in order to boost regional security cooperation. Finally, the AU and RECs should prioritize maintaining peace and facilitating constructive conversation between Pro-Kabila and Pro-Tshisekedi. This would result in a healthy opposition, as is required in a democracy that does not fuel conflict or undermine governmental institutions.

CONCLUSION

Despite significant progress in the DRC's, fight against impunity for human rights violators must be reviewed and making in action new policies to deal with it. Such as the President of the Republic's promulgation of legislation on the implementation of the Rome Statute of the International Criminal Court on December 31, 2015, or the law n°15/013 of August 1, 2015 on rules for implementing women's rights and gender parity, several malfunctions negatively impact the Congolese justice system and impede progress in the effect. During the time under review, the President and Congolese authorities, with the backing of the international community, spearheaded initiatives and public campaigning that resulted in the conviction of at least 231 State agents for conflict-related sexual violence.

Furthermore, according to UNJHRO data, at least 447 FARDC soldiers and PNC operatives were convicted of human rights breaches during the same time. In comparison to the large number of reported human rights breaches, this remains a low figure. The low number of security agents successfully convicted, particularly high-ranking officers, and the difficulty in prosecuting armed group combatants as they physically evade justice. In other word or are rather targeted by military operations, are concerning considerations, especially given that United Nations bodies frequently emphasize the importance of bringing perpetrators of serious human rights and international humanitarian law to justice in order to effectively combat impunity. The percentage of human rights breaches committed by government agents (54, 5%) is alarming. It exposes major institutional flaws as well as a lack of criminal prosecution of human rights violations, particularly by high-ranking officers. This situation must be rectified immediately, especially given the country's current electoral setting, in which security forces are viewed as a tool of the state used to achieve political ends, namely to suppress political opponents, civil society, and the media. Prosecution of armed group combatants for crimes including human rights violations is extremely rare, with only 28 convictions recorded over the time period under consideration.

Amnesty or absorption into the FARDC ranks are frequently offered to armed group combatants. Indirectly, this de facto impunity encourages the commission of violations, which has a negative impact on the victims. The National State of Justice held in Kinshasa from April 27 to May 2, 2015, and coordinated by the Ministry of Justice and Human Rights and the *Conseil supérieur de la magistrature* conveyed a strong message about the government's intention to strengthen the Congolese legal system. The Ministry of Justice

**International Conference on Global Practice of Multidisciplinary Scientific Studies-
IV
Turkish Republic of Northern Cyprus, April 28-30, 2023**

and Human Rights' efforts to institutionalize judicial changes are admirable; nevertheless, aggressive prosecutions of human rights violators, legislative reforms, and enough resources supplied by the government and its foreign partners must back them. The East African migration is underlined with a big number of Congolese who abandoned their mother in search of freedom and care of human rights values. The region of eastern RDC is the main in the case of national migration index influenced by several repletion of war and human right violation. Non-respect of principal human right value in the rule of power and well-being of people sourced from government staffs and non-government groups has negative impacts on forming national peace and stability aimed to develop the country.

ABSTRACT

The political and economic interdependency pushes several states to come under cooperation and establishes strong partnership in many aspects of life. The development and foundation of European Union promoted economic and welfare of European countries and decreases political instability in the region. This study focus on the Romanian EU relation from full membership to the present, analyses the regional relation under economic and political dimension. This study displayed the Romanian interest on EU, the process and political dimension applied by Romania and it advantages of full integration. The research demonstrated that Romania gained much more advantages than consequences in his membership in the EU member states. In its conclusion, this paper confirmed that the integration of Romania in European Union contributed in setting policies of ameliorating social, economic, and political structures. The relationship between Romania and the EU from its full membership to the present is examined in this article using the content analysis method of qualitative research.

Keywords: Romania, EU, Full Membership, Social Mobility, Integration, Diplomatic Relation.

1. Introduction

The foundation of European Union as an intergovernmental organization in 1993 promoted much more European countries to be collective and work under a policy of partnerships in several issues. Since its foundation, many countries of Europe gate chance to move from a bad style of life to a precious one. Due on this policy of welfare of European countries, many states established several policy toward the EU integration and worked with dignity in order to gain membership.

The foundation based on promoting economy in the region, did not limit his affection on trade cooperation but it outmoded the main point and development many other branches to push over stability and economy in the region. EU seems to be one of the most successful intergovernmental organization in the globe, it power of application still pushing other states to take example from it. The economy interdependency pushes some states to follow the line of integration in the EU, starting from forming strong partnership to a membership status, are timeline exerted by countries in dealing with the incorporation in EU. Romania is one of country who tried and succeed in taking party in EU since 20007. As it was before and after it, Romania is taking place of one of the most important country doing business with EU member states from long.

This study took a while on displaying the demographic structure of Romania followed by its socio-politic structure, give a brief understand of the time line of Romanian policy toward European Union and its diplomatic aspect of progression. Moreover, the study will present advantages and consequence of the integration of Romania in the EU. After the official integration of Romania in the EU many aspect seem to change in the country and the new policy have been established toward the standard of EU member countries. From 2007 to the ongoing time, Romania developed his intern politic and economic. The influence of being member of EU help on state reconstruction and resized the political situation that was facing the country from long. National industry and trade capacity upsized and pushed the stability of development in several aspect of life in the region.

1.1. PRESENTATION OF ROMANIA

1.1.1. Demographique Presentation of Romania

Romania is a state situated in the Southeastern Europe with a total of 238 391 km², it has border with Bulgaria in South, Ukraine in North, the West part there is Hungary and

Serbia in the Southwest followed by Moldova in the East and the Black Sea in the Southeast (Britannica, 2021). The county is very popular and know depend on its forest region of Transylvanian. The country's official language is Romanian and its currency is Romanian Leu, the population of the state is 19.29 million (Macrotrends LLC, 12), (The World Bank, 2021). The report of World Bank demonstrated that in Romania population range is decreasing instead of increasing.

1.1.2. Socio Politic and Economic Structure of Romania

The socio politic situation of Romania changed several times due on politic played in the region and the change rule in the country. In this party starting from social reform to political changes, brief analyze will be done in order to compare the polity of Romania before the membership and how it changes after his integration in the European Union in 2007. According to the historical background of the country, the change of socio political views took place while it started to pursue the participation in NATO. Romania started the movement of taking way to democracy in 20003 with the target of entering NATO and European Union (Constitutional Court of Romania, 2003). The policy toward EU integration pushed the proclamation of Social republic where people derived sovereignty. From the full membership in the European Union, Romania established several policies and developed many factors of promoting social life style followed by economy and political structures.

1.1.2.1. Social

In the past of Romania, the republic was well known as a Social Republic of Romania; during the era of 1947 until 1989 Marxist-Leninist and one party communist dominated the country. The long of 1989 to 1965 the country was recognized as the Romanian People's Republic (Bachman, Romania: A Country Study, 1991).

After the reform of social class in the country, social mobility took place in the region and pushed several changes to be in application. The social mobility was founded by maintaining the evolution of family law, changes of family structure and family life. In other side Break out of women organization, education system was promoted. People of Romania even the political influence of religion in the region is punched principally on Orthodox and Catholics; other religions are not taking important place as the two on top. Finally, the social mobility seems to increase amelioration of social condition, case of Housing, public health and state welfare assistance (Bachman, 1989). The transformation of social class in Romania built a schema of social class under 10 classified groups (Pop, 2013). Staring from

Employers, Managers, Professionals, Supervisors, Self-employed, Technicians and officer workers, skilled manual workers, service and trade workers, unskilled manual works and farmers (peasants). This classification was designed by the report done by Pop while analyzing the new class schema in the Republic of Romania.

After a brief passage dating from the past of Romania in social mobility, Romania established policies to act in accordance with the EU integration and helped on developing several sectors of social life. The Romanian policy toward EU integration was characterized by changing its social status and put in place some amelioration of citizen's life. Creating occupation, establishing a policy to face social income and welfare of householders seem to be in priority of change in social structure in the last decades (China-cee.eu, 2021). The social life of Romanian changed its views after its full integration in the European Union, benefiting from EU social policy and social development toward welfare of people gives change to Romanian to develop its skills and promote much more social security.

1.1.2.2. Economic

As it was in the social structure of Romania before its integration in the EU, the economic average was at the same time under a shot. The country was full of people living in rural economic power, people of the region was much influenced by law economy depended on agriculture. It was underlined by several study that the economic situation of Romania took reform after 2007; its integration to EU promoted the reconstruction of economy and helped on developing his industrial sectors. The world economical rank demonstrated that, in 2020 Romania occupied 45th place of Gross Domestic product globally (World Bank, 2021), the index of economic freedom in 2021 demonstrated that Romania is occupying 43th place with a score of 69.5 in the globe. At the sometime Romania, appear at the 26th class of 45 European countries (Heritage.Org, 2021).

Out of economic change of Romania, one of the most important factor of production that promote education in the region is rentable land. Romania is rich of naturel resources, local industry utilize the prosperity of and contribute in national economic and development (123Helpme, 2021). I should argue that Romania is one of the European states that has adequate suppliers of nature gas and petroleum; it has iron, ore, timbre, coal and salt. By analyzing the result of commercial evolution of Romania, it has high income that is mixing economy and high Human development index and organized labor force. It concluded the

12th place of Europe in total nominal DDP and occupied the seventh largest by sup up power equivalence (International Trade Administration, 2021).

1.1.3. Political Structure

Romania is a democratic republic with has a semi presidential rule, in the state the Prime Minister is at top of government and the president is taking representation of the country at international level. The president has authority of signing some decree and ratify laws announced by the parliament (Europa.eu, 2021). The republic of Romania is an independent sovereign and unitary, the president of Romania is coming to power from a direct election with a term of five years and renewable only two times. The body is government is compose by 329 deputies the government under control of Parliament and 136 senator directly elected (Europa.eu, 2021). Executive, judicial and legislative, forms the Romanian main power (Global Edge, 2021)

2. HISTORICAL BACKGROUND OF THE EU

European Union is an intergovernmental organization established on 1993, it took existence from the European Coal and Steel Community (ECSC) founded in July 23 1952 in Paris (Europa, 2022) followed by the European Economic Community founded under the treaty of Paris in 1951 and the Treaty of Rome in 1957. The movement was influenced by the cooperation of six countries that come together to establish an economic organization with aims to facilitate trade and market between then, the up listed members of the organization at the beginning were: *Belgium, France, West Germany, Italy, the Netherlands, and finally Luxembourg* (EUR-LEX, 2022). By analyzing, the main reasons of creating the European Union seem to stop war among neighbors, establishment of supranational organization to deal with enforcement of democracy and making war unthinkable (European Union, 2022).

2.1. Development of EU Over Decades and Important Events

The periodical analyses of European Union starts with the era of 1945 just after the end of the second WW. Taking point from this time to 1993 is period-characterized changes and development of EU from beginning of cooperation between European countries to the foundation of the intergovernmental and supranational organization.

- Period between 1945 and 1959

This period defined as the post war era, is characterized by the break out of cooperation in Europe, which gives result of foundation of several organization and treaties.

**International Conference on Global Practice of Multidisciplinary Scientific Studies-
IV
Turkish Republic of Northern Cyprus, April 28-30, 2023**

The break out of the period are as bellow: 1945, end of WW II in Europe followed by the establishment of the ECSC in 1951. The first treaty in Europe after the WW II took place in 1957 well known as Treaty of Rome that played an important role in bringing together European states (Netaffair.org, 2022). Many European bodies were established just after the WW II as determined in the EU country history: On 4 April 1949 the establishment of NATO, 5 May 1949 the Council of Europe, 9 May 1950 New political Cooperation in Europe and on 18 April 1951 the European Coal and Steel Community (EU, 2022).

- Period between 1960 and 1969

An important remark point named “Period of Economic growth” characterized the era between 1960 and 1969. Some of major activities and events realized in this period was 1960 creation of European Free Trade Association, 1961 construction of Berlin Wall, 1962 Common Agriculture policy, 1963 first international Agreement signed by EEC, 1965 Merger Treaty, 1968 Student riot in Paris, 1968 Break out of Customs Union and finally in 1968 the crush of Prague spring (EU, 2022).

- Period between 1970 and 1979

The fill out of European Community characterized this period, some of predominant events of the era are: the Environmental protection in 1970, up size the member of EU from six to nine in 1973, oil crisis in Europe 1973. During 1974, there was a reduction of disparities among region, new democracy in three country in 1975 and the direct election in the European Parliament in 1979 (EU, 2022).

- Period between 1980 and 1989

During this period in Europe, there has been a change of the views of Europe and the give way from communist. Some events of this term are, rights of worker established in 1980, set up of the initial European research program in 1981, maintaining the policy on the road of single market in 1986, in 1987 the starts of Erasmus program and finally in 1989 the drop down of Berlin wall (EU, 2022).

- Period between 1990 and 1999

This era is the promoted first decade just after the foundation of European Union, during this period in Europe various changes have been remarked, the main aspect of the period is that Europe passed to "*no border system*". All countries member of the organization gained a privilege of free travel. The remarked changes and events of this decade are the first event took place in 1991 that was the break-up of Yugoslavia, 1992 the Maastricht Treaty. the put in place of single market in 1993, creation of European Economic area in 1994, establishment of free border in 7 countries, the treaty of Amsterdam in 1997, and finally the nascent of the Euro in 1998 (EU, 2022).

- Period between 2000 and 2009

This period recognized as the period of "*Further expansion*", during this period extend of Europe influenced by new members occupied the reality of Europe. Some of event and important activities of the decade are the Treaty of Nice in 2001, break out of Euro notes and coins in twelve states in 2002, the first peacekeeping operation of Balkans in 2003. In 2005 the establishment of EU constitution followed by Lisbon treaty in 2007 and finally the global crisis based on economy in 2008 (European Union, 2022).

- Period between 2010 and 2019

This decade was announced as the *challenging* era of EU, in this term the European Union played mayor role in setting policies toward welfare of people and the respect of human right. Underlined that this decade gives conclusion on the decrease of member stated resulted from the referendum of 2016. Displayed events and activities of the decades were listed as bellow; in 2010 the Europe windless the financial crisis, in 2012 Nobel peace prize, 2015 terrorism in Europe followed by the Paris agreement of climate change. After 2015 Europe faced a problem of asylum seeker, in 2016 the United Kingdom elected to be away from the EU and in 2019 the establishment of process to face climate change (EU, 2022).

- The ongoing period from 2020 until present

The most import issues influencing the ongoing era of Europe is the global crises pushed by the Pandemic Covid-19. In the history of EU, this era is called the period

of "Covid-19 and the road to recovery". The main event of the ongoing situation is the Covid-19 pandemic and the fight of human health (European Union, 2022).

2.2. Timeline of European Union Member States

The EU founded in 1993, was promoted by the starting of ECSC under membership of six countries. From this promotion in 1952, the line of change seem to lake progression over time and gives the result of founding the EU in 1993. Since its creation to 2020, the organization has 28 member states. At the end of January 2020, the UK abdicated the organization and given the result of member states of EU to become 27 (European Union, 2022). The timeline of member states of EU is; at the first time, the organization commenced with six countries that established the ECSC in 1951, in 1957 the EEC and the EAEC. The six countries are Belgium, Germany, France, Italy, Luxembourg and the Netherlands (European Commision , 2022).

Timeline of countries that joined the union after the six (Schengen Visa Info, 2022):

1973: Denmark and Ireland

1981: Greece

1986: Portugal and Spain

1995: Australia, Finland, Sweden

2004: Cyprus, Czech Republic, Estonia, Hungry, Latvia, Lithuania, Malta, Poland, Slovakia and Slovenia.

2007: Bulgaria and Romania.

2013: Croatia

The study displayed that many European states joined the Union after the demolishment of Yugoslavia. Romania is one of the recent states to join the European Union comparing with other countries in the timeline of the EU member states (De Munter, 2021).

2.3. Romania's Journey towards Integration into the European Union

2.3.1. Process

The process of Romania to join the EU started long time even before the official idea of founding the European Union, after the Romanian revolution in 1989; the countries started by participate in the EC. After this era, the government of Romania and all political parties manifested the important of it integration in the European Union. In other sources, the regional interest pushed the government of Romania to follow the line of integration, as the

Republic of Bulgaria seem to follow the line in the same time (European Commission D G C, 2022). The first process of Romania to integrate in the European Union started with its first application of membership in 1995, this application take place of decision of the Council of Ministers on 17 July 1995 and provided its consultation under the commission (European Commission, 2022). During his process to join the EU, the government of Romania demonstrated with high competence his capability of dealing with all realizations and norms, obligations of EU member states, at his stage the government promised to upgrade and realizes the obligation under cited.

Some of principal criteria expressed by the Romanian government toward EU are:

- Development of the implementation law and Consolidation,
 - Access of pluralism in politic
 - To separate power
 - Freedom in election
 - Priority and respect of human rights
- Establish the market and capability of economy in accord with EU. All this criteria, are taking reference from the EU enlargement criteria well defined as "*the Copenhagen Criteria*" (European Commission, 2022).

The change of government of Romania in 1966 promoted much more the way to reach the integration in the EU, the president of the term starting by saying that the policy of the country must work hard to make reform in the economic structure of the country (Popescu, 1997).

By analyzing the timeline and process of Romania integration to EU, even there was no any problem remarked during it wait for accordance there have been a hold up of years before it official recognition. The research released that scarcity of reform in administration and slow-moving economy seem to be the main reason of the delay in passing on full agreement (European Commission, 2022). It was remarked that Romania applied its EU membership with too many other countries that have been accepted as countries member of EU in 2004, but the accord of Romania and Bulgaria joined in 2007. According to the register of EU the two states integration is recognized as the *fifth enlargement of the European Union* **Invalid source specified..** On the road to EU, the government of Romania updated it intern policy in order to arrive at the accomplishment of Copenhagen criteria, several changes were realized by the government include the change of government. Romania participated in many

cooperation with other European states. In 1990s, Romania and EU countries signed an agreement on trade cooperation (Phinnemore, 2008).

2.3.2. Diplomatic Relationship

After the deterioration of Romania and Russia in 2000, Romania started to push its foreign policy in the west power (IMEMO, 2022). The accession of the country in NATO promoted its relation with the United States. After 2007 Romania played a major role of increasing its relation with European states due to its full membership in the European Union (Pridham, 2007). The summary of diplomatic relations of Romania and European Union was not founded by the full membership in the organization but since the regional cooperation between European countries, the government of Romania was influenced by western cooperation more than the other side of Soviet priority. The views of Romanian foreign policy changed just after it got the occasion of joining NATO in 2004 and the EU in 2007 (OLTEANU, 2020).

3. ADVANTAGES AND CHALLENGES OF ROMANIA IN THE EUROPEAN UNION

3.1. ADVANTAGES

3.1.1. Social-economic

In this passage we will try to take away to analyze the socio-economic changes in Romania before its membership to EU and compare with its situation after the integration in the European Union. Comment on the reality of change and the influence of EU on the socio-economic changes of Romania.

3.1.1.1. Social

During the process of Romania to access the EU, several developments took place and influenced extraordinary changes in all aspects of life and social evolution. As the government played an important role in promoting and achieving the request of membership of EU, at the same time welfare of people and upsizing social criteria were at the first place.

The timeline of social change of Romania started with the end of the communist regime in 1989 **Invalid source specified.**, that promoted his way regarding democracy and capitalist system. The long of communist era, Romanian people's life was set with successful policy from the communist rule; all rights and needs of people were fulfilled. The situation of Romania seems to change and passed in mediocre situation just after its social structure changes from Communist to road of democracy **Invalid source specified.** It was argued

with Friedlmier and his colleagues that, after the social change in 1989 in social life the role of women changed its views and women were taking role in the care of family and jobs. Young and adolescent were the most challenged by the changes due on the non-adaptation on work **Invalid source specified..**

With the success of Romania to integrate in the European Union, countless social changes break out, with the power of democracy the social class of Romania changed and women participation in much aspect of life took place. Democratic liberation pushes political parties to act with guaranty of existence and freedom. With the contribution of the EU, established policies to maintain welfare of Romanian and durability of social structure are mentioned as bellow **Invalid source specified.:**

- *Employment:* it is policy established in order to decrease the economic situation in the region and promote the increase of social income in the society. In additional this policy promoted active labour and market policies, facing the take forward of working mass and skill inadequacy.

- *Poverty and income inequity:* this policy was established in 2015 with the aim of resizing the average of poverty in the country and make stability on income issues. This policy pushed the integration of social income, education, labour market, health, housing and social participation policies for people of countryside.

- *Social inclusion of downsides category:* this policy faces women places in society and the principle right of children.

- *Migration policy:* this policy was established to deal with "*Diaspora start-up*" influenced by people who emigrant back to Romania.

Out of those policies putted in place by the EU, many other programs have been organized by the organization in order to promote the development of social structures of Romania. From it full membership in the EU Romania benefited from the EU more package of setting is socio economic progress **Invalid source specified..** The republic of Romania has 15 representative in the European Economic and social committee (EESC) working in the advisory of the countries and deal with changes and social situation (EU, 2022).

3.1.1.2. Economic

Statistical result of several research's done in 2007 demonstrated that Romania upsized it socio-economic style just after its integration in EU. Economically, the country developed much more all sectors of production. Starting from industry, foreign trade,

tourism, trade and services, Earning, labour force and marketing, unemployment (Voineagu , 2022). According to the many found of realized studies, the full membership of Romania promoted the sectoral development followed by increasing welfare of people and guaranty of work.

The sectorial index of development realized after the full membership of Romania in the EU are briefly demonstrated as bellow (Voineagu , 2022): This average are given by comparing February 2006 and February 2007, economy of Romania changes followed this line. Source *Sectoral evolution of Romania*.

- Industry 5.6%
- Resource of primary energy 80.3%
- Construction 27.9%
- Trade and services 71.3% (wholesaler)
- Foreign trade 73.3% Export and 71% Import
- Tourism 16.6%
- Earning 2.5 %
- Unemployment (decreased women 1.3% and men 4.5%)

Out of the brief statistical result of Romania just after a sort moment of its integration in the EU, depends on the economic development of European Union and the implementation of its policy over member states, Romania get chance to upsize it economy and occupied a good rank among European counties even globally.

Global ranking of Romania during time changes;

In 2006, Romania was 48th ranking in GDP of 195 countries published globally; it figured \$122.024 million in 2006 (Country Economy, 2022). In 2020, the World Bank denounced the GDP of Romania with a number of 248.75 billion \$. The World Bank argue that in 2020 Romanian GDP was 0.22 % of global economy (Trading Economic, 2022).

3.1.2. Politics and Security

The political structure of roman seem to move to from another aspect just after if route to democracy, it separation from the communist movement promoted much pore political change in Romania. The political construction of Romania before 1989 was founded under one political party that was the *Communist party of Romania*, it was the only one party officially recognized and acting as the main force in Romanian society (Britannica, 2022). Political change in Romania stated in 1991 under push of constitution of that year, the

adopted constitution of 1991 delated the single party in politics and adopted the rule of democracy and plurality in political parties. It was underlined by the Britannica that, after the adoption of new law in the 1991 constitution political parties revived from WW II come back in activity after this new adoption of law (Britannica, 2022). Security and peace process was not that easy in Romania before it joined NATO in 2004, even before its acceptance as member of NATO Romania seem to be the first Eastern Europe state to join the North Atlantic Treaty Organization (Britannica, 2022). It was argue that the *military force of Romania played an important role in Afghanistan in 2002 where they was representing international security assistance*, confirmed by the Britannica. The body of Romania security is under control of the Ministry of Administration and Interior (MAI). Three divided groups NPF, NG, and BPF form police force.¹⁵

3.1.2.1. Record of event in Romania outline

The time line of Romania profile from its path to EU until now was collected from the BBC news channels in comparison with the Romanian official web and EU reports (BBC, 2022), (Romania-Insider, 2022).

Right way to EU membership

On his way to EU membership in 2004 Romania joined NATO, the presidency of Trian Basescu voted in 2004, Ally Calin Tariceanu took power of prime ministry with plan of stimulating EU oriented changes. In 2005, Romania adopted EU joining treaty (European Union law, 2021).

Full member ship

Romania joined the EU in 2007; this period was characterized by several changes in Romania politic along with the EC notification over Romania prominent corruption in 2008 (CSIS, 2021). The financial crisis in Romania pushed the IMF to fund a package of 20 billion euros to redeem Romania's situation (The New York Times, 2022).

Other political events over time

Here are some political events that took place between 2012 and 2020. In 2012, the government started confrontation over self-denial and corruption and the push of Victor Ponta on the rule of prime ministry (Leaders Mag, 2022). The out pointed event of 2015 was

¹⁵ **NPF:** National Police Force

NG: National Gendarmerie (Military branch of the National police)

BPF: Border Police Force

the resign of Victor Ponta in his previous position after the misconduct that resulted in died of citizens in fire (Chandler, 2015). In 2016, NATO installed a system of defense in the views of Russian opposition (NATO, 2022). The first political event of 2017 was the formation of government by social democrats after the win of December 2016 election and the posttest over government due on corruption process. It was remarked that since the change of political structure in Romania from the communist regime in 1989 the huge demonstration was manifested in 2017 (DW, 2022). 2019 was remarked by the misplace of social democracy that given priority to Centrist Ludovic Orban on the place of prime minister, one year later the defense minister become prime minister in action at the place of Orban (Balkan Insight, 2022).

3.2. CHALLENGES

3.2.1. Copenhagen Criteria

As required to all country that apply membership to the EU, Romania faced the challenge of completing the Copenhagen criteria while starting it road to the EU. At this act, Romania played important role of dealing with the EU requirement. Romania was challenged by establishing an institution of dealing with democracy, implementation of law, promoting human rights and protecting minorities (OECD, 2022). With the work toward integration to EU Romania's incapability on facing integration, criteria seem to result on the delay of Roman to being accepted in the European Union member states.

3.2.2. Socio-economic

After the full membership of Romania there, have been a break out of migration in Romania changes the social status of the country and promoted the fair of EU member states to do not react directly on the issues of Romania. These issues contributed in border instability between EU countries (MPI, 2022). It was underlined that a big number of immigrant who moved from a region to region were under search of labour, in social case one of the most remarked challenge of Romania was of dealing with the decreasing of number of unemployment. Rebuilt economy of Romania was observed as main challenge of the country in completing the criteria of integration, even the government tried why high stage in pushing national economy the reality of corruption seem to increase and pushed the late of country's opportunity to integrate (Statista, 2022). Challenges faced by Romania toward EU membership were characterized by the scarcity of economy and social structure, from its way to EU integration the country worked hard in promoting the power of stability

and complete all needs from the EU. Away from challenges faced by Romania toward EU, the ongoing situation of Romania demonstrate that as all country in globe are suffering from global crisis resulted from the Pandemic Covid-19, at the same level Romania is surviving that challenges (ITA, 2021).

3.2.3. Current important issues that Romania is facing

Source: Statista 2022. <https://www.statista.com/statistics/1109873/challenges-romania/>

CONCLUSION

Starting from the full membership of Romania in EU, the relation of the two actors seem fruitful due on the policies of EU toward member states and the contribution of Romania in the EU. A back analyses of the collected data demonstrated that the EU did not give that much priority on Romania integration due on several challenges faced the country as determined in the timeline. Even Roman applied to join the organization since long time, being out of those states that joined the organization in 2004 displayed how Romania was not that much attractive in the join of the organization at same case of Bulgaria. The join of Romania was not easy depend on that the country was not eligible to complete all the required criteria case of Copenhagen.

The relation of EU and Romania was founded under the EU member states policies toward development and welfare of EU people. Out relation based in organization, Romania has a strong relation with other EU member states due on its power of energy supply. The development of industry in Romanian promoted the increase of bilateral relation between the EU and Romania. With its strong cooperation and integration to EU Romania upsized it economy globally and pushed the change of social structure of the region. The relation

between EU and Romania seem to resize the case in racism in the countries and promoted much social development in the region, at the sometime Romania faced several problem before even after its full membership in the region. Even the relation of Romania and EU appeared in several aspect of development still Romania is facing much many challenges. The most important challenges that is facing Romania are at the top al all there are Heath problems, economic instability followed by the rise of price influenced by inflation. At other side education, system, housing, and environment are underlined in the list of the post important issues of that are facing the country.

In conclusion, the two actor's relation is built under the EU's membership relation followed by the regional influence that are resulted from geopolitical aspect of Romania and the European Union. Even Romania faced more challenges toward EU integration his participation in the intergovernmental organotin displayed this good will in the road of development and cooperation.

ABSTRACT

The 1970s were quite difficult for the world economies; Bretton Woods' gold and dollar-centered fixed exchange rate system disintegrated and Keynesian policies began abandoned thus neoliberal economy policies took the stage. The minority government led by Süleyman Demirel put forward a series of economic decisions on January 24, 1980. In the first period of the January 24 decisions, all the main problems continued to exist, but it was agreed that a period of five years should be waited in order to overcome these ongoing problems and to get the significant results of the January 24 measures. The five years following the January 24 decisions were the years in which some changes began to be seen in the education policies of the country. The commercialization of public schools and the increase in attempts to open private education institutions since the 1980s have significantly weakened the egalitarian character of the education offered by the state in the previous period since the beginning of Republic of Türkiye. In this article, using the document analysis method, the three newspapers with the highest circulation of the period between 1980-1984 were analyzed. Cumhuriyet, Milliyet and Hürriyet newspapers were examined in the context of news and columns on education in this period. The reflections of January 24 decisions on Türkiye's education policies were analyzed in the context of these three newspapers between 1980-1984. Findings were subjected to content analysis through the codes to be created. While analyzing the results of the January 24 decisions on education policies, the themes were grouped separately as primary, secondary and higher education levels.

Keywords: January 24 1980 Decisions, Neoliberalism, Education Policies

Introduction

The 1970s were quite difficult for the world economy, and Bretton Woods' gold and dollar-centered fixed exchange rate system disintegrated, Keynesian policies began to be abandoned one by one. The most striking aspect of Keynesian policies was the idea that the state could fix the economy by directing effective demand. Since the economy was not coming to equilibrium by itself in the inflationary deficit problem, the state was intervening by reducing public expenditures and/or increasing tax rates. In order to eliminate the deficit problem, the government's intervention in the economy was required by directing demand (Aktan, 2000). Thatcher in England and then Reagan in the USA decided to abandon Keynesian policies and turn to economic policies that focused on market mechanisms; the privatization of state-owned enterprises by emphasizing neoliberal economic policies and reducing public expenditures constituted the basic steps of this orientation (Pamuk, 2022, p.242). The 1970s were also very difficult for Türkiye. Difficulties were experienced in the field of imports and production, and inflation increased considerably. In the face of factors such as increases in oil prices, conflicts such as the Vietnam War, and the 1974 Cyprus Peace Operation in which Türkiye was involved, the Turkish economy was severely damaged and that increased social tensions, led to a high rise in social conflicts. The minority government, under the premiership of Süleyman Demirel, put forward a series of economic decisions on January 24, 1980 in this regard. Turgut Özal, who served as the Undersecretary of the State Planning Organization during the Demirel government, was responsible for the implementation of the new economy program as the undersecretary of the Prime Ministry. The restrictive monetary policy included elements such as reducing taxes, encouraging investments with fiscal policies, reducing government interventions, creating conditions for the free functioning of the market, reducing social expenditures, taming unions and lowering wages (Başkaya, 2015, p.209). Nevertheless, the January 24 decisions taken by the Justice Party (AP) government, which contained various provisions proposed by the liberal economic doctrine, were related to the fact that the provision of external resources necessary for the exit from the economic crisis was conditional on the taking of these decisions, rather than the party's sympathy for economic liberalism. Taking these decisions was an example of the pragmatism of the AP rather than being an indicator of convergence with economic liberalism (Demirel, 2018, p.576).

At that time, the Demirel government did not have the necessary political support to carry out the new program, but the military administration established after the coup in September of the same year also adopted this program and appointed Özal as the deputy prime minister responsible for the economy. According to Pamuk (2022), the main objectives of the January 24 decisions were to provide stability by improving the balance of payments and reducing inflation in the short term, and to create an economy that places more weight on the market, oriented towards foreign, especially exports, in the long run. However, in order to ensure competition in the international markets, reduction of wages and the income of agricultural producers caused the resistance of the workers' organizations, but these resistances were suppressed to a large extent with the military coup, the bans on strikes and union organizing. It was a fully neoliberal restructuring plan that has been put into practice and the problem of political actor was still not resolved as none of the existing political parties had the capacity to implement the policies proposed by the IMF and the World Bank; at this point, the army, which took over the administration with the coup on September 12, 1980, carried out the second non-political intervention (Bekmen, 2018, p.74). According to Boratav (2011), the "model of January 24", presented to the masses and the public with the slogan "There is no alternative" from beginning to end and with a very intense ideological campaign; it was not an original package of measures for neither Türkiye nor the world; these resolutions included all the familiar elements of a typical structural adjustment program developed by the World Bank, with the standard stabilization policy imposed by the IMF in the 1970s on many underdeveloped countries that were overwhelmed by external stagnation. In those years, there was no other solution but to lean on the door of the IMF (Kozanoğlu, 2001). According to Kazgan (2006, p.123), the January 24 package came with structuring that went far beyond being a package containing economic policies aimed at returning to stability and repaying debts in a short time; this liberal ideology turned into a campaign to instill a kind of "vulgarized liberal ideology" on people, to change their value judgments accordingly, to create a new type of person and to reconstruct the economy with this vulgarized ideology, which turned into a campaign to spread the "opportunistic-cunning little man" mentality.

According to Çavdar (1983, p.1076), after January 24, 1980, the implemented economic policy had a great impact especially on some faculty members, and it was necessary to change the economic views they had defended until that day. Today, the

concepts derived from the January 24 Decisions constitute the focus of the discussions on economy in Turkey. The debate focused and still focuses on the dilemma of "stability first, then growth" or "growth as a condition of stability", and whether structural reforms, which were accepted by almost everyone, should be done with market mechanisms or whether they require state intervention (Çavdar, 1983, p. 1076). In the first period of the January 24 decisions, all the main chronic problems continued to exist, but it was agreed that a period of 5 years should be waited in order to overcome these chronic problems and to get the "positive" results of the January 24 measures (Sönmez, 1980). The 5 years following the January 24 decisions were the years in which some changes began to be seen in the education policies of the country. The commercialization of public schools and the increase in attempts to open private education institutions since the 1980s have significantly weakened the egalitarian character of the education offered by the state in the previous period (Özden, 2018, p.222).

In the tenth education meeting held in 1981, it was stated that the structure of the school system in the new period should be prepared by taking into account the needs of developing Türkiye, because Türkiye entered the industrial period and it was necessary to focus on vocational and technical education from kindergarten to university in an industry-oriented education system. The principles and policies regarding education determined in the Fourth Five-Year Development Plan covering the years 1979-1983 were pointing that education should be considered as a whole with other systems and an institutional structure consistent with the technological and economic structure should be achieved and formal and non-formal education should be developed in a way that complements each other (Tenth Education Council. , 23-26 June 1981). In the eleventh education council held in 1982, the continuation of the principles and policies regarding education determined in the Fourth Five-Year Development Plan was foreseen, and the speech of the head of state, Kenan Evren, was important in terms of shedding light on the education policies of the period. According to Evren, before September 12, teachers and students joined hands to write banners, manufactured bombs, went to the streets together and chanted slogans together; such people have been purged from society and after September 12, teachers walked through the the footsteps of Atatürk (Eleventh National Education Council, 8-11 June, 1982). In the plan of the government of 1983, after the Özal government was established (ANAP), it was stated that they should try to eliminate anarchy by having fight it and all legitimate powers would

join hands on this issue and it was obligatory for the state to take the necessary measures for religious education and training in primary and secondary education institutions in order to raise a well-equipped and balanced generation (T.B.M.M. Record Journal, 1983).

Method

In this article, using the document analysis/analysis method on the basis of qualitative research design, the three newspapers with the highest circulation of the period, Cumhuriyet, Milliyet and Hürriyet and the years 1980-1984 were examined in the context of news and columns on education. Findings were subjected to content analysis through the codes that were created. News that were not related to neoliberal education policies were excluded from the analysis. While analyzing the effects of the January 24 decisions on education policies, how they affect entry to higher education, secondary education and higher education were analyzed separately.

Findings And Comment

Tablo

Theme	Sub-Theme
The Impact of Neoliberal Policies on Higher Education	Commercialization of Education
	Inequality in education
	Politization of education
The Impact of Neoliberal Policies on the Transition to Higher Education	Commercialization pf Education
	Inequality in education
	Politization of education
The Impact of Neoliberal Policies on Secondary Education'	Commercialization of Education
	Inequality in education
	Politization of education

Three themes emerged in our analysis of the newspapers Cumhuriyet, Milliyet and Hürriyet covering the years 1980-1984 regarding the reflection of the January 24 decisions on education policies; these are the impact of neoliberal policies on higher education, the

impact of neoliberal policies on higher education entry, and the impact of neoliberal policies on secondary education. Each theme has three sub-themes; these are inequality in education, politization of education, and commercialization of education. There are codes that caters to sub-themes and themes.

For example, under the theme of the effect of neoliberal policies on higher education entry, we see the sub-theme of commercialization of education and the codes such as education expenses, tax immunity, prevention of education, tuition fees, contradictory social realities, financial autonomy, human value, staff swelling, private practice and dormitory. Two examples of this kind are as follows:

"Prof. Dr. Metin Şengonca wrote that equipments of newly opened higher education institutions were built by their own foundation companies benefiting from tax immunity and their employees were benefited from the state purse; the paid supplementary course application further encouraged the opening of new universities and the quality of education thus tended to decline" (Cumhuriyet, 28.3.1981) (Code: Tax immunity, Sub Theme: paid education, Theme: Higher Education). "Medical students will pay 340 thousand liras per year; it has been stated that if 100 students who are entitled to study at Anadolu Medical Faculty come together and stop paying the fees they will pay for 6 years and save up, they will have a capital of 790 million TL within this period and they can open a private practice" (Cumhuriyet, 27.9.1982).

The sub-theme of inequality in education, which is under the theme of the impact of neoliberal policies on higher education, has codes such as includes negative social contribution, perfect worker, attendance obligation, favoritism method, higher education projects, student loans, wealthy students, open education faculty, intermediate profession, unemployed student, earning money, compulsory service, graduate unemployed, housing problem, attendance obligation, financial difficulties, private teaching institutions. The examples we can look at from this point of view are as follows: "About the students who are asked to choose either a job or a school due to the attendance requirement stipulated in the Higher Education Law, the Undersecretary of the Ministry of National Education Cezmi Biren stated that many students will have to drop out of school due to the obligation to attend." (Milliyet, 11.12.1981). "Higher Education Council Advisory Council member Prof. Dr. Selçuk Kantarcıoğlu stated that with YÖK, equality of opportunity was abolished, those who have money were given the opportunity to pursue an academic career, that the method

of favoritism would find an area of application with this law, and evasion from duty would increase. Kantarcıoğlu also claimed that the inventors of the universities that grew like mushrooms were included in the Council of Higher Education"(Cumhuriyet, 25.1.1982).

Under the theme of the impact of neoliberal policies on higher education, the sub-theme of politization of education includes codes such as punishment, students involved in anarchy, expelled faculty members, union membership, coffeeshouses, Turkish ancestry, information slips, dismissal of faculty members, civil service, apprehension, intelligence bill, fear of being expelled, deficient disciplines. In this context, the following example can be examined: "The expulsion and punishment of both the teacher and the student dealing with politics has been determined" (Hürriyet, 9.6.1981). "With the new university law, credit will not be given to students involved in anarchy". "With the new YOK law, education in all branches of science cannot be provided in Open Education Faculties, so students who have to work in an unequal situation" (Cumhuriyet, 14.2.1984).

The theme of the impact of neoliberal policies on the transition to higher education's sub-theme commercialization of education has codes such as private schools, private teaching institutions. The example is as follows:

"İlhan Açıkgöz, Chairman of the Executive Board of Private Murat Dershanesi, stated the function of private courses as follows: "The first outstanding task of private courses today is to prepare students who are not sufficiently trained in secondary education for the university entrance exam. But our mission does not stop there. We are trying to give the student the right to enter a good school, as well as the infrastructure to continue their education in the school they have won. There are students who have not had a physics lesson for a year due to the absence of a teacher, and they do not like this lesson. But you see, he won a department about physics. This kind of student can gain his/her background in physics with us. Another benefit of classrooms is social aspect. There is a change in the culture and social environment of the incoming student." (Milliyet, 2.2.1983).

The theme of the impact of neoliberal policies on the transition to higher education's sub-theme inequality in education has codes such as financial opportunities, special education, social justice, chance of settlement, socioeconomic level, wealthy people, private teaching institutions, wealthy students, school enrollment rate, youth growing up with exams. Some examples are as follows:

"Due to the differences observed in the quality of education between secondary education institutions at university entrance, families with good financial means want to send their children to private teaching institutions in big cities from the countryside to increase their chances of success in exams (Milliyet, 13.6.1980). "The doors of higher education are closing every year for the children of poor families, deprived areas, impossible schools, and moreover, the existing inequality in benefiting from higher education is getting worse with private teaching institutions, various courses, expensive test books (Cumhuriyet, 9.5.1980). In the theme of the impact of neoliberal policies on the transition to higher education, codes such as difference between regions, country conditions, selection and placement tests, social justice have been found to meet the sub-themes of politization of education. The example is as follows:

"University students who mentioned that poor students' chances of higher education were hindered also stated that paid education would bring a great economic burden to their families; according to the country's conditions, they claimed that many students would be left out due to lack of quota, and this time they would be faced with the danger of not being able to study because they did not have enough money" (Hürriyet, 28.9.1983). "Lecturer Pakize Türkoğlu stated that no matter how technically advanced the selection and placement exams applied at the entrance to higher education are, they were not prepared with a concern that includes the inequality of opportunity that exists in our society. She also stated that some of the students were able to pass these exams by learning the exam techniques and even the questions by obtaining compressed information through private teaching institutions" (Cumhuriyet, 9.2.1984). "In Turkey, the people of Eastern and Southeastern origin compared to those of Western origin, villagers compared to urban residents, girls compared to boys, and the poor compared to the wealthy have less chance to enter the university, which is against the basic principle of "social justice" in Constitution, It is also diametrically opposed to "equality of opportunity and possibility" " (Milliyet, 23.8.1980).

Codes such as private courses, private schools, Anatolian high schools appeared in the sub-theme of commercialization of education under the theme of the effects of neoliberal policies on secondary education. Examples in this regard are as follows:

"The special courses that the Ministry of National Education envisaged to be opened in primary and secondary schools could not be realized, especially in big cities, due to insufficient demands of students and parents, and teachers find additional course fees

insufficient (Cumhuriyet, 22.1.1982). "Minister of National Education, Youth and Sports, Vehbi Dinçerler, stated that Anatolian high schools would be paid as of 1985, and suggested that those who want to educate their children in Anatolian high schools should establish companies and foundations (Milliyet, 283.1984).

Under the theme of the effects of neoliberal policies on secondary education, the sub-theme of inequality in education has codes such as special preparatory courses, student expenses, private school, Anatolian high schools. The following example can be given in this regard: "College entrance exams disrupt the psychology of students, special preparatory courses given in schools have brought up failures due to income inequality, as well as problems such as eating money / irregularities" (Cumhuriyet, 8.3.1980).

The sub-theme of politization of education under the theme of the effects of neoliberal policies on secondary education includes codes such as the right to unionize and the intelligence draft. The following examples can be examined:

"Teachers who tried to express their opinions and participated in actions in this way were dismissed from their duties and applied to the Council of State; It has been demanded that the raises be withdrawn and the salaries increased, TÖB-DER should be opened, and the right to unionize with strikers and collective agreements" (Cumhuriyet, 13.2.1980). "The draft law regulating the National Education was prepared and the "intelligence bill" was issued" (Cumhuriyet, 2.6.1982)

Conclusion

Nussbaum (2018, p.37), in her work titled *Creating Capabilities*, uses this important sentence: "If you don't have an idea about it one way or another, you won't be able to find what you're looking for." Instead of "development" indicators such as Gross National Product, Nussbaum particularly recommends considering internal capabilities. She defines learned, equipped and developed skills as a result of interaction with the social, economic and political environment. For her, if a society wish to expand the capabilities of individuals, it should devote its resources especially to the improvement of education. It can be argued that the emergence of the Higher Education Council, the politicization of education, the mercenary of education were related with manipulating the internal capabilities and alienate the individual from himself/ herself in the first place and turn him/ her into a cogwheel of neoliberal economic policies. In fact, an inspiration can be taken from Berlin (2016); the

possibility to ask the question “How many doors are open to me?” was prevented by these neoliberal policies in education so the negative freedom was hindered.

The economic policy implemented in Turkey after January 24, 1980, had a great impact especially on some faculty members - those who prefer/could stay in universities - that they felt the need to change their economic views they have defended until that day. As Walker (2019) stated, due to neoliberal policies, inequality could take its place in education decisions as a political choice. The five years following the January 24 Decisions were the years in which some changes began to be seen in the education policies of the country. The commercialization of public schools, the increase in attempts to open private education institutions since the 1980s, the establishment of private universities, the orientation of working students to the open education option and their victimization with limited branch opportunities significantly weakened the egalitarian feature of education. It was also in contradiction with social realities; human values were gradually lost because of the character of the neoliberal economic policies (Kumar and Hill, 2009). Starting from the first year, 1980, teachers who tried to express their views and participated in actions were dismissed from their duties. Equality of opportunity was abolished with Higher Education Council (YÖK); those who had money have given the opportunity to pursue an academic career, the method of favoritism found its application area. An environment arised where high-level executives such as the rector and dean could be dismissed before their term of office expires, and academic members could be dismissed if desired; higher education institution officials entered to "the civil service process".

As Doğan and Selenica (2022) stated, the pressure on academic staff was as a result of neoliberal policies in Turkey and it has been observable until today. By 1982, it was revealed that the students who took the first three places in the university exam were studying in special education schools; the transition to higher education emerged as an area where the consequences of inequality in education could be observed. Private schools and private teaching institutions have increased the social inequalities. Unemployed graduates increased, the necessity of earning money prevented education, financial difficulties increased the level of anxiety among students. These findings are consistent with Hedegaard-Soerensen and Gruomlaese's findings that neoliberal education policies reduce social inclusion and pluralism, and increase social exclusion and collective indifference mechanisms (Hedegaard-Soerensen and Gruomlaese, 2020). Higher education entry success

was also negatively affected by regional disadvantages; the children of the underdeveloped region, who suffered from economic poverty, started to fail the exams due to the lack of private teaching institutions and private schools. This result is in line with the findings of Lipman (2011) that neoliberal education policies, when combined with undemocratic management mechanisms, bend capital accumulation for the benefit of the rich and construct social capital to the advantage of the rich. Since working students were obliged to attend universities, open education was demanded - about 45,000 people enrolled - but young people already realized that graduating from open education meant falling far beyond from being visible in the sector. It was decided that the student who was involved in "anarchy" in the university would not be given credit, and the teachers who think differently would get their share from this punishment. Because, as Attick (2017) argues, neoliberal education policies demand homogenized, standardized and measurable associations and outcomes from students and teachers.

Althusser (2002) argued that every ideology, in its necessary imaginary distortion, shows not the existing relations of production (and other relations deriving from them), but above all, the imaginary relation of individuals to the production and relations that derive from it. The argument that Turkish society was a classless society was included to the founding process of Kemalist ideology of the Republic, and the corporatist policies were driven from this belief by trying to provide an anti-liberal theoretical-moral rationale for capitalism (Parla, 2011). It can be argued that the normalization of labor exploitation in society appeared over time and after the decisions of January 24, 1980, this exploitation increased gradually.

Güllüpcinar (2015) states that in Türkiye, the encouragement of private universities to entrepreneurship since the 1990s exceeds simply by supporting the privatization of private universities and this situation causes the information to be commodified and recontextualized for the market; the policies for the marketization of educational services have become widespread since the early 2000s which has reduced the entire education process to "performance". As Sipahioğlu (2020) stated, the education process in Türkiye has been compressed into a function that produces affordable values with the effect of neoliberal policies. İnal and Akkaymak (2012) read the economic decisions of January 24, 1980 by combining the establishment and progress strategies of the contemporary politics in terms of education policies; contemporary politics supported a structural reform that would enable a

transition to a liberal and constructivist education model, and implemented a plan (both financially and intellectually) in 2004 with the guidance and support of the World Bank (WB), IMF and European Union.

The education reform initiated in 2004 was in line with the report of TUSIAD, which argued that the education system should aim to produce the workforce needed by the market economy. This has left educational processes under the control of neoliberal ideology and contemporary policies rearranged the education system to train students/citizens as required by the market economy, so the social justice in education has been overlooked (İnal and Akkaymak, p.15). It can be argued that the way to re-establish social justice and equality of opportunity in educational policies in the upcoming period is to redesign the educational processes.

AKILLI ŐEHİRLERDE AFET YÖNETİMİ

Hasan Emre KILIÇ (Orcid ID: 0009-0005-4644-3610)

Sakarya Üniversitesi, Fen Bilimleri Enstitüsü, Afet Yönetimi, Sakarya

E-mail: hasan.kilic7@ogr.sakarya.edu.tr

ÖZET

Ülkemizde ve dünyada nüfus sürekli olarak artmaktadır. Artan nüfus, şehirleşme hızını da aynı doğrultuda artırmaktadır. Şehirleşmenin hız kazanmasıyla ulaşım, alt yapı, doğal kaynakların sürdürülebilirliği, enerjinin verimli kullanılması gibi birçok sorun ortaya çıkmıştır. Ortaya çıkan bu sorunları ortadan kaldırmak, şehrin kaynaklarını daha verimli kullanmak ve kişilerin daha iyi hizmet alabilmelerini sağlamak için akıllı şehir kavramı ortaya çıkmıştır. Akıllı şehir, teknolojiyi kullanarak ihtiyaçlara yönelik çözüm üreten ve yaşam standartlarını arttıran şehir olarak değerlendirilir. Nüfusun daha yoğun olarak yaşadığı şehirlerde meydana gelen afetlerin etkileri daha şiddetli olmaktadır. Afetlerin olumsuz etkilerini en az düzeyde tutmak için şehirleri afetlere karşı hazır duruma getirmek gerekmektedir. Şehirleri afetlere karşı hazırlamak için afet yönetimi şehirlere entegre edilmeli ve şehirler akıllı hale getirilmelidir. Bunu gerçekleştirmek için afetlere yönelik akıllı şehir uygulamalarına önem verilmesi gerekmektedir. Afetlerin neden olduğu kayıpları önlemek için ve afetleri yönetilebilir hale getirmek için afet yönetimine önem verilmesi gerekmektedir. Afet yönetimi ile afetlere yönelik mevcut riskler azaltılarak ve gerekli olan önlemler alınarak afet sürecinin kontrol altında tutulması sağlanmaktadır. Afet yönetiminin başarılı olabilmesi için afet meydana gelmeden önce yapılması gerekenlerin belirlendiği risk yönetimi aşamasına önem verilmesi gerekmektedir. Teknolojik gelişmeler doğrultusunda afet yönetimine yönelik olarak geliştirilen akıllı şehir uygulamaları ile başta yangın, heyelan, sel, taşkın gibi afetlere karşı şehri hazır hale getirmek mümkündür. Özellikle afet bilgi sistemi, akıllı ihbar sistemi, erken uyarı sistemi ve afet türlerine göre oluşturulmuş mobil uygulamalar kişilerin bilgilendirilmesi ve yönlendirilmesine katkı sağlamanın yanında afetlerin olumsuz etkilerinin en az düzeyde tutulmasına da katkıda bulunmaktadır. Şehirleri daha yaşanılabilir kılmak için akıllı şehir uygulamaları geliştirilmeli ve toplum afetlere karşı daha dirençli hale getirilmelidir. Bu çalışmada ele alınan afet yönetimine yönelik geliştirilen akıllı şehir uygulamaları, toplumun afetlere karşı olan direncini artırmakta ve şehirlerin afetlere karşı daha dirençli hale getirilmesini sağlamaktadır. Bu nedenle afetlere yönelik akıllı şehir uygulamaları geliştirilmeli ve kullanım alanları genişletilmelidir.

Anahtar Kelimeler: Afet, Afet Yönetimi, Akıllı Şehir, Akıllı Şehir Uygulamaları, Şehir

DISASTER MANAGEMENT IN SMART CITIES

SUMMARY

Population is constantly increasing in our country and in the world. Increasing population increases the rate of urbanisation in the same direction. With the acceleration of urbanisation, many problems such as transportation, infrastructure, sustainability of natural resources, efficient use of energy have emerged. The concept of smart city has emerged in order to eliminate these problems, to use the resources of the city more efficiently and to ensure that people can receive better service. Smart city is considered as a city that produces solutions for needs and increases living standards by using technology. The effects of disasters occurring in cities where the population lives more densely are more severe. In order to minimise the negative effects of disasters, it is necessary to make cities ready for disasters. In order to prepare cities against disasters, disaster management should be integrated into cities and cities should be made smart. In order to realise this, smart city applications for disasters should be given importance. Disaster management should be given importance in order to prevent losses caused by disasters and to make disasters manageable. With disaster management, existing risks for disasters are reduced and necessary precautions are taken to keep the disaster process under control. In order for disaster management to be successful, it is necessary to give importance to the risk management stage where the things to be done before the disaster occurs are determined. With smart city applications developed for disaster management in line with technological developments, it is possible to make the city ready for disasters such as fire, landslide, flood and flood. Especially disaster information system, smart notification system, early warning system and mobile applications created according to disaster types contribute to informing and guiding people as well as minimising the negative effects of disasters. Smart city applications should be developed to make cities more livable and society should be made more resilient against disasters. Smart city applications developed for disaster management, which are discussed in this study, increase the resilience of the society against disasters and make cities more resilient against disasters. Therefore, smart city applications for disasters should be developed and their usage areas should be expanded.

Keywords: Disaster, Disaster Management, Smart City, Smart City Applications, City

GİRİŞ

Multidisipliner bir kavram olan afetin tek bir tanımı yoktur. Örneğin AFAD'a göre '*Toplumun tamamı ya da belli bir kesimi için fiziksel, ekonomik ve sosyal kayıplar doğuran, normal yaşamı ve insan faaliyetlerini kesintiye uğratan, etkilenen toplumun baş etme kapasitesinin yeterli olmadığı doğa, teknolojik veya insan kaynaklı olay*' olarak tanımlanmaktadır (AFAD, 2022). TDK'ye göre ise afet; '*çeşitli doğa olaylarının sebep olduğu yıkım*' olarak tanımlanmaktadır (TDK, 2022). Genel bir ifadeyle afet kavramı; insanlar için fiziksel, ekonomik ve sosyal kayıplar doğuran, normal yaşamı ve insan faaliyetlerini durdurarak veya kesintiye uğratarak toplumu etkileyen doğal, teknolojik veya insan kökenli olaylara denilmektedir. Afetler hem seyrek hem de yoğun nüfuslu şehir bölgelerinde meydana gelebilmektedir. Günümüzde şehirlerin imkan ve fırsatlarının daha fazla olmasından dolayı insanlar şehirlere göç etmekte ve şehirlerin nüfus yoğunluğu artmaktadır. Bu yoğunluğun artması beraberinde bir takım tehlike ve riskleri de getirmektedir. Tehlike ve risklerin artmasıyla toplumun olası afetten zarar görebilirlik düzeyi de artmaktadır. Bu durumda olası bir afette can ve mal kaybını artırmaktadır. Meydana gelebilecek kayıpları minimum düzeyde tutmak için afet yönetimine ve akıllı şehir uygulamalarına önem verilmesi gerekmektedir (TÜRKOĞLU, 2014). Afet yönetimi, afet meydana gelmeden önce afete hazırlanmak için ve afet meydana geldikten sonra afetin olumsuz etkilerini azaltmak için yapılması gereken çalışmaları kapsamaktadır. Afetin olumsuz sonuçlarını azaltmak için afet meydana gelmeden önce yapılması gereken risk yönetimine önem verilmesi gerekmektedir (ŞAHİN Ş. , 2019). Teknolojiyi kullanarak ihtiyaçlara yönelik çözümler üreten ve insanların yaşam standartlarını arttıran şehirlere akıllı şehir denilmektedir (YILDIRIM, 2022). Akıllı şehirlerin amaçlarından bir tanesi de şehri afetlere karşı hazır duruma getirerek afetlerin etkilerini minimum düzeyde tutmaktır. Bunu gerçekleştirmek için ise akıllı şehir uygulamalarına önem verilmesi gerekmektedir. Afetlere yönelik geliştirilen akıllı şehir uygulamaları; deprem, sel, taşkın, fırtına gibi afetlere karşı hazırlıklı olmayı ve erken uyarı sistemleri ile olaya hızlı bir şekilde müdahale edilmesini sağlamaktadır (Türkiye Cumhuriyeti Cumhurbaşkanlığı Strateji ve Bütçe Başkanlığı, 2014). Afetlere yönelik geliştirilen yenilikçi ve akıllı çözümler sunan akıllı şehir uygulamaları, şehirlerin gelişimini ve insanların bilgi düzeyini artırmaktadır. Afetlere karşı daha bilinçli bir toplumun oluşturulmasına katkıda bulunmaktadır.

AKILLI ŐEHİRLER

Akıllı Őehir Kavramı

Akıllı Őehir (smart city), teknolojinin kullanımı ve yenilikçi çözümlerin entegrasyonu yoluyla Őehirlerin sürdürülebilirlik, verimlilik ve yaşam kalitesi gibi konularda gelişmesini hedefleyen bir kavramdır. Bu kapsamda, akıllı Őehirlerde binalar, ulaşım aęları, enerji sistemleri, çevre yönetimi gibi birçok alanda teknolojik yenilikler kullanılarak Őehirlerin yönetimi ve planlaması yapılır. Akıllı Őehirlerde veri toplama, analiz ve paylaşımı yapılarak, karar vericilerin daha doğru ve etkili kararlar alması amaçlanır. Bu sayede Őehirlerin sürdürülebilirlięi artar, çevre dostu uygulamalar yaygınlaşır, insanların yaşam kalitesi yükselir (ILGAZ, 2018).

Genel bir ifadeyle akıllı Őehir; Őehrin kaynaklarının daha etkin kullanılmasını ve kişilerin daha iyi hizmet almalarını saęlayan bir modernleşme sürecidir.

Akıllı Őehirlerin Temel Bileşenleri

Akıllı Őehirlerin temel bileşenleri akıllı Őehirlerin karakteristik özelliklerini oluşturur. Bunlar 6 tanedir.

- Akıllı ekonomi
- Akıllı insan/vatandaş
- Akıllı yönetim/devlet
- Akıllı yaşam
- Akıllı çevre
- Akıllı ulaşım/hareketlilik

Akıllı Ekonomi: Őehrin mali kaynaklarının adil bir şekilde dağıtılması, adil rekabet ortamının oluşturulması ve Őehrin gelirlerinin sürdürülebilir bir şekilde yönetilmesi, Őehrin ekonomik ve sosyal sürdürülebilirlięi için önemlidir (YILDIRIM, 2022). Yenilięi, girişimcilięi ve teknolojinin geliştirilmesini savunur, yerli ekonomi ile dünya ekonomisi arasındaki ilişkiyi geliştirmeyi hedefler (ARMAĖAN, 2018).

Akıllı İnsan: Akıllı insan kavramı, akıllı Őehirler içinde yaşadığı çevreye karşı duyarlı, Őehrin sunduęu imkanları etkili bir şekilde kullanabilen ve teknolojileri hayatını kolaylaştırmak için entegre eden insanları ifade eder (YILDIRIM, 2022).

Akıllı Yönetişim/Devlet: Akıllı yönetim, Őehrin tüm bileşenlerinin bir arada çalışmasını saęlar ve Őehirlerin daha sürdürülebilir hale gelmesine katkıda bulunur (NAM & PARDO, 2011).

Akıllı Ulaşım/Hareketlilik (Mobilité): Akıllı ulaşım sistemleri öncelikle ulaşımı ele alır ve ulaşım ağına odaklanır (ALAVİ, PENGCHENG, WILLIAM, & NİZAR, 2018). Akıllı ulaşım; çevre dostu, güvenli, sürdürülebilir ve çoğunlukla motorsuz seçeneklere öncelik vererek ulaşımı daha kaliteli ve faydalı hale getirmeyi amaçlayan bir kavramdır (McKinsey, 2018).

Akıllı Yaşam: Akıllı yaşam, internet teknolojisi aracılığıyla insanların daha kolay bir şekilde iletişim kurmasını ve işlerini yönetmesini sağlayarak yaşam kalitesini arttırmayı amaçlayan bir kavramdır (ARMAĞAN, 2018).

Akıllı Çevre: Şehrin doğasının korunmasını ve geliştirilmesini, atık maddelerin geri dönüştürülmesini, canlıların daha sağlıklı ortamda yaşamasını, kaynakların sürdürülebilir yönetiminin sağlanmasını kapsamaktadır (YILDIRIM, 2022).

Şekil 3: Akıllı Şehir Çemberi

Kaynak: (T.C. Çevre ve Şehircilik Bakanlığı, 2019).

Akıllı Şehir Uygulamaları

Akıllı şehir uygulamaları;

- Kişilerin yaşam alanını geliştirmek,
- Refah seviyesini arttırmak,
- Vatandaşların yapılan hizmetlerden eşit olarak yararlanmasını sağlamak,
- Ülkenin ekonomik olarak büyümesine katkıda bulunmak,
- Yenilenebilir enerji kaynaklarını geliştirmek ve enerji tasarrufu sağlamak için kullanılır (AKSOĞAN & ÇALIŞ DUMAN, 2018).

Akıllı şehir uygulamalarının amaçlarından bazıları aşağıdaki şekilde gösterilmiştir.

Şekil 4: Akıllı şehir uygulamalarının amaçlara göre dağılımı

Kaynak: (Türkiye Bilişim Vakfı (TBV), 2016).

Akıllı Ulaşım Sistemleri

Akıllı ulaşım sistemleri, seyahat süresini azaltarak trafik güvenliği, seyahat konforu ve enerji tasarrufu sağlamak amacıyla oluşturulan bir sistemdir. Ayrıca yolların verimli kullanımını ve çevreye verilen zararları azaltmayı hedefler (JESUS, MACHADO, carvalho, FERREIRA, & FIGUEIREDO, 2001). Aşağıdaki şekilde ulaşım alanındaki akıllı şehir uygulamalarının kullanımlarına göre dağılımı gösterilmiştir.

Şekil 5: Ulaşım Alanındaki Uygulamaların Dağılımı

Kaynak: (Türkiye Bilişim Vakfı (TBV), 2016).

Los Angeles'da Trafik kontrol ve takip sisteminin otomatik hale getirilmesiyle trafikte meydana gelen duraklamalar %35, kavşaklardan geçiş yapılırken meydana gelen gecikmelerde %20, yolculuk süresinde %13, yolculukta aracın yakıt tüketiminde %12,5 ve hava emisyonunda %10 azalma meydana gelmiştir (Şekil 4) (Deloitte Vodafone, 2016).

Şekil 6: Otomatik duruma getirilmiş trafik kontrol ve takip sisteminin faydaları

Kaynak: (Deloitte Vodafone, 2016).

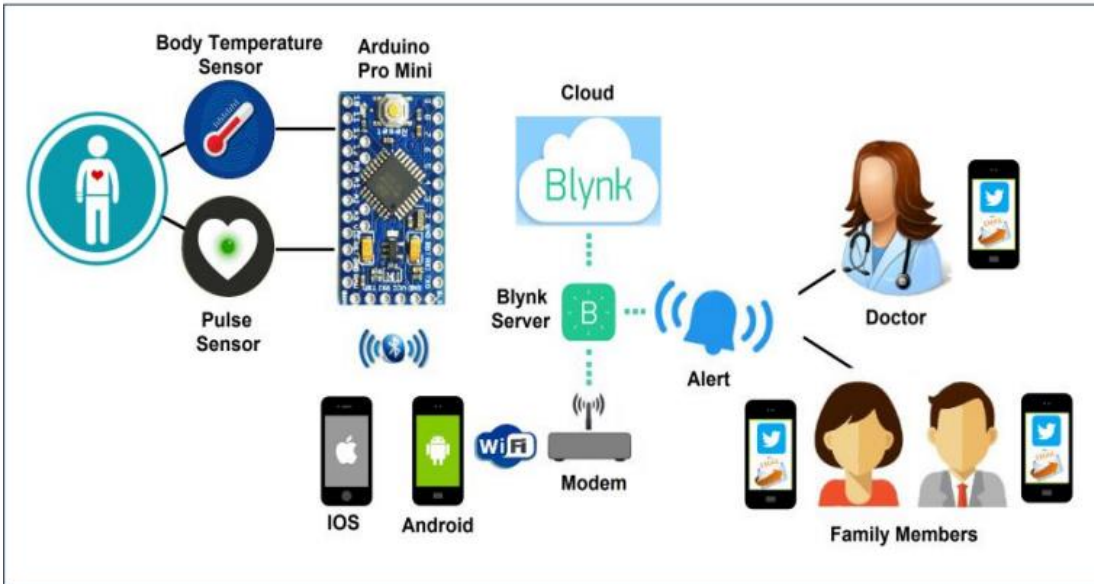

Akıllı Güvenlik Sistemleri

Vatandaşların can ve mal güvenliğini sağlamak için oluşturulmuş bir sistemdir. Mobese kamerası, acil çağrı butonu, drone gibi uygulamalar kullanılmaktadır. Ayrıca acil durumlarda polis, itfaiye, 112 acil sağlık gibi birimlere bilgiyi ulaştırarak olaya hızlı bir şekilde müdahale edilmesi de hedeflenmektedir (MARCO, MANGANO, SCORRANO, NEIROTTI, & CAGLIANO, 2014).

Akıllı Sağlık Hizmeti

Akıllı sağlık uygulamaları, artan nüfusun sağlık hizmetlerine olan ihtiyacının karşılanması amacıyla oluşturulmuş bir sistemdir. Bu uygulamalar, sağlık hizmetlerinin kalitesini artırmak, maliyetleri azaltmak, erken teşhis ve tedavi işlemlerini daha hızlı ve etkili hale getirmek için geliştirilmiştir (SOLANAS, ve diğerleri, 2014).

Health Fog, kalp hastalıklarının otomatik teşhisinde kullanılan bir akıllı sağlık uygulamasıdır. Giyilebilir sensörler sayesinde hastadan gelen veriler sürekli olarak ölçülerek kablosuz bağlantı üzerinden Android sisteme gönderilir. Belirlenmiş kritik değerler aşıldığında, hastanın konumu ve hastalıkla ilgili veriler hem doktoruna hem de aile bireylerine e-posta yoluyla gönderilir (TAŞTAN, 2018).

Şekil 7: Akıllı sağlık uygulaması örnek gösterimi

Kaynak: (TAŞTAN, 2018).

Akıllı Enerji Sistemleri

Akıllı enerji sistemleri, şehirlerde enerji üretim ve dağıtım altyapılarının verimli kullanımını amaçlar. Bu sistemler sayesinde;

- Enerji dağıtımını daha verimli hale gelir,
- Bakım onarım maliyetleri azalır,
- Karbon emisyonu azalır,
- Enerji tüketim ücretlerinde azalma olur (GİORDANO, GANGALE, FULLİ, & JİMENEZ, 2011). Aşağıdaki şekilde enerji alanındaki akıllı şehir uygulamalarının kullanımlarına göre dağılımı gösterilmiştir.

Şekil 8: Enerji alanındaki uygulamaların dağılımı

Kaynak: (Türkiye Bilişim Vakfı (TBV), 2016).

Akıllı Çevre Sistemleri

Çevre faktörlerine yönelik olarak oluşturulan bir sistemdir. Bu sistem, gürültü, sera gazı, hava-su kirliliği, orman alanlarının genişletilmesi gibi faktörlere yönelik çözümler sunar. Akıllı Çevre Sistemi, yeşil binalar, akıllı çöp kutuları, nem ve ısı ölçerler gibi uygulamaları içerir. Bu sayede kişilere daha yaşanılabilir bir yaşam alanı sunulur ve sürdürülebilir kalkınma sağlanır (ZHANG, ve diğerleri, 2017).

Akıllı Doğal Afet ve Acil Durum Sistemleri

Akıllı doğal afet ve acil durum sistemi, doğal afetlerin önlenmesi, tedbir alınması ve afet sonrası zararların en aza indirilmesi amacıyla geliştirilen bir sistemdir. Bu sistem, vatandaşlarla kamu kurumları arasında iletişimi sağlayarak afet öncesi, anı ve sonrasında doğru bilgi akışını sağlar. Akıllı uygulamalar aracılığıyla afet bilgi sistemi ve akıllı haritalar gibi çeşitli araçlar kullanılarak afetlerin etkileri minimize edilir (YAMAN & ÇAKIR, 2018).

Şekil 9: Akıllı harita uygulaması

Kaynak: (Deloitte Vodafone, 2016).

AFET

Afet Kavramı

Afet, beklenmedik zamanda meydana gelen, meydana geldiği bölgenin yerel imkanları ile baş edilemeyen, dış yardıma gereksinim duyulan, normal yaşamı ve insan faaliyetlerini durduran ya da kesintiye uğratan, can mal kayıplarına yol açan insan veya doğal kaynaklı olaylara denmektedir (AFAD, 2022).

Afet Türleri

Afetler, doğal ve insan kaynaklı olmak üzere 2'ye ayrılır.

Doğal Afetler

Doğal afetler, kontrol dışında gerçekleşen ve can ve mal kaybına neden olan doğa olaylarıdır. Yavaş gelişen doğal afetler ve ani gelişen doğal afetler olarak iki gruba ayrılırlar (Tablo 1). Ancak, doğal afetlerin meydana gelmeye başlamasıyla birlikte önlenememe durumuna gelirler (AFAD, 2022).

Tablo 2: Doğal Afet Çeşitleri

Ani gelişen doğal afetler	Yavaş gelişen doğal afetler
Deprem	Şiddetli soğuk
Sel ve taşkın	Kuraklık
Toprak kayması	Kıtlık
Çığ	
Fırtına/kasırga/hortum	
Yangın	
Volkan patlaması	

Kaynak: (ÇELİK, USTA, YILMAZ, & YAKUPOĞLU, 2020).

İnsan Kaynaklı Afetler

Doğal olarak gelişmeyen kısmen de olsa gelişmesinde insan etkisi olan afetlerdir. Hava kirliliği, kimyasal-biyolojik-radyolojik-nükleer kazalar, endüstriyel kazalar, ulaşım kazaları, asit yağmuru, çevre ve su kirliliği insan kaynaklı afetlere örnektir (AFAD, 2022).

AFET YÖNETİMİ

Afet yönetimi; afetlerin önlenmesi, etkilerinin azaltılması, kayıpların en aza indirgenmesi için afet öncesi, anı ve sonrasında yapılması gereken faaliyetleri içeren bir süreçtir. Bu süreçte zarar azaltma, hazırlık, müdahale, iyileştirme ve yeniden inşa aşamaları yer almakta ve tehlike ve riskler belirlenerek ortadan kaldırma çalışmaları yapılmaktadır. Afet yönetimi, afetlere yol açan olağandışı durumların üstesinden gelme çabasıdır (POSER & DRANSCH, 2010).

Afet Yönetim Sistemi

Afet yönetim sistemi, birbirinden ayrı ama birbirini tamamlayan iki yönetim sisteminden oluşur (Şekil 8, 9). Bunlar;

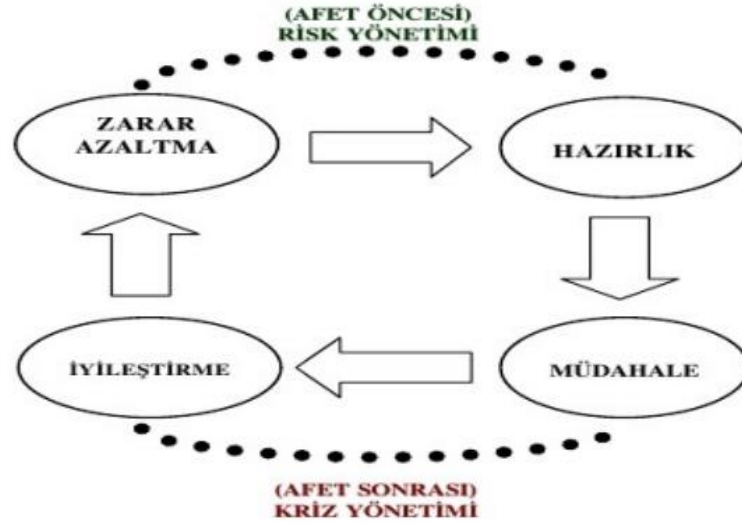

- Risk Yönetimi,
- Kriz Yönetimi.

Risk Yönetimi (Afet Öncesi Dönem)

Afet yönetimi, afetin meydana gelmesini engellemese de afet öncesi dönemde zarar azaltma ve hazırlık faaliyetleriyle afetin etkilerini en aza indirmeyi hedefler. Bu faaliyetlere risk yönetimi denir ve afetin oluşturacağı zararlar, etkileri ve riskler azaltılmaya çalışılır. Örneğin, zorunlu deprem sigortası yapılması, depreme uygun olmayan binaların güçlendirilmesi ve alt yapı çalışmaları risk yönetimine örnek olarak verilebilir. Bu çalışmalar sayesinde afet öncesi dönemde alınan tedbirlerle, afet sırasında oluşabilecek zarar ve kayıplar en aza indirgenmeye çalışılır (AKYEL, 2007).

Kriz Yönetimi (Afet Sonrası Dönem)

Afet anı ve sonrası dönemde yapılması gereken faaliyetlere kriz yönetimi denir. Kriz yönetimi, müdahale ve iyileştirme aşamalarını içerir. Afetin etkilerini azaltmak, zararları en aza indirmek ve normale döndürmek için gerekli olan faaliyetleri kapsar. Kriz yönetimi sürecinde, öncelikli olarak can ve mal kaybı önlenmeye çalışılır. Sonrasında ise, afetin neden olduğu hasarın tespit edilmesi, acil ihtiyaçların karşılanması ve iyileştirme çalışmalarının yapılması için çalışmalar yürütülür (AKYEL, 2007).

Şekil 10: Afet yönetim sistemi

Kaynak: (TÖRENCİ, 2015).

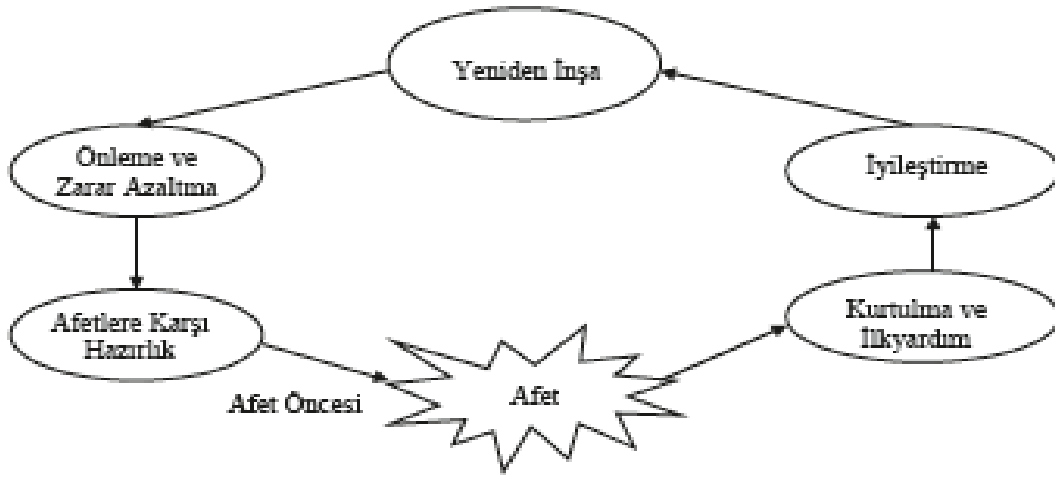

Şekil 11: Afet yönetim sistemi

Kaynak: (MEDAK, 2022).

Afet Yönetim Safhaları

Afetin çeşidi ve meydana geliş hızı fark etmeksizin, bütün afet olayları ile ilgili çalışmalar, beş ana safhaya ayrılmıştır (Şekil 10). Bu safhalar;

- Zarar azaltma,
- Hazırlık,
- Müdahale (Kurtarma ve ilk yardım),
- İyileştirme,
- Yeniden inşa.

Şekil 12: Afet yönetiminin safhaları

Kaynak: (ÖZMEN, Deprem ve Antalya, 2013).

Zarar Azaltma

Afet tehlikesi ve riskinin önlenmesi ya da büyük kayıplar oluşmaması için alınması gereken bütün önlemler ve yapılması gereken çalışmalar zarar azaltma safhasında yapılır (ŞAHİN N. , 2007). Zarar azaltma safhasında yapılan bazı çalışmalar şunlardır:

- Afet ile ilgili kanun ve yönetmeliklerin düzenlenmesi,
- Afet tehlikesi riskinin değerlendirilmesi ve tehlike risk haritalarının hazırlanması,
- Afetler için erken uyarı sistemlerinin kurulması ve geliştirilmesi,
- Afetlere karşı önleyici ve zarar azaltıcı çalışmaların yapılması ve uygulanması,
- Bilimsel araştırma ve geliştirme faaliyetlerinin planlanması ve uygulanması bu çalışmalardan bazılarıdır (KADIOĞLU, Afet Zararlarını Azaltmanın Temel İlkeleri, 2008).

Hazırlık

Afet sonrasında oluşabilecek zarar ve kayıpların giderilmesi, afet nedeniyle mahsur kalan kişilerin kurtarılması, kayıpların bulunması ve arama-kurtarma çalışmalarının geliştirilmesi

ve hazır bulundurulmasını sağlamak için yapılan çalışmalara ‘Hazırlık’ denir (AKYEL, 2007). Hazırlık çalışmalarının ana amacı; canlılar için olumsuz sonuçlara neden olabilecek tehlikelere karşı önlemler alarak, en hızlı, en uygun şekilde müdahale etmeye hazırlanmaktır. Hazırlık safhasında yapılan bazı çalışmalar şunlardır:

- Afet yönetimine ve acil yardıma yönelik planların hazırlanması ve geliştirilmesi,
- Eğitim ve tatbikatlar düzenleyerek görevli personellerin bilgi düzeylerinin yükseltilmesi,
- Vatandaşların bilinçlendirilmesine yönelik eğitim ve çalışmalar,
- Arama-kurtarma faaliyetlerine yönelik eğitimlerin verilmesi,
- Bölge teçhizat merkezlerinin kurulması ve kritik malzemelerin stoklanması bu çalışmalardan bazılarıdır (KADIOĞLU, Afet Zararlarını Azaltmanın Temel İlkeleri, 2008).

Müdahale (Kurtarma ve İlk Yardım)

Afet meydana geldikten sonra en etkin ve en hızlı şekilde hayat kurtarmak ve afetin neden olduğu zararlarını azaltmak, yaralıların ve afetzedelerin ihtiyaçlarını gidermek için yapılan çalışmaların tamamını kapsar. Müdahale aşamasında yapılacak olan bütün faaliyetlerin en kısa sürede ve en uygun yöntemle yapılması gerekmektedir (ŞAHİN N. , 2007). Müdahale safhasında yapılan bazı çalışmalar şunlardır:

- İletişim ve ulaşım,
- İhtiyaçların tespit edilmesi,
- Arama, kurtarma ve ilk yardım çalışmaları,
- Geçici barınmanın sağlanması,
- Yiyecek, içecek, giyecek ve yakacak temini,
- Güvenlik, çevre sağlığı çalışmaları,
- Yangın, patlama, salgın hastalıklar ve diğerleri gibi ikincil afetlerin önlenmesi bu çalışmalardan bazılarıdır (KADIOĞLU, Afet Zararlarını Azaltmanın Temel İlkeleri, 2008). Herhangi bir afet meydana geldiğinde yapılması gereken en önemli nokta insan yaşamını korumaktır. İnsan yaşamını korumak için afetten sonraki ilk 72 saat çok kritiktir. İlk 72 saat ‘Altın Saat’ olarak adlandırılmakta ve bu da arama-kurtarma çalışmalarının mümkün olduğunca hızlı ve verimli yapılması gerektiği anlamına gelmektedir (INSARAG, 2017).

İyileştirme

İyileştirme; afet meydana geldikten sonra başlar ve toplumun afet olmadan önceki yaşamına dönmeye kadar devam eder. İyileştirme çalışmaları afetten etkilenen kişilerin ve toplumun

afetten önceki faaliyetlerini devam ettirmesini sağlamak için çalışmalar yapmaktadır (ERSOY YILMAZ , 2020). İyileştirme safhasında yapılan bazı çalışmalar şunlardır:

- Yerel ekonomik canlılığı yeniden kazandırma çalışmaları,
- Altyapıyı geliştirme,
- Sanayi ve ticareti destekleme,
- Toplumun eğitim ve bilgi düzeyini yükseltme çalışmaları,
- Toplumun olası bir afet karşısında daha dirençli olmasını sağlamak için sosyal ve psikolojik destek vermek bu safhadaki çalışmalardandır (AKYEL, 2007).

Yeniden İnşa

Afet, meydana geldiği toplumun sosyo-ekonomik yapısını ve afetzedelerin psiko-sosyal yaşantısını bozmaktadır. Yeniden inşa safhası; bozulmuş olan sosyo-ekonomik yapı ve psikososyal yapının en az afet öncesindeki düzeye yükseltilmesini sağlamak ve yıkılan ya da hasar gören tüm yapıları yeniden inşa etmek için çalışmalar yürütür. Yeniden inşa çalışmalarının süresi afetin büyüklüğüne ve etkisine göre değişmektedir. Afetin meydana geldiği bölgede zarar gören insan, kurum, yerleşim alanı gibi bütün unsurlar ekonomik, sosyal, eğitim, sağlık, fiziki yönden yeniden inşası gerekmektedir. Bu safhada yapılan bazı çalışmalar şunlardır:

- Afet sonucunda hasar almış ya da yıkılmış yapıların yeniden inşa edilmesi,
- Afetzedenin bozulmuş olan psikolojisinin tedavi edilmesi,
- Afet neticesinde bozulmuş olan ekonomik hayatı yeniden canlandırmak için ekonomik destek paketlerinin uygulanması,
- Afet nedeniyle bozulan sosyal yaşam alanlarının yeniden inşa edilmesi bu safhada yapılan çalışmalardan bazılarıdır (ERSOY YILMAZ , 2020).

AKILLI ŞEHİRLER VE AFET YÖNETİMİ

Şehirler, insanların için yaşam alanıdır. Doğal veya insan kaynaklı afetler toplumsal yaşamı etkilemekte ve bu etkiler en çok şehirler üzerinde olmaktadır. Bu nedenle şehirlerdeki tüm sorunlara çözüm aranması gerekmektedir. Şehirlerin afetlerden en az düzeyde etkilenmesi ve can ve mal kayıplarının oluşmaması için afet yönetimi şehirlere entegre edilmeli ve akıllı şehirlere önem verilmelidir. Bu çalışma afetlere karşı akıllı şehir uygulamalarının afet yönetimi için önemini göstermektedir.

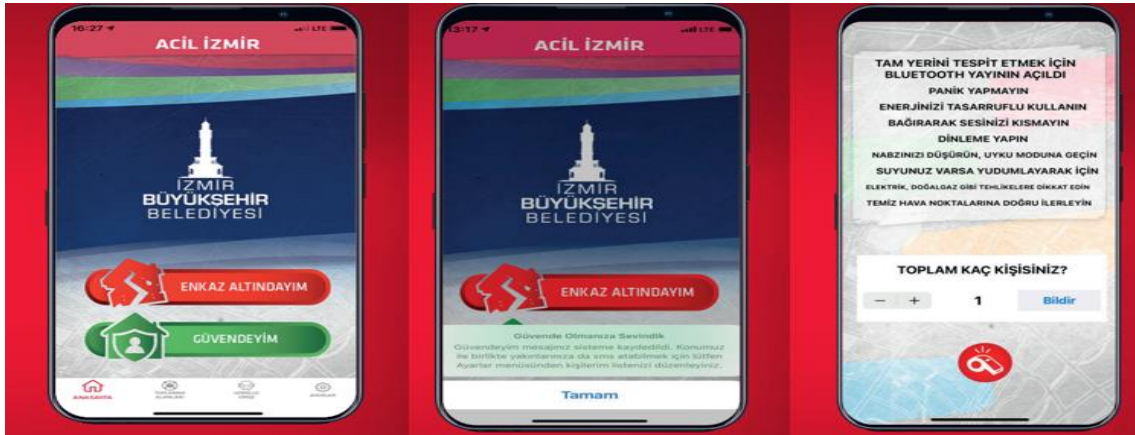

Afet Yönetim Sürecinde Öne Çıkan Akıllı Şehir Uygulamaları

Afet yönetim sürecinde dünyada ve Türkiye’de öne çıkan ve iyi uygulama örneği olarak gösterilen akıllı şehir uygulamalarından bazıları aşağıda açıklanmıştır.

Acil İzmir Uygulaması

İzmir, deprem tehlikesi açısından riskli bölgede yer aldığı için depremin neden olacağı zararları önlemek ya da en düşük düzeye indirmek için akıllı şehir uygulamalarının kullanımının yaygınlaştırılması gerekmektedir. Depremin etkilerini en aza indirebilmek için ‘Acil İzmir’ uygulaması hizmet vermektedir.

Acil İzmir uygulaması olası deprem sonrasında enkaz altında kalan vatandaşlara ulaşmak ve arama kurtarma çalışmalarını daha verimli hale getirmek amacıyla oluşturulmuştur. Uygulama, deprem sonrasında vatandaşların enkaz altında olduklarını ya da güvende olduklarını bildirdikleri bir mobil uygulama olarak çalışmaktadır. Ayrıca deprem sonrasındaki çalışmalarda gönüllü olarak yer alacak vatandaşlar arasındaki iletişimin sağlıklı bir şekilde gerçekleşmesini sağlamak ve toplanma alanlarının yerleri de bu uygulama içerisinde gösterilmektedir. Uygulamanın içeriği şu şekildedir (İzmir Büyükşehir Belediyesi, 2021).

Şekil 13: Acil İzmir uygulaması

Şekil 14: Acil İzmir uygulaması

Kaynak: (İzmir Büyükşehir Belediyesi, 2021).

Smoke Detectors

Amerika'nın Louisiana Eyaleti'ne bağlı New Orleans şehrinde kullanılan 'Smoke Detectors' uygulaması ile olası bir yangın önceden tespit edilip önlenmektedir. New Orleans itfaiyesi yangına daha erken müdahale edebilmek ve yangının olumsuz sonuçlarını en aza indirebilmek için evlere ücretsiz bir şekilde duman dedektörü kurulumunu sağlamıştır. Şehrin yangın risk haritası birinci dereceden beşinci dereceye kadar renklendirme yöntemiyle oluşturulmuştur (Şekil 13). Yangın riskine göre belirlenen alanlarda alınan önlemler ve kurulan duman dedektörü sayesinde yangına erken müdahale imkanı sağlanmaktadır. New Orleans'ta kullanılan bu uygulama ile olası bir yangının neden olacağı can ve mal kayıpları en aza indirilmektedir (SHROPSHIRE, 2019).

Şekil 15. New Orleans Smoke Detectors

Kaynak: (SHROPSHIRE, 2019).

İzmir-Yapay Zeka İle Yangın Tespit ve Analiz Sistemi/Akıllı İhbar Sistemi (AİS)

Şehirleşme ve iklim değişikliği, doğal yaşamı tehdit eden orman yangınlarının oluşma riskini her geçen gün artırmaktadır. Türkiye’de orman yangın riski yüksek olan İzmir’de ‘Akıllı İhbar Sistemi (AİS)’ ile İzmir ormanlarının %62’lik kısmı 18 kuleden toplam 72 kamera ile 360 derece 7/24 kesintisiz olarak izlenmektedir. AİS, kameralar yardımıyla dumanı algılayıp, yangının şeklini ve seyrini belirleyip dumanın görüntüsünün yerini, koordinatlarını itfaiye ekipleri ile muhtarlara aktarmaktadır. Sistem canlı izleme özelliği sayesinde ekipler tarafından alınan ihbar canlı olarak izlenebilir ve kayıt altına alınabilir (Şekil 14, 15). Akıllı İhbar Sisteminin amacı yangını başlangıç anında söndürmektir. AİS ile 3 ayda 34 orman yangınına başlangıç aşamasında müdahale edilip yangının büyüüp genişlemeden söndürülmesi başarılı bir şekilde gerçekleştirilmiştir (İzmir Büyükşehir Belediyesi, 2022).

Şekil 16. Akıllı İhbar Sistemi (AİS)

Beylikdüzü Afet Bilgi Sistemi (ABİS)

İstanbul'un Beylikdüzü İlçesi can ve mal kaybına yol açan deprem, heyelan gibi afetlere maruz kalmaktadır. İlçenin litolojik yapısı kum, kil, çakıl, marn gibi gevşek yapıları zeminden oluştuğu için heyelan olaylarının yaşanmasına ortam hazırlamaktadır. Heyelan olayı genel olarak kıyı kesimlerde eğim değerlerinin arttığı yamaçlar ile akarsu vadilerinde eğim değerlerinin arttığı yamaçlarda yoğunlaşmıştır. İlçede heyelan olayı en fazla Gürpınar Mahallesi'nin Büyükçekmece koyuna bakan yamaçlarında meydana gelmektedir. Ayrıca Marmara Denizine komşu güney yamaçlarda da heyelan olayı görülmektedir (YAMAN KOCADAĞLI, 2017).

Şekil 18. Eski ve güncel heyelan alanlarının dağılımı

Kaynak: (YAMAN KOCADAĞLI, 2017).

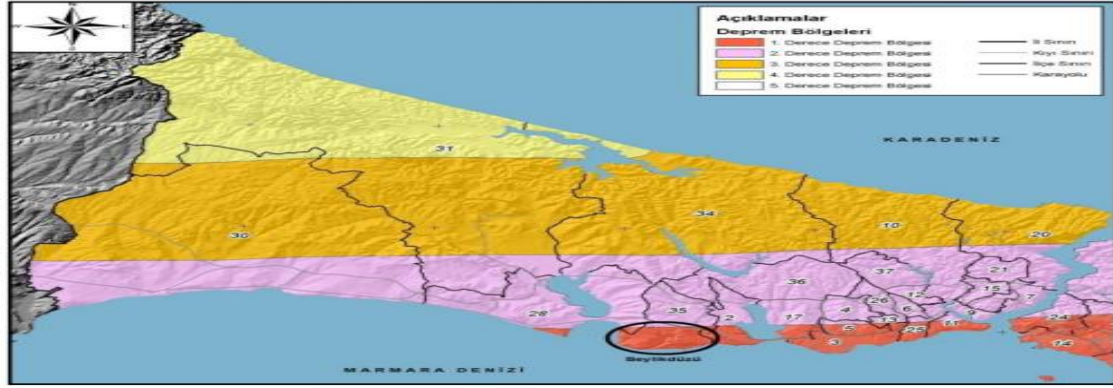

Beylikdüzü için tehlike arz eden bir diğer afet depremlerdir. Kuzey Anadolu Fay Hattı'nın varlığı bölgenin deprem riskini arttırmaktadır (Şekil 17). Tarihsel süreç içerisinde bu fay hattı üzerinde büyük miktarlarda can ve mal kayıplarına neden olan birçok deprem meydana gelmiştir.

Şekil 19. Kuzey Anadolu Fay Hattı'nın Marmara Denizi içerisindeki uzanım hattı ve Beylikdüzü'ne göre konumu

Kaynak: (YAMAN KOCADAĞLI, 2017).

Ülkemizin en aktif ve deprem üretme potansiyeli en yüksek fay hatlarından birisi Kuzey Anadolu Fay Hattıdır. Aktif bir deprem sahasında yer alan Beylikdüzü 1.dereceden deprem bölgesinde yer almaktadır (Şekil 18). İstanbul ve çevresinde 1999 Marmara depremleri başta olmak üzere çeşitli büyüklüklerde birçok deprem meydana gelmiştir (Şekil 19).

Şekil 20. İstanbul deprem bölgeleri dağılım haritası

Şekil 21. 1900 ile 2010 yılları arasında Marmara Denizinin kuzeyi ve İstanbul ilinde büyüklüğü 2 'nin üzerinde meydana gelmiş olan depremlerin dağılımı

Kaynak: (YAMAN KOCADAĞLI, 2017).

Afetler açısından riskli bir konumda olan Beylikdüzü İlçesinde olası bütün afetlere karşı hazırlıklı olma yönünde çalışmalar yapılmaktadır. Ayrıca doğa olaylarının bir afete dönüşmesini engellemek için ve vatandaşların güvenli bir yaşam sürdürmesini sağlamak amacıyla etkin bir 'Afet Yönetim Sistemi' oluşturma yönünde çalışmalar yapılmaktadır. Bu doğrultuda 'Beylikdüzü Hazır' uygulaması kullanılmaktadır. Bu uygulamada;

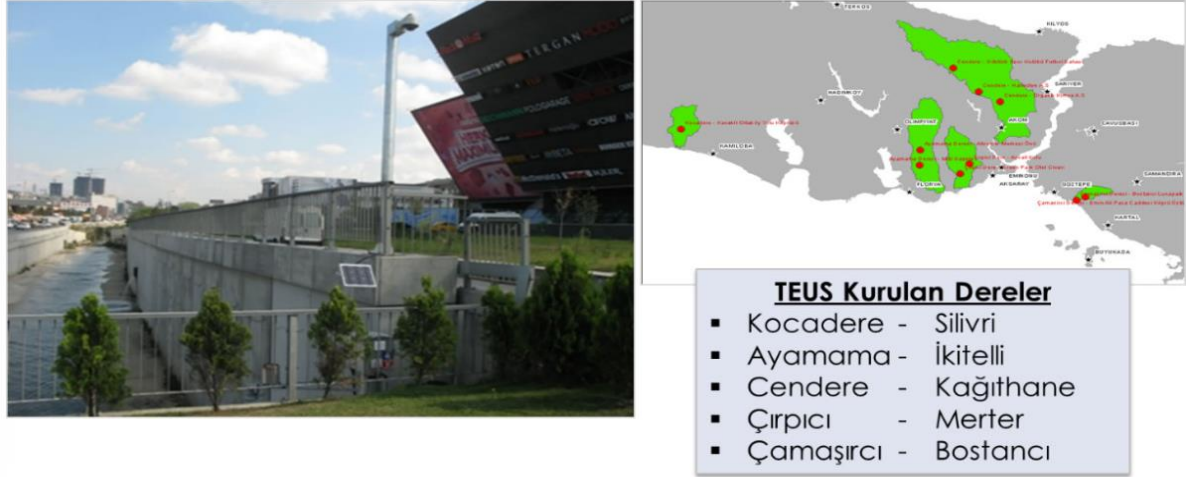

- Acil durum planı,
- Toplanma alanları,
- Deprem çantasında nelerin bulunması gerektiği,
- Afet öncesi, anı ve sonrasında dikkat edilmesi gerekenler,

- Afet öncesinde yapılması gereken risk azaltma faaliyetleri,
- Alınması gereken önlemler,
- Vatandaşlara yönelik eğitim çalışmaları,
- İlçenin güncel verilerine yönelik bilgiler yer almaktadır (Beylikdüzü Belediyesi, 2017).

Ayrıca ‘Afet Bilgi Sistemi (ABİS)’ uygulaması Beylikdüzü’nün afetlere karşı var olan tüm kapasitesinin belirlenmesini ve yönetilmesini sağlamaktadır. ABİS ile ilçede yaşayan vatandaşların ikamet ettikleri ya da çalıştıkları yerlere özel toplanma alanları oluşturulmuştur. Ayrıca olası bir afet durumunda ihtiyaç duyulan tüm unsurların (hastane, eczane, acil ulaşım yolları, su temin noktaları vb.) adres bilgileri bu sistemde yer almaktadır. Beylikdüzü İlçesi sahip olduğu akıllı şehir uygulamaları ile afet yönetimini etkin bir şekilde uygulamaktadır (Beylikdüzü Belediyesi, 2017).

Taşkın Erken Uyarı Sistemi (TEUS) ve Sel Erken Uyarı Sistemi

Türkiye orta kuşakta yer almasından dolayı atmosferik kökenli afetlere maruz kalmaktadır. Türkiye’de yaşanan taşkınların genel nedeni, plansız ve kontrolsüz yapılaşma ve şehirleşme faaliyetleridir (ÖZMEN, Sel-Taşkın Türkiye ve Antalya, 2015). Dünyada önemli afetler arasında gösterilen taşkın afeti, Türkiye’de en fazla can ve mal kaybına yol açan ikinci afet türüdür. (Birinci sırada deprem vardır.) Bu nedenle taşkınların önlenmesi ve etkilerinin azaltılması için taşkın tahmin yöntemleri kullanılmaktadır. Taşkının önceden tahmin edilmesi ve etkilerinin azaltılması hususunda taşkın bölgesinde yaşayan kişilere erken uyarı sistemiyle uyarı yapılabilen, can ve mal kayıpları en aza indirilebilmektedir (KADIOĞLU, Kent Selleri Yönetim ve Kontrol Rehberi, 2019). Türkiye’nin en büyük şehri olan İstanbul’da AKOM ve İSKİ tarafından ortak bir çalışma yürütülerek taşkın afeti sonucunda oluşabilecek can ve mal kayıplarını en az düzeyde tutmak için ‘Taşkın Erken Uyarı Sistemi (TEUS)’ kurulmuştur (Şekil 20). TEUS, su seviyesinde meydana gelen artışı ve bu artışa bağlı olarak artan su akımının yerleşim alanlarında oluşturduğu taşkın riskini tespit etmek için kullanılır. Bu sistem dereler üzerine kurulan akım gözlem istasyonu ve bazı sensör ve ekipman yardımıyla su seviyesi takip edilmekte ve kamera vasıtasıyla dereler izlenmektedir. Su seviyesinin anlık ve canlı bir şekilde izlenip takip edilebildiği bu uygulama sayesinde İstanbul’un taşkın karşısındaki dirençliliği arttırılmış ve afet yönetimi noktasında şehrin güvenliği sağlanmıştır.

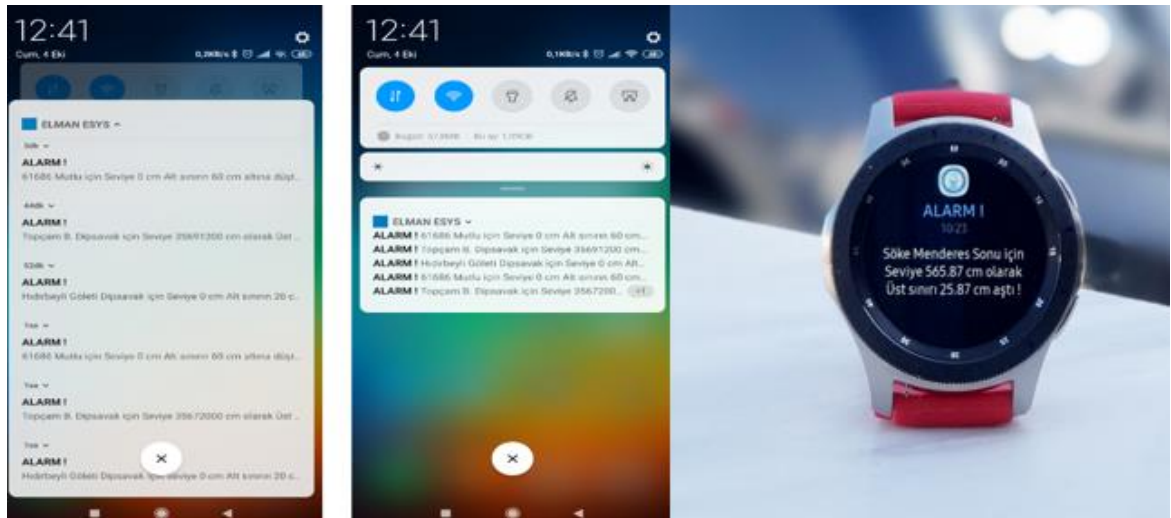

Şekil 22. Taşkın Erken Uyarı Sistemi (TEUS)

Kaynak: (İstanbul Büyükşehir Belediyesi AKOM, 2022).

Sel erken uyarı sistemi, akarsularda bulunan suların ani olarak yükselmeleri durumunda ilgili kamu kurum ve kuruluşlarına erken uyarı verip önlemlerin önceden hızlı bir şekilde alınmasını ve can ve mal kaybının önlenmesini sağlamaktadır. Tehlikeli bir durum oluştuğunda sistemi kullanan kurum kuruluşlara;

- Akıllı telefon ya da tablet üzerinden bildirim göndererek (Şekil 21),
- Akıllı saatlerden alarm uyarısı ileterek (Şekil 21),
- SMS ile bildirim yaparak,
- Hoparlör ile sesli uyarı vererek tehlikeli duruma karşı erken uyarı sağlanır. Böylece sel durumu gerçekleşmeden önce hazırlık yapmak için, meydana gelebilecek can ve mal kaybını en az düzeyde tutmak için gerekli olan önlemleri alma fırsatı oluşur (ELMAN, 2023).

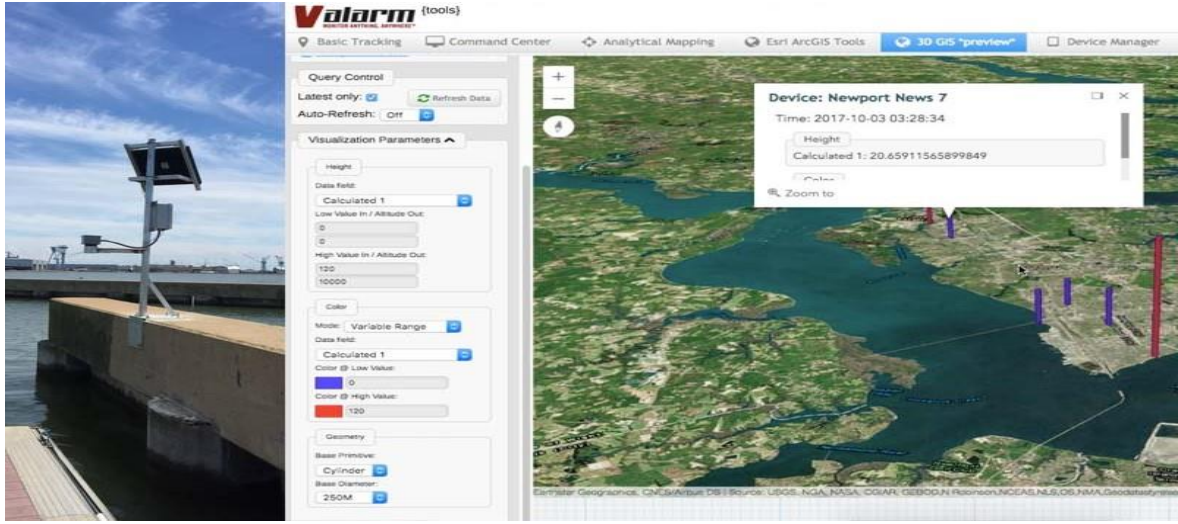

Şekil 23: Sel erken uyarı sistemi

Kaynak: (ELMAN, 2023).

Valarm

Amerika'nın okyanus kıyısında yer alan Virginia Eyaleti'nde sel afetiyle mücadele etmek için 'Valarm' sistemi uygulanmaktadır (Şekil 22). Bu uygulama ile fırtınalardan, yağmurdan ya da gelgitlerden kaynaklanan sel olayını engellemek hedeflenmektedir. Bunun için okyanus kenarlarına ve şehrin belirli bölgelerine konumlandırılan sel ve su izleme sistemleri ve derinlik sensörleri kullanarak su seviyesi ve derinlik seviyesi ölçülmektedir (Şekil 23). Olası bir tehdit durumunda eyalet sakinleri erken uyarı sistemleriyle harekete geçirilecektir. Böylece sel nedeniyle oluşabilecek can ve mal kaybı en düşük seviyede tutulmuş olacaktır (Valarm, 2022).

Şekil 24. Valarm

Kaynak: (Valarm, 2022).

Şekil 25. Valarm

Kaynak: (Valarm, 2022).

Smart Water Vejle

Danimarka bulunduğu konum nedeniyle sel afetine maruz kalmaktadır. Danimarka'nın kıyı şehirlerinden birisi olan Vejle şehri, nehirlerin ve vadilerin birleştiği yerde bulunduğundan dolayı sel riskiyle karşı karşıyadır. Tarihsel süreç içerisinde Vejle şehrinde yoğun yağışlar ve sık sık sel olayları meydana gelmiş ve bu sel olaylarından şehir sakinleri zarar görmüştür. Zaman içerisinde yağışların artması, deniz suyu seviyesinin yükselmesi, iklim değişikliğinin etkisi ve fırtınaların sık sık olması nedeniyle sellerin sıklığı ve şiddeti artmıştır. Vejle şehrinin bu yapısı nedeniyle sel afeti şehir için sürekli bir tehdit oluşturmaktadır. Şehri sellerden korumak için nehirlere taşkın koruma kapakları yapılmıştır (Şekil 24) (DHI Worldwide, 2018). Sel olayının olumsuz sonuçlarını minimuma indirmek için taşkın kontrol yapılarını etkin bir şekilde yönetmek gerekmektedir. Bunu gerçekleştirmek için 'Smart Water Vejle' uygulaması geliştirilmiştir. Bu uygulama ile taşkına bağlı ölçüm ve hesaplamalar yapılarak uyarı sistemleri ve planlamalar geliştirilir. Smart Water Vejle uygulamasıyla;

- Radar tahminlerini kullanma: 10 dakika arayla radardan gelen yağış verileri ilk olarak yağmur ölçere göre kalibre edilir. Sonra 2 saatlik yağış tahmini yapılır.
- Nehir akışını ve su seviyelerini tahmin etme: Radar ölçümlerine göre yüzey sularının, nehir sularının ve yer altı sularının akışı tahmin edilir.
- Yağış tahminleri, sensör verileri, su seviyesi ve akış tahminlerini kullanarak taşkın kontrol sistemlerinin kontrolü gerçekleştirilir.
- Yer altı, nehir ve yağmur suyunun drenajı için destek sistemleri geliştirilir, kentsel yağmur suyu drenajını belirlemek için modelleme yöntemiyle tahmin yapılır.
- Veri görselleştirme: Ölçülen, tahmin edilen verilerin daha iyi anlaşılabilmesi için görselleştirme yapılır.
- Elde edilen bütün veriler ve tahminler tek bir platforma aktarılır (DHI Worldwide, 2018).

Bu uygulama ile sel tehlikesi altında yer alan Vejle şehrinin sel olayına karşı direnci arttırılmış, selin meydana getirebileceği muhtemel zararları en az düzeye indirmek için çalışmalar yapılmıştır. SMART Water Vejle uygulaması olumlu sonuçlar vermiştir. Sonuç olarak;

- ✓ Vejle şehri; akarsu, yağmur, kıyı taşkın riskini yönetebilir seviyeye gelmiştir.

- ✓ Erken uyarı sistemiyle daha güvenli ve daha hızlı sel acil durum yönetimi sağlanır (Resilient Vejle, 2016).

Şekil 26. Taşkın koruma kapakları

Kaynak: (DHI Worldwide, 2018).

Tokyo-Japonya Sel Suları Yeraltı Depolama Sistemi

Japonya'nın başkenti Tokyo'da şehri fırtına, sel ve taşkından korumak için yeraltına sel sularını depolama sistemi yapılmıştır. Tokyo'nun bazı eyaletleri Nakagawa Havzasında yer almaktadır. Bu havza; Edogawa Nehri (Şekil 25) seviyesinin altında, alçak bir arazi şeklinde ve içinden Edogawa Nehri de dahil olmak üzere birkaç nehrin geçtiği bölgedir. Bölge, nehir sularının kaynağını oluşturan dağlardaki karların erimesi döneminde ve şiddetli yağışlarla beraber oluşan tayfun ve fırtına sonucunda sel ile karşı karşıya kalmaktadır. Şehir, meydana gelen sel ve taşkınlar sonucunda zarar görmektedir. Tarım mahsulleri, tarım arazilerinin sular altında kalmasından dolayı yok olmaktadır. Bölgede defalarca ciddi sel olayları meydana gelmiş ve sel afeti sonucunda birçok kişi mağdur olmuştur. Nüfusun yoğun olduğu bölgeyi sel afetinin olumsuz etkilerinden korumak için yeraltı depolama sistemleri geliştirilmiştir. 1992 yılında başlanan bu proje 2006 yılında tamamlanmıştır. Geliştirilen proje sonucunda, şehirde sel ve taşkınların yol açtığı can ve mal kayıpları azalmıştır. Bu proje, üzerinde bina bulunmayan tarım arazisi altına inşa edilmiştir.

Şekil 27. Edogawa Nehri

**International Conference on Global Practice of Multidisciplinary Scientific Studies-
IV
Turkish Republic of Northern Cyprus, April 28-30, 2023**

Yeraltı depolama sistemi (Şekil 26, 27);

- 6,3 km. uzunluğundaki merkezi tünel aracılığı ile nehirlerdeki fazla su toplanır ve muhafaza silolarına aktarılır.
- Yüksekliği 70 metre, genişliği 30 metre olan muhafaza siloları fazla suyu biriktirir.
- Toplanan su daha sonra 10 metre genişliğindeki yeraltı su tünelinden dengeleme tankı tesisine aktarılır.
- Yağış bittikten sonra ve durum normale döndüğünde depolanan su güvenli bir şekilde Tokyo Körfezi'ne bırakılmak için Edogawa Nehrine Pompalanır.
- Sel suları Edogawa Nehri aracılığı ile Tokyo Körfezi'ne boşaltılır (Japan Experience , 2014).

Stockholm (İsveç)-Hammarby Sjöstad

Sera gazları, atmosferdeki ısıyı tutarak sıcaklığı artırmakta ve küresel ısınmaya ve iklim değişikliğine neden olmaktadır. Stockholm (İsveç) yetkilileri atmosfere zararlı olan sera gazlarının salınımını azaltmak için fosil yakıt kullanımı azaltıp yenilenebilir enerji kaynaklarının kullanımını yaygın hale getirmiştir. Bu sayede sera gazının salınımı Stockholm’de ülke ortalamasının yarısına düşürülmüştür (YILDIZ, 2013). Stockholm’ün Hammarby Sjöstad semti akıllı şehir kapsamında yeniden inşa edilmiştir. 1997 yılında başlanan bu proje kapsamında;

- Yeraltına otomatik atık toplama sistemi yapılması,
- Isıtma ve soğutmanın merkezi sistem üzerinden sağlanması,
- Sıcak su ve elektriğin güneş enerjisinden elde edilmesi,
- Eysel kanalizasyon suyu ve atıklardan biyogaz elde edilmesi,
- Yüzey sularının toplanması ve filtrelenmesi yer almaktadır (YILDIZ, 2013).

Hammarby Sjöstad semtinde yer altına atık maddelerin dönüşümünü sağlamak için bir alt yapı sistemi kurulmuştur (Şekil 28) (YILDIZ, 2013). Bölgedeki evlerin önüne çöp kutusu yerine geçen metal kutular yerleştirilmiştir (Şekil 29). Bu kutuların kapakları farklı renklerde, bu renkler atık maddelerin cinslerine göre ayrılmasını sağlamak ve atık maddelerin uygun çöp kutusuna atılmasını sağlamaktadır. Bu çöp kutuları günde 2 defa vakum sistemiyle çöpleri yeraltındaki boru sistemine aktarmaktadır (Şekil 28). Organik atık maddeler gübre üretim merkezine gönderilmekte, diğer atık maddeler yakılarak enerji elde edilmekte ve merkezi ısıtma sisteminde kullanılmaktadır. Atık sıvı maddelerden ise arıtma tesislerinde biyogaz elde edilmektedir. Elde edilen biyogaz mutfaklardaki ocaklarda ve belediye otobüslerinde kullanılmaktadır (YILDIZ, 2013).

Şekil 30. Yeraltı atık toplama sistemi

Kaynak: (YILDIZ, 2013).

Şekil 31. Metal çöp kutuları

Kaynak: (YILDIZ, 2013).

Bölgede soğuk geçen kış aylarında ısınmayı sağlamak için ‘temiz atık yakım teknolojisi’ ile bölgesel merkezi ısıtma sistemi oluşturulmuştur. Bu sistem ile bölgedeki enerji tesislerinde elde edilen buhar ve sıcak su, yeraltındaki borular aracılığı ile binalara iletilmektedir. Bu sistem aracılığıyla bölge nüfusunun %50’sinin ısınma ihtiyacı karşılanmaktadır. (YILDIZ, 2013). Stockholm şehrinde ısınma için gerekli olan enerjinin %80’i yenilenebilir enerji kaynaklarından karşılanmaktadır. Bu sistem sayesinde atmosfere salınan sera gazı emisyonunun azaldığı belirlenmiştir. Yaz aylarında bölgenin soğutma ihtiyacı da aynı sistem üzerinden soğuk göl ve deniz suyu kullanılarak gerçekleştirilmektedir. Bu soğutma sistemi sayesinde karbondioksit emisyonu yılda yaklaşık olarak 50 bin ton azalmaktadır (DİLER, 2012). Ayrıca bölgede sıcak su ve elektrik üretimi konusunda güneş enerjisi teknolojilerinden yararlanılmaktadır. İsveç’te ısınma ve elektrik üretimi için kullanılan petrol miktarı %90 oranında azalmıştır. Buna bağlı olarak da karbondioksit emisyonu azalmıştır (YILDIZ, 2013).

SONUÇ VE ÖNERİLER

Dünya nüfusunun hızla artış göstermesi ve insanların daha iyi imkanlar altında yaşamak istemesinden dolayı şehirlerde yaşayan insan sayısı gün geçtikçe artmaktadır. Şehirleşmenin hızlı bir şekilde olması şehirlerde; çevre sorunları, denetimsiz yerleşim, gecekondulaşma, alt yapı sorunları gibi birçok sorunları ciddi boyuta ulaştırmıştır. Böyle bir durumda şehirlerde meydana gelebilecek olası afetlerin maddi ve manevi etkileri çok büyük olacaktır. Bu nedenle şehirleri daha yaşanabilir kılmak için ve yaşam standartlarını arttırmak için akıllı şehir uygulamaları geliştirilmektedir. Afetlerin olumsuz etkilerini azaltmaya yönelik ve afetleri daha yönetilebilir kılmaya yönelik geliştirilen akıllı şehir uygulamalarından bazıları ele alınarak anlatılmıştır.

Doğal kökenli ya da insan kökenli meydana gelen afetler her geçen gün daha çok can ve mal kaybına neden olmaktadır. Özellikle çarpık kentleşme, nüfusun hızla artması, zayıf binalar, alt yapı eksiklikleri, toplumun afet bilinci düzeyinin düşük olması gibi etkenler afetin toplum üzerindeki etkilerinin artmasına neden olmaktadır. Afetleri önlemek ya da afetlerin zararlarını azaltmak için toplumu afetlere karşı dirençli hale getirmek gerekmektedir. Toplumun afetlere karşı direncini arttırmak için;

- Afetlere yönelik eğitim verilmeli,
- Afet yönetimi konusunda risk yönetimi alanına daha çok önem verilmeli,

- Afet meydana gelmeden önce önlem alınmalı, hazırlık yapılmalı,
- Afetlerle mücadele modelleri, uygulamaları oluşturulmalı,
- Afet risk haritaları oluşturularak afetlere özel çalışmalar yapılmalı,
- Afet tehlikesi ve riski konusunda toplum bilinçlendirilmelidir.

Afetler, toplumun olağan yaşamını etkileyen önemli etkenlerden bir tanesi olmakla beraber özellikle şehir yaşamını olumsuz etkilemektedir. İklim değişikliği, toprak kayması, sel, deprem gibi birçok afetlere karşı yenilikçi çözüm üretmek gerekmektedir. Bu noktada çözüm üretme aracı olarak karşımıza akıllı şehir uygulamaları çıkmaktadır. Şehirlerdeki; alt yapı yetersizliği, birimler arasındaki koordinasyon eksikliği, toplumun bilinç düzeyindeki eksiklikler afetlerle mücadele konusunda karşılaşılan zorluklardandır. Akıllı şehir uygulamaları karşılaşılan bu ve buna benzer sorunların giderilmesi konusunda yenilikçi çözümler üretmektedir. Şehirlerin sorun ve ihtiyaçlarına çözüm üreten akıllı şehir uygulamaları, afet yönetimi sürecinde de çözüm üretmektedir. İzmir, New Orleans, İstanbul, Virginia, Vejle, Stockholm, Tokyo gibi şehirlerde uygulanan akıllı şehir uygulamalarının;

- Afet yönetiminde kullanılan birçok akıllı uygulama geliştirdiği,
- Afetlerin neden olduğu can ve mal kaybının azalmasında etkisi olduğu,
- Şehirlerin afetler karşısında daha dirençli hale gelmesinde etkisi olduğu görülmektedir.

Akıllı şehir uygulamaları, ihtiyaç ve sorunlara yönelik vatandaş odaklı sürdürülebilir çözümler üretmesinden dolayı afet yönetimi sürecinde etkin rol oynamakta ve afet ve acil durumlarda mücadelede önemli bir yer tutmaktadır.

Afetlere karşı dirençli şehirler geliştirmek için akıllı şehir uygulamalarına önem verilmelidir. Afet yönetiminde öne çıkan akıllı şehir uygulamaları vatandaşları bilgilendirerek toplumun afetlere karşı olan direncini artırmakta ve akıllı uygulamalarla şehirleri afetlere karşı daha dirençli hale getirmektedir.

ÖNERİLER

- Akıllı şehirler konusunda öncelikle yapılması gereken ‘Merkezi Kent Bilgi Sistemi’ uygulamalarının yaygınlaştırılması gerekmektedir.
- Akıllı şehir projelerinin yaygınlaşması için akıllı şehir çalıştayları ile belediyeler arasında bilgi aktarımı geliştirilmelidir.
- Kentsel dönüşüm çalışmalarında akıllı şehir yaklaşımı temel alınmalıdır.

- Akıllı şehir uygulamaları şehrin ihtiyaçlarına ve zorluklarına cevap verecek şekilde dizayn edilmelidir.
- Akıllı şehirlerde sürdürülebilir ve modern bir ağ altyapı sistemleri oluşturulmalıdır.
- Akıllı şehirleşme sürecinde insanlarla olan iş birliği ve iletişim artırılmalıdır.
- Afetler önlenemez ancak zararları toplumun direncini arttırarak azaltılabilir. Afet zararlarının azaltılabilmesi için akıllı ve bütünleşik afet yönetim sistemi uygulanmalıdır. Afet planları akıllı ve sürdürülebilir hale getirilmelidir.
- Toplumun afetlere karşı dirençli yapıya getirilmesi için afet bilinci eğitimi verilmelidir.
- Afetlere yönelik akıllı şehir uygulamaları geliştirilmeli ve kullanım alanları artırılmalıdır.
- Toplumun afetlere karşı bilinci arttırmak için afet bilgi sistemi gibi uygulamalar yaygınlaştırılmalıdır.
- Yangın afetine karşı akıllı ihbar sistemi ve duman dedektörleri gibi uygulamaların kullanımı yaygınlaştırılmalıdır.
- Sel ve taşkın olaylarının afete dönüşmesini engellemek için erken uyarı sistemlerinin kullanımı yaygınlaştırılmalıdır.
- Şehirleri afetlere karşı hazırlamak için afet planları geliştirilmelidir.
- Şehirlerde afetlerin neden olduğu olumsuz etkileri azaltmak için afetlere özel akıllı şehir uygulamaları geliştirilmeli ve bu uygulamalarının kullanımlarının yaygınlaştırılması gerekmektedir.

**ANALYZING TEACHERS' VIEWS REGARDING SCHOOL ADMINISTRATORS'
SOCIAL JUSTICE LEADERSHIP IMPLEMENTATIONS**

ABSTRACT

Social justice leadership has recently become a significant phenomenon within the organizations in terms of the fact that it attaches importance to each member's gaining the equal rights and opportunities to improve the organization and the self no matter what their identical characteristics are. According to what the literature illustrates, prominent school leaders might utilize social justice leadership and implement the concept into their managerial decisions and organizational procedures and thus might enable a desirable education environment. Nevertheless, there is no adequate research – based knowledge about teachers' comprehension of the social justice leadership implementations of the school administrators in a deep, inquisitive qualitative analysis in the context of vocational and technical Anatolian high schools in Türkiye. In that respect, this paper reports an in-depth analysis of the social justice leadership in the case of a vocational and technical Anatolian high school. Using data gathered from the teachers views' regarding the school administrators' social justice leadership implementations, the study aims to analyze the following topic: how the teachers comprehend the school administrators' implementations in the context of the social justice leadership. Based on the data of the study, it has been concluded that social justice leadership is a critical matter as for the participants of the study and thus it is recommended that social justice leadership be emphasized by the school administrators within the organizational behaviours so as to enable a positive school climate.

Keywords: Social justice leadership, school administrators, teachers, vocational and technical Anatolian high schools

Introduction

With the ever-changing interpretation of the organizations and the procedures led by the management within them, it is evidently seen that there has become an evolutionary tendency towards the contemporary leadership styles rather than the classical understanding of leading the organizations. In that respect, the literature illustrates that social justice leadership has recently obtained a remarkable place on the organizational management procedures. Social justice leadership can be expressed as an inclusive leadership style that enables the equality for access to the organizational services by supporting the minority differentiating from the majority in terms of the language, racial, religious, gender – based aspects and so on (Theoharis, 2007). In that respect, a social justice leader can be considered as the one who considers the differences as the source of the power in a whole sense within the management procedures no matter what the members of the organization carry as properties.

As for the identification of the social justice leadership, Warner (2020) emphasizes the fact that the implementation of focusing on the social justice with the preliminary target is what social justice leadership actually means and requires and adds that it aims to remove segregation depending on ethnical or socioeconomical positions by carrying out the just and equal applications for the education process. According to Fraser (2012), by the way, social justice leadership might be identified as a style of leadership which focuses on the efficiency of the leader in terms of the implementations so as to enable a better and more successful organization experienced by all the stakeholders even if they are in extreme despair.

Social justice leaders naturally assume and become aware of the current situation in terms of the inequalities in their organization and implement the reflective decisions or actions regarding this situation (Doğan & Yıldırım, 2022). When viewed from this aspect, social justice leadership is the most appropriate leadership to be exhibited so as to overcome the problems resulting from the inequalities and find out the strategical remedies to them (Furman, 2012). Regarding the requirement of the social justice leadership, Turhan (2010) emphasizes the fact that social justice is necessary to be guaranteed within the education and the various fields of everyday life as in the legal documents and laws consider it as the basic element of their essence as well as its significance within organizing and managing processes of the organizations.

As for the educational institutions that have the role and the mission of improving and serving the society via the output of individuals, social justice leadership implementations have key importance considering the fact that the stakeholders' behaviours and attitudes are directly affected by the school leaders' policies and strategies in terms of their understanding of justice (Demirel, 2009). In coherence to this, it is an irrefutable fact upon the accumulated knowledge

via the literature that school leader's acting in sensitivity regarding social justice by enhancing justice-based implementations will have a positive impact upon teachers' commitment to the school, success and motivation as well as the school climate that influences all the stakeholders of the school (Küçükçene & Aydoğan, 2018). Establishing social justice within the educational institutions is correlated to the implementations of the management of the schools, including a wide range of differences within the students and teachers regarding the racial, ethnic and gender-founded factors; in that context, school leaders have a great responsibility in order to enable a school environment that attaches importance to the social justice within the institution regardless of the qualities of the stakeholders by implementing just and equal school build-up (Turhan, 2010).

Skousen & Domenque (2020) focuses on the challenges of the social justice leadership in that schools can consist of the students who are deliberately or indeliberately in extreme ends due to the socioeconomic deficiencies they have, as a result of which leaders of the school had better get the awareness of those extreme student groups and improve their leading skills so as to enable the social justice based organization functioning. Within the scope of educational aspects, social justice leadership includes certain wide categories such as ethical virtues, equality, respectful and careful attitudes or behaviours in the permanently significant place and getting the fundamental consciousness over the influence of racial, gender – based and disability – related conditions on the educational institutions and student enhancement (Cameron – McCabe & McCarthy, 2005).

Bozkurt (2023) advocates that school climate is affected by the social justice leadership skills of the school administrators and this seems as a controversial issue due to the fact that enabling just implementations at institutions like schools focusing on the education is not an easy thing to accomplish as for the building of the schools with the members having distinct properties and that schools carry the characteristic of a social entity.

When focusing on the literature regarding the negligence or deficiency of the social justice leadership implementations in the educational institutions, it is evidently seen that this might lead to organizational conflict, professional burnout, isolation or anomie, dissent and cynicism that would be experienced by the stakeholders of the organization. Nevertheless, depending on analyzing the literature and the implementations at schools, social justice leadership contributes to the organization in that it enables stakeholders of the institution such as parents, students, teachers and auxiliary staff to get through some negative impacts they feel related to the managerial processes and experience trust, commitment, motivation, collaboration, equality and inclusiveness within their organization more evidently, which helps them become an integrated component of the institution. According to Bilgi (2020), in order that school administrators can lead successfully and effectively, they have to create a non-problematic and tolerant interaction

with the members of the organization. In that respect, the interaction between a school manager who exhibits the social justice leadership implementations and the other stakeholders such as teachers, students and parents should rely on the feeling of trust (Furman, 2012). In line with this, it can be emphasized that school administrators who have social leadership skills target to build up a positive school climate (Gören, 2019).

The following is the diagram illustrating the theoretical framework of the study with regard to the themes or sub –categories:

Figure 1: Theoretical Framework of Social Justice Leadership

Research and Findings

The study, which is essentially a case research, has been carried out via the semi – structured interview technique which is one of the preliminary qualitative research methods. Herein, it is aimed to get a comprehensive and deep accumulation of knowledge related to the implementations of the school administrators by demanding both the views of the teachers’ and those of the school administrators.

Due to the fact that eight department chiefs in the school, which is basically a vocational and technical Anatolian high school, directly participate in the implementations (training process), and in that respect, they have a great deal of information on this process thanks to their active interactions with the students and their parents and the other teachers in different fields, they have been included in the study within the scope of the purposeful sampling pattern and on the basis of the criterion of at least two – year professional seniority, the views of the department chiefs have been asked via the semi – structural interview form.

In that respect, the questions of the form have been formed in accordance with the research problem and themes of the study. The answers obtained from the study group have been classified into the categories related to the theoretical framework of the study and the recommendations have been made in the conclusion by making an overall assessment.

Within the study, it has been aimed to put forward how school administrators' social justice leadership implementations are comprehended by the teachers. In that respect, the problem statement of the study is how the teachers comprehend the school administrators' implementations in the context of the social justice leadership. The subproblems of the study are given as below:

- How are the school administrators' implementations towards parents in the context of social justice leadership? (How do the parents' socioeconomic positions / differences / identities (etnical – political – gender based, etc.) / cultures reflect on the school administrators' implementations towards them?)
- How are the school administrators' implementations towards students in the context of social justice leadership? (How do the students' socioeconomic positions / differences / identities (etnical – political – gender based, etc.) / cultures reflect on the school administrators' implementations towards them?)
- How are the school administrators' implementations towards teachers in the context of social justice leadership? (How do the teachers' socioeconomic positions / differences / identities (etnical – political – gender based, etc.) / cultures reflect on the school administrators' implementations towards them?)
- How are the school administrators' implementations towards auxiliary staff in the context of social justice leadership? (How do the auxiliary staff's socioeconomic positions / differences / identities (etnical – political – gender based, etc.) / cultures reflect on the school administrators' implementations towards them?)
- How are the reflections of the social justice leadership implemented by the school administrators towards parents, students, teachers and auxiliary staff on trust, commitment, motivation, collaboration, equality and inclusiveness at school?

The following is the table illustrating the demographic variables of the participants:

Table 1. Demographic variables of the participants

Participants	Gender	Age	Institution	Professional Seniority	Educational Status	Career Title	Field	Occupation
P1	Male	31 – 40	6 years and over	11 – 20 years	B.A.	Specialist Teacher	Food and Beverage Services	Field Chief
P2	Male	31 – 40	6 years and over	11 – 20 years	B.A.	Specialist Teacher	Food and Beverage Services	Department Chief
P3	Male	31 – 40	6 years and over	11 – 20 years	B.A.	Teacher	Food and Beverage Services	Department Chief
P4	Male	31 – 40	0 – 2 years	11 – 20 years	M.A.	Specialist Teacher	Food and Beverage Services	Department Chief
P5	Female	41 – 50	3 – 5 years	21 years and over	B.A.	Specialist Teacher	Accommodation and Transportation Services	Field Chief
P6	Female	31 – 40	6 years and over	6 – 10 years	B.A.	Teacher	Accommodation and Transportation Services	Department Chief
P7	Male	31 – 40	0 – 2 years	6 – 10 years	B.A.	Teacher	Accommodation and Transportation Services	Department Chief
P8	Female	30 years and below	0 – 2 years	0 – 5 years	B.A.	Teacher	Accommodation and Transportation Services	Department Chief

As seen in the table above, while the half of the teachers are the field and department chiefs working at Food and Beverage Services Department, the other half consists of those working at Accommodation and Transportation Services. It is also seen that four of the participants are specialist teachers -a title brought by the Ministry for those who have ten years of experience, passes the proficiency exam or a graduate degree- while four of them are not, due to the low experience period. In addition, just one of the participants has a graduate degree and only two of the participants are field chiefs responsible from all the procedures.

Table 2. Demographic variables of the participants of the study

Sub-Problems	Some Replies of the Participants Regarding the Questions for the Sub – Problems
School administrators' implementations towards parents in the context of social justice leadership	<p>P1 says "In our school, it is seen that administrative staff does not exhibit an inclusive and integrative approach towards parents in terms of political power, social status, economical power and official status."</p> <p>P2 says "I think that parents' socioeconomic situation is effective within the decisions of the school administrators in our school and parents who are economically powerful or close to the politicians can make what they want realized more easily than the others."</p>
School administrators' implementations towards students in the context of social justice leadership	<p>P3 says "The school administration approaches the students equally without making any discrimination regarding socioeconomic terms, language, religion or gender; however, for the activities that are organized in and outside the school, the students who have tight ties with the school administration are selected. Those who are introvert, cannot express themselves explicitly but who are academically successful and do not have any discipline problems might not utilize the school activities or school projects."</p> <p>P4 says "The school administration, as for the students, gives moral and material support they need to them who have socioeconomic problems and cares about the students having family problems. They act more tolerantly in terms of appearance and clothes. They enable the students to equally utilize the school facilities regardless of the ethnical origins of the students."</p>
School administrators' implementations towards teachers in the context of social justice leadership	<p>P5 says "The school administration does not explicitly exhibit discriminative acts towards teachers; however, they share information and ideas related to the school management and planning more often with the teachers they feel close to them politically and as gender."</p> <p>P6 says "The implementations of the school administrators do not vary towards teachers' ethnic, politic or gender-based properties and everyone is approached equally."</p>
School administrators' implementations towards auxiliary personnel in the	<p>P7 says "In our school, as the auxiliary personnel are generally selected from the acquaintance in the cities the school administrators reside in, the personnel are those who do not reject anything, do not have any problems, do not have a stable political thought and whom the school management can even be transferred at some points."</p>

context of social justice leadership	P8 says “In our school, regardless of any factors, implementations are equally realized.”
Reflections of social justice leadership implemented by school administrators towards parents, students, teachers and auxiliary staff	<p>P1 says “School administrators’ social justice leadership towards parents are not completely realized in terms of the reflections on the trust, commitment, motivation, cooperation, equality and inclusiveness at the school. It is seen that activities integrating parents and the school are not adequately organized, no activities other than the economical based meetings made in the cooperation by school – family union exist; there is no trust towards all of the teachers, adequate attitude and behaviours to enable the motivation for a better working performance are not exhibited while speeches towards students enabling morale and motivation are occasionally made during ceremonies and meetings. Short – time talks with the auxiliary personnel and close care and motivating sayings for them can be said towards improving the feeling of the commitment and enabling the motivation.</p> <p>P2 says “In line with the views I have previously indicated, I don’ have positive ideas regarding trust, commitment and motivation at our school. I think that the majority of the problems experienced at our school stems from the staff’s unconfidence in the institution and the administrators.</p>

The table illustrating the selection of the participants' replies regarding the sub-problems – oriented questions is as follows:

Conclusion

In accordance with the data obtained from the views of the eight teachers, in our case – the department chiefs, it can be emphasized that the reflections of the social justice leadership implemented by the school administrators in the school can be commented as having some problems or deficiencies in terms of the inclusiveness, motivation, trust, commitment, equality and collaboration. As for finding out the current situation related to the social justice leadership implementations towards parents, students, teachers and auxiliary staff, the participants mostly underline the fact that the equal and just practice of the managerial actions is not efficient and effective while a minority of the participants advocates the vice versa. From this point of view, the data illustrate the fact that the school administrators have some way to get through regarding their social justice leadership implementations, due to the fact that the existing reflection of the case is not mostly welcomed by the participants of our research.

Considering the demographic variables of the participants, the data illustrates that gender, term time in the institution, career title, occupation and educational status have no significance in terms of differentiating the views of the participants regarding the social justice leadership

implementations of the school administrators. However, age and professional seniority are significant in that the participant who is 30 years old and below and who has 0 – 5 years of experience thinks differently from the other ones as advocating that all the dimensions of the social justice leadership implementations of the school administrators are well – organized and there is no problem at school.

As for the recommendations; based upon the preliminary studies, practices and the literature, social justice leadership in educational institutions is so significant that it must be attached importance by the school administrators:

- a positive school climate
- a collaborative teacher work
- an inclusive environment
- organizational trust
- organizational commitment
- professional motivation by the stakeholders

To make a final point, in the case of our research; if the school administrators apply social justice leadership in a more comprehensive and inclusive manner regardless of any difference, they might easily improve their organization and realize the organizational aims.

ABSTRACT

In this study, geopolymeric behavior of two pozzolans as a result of calcination was investigated. 900°C was used as the calcination temperature. After the calcination process, compressive strength, XRD and SEM/EDX analysis were performed. From the analysis it was observed that both raw materials calcined at 900°C had amorphous structure. As a result of the compressive strength analysis, clinoptilolite-bearing pozzolan reached a compressive strength of 40MPa at room temperature. However, pozzolan, which does not contain clinoptilolite, did not achieve sufficient compressive strength. From this, it was concluded that the calcination process is not sufficient to activate every material. In other words, in order to the calcination process to be successful, the mineralogical content of the raw material must be appropriate. The decrease in the clinoptilolite peak as a result of XRD analysis indicated that clinoptilolite consumed and participated in the geopolymeric reaction. Additionally, the hump pattern indicating the glassy phase demonstrates the formation of geopolymeric gel. Si/Al ratio, which gives similar values in SEM/EDX analysis, indicates well developed CSH phase. The decrease in peak intensity and the presence of geopolymeric gel observed in clinoptilolite-bearing pozzolan-based geopolymer were not observed for clinoptilolite-free pozzolan-based geopolymers.

Keywords: Geopolymer, clinoptilolite, Pileki Taşı, curing time, cure temperature

1. Introduction

Concrete used in the construction industry is a preferred material due to its advantages such as easy production, low cost, high durability and accessibility. However, it is known that CO₂ gas released into the atmosphere during the burning of clinker at high temperatures during concrete production increases global warming and negatively affects the ecological balance. For this reason, new binding materials are being tried to be developed. Among these materials, geopolymers have attracted worldwide attention as an alternative binder material, as they cause very low CO₂ emissions (80-90%) compared to Portland cement (van Deventer et al., 2021). Geopolymers, also called alkaline activated material (AAM), were first used as a construction material by Glukhovsky, Kiev, Ukraine in 1960. Later, Davidovits activated the metakaolin with alkaline solutions and called polysialate consisted of tetrahedral anions.

Although geopolymers are an important alternative to portland cement, they have some disadvantages. For example, the supply of industrial by-products such as blast furnace slag and fly ash, which have high binding properties in geopolymer production, is not sufficient for the long term (Ruiz-Santaquitera et al., 2016). In the literature, it has been stated that this problem can be overcome by using natural material-based geopolymers in addition to waste material-based geopolymers. For this reason, pozzolans are shown as a good alternative. However, natural pozzolans have some disadvantages such as low early strength development despite their high reserve capacity (Özen and Uzal, 2021). Some methods are being developed to overcome the disadvantage of natural material-based geopolymers. These methods include activating the natural material by the calcination process. With the calcination method, the crystal structures of the minerals are deteriorated and converted into a glassy structure that can be easily dissolved in a low alkaline environment. For example, Bondar et al., (2011) produced geopolymer from calcined pozzolan and showed that the strength of these geopolymers was increased. In addition, Nikolov et al., (2020) tried to calcine the clinoptilolite-containing tuff to activate it for geopolymer synthesis.

To sum up, significant developments have been achieved in terms of improving the mechanical and physical properties of geopolymers produced with calcined natural materials. However, there are still questions that need to be answered in the literature. Research is needed to understand and develop the mechanisms of the binder systems produced after the calcination process in detail. For this reason, the phase content of the two starting materials was examined and the role of the calcination process in the synthesis of geopolymers was examined.

2. Materials and Method

The two pozzolan (volcanic tuff) used as the starting raw material in the study. Sodium silicate (Na_2SiO_3) and sodium hydroxide (NaOH) activators were used to activate the starting raw material. Sodium silicate, also known as glass water, was supplied in liquid form (27.7% SiO_2 , 9.8% Na_2O , 62.5% H_2O). Sodium hydroxide was supplied in the form of pellets and was prepared for use as sodium hydroxide solution (12M).

The raw materials were ground with a bond type ball mill to pass through a 45 micron sieve. Grain size distribution was determined by sieve analysis. Chemical analysis of the starting materials was done by X-ray fluorescence (XRF) analysis. Pellets were prepared from 5 gr powdered pozzolan samples and XRF images were taken and the results were determined as oxide. In order to understand the behavior of two pozzolans as a result of calcination, the phases in the raw materials were determined by quantitatively (Pittsburg Mineral and Environmental Technology Inc., PMET Inc.). Laboratory measurements were made using the PANalytical X'Pert Pro device X'Pert High Score Plus 3.0. The obtained readings were recorded in vertical Bragg-Brentano geometry varying from 3 to 80°C with an angle of 2θ and values of 40 kV and 30 mA (Philips PW1730).

2.1. Calcination

Two starting raw materials were subjected to calcination process to increase the raw material reactivity before geopolymer synthesis. The calcination process was carried out in an oven at 900°C with an increase of 10°C per hour (Figure 1).

Figure 1. The calcination process of the starting raw material at 900°C .

2.2. Geopolymer Synthesis

For the production of geopolymer, the pozzolan measured was poured into the Hobart mixer. Then NaOH alkali activator was added to the mixture and mixed for 3 minutes. After, Na₂SiO₃ alkali activator was added to the mixture. After the geopolymer synthesis process, the mixture was placed in cube molds of 5X5X5 cm (Figure 2). As the curing process, two cures were applied at room conditions and at 50°C.

Figure 2. Synthesis of geopolymers.

3. Results

3.1. Mineralogical Characterization

The mineral contents and values of the pozzolans named as B-1 and B-2 are given in Table 1. As can be seen from the table, sample B-1 contains clinoptilolite mineral, but sample B-2 does not contain clinoptilolite mineral. B-2 raw material consists of 12% K-feldspar and 25% plagioclase minerals. When the mineralogical analysis results are examined, we can say that the B-1 pozzolan will be much more active than the B-2 pozzolan.

Table 1. Quantitative XRD (QXRD) analysis results of starting raw materials.

Mineral	B-1 (%)	B-2 (%)
Clinoptilolite	65	
Quartz	15	37
K-Feldspar	20	12
Plagioclase		25
Mica		15
Kaoline		5
Calcite		6
Sum	100	100

3.2. Physical and Chemical Characterization

The results of chemical analysis of the pozzolans used in the production of geopolymer are given in Table 2. When the table is examined, it can be seen that the SiO₂ and Al₂O₃ amounts of the B-2 sample are higher than the B-1 raw material. In addition, the amount of CaO of B-2 pozzolan is slightly higher than that of B-1 pozzolan.

Table 2. Chemical compositions and physical properties of starting materials.

	B-1	B-2
Chemical Composition (%)		
SiO ₂	53	67.3
Al ₂ O ₃	17	12
Fe ₂ O ₃	4	0.8
CaO	10	12
MgO	1	0.9
Na ₂ O	0.1	0.2
K ₂ O	1	0.6
MnO	0.3	0.2
L.O.I.	13.6	6
Total	100	100
Physical Properties		
Specific Gravity	2.13	2.14
Fineness (<45µm,%)	84	83

3.3. SEM Analysis of Raw Material

SEM image of B-1 is given in Figure 1. As can be seen in figure, clinoptilolite crystals that grow secondarily in the glassy pumice fragment are found as euhedral crystals in assemblages.

Figure 3. Scanning electron micrograph (SEM) of B-1 sample.

When we examine the SEM image of the B-2 pozzolan, we see that there are anhedral and massive structures in general. Quartz mineral is only seen as euhedral crystals.

Figure 4. Scanning electron micrograph (SEM) of B-2 sample.

3.4. Compressive Strength Analysis

In Figure 3, the highest compressive strength values of B-1-900°C and B-2-900°C geopolymers at 7, 28 and 56 days are compared. As can be seen from the figure, the 7-day compressive strength of both geopolymers is the same. However, the compressive strength of B-1-900°C geopolymer increased rapidly after 7 days, but such an increase was not detected in B-2-900°C geopolymer. The reason for the difference is thought to be due to the fact that both pozzolana have different mineralogical contents despite being taken from the same tuff bed. B-1 contains 65% clinoptilolite in the starting pozzolan. It is known that clinoptilolite is an active phase for geopolymeric reaction (Güngör and Özen 2021). With this study, it is seen that its reactivity is much more increased as a result of calcination.

Figure 5. Compressive strength developments of B-1-900°C and B-2-900°C geopolymers.

3.5. SEM/EDX Analysis of Geopolymer Products

After the micro-morphological examinations of the geopolymers, semi-quantitative chemical analyzes were made. According to the analysis results, we see that the Si/Al ratios of the B-1-900°C geopolymer are in the similar range. Si/Al ratio of B-2-900°C geopolymer, on the other hand, exhibits a wide spread range. Based on this data, we conclude that the geopolymeric gel, which gives strength to the material, well developed in the B-1-900C geopolymer. This result is also supported by compressive strength analysis. Because the compressive strength of B-1-900°C geopolymer is high.

Figure 6. Semi-quantitative SEM/EDX analysis results of B-1-900°C and B-2-900°C geopolymers.

Conclusions

- In this study, the starting material was calcined at 900°C and the crystalline structure of clinoptilolite was transformed into amorphous structure. The pozzolan-based geopolymer containing calcined clinoptilolite was cured at room conditions and a compressive strength of 22 MPa for 28 days was obtained. In other words, the calcination process has been successful and it has been shown that natural material-based geopolymers can be cured at room conditions without thermal curing.
- However, feldspar group minerals did not become active despite calcination process and could not reach the expected compressive strength values both at room conditions and 50°C.
- Based on these data, it is concluded that although the calcination process is a suitable method for activating the starting material, its success depends on the mineralogical phase content of the raw material.
- It was also concluded that the mineralogical characterization of the starting raw material is an important step for the predicting the geopolymer behavior.
- As a result of SEM/EDX analysis of geopolymers, we conclude that the gel (CSH) that gives strength to the material is well developed in B-1-900°C geopolymer.

Özet

Küreselleşme kavramı giderek hayatın her alanında kendini hissettiren bir kavram olmaktadır. Özellikle internetin gelişimi, teknolojik ilerlemeler, iletişim araçlarının yaygınlaşması, ulusal ve uluslararası ulaştırma hizmetlerinin artması vb. gelişmeler ulusların birbirinden çeşitli alanlarda etkilenmesine neden olarak küreselleşmeyi hızlandırmaya katkı sağlamaktadır. Ulusların birbirinden etkileşimi başta sosyal, ekonomik, politika, siyaset vb. bir çok alanda gerçekleştiği insanların üretim, tüketim, tasarruf gibi birey davranış ve tutumları üzerinde de etkileri ortaya çıkması kaçınılmazdır. Bu noktadan hareketle bu çalışmanın amacı küreselleşmenin tüketim harcamaları üzerindeki etkisini ortaya koymaktır. Çalışmanın ampirik analizleri 1987-2020 dönemini kapsamakta olup Türkiye için gerçekleştirilmiştir. Çalışmanın ampirik analizlerinde kurulan ekonometrik modele nihai tüketim harcamaları bağımlı değişken, genel küreselleşme, ekonomik küreselleşme, sosyal küreselleşme indeksleri ve ekonomik büyüme de bağımsız değişken olarak dahil edilmiştir. Zaman serisi ADF ve Phillips-Perron birim kök test sonuçları neticesinde değişkenlerin I(0) ve I(1) olduğu tespit edilmiştir. Değişkenlerin birim kök durağanlık mertebelerinin farklı olmasından dolayı ARDL sınır testi yaklaşımı ile ampirik analizlere devam edilmiştir. ARDL sonuçlarına bakıldığında öncelikle modelde %1 istatistiksel önem düzeyinde eşbütünleşme ilişkisi elde edilmiştir. Uzun dönem katsayı sonuçları genel küreselleşme indeksinin, sosyal küreselleşmenin ve ekonomik büyümenin tüketim harcamalarını pozitif yönde etkilediği, ekonomik küreselleşmenin negatif etkilediği sonucu elde edilmiştir. Kısa dönemde ise genel küreselleşme ve ekonomik büyümenin tüketim harcamaları üzerinde etkisi olduğu görülmüştür.

Anahtar Kelimeler: Küreselleşme, Tüketim harcamaları, ARDL, Türkiye.

**THE EFFECT OF GLOBALIZATION ON CONSUMPTION EXPENDITURE: AN
EMPIRICAL ANALYSIS FOR TÜRKİYE**

Abstract

The concept of globalization is increasingly becoming a concept that makes itself felt in all areas of life. It can be stated that developments such as the development of the internet, technological advances, the widespread use of communication tools, and the increase in national and international transportation services contribute to accelerating globalization by causing nations to be affected in various fields. The interaction of nations with each other takes place in many areas, especially in social, economic and political areas, and it is possible for people to have effects on individual behaviors and attitudes such as production, consumption and savings. From this point of view, the aim of this study is to reveal the effect of globalization on consumption expenditures. The empirical analyzes of the study cover the period 1987-2020 and were carried out for Türkiye. In the econometric model established in the empirical analysis of the study, final consumption expenditures are included as dependent variables, general globalization, economic globalization, social globalization indices and economic growth are included as independent variables. As a result of time series ADF and Phillips-Perron unit root test results, it has been determined that the variables are $I(0)$ and $I(1)$. Since the unit root stationarity levels of the variables are different, empirical analyzes were continued with the ARDL bound approximation test. Considering the ARDL results, first of all, a cointegration relationship was obtained at the 1% statistical significance level in the model. Long-term coefficient results have been obtained as the result that the general globalization index, social globalization and economic growth affect consumption expenditures positively, while economic globalization affects negatively. In the short term, it has been observed that general globalization and economic growth have an effect on consumption expenditures.

Key Words: Globalization, Consumption expenditures, ARDL, Türkiye

Giriş

Son iki yüzyılda başlayıp süregelen dönemde toplumlar ekonomik, kültürel, sosyal vb. birçok alanda değişimler yaşamıştır. Bu değişim sürecinde teknolojik ilerlemeler, uluslararası ulaşım ve transfer sistem ve araçlarındaki artış ve gelişimlerle toplumlar kültürel, sosyal, politik ve ekonomik olmak üzere birçok alanda bir bütünleşme ve yakınsama yaşamıştır. Dünyada meydana gelen bu gelişmelere bağlı olarak ortaya çıkan bütünleşme ve yakınsama küreselleşme olarak ifade edilmektedir (Adıgüzel, 2013;1).

Küreselleşme sürecinin nedenleri sırlanırken yukarıda belirtilenler haricinde başka unsurlardan da söz edilebilir. Yani küreselleşme süreci bir veya birkaç unsur sonucu olarak ifade edilemez. Diğer yandan küreselleşmenin sosyal, siyasal, kültürel ve ekonomik olmak üzere çeşitli sonuçları da olmaktadır. Aslında nedenler ve sonuçlar genel olarak göz önün alındığında neden-sonuç, sonuç-neden şeklinde bir etkileşim olduğu görülmektedir. Fakat bu etkileşim döngüsünde özellikle gelişmekte olan ülkelerde ekonomik etkilerinin daha belirgin olduğu gözlemlenmektedir. Bu da 1980'li yıllardan itibaren uluslararası sermaye hareketlerinin artması, dışa açılma ve liberalleşme hareketleri ekonomik küreselleşmeyi öne çıkarmıştır. Ekonomi küreselleşme beraberinde piyasa ekonomisinin gelişmesi, serbest ticaretin yaygınlaşması, ekonomik birliklerin hızlanması, çok uluslu firma faaliyetlerinin artması ve dış ticaret hacmindeki artışları da beraberinde getirmiştir (Aktel, 2001;197).

Küreselleşmenin bölge ve ülke ekonomileri üzerindeki etkilerinin yanında bireysel iktisadi davranışlar üzerinde de etkilerinin olması kaçınılmazdır. Şöyle ki küreselleşme ile beraber bireylerin tutum, zevk ve tercihlerinin değişmesi ile bunlara bağlı olarak da tüketim ve tasarruf eğilimleri değişecektir. Nitekim bir ekonomi için yatırım harcamaları nasıl önemli ise tüketim harcamaları da ekonominin dinamikliği açısından önemlidir. Bu noktadan hareketle bu çalışmanın amacı küreselleşmenin tüketim harcamaları üzerindeki etkisi ortaya koymaktır. Çalışma 1987-2020 dönemini kapsayacak şekilde elde edilen Türkiye ekonomisine ait veriler ARDL sınır testi yaklaşımı ile incelenmiştir. Bu çalışmanın küreselleşme ve tüketim harcamaları ilişkisini özellikle Türkiye için ele alan nadir çalışmalardan olması bakımından literatüre katkı sağlaması beklenmektedir.

Çalışma dört bölümden oluşmaktadır. Birinci bölümünde giriş, ikinci bölümde literatür taraması, üçüncü bölümde veri seti, model ve yöntem, dördüncü bölümde ampirik bulgular ve son bölümde sonuçlar olmak üzere dizayn edilmiştir.

Literatür

Literatür taramasında küreselleşmenin tüketim harcamaları üzerindeki etkisini doğrudan ele alan çalışmaya rastlanmamıştır. Ancak tüketim harcamalarının dolaylı da olsa yoksulluk, gelir

dağılımı ile ilgili olduğundan elde edilen çeşitli çalışmalar ve bu çalışmalara ait bulgulara aşağıda yer verilmiştir. Bunlardan ilki Bergh ve Nilson (2014) tarafından gerçekleştirilen çalışmadır. Çalışmada 14 ülke için küreselleşmenin yoksulluk üzerindeki etkisini rassal etkiler modeli incelemiştir. Küreselleşmenin yoksulluğu olumsuz yönde etkilediği sonucuna ulaşılmıştır.

Kiangi (2015) Tanzania ekonomisi için küreselleşmenin kamu harcamaları üzerindeki etkisini incelemiştir. Küreselleşmenin kamu harcamaları üzerinde negatif bir etkisi olduğu sonucuna ulaşılmıştır.

Akbakay ve Barak (2020) yükselen piyasa ekonomileri için küreselleşme ve gelir dağılımı ilişkisini ele almıştır. 1994-2014 dönemini kapsayan çalışmada PMG yöntemi ile tahmin edilmiştir. Elde edilen sonuçlara göre küreselleşmenin gelir eşitsizliğini olumsuz yönde etkilediği görülmüştür.

Benzer şekilde Tabetando (2014) Endonezya için küreselleşmenin gelir dağılımı üzerindeki etkisini 2000-2010 dönemi için araştırmış ve küreselleşmenin gelir dağılımı adaletsizliğini arttırdığını ortaya koymuştur.

Literatüre küreselleşme ve tüketim harcamalarını direk ele alan çalışmaya rastlanmamıştır. Bu durum yapılan bu çalışmanın ilgili literatüre önemli bir katkı sağlayacağı düşünülmektedir.

Veri Seti ve Model

Bu çalışmanın amacı küreselleşmenin tüketim harcamaları üzerindeki etkisini Türkiye ekonomisi için ortaya koymaktır. Çalışma veri setinin mevcut olduğu kadarıyla alınmış olup ampirik analizler 1987-2020 dönemini kapsamaktadır. Nihai tüketim harcamaları (Consumption-C) bağımlı değişken, genel küreselleşme endeksi (Globalization-GL), ekonomik küreselleşme (Economic globalization-EG), sosyal küreselleşme (Social globalization-SG) ve ekonomik büyüme (Economic growth-GDP) bağımsız modele dahil edilmiştir. Tüketim harcamalarının logaritması alınarak modele dahil edilmiştir. Veri seri Dünya bankası ve İsviçre Ekonomi Enstitüsünden elde edilmiştir.

Ampirik analizlerde öncelikle serilere ADF ve Phillips-Peron birim kök testi uygulanmıştır. Daha sonraki aşamada birim kök sonuçlarının I(0) ve I(1) düzeyinde farklı mertebelerden durağan olmaları nedeniyle ARDL sınır yaklaşım testinden faydalanılmıştır. Ayrıca ARDL sınır testi yaklaşımının eşbütünleşme, kısa ve uzun dönem tahmin sonuçlarını vermesinden dolayı tercih edilmiştir.

ARDL kısa dönem tahmin sonuçları Denklem 1'de ve uzun dönem tahmin sonuçları ise Denklem 2'de verilmiştir.

$$\Delta \log C_t = \alpha_0 + \sum_{i=1}^p \alpha_{1i} C_{t-i} + \sum_{i=1}^p \alpha_{2i} GL_{t-i} + \sum_{i=1}^p \alpha_{3i} EG_{t-i} + \sum_{i=1}^p \alpha_{4i} SG_{t-i} + \sum_{i=1}^p \alpha_{5i} GDP_{t-i} + \varphi ECT_{T-1} + \varepsilon_t \quad (1)$$

$\Delta \log C_t = \varphi_t + \varphi_1 \log C_{t-1} + \varphi_2 GL_{t-1} + \varphi_3 EG_{t-1} + \varphi_4 SG_{t-1} + \varphi_5 GDP_{t-1} + \sum_{i=1}^p \alpha_{1i} \log C_{t-i} + \sum_{i=1}^p \alpha_{2i} GL_{t-i} + \sum_{i=1}^p \alpha_{3i} EG_{t-i} + \sum_{i=1}^p \alpha_{4i} SG_{t-i} + \sum_{i=1}^p \alpha_{5i} GDP_{t-i} + \varepsilon_t$	(2)

Bulgular

Birim Kök Test Sonuçları

Modeli oluşturan değişkenlere ait birim kök test sonuçları Tablo 1’de gösterilmiştir. Elde edilen sonuçlara göre tüketim harcamalarını ifade eden logC ile sosyal küreselleşmeyi gösteren SG değişkenleri sabit ve sabitli & trendli modellerin her ikisinde de seviyede birim köklü, birinci farkta durağan hale geldiği tespit edilmiştir. Küreselleşme endeki sabitli modelde %10 istatistiksel önem düzeyinde seviyede durağan, sabitli ve trendli modelde ise birinci farkta durağan hale gelmektedir. Ekonomik küreselleşme endeksini temsil eden EG değişkeni her iki modelde de seviyede durağandır. GDP değişkenini de seviyede durağan olduğu görülmektedir.

ARDL Sınır Yaklaşımı Test Sonuçları

Modeli oluşturan değişkenlerin birim kök sonuçlarında $I(0)$ ve $I(1)$ olmak üzere farklı mertebelerden durağan oldukları görülmüştür. bu sonuç doğrultusunda ARDL sınır testi yaklaşımı ile analizlere devam edilmiştir. Çünkü bu test değişkenler $I(2)$ olmamak koşulu ile farklı durağanlık mertebelerine sahip değişkenler arasında eşbütünleşme ilişkisini sınavabilmektedir.

ARDL sınır testi yaklaşımı eşbütünleşme sonuçları Tablo 2’de gösterilmiştir. Elde edilen sonuçlara göre modelde %1 istatistiksel önem düzeyinde eşbütünleşme ilişkisi elde edilmiştir.

Tablo 2. ARDL Sınır Testi Yaklaşımı Eşbütünleşme Sonuçları

Test İstatistikleri	Değer	K
F-istatistiği	10.7968 ^a	4
Kritik Sınır Değerleri		
Anlamlılık Düzeyleri	I(0) Sınırı	I(1) Sınırı
% 1	4.768	6.67
% 5	3.354	4.774
% 10	2.752	3.994

Not: ^a, $p < 0,1$ temsil etmektedir.

Modelin uzun dönem katsayı sonuçları Tablo 3'te verilmiştir. Elde edilen bulgulara göre GL değişkeni olarak ifa edilen küreselleşme endeksinin tüketim harcamaları üzerinde %10 istatistiksel anlamlılık düzeyinde pozitif etkilediği görülmektedir. Ekonomik küreselleşmenin de %10 istatistiksel önem düzeyinde tüketim harcamalarını anlamlı etkiye sahip olduğu ancak negatif bir etkinin varlığı tespit edilmiştir. Ekonomik büyümenin de istatistiksel olarak %5 istatistiksel önem düzeyinde tüketim harcamalarını pozitif etkilediği sonucuna ulaşılmıştır.

Tablo 3. ARDL Uzun Dönem Katsayı Sonuçları (2.0.0.4.3)

Değişkenler	Katsay	t-istatistiği	Olasılık (P-value)
GL	0.0385 ^c	2.021	0.060
EG	-0.0263 ^c	-2.017	0.061
SG	0.0110	1.330	0.202
GDP	0.0169 ^b	2.641	0.017
R-kare	0.87	F-istatistik	15.899
Düzeltilmiş R-Kare	0.82	Prob.(F-istatistik)	0.000

Not: ^b ve ^c, sırasıyla $p < 0,5$ ve $p < 0,1$ temsil etmektedir.

Model ait ARDL kısa dönem hata düzeltme katsayı sonuçları Tablo 4'te gözlemlenmektedir. ARDL modeli (2.0.0.4.3) ile tahmin edilmiştir. Öncelikle hata düzeltme teriminin (CointEg(-1)) %1 istatistiksel önem düzeyinde anlamlı olduğu ve katsayısının -0.995 yani (-1 ile 0) aralığında olduğu görülmektedir. bu katsayı modelde meydana gelen kısa dönem sapmaların 1 yılı aşkın bir sürede dengeye geldiğini göstermektedir. diğer yandan bağımsızın değişkenler arasından sosyal küreselleşmeyi, temsil eden SG değişkeninin ile GDP'nin tüketim harcamalarını sırasıyla %5 ve %1 istatistiksel önem düzeyinde tüketim harcamaları üzerinde pozitif etkiye sahip olduğu görülmektedir.

ARDL modeli (2.0.0.4.3) olup GL ve EG değişkenlerinin uygun gecikme uzunluklarının 0 olduğu görülmektedir. uygun gecikme uzunluğunun burada 0 olması kısa dönemde bu

değişkenlerde herhangi bir sapma olmadığı anlamına gelmektedir (Çelik, 2022; 155). Söz konusu değişkenlerin uygun gecikme uzunlukları 0 olduğundan yani kısa dönemde dengeden sapma olmadığı için tabloda görülmemektedir.

Tablo 4. ARDL Kısa Dönem Hata Düzeltme Sonuçları (2.0.0.4.3)

Değişkenler	Katsayı	t-istatistiği	Olasılık (P-value)
Cons	9.638 ^a	1.172	0.000
D(SG)	0.001 ^b	2.379	0.030
D(GDP)	0.0055 ^a	4.379	0.000
CointEq(-1)	-0.995 ^a	0.061	0.000

Not: ^a ve ^b sırasıyla $p < 0,01$ ve $p < 0,05$ temsil etmektedir.

Uzun ve kısa dönem katsayı tahminlerinin istikrarlı olup olmama durumları CUSUM ve CUSUM² testleri ile gerçekleştirilmiştir. CUSUM ve CUSUM² dağılımları Grafik 1’de gösterilmiştir. İstikrar koşulunun grafikten incelendiği zaman dağılım dağılımların %5 istatistiksel önem düzeyini temsil eden kırmızı çizgiler arasında olması beklenir. Çalışmamıza ait CUSUM ve CUSUM² grafikleri incelendiğinde dağılımın beklenen istatistiksel anlamlılık sınırları içinde dağıldığı görülmektedir.

Grafik 1. CUSUM ve CUSUM² Dağılımları

Sonuç ve Öneriler

Bu çalışmada küreselleşme tüketim harcamaları ilişkisi ele alınmıştır. Çalışmanın ampirik analizleri Türkiye için gerçekleştirilmiştir. 1987-2020 dönemini kapsayan yıllık frekanslı veri seti ADF ve Phillips-Peron birim kök testleri ve ARDL sınır testi yaklaşımı ile analiz edilmiştir. Ampirik analizler neticesinde değişkenlerin I(0) ve I(1) olmak üzere farklı mertebelerden durağanlığa sahip olduğu sonucu elde edilmiştir. ARDL sonuçlarından eşbütünleşme ilişkisinin varlığı tespit edilmiştir. Uzun dönemde genel küreselleşme endeksinin tüketim harcamalarını

arttırdığı, ekonomik küreselleşmenin tüketim harcamalarını istatistiksel olarak anlamlı şekilde azalttığı gözlemlenmiştir. Sosyal küreselleşmenin tüketim harcamalarını pozitif etkilediği ancak istatistiksel olarak anlamlı olmadığı görülmüştür. diğer yandan ekonomik büyümenin de anlamlı olarak tüketim harcamalarını arttırdığı tespit edilmiştir.

Küreselleşme hayatın birçok alanında etkileri olduğu gibi tüketim, tüketim alışkanlıkları ve buna bağlı olarak da tüketim harcamalarını etkilemektedir. Tüketim harcamalarının artması aynı zamanda refah artışı olarak değerlendirildiğinden burada iktisadi bir perspektiften ele alındığında artan tüketimin azaltılması ve artırılmasından ziyade nasıl karşılandığına bakılmalıdır. Yani tüketimin ne derece de yurtiçi veya ithalattan karşılandığı önemlidir. Çünkü tüketim ithalata dayalı bir yapıya sahip ise artan tüketim harcamaları dış ticaret açığı, döviz kurları, carı açık gibi iktisadi göstergeler üzerinde etkileri doğacaktır. Tüketimin önemli kısmını yurtiçi üretimden karşılayabilen ülkeler artan tüketimin çeşitli ekonomik göstergeler üzerinde doğabilecek olumsuzlukları da bertaraf etmiş olacaktır. Bu bağlamda birkaç politik öneride bulunulabilir. Öncelikle yurtiçi tüketimin içeriği ve yapısı doğru belirlenerek yurtiçi üretimin iç tüketime cevap verebilmesi sağlanabilir. Tüketime yönelik mal ve hizmetlerin yurtiçi talebi aşan kısmı ihraç edilerek dış ticaret hadleri üzerinde olumlu etkilerin ortaya çıkması da sağlanabilir.

Tüketim harcamalarının genel olarak ele alınması bu çalışmanın sınırlılıkları olarak ifade edilebilir. Gelecekte yapılacak çalışmalarda tüketim alt kalemler bazında ele alınarak küreselleşmenin etkileri ele alınabilir. Küreselleşme ve tüketim ilişkisi başka ülke veya ülke grupları için ele alınabilir.

COVID-19 HASTALARINDA TORAKS BİLGİSAYARLI TOMOGRAFİ (BT)
BULGULARI İLE VÜCUT KİTLE İNDEKSİ (VKİ) ARASINDAKİ İLİŞKİ

Dr. Öğr. Üyesi Semih SAĞLIK (Orcid ID: 0000-0002-4224-9272)
Siirt Üniversitesi Tıp Fakültesi Radyoloji ABD, Siirt
E-mail: drsmhsglk@gmail.com

ÖZET

AMAÇ: Bu çalışmada koronavirüs hastalığı 2019 (COVID-19) tanısı alan 440 hastanın ilk başvuru sırasındaki toraks bilgisayarlı tomografi (BT) bulguları ile vücut kitle indeksi (VKİ) değerleri arasındaki ilişkiyi belirlemeyi amaçladık. **GEREÇ VE YÖNTEM:** Bu retrospektif çalışmaya mayıs 2020 ile temmuz 2021 tarihleri arasında hastanemizde COVID-19 tanısı alan ve toraks BT incelemesi olan 440 hasta dahil edildi. Altta yatan komorbiditelere ilişkin veriler, tip 2 diabetes mellitus, hipertansiyon, kardiyovasküler hastalık, kronik akciğer hastalığı ve kanser dahil olmak üzere hastaların geçmiş tıbbi öykülerinden elde edildi. Hastaların şikayetleri, RT-PCR test sonuçları ve ek hastalıkları tıbbi kayıt sisteminden, BT görüntüleri ise PACS sisteminden retrospektif olarak tarandı. Toraks BT’de parankim lezyonları buzlu cam sahası, konsolidasyon ve buzlu cam sahası ile konsolidasyon birlikteliği tipik bulgular olarak kabul edildi. Pnömoni şiddeti toraks BT’de toplam akciğer hacminin tutulum derecesine göre hafif (parankimal tutulum < %25), orta (parankimal tutulum = %25-50) ve ağır (parankimal tutulum > %50) pnömoni şeklinde kategorize edildi. VKİ (kg/m^2) ağırlığın (kg), boyun (m) karesine bölünmesiyle hesaplandı. **BULGULAR:** COVID-19 tanısı alan 440 hastanın 213’ü kadın 227’si erkekti. Tüm hastaların yaş ortalaması 40.8 ± 12.5 iken bu oran erkeklerde 41.2 ± 11.3 , kadınlarda ise 40.3 ± 13.7 olarak bulundu. Torak BT bulgularına göre hastalar 3 grup şeklinde kategorize edildi. Grup 1’e pnömoni bulgusu bulunmayan hastalar (189 hasta), grup 2’ye hafif-orta pnömoni bulgusu olan hastalar (166 hasta) ve grup 3’e ağır pnömoni bulgusu olan hastalar (85 hasta) dahil edildi. Vücut kitle indeks değerleri grup 1’de $24,3 \pm 4,2 \text{ kg/m}^2$, grup 2’de $25,1 \pm 3,7 \text{ kg/m}^2$ ve grup 3’de $31,6 \pm 5,5 \text{ kg/m}^2$ olarak belirlendi. Ağır pnömoni bulgusu olan grup 3 hastalarda VKİ anlamlı olarak daha yüksekti (grup 1-2 $p=0,180$, grup 1-3 $p<0,05$, grup 2-3 $p<0,05$). En az bir ve daha fazla komorbiditesi olan hastalar çalışmaya dahil edilmediğinde benzer şekilde ağır pnömoni bulgusu

olan hastalarda VKİ anlamlı olarak daha yüksek bulundu (grup 1-2 $p=0,537$, grup 1-3 $p<0,05$, grup 2-3 $p<0,05$)

SONUÇ: Çalışmamız, COVID-19'lu obez hastaların ağır pnömoni açısından daha yüksek risk altında olduğunu göstermektedir. Bulgularımız, VKİ'nin COVID-19 pnömonisinin radyolojik şiddetindeki önemli rolünü vurgulamaktadır ve bu nedenle obez COVID-19 hastalarında olası komplikasyonlarının önlenmesi için hastaneye erken yatış dahil olmak üzere daha agresif bir yaklaşımdan fayda görebileceğini düşündürmektedir.

Anahtar Kelimeler: COVID-19, Vücut Kitle İndeksi (VKİ) , Pnömoni, Toraks Bilgisayarlı Tomografi (BT)

GİRİŞ

COVID-19 (koronavirüs hastalığı-2019) ateş, nefes darlığı, halsizlik ve kas ağrıları gibi semptom ve bulgularla ortaya çıkan çoğunlukla asemptomatik seyreden fakat viral pnömoni, sepsis hatta ölümlle sonuçlanabilen bulaşıcı bir hastalıktır (1). Yapılan çalışmalarda, diabetes mellitus, hipertansiyon, koroner arter hastalığı ve yüksek vücut kitle indeksi (VKİ) gibi risk faktörleri bireylerin enfekte olma olasılığını ve komplikasyon gelişme ihtimalini artırmaktadır (1-3).

Obezite, proinflamatuvar sitokinlerin artışa neden olan bağışıklık yanıt etkinliğini bozan ve çeşitli kronik hastalıklara yol açan önemli bir sağlık sorunudur (4). Bu hastalarda enfeksiyon, malignite ve kardiyovasküler hastalıkların normal popülasyona göre arttığı öne sürülmüştür (5). 2009 yılında H1N1 influenza A pandemisinde obezitenin hastaneye yatış, akut solunum sıkıntısı sendromu (ARDS) ve mortalite için bir risk faktörü olduğu bildirilmiştir (6-8). COVID-19'un patogeneğinde önemli bir rol oynayan bağışıklık sistemi, obezite kaynaklı yağlı doku inflamasyonunda da önemli bir yere sahiptir. Yağ dokusunun inflamasyonu, potansiyel olarak dislipidemiye, insülin direncine, tip 2 diabetes mellitusa, hipertansiyona ve kardiyovasküler hastalığa yol açan metabolik işlev bozukluğuna neden olur (9). Obezitenin bağışıklık yanıt etkinliğini bozduğunu bu nedenle COVID-19 hastalarında morbidite ve mortalite için bir risk faktörü olabileceği bildirilmiştir (10).

Obezite, solunum sisteminin fonksiyonel yeteneğini azalttığı gibi solunum fizyolojisini de değiştirdiği bilinmektedir (11). Obez hastalarda özellikle artan hava yolu direnci, bozulmuş gaz değişimi, azalan zorlu vital kapasite (FVC) ve zorlu ekspirasyon volümü (FEV) ile karakterize edilen solunum fonksiyon bozukluğu vardır. Bu nedenle obezite pnömoni için bir risk faktörü olarak kabul edilmektedir (12). COVID-19 hastalarında özellikle yüksek duyarlılık nedeniyle bilgisayarlı tomografisi (BT), asemptomatik hastalarda bile erken dönemde bazı parankim bulgularını ile hastalığın teşhisine yardımcı olabilmektedir (13). Ayrıca BT, hastalığın şiddetinin ve tedaviye yanıtın değerlendirilmesinde de önemli bir role sahiptir (14).

Bu çalışmada, COVID-19 hastalarında toraks bilgisayarlı tomografi (BT) bulguları ile vücut kitle indeksi (VKİ) arasındaki ilişkiyi belirlemeyi amaçladık.

GEREÇ VE YÖNTEM

Bu retrospektif çalışmaya Mayıs 2020 ile Temmuz 2021 tarihleri arasında hastanemizde COVID-19 tanısı alan ve toraks BT incelemesi olan 440 hasta dahil edildi. Altta yatan komorbiditelere ilişkin veriler, tip 2 diabetes mellitus, hipertansiyon, kardiyovasküler hastalık, kronik akciğer hastalığı ve kanser dahil olmak üzere hastaların geçmiş tıbbi öykülerinden elde

edildi. Hastaların şikayetleri, RT-PCR test sonuçları ve ek hastalıkları tıbbi kayıt siteminden, BT görüntüleri ise PACS sisteminden retrospektif olarak tarandı.

Klinik muayene, laboratuvar testleri ve RT-PCR test sonucuna göre COVID-19 tanısı alan bütün hastaların toraks BT görüntüleri incelendi. Tüm toraks BT çekimleri supin pozisyonda ve uygun toraks protokolünde 16 kesit BT cihazı (Siemens Scope 16) ile 3 mm kesit kalınlığında kontrast madde verilmeden aksiyel kesitler şeklinde elde edildi. Toraks BT’de parankim lezyonları buzlu cam sahası, konsolidasyon ve buzlu cam sahası ile konsolidasyon birlikteliği tipik bulgular olarak kabul edildi. Tipik bulguların eşlik etmediği plevral effüzyon, septal kalınlaşma, hava bronkogramı ve mediastinal LAP gibi atipik bulguları olan hastalar çalışmaya dahil edilmedi. Pnömoni şiddeti toraks BT’de toplam akciğer hacminin tutulum derecesine göre hafif (parankimal tutulum < %25), orta (parankimal tutulum = %25-50) ve ağır (parankimal tutulum > %50) pnömoni şeklinde kategorize edildi (15,16). VKİ (kg/m^2) ağırlığın (kg), boyun (m) karesine bölünmesiyle hesaplandı. Ağırlık verileri hastaneye yatışın ilk günündeki ölçümlere göre, boy verileri ise hastaların beyan ettiği ölçülere göre hesaplanmıştır. VKİ, zayıf ($\text{BMI} < 18.5\text{kg/m}^2$), normal ağırlık ($\text{VKİ } 18,5\text{--}24,9 \text{ kg/m}^2$), fazla kilolu ($\text{VKİ } 25\text{--}29,9 \text{ kg/m}^2$) ve obez ($\text{BMI} \geq 30 \text{ kg/m}^2$) şeklinde kategorize edilmiştir (17).

İSTATİSTİKSEL ANALİZ

Veri analizleri Statistical Package for Social Sciences 18.0 for Windows (SPSS Inc., Chicago, IL) kullanılarak yapıldı. Çalışma verilerinin değerlendirilmesinde tanımlayıcı istatistiksel yöntemlerin (ortalama, standart sapma) yanında nicel verilerin analizinde Student-t testi, ikiden fazla grubun kıyaslanmasında tek yönlü anova ardından gruplar arası farklılıklar için TUKEY testi kullanıldı. Tüm parametrelerin birbiriyle ilişkisi Pearson korelasyon katsayısı ile irdelenmiştir. Sonuçlar %95’lik güven aralığında, anlamlılık $p < 0,05$ düzeyinde değerlendirildi.

BULGULAR

COVID-19 tanısı alan 440 hastanın 213’ü kadın 227’si erkekti. Tüm hastaların yaş ortalaması 40.8 ± 12.5 iken bu oran erkeklerde 41.2 ± 11.3 , kadınlarda ise 40.3 ± 13.7 olarak bulundu. VKİ’ne göre 21 hasta zayıf ($16,9 \pm 1,2 \text{ kg/m}^2$), 139 hasta normal kiloda ($22,1 \pm 1,6 \text{ kg/m}^2$), 179 hasta fazla kilolu ($26,8 \pm 1,4 \text{ kg/m}^2$) ve 101 hastanın obez ($33,3 \pm 3,7 \text{ kg/m}^2$) olduğu saptandı. Tüm hastaların VKİ ortalaması $26,3 \pm 5,1 \text{ kg/m}^2$ idi. En az bir komorbidite sahip 151 hastanın % 6’i zayıf (9 hasta), %22’si normal kilolu, %42’si fazla kilolu ve %30’u obez grupta idi (Tablo 1).

Grup1 normal akciğer parankim bulguları, Grup 2 hafif-orta pnömoni bulguları Grup 3 ağır pnömoni bulgularına sahip hastalar.

Vücut Kitle İndeksi^x tüm hastalar, Vücut Kitle İndeksi^y herhangi bir komorbiditesi olmayan hastalar.

^ap < 0.05, istatistiksel olarak anlamlı kabul edildi (tek yönlü ANOVA).

^bp < 0.05, istatistiksel olarak anlamlı kabul edildi (post-hoc Tukey testi).

Toraks BT bulgularına göre hastalar 3 grup şeklinde kategorize edildi. Grup 1'e pnömoni bulgusu bulunmayan hastalar (189 hasta), grup 2'ye hafif-orta pnömoni bulgusu olan hastalar (166 hasta) ve grup 3'e ağır pnömoni bulgusu olan hastalar (85 hasta) dahil edildi. Vucut kitle indeks değerleri grup 1'de 24,3±4,2 kg/m², grup 2'de 25,1±3,7 kg/m² ve grup 3'de 31,6±5,5 kg/m² olarak belirlendi. Gruplar arası akciğer tutulum bulgularına göre anlamlı farklılık gösterip göstermediğini test etmek için anova testi uygulandı ve test sonucunda gruplar arasında anlamlı farklılık saptadık. Farklılığın yönünü belirlemek için Tukey testi yapıldı ve test sonucuna göre, ağır pnömoni bulgusu olan grup 3 hastalarda VKİ anlamlı olarak daha yüksekti (grup 1-2 p=0,180, grup 1-3 p<0,05, grup 2-3 p<0,05). En az bir ve daha fazla komorbiditesi olan hastalar çalışmaya dahil edilmediğinde benzer şekilde ağır pnömoni bulgusu olan hastalarda VKİ anlamlı olarak daha yüksek bulundu (grup 1-2 p=0,537, grup 1-3 p<0,05, grup 2-3 p<0,05)(Tablo 2 ve şekil 1).

Şekil 1: Her grup için görünen vucut kitle indeksi (VKİ) değerleri (grup 1: normal, grup 2: hafif-orta pnömoni grup:3 ağır pnömoni)

Kutu grafikleri, tüm hastaların (A) ve komorbititesi olmayan (B) hastaların vucut kitle indeksi (VKİ) değerlerini gösterir. Her kutu içindeki yatay çizgiler ortalama değerleri, her kutunun alt ve üst çizgileri sırasıyla minimum ve maksimum değerleri temsil eder.

TARTIŞMA

Obezite, başta kronik hastalıklar olmak üzere önemli bir halk sağlığı sorunu olarak kabul edilmektedir. Obezitenin COVID-19'da hastalık şiddetinde katkıda bulunan bir etken olduğu bilinmektedir. Bu katkıyı açıklayacak kesin bir mekanizma olmamakla beraber obez hastalarda akciğer fonksiyonunun bozulması, düşük kronik inflamasyon, azalan makrofaj aktivitesi, daha yüksek leptin ve daha düşük adiponektin konsantrasyonları hastalık şiddeti için potansiyel risk faktörleridir (19-22). Ayrıca adipoz doku, makrofajlardan interlökin (IL-1, IL-6, IL-8, IL-10), tümör nekroz faktörü (TNF- α) ve C-reaktif protein (CRP) gibi proinflamatuvar sitokinlerin salınımına neden olabilir. Obez hastalarda gözlenen bu proinflamatuvar sitokinlerin artışı, COVID-19 hastalarında ki inflamasyonu daha da kötüleştirip kötü prognoza yol açabilir (18-20).

Simonnet ve arkadaşları, yoğun bakım hastaları üzerinde yaptıkları araştırmada COVID-19 dışı solunum hastalığı olan hastalara kıyasla COVID-19 enfeksiyonu olan hastalarda obezite ve şiddetli obezite sıklığının daha fazla olduğunu belirtmişlerdir (21). Cai ve arkadaşlarının, 383 COVID-19 hastasıyla yaptığı bir çalışmada normal kilolu hastalara kıyasla aşırı kilolu ve obez hastalarda daha yüksek oranda ciddi pnömoni gelişme riski olduğunu bildirmişlerdir (22). Ayrıca Földi ve arkadaşlarının yaptıkları bir meta-analizde, obezitenin COVID-19 hastalarında hastalık şiddetini artırdığını ve obezitenin önemli bir risk faktörü olduğunu kabul etmişlerdir(3). Bizim çalışmamızda akciğer tutulumu olan hastalar içerisinde en yüksek pnömoni sıklığını fazla kilolu (VKİ > 25 kg/m²) ve obez (VKİ > 30 kg/m²) hastalar oluşturuyordu (sırasıyla; %43 ve %33,8

). Ayrıca, önceki çalışmalara benzer şekilde COVID-19'lu obez hastalar, normal ve fazla kilolu COVID-19 hastalarına kıyasla daha yüksek ciddi pnömoni riski taşıyordu (21-24). Yapılan bazı çalışmalarda yüksek VKİ'nin enfeksiyonlara yatkınlık oluşturduğu ve obezitenin şiddetli COVID-19 için bağımsız bir risk faktörü olduğu belirtilmiştir (25,26). Bizim çalışmamızda da en az bir veya daha fazla komorbiditesi olan hastalar çalışmaya dahil edilmediğinde ağır pnömonisi olan hastalar daha yüksek VKİ'ne sahipti.

SONUÇ

Çalışmamız, COVID-19'lu obez hastaların ağır pnömoni açısından daha yüksek risk altında olduğunu göstermektedir. Bulgularımız, VKİ'nin COVID-19 pnömonisinin radyolojik şiddetindeki önemli rolünü vurgulamaktadır ve bu nedenle obez COVID-19 hastalarında komplikasyonların önlenmesi için hastaneye erken yatış dahil olmak üzere daha agresif bir yaklaşımdan fayda görebileceğini düşündürmektedir.

ÖZET

Günümüzde tüketiciler, sağlığa yönelik koruyucu önlem olarak veya beslenme yetersizliklerinden kaynaklanan rahatsızlıkları gidermek amacıyla sağlığa faydalı olduğu bilinen bitkileri tedavi veya takviye edici olarak tüketme eğilimindedirler. Yüksek besin değerlerine sahip bitkiler, bilinçli tüketicilerin ve üreticilerin dikkatini çekmektedir. Bu bitkiler farklı istek ve ihtiyaçlara yönelik olarak tüketilmektedir. Kudret narı (*Momordica charantia*) meyvesi; kökeni Çin ve Hindistan'a dayanan, tropikal bölgelerde doğal olarak yetişebilen, kabakgiller familyasına ait bir meyvedir. Dünyanın birçok bölgesinde kudret narı meyvesi; dolması yapılarak, zeytinyağında macun yapılarak, farklı meyve veya sebzelerle birlikte sotelenerek, suyu sıkılarak, ham veya işlenmiş olarak tüketilmektedir. Uluslararası piyasada ilgi görmekte olan kudret narı meyvesinin ticareti yapılmakta böylece yetiştirildiği veya işlendiği bölgelerin ekonomisine katkı sağlamaktadır. Tıp, beslenme ve gıda alanında birçok çalışmaya konu olan kudret narının; vitamin, mineral, protein, konjuge linolenik asit izomerleri, biyoaktif bileşikler açısından oldukça zengin olduğu ve iyi bir antioksidan kaynağı olduğu bilinmektedir. Bitki antiviral, antibakteriyel, antikanser özellik taşımaktadır. Bitkinin; gastrit, ülser, reflü gibi mide rahatsızlıklarına, şeker hastalığına, açık yaralara iyi geldiği bilinmektedir. Diyabet tedavisinde kan şekeri kontrolünde kullanılmaktadır. Bu çalışmada kudret narı meyvesinin genel özelliklerinden, besin değerinden, sağlık üzerindeki etkilerinden ve gıda ürünlerinde kullanımından ve alternatif tüketim şekillerinden bahsedilmiştir. Kudret narı meyvesinin gıdalarda kullanımına yönelik yapılmış çalışmaların literatür cetveli hazırlanmış; çalışmalar amaçları, yöntemleri ve sonuçları bakımından incelenmiştir. Sonuç olarak, kudret narının farklı kısımlarının fonksiyonel ve besleyici özelliklerinden yararlanabilmek için gıda, tıp, eczacılık gibi alanlarda yeni çalışmaların yapılması gerekmektedir.

Anahtar Kelimeler: Kudret Narı, Acı Kavun, Gıda, Sağlık, Beslenme

USAGE OF BITTER MELON (*Momordica charantia*) IN FOOD PRODUCTS

ABSTRACT

In today's world, consumers tend to consume plants known to have health benefits as a preventive measure for health or to address discomfort caused by nutritional deficiencies, either as a treatment or as a dietary supplement. Plants with high nutritional values attract the attention of conscious consumers and producers. These plants are consumed for different desires and needs. Bitter melon is a fruit belonging to the cucurbit family which is native to China and India and naturally grows in tropical regions. In many parts of the world, bitter melon is consumed raw or processed, by stuffing it, making paste with olive oil, stir-frying it with different fruits or vegetables, and squeezing its juice. The trade of bitter melon, which attracts international attention, contributes to the economy of the regions where it is grown or processed. Bitter melon, which has been the subject of numerous studies in the fields of medicine, nutrition, and food, is known to be rich in vitamins, minerals, proteins, conjugated linolenic acid isomers, and bioactive compounds, and is a good source of antioxidants. The plant possesses antiviral, antibacterial, and anticancer properties. It is known to be beneficial for stomach disorders such as gastritis, ulcers, and reflux, as well as diabetes and open wounds. It is used for blood sugar control in the treatment of diabetes. In this study, the general characteristics, nutritional value, health effects, and usage in food products, as well as alternative consumption methods, of bitter melon were discussed. A literature review was conducted on studies related to the use of bitter melon in food, and relevant studies were examined in terms of their objectives, methods, and results. As a result, it was determined that further research was needed in fields such as food, medicine, and pharmacy to take advantage of the functional and nutritional properties of different parts of bitter melon.

Keywords: Bitter gourd, Bitter melon, Food, Health, Nutrition

1. INTRODUCTION

A sedentary lifestyle and poor eating habits cause various illnesses such as diabetes, cardiovascular diseases, and hypertension. Plants are improving health and treating these diseases due to their dietary components and phytochemicals. Therefore, plants and their products are consumed not only to meet basic nutritional needs but also to contribute to the prevention and treatment of diseases (Saeed, et al. 2021). Bitter melon, has been considered a medicinal plant for a very long time. Bitter melon, with its high nutritional value and antioxidant properties, shows protective effects against many chronic diseases. This fruit, which promotes health, attracts consumer attention due to the positive research conducted on it and the increasing awareness level (Kumari, et al. 2017). Bitter melon is consumed as a fruit, tea, or added to dishes in many regions of the world, especially in tropical areas. However, the bitter taste and lack of widespread availability limit the consumption of bitter melon. Therefore, this study aims to provide information about bitter melon, discuss its use in food products, and encourage consumers to consume the fruit. This study examines the general characteristics, nutritional value, and health effects of bitter melon. In addition, the use of bitter melon in food products is discussed, and the results of studies conducted in this field are presented.

2. GENERAL CHARACTERISTICS OF BITTER MELON

Bitter melon, is a member of the Cucurbitaceae family. It has a rectangular shape, ranging from 9-60 cm in length, and looks similar to a cucumber, but with a very rough outer appearance (Tan et al., 2014). Bitter melon is a tropical and subtropical fruit that originated in China and India. It is widely cultivated in China, Malaysia, India, Africa, the Amazon, and the Caribbean. Bitter melon can be grown up to an altitude of 1500m. In the hot season, from April to July, the seeds are planted in a pit to grow. The seeds should be planted half a meter apart (Gupta et al. 2011). In Turkiye, bitter melon is commonly grown in Yalova, Bursa, and the Aegean Region (Kızılaslan et al. 2022). Fruits of bitter melon can be protruding, blunt, pointed, short, or long. The fruit is green in the early stages and turns yellow and orange as it ripens. After ripening, the shiny red seeds of the fruit are revealed by splitting into three from their tips and curving backward. Bitter melon, which belongs to the Cucurbitaceae family, needs a minimum temperature of 15-18°C and should be grown under the same conditions as other plants in the same family (Arslanoğlu et al., 2012).

2.1. Nutritional Value of the Bitter Melon Fruit

The bitter melon fruit provides health benefits against various diseases to enhance the quality of life. It is a nutritious plant that contains alkaloids, polypeptides, vitamins, minerals (Saeed et al., 2021). The bitter melon fruit is rich source of carotene, iron, phosphorus, and potassium (İnce et al., 2019). Bitter melon fruit contains antioxidants. In addition, it contains high amounts of vitamins A, B, and C (Arslanoğlu et al., 2012). The bitter melon fruit is the most nutritionally valuable fruit in the Cucurbitaceae family. Its nutritional value is enhanced by the presence of phenolic acids, triterpenes, flavonoids (Sur et al., 2021).

2.2 The Effects of Bitter Melon on Health

Bitter melon grows in many countries in Asia. Its fruit, juice, and dried powder are widely used as traditional medicines to lower blood sugar levels, treat obesity, and prevent the proliferation of various cancer cells (Yoon et al., 2019). Many studies have shown that bitter melon, a medicinal plant, contains more than 30 natural products, some of which have antitumor potentials and also bitter melon, against diabetes and HIV virus (Fang et al., 2019). The increased consumption of bitter melon fruit in developed countries is thought to be effective in the treatment of obesity and type II diabetes. Additionally, the fruit is known to have anthelmintic properties, and contraceptive effects, and to be beneficial for ailments such as gout, kidney stones, hemorrhoids, and rheumatism (Raina et al., 2016).

Bitter melon is an antioxidant, anti-allergic fruit, and therefore, consumption of bitter melon extract is increasing day by day. The fruit is known to have a therapeutic effect on diabetes, cancer, and cardiovascular diseases in both humans and animals. Moreover, due to the presence of β -carotene, it is effective in the treatment of eye disorders and in improving visual ability. In addition, some studies have shown that bitter melon fruit is effective against gastrointestinal parasites (Muronga et al., 2021). Bitter melon fruit, leaves, and stems are used as herbal medicine and dietary supplements for the treatment of gout, graying of hair, skin infections, and respiratory diseases (Clardy, 2018). Bitter melon fruit is traditionally used for the treatment of wounds and stomach ailments. The fruit should be taken orally for the treatment of peptic ulcers that cause stomach discomfort and applied externally for the treatment of wounds. Bitter melon fruit is also preventive against *Helicobacter pylori*, a bacterium that grows in the stomach and increases stomach acid. Moreover, it has been observed in studies to be effective in preventing diseases such as reflux and gastritis (Kızılaslan et al., 2022).

3. USAGE OF BITTER MELON FRUIT IN FOOD PRODUCTS

In the regions where it is grown, bitter melon is consumed as a vegetable by boiling it in salty water to remove the bitterness. The consumption of its seeds is not recommended due to their laxative effect. Since ripe fruits are bitter, the consumption of unripe fruits is more common. Bitter melon fruit is also added to drinks either raw, cooked, or fried (Arslanoğlu et al., 2012). The leaves and seeds of bitter melon fruit are used in tea making. Additionally, the fruits can be dried, pickled, or canned. To add a slightly bitter taste to food, it can be added to curries and other spices. For traditional medicinal purposes, fruit juice is traditionally consumed on an empty stomach in the early morning to control glucose levels in hyperglycemic conditions (Raina et al., 2016).

Bitter melon fruit is a commonly consumed product in Asian and Indian cuisines. In Chinese cuisine, it is usually fried with pork, used in soups, and consumed as tea. In the northern region of India, the inside of the bitter melon fruit is filled with spicy mixtures and fried in oil. It is served with yogurt to reduce its bitterness. In the southern region of India, bitter melon fruit is mixed with coconut and various spices for flavoring. In the Caribbean, bitter melon is consumed by sauteing it with onions and garlic. Additionally, bitter melon can be consumed as juice either alone or in combination with other fruits and vegetables (Clardy, 2018).

4. LITERATURE REVIEW: USAGE OF BITTER MELON (*MOMORDICA CHARANTIA*) IN FOOD PRODUCTS

This section includes studies on the use of bitter melon fruit in food products. Table 1 contains 2 Turkish studies and 8 foreign studies that have been examined in terms of their objectives, methods, and results, and literature tables have been created.

	References	Purpose, Method, and Results of the Study
1	Aydos (2022)	<ul style="list-style-type: none">➤ This study aims to produce functional biscuits using dried bitter melon and medlar powders with different techniques and to determine the physical, chemical, nutritional, and sensory properties of the obtained products.➤ In this study, bitter melon fruit powder, which was dried by vacuum, tray, and microwave methods, was used as a flour substitute at ratios of 0%, 3%, 6%, and 9%.➤ As a result, the biscuit samples with bitter melon addition had the highest L* value with tray drying and the highest a*, b* values with vacuum drying.

International Conference on Global Practice of Multidisciplinary Scientific Studies-IV
Turkish Republic of Northern Cyprus, April 28-30, 2023

		<ul style="list-style-type: none"> ➤ With the increase in the ratio of bitter melon powder, an increase in moisture, ash, protein, and fat values was observed in the products, while a decrease in energy and carbohydrate values was observed. Total phenolic compound and antioxidant activity values increased with the increase in bitter melon powder ratio and reached the highest values with microwave drying method. ➤ It is suggested that bitter melon, as a functional food, can be used in the food industry according to the results of this study.
2	Maria et al., (2021)	<ul style="list-style-type: none"> ➤ This study aims to investigate the effect of bitter melon powder on the quality of whole wheat bread. ➤ Bitter melon powder was added to the bread dough in 1.5%, 2%, 2.5%, and 3% ratios. The physical-chemical, antioxidant, and sensory properties of the bread were analyzed. ➤ The study found that as the bitter melon powder content in the bread increased, the ash, protein, and fat content also increased. ➤ Additionally, the addition of 3% bitter melon powder had a positive effect on the total phenolic content and antioxidant activity of the bread. ➤ According to the research results, the addition of 2.5% bitter melon powder did not affect the taste profile of the bread. This finding indicates that bitter melon could be a promising and nutritious alternative for consumers.
3	Snee et al., (2011)	<ul style="list-style-type: none"> ➤ The aim of this study was to develop formulations containing bitter melon and test their acceptability in terms of taste. Additionally, the study investigated the effect of consuming bitter melon on health benefits. ➤ Fifty healthy individuals participated as panelists in the study. ➤ Bitter melon fruit added to dishes with hot sauce, as it was thought that the fruit's bitter taste could be suppressed in this way. ➤ It was observed that health information about bitter melon did not show significant effect on the desire to consume. ➤ In conclusion, it is thought that including spicy foods in meals can suppress the bitter taste of bitter melon.
4	An (2014)	<ul style="list-style-type: none"> ➤ The objective of this research was to create muffins that incorporate bitter melon and assess their quality. ➤ To achieve this, muffins were made with various formulations, including 0%, 3%, 6%, 9%, and 12% bitter melon powder. ➤ The findings of the study revealed that muffins made with the addition of bitter melon powder had a higher specific gravity compared to the control group. ➤ The moisture content of the samples containing bitter melon powder was found to be higher than the control group, while their pH was lower. ➤ The inclusion of bitter melon also resulted in an increase in the antioxidant properties of the muffins.

		<ul style="list-style-type: none"> ➤ Furthermore, the inner color of the muffins became darker with the addition of bitter melon powder, as indicated by the decrease in the L value, while the a and b values significantly increased. ➤ When examining the texture properties of the muffins, the incorporation of bitter melon powder resulted in a significant decrease in hardness, spreadability, adhesiveness, chewiness, and brittleness. ➤ The sensory evaluation scores indicated that the appearance, taste, texture, and overall preference of the muffins containing 3% and 6% bitter melon powder did not differ significantly from those of the control group. ➤ Based on the results, it was concluded that using less than 6% bitter melon powder would be a practical choice for producing muffins with the desired characteristics.
5	Zakaria (2007)	<ul style="list-style-type: none"> ➤ This study aims to make jam from bitter melon fruit and determine its physical, sensory, and chemical properties. ➤ For this purpose, the jam was produced in three different formulations containing 40%, 50%, and 60% bitter melon. ➤ The sample containing 40% bitter melon was determined to have the highest score in terms of total soluble solids (Brix) and spreadability with values of 73.00 ± 2.0 and 102.17 ± 1.31, respectively. ➤ The sample containing 60% bitter melon had the highest moisture, protein, carbohydrate, and fiber content compared to the other samples. ➤ Sensory evaluation was performed on sweetness, bitterness, and overall acceptance, and as a result, the jam containing 40% bitter melon received the highest score.
6	Kızılaslan et al., (2022)	<ul style="list-style-type: none"> ➤ This study aims to convert the bitter melon fruit into a gelatin capsule, in order to overcome the difficulties in the consumption of the fruit due to its bitter taste and smell. ➤ The fruit was transformed into a product using the soft gel technology to facilitate its use and prevent oxidation, while preserving its valuable components. ➤ To produce the gelatin capsules, the seeds of the bitter melon fruit were removed and the fruit was crushed. The separated juice of the bitter melons was macerated in olive oil for six months. The capsule shell is made of gelatin and water. The materials were heated and mixed in the gelatin melting system. The products underwent the necessary tests before being put into production. ➤ With this study, the bitter melon fruit has been produced as a gelatin capsule, thus facilitating its use. The product, which was released to the market as a food supplement, received significant feedback and achieved high sales.
7	Fu et al., (2021)	<ul style="list-style-type: none"> ➤ This study aims to develop a tea containing the main ingredients known to be good for diabetes, bitter melon fruit, and green tea

		<p>extract.</p> <ul style="list-style-type: none"> ➤ The study aimed to develop formulations with varying proportions of green tea extract and bitter melon juice and subject them to sensory analysis. ➤ The formulation with 7% bitter melon juice and 20% green tea extract received the highest sensory score. ➤ The resulting low-sugar formulation with this combination of bitter melon and green tea had a pleasing green color, balanced aroma, moderate acidity, sweetness, and clear texture. ➤ As a result of the study, this tea, which does not cause post-meal spikes in blood sugar levels, can be a healthy alternative for individuals with diabetes and obesity looking to diversify their diet.
8	Moreno et al., (2020)	<ul style="list-style-type: none"> ➤ This study aims to measure the acceptability level by producing cakes with the addition of bitter melon fruit, which is used as medicine in many countries. ➤ Cakes were produced with the addition of bitter melon and sensory analyses were carried out for this purpose. ➤ As a result of the study, it was revealed that the cakes produced with bitter melon were generally acceptable products.
9	Moon et al., (2014)	<ul style="list-style-type: none"> ➤ This study aims to determine the quality properties of cookies produced using bitter melon powder. ➤ Cookies containing bitter melon powder were produced and subjected to chemical and sensory analysis. ➤ The cookies containing bitter melon powder showed higher antioxidant properties compared to the control group. Furthermore, the sensory evaluation scores of the group containing 3% bitter melon powder were significantly higher than those of the control group in terms of appearance, taste, texture, and overall preference.
10	Sharma et al., (2016)	<ul style="list-style-type: none"> ➤ This study aims to produce a fruit juice that combines kiwi and bitter melon, which is high in nutritional value but has not received much attention in terms of its use in food products. ➤ Fruit juices containing different ratios of kiwi and bitter melon were produced for this purpose and subjected to sensory and chemical analyses. ➤ According to sensory analysis results, the product containing 80% bitter melon and 20% kiwi juice received the highest score. ➤ During storage, the products showed only minor changes in their physicochemical, nutritional, and sensory properties. ➤ The high antioxidant potential of the developed product compared to the control sample has demonstrated the health benefits of the product.

5. RESULTS

For many years, herbal products have been used as dietary supplements and therapeutic remedies due to their contributions to improving health. bitter melon is a beneficial plant that

is considered a functional food due to its rich nutrient content. Thanks to the components it contains, the bitter melon effective treatment of many diseases. For this reason, it is frequently consumed by consumers for the purpose of preventing and healing diseases.

This study focuses on the general characteristics of bitter melon, its nutritional value, and its effects on health, as well as providing information on the use of bitter melon in the food industry. In addition, studies on the use of bitter melon in the food industry have been reviewed. A literature review table was created that included the objectives, methods, and results of these studies. In this study, 10 studies on the usage of bitter melon as a food product were examined. Two of these studies were Turkish and eight were foreign. One of the common goals of these studies was to create a sensory acceptable product that would allow bitter melon to be added to daily diets. To achieve this goal, methods were used to reduce the bitter taste of bitter melon. Sensory, chemical, and physical analyses were conducted on the obtained products. In all of the studies, an increase in the nutritional value of the products obtained with the addition of bitter melon was observed. These studies are important in demonstrating that reasonable products can be obtained using bitter melon, in terms of taste and overall acceptability.

As a result of the research conducted, it was observed that bitter melon has become a popular research topic in the fields of nutrition and medicine. Many studies have been conducted on the health benefits, therapeutic effects on diseases, and chemical and nutritional properties of bitter melon. However, compared to these areas, the number of studies on the usage of bitter melon as a food product is much lower. Therefore, it is recommended that more studies be conducted on the usage of bitter melon as a food product, which is known as a functional food.

**NO_x MODELING OF AIRCRAFT WITH MIXED FLOW TURBOFAN ENGINES
USING CUCKOO SEARCH ALGORITHM**

Assist. Prof. Dr. Rıdvan ORUÇ (Orcid ID: 0000-0002-9856-2989)

Transportation Services, Ağrı

E-mail: rdvan0465@gmail.com

ABSTRACT

Depending on the continuous development of aviation, air traffic and therefore the total fuel consumption of aircraft engines are increasing. The harmful effects of the increase in emissions caused by increased fuel consumption on the environment and people have caused engineers, academicians and relevant authorities to focus more on this issue. In this study, NO_x modeling was performed for 50 different mixed flow turbofan engines. For modelling, the cuckoo search algorithm method, which has proven itself in many optimization problems, has been used. The aim of the model is to create an empirical formula that can predict real NO_x values for three different flight stages according to 3 different input parameters (by-pass ratio, fuel consumption and pressure ratio). As a result of modeling, the R² value was found to be 0.94 for take-off, 0.8744 for climb-out and 0.6937 for approach. Important design parameters were used as model inputs. In addition, the model gave good results for take-off and climb-out, although NO_x data exhibited a rather non-linear structure according to the input parameters. For these reasons, it is thought that the model obtained as a result of the study will help in estimating emissions in new engine designs and in estimating the environmental impact caused by turbofan engines around the airport.

Keywords: Cuckoo search algorithm, emission, mixed flow turbofan engine, optimization

Introduction

Global warming has become an important problem not only for the scientific community but also for the society (Florides & Christodoulides, 2009). Although the machines that come into our lives due to the development of technology make our lives easier, the greenhouse gases released by many machines to the environment are one of the main sources of global warming. The increase in greenhouse gases is an undesirable situation for the environment and human health. In this context, relevant authorities and individuals are working hard to reduce greenhouse gas emissions.

Air transportation is developing rapidly, especially since it is the most preferred mode of transportation in the international sense. As a matter of fact, it is estimated that air transportation will grow by approximately 3.6%-3.8% on an annual basis between 2019-2041 (Airbus, 2022; Boeing, 2022). Increasing air traffic and the number of aircraft increase the amount of emissions due to fuel consumption of aircraft engines is one of the biggest problems that the aviation community has focused on. For this reason, suggestions have been made to reduce emissions, such as producing more efficient aircraft engines, creating new air traffic applications in order to ensure that aircraft stay in the air and on the ground less, and a tendency to alternative fuels (Baklacioglu, 2016, 2021; Khandelwal et al., 2013; Oruc et al., 2022; Oruc & Baklacioglu, 2020b). In the literature, there are many studies on the calculation, optimization and modeling of emissions caused by different types of aircraft engines for the stated purpose. An example of this is the modeling study for 51 different mixed-flow turbofan engines using International Civil Aviation Organization (ICAO) data. The main purpose of the study is to estimate the real NO_x emission index value for take-off with high accuracy by using the by-pass ratio, fuel flow and overall pressure ratio parameters of the specified engines. In this context, a multiple regression model was created for mixed flow turbofan engines, and the error was tried to be reduced by simulated annealing and genetic algorithm. The created model was also used in the estimation of different exergy parameters. The fact that the R^2 value between the model data and the actual NO_x emission index value is close to 1, such as 0.862, shows the accuracy of the model (Ucar et al., 2023). The estimation study for the take-off phase for 171 different turbofan engines using ICAO data is another relevant example. In addition to emission estimation, different parameters related to exergy were also estimated in the study. In this context, support vector regression (SVR) and long short-term memory (LSTM) methods were used for optimization. Within the scope of the study, four different input parameters were used for the estimation of

HC, NO_x, CO emission index parameters. These are the actual by-pass ratio, thrust, combustion type and overall pressure ratio design parameters. As a result of the analysis, although the R² value was slightly low (around 0.63-0.65) for HC, the fact that the R² value for NO_x and CO was very close to 1 with both methods indicates the accuracy of the model. This is the first study to estimate emission index and exergy environmental parameters for aircraft with high bypass ratio using SVR and LSTM methods(Dursun et al., 2023).

To the author's knowledge, there is no study using the cuckoo search algorithm (CSA) for the NO_x emission index estimation of mixed-flow turbofan engines at different flight stages. This is the main motivation for this study. In this context, NO_x modeling was carried out for 50 different mixed flow turbofan engines. For modelling, the CSA method, which is relatively new but has proven itself in many optimization problems, is used. The aim of the model is to create an empirical formula that can predict the actual NO_x values for three different flight stages (take-off (T/O), climb out (C/O), approach (App)) according to 3 different input parameters (by-pass ratio, fuel flow and overall pressure ratio). As a result of the analyzes made, it was seen that the model created predicts the real emission index values with high accuracy.

Cuckoo Search Algorithm

The CSA was created in 2009 and its main inspiration is brood parasitism, the reproductive strategy of some cuckoos. Although the algorithm is new, it has given good results in optimization studies in many areas. In this context, it is frequently used in the literature. The analyzes show that the CSA method gives better results than the genetic algorithm and PSO methods. There are three basic rules in the algorithm (Oruc et al., 2022).

- Each cuckoo lays one egg in a randomly selected nest at one time.
- The best nests with high-quality eggs will be passed on to future generations.
- In CSA, the number of nests is fixed and the egg laid will be found by the host bird with a probability between 0 and 1. If the host bird notices the cuckoo egg, it will either get rid of it or leave its current nest to build a new nest (Joshi et al., 2017; Oruc & Baklacioglu, 2020a; Yang, 2014)

CSA uses a combination of local and global random walk controlled by the parameter p_a given in Equation (1). The local random walk can be written as:

$$x_i^{t+1} = x_i^t + \alpha s \otimes H(p_a - \epsilon) \otimes (x_j^t - x_k^t) \quad (1)$$

Here, x_i^t denotes the current solution, and the term x_i^{t+1} denotes the new solution obtained. From other terms, x_j^t and x_k^t are randomly selected two different solutions by random permutation, s

is the step size, $\alpha > 0$ is the step size scaling factor that should be related to the scales of the problem of interest, ϵ is a random number drawn from a uniform distribution, \otimes is the entry-wise product, and $H(u)$ is the heaviside function. Finally p_a denotes switching factor.

The global random walk, shown in Equation (2), uses Lévy flights, unlike the local random walk.

$$x_i^{t+1} = x_i^t + \alpha L(s, \lambda), \quad (2)$$

and

$$L(s, \lambda) = \frac{\lambda \Gamma(\lambda) \sin(\pi\lambda/2)}{\pi} \frac{1}{s^{1+\lambda}}, (s \gg s_0 > 0) \quad (3)$$

where, Γ is a constant given for the Lévy flight parameter λ of the function. In Equation (2), the first term on the right-hand side of the equation represents the current solution and the second term represents the transition probability (Gandomi et al., 2013; Yang & Deb, 2009, 2014).

Methodology of the Model

Within the scope of this study, a mathematical model was created to estimate the NO_x emission index value for 50 different mixed flow turbofan engines using ICAO emission databank data. In this context, by-pass ratio, fuel flow and overall pressure ratio parameters, which have important effects on engine performance, were determined as model input values. Modeling was carried out for three different flight stages, namely T/O, C/O and App. The CSA method was used in the whole modeling and optimization process. Although the NO_x values exhibited a rather non-linear structure for different engines, the model created predicted the real values with high accuracy. The mathematical formula obtained as a result of the study is shown in Equation (4).

$$f(\text{FFR}, \alpha, \pi) = (a_1 + a_2 \text{FFR} + a_3 \text{FFR}^2 + a_4 \text{FFR}^3) + (a_5 + a_6 \text{FFR} + a_7 \text{FFR}^2 + a_8 \text{FFR}^3) e^\alpha + (a_9 + a_{10} \text{FFR} + a_{11} \text{FFR}^2 + a_{12} \text{FFR}^3) e^\pi \quad (4)$$

where, FFR is the fuel flow, α is the by-pass ratio, π is the overall pressure ratio and symbols from a_1 to a_{12} denote model coefficients. The model was found as a result of a trial and error process. Namely; First, a mathematical formula was created, and then the coefficients of the mathematical formula were optimized using the CSA method. Until the mean square error (MSE) between the model values and the actual NO_x values was at the desired level the formula was modified and the optimization of the model coefficients continued. When the desired result was obtained, the same process was performed for the other flight stages and the formula given above was obtained. The main reason for using the exponential function in the formula is that

it gives better results. In the CSA method, the lower and upper limits of the coefficients were determined as -100 and +100, respectively. The iteration number, which is the stopping criterion of the algorithm, was determined as 250000, the number of nests from the CSA parameters was determined as 25, and the switching factor (p_a) was determined as 0.25. In studies on CSA performance, it has been seen that the number of nests gives good results in the range of 15 to 25, p_a 0.15-0.30. In this context, the above-mentioned values were given to these parameters and it was observed that they gave good results. Finally, the model data has been reduced to the 0-1 range in order to get better results. In order to reduce the values to the specified range, the formula given in Equation (5) was used.

$$x' = \frac{x - x_{\min}}{x_{\max} - x_{\min}} \quad (5)$$

Results and Discussion

The comparison of the values obtained for three different flight stages with the actual values is shown in Figure 1-3, the coefficients are shown in Table 1. When the specified figures are examined, it is seen that the model values are in great agreement with the actual values. Although the NO_x values for different engine types exhibit a rather non-linear structure, the fact that the model data is largely similar to the real data shows the model accuracy.

Figure 1. Comparison of actual and model NO_x values by engine types for T/O

Figure 2. Comparison of actual and model NO_x values by engine types for C/O

Figure 3. Comparison of actual and model NO_x values by engine types for approach

Table 1. CSA model coefficients

	T/O	C/O	Approach
a₁	0.2032	0.0443	0.5275
a₂	-5.7989	-8.0048	-17.5638
a₃	0.9783	20.6771	65.0487
a₄	4.1758	-22.4159	-63.3167
a₅	0.0507	0.1199	-0.4853
a₆	-3.0507	-2.2714	7.8885
a₇	14.4371	8.4611	-27.8499
a₈	-14.1862	-4.8248	27.1618
a₉	-0.0694	0.0609	0.3257
a₁₀	6.072	5.4751	3.1342
a₁₁	-10.1365	-12.9468	-12.1835
a₁₂	6.5016	11.1987	11.5078

The error rates between the model data and the actual data are given in Table 2. When the specified table is examined, values close to one for R² value T/O and C/O were found. For the Approach flight stage, although the value was a little low, the model's coverage of 50 different engines and good results for the other two flight stages demonstrate the accuracy of the study.

	MSE	R²
T/O	2.361462	0.940005
C/O	2.177443	0.874397
App	0.871201	0.693683

Conclusion

Aviation engines account for 2% of global greenhouse gas emissions. Its share in the transportation sector is around 10% (Atilgan et al., 2013; Aydin et al., 2012). This rate seems low at first glance. However, the values stated today, where the rapid development of aviation and the reduction of emissions even at a very low rate are very valuable, are also important. In this context, this model study for different flight stages is important.

It is thought that the model obtained can be used for emission estimation in new engine designs, since the parameters that significantly affect the engine performance are used for

modeling and the results are generally good. Since the flight stages modeled are flight profiles with relatively low altitude, it is thought that the model will help in estimating the environmental impact caused by turbofan engines around the airport.

As a result of the error analysis, the R^2 value for T/O and C/O was 0.940005 and 0.874397, respectively, which indicates the accuracy of the model in this case where the number of engines and non linearity are high.

ABSTRACT

Floating markets are a unique feature of the Mekong Delta region in Vietnam, attracting both local and international tourists. Can Tho, as the largest city in this region, is famous for its floating markets and local cuisine. Understanding factors that contribute to tourists' satisfaction with the culinary experiences in these markets is crucial for tourism development. This study aimed to explore the factors affecting tourist satisfaction with the culinary offerings at floating markets in Can Tho City, Vietnam, and provided insights for local authorities and businesses to enhance gastronomic experiences and boost tourism in the area. A mixed-methods research design was employed, utilizing a quantitative survey of tourists visiting Can Tho's floating markets and qualitative interviews with local vendors and tourism stakeholders. The survey assessed tourists' satisfaction with taste, presentation, variety, hygiene standards, and overall experience of the local cuisine, while the interviews explored the perspectives of vendors and stakeholders on the challenges and opportunities in enhancing culinary experiences. The findings revealed that several factors significantly contributed to tourist satisfaction, including (1) food quality, encompassing taste, presentation, and authenticity of the dishes; (2) food pricing; (3) staff attitudes; and (4) the unique atmosphere of the floating markets. Nonetheless, the study identified specific challenges, including (1) maintaining hygiene standards, (2) enhancing food variety, and (3) addressing the need for improved marketing efforts. To address these issues, local authorities and businesses could collaborate on developing targeted strategies, including better hygiene management, promotion of culinary diversity, and enhanced marketing efforts. The culinary offerings at Can Tho's floating markets play a vital role in attracting tourists and ensuring their satisfaction. By addressing the identified challenges and capitalizing on the unique features of the floating markets, Can Tho can further enhance its gastronomic tourism potential and contribute to the overall development of the region.

Keywords: floating markets, culinary experiences, tourist satisfaction, Can Tho, Mekong Delta, gastronomic tourism

INTRODUCTION

The global tourism industry is continuously growing, with international tourist arrivals reaching 1.5 billion in 2019, a 4% increase from the previous year (UNWTO, 2021). Gastronomic tourism, or food tourism, has emerged as a significant niche within the industry, accounting for 88% of leisure travelers actively seeking unique food and beverage experiences while traveling (World Food Travel Association, 2020). This trend has led to the recognition of local culinary experiences as an essential factor in tourist satisfaction and destination marketing.

Floating markets, a distinctive feature of the Mekong Delta region in Vietnam, have long been an attraction for both local and international tourists. Can Tho, the largest city in the Mekong Delta, is particularly famous for its floating markets and local cuisine. According to the Can Tho Tourism Association, in 2019, the city welcomed 8.8 million visitors, up 4.6% over the same period in 2018, contributing significantly to the total number of international visitors to Vietnam (Hoang Tung, 2020). However, despite the growing interest in gastronomic tourism, there has been limited research on the factors that contribute to tourist satisfaction with the culinary experiences offered in Can Tho's floating markets.

The increasing competition among tourist destinations has made it vital for local authorities and businesses to understand the factors influencing tourist satisfaction to provide exceptional experiences and boost tourism. Research has demonstrated that satisfying gastronomic experiences positively impact destination image, revisit intention, and word-of-mouth marketing (Henderson, 2009; López-Guzmán et al., 2014). In this context, a comprehensive study of the factors affecting tourist satisfaction with the culinary offerings at Can Tho's floating markets is of paramount importance.

This study aimed to fill the research gap by investigating the factors that contribute to tourist satisfaction with the culinary experiences in Can Tho's floating markets. By employing a mixed-methods research design, the study sought to provide valuable insights for local authorities, businesses, and tourism stakeholders. The findings can be used to develop targeted strategies that address the identified challenges, capitalize on the unique features of the floating markets, and enhance the gastronomic tourism potential of Can Tho and the Mekong Delta region. In light of the research gap and the importance of understanding the factors influencing tourist satisfaction with culinary experiences in Can Tho's floating markets, the following research questions have been formulated:

Research Question 1 (RQ1): What are the key factors that contribute to tourist satisfaction with the culinary offerings at floating markets in Can Tho City, Vietnam?

Research Question 2 (RQ2): How do food quality, pricing, staff attitudes, and the unique atmosphere of the floating markets impact tourist satisfaction?

Research Question 3 (RQ3): What challenges do local vendors and tourism stakeholders face in enhancing the culinary experiences at Can Tho's floating markets?

Research Question 4 (RQ4): What strategies can local authorities and businesses adopt to address these challenges and improve the gastronomic experiences offered to tourists in Can Tho's floating markets?

In the upcoming sections of this research paper, readers will be guided through a systematic exploration of the factors influencing tourist satisfaction with the culinary experiences in Can Tho's floating markets. The paper is structured as follows: first, a comprehensive literature review will provide the theoretical background and context for the study; next, the research methodology, including the mixed-methods approach and data collection procedures, will be detailed; following this, the results and findings of the study will be presented and discussed; and finally, the paper will conclude with recommendations for local authorities and businesses to enhance gastronomic experiences, along with the potential implications and future research directions.

RESEARCH DESIGN

Literature Review

This section covered the following key topics, providing a solid theoretical foundation and context for the study:

Gastronomic Tourism: An Overview

Gastronomic or food tourism refers to the pursuit of unique and memorable culinary experiences by travelers, often involving the exploration of local food cultures, traditions, and flavors (Hall & Sharples, 2008). The significance of gastronomic tourism in the global tourism industry has grown rapidly in recent years, with food and beverage experiences becoming a primary motivation for many leisure travelers (Björk & Kauppinen-Räsänen, 2016). According to the World Food Travel Association (2020), 88% of leisure travelers actively seek out unique food and beverage experiences while traveling, demonstrating the growing prominence of gastronomic tourism as a niche market.

The role of local culinary experiences in shaping tourist satisfaction and destination marketing has been widely acknowledged in the literature (Ellis et al., 2018; López-Guzmán et al., 2014). Gastronomic experiences can enhance the overall perception of a destination, as they contribute to the sensory and emotional aspects of the tourist experience (Quan & Wang, 2004). Moreover, satisfying gastronomic experiences have been found to positively impact destination image, revisit intention, and word-of-mouth marketing, further emphasizing the importance of local culinary experiences in tourism development (Henderson, 2009; López-Guzmán et al., 2014).

Several studies have identified the key dimensions of gastronomic experiences that influence tourist satisfaction, such as food quality, authenticity, variety, presentation, and atmosphere (Kim et al., 2009; Tse & Crofts, 2005). Additionally, factors such as food pricing, staff attitudes, and cultural elements have been found to play a significant role in shaping tourists' satisfaction with culinary experiences (Okumus et al., 2007; Mak et al., 2012). As such, understanding the dynamics of gastronomic tourism and the factors that contribute to tourist satisfaction is crucial for destination marketing and the enhancement of local culinary offerings.

In summary, the concept of gastronomic tourism has gained considerable importance in the global tourism industry, with local culinary experiences playing a vital role in shaping tourist satisfaction and destination marketing. Future research should continue to explore factors influencing gastronomic experiences, particularly in unique contexts such as floating markets, which possess the valuable cultural characteristics of destinations. For example, Can Tho City, which possesses a system of rivers, canals, and traditional floating markets are typical features of the city in particular and of the Mekong Delta region in general. In-depth research in this area will provide better information for stakeholders involved in tourism and contribute to the development of gastronomic tourism in the city.

Tourist Satisfaction: Determinants and Factors

Tourist satisfaction has been widely studied in the literature, as it plays a crucial role in determining tourists' intentions to revisit, recommend, and share positive experiences with others (Alegre & Garau, 2010; Chen & Chen, 2010). Researchers have identified numerous determinants of tourist satisfaction, ranging from destination attributes to service quality and personal factors (Kozak & Rimmington, 2000; Prayag, 2009).

With regard to culinary experiences, several factors have been found to significantly influence tourist satisfaction. Food quality, encompassing aspects such as taste, freshness, presentation, and diversity is considered one of the most critical factors affecting satisfaction with culinary experiences (Namkung & Jang, 2007; Ryu et al., 2010). Authenticity, or the degree to which local dishes represent the cultural and historical characteristics of a destination, has also been recognized as an essential determinant of tourist satisfaction (Rand et al., 2003; Lin et al., 2011). Pricing is another crucial factor influencing tourists' satisfaction with culinary experiences. Studies have shown that perceptions of value for money, or the extent to which the price paid for a meal is perceived as fair, can significantly impact satisfaction and future intentions (Heung & Quf, 2000; Kim et al., 2013). Similarly, staff attitudes, including friendliness, responsiveness, and professionalism, play a vital role in shaping tourists' satisfaction with culinary experiences (Kivela et al., 2000; Stevens et al., 1995).

Ambiance, or the physical environment of a dining establishment, has also been found to influence tourists' satisfaction with culinary experiences. Factors such as cleanliness, “décor”, and layout can contribute to the overall atmosphere and directly impact tourists' enjoyment of a meal (Ryu & Jang, 2007; Wakefield & Blodgett, 1996). In the context of floating markets, the unique setting and atmosphere may be particularly influential in shaping satisfaction with the culinary experience (Lertputtarak, 2011).

Last but not least, factor marketing also plays a crucial role. According to recent research, effective marketing efforts can significantly impact tourists' satisfaction and their overall experience (Chenini & Touaiti, 2018). Marketing strategies that promote local culinary specialties and emphasize their unique cultural aspects can enhance tourists' awareness and contribute to their satisfaction (Lai & Vinh, 2013). It is essential to use up-to-date marketing channels, such as social media, to reach potential visitors and showcase the authentic culinary experiences offered at floating markets (Kim et al., 2017). By implementing well-planned and targeted marketing strategies, tourist satisfaction with floating market cuisine can be improved and contribute to the sustainable development of the local tourism industry (Schimperna et al., 2021).

In conclusion, the literature on tourist satisfaction highlights the importance of various factors, including food quality, pricing, staff attitudes, and ambiance, in shaping tourists' satisfaction

with culinary experiences. Understanding these determinants and their interrelationships is essential for enhancing gastronomic tourism and ensuring memorable experiences for travelers.

Floating Markets and Culinary Experiences

Floating markets have long been an essential aspect of life in the Mekong Delta region, particularly in Can Tho City, where they serve as a critical economic and cultural hub (Nguyen & Huynh, 2023). These markets are characterized by their unique setting on waterways, where vendors sell goods from boats, creating an atmosphere that attracts both domestic and international tourists (Scott et al., 2011).

In recent years, the tourism potential of floating markets has been increasingly recognized, with local cuisine playing a crucial role in attracting visitors and ensuring their satisfaction (Bessiere, 1998; Agyeiwaah et al., 2019). Food is considered a vital component of the overall tourist experience, as it allows visitors to immerse themselves in the local culture and understand the historical and social context of a destination (Rand et al., 2003; Cohen & Avieli, 2004).

Can Tho City, in particular, has become a hotspot for culinary tourism, with its floating markets offering a diverse range of traditional Vietnamese dishes and varied agricultural products from the abundant Mekong Delta region that showcase the region's rich gastronomic heritage (Avieli, 2013; Nguyen, 2018; Nguyen & Nguyen, 2021; Nguyen, 2022). The unique atmosphere of these markets, combined with the variety and authenticity of the local cuisine, has been found to significantly contribute to tourist satisfaction and destination appeal (Nguyen, 2018; Lertputtarak, 2011; Nguyen & Huynh, 2023).

However, despite the growing interest in the role of floating markets and culinary experiences in tourism, there remains a gap in the literature regarding the specific factors that influence tourist satisfaction with the cuisine offered at these markets. Furthermore, while the importance of food in tourism has been widely acknowledged, few studies have specifically focused on the floating markets of Can Tho City and their culinary offerings (Avieli, 2013; Nguyen, 2018; Nguyen & Nguyen, 2021; Nguyen & Huynh, 2023).

In conclusion, the literature on floating markets and culinary experiences highlights the unique features of these markets, particularly in Can Tho City, and the importance of local cuisine in attracting tourists and ensuring their satisfaction. However, there is a need for further research to explore the specific factors influencing tourist satisfaction with the culinary experiences at

these markets, as well as the challenges and opportunities for enhancing gastronomic tourism in the region.

Challenges and Opportunities in Enhancing Culinary Experiences

The literature on gastronomic tourism has identified several challenges that local vendors and tourism stakeholders face in improving culinary experiences, as well as potential opportunities for enhancing the appeal of food-related attractions in a destination (Boyne et al., 2003; Okumus et al., 2007).

One of the main challenges identified in the literature is maintaining hygiene standards, which have a direct impact on tourist satisfaction and destination reputation (Telfer & Wall, 2000; Wall & Mathieson, 2006). Ensuring cleanliness and proper food handling practices is critical in attracting tourists and ensuring their satisfaction with the culinary experience. However, local vendors in floating markets, such as those in Can Tho City, may face difficulties in adhering to strict hygiene standards due to the unique setting and limited resources (Nguyen, 2018).

Another challenge is enhancing food variety, as tourists increasingly demand diverse and authentic culinary experiences (Henderson, 2009; Sims, 2009). Although floating markets in Can Tho City offer a wide range of traditional Vietnamese dishes, there may be room for further diversification and innovation in the culinary offerings to cater to different tastes and preferences (Avieli, 2013; Nguyen & Nguyen, 2021; Nguyen, 2022).

Marketing efforts also play a crucial role in promoting gastronomic tourism, with researchers highlighting the importance of effective destination branding and promotion strategies to attract food tourists (Hall & Mitchell, 2007; Mak et al., 2012). However, local vendors and tourism stakeholders in Can Tho City may lack the resources and expertise to develop and implement successful marketing campaigns, which could limit the potential growth of gastronomic tourism in the area (Nguyen, 2018; Nguyen & Huynh, 2023).

Despite these challenges, there are several opportunities for enhancing culinary experiences and promoting gastronomic tourism in the region. Collaboration between local authorities, businesses, and tourism stakeholders can lead to the development of targeted strategies, such as better hygiene management, promotion of culinary diversity, and enhanced marketing efforts (Bessiere, 1998; Telfer & Wall, 2000). Additionally, capitalizing on the unique features of floating markets, such as their distinctive atmosphere and cultural significance, can further

boost the appeal of gastronomic tourism in Can Tho City and the broader Mekong Delta region (Lertputtarak, 2011; Nguyen & Huynh, 2023).

In conclusion, the literature on challenges and opportunities in enhancing culinary experiences highlights the importance of addressing hygiene standards, food variety, and marketing efforts to ensure a memorable and satisfying gastronomic experience for tourists. Collaborative efforts and targeted strategies can help to overcome these challenges and capitalize on the unique features of floating markets, ultimately contributing to the growth of gastronomic tourism in the city.

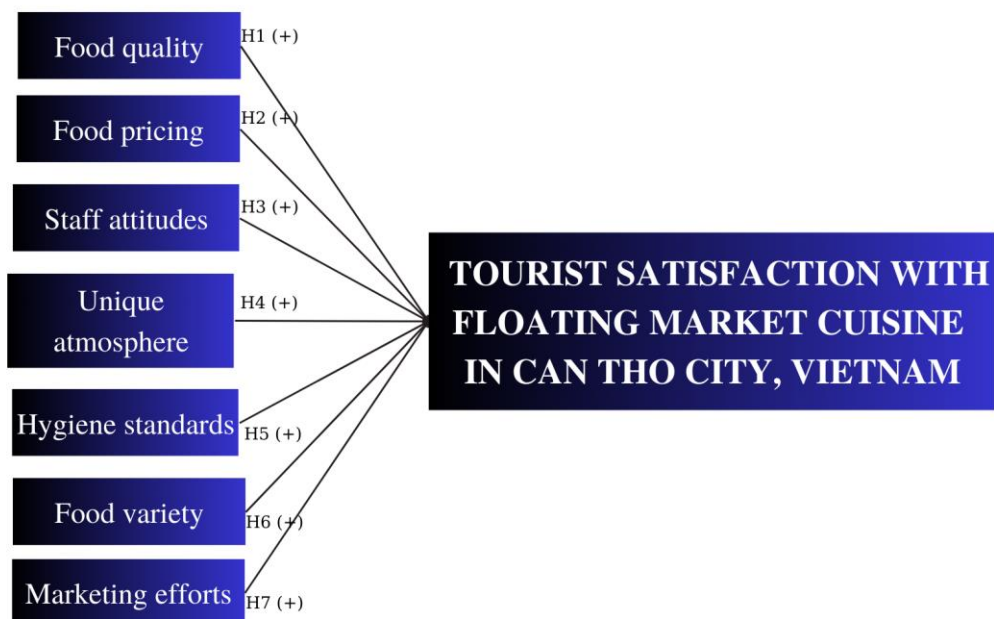

By reviewing these topics, the "Literature Review" section established a comprehensive understanding of the research context, facilitating the subsequent analysis of the factors affecting tourist satisfaction with the culinary experiences at Can Tho's floating markets.

Research Methodology

Research Model

Then, the author created the research model, which was grounded in the existing literature and was appropriate for the purposes of this study:

Figure 1. Research Model.

Source: From the author (2023)

Research Hypotheses

The author proposed seven research hypotheses for this study:

Hypothesis 1 (H1): Food quality, including taste, presentation, and authenticity, has a significant positive impact on tourist satisfaction with the culinary experiences in Can Tho's floating markets.

Hypothesis 2 (H2): Food pricing has a significant positive influence on tourist satisfaction with the culinary experiences in Can Tho's floating markets.

Hypothesis 3 (H3): Staff attitudes, such as friendliness, responsiveness, and professionalism, have a significant positive effect on tourist satisfaction with the culinary experiences in Can Tho's floating markets.

Hypothesis 4 (H4): The unique atmosphere of the floating markets has a significant positive impact on tourist satisfaction with the culinary experiences in Can Tho's floating markets.

Hypothesis 5 (H5): Improving hygiene standards will result in increased tourist satisfaction with the culinary experiences in Can Tho's floating markets.

Hypothesis 6 (H6): Enhancing food variety will lead to increased tourist satisfaction with the culinary experiences in Can Tho's floating markets.

Hypothesis 7 (H7): Improved marketing efforts will positively affect tourist satisfaction with the culinary experiences in Can Tho's floating markets.

These hypotheses were tested and analyzed through the quantitative survey and qualitative interviews, as presented in the findings and discussion of this study. The results provided insights into the factors that contribute to tourist satisfaction with the culinary experiences at floating markets in Can Tho City, Vietnam, and informed strategies for enhancing gastronomic tourism in the area.

Mixed-Methods Approach

In this study, the researcher adopted a mixed-methods research design to comprehensively investigate tourists' satisfaction with the culinary experiences at Can Tho's floating markets and to gain insights into the challenges and opportunities faced by local vendors and tourism stakeholders. By combining quantitative and qualitative methods, the author aimed to triangulate the findings and offer a more nuanced understanding of the research problem.

Quantitative research

The quantitative component of the study involved administering a structured survey to a random sample of tourists visiting Can Tho's floating markets (n=182). The survey assessed participants' satisfaction with various aspects of their culinary experiences, such as taste, presentation, variety, hygiene standards, and overall enjoyment. The author utilized a 5-point Likert scale for participants to assess their satisfaction levels, ranging from "very dissatisfied" to "very satisfied." The names of those interviewed and surveyed have been changed or anonymized to protect privacy. The survey data were examined using descriptive statistics to calculate mean satisfaction scores for each factor and inferential statistics to detect any significant connections between the factors and overall satisfaction levels. The data analysis process consisted of several stages:

- (1) Verifying the primary data: This stage ensured the data collected was accurate, reliable, and pertinent to the research goals.
- (2) Storing data in Excel: Excel was used as a preliminary tool for organizing and preparing the data for further analysis.
- (3) Transferring data to SPSS 20.0: SPSS, a potent statistical software, enabled the performance of various data analysis types, including descriptive statistics in this instance.
- (4) Implementing Structural Equation Modeling (SEM) with SMARTPLS 3.0: SEM, a multivariate analysis method, was used to examine relationships between multiple variables, while SMARTPLS was employed for Partial Least Squares (PLS) path modeling, a component of SEM.

By utilizing these tools and techniques, the author effectively analyzed the data, assessed the relationships between variables, and tested the research hypotheses in a thorough and robust manner.

Quantitative Research

In addition to the survey, qualitative interviews were conducted with a purposive sample of local vendors (n=12) and tourism stakeholders (n=18). These semi-structured interviews aimed to explore their perspectives on the challenges and opportunities in enhancing the culinary experiences offered at the floating markets. The interview data were transcribed, coded, and analyzed using thematic analysis, a widely used qualitative data analysis technique. This allowed the author to identify common themes and patterns in the participants' responses, providing a deeper understanding of the study's context and the factors influencing culinary experiences at the floating markets.

By integrating the results from both quantitative and qualitative data, the researcher was able to provide a comprehensive picture of tourists' satisfaction and the issues faced by local vendors and stakeholders. This mixed-methods approach enabled the author to not only identify the areas of improvement but also to suggest practical strategies for enhancing culinary experiences at Can Tho's floating markets.

The author of this present study focused on the two most popular and busiest floating markets of Can Tho city, including Cai Rang Floating Market and Phong Dien Floating Market to ensure a diverse and representative sample of participants.

(1) Cai Rang Floating Market: As the largest and most renowned floating market in Can Tho, Cai Rang attracts a significant number of tourists daily. Its vibrant atmosphere and extensive array of food offerings make it an ideal location for the study.

(2) Phong Dien Floating Market: Located 20 kilometers from Cai Rang, one of the oldest floating markets in Can Tho City, Phong Dien Floating Market is another bustling and popular destination for tourists. Known for its authenticity and variety of local products, this market also provides an excellent setting for research.

By conducting the study at both Cai Rang and Phong Dien floating markets, the researcher can gather comprehensive data and gain valuable insights into the culinary experiences of tourists and the challenges faced by local vendors and tourism stakeholders.

This study was conducted over six months, from October 2022 to March 2023. Interviews and surveys were carried out between December and February, which is the most suitable time for conducting such research in Can Tho City, Vietnam, as tourist arrivals typically reach their peak during this period. During these months, the weather is generally cool and dry, attracting a significant number of international and domestic tourists. This period would provide an ideal opportunity to gather a diverse and representative sample of participants for the study of culinary experiences at Can Tho's floating markets.

FINDINGS AND DISCUSSION

Demographics of Survey Respondents (n=182)

The total number of valid survey responses collected was 182, out of the 189 surveys that were distributed. The author provided information about the actual sample structure (n=182) in Table 1. As a result, the actual sample size exceeded the minimum requirement, ensuring that further analytical methods could be performed with confidence.

Table 1. Demographic Composition of the Quantitative Research Sample (n=182).

		Frequency	Percent (%)
Gender	Female	90	49.5
	Male	86	47.3
	Other/Prefer not to say	6	3.2

Demographics of Interview Participants (n=30)

The qualitative research results provided in-depth insights into the demographics of the interview participants. Out of the 30 interviewees, 40% (n=12) were local vendors operating at Can Tho's floating markets. These vendors comprised a mix of food sellers, offering traditional and authentic dishes from the Mekong Delta region, as well as beverage and snack providers catering to the diverse tastes of tourists.

The remaining 60% (n=18) of interviewees were tourism stakeholders, who represented a variety of sectors related to gastronomic tourism in Can Tho. These stakeholders included local government officials responsible for tourism development, representatives from tourism agencies promoting the floating markets, and hospitality business owners such as hotel and restaurant managers. They were actively involved in enhancing the culinary experiences at the floating markets and played a crucial role in shaping the future of gastronomic tourism in the region.

By incorporating the perspectives of both local vendors and tourism stakeholders, the study was able to capture a comprehensive understanding of the factors affecting tourist satisfaction with the culinary offerings at Can Tho's floating markets, as well as the challenges and opportunities for enhancing the city's gastronomic tourism potential.

Quantitative Survey Results

Evaluating the Measurement Model

The validation of the measurement model was supported by the results. Factor loading coefficients of the observed variables met the convergent validity condition, with all coefficients exceeding 0.7. Scale reliability was acceptable, as the Composite Reliability (CR) values ranged from 0.876 to 0.966, and the Average Variance Extracted (AVE) values ranged between 0.588 and 0.769. Discriminant validity was established, as the square root of AVE values were higher than the respective correlation coefficients of each construct in relation to others in the research model. Furthermore, the constructs demonstrated discriminant value, with cross-load coefficients higher than those of other constructs. The Heterotrait-Monotrait Ratio (HTMT) values for each construct were below 0.9, confirming the discriminant validity criterion for the HTMT.

Assessing the Structural Model

Examining Multicollinearity in Partial Least Squares Structural Equation Modeling (PLS-SEM): The results revealed no multicollinearity issues among latent variables, with Variance Inflation Factor (VIF) coefficients below the recommended threshold of 5 (maximum VIF=2.174, minimum VIF=1.915). The "tourist satisfaction with floating market cuisine in Can Tho City, Vietnam" exerted a substantial impact on the research model, as evidenced by an R2 value of 0.497 (surpassing 0.26).

Communality Value: The AVE values (greater than 0.5) demonstrated a strong alignment between the structural model and the observed data.

Goodness of Fit (GoF): The GoF index (0.525, which is higher than 0.36) significantly influenced the model.

In conclusion, the PLS model was well-aligned with the empirical data, as supported by the data analysis outcomes.

Examining the Research Hypotheses and Establishing the Relative Significance of the Identified Factors

Evaluating the Research Hypotheses: Examining the Relationships and Impacts: all seven hypotheses were confirmed, with significant correlations observed between the variables in each hypothesis, as evidenced by the β coefficients and p-values. The research model accounts for 49.7% of tourist satisfaction variation ($R^2 = 0.497$).

The factors affecting satisfaction, ranked in descending order of significance, included:

- (1) Food quality, which encompasses taste, presentation, and authenticity, emerges as the most crucial determinant of satisfaction.
- (2) Hygiene standards play a vital role in shaping tourists' overall satisfaction.
- (3) The unique atmosphere of floating markets significantly contributes to visitors' enjoyment.
- (4) Staff attitudes also have a notable impact on satisfaction levels, including aspects like cordiality, attentiveness, and expertise.
- (5) Food pricing is an essential aspect to consider for customer satisfaction.
- (6) Food variety, while less influential than the other factors, still holds importance.
- (7) Lastly, marketing efforts play a role in shaping tourists' satisfaction.

As for the identified challenges:

- a) Ensuring hygiene standards are maintained remains a crucial obstacle to overcome.
- b) Enhancing food variety is another area that requires improvement.
- c) Strengthening marketing efforts will further contribute to overall satisfaction.

Qualitative Interview Findings

Factors contributing to tourist satisfaction

From the qualitative interviews conducted with local vendors and tourism stakeholders, the findings indicated insights into their perspectives regarding factors contributing to tourist satisfaction at the floating markets. The major factors identified in the study results included food quality (e.g. taste, presentation, and authenticity), food pricing, staff attitudes, and the unique atmosphere of the floating markets.

Food quality (taste, presentation, and authenticity): Participants emphasized the importance of food quality in contributing to tourist satisfaction. A local vendor shared, "Our customers expect flavorful, well-presented, and authentic dishes that represent our culture" (Vendor A). Tourism stakeholders also acknowledged the significance of food quality, with one stakeholder stating, "Tourists often seek out unique and authentic culinary experiences, which can greatly impact their overall satisfaction" (Stakeholder B).

Food pricing: Affordable and reasonable food pricing was identified as a crucial factor in tourist satisfaction. One vendor noted, "We try to offer competitive prices, as we understand that tourists are price-sensitive and appreciate good value for their money" (Vendor C). A tourism stakeholder supported this notion, explaining, "Affordability is essential for tourists, especially when considering the diverse backgrounds and budgets of those visiting the floating markets" (Stakeholder D).

Staff attitudes: Positive and friendly staff attitudes were recognized as a vital component in enhancing tourist satisfaction. A local vendor mentioned, "We always strive to provide excellent service with a smile, as it creates a welcoming atmosphere for our customers" (Vendor E). Similarly, a tourism stakeholder highlighted the importance of staff attitudes, stating,

"Tourists appreciate engaging with friendly and helpful staff, which contributes to their overall experience" (Stakeholder F).

Unique atmosphere of the floating markets: The interviews revealed that the distinctive ambiance of the floating markets plays a significant role in attracting tourists and ensuring their satisfaction. A vendor shared, "The floating markets offer a one-of-a-kind experience, where tourists can enjoy delicious food while immersing themselves in the local culture" (Vendor G). A tourism stakeholder added, "The vibrant and lively atmosphere of the floating markets greatly appeals to tourists, making it a memorable and enjoyable experience" (Stakeholder H).

In conclusion, the qualitative interviews with local vendors and tourism stakeholders have provided valuable insights into the factors contributing to tourist satisfaction at the floating markets. By focusing on these factors, including food quality, pricing, staff attitudes, and the unique atmosphere, the floating markets can continue to attract and satisfy tourists, ultimately benefiting both the local vendors and the wider tourism industry of the city.

Challenges and opportunities:

From the qualitative interviews conducted with local vendors and tourism stakeholders, the findings revealed insights into their perspectives regarding challenges and opportunities in enhancing culinary experiences at the floating markets.

Challenges:

Limited variety of food offerings: Local vendors and tourism stakeholders acknowledged that the food offerings at the floating markets are often limited and repetitive. As one vendor mentioned, "We tend to serve the same dishes every day, which might not appeal to tourists seeking diverse culinary experiences" (Vendor A). Another vendor candidly revealed, "Since these floating markets typically operate only during the morning hours, we mostly serve breakfast dishes to our customers. This sometimes results in tourists not having the opportunity to experience the diverse local specialty dishes.

Food quality and hygiene concerns: A recurring concern among the participants was the need for improved food quality and hygiene standards. One tourism stakeholder explained, "Many

tourists are hesitant to try local dishes at the floating markets due to concerns about food safety" (Stakeholder B).

Lack of culinary innovation: The interviews revealed that the floating markets lack innovation in their culinary offerings. A local vendor shared, "We have been serving traditional dishes for years, and there's little incentive to innovate or introduce new items" (Vendor C).

Inadequate promotion and marketing: Another challenge identified was the lack of effective promotion and marketing of the floating markets' culinary experiences. As one tourism stakeholder noted, "The floating markets are not well-marketed as gastronomic destinations, leading to missed opportunities" (Stakeholder D).

Opportunities:

Collaboration between vendors and stakeholders: Participants emphasized the importance of collaboration between local vendors and tourism stakeholders to enhance culinary experiences. One stakeholder suggested, "By working together, we can develop a diverse and innovative menu that caters to different tastes" (Stakeholder E).

Capacity building and skills development: The interviews highlighted the need for capacity building and skills development among local vendors. As one vendor stated, "Training programs in food safety and culinary skills would help us to better serve our customers" (Vendor F).

Emphasis on local and sustainable ingredients: Participants identified the potential to promote local and sustainable ingredients to attract more tourists. A tourism stakeholder noted, "We can enhance the culinary experience by emphasizing the use of fresh, locally sourced ingredients" (Stakeholder G).

Improved marketing and promotion: The interviews revealed opportunities for better marketing and promotion of the culinary offerings at the floating markets. One vendor suggested, "We should collaborate with tourism agencies to promote our unique food experiences and attract more visitors" (Vendor H).

In conclusion, the qualitative interviews with local vendors and tourism stakeholders have provided valuable insights into the challenges and opportunities in enhancing culinary experiences at the floating markets. By addressing these challenges and capitalizing on the identified opportunities, the floating markets can significantly improve their culinary offerings, ultimately benefiting both the local vendors and the wider tourism industry.

Discussion

The present study aimed to explore the factors affecting tourist satisfaction at the floating markets in Can Tho City, Vietnam, and identify challenges and opportunities for enhancing the culinary experience. By employing both quantitative and qualitative research methods, the study provided comprehensive insights into the significant factors and barriers, as well as potential strategies for improvement.

The quantitative findings confirmed all seven hypotheses, indicating that food quality, hygiene standards, unique atmosphere, staff attitudes, food pricing, food variety, and marketing efforts significantly influence tourist satisfaction. Notably, food quality emerged as the most crucial determinant of satisfaction, followed by hygiene standards and the unique atmosphere of the floating markets. These findings align with the qualitative results, which highlighted the importance of food quality, pricing, staff attitudes, and the unique atmosphere from the perspectives of local vendors and tourism stakeholders.

Furthermore, the qualitative interviews revealed challenges in the form of limited food variety, food quality and hygiene concerns, lack of culinary innovation, and inadequate promotion and marketing. In contrast, opportunities included collaboration between vendors and stakeholders, capacity building and skills development, emphasis on local and sustainable ingredients, and improved marketing and promotion. These insights can serve as a guide for policymakers and stakeholders in enhancing the overall culinary experience at the floating markets.

Comparing the quantitative and qualitative findings, it is evident that both data sources complement each other in identifying the key factors affecting tourist satisfaction. The consistency between the results reinforces the validity and reliability of the study. However, the study also highlights the importance of addressing the identified challenges and capitalizing on the available opportunities to foster the development of the floating markets as a gastronomic destination.

The implications of this research extend beyond the floating markets in Can Tho City. By understanding and addressing the factors affecting tourist satisfaction, similar destinations worldwide can enhance their appeal and competitiveness in the Mekong Delta and beyond in the global tourism industry. Moreover, fostering collaboration among local vendors, tourism stakeholders, and policymakers can facilitate the creation of innovative and sustainable culinary experiences that cater to diverse tourist preferences. In turn, this can contribute to the economic growth and development of local communities reliant on tourism.

In conclusion, this study offers valuable insights into the factors affecting tourist satisfaction at the floating markets and provides a comprehensive understanding of the challenges and opportunities in enhancing the culinary experience. By addressing these aspects and promoting collaboration among stakeholders, the floating markets can continue to attract and satisfy tourists, ultimately benefiting the local vendors and the wider tourism industry.

CONCLUSION

In summary, this study has successfully addressed the research questions posed, providing valuable insights into the key factors contributing to tourist satisfaction at the floating markets in Can Tho City, Vietnam, and shedding light on the challenges faced by local vendors and tourism stakeholders in enhancing the culinary experiences at these markets.

The findings of this study have confirmed that food quality, pricing, staff attitudes, the unique atmosphere of the floating markets, hygiene standards, food variety, and marketing efforts play a significant role in impacting tourist satisfaction (RQ1 and RQ2). *The order of importance was arranged as follows:* (1) food quality, encompassing taste, presentation, and authenticity of the dishes; (2) hygiene standards; (3) the unique atmosphere of the floating markets; (4) staff attitudes; (5) food pricing; (6) food variety; and (7) marketing efforts.

Through in-depth qualitative interviews, the challenges faced by local vendors and tourism stakeholders in enhancing the culinary experiences at Can Tho's floating markets have been identified, including issues related to hygiene standards, food diversity, and marketing (RQ3). Based on these findings, targeted recommendations for local authorities and businesses have been proposed to address these challenges and improve the gastronomic experiences offered to tourists in Can Tho's floating markets (RQ4). These recommendations focus on better hygiene management, promotion of culinary diversity, and enhanced marketing efforts, which, if implemented, can lead to a more satisfying and memorable experience for tourists. Furthermore, the study has highlighted the broader implications for gastronomic tourism development in Can Tho and the Mekong Delta region. By addressing the identified challenges and capitalizing on the unique features of the floating markets, the region's tourism potential can be enhanced, contributing to the overall development of the area.

Recommendations for Local Authorities and Businesses

Based on the findings from the quantitative surveys and the qualitative interviews that were conducted, several targeted strategies are proposed for local authorities and businesses to collaborate on, with the aim of boosting tourism in the area through the enhancement of the culinary experiences at the floating markets. The following recommendations focus on better hygiene management, promotion of culinary diversity, and enhanced marketing efforts:

Better hygiene management: It is crucial for local authorities and businesses to work together to improve food safety and hygiene standards at the floating markets. This can be achieved through regular inspections, implementation of strict food safety guidelines, and providing training programs for vendors to ensure compliance with hygiene regulations. By improving food safety and hygiene, tourist confidence in the culinary offerings at the floating markets will increase.

Promotion of culinary diversity: Local authorities and businesses are encouraged to collaborate on initiatives that promote culinary diversity at the floating markets. This can include the introduction of new, innovative dishes that represent the local culture, as well as providing incentives for vendors to diversify their menus. A more diverse and appealing range of food offerings will attract a wider variety of tourists and enhance their overall experience.

Enhanced marketing efforts: It is important for local authorities and businesses to join forces in promoting the floating markets as gastronomic destinations. This can involve creating targeted marketing campaigns, collaborating with travel agencies and influencers, and developing promotional materials that highlight the unique culinary experiences available at the floating markets. By raising awareness of the rich gastronomic offerings, the floating markets will attract more visitors, ultimately benefiting both the local vendors and the wider tourism industry.

By focusing on these targeted strategies, local authorities and businesses can effectively collaborate to address the challenges and capitalize on the opportunities identified in the study. In turn, this will boost tourism in the area and enhance the culinary experiences at the floating markets, benefiting all stakeholders involved.

Implications for Gastronomic Tourism Development

The broader implications of the study's findings for gastronomic tourism in Can Tho and the Mekong Delta region highlight the importance of addressing the identified challenges and capitalizing on the unique features of the floating markets to enhance tourism potential and contribute to the overall development of the region.

The floating markets are an integral part of the Mekong Delta's cultural heritage, providing visitors with a one-of-a-kind experience that blends traditional food offerings with a lively, picturesque atmosphere. By focusing on the enhancement of culinary experiences at these markets, local authorities and businesses can strengthen the region's gastronomic tourism appeal and attract a diverse range of tourists.

Addressing the challenges identified in the study, such as improving food quality, hygiene standards, culinary diversity, and marketing efforts, is crucial for maximizing the tourism potential of the floating markets. Ensuring high standards of food quality and hygiene will not only improve tourist satisfaction but also contribute to a positive image of the Mekong Delta region as a safe and enjoyable gastronomic destination.

Promoting culinary diversity by encouraging innovation and introducing a wider range of dishes will help to satisfy the diverse palates of tourists and enhance the overall appeal of the floating markets. Moreover, a focus on sustainability and the use of local, fresh ingredients can further elevate the culinary experiences at the floating markets, showcasing the region's unique gastronomic offerings and cultural heritage.

Collaboration between local authorities, businesses, and tourism stakeholders is essential for developing and implementing effective marketing strategies that promote the floating markets as gastronomic tourism destinations. By leveraging the power of targeted marketing campaigns, promotional materials, and partnerships with travel agencies and influencers, the floating markets can attract a wider audience, boosting tourism in the region and contributing to its overall economic growth.

In conclusion, the implications of the study's findings emphasize the importance of addressing the challenges and capitalizing on the unique features of the floating markets to enhance gastronomic tourism in Can Tho and the Mekong Delta region. By taking these steps, local authorities, businesses, and stakeholders can work together to realize the full potential of the

floating markets, ensuring their long-term success and contributing to the sustainable development of Can Tho city in particular and the Mekong Delta region in general.

The contributions of this study not only provide valuable insights for local authorities, businesses, and tourism stakeholders in Can Tho and the Mekong Delta region but also serve as a valuable reference for other destinations with similar cultural and gastronomic attractions. By fostering collaboration and implementing the suggested strategies, it is possible to improve the culinary experiences at floating markets, ultimately benefiting the local community, the tourism industry, and tourists alike.

Limitations and Future Research Directions

Despite the valuable insights provided by this study, several limitations should be acknowledged, as well as directions for future research to build upon the findings and further explore the gastronomic tourism potential in Can Tho and the Mekong Delta region.

Limited sample size: The study relied on a relatively small sample of tourists, local vendors and tourism stakeholders, which may not fully represent the diverse perspectives within the community. Future research could benefit from expanding the sample size and including a wider range of participants to gain a more comprehensive understanding of the challenges and opportunities in enhancing the culinary experiences at floating markets.

Limited geographical scope: The study focused on Can Tho City and its two typical floating markets, potentially limiting the generalizability of the findings to other regions. Future research could explore similar issues in other floating markets within the Mekong Delta or different cultural contexts, comparing and contrasting the findings to identify commonalities and differences.

Temporal limitations: The study was conducted at a specific point in time, and the dynamic nature of the tourism industry, as well as the evolving preferences of tourists, may affect the relevance of the findings in the future. Longitudinal research could be conducted to monitor changes in the factors contributing to tourist satisfaction and the effectiveness of the recommended strategies over time.

By addressing these limitations and exploring the suggested future research directions, scholars and practitioners can continue to deepen their understanding of gastronomic tourism development, particularly in the context of floating markets, and contribute to the sustainable growth of the tourism industry in Can Tho City, the Mekong Delta region, and beyond.

**BRÂNCOVENI MONASTERY – NATIONAL AND UNIVERSAL MOVABLE
CULTURAL HERITAGE. CASE STUDY: TREASURE AND FUND
CATEGORY.**

Dr. Florentina Udrea, National Institute of Heritage (NIH),
florentina.udrea@patrimoniu.gov.ro

ABSTRACT

Brâncoveni Monastery (end of the 16th-1699/1704), national architectural monument (OT-II-a-A-08687), it's located in Oltenia region. The ensemble is composed of the large church, the abbot's house (princely house), the bell tower, cells, annex buildings, enclosure wall, and the hospital church; Monastery was built at the end of the 16th century, the last constructive stage being due to Constantin Brâncoveanu [Theodorescu, 1987, 1992], who rebuilt the church in 1699. The abbot's house keeps the museum collection and the storehouses of the monastery's objects [URL 1].

The exhibition at the Brâncoveni Monastery (rebuilt in 2014) includes the most representative brancovean and post-brancovean cult objects of goldsmiths (oil candle wick, cross in filigree, discos etc.), but also religious prints (gospel, anthology, liturgy, rule book etc.). The novelty of the exhibition was the display for the first time of the Gospel, printed at the end of the 17th century, with the dedication of the ruler. To complete the museum collection, copies of valuable liturgical objects that belonged to the Monastery, and which, today, are in the custody of the National Art Museum of Romania, were exhibited in the large hall of the Abbot's House. They are representative of the brancovean style, being a synthesis between Byzantine, Late Renaissance and Baroque art [Giurescu, 2014]. The objects are listed in the National Cultural Heritage, according to Law 182/2000, and are part of the legal category *Treasure* (cultural goods of exceptional value for humanity) [URL4].

The collection consists of 5 movable heritage objects: oil candle wick, chalice cup, discos, gilded silver bookbinding and a chalice [URL2]. In addition to the 5 classified, there are in the monastery museum about 480 pieces that have movable heritage object sheets, of which 12 are likely to be classified in the *Fund* category (cultural goods of special value for Romania); 6 of them will be the subject of the article.

Keywords: cultural heritage, religious movable heritage, cultural assets, religious museum collection, cult objects

INTRODUCTION

Brâncoveni Monastery (end of the 16th-1699/1704), national architectural monument (OT-II-a-A-08687) is mentioned for the first time in 1582, by voivode (prince) Mihnea Turcitul (The Turkey). Monastery was built at the end of the 16th century, the last constructive stage being due to Constantin Brâncoveanu who rebuilt the church in 1699 [Mănăstirea Brâncoveni, Archive NIH, 2023]. The ensemble, located at the foot of a terrace of Olt river, Brâncoveni commune, Olt county, Oltenia region, is composed of the large church of the monastery, dedicated to "The Assumption of the Virgin Mary" (OT-II-m-A-08687.01), surrounded by the abbot's house (OT-II-m-A-08687.03), the bell tower (OT-II-m-A-08687.04), cells (OT-II-m-A-08687.05), annex buildings (OT-II-m-A-08687.06), and the wall of enclosure (OT-II-m-A-08687.07) forming a monastic settlement with a fortification aspect. The church of the hospital, dedicated to "St. Archangels" (OT-II-m-A-08687.02) is located south of the enclosure, on the bank of a pond (Figure 1, Figure 2, Figure 3, Figure 4).

The large church of the monastery has a triangular plan, an open porch and a polygonal spire, with 10 sides; on the nave (the one on the nave, collapsed in 1838, was never rebuilt). The apse of the altar, polygonal on the outside and circular on the inside, is covered with a dome. Proscomidia and diaconicon are practiced in the thickness of the walls. The pronaos is covered with a spherical dome and the porch with a semi-cylindrical vault, with penetrations [Popa, 2011].

The stone-carved portal of the entrance to the church bears, in a medallion, the coat of arms of the Wallachia and is overlaid by the pisanian framed between carved arches. The wooden iconostasis, dating from the 19th century, probably replaced a wall pediment. The window frames, with flat floral reliefs, were redone in 1842; only one original frame is preserved, with a Gothic profile, at the diaconicon. Carved plant reliefs also adorn the stone columns of the porch [Sacerdoțeanu, 1964].

In the porch, under tombstones placed in 1688 and 1699, rest members of the family of the ruler Constantin Brâncoveanu (Preda vel vornic - grandfather, Papa postelnic - father, Stanca Cantacuzino - mother and Barbu - brother); in the porch is the tomb of the last abbot of the monastery, priest Radu Șapcă from Celei, hero of the 1848 revolution [Iorga, 2000].

The abbot's house is located in the northwest corner of the premises. Square plan, with two levels, the house has a cellar at ground level, compartmentalized by pillars and arches, in three

vaulted bays "in a cradle". The research that preceded the restoration in 1985 made relevant the original system of covering the floor with spherical caps resting on corner pipes and masonry arches. The concrete staircase attached to the eastern facade of the house, for access to the first floor, is a result of the restoration. In 1989-1990, the cellar of the abbot's house was set up as a lapidary and houses pieces from the Văcărești and Pantelimon monasteries. A two-level body, attached to the enclosure wall, connects the abbot's house and the tower.

The gate tower, prismatic with eight sides, with 4 levels raised on a square base preserves many of the attributes of Matei Basarab's era, being similar to those from the Brebu (Prahova) and Codreni (Călărași) monasteries. The restoration phase of the 70s and 80s (1985-1988) is due to the last level, which is rebuilt according to the model of the Brebu monastery [Giurescu, 1946]. The annex buildings in the north-eastern corner and the outer building were built for household functions in the 19th century (after the earthquake of 1838 and rebuilt in 1842-1847) and during the period when the function of the monastery changed, in an asylum of old.

The enclosure wall preserves from the restoration and fortification stage of the pre-existing monastery due to Matei Basarab a fragment contained between the entrance tower and the abbot's house, a raised wall in the Constantin Brâncoveanu stage [Țighiliu, 1989]. Other portions of the wall belonging to the reinforced enclosure are located on the west and east sides, free or embedded in the body of the cells, and bear the signs of renovations from the 18th and 19th centuries [Giurescu, 1907].

The cells on the south side are attributed to the restoration stage during the time of Constantin Brâncoveanu (1699-1702). The rehabilitation works from 1957-1959 and the restoration from 1973-1977 mark today's appearance of the building with ground floor and upper floor, with rooms served by an open gallery on the ground floor and closed on the upper floor with a window. The end to the west is more developed, using it as an arhondaric and abbot's house. On the ground floor of this building, a narrow passage leads to an access door to the garden and to the hospital church [Drăguț, 1971].

The church of the hospital, built by Constantin Brâncoveanu in 1702, on the site of the wooden church of the Calea parish, is the only component of the ensemble that remained unaffected by the transformations. The place is a pure specimen of the triconch planimetric type, with a massive spire on the nave. The apses are semicircular on the inside and polygonal on the outside. The altar, framed by the pastophors, is covered with a dome, the nave with the pantocrator spire, on pendants, and the pronaos, separated from the nave by a full wall with a

dome on pendants. The facades are treated uniformly - stone plinth, walls surrounded by a median girdle, with a torus, cornice decorated with a register of two rows of brick dentils. The windows have frames carved in stone, as does the western entrance which is accentuated by the stone pisana and the niche of the icon of the patron saint. The prismatic, eight-sided spire stands on a cubical base and has cornices marked by jagged brick registers [Ionescu, 1969].

The original painting, from 1702, although very damaged in the altar shell, the west wall of the nave and the dome of the pronaos, allows the recomposition of the iconographic program dominated by the scenes of Descent into Hell and Deisis (Prayer for the salvation of souls) in connection with the funerary function of the hospital churches. The votive painting depicts Constantin Brâncoveanu and his grandfather, Preda Brâncoveanu, Papa Brâncoveanu, the ruler's father, and Danciu vel vel Vornic, the father of Matei Basarab [Ghika-Budești, 1936].

The abbot's house (formerly the Royal House) is located in the north-west corner of the premises and part of it houses the museum collection and the monastery's storage of objects. Square plan, with two levels, the house has a cellar at ground level, compartmentalized by pillars and arches, in three vaulted bays "in a cradle". In 1989-1990, the cellar of the abbot's house was set up as a lapidary and houses pieces from the Văcărești and Pantelimon monasteries [Vlasie, 1995], but also furniture - bishops', deacons' chairs, pews - from places of worship in the area, destroyed or without storage conditions, as well as from the church of the monastery hospital [Pippidi, 2001].

RESEARCH AND FINDINGS

The exhibition at the Brâncoveni Monastery, taking into account the state of restoration of the objects, tries to capture the most representative Brâncoveni and Posatbrâncoveni goldsmith objects (candle, anaornica, filigree cross, disk). Also, the attention given by the ruler to religious prints was also noted. A novelty of the exhibition is the display for the first time of the Gospel printed in the last quarter of the 17th century, with the ruler's dedication on it.

Among the prints preserved today at the Brâncoveni monastery, the best preserved are the post-Brâncoveni ones (18th century), also present in the exhibition: gospel, anthology, liturgy, catavasier, minei, pravila, pravalioara [[Theodorescu, 1989].

In order to enrich the museum collection at the Brâncoveni Monastery, copies of important liturgical objects that belonged to the Brâncoveni Monastery, and which, today, are in the custody of the National Art Museum of Romania, were exhibited in the large hall of the Abbot's House.

They are representative of the brancovean style, being a synthesis between Byzantine, Late Renaissance and Baroque art. The objects are listed in the National Cultural Heritage, according to Law 182/2000 [URL 3.], and are part of the legal category *Treasure* (cultural goods of exceptional value for humanity). The collection consists of 5 movable heritage objects: oil candle wick, chalice cup, discos, gilded silver bookbinding and a chalice [Theodorescu, 2006].

1.Wick (Figure 5)

1700, Brâncoveni Monastery

© The National Museum of Art of Romania

Made of hammered gilded silver, using the repoussé technique, it bears the hallmark of Georg May II, an artisan from Braşov at 1700. It has three registers: the upper register is decorated with heads of angels and tulips; middle register with angels and heliantus; last register is decorated with heliantus (sunflower decorative) and tulips. TREASURY item

2.Chalice Cup (Figure 6)

1686, Brâncoveni Monastery

© The National Museum of Art of Romania

According to the inscription, the chalice cup is offered to the monastery Brancoveni by Prince Constantin Brancovan, in 1686. Manufactured in a Wallachian workshop of hammered and engraved gilded silver, chalice cup have the shape of a bell. TREASURY item.

3.Discos (Figure 7)

1635, Brâncoveni Monastery

© The National Museum of Art of Romania

Manufactured in a Wallachian workshop of hammered and engraved gilded silver. It has an inscription in Greek, enriched with floral: "I Prince Matthew Basarab. Holy God, Holy Mighty, Holy Immortal, have mercy on us". TREASURY item

4. Gilded Silver Bookbinding (Figure 8)

1636, Brâncoveni Monastery

© The National Museum of Art of Romania

Manufactured in a Wallachian workshop of hammered and engraved gilded silver, in 1636. Is offered to the monastery Brancoveni by Prince Matthew Basarab and his wife, Helen. The bookbinding is made from gilded silver. Two themes are represented: in front – The Resurrection, back – The Crucifixion. TREASURY item.

5. Chalice (Figure 9)

1636, Brâncoveni Monastery

© The National Museum of Art of Romania

The chalice is offered to the monastery Brancoveni by Prince Matthew Basarab and his wife Helen. Made in 1636, of gilded silver, hammered au repoussé, and polished, has the signature of the craftsman Alexander's Acrivis from Trikke-Greece. The composition includes various themes: Dinner at Mamre, the head of an ox (symbol of the Evangelist Luke), the eagle (symbol of the Evangelist John), Our Lady Platitera, lion (symbol of the Evangelist Mark) and angel (Matthew's symbol). TREASURY item.

The classification of movable cultural assets is carried out according to the provisions of Law no. 182/2000 [URL 3], with subsequent amendments and additions, and to the present rules developed by the Ministry of Culture and Religion, with the approval of the National Commission of Museums and Collections. By classification is meant the procedure of establishing movable cultural assets that are part of the legal categories of movable national cultural heritage, fund and treasure, according to the law. The ranking criterion is a qualitative and quantitative standard based on which the significance or cultural importance of movable assets is evaluated and the legal category of the national cultural heritage of which these assets are a part is determined. In order to be classified in the fund and treasure categories, the two types of classification criteria, general and specific, provided in these rules will be taken into account. The general ranking criteria are standards based on which the significance or cultural importance of movable assets is evaluated and by which it is determined whether they are likely to be ranked.

For each of the 3 general criteria, the maximum score that can be awarded is 100 points. The general ranking criteria are:

- a) age - the criterion based on which it is analyzed whether a cultural asset was created in a more distant period, at least 50 years before the date of the expertise, and value points are awarded in an amount proportional to the determined age;
- b) frequency - the criterion based on which it is analyzed whether the cultural property belongs to a series of identical goods or a lot of goods of the same typology and the presence of the goods in question on the Romanian territory is determined; in relation to the artistic significance, it is analyzed whether they belong to a determined typology that includes works with a relatively similar theme and manner of artistic realization and whether such works are present in public or private collections or in the civil circuit;
- c) state of conservation - the criterion based on which the degree to which the cultural asset preserves its integrity and initial characteristics is analyzed or is in a state that allows its reconstitution or restoration.

The expertise according to the general classification criteria is carried out in order to establish whether the movable cultural goods are likely to be classified.

- a) the value points are awarded for each general criterion and are added up;
- b) if the realized amount is up to 150 value points, the expertized movable cultural asset is not susceptible to being ranked;
- c) if the amount realized is equal to or greater than 150 value points, the appraised movable cultural asset is likely to be classified and its appraisal is carried out by an expert accredited by the National Commission of Museums and Collections, depending on the field of which the cultural asset in question is a part;
- d) the expert validates or invalidates the score given according to the general criteria and expertizes the good according to the specific ranking criteria.

The specific ranking criteria are standards specific to a field, based on which the archaeological, historical-documentary, artistic, ethnographic, scientific or technical significance or importance of cultural goods is evaluated and through which the special or exceptional cultural value is determined, establishing the category legal status of the national cultural heritage of which they are a part.

The specific ranking criteria are: a) historical and documentary value; b) memorial value; c) authenticity; d) the author, the workshop or the school; e) formal quality .

The value score that can be awarded following the expertise according to the specific ranking criteria is differentiated according to the placement of the movable cultural asset in one of the fields: archaeological and historical-documentary, artistic, ethnographic, scientific or technical. For the article, it is about:

... Goods of scientific importance 100 | 25 | 100 | 25 | 100

Following the expertise, it is proposed to classify the mobile cultural asset that is susceptible to classification, according to the law:

- 1) if the final amount of value points is between 200 and 350 value points, the good in question is classified in the substantive legal category of the national cultural heritage;
- 2) if the final amount is more than 350 value points, the property in question is classified in the legal category treasure of the national cultural heritage.

In addition to the 5 classified, there are in the monastery museum about 480 pieces that have movable heritage object sheets; of which 11 are likely to be classified in the *Fund* category (cultural goods of special value for Romania). 6 of them are the subject of this article [Brâncoveni Monastery Archives: warehouse and exhibition, 2014, 2021].

1. Gospel (Figure 10, Figure 11, Figure 12), 1682, no. Inventory 299, with L=32, l=22, above text VELVET-WOOD, SILVER, GOLDEN. State of preservation - Loss of the book's unity, lack of locking tongues. Notes f[4], file guard 1 and 3, f[3] (F[4]),

"This holy Gospel beautifying itself with silver on the outside as seen I dedicated it to the holy Monastery of Brancoveni, where it is dedicated to the Dormition of the Mother of God to our Lady Mother la leat 7199, (1691)..."- the dedication of Prince from Valahia, Constantin Brâncoveanu (1688-1714).

Mirror of the title page. Category: Old Romanian book; Place of publication: Bucharest Black and red print. Language: Romanian (Cyrillic characters). Wooden cover dressed in red velvet with gilded silver fittings: in the corners the 4 evangelists, in the middle the Resurrection of the Lord. BRV,I, 74. Pagination 4, 175 file

2. Boyar charters (Figure 13), sec. XIX, anonymous, no. inventory 218, diameter = 12 cm, silver.

They have a circular shape, in the center they have a floral cross and around it two small arms, a row of flowers among grapes and two more arms with geometric motifs. The catch ring is masked by a heraldic emblem, the double-headed eagle.

3. Large Wick (Figure 14, Figure 15, Figure 16), 18th century, author Georg May II, inventory item 59, silver, manufacture, casting, h=21 o=15.6 cm, weight: 578 g.

Description: Manufacturing candle, assembled by riveting. Equipped with three support chains and three bells and a die-cut engraved brush cover. It is decorated with three floral registers, and the second register is separated from the third by a floral ring on the outside. Registers 2 and 3 are formed by different flowers included in the arches. The lower part is flattened and has the letters "GM" stamped on it. On the lid is a floral motif with a wavy edge.

4. Icon St. Great Martyr George (Figure 17), 1869, author Matei Zograful (Matthew The Painter), inventory object 173, wood, tempera painting, dimensions: 72.5/53.5/3 cm.

Description: The wood of the icon is made of three tops, not supported on the back. The icon is on a blue background with a brown border and red corners. St. George has a breastplate and is covered by a red cloak on his left shoulder. In his left hand he holds St. cross, and on the right a spear. He is young, with short, wavy hair. He has a dark green tunic underneath. It has traces of caries; pieces of the icon's wood are missing from the bottom left corner, top right and left side. The paint is chipped in several places. It was retouched with oil paint.

5. Double-faced icon (Figure 18, Figure 19), obverse *Last Supper*, reverse *Capture of the Savior*, 1815, post-Byzantine workshop, anonymous author, no. inventory 212, linden wood, tempera painting with emulsion, dimensions 24/19/0.5 cm.

Description: A navy blue curtain is painted at the top, all the apostles are painted with a halo, the background is beige at the top and orange at the bottom. The icon with the *Capture of the Savior* and the kissing of Judas is on a vernal background, the soldiers are tightly grouped, with spears and a red torch, St. Peter is with his sword raised and the fallen servant looking at him. The savior wears a dark pink garment with a blue cloak. Greek inscriptions, brown border on both sides.

The wood of the icon is slightly curved, from the center to the sides at the top and like a slight at the bottom, the paint has fine cracks and is slightly chipped at the corners and on some edges, the icon is perforated in the center at the top.

6. Flag (Figure 20, Figure 21), 1844, author Gheorghe Zograful, academic workshop, no. inventory 119, canvas, primer, tempera painting with emulsion, dimensions L=103 l=90 cm.

Description: It is rectangular in shape, painted on both sides, obverse with the *Dormition of the Mother of God*, reverse with the *Baptism of the Savior*. The inscriptions are in Romanian with

Cyrillic characters. At the top it has a wooden crossbar, and at the bottom are sewn cream fringes.

CONCLUSION

The restoration of the exhibition at Brâncoveni Monastery aimed to bring back to the memory of contemporaries the exceptional cultural dimension that Wallachia knew during the reign of Constantin Brâncoveanu. The exhibition preserves objects of great value belonging to the national cultural heritage from the mentioned era.

Starting with the middle of the 18th century, the style created during Brancoveanu's time will survive, in provincial formulas, in numerous local centers of painting and goldsmithing. The Brancovean style was reflected in the secular and cult silverware commissioned from renowned artists, the most well-known and appreciated being the Saxon silversmiths from Transylvania: Georg May II, Sebastian Hann, Johannes Henning, etc., appreciated for their style close to the Baroque: rich decorations, ornaments loaded, vegetable motifs (peony, tulip, narcissus, rose and carnation) and animals, and for the chiseling and "au repoussé" technique. The embroideries made in various workshops in Wallachia were true works of art in the Brancoveanu era, with gold and silver threads and natural silks used especially for religious objects.

The 6 objects of worship, presented above, are part of a batch of 12 specimens that are in the process of expertise and for which classification files will be drawn up, they being likely to be classified, depending on the sought score (according to Law 182/2000) in the FUND category (250-350 points) and possibly TREASURY (over 350 points; the Gospel with the autograph of ruler Constantin Brâncoveanu).

Abstract

In recent years, a huge amount of scientific research have been carried out on plant extracts with pharmacological importance and their compound analysis. Despite the great advances in modern medicine, plants still make an important contribution to the field of health and pharmacy. A large number of plants are being researched worldwide in terms of their phenolic, flavonoid and antioxidant activity. *Artemisia* is a genus which has a great chemistry and biological activities as a medicinal plant comprises of about 500 species. Historically *Artemisia absinthium* is known as wormwood which is a perennial shrubby. It belongs to the plant family Asteraceae. It has displayed several pharmacological activities like anti-cancer, anti-microbial, anti-viral, anti-oxidant, wound healing, anti-inflammatory, insecticidal, hypoglycemic, hepatoprotective properties in most researches. Artemisinin, absinthin, quercetin, artemetin, coumarin, chlorogenic acid, rosmarinic acid, gallic acid are the main compounds which are reported for this plant. Thujyl alcohol esters, α -thujone, β -thujone, camphene, γ -terpinene are the major constituents for *Artemisia absinthium* essential oil. In this paper, it was aimed to examine the total phenolic, total flavonoid and antioxidant activity of *Artemisia absinthium* according to the extraction conditions from a pharmacological point of view and to create a review of the recently published scientific literature. It was determined that different extraction conditions had a significant effect on the phenolic, flavonoid and antioxidant capacity of *Artemisia absinthium* and a comprehensive analysis was carried out.

Keywords: *Artemisia absinthium*, chemical composition, antioxidant activity, bioactive compounds.

Introduction

Many factors such as industrial lifestyle, smoking, infectious diseases, stress, toxins, drugs cause the development of oxidative stress on people [1]. Oxidative stress triggers the formation of free radicals such as free oxygen species. Free radicals, which play a role in the etiology of many diseases, are an important part of aerobic life and metabolism [2]. Antioxidants are substances that protect the cells from damage caused by free radicals via terminate the chain reactions and prevent or slow down the oxidation of other molecules [3]. These antioxidants can be provided by the body system such as superoxide dismutase, catalase or external sources such as ascorbic acid, polyphenols. Flavonoids and phenolics that are secondary metabolites found in plants, are the bioactive components, protect health and act as a bridge between the food and pharmaceutical industries [4].

Since ancient times, herbs have played a vital role as a standard therapy in the treatment of many diseases. Today, scientists focus on the healing abilities and roles of plants and their contribution to the therapeutic properties of diseases and encourage the use of natural products [5,6]. In several studies conducted on both adults and children in Turkey, it has been determined that the use of herbal-based treatments has an increasing trend and is approximately 77% in the data [7,8]. In the study by Özlü et al., it was determined that approximately 54% of individuals in Turkey believed that treatment approaches on phytotherapy were beneficial in prevention and recovery from the COVID-19 epidemic [9]. Many studies have shown the positive effects of various herbs and medicinal plants on cancer [10], wound healing [11], obesity [12], hormone disorders [13], liver disorders [14], cardiovascular disorders [15], and anemia [16]. According to the World Health Organization (WHO), around 80% of people worldwide rely on the benefits of traditional medicine and herbs [17].

Artemisia absinthium is the most common and dominant species of the Asteraceae family [18]. Scientific classification of *A. absinthium* is given in Table 1. It is a herbaceous perennial herb native to the Middle East, North Africa and Asia, and known by many vernacular names, often referred to as wormwood [20]. *A. absinthium* is a perennial woody plant with a hard root, long and leafy stem, round flower head with bitter aroma [6,21]. The aerial parts and flowers of *A. absinthium* are shown in Figure 1. Many current pharmacological studies have focused on confirming and determining the mechanism of this herb. Many experimental studies have shown that *A. absinthium* has antioxidant [23], antibacterial [24], anticancer [25], antiviral [26],

hypoglycemic [27], wound healing[28], anti-inflammatory [29], antimalarial [30], antipyretic [31], treatment for chronic fever [32], cardiovascular diseases [33] and aromatic ingredient for beverage [34].

Figure 1. Aerial parts and flowers of *Artemisia absinthium* [6, 22].

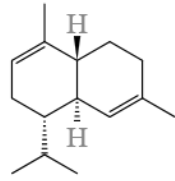

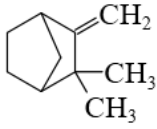

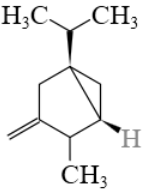

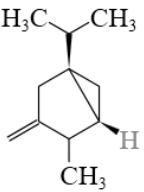

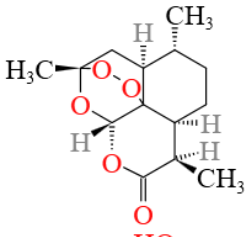

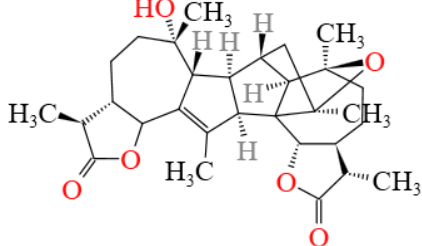

In this review article, the present findings regarding the antioxidant capacity of *A. absinthium* and the total phenolic and flavonoid contents of these various bioactive components were tried to be outlined. A comprehensive search was performed by using keywords such as “*Artemisia absinthium*,” ‘Antioxidant’, ‘Bioactive compounds’, and “Pharmacological activities” in the following databases: PubMed, Web of Science, and Google Scholar.

Bioactive components of *Artemisia absinthium*

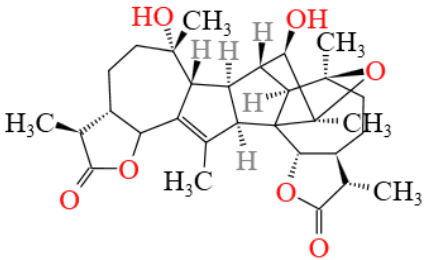

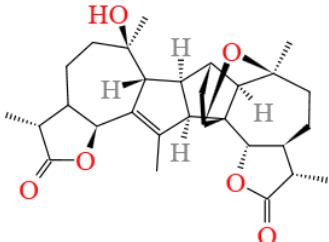

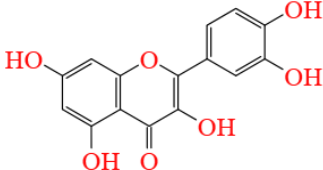

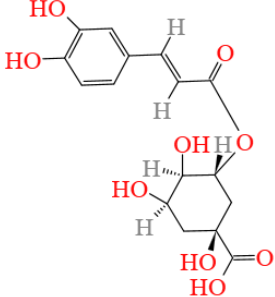

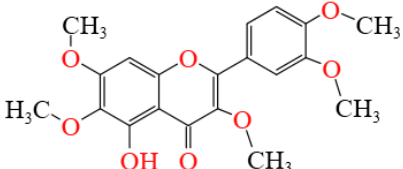

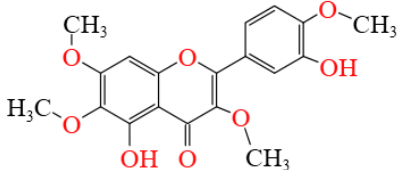

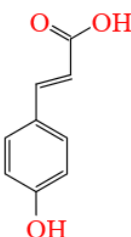

A. absinthium contains numerous valuable compounds responsible for its biological activities. These components may have different chemotypes depending on the location of the plant and growing conditions. *A. absinthium* contains many phytochemical compounds such as flavonoids, phenolic compounds, tannins, terpenoids, essential oils, lactones, organic acids [6].

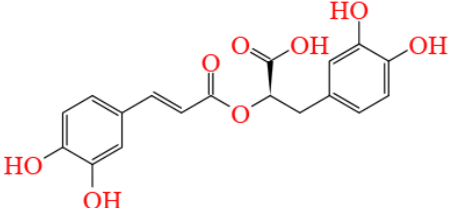

The main active constituents isolated from the *A. absinthium* are shown in Table 1 and total phenolic and flavonoid contents of *A. absinthium* are summarized in Table 2.

Table 1. The main constituents of *A. absinthium* [6].

Compound	Chemical Groups	Chemical Structure
α -cadinene	Essential oil	
camphene	Essential oil	
β -thujone	Monoterpenoids	
α -Thujone	Monoterpenoids	
Artemisinin	Sesquiterpenoid lactones	
Anabsinthin	Sesquiterpenoid lactones

Antioxidant activity of *Artemisia absinthium*

A. absinthium contains valuable flavonoids and phenolics components that determine its many antioxidant potentials that are considered important in protecting against disorders caused by oxidant damage. The data obtained on the antioxidant capacity of *A. absinthium* are summarized in Table 3.

Table 3. Antioxidant activity of *Artemisia absinthium*.

Type of extract	Method	Results	Year / Ref.
soxhlet extraction -Ethylacetate -Water	-DPPH -FRAP -β-Carotene Bleaching Test	In both DPPH and FRAP tests, it was determined that ethyl acetate extraction showed higher antioxidant activity than aquatic extraction. The β carotene test showed that the two extraction results delayed β carotene decolorization with a similar inhibition.	2022 [47]
maceration extraction -Ethanol	-DPPH -ABTS	It was observed that the vegetation year and the part (leaf/stem) of plant changed the antioxidant capacity. The data obtained from the second year has higher values than the data obtained in the first year. ABTS (μM Trolox/g dry weight) results were found to be higher than DPPH (μM Trolox/g dry weight) results.	2023 [48]
Maceration (Ethanol/Water: 80/20) 48 h at 25 °C	-DPPH -FRAP	It has been reported that the DPPH radical scavenging capacity of <i>A. absinthium</i> is much higher than that of <i>C. paradise</i> plant. Also was determined that the reducing capacity of ferric ion (III) to ferro ion (II) was high in <i>A. absinthium</i> .	2021 [39]
Maceration (Methanol/Water: 80/20)	-ABTS -CUPRAC	The results of <i>A. absinthium</i> plant according to ABTS method were found to be higher than trolox and BHT standard. It was determined that it was less in the CUPRAC method.	2018 [35]
Maceration ethanol/water (70/30)	-DPPH -ABTS -ORAC	<i>A. absinthium</i> exhibited significant activity towards scavenging of free radicals. <i>A.absinthium</i> extract had stronger	2012 [49]

		antioxidant activity than trolox with 0.57 ± 0.05 mg/mL IC50 value calculated for DPPH free radical scavenging activity. Its extract had higher values in ORAC and TEAC assays (917.89 μ mol and 690.62 Trolox equivalents/g extract, respectively)	
--	--	---	--

Conclusions

In this study, it was revealed that using different extraction conditions and different solvents, the total phenolic content and flavonoid content varied greatly. This demonstrated the possible effect of the solvent used to extract the total phenolic and flavonoid content. Many studies confirmed the antioxidative effects of *A. absinthium*. Its results on antioxidant and radical scavenging effects have shown that it can be reliable in preventing and treating oxidative stress-related diseases. It is suggested that the structure of *A. absinthium* needs to be clarified by both phytochemical and pharmacological tests.

ABSTRACT

Indian Insurance industries change over traditional into modern technology. In this way of approach, helps to adopt innovation using technology. Insurtech means insurance Technology. The recent development of internet connections, home computing, and mobile devices, applications help to increase the insurance industries' growth. Consumers access anything, everywhere at any time by using technologies. Payment processes, online inquiries processing are done through communication networks and processing. Industries provide lower transaction costs and processing fees for the services. The main role of insurance sector interactions with customers describes service is now processing through new distribution techniques and technology. It helps to reduce paperless transactions and access non-business hours. Using AI, software, mobile applications are a few emerging technologies in Insurance Technology. In this study discussed emerging technologies in the insurance sector. Firstly, insurance and its global market conditions. Secondly, insurtech revolution in India and its startup plans in India finally, emerging technologies in insurance like AI, mobile apps, etc.

Keywords: Insurance, Insurtech, Fintech, Blockchain Artificial Intelligent, Chatbot, Internet of Things, Mobile Apps.

INTRODUCTION

Insurance is an essential cost that one needs to make in order to secure the future of his/her family. Even the financial advisers suggest you to avail insurance before you start with your financial planning. Insurance is an important necessity for various reasons (Sejpal, A.,2020) and India is one of the world's largest and fastest-growing auto insurance markets – but until now, the sector has had to rely on traditional ways to renew lapsed policies or make repair claims. Both services have required inspectors to physically look over vehicles and make damage assessments.(<https://news.microsoft.com/en-in/features/icici-lombard-ai-enabled-car-inspection-appindia/>)Insurance has been a vital industry for the economic development of any country; however, it has seen a very low market penetration in India. The insurance penetration in India is 3.7% of the GDP while the world average is 6.31% (FY 2020)

<https://community.nasscom.in/communities/digital-transformation/fintech/insurtech-5-trends-thawill-redefine-the-industry-in-the-covid-era.html>.Digital technologies are rapidly changing every aspect of human life, including how we live, work and engage. Insurtech is having a similar impact on the insurance industry the world over. When supported by a conducive ecosystem, insurtech holds great promise to enhance customer experience, reduce claims response time, provide data-driven insights and support both customers and insurers to make informed decisions.(<https://www.livemint.com/money/personal-finance/opinion-is-an-insurtech-revolution-coming-our-way-1548099534499.html>) Integration of Big Data and AI in InsurTech to drive market growth. InsurTech companies are seeking the means to store, analyze, and search vast amounts of data. Such an analysis would help them in segmenting customer populations, identifying opportunities for new products and services, and optimizing pricing mechanisms. The use of Big Data and new data can improve investment decisions and help insurance companies in arriving at the comprehensive credit scoring mechanism. The analysts have predicted that the InsurTech market will register a CAGR of over 41% by 2023.India's 670 million internet users would rise to 914 million by 2027 according to a Morgan Stanley report. The overall Indian Insurance market is expected to grow at an annual rate of 15%-18% over the next 5yrs and is expected to reach a market size of approximately USD 200 – USD 250 billion by 2025.(C. T and Team, C,2020)

REVIEW OF LITERATURE

Lin, L. and Chen, C. C. (2019) the insurance sector, in riding the wave of the FinTech phenomenon, has been rapidly expanding, with a slew of firms having emerged to provide so-called 'InsurTech' services. These services incorporate concepts such as blockchain, artificial intelligence, digitalisation, and the sharing economy to various aspects of the insurance industry. Chen, C. C. (2018) This paper argues that, while technology does bring a lot of innovation to the insurance sector, it has not really challenge the existing framework by challenging the meaning of insurance or providing non-insurance risk management tools. Instead, most applications seem to be about refining and improving existing insurance products, the selling of insurance policies, and back-office operations (e.g. processing applications, information disclosure, or claim processing, etc.). Borselli, A. (2018) artificially intelligent algorithmic systems have the potential to transform large sectors of the economy, and the insurance sector makes no exception. Although the insurance industry might have been slow in recognizing and exploiting the value of artificial intelligence at first, today the applications of intelligent machines in insurance are growing. Chibvuri, I. (2012) The conditions for doing business are rapidly changing. The Internet and related advances in information technology significantly affect financial services in general and insurance markets and banks in particular. The growing importance of e-commerce represents a watershed event for insurance markets and banking institutions, as it does for most industries.

Definition of InsurTech

"Insurtech is technology that supports the digital evolution of insurers. It drives strategic and IT priorities while disrupting/collaborating the business processes and models of one of the world's largest industries."— Michael J. de Waal, Global IQX. (<https://4tifier.com/what-is-insurtech-what-you-should-know-about-emerging-technologies-in-the-insurance-sector/>)

INSURTECH

Insurtech—short for "insurance technology"—is a broad category of constantly changing technologies used in the insurance industry. Any technology that's used by an insurance company to increase the efficiency of its operations could be considered insurtech. (Bonner, M. 2020) Insurtech refers to the use of technology innovations designed to squeeze out savings and efficiency from the current insurance industry model. Insurtech is a combination of the words

“insurance” and “technology,” inspired by the term fintech(Hargrave, M.,2020) Insurtech companies have made the process of buying all types of insurance easier and more convenient, from consumer products to small business insurance. Customers can now research, compare policies, and make a purchase online whenever they want without having to physically visit a local agent. (<https://www.insureon.com/insurance-glossary/insurtech>)

Insurtech refers to the use of technology in the insurance industry to improve efficiency and more accurately assess risk. The value of capital being invested in insurance technology companies globally is on the rise. The insurance industry has always been very traditional, so these new developments have the potential to dramatically change the industry. The market for underwriting improvements is set to grow by over 60 percent by 2020.(Rudden, J,2019)

GLOBAL INSURTECH MARKET

Global Insurtech Market revenue is valued at 5.48 billion in 2019 and is expected to reach 10.14 billion by 2025, growing at a CAGR of 10.80% during the period 2019-2025. The insurance industry with global premiums exceeding US\$4.9 trillion in 2017, is one of the most complex businesses around. Although late, the industry now appears to be at a key inflection point with many experts viewing the digitization of insurance as the next big opportunity after FinTech. (<https://www.giiresearch.com/report/moi937853-global-insurtech-market-growth-trends-forecast.html>)

INDIA'S INSURTECH REVOLUTION

Insurance companies are unique — most of their interactions with customers happen through an agent. In effect, a chunk of technology investment goes into improving agent experience. Insurers have developed systems to advise agents on products tailored for specific customers, depending on their history with the insurer and income band (Revathi, P.,2020) New insurtech players now offer all critical 360-degree support and a marketplace to compare policies and prices. For instance, while some companies have become fully-digital general insurance companies, others offer rewards to insurers on being fit, or pay as you go insurance.(<https://www.financialexpress.com/>)Indian technology companies are leading InsurTech innovations and 6 firms have successfully secured a spot in the InsurTech100.(<https://www.mantralabsglobal.com/>)

The insurance sector in India is expected to grow to \$150 billion by 2023. One of the factors

boosting this growth is the increasing customer reach and growing customer sophistication on service levels which is creating a new wave of InsurTech companies changing how insurance is sold and serviced. The internet-first insurance platforms are receiving positive customer feedback because of the quick service they provide, coupled with mobile-first convenience, as compared to interaction with the agents. (<https://www.consultancy.in/news/2744/technology-acting-as-catalyst-for-indias-insurtech-revolution>)

INSURTECH STARTUPS IN INDIA

Policybazaar

Policybazaar is an online insurance aggregator for comparative analysis of products from various insurers based on price, quality and key benefits. Currently, the website offers information to users to help them make informed decisions along with solution driven customer service. They feature content in various forms such as top five features of a product, best sellers and conversion rates. Raised \$40M in April 2015 for Series D round from PremjiInvest. (<https://tracxn.com/explore/Insurance-Tech-Startups-in-India>)

ET Insure

Launched by the owners of India's largest English newspaper The Times Of India. ET Ensure claims to enable savings of up to 70% on premiums paid on vehicle insurance. The company is planning to soon introduce terms and health insurance for the Indian market. Visit their website to compare and buy from different policy providers. (N., Singh et al, 2020)

Artivatic

Artivatic provides an insurance SaaS platform to automate buyer onboarding, profiling, underwriting, and claims administration. Their solutions leverage cutting-edge technologies like NLP, ML, Deep Learning, Behavior Analysis, AI, and IoT. Currently, the company is working with 16 clients which include Deloitte, KPMG, HCL, and Cynopia, among others. (<https://www.mantralabsglobal.com/blog/insurtech-companies-in-india-insurtech100/>)

Digit Insurance

Digit is an internet-first general insurance startup company launched in the year 2016. It covers insurance for cars, mobile phones, travel, bikes, jewelry, and health. Headquartered in Bangalore, it has bagged total funding of \$100 Million from the time of its inception. (Patil, S. and Patil, S, 2020)

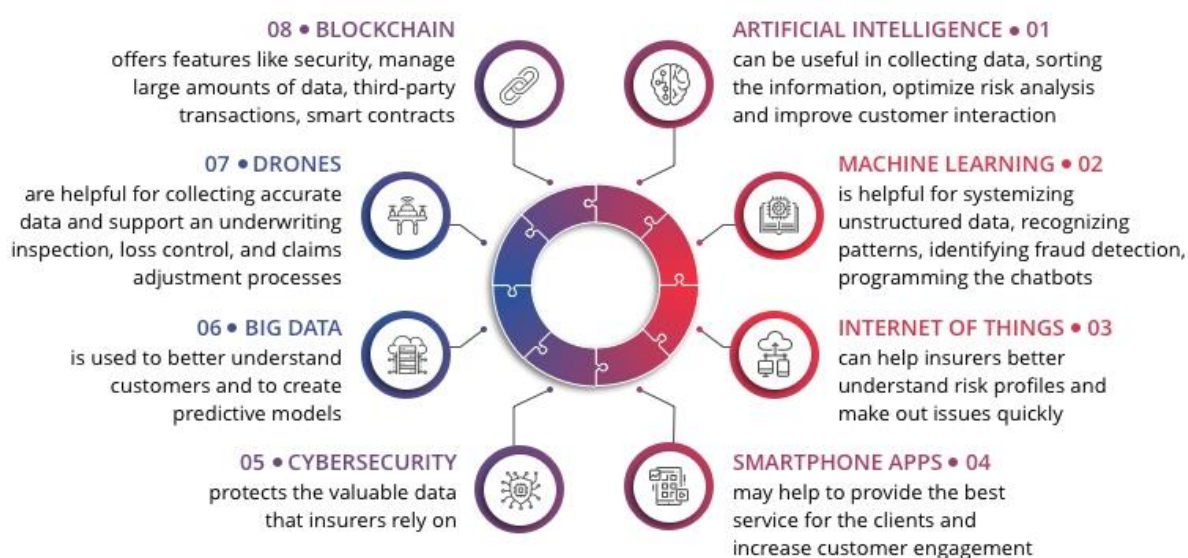

Key features of most of the emerging Insurtech startups in India (Kaur, P et al, 2020)

Promoting Usage Based Insurance: Wearable technology such as fitbit, Apple watch or Samsung gear is undoubtedly the new buzz in town. They have the potential to aid usage-based insurance. Large insurance companies have started using personalized data from these small wearable and fashionable devices to decide premium rates for your driving skills, and as a result, give you discounts if you follow a regular workout routine, etc.

Innovative Products: Promoting customized products as per individual needs and discovering new methods of pricing them effectively.

Online Coverage, Wider Reach: In a fast-paced world, it is very important to have an online presence and reach to build a faster connection with the client. It results in lower costs due to lesser land acquisition, low manpower requirements, etc. **Joint Venture with E-Commerce Giants:** Some Insurtech startups have ventured with e-commerce giants such as Amazon to provide point of sale insurance for various products to its customers.

Figure 1: Emerging Technologies in the InsurTech

source:<https://4tifier.com/what-is-insurtech-what-you-should-know-about-emerging-technologies-in-the-insurance-sector/>

AI Technology

AI technology has progressed immensely over the last few years and insurers are embracing its many facets from natural language processing, computer vision technology, machine learning and neural networks to robotic process automation to empower agents, brokers and employees to enhance customer experience by providing personalized services such as individual risk-based underwriting processes and faster claim settlement. The magic of AI will revolutionize four core capabilities that underlie the insurance value chain. (<https://www.expresscomputer.in/columns/ai-the-new-magic-in-insurance/57653/>)

Figure 2: Artificial Intelligence in Insurtech

Source:<https://towardsdatascience.com/how-are-insurance-companies-implementing-artificial-intelligence-ai-aaf845fce6a7>

Chatbot

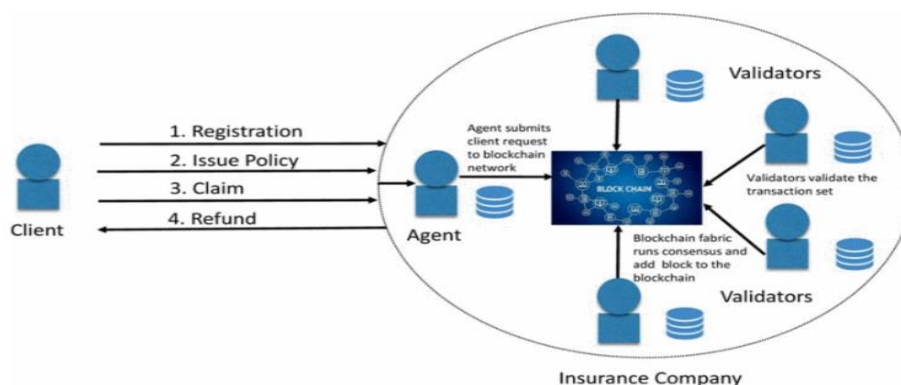

One of the most common technologies used in the insurance sector is chatbot. A chatbot is used by websites to allow conversation through audio or text methods. It's an AI based programme. A technological advancement made especially with the new-age group in the mind. Apart from being hassle-free, it's also cost-effective. (<https://www.outlookindia.com>)

Blockchain Technology

Blockchain technology in insurance is mainly utilized to enhance data security and build trust among all the parties of the contract, all while reducing operating costs associated with transaction processing. Insurtech blockchain startups leverage technology to free up human resources and make sure of prompt claims administration and reliable data sharing, particularly

in case of cataclysmic events (<https://www.dashdevs.com/blog/introduction-to-insurtech-business-models-challenges-trends-and-examples/>)

Figure 3: System model of the Insurtech Blockchain Framework

Source:<https://innovate.ieee.org/innovation-spotlight/blockchain-framework-insurance-processes-claims/>

Internet of Things

Future insurance is set to be completely transformed because of IoT. There are already some insurance companies that have adopted IoT and Insurance Tech such as Bajaj Allianz, ICICI Lombard, HDFC life. (<https://www.mantralabsglobal.com/blog/iot-in-insurance-sector/>)

Mobile Apps

With the explosive growth of smartphones and mobile devices, Insurers are eager to develop mobile applications and self-service portals to meet the growing expectation of policyholders, agents and internal users. These user groups seek to have anywhere, anytime and real-time access to the information stored in the backend systems. (<https://jarustech.com>)

INSURTECH MARKET LANDSCAPE: SEGMENTS

Aggregators/Policy Management

These companies provide digital tools that enable users to search compare and find affordable premiums from multiple carriers. These companies also assist users in managing policies and finance premiums from a single platform.

Online-first Insurance

These insurance providers sell their own insurance products such as life, property and casualty (P&C) and health premiums through their digital channels.

Internet of Things (IoT)

Companies use connected device (IoT) technologies, such as sensors and wearables, to identify and analyse risk to users. At present, this technology is widely used in the car insurance industry, under the usage-based or telematic insurance programme, which allows insurance companies to monitor and store driving-related data. Companies also offer custom insurance solutions for home and life insurance.

Software/White Label/Application Programming Interface (APIs)

These companies deliver software solutions to insurance companies and brokerages. They provide solutions such as risk assessment, underwriting, fraud detection, regulation, policy administration, marketing, sales, chatbots and customer relationship management (CRM) tools.

Claims

These start-ups create platforms to digitise claim processes by developing technological solutions such as video, mobile options and self-service. These companies leverage technologies such as ML and robotics to digitise payment systems to enable customers to effortlessly complete their payments by just a click of a button.

KEY TECHNOLOGIES IMPACTING THE INSURANCE INDUSTRY

Source: India Insurtech Annual Report 2021

Insurtech Unicorns in India

With two Insurtech unicorns, India stands shoulder-to-shoulder with China, but lags behind the US that comprises six Insurtech unicorns.

Policybazaar: Founded in 2008, the company became a unicorn in 2018. It announced plans for an initial public offering (IPO) in 2021 to raise US\$ 500 million and is targeting a valuation of US\$ 3.5 billion.

Digit Insurance: Founded in 2016, the company became India's first unicorn of 2021, with a valuation of US\$ 1.9 billion.

International Conference on Global Practice of Multidisciplinary Scientific Studies-IV
Turkish Republic of Northern Cyprus, April 28-30, 2023

Innovations	Select examples
Theme: Product innovation to address niche segments, contextual and new-age needs	
Introducing bite-sized insurance services to cater to a specific need or context	<ul style="list-style-type: none"> • Acko General Insurance joined forces with >20 digital platforms across retail, travel, finance, etc., to provide bite-sized insurance products. For example, the company offers insurance on Ola rides; through this, it has insured 23 million rides in <10 months. • Toffee Insurance offers bite-sized policies such as cycle theft insurance and fitness insurance
Launching products that meet niche segments and demands of the new age	<ul style="list-style-type: none"> • Toffee Insurance offers services such as 'Bicycle Protection' for cyclists and 'Mosquito Insurance' to cover seven mosquito-borne diseases • OneAssist launched cyberthreat insurance
Offering products that lead to a shift from protection to prevention	<ul style="list-style-type: none"> • BeatO offers comprehensive wellness plans, including connected glucose monitors and bands, for diabetic patients; provides unlimited medical consultations with insurance coverage. • Clover Health provides genomic testing for drug management
Non-exhaustive examples	Acko, BeatO, OneAssist, Kruzr, Toffee Insurance, Go Digit and TropoGo
Theme: Offering services and solutions beyond core insurance products	
Building an ecosystem to become one-stop shop for customers	<ul style="list-style-type: none"> • PayTM has built an ecosystem for its customers and provides numerous offerings such as e-commerce, mutual funds and insurance, in addition to payments
Exploring B2B opportunities beyond insurance	<ul style="list-style-type: none"> • Symbo's POS platform enables recruitment of agents and empowers them to sell insurance. • The company extends this capability to insurers in a white-labelled and customisable manner, for example, Cholamandalam MS General Insurance Ltd. partnered with Symbo to empower its 10,000 agents using data-driven solutions
Non-exhaustive examples	Docprime, CoverFox, Wellthy Therapeutics and Policybazaar
Theme: Data-enabled innovations across the value chain	
Introducing new underwriting and pricing models by utilising alternative sources of data	<ul style="list-style-type: none"> • CropIn provides crop insurance and covers >2 million farmers and >6 million acres of farmland across 52 countries. It processes farm-related information by combining ML, satellite monitoring and weather analytics to provide customised reports and information
Leveraging data to provide insights across the value chain	<ul style="list-style-type: none"> • Mantra Labs developed AI-based capabilities to optimise conversion across sales channels and leverage analytics to prioritise leads and assign them to the best suited sales team members
Non-exhaustive examples	Vymo, GOQii, Pentation Analytics, BeatO and Kruzr

Regulatory Tailwinds

In Union Budget 2021, the government increased the FDI limit in insurance from 49% to 74%. The following announcements by Insurance Regulatory and Development Authority (IRDAI) support innovation in the industry.

Topic	Timeline	Details
Approval for e-KYC via UIDAI	w.e.f. 23.04.2020	Due to COVID-19 lockdown, IRDAI allowed carriers to avail paperless KYC via <i>Aadhaar's</i> e-KYC facility
Launch of working group to study drone insurance	Announced on 24.06.2020 (6-week horizon)	<ul style="list-style-type: none"> Working group to explore insurance standards for remotely piloted aircraft systems (e.g., drones) Areas of research include third-party liability & reinsurance cover
Approval for teleconsultation	w.e.f. 11.06.2020	Approval for reimbursement of telemedicine procedures as per the policy benefits of the insured
Digital signatures on proposal forms (Life Insurance)	w.e.f. 05.08.2020	Insurance carriers can replace physical signatures with OTPs via email, mobile or other electronic means
Permission for electronic signatures (General Insurance)	w.e.f. 10.09.2020	Insurance companies can offer an e-signature option, including <i>Aadhaar</i> offline e-KYC
No physical signature in life insurance forms	w.e.f. 12.11.2020	Life Insurance 'proposal' (i.e., customer application) forms previously required a wet signature. The IRDAI had permitted e-signature until 31.12.2020 but extended it to 31.02.2021 with new notice

CONCLUSION

The revolution of the Internet has changes all industries, especially the insurance industry entering into the digital era. Insurtech considers consumer queries like the transparency of the contract agreement; improve claims management process, concentrate fraud detection, providing clarity premiums payment, etc., using technologies. Identification and evaluation of big data techniques and artificial intelligence provide risk-bearing capacity. It develops the cyber risk insurance market need to analyze data protection using data protecting interact with big data applications. Technologies provide better living and financial security through insurance coverage to people, especially middle and lower-middle-class people. Technology helps meet insurance regulations through extensive data protection and cyber security for consumer protection and follow safety standards to positive customer experience. Indian insurance industries remain a challenge for startup and sustain through new technology. The coverage area is undergoing a metamorphosis, with evolving client preferences and developing

importance of virtual offerings. With the energy of automation, cellphone apps, advanced analytics, artificial intelligence and IoT tools, digital coverage organizations are able to offer extra consumer delight with a small body of workers. These sorts of lean companies, with wider coverage, are ordinarily probable to will benefit prominence inside the future coverage ecosystem. Big era companies are vying to grow to be virtual intermediaries in the coverage area, for instance, AmazonPay has begun dispensing insurance products in India, at the same time as Google and Apple are interested by insurance. Moreover, start country. That could assist incumbents and big techs in making virtual transition are possibly to emerge as winners.

ABSTRACT

The decentralized control systems possess the ability to manage and regulate small-scale power generation units that are connected to the main power grid. Such units include renewable energy generators and conventional ones like diesel generators. In this study, a control algorithm based on multi-agent systems is proposed to schedule the power flow from these distributed generators and the main grid to the loads based on the JADE (Java Agent Development Framework) platform for Multi-Agent Systems. This platform is used to implement the decentralized control algorithm, which enables autonomous agents to communicate and coordinate with each other to achieve the common goal of efficient power management in the microgrid. The algorithm considers various priorities, such as the geographic distances between the generators and the loads, load demands, costs associated with fuel, maintenance, and construction, as well as the power provided by the distributed generators. The proposed algorithm is evaluated through multiple scenarios, including changes in the loads and generator power variations, as well as some of the generators going out of service. The results indicate that the decentralized control systems based on multi agent system approach are capable of efficiently managing and regulating the power flow in the microgrid, minimizing the losses to a great extent.

Keywords: Decentralized Control Systems, Multi-Agent Systems, Microgrid, Renewable Energy Generators, Power Management

INTRODUCTION:

The modern electrical systems have been developed in recent years. Yet with this development they have sustained the same centralized structure which has one direction for energy flow, starts in electrical power stations –central generation- going through transformers to the high-voltage network which in return delivers the power to the distribution network through the distribution transformers until it reaches the consumers. However, in recent years a parallel development has appeared that connects small power units directly to the distribution network [1], they are called distributed generation units (DGs). So generated power was no longer just in power station level but also in distribution level, that is because there are DGs controlled by smart systems to work optimally to adjust the amount of generated power, storing it and feeding the loads with the lowest cost possible [2], and this is one of the features that smart grids have been built on. Fig1 demonstrates a typical diagram for a distributed generation system consists of DGs, loads, storage devices, and control system [3] [4].

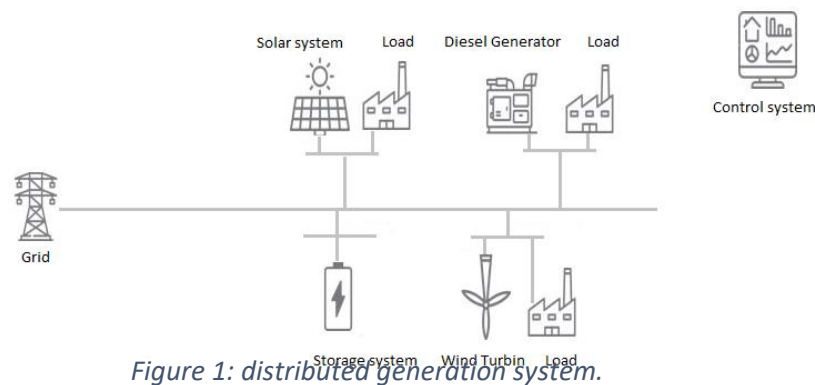

Figure 1: distributed generation system.

The purpose of this research is to build a control system for distributed generation system which its main goal is to achieve optimal distribution of power economically. The study was carried on a system consisted of three small DGs some of them depend on renewable energy (Wind and Solar) and one depends on traditional fuel (Diesel), by considering the maximum limit of power for each unit would not exceed 1MW which are connected to 20KV distributed network in addition to three static residential loads. The work focused on developing the control algorithms by using Multi Agent System (MAS) approach and linear programming to find the optimal solution to feed loads under operating circumstance like load needs, available power in units, and others.

The importance of this research lies in entering the concept of distribution generation systems and micro grids to the electrical power systems for its economical and positive environmental impact and also to improve the reliability of electrical grid.

The system was studied and modeled in only on-grid case. The control algorithm was applied to distribute the power in the system optimally according to virtual values for delivered and needed power, these values are compatible with grid parameters like voltage, frequency, and others. Power DIGsilent program has been chosen to build the system which is similar to Matlab but more suitable with power systems and for the management algorithm JADE platform including NeatBeans IDE has been chosen to build the algorithm.

BACKGROUND:

The control strategy of DGs that are connected with the grid has two approaches [5]:

Control and Coordinate Center (CCC): as shown in Fig2, this unit receives signals from the loads and processes them by a logical algorithm producing control signals sent to a controller, it is called distributed generator controller (DGC), its task is to adjust the output power of its own DG according to the received control signal from CCC. DGC is also responsible to adapt local generator with main grid this controller is in general a PI controller.

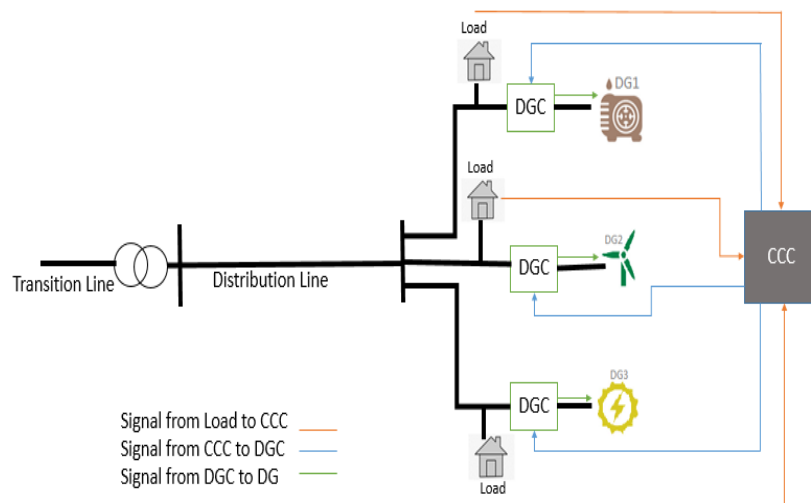

Figure 2 : Control and Coordinated Center (CCC).

Local controllers (LC): there is no central processing, but each DG is controlled locally by its own LC, and the actual power of each DG is adjusted by its DGC which is controlled by a LC that has its own logic control algorithm. As shown in Fig3.

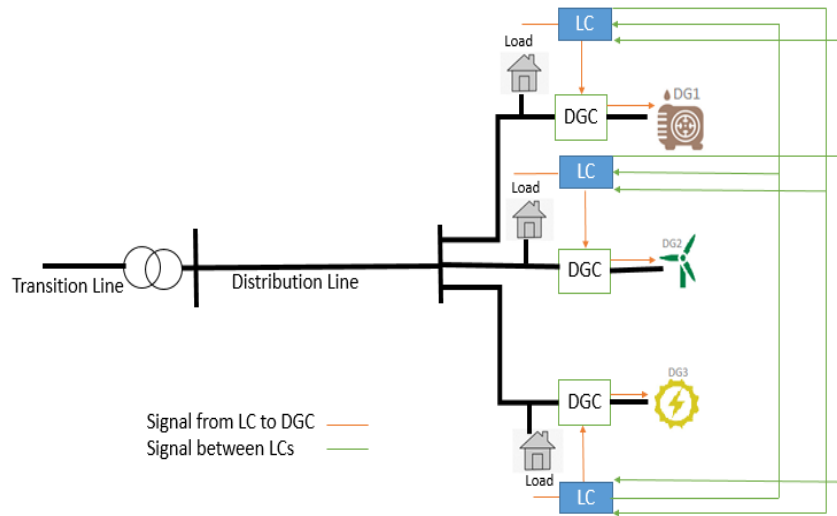

Figure 3 : Local controllers (LC).

In this paper, it is combined the two previous strategies by dividing the system to entities, each one has its local controller LC which is reasonable for many tasks. Even though, distributing power task still relates to one entity, that achieved by using multi agent systems (MAS) approach, it also gives the system flexibility by adding or removing entities like DGs, and loads. DGC of units depended on renewable energy [6], [3] [7]:The amount of injected power in the system by wind and PV DGs, is controlled by three phase converter is connected to grid and controlled by SPWM technique. Control pulses is generated by PQ controller. Fig.4 shows the steps of generation control pulses to control the injected power by inverter [8], [9].

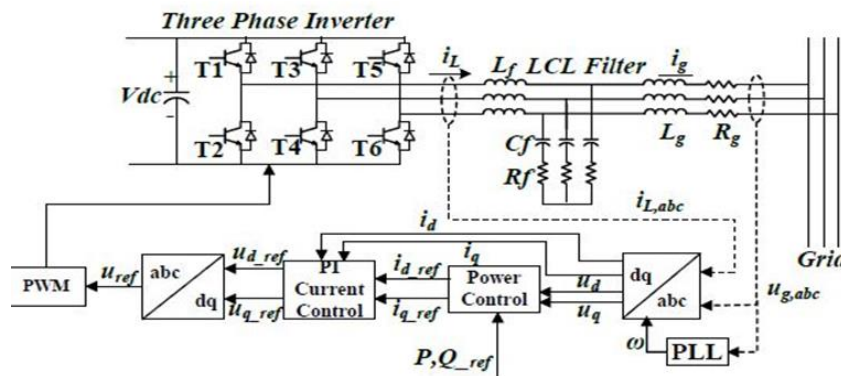

Figure 4 : Three phase controlled converter .

The
Figure 5: PI controller.

DGC of Diesel DG: The diesel unit is modelled as a three phase synchronous machine works in parallel with the grid after synchronization unit with grid by matching their parameters (voltage, frequency, and phase). When synchronous machines, which have power less than 1MW , work in parallel with the grid (infinite bus), they differ with their behaviors from that of which feed a single load [10].

By adjusting the output current in synchronous machine which is connected to infinite bus which is achieved by adjusting E_a through ϕ or n_s . Changing n_s rebuts the most important principle of the synchronous machines which is fixing of synchronous speed. Active power: It is adjusted by controlling the rotational torque for the generator's engine (prime mover), through governor which adjusts the amount of fuel, Fig 6. Reactive power: It is adjusted by controlling the current which feeds the excited induction to control ϕ , using AVR circuit (Automatic Voltage Regulator), Fig 6.

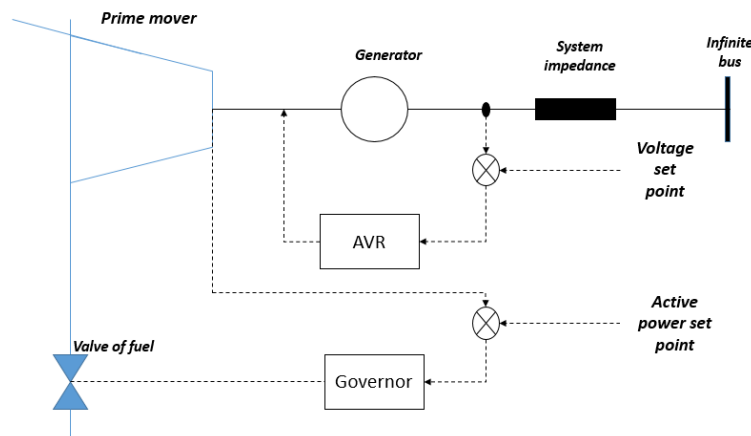

Figure 6 : control active and reactive power in diesel DG.

MULTI-AGENT SYSTEMS (MAS):

MAS is one of branches of distributed artificial intelligence. MAS is a connection network between groups of entities included software. The entities are called agents. Every agent has

its own goal and local knowledge of the environment. They are able to interact with one-another and with the environment to achieve their own goal [11] and as a result, achieving the main goal of the system. There are essentially four forms of interactions: cooperation, coordination, negotiation and competition [12]. These systems have high efficiency, reliability and robustness (the failure of one agents dose not lead to the failure of the entire system), flexibility (it is easy to add or remove agents), developing and re-using ability. Agent has three types shown in fig7:

Fig (7-a): Interacting Agent

Fig (7-b): Planning Agent.

Fig (7-c): Hybrid Agent.

Figure 7 Agents Types .

PROPOSED ALGORITHM:

Distributing process goes under many considerations:

- Geographic distance between DGs and loads where losses can be limited as possible by transporting the power to the nearest load to a generation unit.
- Construction, maintains costs and fuel costs for diesel engine in addition to the power cost from utility.
- Load's needs and available power in each DG, which can vary based on wind speed and solar radiation for renewable DGs.

Problem formation: Transport cost for 1 kVA C_{ij} from source i to load j is determined according to the previous consideration as:

$$C_{ij} = C_f + C_m + C_t \tag{Eq.11}$$

Where:

C_f : Fuel cost for 1 KVA. It equals to zero in renewable units, it is only considered for power delivered from diesel unit or grid.

C_m : The station's construction and maintenance cost for each 1 kVA.

C_t : The losses cost for transmitting 1 kVA from i to j.

$\Delta P = I^2 R$: Losses for active power per 1 Km of transmitting line.

$\Delta Q = I^2 X$: Losses for reactive power per 1 Km of transmitting line.

I[A]: The current through transmitting line. R [Ω]: The resistance of 1 Km for transmitting line.

Losses for apparent power can be formulated:

$$\Delta S = \sqrt{\Delta P^2 + \Delta Q^2} \quad \text{Eq.12}$$

For length D of transmitting line, the losses equal to:

$$\Delta S_{all} = D * \Delta S \quad \text{Eq.13}$$

It is assumed that the shortest distance between source (i) and load (j) is given:

$$D = \sqrt{(X_i - X_j)^2 + (Y_i - Y_j)^2} \quad \text{Eq.14}$$

Where:

X_i, Y_i : The coordinates for generating unit (i).

X_j, Y_j : The coordinates for load (j).

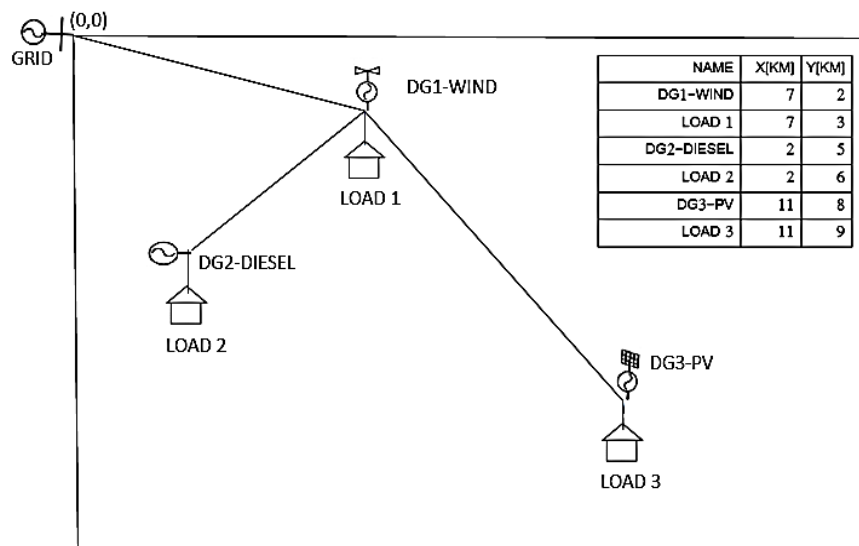

Figure 8: The positions of DGs and loads

Fig.8 illustrates the assumed positions for three loads and three generating units ,this system is connected to main grid .Linear equations (Eq.15) will be modified to express the costs of

generated power by each unit , losses during transmitting ,and consumed power by each load .By solving this formula by using Vogel’s approximating method , minimum cost of distribution of the power among the system id achieved .

$$\begin{aligned}
 C_{PV} &= C_{00} \cdot S_{L1} + C_{10} \cdot S_{L2} + C_{20} \cdot S_{L3} \\
 C_{WIND} &= C_{01} \cdot S_{L1} + C_{11} \cdot S_{L2} + C_{21} \cdot S_{L3} \\
 C_{DIESEL} &= C_{02} \cdot S_{L1} + C_{12} \cdot S_{L2} + C_{22} \cdot S_{L3} \\
 C_{GRID} &= C_{03} \cdot S_{L1} + C_{13} \cdot S_{L2} + C_{23} \cdot S_{L3}
 \end{aligned}$$

$$\begin{bmatrix} C_{WIND} \\ C_{PV} \\ C_{DIESEL} \\ C_{GRID} \end{bmatrix} = \begin{bmatrix} C_{00} & C_{10} & C_{20} \\ C_{01} & C_{11} & C_{21} \\ C_{02} & C_{12} & C_{22} \\ C_{03} & C_{13} & C_{23} \end{bmatrix} \begin{bmatrix} S_{L1} \\ S_{L2} \\ S_{L3} \end{bmatrix} \quad \text{Eq.15}$$

MAS FOR PROPOSED SYSTEM:

In this study the MAS approach will be applied by dividing the components of system to agents, that means every load and DG will be considered as an independent agent [13]. The structure of this system is compatible with hierarchical structure of MAS which is used commonly in electrical power system to administrate the micro grids Fig (9) [14]. The structure consists of three layer: Deliberative layer that has agents sorted as planning type (Loads agents and Load-management agent). Reactive layer, the agents here act directly without thinking, so the agents in this layer sorted as interacting type. Cooperative layer, cooperative between two previous layers.

Figure 9 : MAS approach for electrical power system .

For the structure of every agent, hierarchical structured shown in Fig (10) are used [14].The functional layer represents the core functional attributes, those are the actions of agent to perform. The behavioral layer provides control, when an agent carries out specific tasks. When

the functional layer produces new data, the behavioral layer instructs the message handling layer to inform interested agents of the new data. Similarly, the action taken by an agent in response to the receipt of a new message is decided in the behavioral layer. The message handling layer is responsible for sending and receiving messages from other agents, implementing the relevant Agent Communication Language (ACL) and ontology parsers as well as the control functionalities of conversations with other agents.

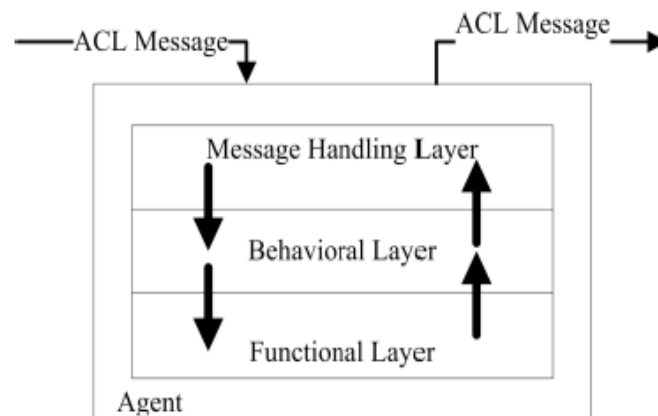

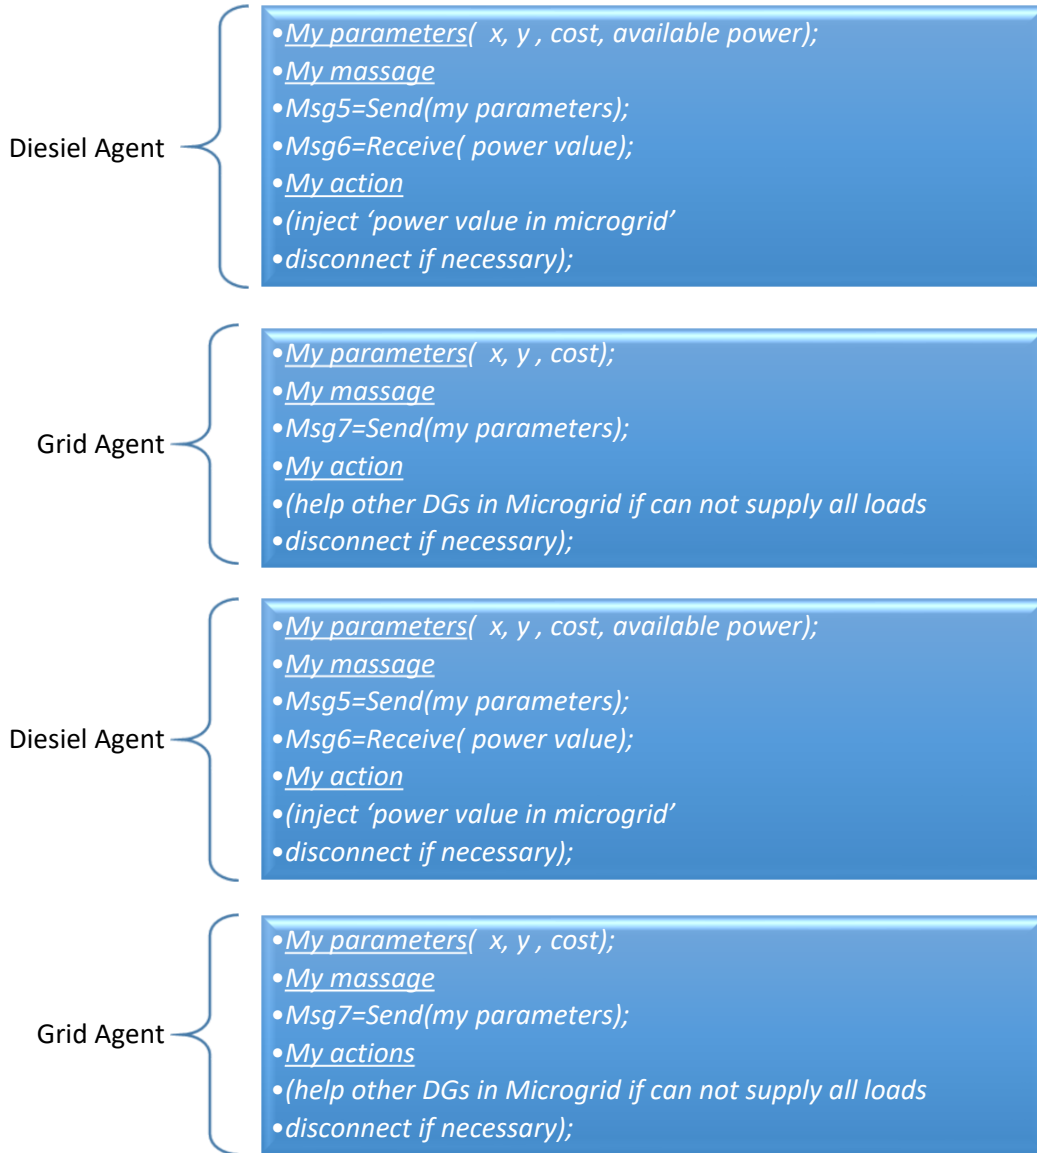

Figure 10 : Agent structure .

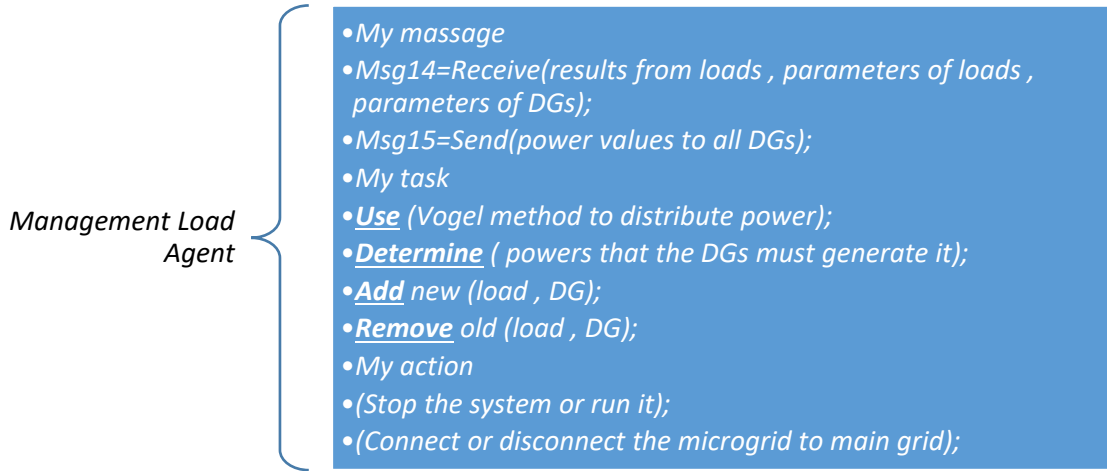

Depending on previous structures, the scheme for each agent is shown in the next chart. In general, every reactive (wind, PV, diesel, and grid) agent determines its main parameters and the messages which it receives and sends from and to other agents like geographical coordinates and the calculated cost, after that doing the actions which will make the changes in some parameters like amount of injected power to the microgrid.

DGs Agents (no plan- Reactive agents)

For loads entities they are considered as a deliberative kind they make some calculations and inferences for distances and losses according to parameters of DGs and send this information to management agent which in turns solve the problem as a set of linear equations and then send to the DGs the amount of power which must inject in the grid.

<u>Deliberative Agents</u>	
Load-1 Agent	<ul style="list-style-type: none"> • <u>My parameters</u>(x, y ,needed P, needed Q); • <u>My message</u> • $Msg8=Send$(Results of my calculates); • $Msg9=Receive$(all information from DGs-agent); • My plan • Calculate (Distance) between me and DGs[Di]); • Calculate (losses) in transman lines between me and DGs [$\Delta P, \Delta Q, \Delta S$]); • Results(the cost) of power from all DGs) • My action • (Get my power • disconnect if necessary).
Load-2 Agent	<ul style="list-style-type: none"> • <u>My parameters</u>(x, y ,needed P, needed Q); • <u>My message</u> • $Msg10=Send$(Results of my calculates); • $Msg11=Receive$(all information from DGs-agent); • My plan • Calculate (Distance) between me and DGs[Di]); • Calculate (losses) in transman lines between me and DGs [$\Delta P, \Delta Q, \Delta S$]); • Results(the cost) of power from all DGs) • My action • (Get my power • disconnect if necessary);
Load-3 Agent	<ul style="list-style-type: none"> • <u>My parameters</u>(x, y ,needed P, needed Q); • <u>My message</u> • $Mag12=Send$(Results of my calculates); • $Msg13=Receive$(all information from DGs-agent); • My plan • Calculate (Distance) between me and DGs[Di]); • Calculate (losses) in transman lines between me and DGs [$\Delta P, \Delta Q, \Delta S$]); • Results(the cost) of power from all DGs) • My action • (Get my power • disconnect if necessary);

Multi-agent simulation platform is developed for the control and energy management of distributed power systems based on IEEE FIPA standards using JADE. [15] IEEE Foundation for Intelligent Physical Agents (FIPA standards are become the mostly accepted standards for development and management of multi-agent systems. FIPA agent management reference model [16], which allows agents to communicate with each other by defining a standard for messaging. The fig (11) shows how the agents in the system interacts with one-another, and how the messages which are generated by agents' flow in the system to share some information so each one can make its process and interact effectively in entire system, so finally the global goal will be achieved by coordination work of the components of the system. The content of every agent is shown in previous pseudocode.

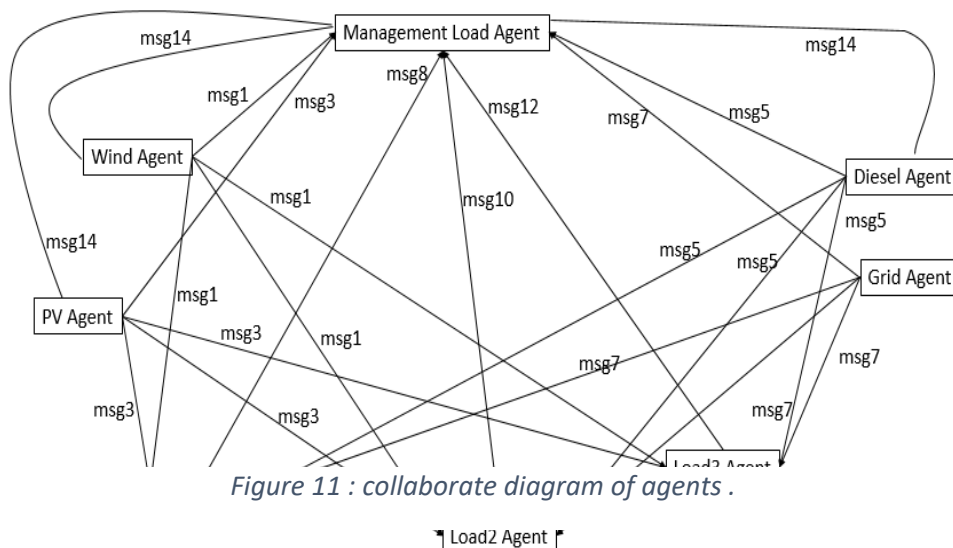

Figure 11 : collaborate diagram of agents .

RESULTS

The system was tested under many conditions according to the weather and failure circumstances. The system was built by using POWER DIGsilent by applying the references signals which are generated by codes in JADE platform.

Scenario 1: The test was carried on according to loads' needs in table (1) and available power in table (2).

Table 1 : Load's needs for scenario 1.

LOADS	P [KW]	Q [KVAR]
LOAD1	400	300
LOAD2	400	300
LOAD3	400	300

Table 2 : Available power in DGs for scenario 1 .

DG	POWER[KVA]
WIND	1000
PV	500
DIESEL	500

Table 3 : The output of agents' algorithms for scenario 1 in KVA.

	Load1	Load2	Load3
Wind DG	500	500	0
PV	0	0	500
Diesel DG	0	0	0
Main grid	0	0	0
The Wind DG output power			=1000
The PV output power			=500
The Diesel DG output power			=0
Power delivered from grid			=0

It is noticeable that the wind DG has fed the first and second loads (which are the closest), whereas PV unit has fed the third load which is the closest to PV unit. That means the renewable units have been relied on to feed the loads without relying on the diesel unit or main grid. The values of busbars for microgrid by using POWER DIGsilent are shown in table (4).

Table 4 : Main values in microgrid for scenario 1.

BUSBAR	P[KW]	Q[KVAR]	V[V]	I[A]
GRID	0	0	20000.0	0
DG1-WIND	800	600	20007.6	28.857
LOAD1	400	300	20003.6	14.431
DG2-DIESIEL	0	0	19997.1	0
LOAD2	400	300	19996.2	14.436
DG3-PV	400	300	20003.4	14.431
LOAD3	400	300	20001.3	14.433

Table 5 :The output of agents' algorithms for scenario 1 when there is an increase in load 1 in KVA.

	Load1	Load2	Load3
Wind DG	1000	0	0
PV	0	0	500
Diesel DG	0	500	0
Main grid	0	0	0
The Wind DG output power		=1000	
The PV output power		=500	
The Diesel DG output power		=500	
Power delivered from grid		=0	

For this case, the load 1 has been increased whereas the other loads have not changed. So, there are changes in priorities of DGs where wind unit feeds load 1 (the closest) with its full power whereas PV unit feeds load3 (the closest one to it) with its full power, so diesel unit covers the need of load2, also there is no need to main grid to feed loads. The values of busbars for microgrid by using POWER DIGsilent are shown in table (6).

Table 6 : Main values in microgrid for scenario 1 when there is an increase in load 1 in KVA.

BUSBAR	P[KW]	Q[KVAR]	V[V]	I[A]
GRID	0	0	20000.0	0
DG1-WIND	800	600	20004.1	28.862
LOAD1	800	600	19999.7	28.868
DG2-DIESIEL	400	300	20002.4	14.434
LOAD2	400	300	20000.3	14.434
DG3-PV	400	300	20002.0	14.432
LOAD3	400	300	19999.8	14.434

Scenario 2: The system was tested under failure circumstances, for example at night PV will not work or wind DG is out of service. Firstly, the system is operated at night. The available power is given in table (7) and loads' needs in table (8).

Figure 12 : System is tested when PV is out of service.

Table 7: Available power for DGs for scenario 2.

DG	POWER[KVA]
WIND	1000
PV	0
DIESEL	500

Table 8: Load's needs for scenario

LOADS	P[KWAT]	Q [KVAR]
LOAD1	800	600
LOAD2	400	300
LOAD3	400	300

Table 9 :The output of agents' algorithms for scenario 2 in KVA.

	Load1	Load2	Load3
Wind DG	1000	0	0
PV	0	0	0
Diesel DG	0	500	0
Main grid	0	0	500
The Wind DG output power	=1000		
The PV output power	=0		
The Diesel DG output power	=500		
Power delivered from grid	=500		

It is noticeable that wind DG, with all its power, load 1 needs (the closest) as well as the diesel DG for load 2, but load 3 is fed by the main grid. The values of busbars for microgrid by using POWER DIGsilent are shown in table (10).

Table 10 :Main values in microgrid for scenario 2 when PV is out of service .

BUSBAR	P[KW]	Q[KVAR]	V[V]	I[A]
GRID	400	300	20000.0	14.434
DG1-WIND	800	600	19999.9	28.881
LOAD1	800	600	19988.8	28.887
DG2-DIESEL	400	300	19990.9	14.434
LOAD2	400	300	19988.9	14.442
DG3-PV	0	0	19980.1	0
LOAD3	400	300	19979.0	14.448

Considering the wind DG becomes out of service as well Fig (13), at the same time there are changes in loads' needs, as shown in table (11), the values of busbars for microgrid by using POWER DIGSILENT are shown in table (13).

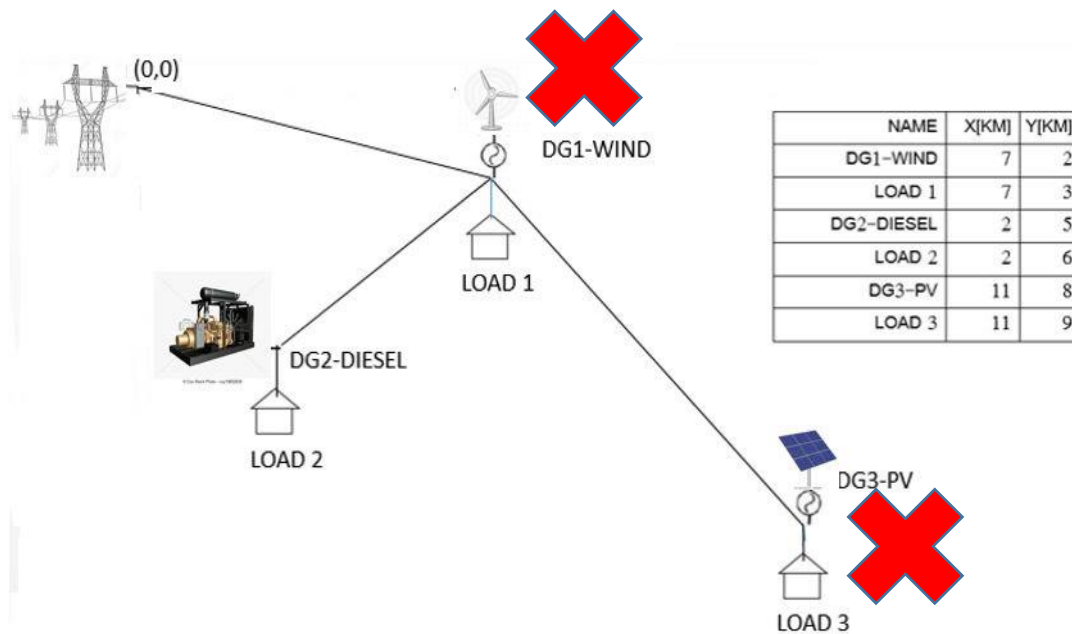

Figure 13 : System is tested when PV and wind DG are out of service .

Table 11 :Changes in loads' need for scenario 2 .

LOADS	P [KW]	Q [KVAR]
LOAD1	800	600
LOAD2	800	600
LOAD3	800	600

Table 12: The output of agents' algorithms for scenario 2 when PV and wind DG are out of service in KVA.

	Load1	Load2	Load3
Wind DG	0	0	0
PV	0	0	0
Diesel DG	500	0	0
Main grid	500	1000	1000
The Wind DG output power			= 0
The PV output power			= 0
The Diesel DG output power			= 500
Power delivered from grid			=2500

Table 13 :Main values in microgrid for scenario 2 when PV and wind DG are out of service .

BUSBAR	P[KW]	Q[KVAR]	V[V]	I[A]
GRID	20007.2	150.5	20000.0	72.434
DG1-	0	0	19929.7	0
LOAD1	800	600	19929.8	28.969
DG2-	400	300	19938.1	14.479
LOAD2	800	600	19936.7	28.959
DG3-PV	0	0	19921.1	0
LOAD3	800	600	19919.6	28.984

CONCLUSION

This paper introduced a model of a control and management system for a small micro grid connected to main grid. This model was built in two level, the first one is classical controllers PI to adjust the amount of the output power for each DG and adapt it while it was working in on-grid system, and the second one was a management algorithm using MAS approach to schedule the priorities of DGs to feed load and achieve the minimum losses during transition the power through the microgrid. The simulation and testing proved the ability algorithms to reduce the dependent on the grid as possible. The priority has always been to transmit the DG's power to the nearest load which will lead to reducing the losses. In addition to that, the system will not be affected by the malfunction of any component in the system. The priorities regulations depend on linear programming, it is better in future work to work with dynamic programming or reinforcement learning algorithms for distributed systems to get optimal solution, in case of huge increasing of loads and DGs. Microgrid and distributed generation with MAS approach is promising solution for electrical power systems due to their abilities to enhance the performance and the reliability of these systems.

**ASSESSING THE UNDERLYING STRATEGIES FOR EFFECTIVE MANAGEMENT
OF JOB-STRESS IN NIGERIAN CONSTRUCTION PROJECTS**

Adefemi Aka¹, Chikezirim Okoroafor² and Naomi U. Ijalija³

^{1&3}Department of Building, Federal University of Technology, Minna, Niger State, Nigeria

²Department of Built Environment, Central University of Technology, Free State, South
Africa

1.0 Background of the Study

Stress is neither a simple nervous tension that can result from damage, nor necessarily something to be avoided (Wahab, 2010). From the Health and Safety Executive (HSE, 2007), It is a neurotic human response to psychological, social, job and environmental pressures. This implies that stress is as an adverse reaction people have due to too much pressure or other types of demand placed on them. Some of the causes of stress encountered by professionals in the construction industry are handling of multiple construction projects at a time, poor planning, poor health condition of an individual, poor site condition, large volume of work, ambitious deadline (Leung *et al.*, 2005). Others are workload that employees' cannot cope with, lack of or inadequate consultation by managers with employees regarding their work, communication and negative relationship issues (Leung *et al.*, 2010). It is essential to note that the various causes of stress encountered by professionals in the construction industry can be categorized into physical work environment stressors, organizational related stressors, work demand stressors and job role stressors.

The consequence of stress to employees and organizations across the globe cannot be over emphasized. It could lead to inefficiency, low productivity, abandonment of project, delay in project delivery, depression, anxiety, health related issues such as high blood pressure; headache; body pains; slump or even death of an employee (Leung *et al.*, 2005; Wahab, 2010). The literature exists on stress and its causes in construction project. Also, there are previous studies on the effects of job-stress on employees' and organizations. However, as at when this study was conducted, there seems to be scarce literature on the underlying Strategies for Effective Management of Job-stress in Nigerian Construction Projects

Therefore, this study was conducted to assess the various forms of stress experienced by workers during construction activities. The causes of the various stresses, the impacts of the stress on employees' and organizations as well as the strategies that can be adapted to reduce or overcome the stress were investigated in this study.

2.0 Literature review

2.1 Over view of construction industry

The construction industry is known to be a complex industry in terms of the managerial skills needed and standards to be met, and it is also characterized by numerous elements that differentiate it from other known business sectors of the economy like the manufacturing, banking, oil & gas, services and the likes (Ozaki, 2003). Despite its complexity, the industry contributes about 10% of Gross Domestic Product in a country (Navon, 2005). The technology used in the construction industry has always been known to be flexible due to the fact that construction processes take place at the location of consumption (Tukel & Rom, 2001). Therefore, high demand for labour mobility, low capital intensity and high entrepreneurial risks continue to affect the performance of construction industry across the globe (Vouzaz, 2004). In Nigeria, the construction industry is known by small, medium and large scale local investors (contractors), which in most cases deals with commercial, industrial and residential projects (Dantata, 2008).

2.2 The concept of job-stress

The term stress is used to refer to hardship, strain, adversity or affliction. It was used in the eighteenth and nineteenth centuries to denote force, pressure, strain, or strong efforts relating to an object or person (Somerfield & McCrae 2000). A study by Aitken and Crawford (2007) revealed that the concept of job-stress originated with the research of Selye in 1978. Schuler, (2014) affirmed that stress as a pathological human response to psychological, social, occupational and/or environmental pressures. Melia and Becerril (2007) on the other hand pointed out that stress is an experience expressed in one's feeling of being strained while the Health and Safety Executive (HSE, 2007) defined stress as the adverse reaction people have due to too much pressure or other types of demand placed on them. Put differently, (Lath, 2010) was of the opinion that every person including a child, an adult, employed or unemployed faces stress in his/her everyday life.

2.3 Causes of stress in construction projects

The main cause of stress in construction projects is as a result of factors that negatively arise from the project, and hence makes desired goal unattainable (Kenneth, 2005). Hence, work overloads, working long hours and role ambiguity are known to be leading causes of stress amongst professionals in construction industry (Sutherland & Davidson, 2012). Srivastava,

(2005) asserted that multilevel subcontracting, time pressure; constant worker rotation and unstable work due to temporary contracts can contribute to psychosocial stress among workers. Others are inadequate room for innovation, unsatisfactory remuneration, and ambiguity of job requirement, inadequate knowledge of project objectives, long working hours, tight schedules and unfavourable working conditions (Leiter, 2012; Campbell, 2006).

2.4 Impacts of stress on employees' and organizations

The consequences of stress could be divided into 3 categories: effect on health, effect on personal characteristics, and effect on employees' working efficiency. The most common appearing health problems caused by stress are high blood pressure, elevated cholesterol and blood fats, adult-onset diabetes or high blood sugar, obesity, poor fitness, and inflammatory illness (Buchan *et al.*, 2008). Therefore, it is imperative to prevent any stress at work and by adapting any stress management program or tool rather than to spend money on workers' treatment or replacement (Ben, 2006).

2.5 Stress management strategies in construction projects

Akubue (2000) stated that stress management strategies are referred to as the methods organizations employed to deal with stressful or disturbing situations. These includes the use of advanced project management software's such as primavera, Microsoft project manager among others in projects execution, adequate time management, conducive site office, well ventilated environment, clarity of job role by creating a work schedule, maximization of break time, proper feeding, reduction of work load by employing the different professionals, building interpersonal relationship skills, adequate funding, adoption of appropriate job design practices and education of professionals in stress management. All these strategies will reduce the incidence of stress among professionals in the building industry.

3.0 Research methodology

3.1 Research Design

Research design is the overall design for obtaining answers to the questions being studied and for handling some difficulties encountered during the course of the research (Jeanne, 2011). Field survey research proposed by Griffith (2014) was adopted in this study. Questionnaire was the instrument used for data collection in the survey research design.

3.2 Questionnaire survey

The questionnaire was designed using the information obtained in the literature on the subject matter. It was distributed directly to the study respondents (professionals in construction firms in the study context). The professionals are Architects, Civil engineer, Builder, Quantity Surveyor, Project Manager and Site Supervisor, which were randomly selected from randomly selected firms. The academic qualifications of the professionals range from PhD to Higher National Diploma (HND). The professionals have been working in construction industry for more than 5 years, and have executed different projects ranging from small to large. Before the distribution of questionnaires, a formal approval was obtained from the management of all the selected construction firms in Federal Capital Territory, Abuja. The question in the questionnaire was based on a 5 point likert scale. These enabled respondents express their level of agreement or disagreement with the information in the questionnaire form strongly agrees (5), to strongly disagree (1). A total of 150 questionnaires were distributed out of which only 119 (88%) were returned back and were used for the study. The data obtained through the questionnaire was analysed using descriptive statistics such as mean item score (MIS) and standard deviation (SD) (Digital Bridge Institute, 2018).

4.0 Results and discussion

4.1 Demographical information of the respondents

Table 1 presents the general information on the qualification, years of experience and job position on site of participants of the study. As earlier stated, total of 150 questionnaires were randomly administered to construction professionals in the construction firms in Abuja. Out of the total distributed, 119 responses were obtained, which represents 88.1% of the total distributed.

**International Conference on Global Practice of Multidisciplinary Scientific Studies-IV

Quantity surveyors	15	12.6
Civil engineers	17	14.3
Contractor	8	6.7
Others	7	5.9
Total	119	100

4.2 Causes of stress in construction projects

Table 3: Main causes of job-stress in construction projects

Causes of stress	SD	MIS	Rank
Bullying by senior colleagues	0.66	1.45	25
Handling more than one project at a time	0.91	1.94	24
Conflict co-worker or labourer	1.03	3.42	19
Ambiguous deadline	0.96	3.21	23
Role ambiguity	1.22	3.25	22
Job complexity	1.15	3.81	2
Poor ventilation in site office	1.03	3.68	9
Too much noise on site	1.04	3.68	9
Poor lighting	1.22	3.76	5
Lack of safety outfit	1.10	3.74	7
Poorly design office space	1.11	3.67	11
Lack of privacy	1.24	3.71	8

**International Conference on Global Practice of Multidisciplinary Scientific Studies-IV
Turkish Republic of Northern Cyprus, April 28-30, 2023**

Inadequate machinery and equipment	1.19	3.60	13	In order to ascertain the causes of stress encounter by professionals in construction site, not less than 25 causes
Resources constraint	1.09	3.37	21	
Changes in organization level	1.06	3.76	5	
Poor organizational structure	1.26	3.50	17	
Inadequate staffing	1.01	3.38	20	
Conflict with artesian	4.78	3.52	16	
Poor relationship with superior	1.15	3.56	15	
Lack of communication skill	1.12	3.58	14	
Conflict with co-workers on site	1.16	3.77	3	
Work over load	1.04	3.97	1	
Unfortunate life event	1.07	3.63	12	
Heath condition	1.18	3.43	18	
Personal trait	1.13	3.77	3	

of stress were identified from literature. Respondents were asked to indicate the one mostly encounter during construction activities. The results obtained revealed that work overload with MIS of 3.97 is the most cause of job-stress in construction projects, followed by job complexity. To be precise, with the exception of bullying by senior colleagues and handling more than a project at a time, all other causes of stress identified in the literature were rated to be very significant by the participants of the study. This implies that 23 of the 25 causes of stress identified in the existing literature in the subject matter are the main causes of stress in construction projects. This is similar to findings of Aryal *et al.* (2017), Xing, *et al.* (2020) on the causes of fatigue among employees' during daily activities.

4.3 Impacts of stress in construction projects

In order to evaluate the impacts of stress on construction workers, nine parameters (impacts of stress) were identified from the literature. Respondents were then requested to indicate their agreement on the identified parameters. The outcomes of this section of the questionnaire study are presented in Table 4.

Table 4: Impacts of job-stress on construction workers

Stress impacts	SD	MIS	Rank
Abandonment of project	1.01	3.30	3
Delay in project delivery	0.77	2.68	7
Low productivity of workers	0.87	2.58	8
Negative impact on health of workers	0.96	2.94	6
Building failure due to bad design	0.95	3.39	2
Cost overrun	1.01	3.22	4
Death	1.05	3.42	1
Poor projects performance	0.85	3.02	5

It is obvious from the results presented in Table 4 that the greatest impact of stress on construction workers is death with a mean score of 3.42 followed by building failure due to bad design (MIS=2.39). This is synonymous to the opinion of Okafor and Okafor (2006) on the impact of stress on employees' in construction projects. In a nutshell, the results presented in Table 4 show that virtually all the impacts of stress identified in the literature are highly significant factors. Hence, strategies that can be used to overcome stress in projects need to be continuously investigated by researchers across the globe.

4.4 Strategies for stress minimization in construction projects

Table 5 presents possible organizational strategies for stress minimization in construction projects.

Table 5: Stress minimization strategies

Possible stress minimization strategies	SD	MIS	RANK
Proper project management plans	0.86	2.83	10
Adequate funding	0.79	2.97	9
Encouraging decentralized organizational structure	0.83	2.98	8
Provision of machineries and equipment	0.90	3.02	7
Provision of conducive site office (well ventilated and adequate lighting)	0.90	3.24	5
Effective time management schedule	0.88	3.11	6
Employing enough staff to reduce workload	1.17	3.29	4
Provision of necessary safety gadgets	0.97	3.35	3
Encouraging effective interpersonal relationships / communication between the management and employees	1.18	3.40	1
Providing seminars and workshops for employees to expose them to new technologies in the construction industry	0.94	3.40	1

In order to establish the various organizational strategies that can be adopted to reduce workers stress in construction projects, 10 strategies were identified from the existing literature. Respondents were then requested to indicate the extent of their agreement on each strategy based on their experience. Encouraging effective interpersonal relationships/ communication between the management and employees and providing seminars and workshops for employees to expose them to new technologies in the construction industry were ranked first by the participants of the study, followed by provision of necessary safety gadgets. To be precise, the MIS of all the identified strategies are above 2.5 and can be adopted for stress reduction in construction projects (Digital Bridge Institute, 2018).

5.0 Conclusion and recommendations

Based on the findings of this study, it is clear that construction professionals experience work stress on a daily basis. It can also be concluded that workload, job complexity, and personal trait are the main causes of job-stress in construction projects. Death is the major impact of stress on construction workers. Other organizations impacts are projects delay/poor projects delivery, low productivity of workers, and abandonment of projects. For effective reduction of stress in construction projects, employees need for effective communication between management and workers. Construction firms also need to introduce workplace wellness schemes. Allow flexible

time for workers and encourage effective interpersonal relationships between the management and employees.

Premised on the above conclusion, the study recommends that construction workers should embrace the use of software in project planning and management such as MS project planner, primavera project planner, Orion, and the use of Microsoft spreadsheet. Management should also ensure that workers are not overworked / overloaded with work and their roles in daily activities should be clearly stated. It is also advisable that site offices should be made comfortable and properly ventilated for effective flow of work. The study further recommends that further research should be conducted to determine the level of effectiveness of the identified strategies on stress reduction in construction projects.

**THE AUTHORITARIAN REGIME AND ITS EFFECTS ON DISAPPEARANCE OF
PERSONS AND THEIR POLITICAL PERSECUTION - THE CASE OF ALBANIA
FROM A HUMAN RIGHTS APPROACH**

Teuta STAROVA

University of Tirana, Faculty of Social Sciences

And

Mirela P. Bogdani

University of Tirana, Faculty of Law

Abstract

Albania is often described by many authors as the former totalitarian country in the Balkans which had the most brutal dictatorial regime for more than forty years. Since the fall of such a regime in the early nineties, challenges remain in restoring justice for many of the victims of that dictatorship, as well as there is much to be done in advancing transitional justice. On the grounds of "the war of classes", a large number of people who were accused of not supporting the communist leaders were later imprisoned, forced to hard labour, and many killed. In this regard, one of the main objectives remains the investigation of human rights violations during the years of the regime. Particular attention will be paid especially to persons who disappeared during communism, in particular women who suffered political prosecution directly or indirectly.

The main aim of the study is to surpass the research of the mere facts, but rather draw conclusions on the role of the political factor and the causes that impeded a full-fledged transitional justice in Albania. The study also analyses several laws that play a crucial role in addressing the issue of victims of enforced disappearance.

In achieving the aim of the study, most materials will be based on archive files on persecuted people, testimonies of representatives of persecuted families, memoirs, online resources, and other secondary sources. The methodological framework of this paper mainly consists of qualitative research on the field of transitional justice.

Key words: transitional justice, disappearance of persons, human rights.

A. Introduction

Historical and life experience has shown that public opinion in all post-dictatorship societies has had to deal with important challenges about the past regime and its stand to it. In the case of Albania, after the fall of the regime, its people did not caution to abide by the applicable laws back then, entirely disregarding them as laws established through violence, demagoguery, and voting processes devoid of freedom of choice for the people. Seen in this light, those laws (such as that on punishing anti-communist agitation and propaganda) could not serve as the basis of just and irrefutable punishments, but only as a means of defending that regime. Some of the violations of those laws that demonstrated opposition to the communist policy can be regarded as the beginning of the popular revolution that would later overthrow the communist regime.

Therefore, even the question “Can a democratic society be built without doing justice on the old communist regime?” implies a negative answer. Albania has not fully done justice on the old communist regime and, as a result, its transition is lingering longer than in other former communist countries. The political discourse between the left wing and the right wing is very fierce and many people feel frustrated by democracy, especially the former politically persecuted.

In Albania, as in all former communist countries, the first attempts to pave the legal way for transitional justice began immediately after the establishment of democracy. Following these democratic changes in Albania in the early 1990s, the Albanian parliament passed three important laws. In 1991, it passed the Law “On the Innocence, Amnesty and Rehabilitation of Former Politically Convicted and Persecuted”. In 1995, two other important laws were passed, called the “Law on Genocide and crimes against humanity committed in Albania during the communist regime for political, ideological and religious reasons” and the “Law on the vetting of officials and other persons related to the protection of democratic state” (the so-called Law on Verifications).

The “Law on Lustration”, adopted in 2008 provided that all people of the old communist regime were banned from public office, but it was repealed by the Constitutional Court in 2010. This decision created problems to the implementation of transitional justice in Albania. Equally important was the law “On the Compensation of Former Politically Convicted by the Communist Regime”, adopted in 2007, amended and improved several times afterwards. Particularly important for the persons disappeared during the communist regime was the amendment introduced to Article 74 of the Criminal Code (2013), which defines enforced disappearance among the crimes against humanity and serves as a basis for the searching of disappeared persons during the communist era.

Shortly afterwards, in 2010, the Institute of the Former Politically Persecuted was established. Scholar Sokol Lleshi says: “The establishment of the Institute was officially supported by the Democratic Party, a centre-right political party. It was hoped that that Institute would have, legally and practically, all the symbolic power of a state institute with unlimited access to the archives of the communist secret police. From the point of view of official institutional features and symbolic power, the Institute would have the same achievements as the other similar institutions. Founded in 2010 and housed in the same building that had housed the representative of Fascist Italy in Tirana, the Institute focused on gathering evidence of the politically persecuted, presenting graphic reconstructions of concentration camps, and publishing a database on victims”.¹

However, there is still much to be done for transitional justice in Albania. As scholar Altin Gjeta puts it, “Transitional justice has been largely overlooked in post-communist Albania, partly due to a lack of human resources, funding, and research interest in the issue. Most research has been done by foreign scholars. [...] There is a general agreement among scholars that the Albanian authorities have failed to address human rights violations by the communist state.”²

Human rights violations in communist Albania and disappearing persons during the regime

The scale of communist crimes in Albania is very painful. There are at least four facts that make those crimes extreme compared to other former communist countries: the targeting of the intellectual elite, the brutality of persecution and crime against women, the seizure of private property and assets, and the considerable number of disappeared persons.

Written documents and accounts of the relatives of the former persecuted show a large number of disappeared persons during the regime. A Study Report conducted by the ICMP experts and supported by the EU in 2018-2020 states that: “It is estimated that around 6,000 persons went missing under the communist regime in Albania in the period between 1944 and 1991. According to official data, 5,501 persons convicted for political reasons were executed during this period. Their bodies were never returned to their families. Official data also indicates that an additional

² Gjeta, Altin, “Transition without justice in post-communist Albania: Its implications to collective memory building and democracy promotion”, OSCE, *Justice and Transformation in Albania*, 2020, pg. 6

987 political prisoners died from various causes in prisons and detention centres in Albania. The whereabouts of their mortal remains are unknown to surviving relatives”³.

As author Fatbardha Saraçi states in her book “The ordeals of women in communist prisons”, “[...] around 10% of those executed by firing squad in Albania by the communist dictatorship were women [457]. Out of 308 persons who lost their mental balance, some were girls and women. 7,367 girls and women were politically convicted and 10,792 were interned.”⁴

The tragic fate of lawyer Erifili Bezhani⁵ is an example of how the dictatorial regime persecuted many intellectuals to extinction. An excellent law graduate in France, Bezhani returned to Albania in 1943. After the war, she told her relatives about the communist terror that “it is a scary reprisal, far from the example of European countries, so it has to be stopped”. She was arrested for her political opinions and sentenced to 20 years in prison. After her release in 1958, she was condemned to working as a street sweeper in Tirana, doing only night shifts. After this humiliating job, she fell ill and died during a hospital surgery in February 1959.

There is also the painful story of Marie Tuci⁶, the only woman among the 38 martyrs of the Catholic Church, who was killed by barbaric physical and psychological torture in October 1950. She was arrested and suffered her tragic fate at the age of 22, when she was a teacher in Mirdita, only because she spoke out against the humiliation of the Catholic Church by the communists.

Several thousand other women who refused to divorce their husbands to make ends meet for themselves and their families experienced savage suffering along with their families in internment camps. As the author Saraçi puts it again in her book about those women, “They became heroines, being chased for years, traveling in cold or hot weather, on foot or on trucks loaded with wood, sleeping on the streets, because the house-doors of the residents near the prisons and labour camps were not opened for them, from fear of the State Security”⁷.

Moreover, the blatant and inhuman human rights violations in Albania included property plunder through the seizure of assets, houses, money or other valuable items. A significant case is that of the intellectual and patriotic teacher Edip Tërshana who openly stood against the dictator’s policy. In a letter found in his pocket before being executed on 18 January 1948, he wrote to Enver Hoxha,

accusing him of betraying Albania and Kosovo*⁸ in collusion with the Yugoslavs. In that letter he says, “I am against the executions of people with or without trials... This is treason ... I am against this power, because it is speculative and robs the people by law, and sells the goods seized from traders at a higher price than theirs, throwing on the street many families of traders labelled as speculators. I am against the call ‘We are the children of Stalin’... I am against it, because there is no freedom of speech and free press. There is only terror...”⁹.

Even the religious communities in Albania did not escape the savage persecution by the communist dictatorship. The Catholic Clergy, in particular, endured brutal reprisals. A short extract from Father Zef Pllumi’s book would suffice to comprehend the dimensions of the tragedy inflicted on Albanians by the communist dictatorship: “The titanic so-called proletariat violence exerted day and night, restlessly and everywhere, with no distinction between villages and cities, associated with the parrot-like shouted slogans and inhuman tortures, lies and fabrications by servile or paid persons: after all those bloody executions, imprisonments and violent mass displacements, they managed to subdue the free people of Albania and thus partisan violence managed to form the government”¹⁰.

Reasons of delays in searching and locating missing persons

In their article about the practical experience of transitional justice in Albania, Robert C. Austin and Jonathan Ellison state that “Having experienced possibly the harshest form of communism in Europe, one would think that Albania had the most compelling reasons to undergo sustained transitional justice. One need not look much past the biographies of Albania’s transition leaders to confirm that Albania did little vis-à-vis with the past. What Albania offered is simply political vengeance.

Albania’s post-communist justice is about the selective destruction of the past, not an attempt to deal with it... From 1991 to 1997, when a few attempts were made, the process was disorganized, politicized and unsuccessful... There were huge purges of the public administration in the aftermath of the victory of the anti-communist Democratic Party in March 1992 and there were

¹⁰ Pllumi, At Zef, “Rrno vetëm për me tregue”, Printing House "55", 2006 edition, pg. 35

again huge purges of the public sector after the Socialist Party (former communists) won the elections in 1997. This cannot be considered lustration as it is entirely consistent with Albania's twentieth century political culture, which has always left open the door to be a hero one day and a traitor the next. This process was heavily influenced by political vengeance"¹¹.

From another perspective, Gjergj and Mirela Sinani state that "Even 30 years after Albania embraced the democratic system, our state institutions, which claim to be democratic, continue to display a serious lack of attention, consideration or support for scientific research in truth-seeking about the communist crime against the Albanian people. We note that as soon as facts about the communist crimes resurface and once an ordinary discourse is raised to understand a certain situation, a whole propaganda army is mobilized against it under the disguise of objective criticism. Indeed, this is a traditional method used during the dictatorship to discourage dignified research-driven scholars and this is one of the reasons why very few researchers stick to this field of research... We note a meagre state interest in listening to and understanding the discovered facts, let alone making them available to the public opinion"¹².

The authors Austin and Ellison make accurate and interesting reasoning on this mentality trend of the new post-communist political elite in Albania. They write: "In the first place, Albania had no dissident movement. Albania was only developing a dissident movement when collapse finally came. The anti-communist leaders and reformist-minded communists that emerged in 1990 and 1991 all had relatively solid communist credentials. Like in Romania, we see elite reproduction, not elite replacement. That said, very few were willing to dig too deeply into the past and even fewer had any reason to call for a complete opening of the police files. However, they all had to work extra hard to prove their anti-communist credentials. The result was a highly politicized quest for justice"¹³.

For this reason, the Albanian post-communist left-wing parties either kept silent about the communist crimes, or tried to bypass or reduce such crimes using phrases like "that was the time and law back then", etc. In holding these views, they were probably influenced by a not-so-open pragmatism that implied that the complicated issues of the former politically persecuted were temporary and would naturally wane off together with the persecuted generation during human

¹¹ Robert C. Austin and Jonathan Ellison, "Transitional Justice in Eastern Europe and the For-mer Soviet Union", ed. Lavinia Stan, Routledge, 2009, pg. 176

¹² AIDSSH, "Profile të 'Armikut të popullit' në diktaturë, ["Profiles of the 'enemy of the people' under the dictatorship"], pg. 156-157

¹³ Robert C. Austin and Jonathan Ellison, "Transitional Justice in Eastern Europe and the For-mer Soviet Union", ed. Lavinia Stan, Routledge, 2009, pg. 180

life and forgetfulness. The left-wing stand also relied on its interest in power that made it unwilling to lose votes from traditional supporters. For this reason, once in power by late 1990, the left-wing granted several amnesties to those few old communist elite leaders who received light sentences from transitional justice.

The post-communist right-wing displayed its lacking political will in another form. Perhaps for lack of experience and knowledge in the transitional justice area, it initially expressed its public idea that all Albanians were “jointly perpetrators and victims” of the past communist regime, which caused disappointment among the politically persecuted and their families. In later years, the right-wing government adopted the above-mentioned laws related to the transitional justice and initiated the rehabilitation and compensation for the politically persecuted, but the process moved very sluggishly and was marred by clientelist interests of the politics. There was even no attempt to condemn the politically driven genocide of the communist dictatorship, while trials against the old communist leaders held them accountable under economic charges only.

It was precisely these general circumstances related to the insufficient process of establishing transitional justice in Albania that have strongly influenced as a major cause in keeping this serious issue unresolved, both in terms of justice and human redemption for the politically persecuted people who disappeared during the communist regime. It continues to be a very troubling problem even today, after thirty years of a pluralist democratic society, manifesting itself in a slowdown in the search, finding and identification of the victims of the genocide of the communist dictatorship. Consequently, “Albania’s incapacity to implement comprehensive transitional justice measures has maintained, if not amplified, the polarization of Albanian society over the totalitarian past”¹⁴.

Major future challenges

Recently, Frédérique Hanotier, Human Rights Officer at the EU Delegation to Albania, commended the ICMP report on missing persons under the communist era in Albania saying, “The EU is strongly committed to supporting transitional justice in Albania, and in particular the Authority [AIDSSH, author’s note, T. Starova] through ICMP. Raising public awareness about reconciliation and addressing the issue of persons missing from the communist era is of the utmost importance.”¹⁵

¹⁴ Gjeta, Altin, “Transition without justice in post-communist Albania: Its implications to collective memory building and democracy promotion”, OSCE, Justice and Transformation in Albania, 2020 edition, pg. 17

¹⁵ ICMP Report, Press Release, 2 March, 2021

Based on this research and the extensive literature and documents reviewed, we believe that Albania probably needs to finally address some major challenges in the field of transitional justice:

- Condemn by law all the communist crimes and their perpetrators, through the adoption of a law by extensive cross-party consensus.
- Set up an inter-institutional co-ordination structure to follow up on the resolution of all the transitional justice issues.
- Review and improve the law on access to former State Security files to eliminate any impediments or untruths related to them.
- Promote and support scholars to engage in research on the former State Security files and shed light on the untold truths about violations committed and plotted by the communist regime.¹⁶
- Launch a significant undertaking to revise the history textbooks so that younger generations comprehend and do not forget the tragic truth of the communist dictatorship.
- Provide state support to historians in shedding light on important historical events and figures in the Albanian history that have been overlooked or misjudged or hindered by the communist dictatorship.
- Build an important monument dedicated to the victims of the communist dictatorship to serve as a meaningful act of historical collective memory for the Albanian people and, especially, for the younger generations.

PHYSIOLOGICAL STUDY FOR EFFECTING OF RADON GAS ON ESTROGEN
LEVEL OF FEMALE RATS

Abstract

In this work, the physiological effect of radon gas (radon-222) on change in estrogen level in females' rats at different time period of exposure. Time periods were 4-day, 8-day, 12 day, and 16 days. The work was done on 25 animals of aged (8-12) weeks and the weight of (132-208) gm. Rats were divided into five groups which it is first group (control group), second group (exposure for 4 days), third group (exposure for 8 days), fourth group (exposure for 12 day), and five group (exposure for 16 day). The results show that there is significant decrease ($p>0.05$) in radiation groups and control groups for estrogen levels (Pg/mL) in five groups 0.92 ± 0.08 , 0.97 ± 0.19 , 0.99 ± 0.19 , 0.98 ± 0.17 , and 1.31 ± 0.09 , respectively. So, it may be concluded the radon gas at different time exposure was affected on estrogen levels in female rats.

Keyword: physiological parameters, estrogen, female rats and radon gas.

1. Introduction

Radon gas is a radioactive gas that is inert, colorless, tasteless, and odourless. It is also known as the "invisible or silent killer". Radon contains three isotopes ^{222}Rn , ^{220}Rn , and ^{219}Rn (Rühle et al., 2017). Radon in itself does not pose a health hazard because it penetrates into a non-reactive gas, however, when radon and its short-lived decay products are inhaled, the alpha particles released by the deposited decay products account for the majority of the radiation dosage to lung tissue, can harm sensitive lung cells, especially those attached to small aerosols, or are in unattached form, raising the risk of cancer. what part of the radon progeny will enter the blood into the lungs and radiate the whole human body (Gaisberger et al., 2021). Indoor radon exposure accounts for the largest proportion of the radiation dose received by the general public (Maier et al., 2021). Therefore, one of the most important and dangerous dangers of ionizing radiation is continuous and prolonged exposure to radon gas, whether in homes or workplaces. Radon acts mainly as the source of its decay outcome, which actually delivers the dosage to the lungs; however, as a convenient abbreviation, the health effects of radon decay products are often referred to as the health effects of radon (Abojassim *et al.*, 2021). Numerous types of non-ionizing and ionizing radiations and both have recognized causative influences on infertility. Other health effects have been studied but there is no conclusive evidence at present concerning radon-induced health effects other than lung cancer (Abojassim et al., 2021). Estrogen, one of the first hormone substances identified, was thought to have only female-selective activities important in female reproduction. We now know, however, that estrogen is also involved in male reproduction and in numerous other systems including the neuroendocrine, vascular, skeletal, and immune systems of both males and females. Estrogen influences many physiological processes, as it is also implicated in many different diseases including obesity, metabolic disorder, a variety of cancers, osteoporosis, lupus, endometriosis, and uterine fibroids (Burns and Korach, 2012). Estrogen works through several possible cellular mechanisms to mediate its biological responses. Therefore, the aim of this research is to study the effect of four period time exposure (4, 8, 12, and 16 day) of radon gas on the estrogen levels for female Albino rats.

2. Materials and methods:

2.1. Preparing laboratory animals

The study included (25) female albino Swiss Rat belonging to the (Bulb/C) breed, whose ages ranged between (8-12) weeks, and their average weight was between (132-208) grams. Animals were used after confirming their fertility for the purpose of conducting fertility testing and the

animals were obtained from the animal house in the Faculty of Science / University of Kufa. The animals were introduced into the animal house at the Faculty of Science / University of Kufa and placed in plastic cages with their own mesh covers and the floor of the cages were furnished with sawdust and were changed weekly and the animals were placed under appropriate laboratory conditions where the temperature ranged between (21 - 30) C and at a fixed lighting system at the rate of (13) hours of light and (11) hours of darkness. The animals were constantly given water and food in blackberry form and according to need, and were obtained from specialized agricultural shops in Kufa.

2.2. Irradiation Source and Radon detector

Radium-226 has been used for samples irradiation of the female rates samples. Radium-226 source was produced in 2009 and has activity 6600 Bq. This source consists of a container containing a rod, where the radioactive nucleus releases the radon gases.

One of the more sensitive polymeric plastics, the CR-39 nuclear track detector sheets is the most commonly used in radionuclides measurement that producing α -particles such as radon gases, and has a small size, simplicity, and durability (Hamzah *et al.*, 2022). The CR-39 abbreviation for the Columbia Resin No. 39 detector. Chemical structure for CR-39 is C₁₂ H₁₈ O₇. Each detector was assigned a unique code in order to differentiate them. TASTRAK Analysis System, Ltd., UK: TASTRACK sold the detector CR-39. A CR-39 detector sheet had dimensions of 2.5cm×2.5cm, a thickness of 1mm, and a code for each sheet that suited the TASL image system. The sheet has a density of almost 1.32 grams per cubic meter.

2.3. Measurements of Estrogen

This ELISA group used the ELISA competitive principle. The small ELISA panel available in this kit is pre-coated with E2. During the reaction, E2 in the samples or standard competes with a fixed amount of E2 on the solid phase supporter for sites on the biotinylated. Detection antibody specific for E2. Excess conjugate and unbound sample or standard were washed from the plate, Avidin conjugated to Horseradish peroxidase (HRP) are added successfully to each micro plate well and incubated. Then TMB substrate solution is added to each well. The enzyme substrate reaction is terminated by the addition of the stop solution and the color change is measured. The optical density (OD) is measured spectrophotometrically at a wavelength of 450 nm +- 2 nm. The concentration of E2 in the samples is then determined by comparing the OD of the samples to the standard curve.

2.4. Calculations

1. The standard curve is used to determine the amount of specimen.

2. Average the duplicate readings for each standard control and sample.
3. As an alternative, . Build a standard curve by scanning the average absorption of each criterion on the y-axis versus focusing on the x-axis and draw a best-fitting curve through the points on the graph
4. The data can be linear by plotting the E2 concentration record against the OD record and the best fit line can be determined by regression analysis. This action will result in sufficient but less accurate fit of the data. If the samples are diluted, the concentration read from the standard curve should be multiplied by the dilution factor.
5. This standard curve is provided for demonstration only. A standard curve should be generated for each set of samples assayed.

2.5. Experimental Design

The rats kept in animal house for acclimation to laboratory condition for two weeks before they were used for the experiment. Then, animals were placed in plastic cages that it is contains of irradiation source (by radon gas) as seen in Figure (1). Each group was formed 5 ats and the Rats exposed by radon gas (^{222}Rn) at different doses which depend on the variable period time. The values of dose exposure of radon gas in control groups, group 1(4 day), group 2(8day), group 3(12 day), and group 4(16 day) were 0 Bq/m^3 , 588.51 Bq/m^3 , 714.62 Bq/m^3 , 756.66 Bq/m^3 , and 840.73 Bq/m^3 , respectively.

Figure (1): Diagram of house of Irradiation for animals in the present study using radon source.

3. Result

The results of Table (1) indicate that there is significant decrease ($p>0.05$) in radiation groups and control groups for estrogen levels (0.92 ± 0.08 , 0.97 ± 0.19 , 0.99 ± 0.19 , 0.98 ± 0.17 , 1.31 ± 0.09 , 1.31 ± 0.09 , 1.31 ± 0.09 , 1.31 ± 0.09) respectively.

Table (1): Demographic of estrogen in control groups, radiation groups.

	Estrogen (Pg/mL)	
	Control	RAD
4 days	1.31 ± 0.09	0.92 ± 0.08
8 days	1.31 ± 0.09	0.97 ± 0.19
12 days	1.31 ± 0.09	0.99 ± 0.19
16 days	1.31 ± 0.09	0.98 ± 0.17
LSD	0.17	0.308
p-value	1.000	0.963

Discussion

Estrogen one of the essential ovarian hormones and controls numerous phases of female reproduction, for example, estrus behavior, the increase in serum gonadotropin concentrations, ovulation, uterine propagation, and endometrial gland secretion (E. Tokunaga *et al.*, 2014, K. J. Hamilton *et al.*, 2014).

As shown in Table (1). RAD administration caused a down estrogen level in blood as compared with control groups. The high effect of radon gas was with 588.51 Bq/m^3 of 4 days. These study agreement with previous studies such as Mahmoud *et al.*, 2020. Study showed that radiation cause down estrogen level. The current had reports about the effect of EMR exposure on female reproductive tract in human (Nazıroğlu *et al.*, 2013) and animals (Kismali *et al.*, 2012).

Conclusion

Radon gas cause effected in estrogen level in female rats, it is found estrogen level decreased with increasing of radon concentrations. Very high levels of radon gas exposure can affect on estrogen level change in female rats for many years or permanently. So, it is clear from this study the exposure to high levels of radon gas affect fertility and may be causing infertility.

Abstract: - In this current work, the numerous goals are to urge prepared NiFe₂O₄ and Mg NiFe₂O₄ mineral primary solid solution nanoparticles through a basic, practical, and greener methodology and to boot do a nitty-gritty characterization of NiFe₂O₄ and MgNiFe₂O₄ mineral primary solid solution nanoparticles. Along these lines, NiFe₂O₄ and Mg NiFe₂O₄ nanoparticles were prepared by an organic compound interceded sol-gel ignition strategy.

Keywords: - Nanoparticles, Characterization, Nanocomposites

Introduction

The nanoparticles embody the particles having size between one and one hundred nm. These particles have totally different properties at their atomic level because of their size. This modification in properties of nanoparticles is helpful in several fields [1, 2]. Engineering is one amongst the foremost fascinating fields for researchers since the last century. Numbers of developments are created since then within the field of engineering. Nanoparticles will be classified as metal nanoparticles, non-metal ceramic nanoparticles and semiconductor nanoparticles [3]. Nanoparticles have those chemical and physical properties that make them terribly totally different from that of the corresponding bulk materials because of their tiny size and enormous surface to volume quantitative relation. They attract abundant attention as a result of their potential applications in several fields together with optics, electronics, magnetism, ceramics, and chemical change [4].

Spinel solid solution nanoparticles have received an excellent potential within the wide selection of applications like data storage, electronic devices to medical specialty, drug delivery, super capacitors, anode materials for lithium-ion batteries, and microwave- and radar-absorbing material. [4-5] Nickel solid solution (NiFe_2O_4) is one amongst the vital candidates among the mineral solid solution family as a result of its application in microwave, electronic, magnetic, and chemistry devices. [6] It exhibits an occasional coercivity, eddy and physical phenomenon loss; so, it's helpful for electronic devices like telecommunications and high-frequency devices. [7] Nickel and metallic element solid solution is extensively used in variety of electronic devices because of their high porousness at high frequency, exceptional high electrical electric resistance, mechanical hardness, chemical stability and affordable cost [8]. NiFe_2O_4 may be a documented inverse mineral with Ni^{2+} at octahedral [B-site] and Fe^{3+} ions distributed equally in tetrahedral (A-site) and octahedral sites [B-site] [9]. Metallic element solid solution (MgFe_2O_4) is one amongst the foremost vital ferrites. It has a spinel structure of traditional spinel-type and may be a soft magnetic n-type conductor, that finds variety of applications in heterogeneous chemical change, adsorption, sensors, and in magnetic technologies [10]. Recently, nanostructures of magnetic materials have received a lot of and a lot of attention because of their novel material properties that are unit considerably totally different from those of their bulk counterparts [11-15]. It's been additionally detected that the electromagnetic radiation absorption capability of mineral solid solution nanoparticles depends on its structural characteristics like crystallinity, particle size, ion distribution, morphology, dopant ions, etc. [16] consequently, goodish efforts are dedicated to prepare mineral solid solution nanoparticles by numerous chemical synthesis

techniques like co-precipitation, hydrothermal/ solvothermal methodology, microwave-assisted synthesis, microemulsion methodology, sonochemical synthesis, sol-gel combustion methodology, etc. [17-19]

Among numerous chemical synthesis approaches, the sol-gel combustion methodology has numerous blessings like a speedy synthesis approach, formation of high-purity product, unvaried composition and stabilization of stability phases, low energy consumption, and an easy, economic, and ascendible synthesis methodology. [20-21]

In this gift work, the foremost objective is to arrange MgNiFe₂O₄ mineral solid solution nanoparticles via an easy, efficient and greener approach and to additional perform a close investigation on the impact of size of MgNiFe₂O₄ mineral solid solution nanoparticles. Therefore, MgNiFe₂O₄ nanoparticles were ready by organic compound from the microwave mediate combustion methodology. To the simplest of the authors' data, this can be the primary report on the synthesis of MgNiFe₂O₄ nanoparticles by urea from the microwave mediate combustion methodology.

Experimental

(i) Synthesis of Magnesium doped nickel ferrite

Magnesium doped nickel ferrite were synthesized by sol-gel microwave auto-combustion technique using urea as fuel. Magnesium nitrate, Nickel Nitrate, Iron nitrate and urea were weighed and mixed in double distilled water and mixed together. The solution was stirred continuously and heated on magnetic stirrer at 80⁰C till a gel is obtained. The gel was then fired in a microwave oven so that a floppy ash was obtained which then ground in a mortar pestle for four hours to get fine powder. This powder was then calcined at 800⁰C.

Results and Discussion

1. XRD Analysis

X-ray diffraction patterns of $\text{MgNiFe}_2\text{O}_4$ and NiFe_2O_4 one spinel ferrite nano- particles are shown in Figure 1 and 2.

Figure 1: X-ray diffraction pattern of $\text{MgNiFe}_2\text{O}_4$

Figure 2: X-ray diffraction pattern of NiFe₂O₄

The XRD patterns well match all the characteristic reflections of cubic spinel structure without any extra peaks therefore the structure is single phase. From the survey of literature, we found that the goodness values of our Rietveld refined sample have the good agreement with the reported values in previous literature. Figure 1 and 2 shows the typical Rietveld refined of X-ray pattern for sample $x = 1$, and one respectively.

FTIR analysis

Fourier transform infrared (FTIR) spectra of the samples were recorded in the frequency range 400–4000 cm^{-1} at room temperature and are shown in the Figure 3. Two absorption frequency bands ν_1 and ν_2 are the characteristic bands of the spinel ferrites corresponding to stretching vibration of metal cation (Me) – oxygen anion (O_2^-) bond in tetrahedral and octahedral sites. The stretching vibrations of higher frequency band, ν_1 corresponds to tetrahedral site and stretching vibrations of lower frequency band ν_2 corresponds to octahedral site. Broad absorption peak around 3435.22 ($\text{MgNiFe}_2\text{O}_4$), 3493.03 (NiFe_2O_4) cm^{-1} and somewhat less broad absorption peak around 1450.43 ($\text{MgNiFe}_2\text{O}_4$), 1514.12 (NiFe_2O_4) cm^{-1} in all the samples corresponds to stretching and bending vibration of O-H interacting via H-bond expected due to absorbed water molecules on the surface [22].

Figure 3: FTIR pattern of MgNiFe₂O₄

Figure 4: FTIR pattern of NiFe₂O₄

Conclusions

Magnesium substituted Nickel Ferrite, MgNiFe₂O₄ and MgNiFe₂O₄ were synthesized by sol-gel auto-combustion technique with microwaves using urea as fuel. The superparamagnetic nanoparticles of size 11–23 nm was synthesized successfully by solgel microwave assisted auto combustion method. The small coercivity and squareness ratio and non-saturation of the samples at even at high applied magnetic fields indicates that the most of the nanoparticles even if not all, are superparamagnetic in nature. The various properties of these nanoparticles studied indicates that they can be of potential applications use in many applied fields like MRI contrast agent, magnetic drug delivery and magnetic hyperthermia, data storage, sensors and catalysts.

Abstract

Numerous studies indicate that phonological abilities are one of the most important factors in children's reading adoption, so it is important to encourage them. The paper presents action research in Preschool institution "Plavi Chuperak" in Serbia, an initial research aimed at determining the development of phonological abilities in preparatory preschool groups. The sample was 100 children tested individually with a test of phonological abilities - FONT 2.1. (51% boys) average age of 6.5 years. The results indicate that almost all children have a developed ability to segment syllables, over 70% and to rhyme and identify the initial phoneme, while 45% of children successfully identifying the final phoneme. In half of the children, the ability of voice analysis was developed, the ability of phonemic substitution developed less than 40% of children, and the elimination of the initial phoneme less than 20% of children. The results confirm that non-phonemic abilities develop earlier, and that phonemic analysis, which are directly related to the adoption of reading in the largest number of children, develop in the year before starting school. It is important to work in a partnership with parents and the school on encouraging phonemic segmentation, initial phoneme elimination, and phoneme substitution so that children are ready to acquire initial reading.

Keywords: phonological abilities, reading adoption, prompting, partnership, transition

INTRODUCTION

Opinions in the literature indicate that the acquisition of literacy is a developmental path that begins early in a child's life and is characterized by the gradual development and acquisition of different aspects of literacy (Nikolić, Cvijetić, Milenković, 2018). A number of authors point out that phonological ability determines initial reading and writing (Fletcher, Snowling & Scanlon, 2004; Gillon 2002; Hulme, Snowling, Caravolas & Carroll, 2005; Koutsoftas, Harmon & Gray, 2009; Reid, 2009; Richardson, Thomson, Scott & Goswami, 2004; Schuele & Boudreau, 2008; Snowling, 2000; Vellutino, Siok & Fletcher, 2001), so it can be considered a crucial component of reading acquisition. In numerous studies of this metalinguistic ability, the question of which skill at the level of phonological abilities is more predictive of success in acquiring reading and writing has been discussed. Some authors emphasized that the most predictive is the ability to recognize rhyme (Bradley & Bryant, 1983; Bryant, Bradley, MacLean & Crossland, 1989; Bryant, MacLean & Bradley, 1990), while others emphasized the ability to segment words into phonemes, and within its omission of the first phoneme (Mutter, Hulme, Snowling & Stevenson, 2004). When assessing this ability, numerous tasks were used in the world: recognizing rhyme, counting syllables, separating syllables, listing words that have the same initial sound, making out the initial sound, counting sounds in words, voice analysis and synthesis, manipulating sounds in terms of omitting, moving, replacing etc. (Yopp & Yopp, 2000, according to: Lazarević, 2014:426). It has been established that the development of phonological abilities begins at a younger preschool age, with the ability to notice rhyme. Between the ages of five and six, children begin to divide words into syllables, then into phonemes, pronounce the initial phonemes of words, and are able to count the phonemes in small words, and between the ages of six and seven they can count the phonemes in longer words, pronounce words with omitting a phoneme that is at the beginning or end of a word and connecting the phonemes into a word (Snow, Burns & Griffi, 1998, according to: Lazarević, 2014:426).

In our environment, in the Republic of Serbia, research into the development of phonological abilities as a predictor for the acquisition of reading and writing began in the 80s of the last century (Göncz and Kodžopeljić, 1991a, Kodžopeljić, 1996b, 1997, Ognjenović and Morača Stojnov, 1982, 1983; according to: Kodžopeljić, 2008). When assessing phonological ability, tasks of phonemic or syllabic word segmentation were mainly represented, the so-called. "tapping" procedure, which was a modified version of the research strategy of Lieberman et al. (Lieberman et al., 1973), while other types of tasks were almost not represented (according to: Lazarević, 2014:427).

Analyzing in detail the incoherence in defining the concept of phonological/phonemic awareness as well as research procedures, Subotić (2011) approached the construction and psychometric evaluation of a test for testing phonological awareness in the Serbian language, on a sample of 96 children aged 5-8 years. He previously points out, relying on the views (Rathvon, 2004:66) that phonological awareness is a broader construct than the more refined phonemic awareness, as it refers to the general awareness of the sound structure of spoken language, while phonemic awareness concerns the understanding that spoken words are composed of individual sounds, which can be analyzed and manipulated. He also states that according to Rathvon (2004), all types of phonological awareness tasks can be classified into two categories: non-phonemic tasks that measure global aspects of phonological awareness, such as rhyme and syllable sensitivity, and phonemic awareness tasks that measure the ability to direct attention to individual phonemes. and to manipulate them.

The phonological awareness test - FONT 2.1, which, in the current version, includes eight types of tasks, with six items each (more about the instrument in the research method) is highly reliable (Cronbach's $d = .96$), with an approximately normally distributed corrected item- total correlations, acceptable range and average value ($Sk = -0.38$, $Ku = -0.88$; $Min = .34$, $Max = .80$, $M = .60$, 95% CI [.56, .64], $SD = .13$), which suggests good internal agreement and discrimination in the included age interval (Subotić, 2011:132).

In the last decade, the FONT 2.1 test. was used in several studies in our speaking area, in the Republic of Serbia and Croatia. In one of the studies conducted on a sample of 22 respondents (16 girls and 6 boys) aged 4.8 to 5.6 years, 6 tasks from the test (Lazić, 2014) were applied (the tasks of combining syllables and segmenting syllables were omitted). The results showed that all examined children aged 5 years (100%) were successful in rhyme tasks, 95.5% were successful in identifying the initial phoneme, and 54.6% in the task of identifying the final phoneme. 18.2% of the children succeeded in the phoneme segmentation tasks, 22.1% in the elimination of the initial phoneme, while only 9% of the examined children succeeded in the phoneme substitution tasks. Children of mothers who have completed higher and higher education are significantly more successful in rhyming than children of mothers with completed SSS, and children of fathers with completed higher and higher education are more successful at the initial phoneme elimination task than children of fathers with SSS.

Similar results were obtained in the research on a sample of 60 children, of both sexes (51.6% boys and 48.4% girls), aged six (33.3%), seven (38.3%) and eight (28.3%) years, which was conducted by group of authors (Golubović, Ječmenica, Subotić, Kobac, 2019) with the aim of

determining the level of development of the elements of phonological awareness and the mutual relationship of these elements in children with typical development. The results showed a generally high achievement of children on all types of phonological awareness assessment tasks (ranging from 73.3% to 90.8% success). Relatively easier tasks (joining syllables, recognizing rhyme, syllabic segmentation and identifying the initial phoneme) were differentiated from relatively difficult tasks (identifying the final phoneme, phonemic segmentation, phonemic substitution of the initial phoneme and elimination of the initial phoneme). The results showed that phonological abilities develop and are acquired by the age of seven. Gender, as well as the interaction of gender and age, did not represent a significant source of differences in children's achievement on phonological awareness tasks.

Given that the results of previous research implicitly indicate that the critical period for the development of phonological abilities measured by phonemic tasks is in the year before children start school, the goal of the research presented in this paper was to confirm the development of all aspects of phonological abilities precisely at this age, including a significantly larger number of children compared to the aforementioned research. It was assumed that the largest number of children have developed abilities of syllabic segmentation, rhyming and identification of the initial phoneme, and that a smaller number of children have developed phonemic segmentation, identification of the last phoneme, elimination and substitution. It was also expected that gender and education of fathers and mothers would significantly differentiate children's performance on phonemic tasks. The goal of this part of the research was to determine the level of development of certain aspects of phonological abilities for each child in order to create a support plan at the level of educational groups and individually in the next phase of the research (this part of the research will be presented elsewhere).¹⁷

RESEARCH AND FINDINGS

Method

Research sample and procedure

The research was carried out in Preschool institution "Plavi Chuperak" in Titel, on a sample of 100 children (51 boys and 49 girls), with an average age of 6.5 months, who attended the preparatory preschool program. In our sample, about 70% of mothers and fathers have completed secondary education, 8% of mothers and 5% of fathers have higher or higher education, and about 20% of parents (both fathers and mothers) have lower vocational education. The

¹⁷ The support plan at the level of educational groups and individually, due to limited space, will be presented in another paper

examination was carried out individually, with each child, with the assistance of the institution's psychologist. The average examination time for one child was 25 minutes.

The examiners reported the following about the course of the examination itself:

The children were very happy to participate in the examination, they rejoiced, they simply raced. Since the testing was done individually, in cooperation with the preschool psychologist, the children who had not yet reached their turn could hardly wait to be invited. One teacher reported that some children even came to kindergarten early to "take a seat" for testing. After completing the testing, the children had fun with the test material by giving each other exercises, analogous to the tasks they did in the test (for example: What will you be called if you swallow the first syllable of your name?). Very quickly, parents became interested in the testing and the results. They asked the teacher what exactly the children were doing. Some of the parents wanted more detailed instructions and expressed their desire that they and their children do similar tasks at home.

Instruments used

Test FONT 2.1 (Subotić, 2011): in the current version, it includes eight types of tasks, with six items each (with attached instructions for assignment): 1) combining syllables 2) syllabic segmentation 3) identifying the initial phoneme, 4) recognizing rhyme, 5) identifying the final phoneme, 6) phonemic segmentation, 7) elimination of the initial phoneme and 8) phonemic substitution (initial phoneme).

All assignments are formatted exclusively for oral assignments. The test did not include tasks that would tend to produce "non-words" in the Serbian language (eg manipulation of central phonemes), or would result in a change of word type, gender, or case (eg elimination or substitution of the final phoneme).

Each task contains six items, which are scored according to the true-false principle. The largest number of items are monosyllabic or two-syllable nouns. In the tasks of recognizing the rhyme and identifying the initial and final phonemes, the respondents answer with yes-no, therefore these tasks have two control items each, which serve to detect mechanical affirmative responding (the correct answer to all control items is "no"). In cases of affirmative from \neg speaking on both control items on one task, a score of zero was calculated for the entire task, as well as in the case of correct answers only on the control items, which suggests mechanical giving of the answer "no".

Data analysis

For the purposes of the research, three groups of responses were first defined by cluster analysis for each child and classified into the following categories: 1) child with underdeveloped phonological awareness; 2) phonological awareness is partially developed and 3) phonological awareness is developed. Descriptive statistics (frequencies and percentages) were used to determine the number (percentage) of children with/without developed phonological abilities, while the correlation between gender, mother's and father's education and success on phonological ability tasks was determined by the Chi-square test.

Results

Table 1 shows the children's achievements in each aspect of phonological abilities. More precisely, the number and percentage of children who have developed, partially developed or not developed each of the examined phonological abilities was determined.

Table 1. Percentage of children who have/have not developed phonological abilities

Phonological ability	Level of development - % of children		
	Not developed	Partially developed	Fully developed
1. Joining syllables	-	1	99
2. Syllable segmentation	1	3	96
3. Identifying the initial phoneme	8	22	70
4. Rima	1	21	76
5. Phonemic segmentation	33	16	51
6. Identifying the final phoneme	31	24	45
7. Elimination of the initial phoneme	65	17	18
8. Phonemic substitution	44	22	38

Analyzing the results in table 1, it can be seen that almost all children from the sample are completely successful in the tasks of syllabic merging and syllabic segmentation (96-99%). Therefore, almost all children of preschool age can break down a word into syllables, or synthesize a word based on syllables. About 70% of preschool children are successful in identifying the initial phoneme and rhyming, while only about 50% of preschool children develop the ability to analyze sounds, as well as identify the final phoneme. The most difficult tasks for

children of this age are elimination of the initial phoneme and phoneme substitution. 38% of children can successfully replace one phoneme with another, and only 18% of children have the ability to pronounce a word without the initial phoneme. The first hypothesis was confirmed because it was determined that a smaller number of children of preschool age have developed the ability of phonemic segmentation, elimination of the initial phoneme and phonemic substitution, while the majority of children have mastered the so-called non-phonemic tasks (syllabic segmentation and rhyming), as well as identification of the initial phoneme. Identification of the final phoneme is, obviously, a more difficult task for children, because it involves keeping pairs of words in working memory, and then comparing them.

The Relationship Between Phonological Abilities And Children's Gender And Parents' Education

Based on the value of the Chi-square test, no differences were found in the development of phonological abilities in children in relation to gender and father's education (all values are $p > 0.05$), so in this part we reject the hypothesis. In relation to the mother's education, statistically significant differences were found in the following phonological abilities: phonemic segmentation (Chi square= 9.924, $df=4$, $p=0.042$), final phoneme identification (Chi square=10.924, $df=4$, $p=0.027$), elimination phoneme (Chi-square=14.550, $df=4$, $p=0.006$) and phoneme substitution (Chi-square=9.937, $df=4$, $p=0.041$). Children of mothers with higher and higher education have better developed mentioned aspects of phonological ability, and in that part the hypothesis is rejected.

Discussion of results

As earlier researches in the world and in our country have established, the ability of syllabic segmentation appears at earlier ages, so, developmentally, all children of preschool age have mastered this ability. 70% of children are successful in recognizing rhyme and identifying the initial phoneme, which indicates that at preschool age 1/3 of children still have more or less difficulty in these aspects of phonological abilities, but that, nevertheless, these tasks represent easier language material for children in relation to phonemic tasks, which is in accordance with the results of the research of Golubović et al. (2019). What is particularly important for further steps is the finding that 50% of children have developed the ability of phonemic segmentation, which, according to the results of a large number of studies, is a crucial component of reading acquisition. This indicates that at the preschool age, it is necessary to work on encouraging the development of phonemic abilities in children with the aim that as many children as possible will be ready to learn reading by entering the first grade. Increasing awareness of the

importance of the development of phonemic abilities to success in acquiring reading and writing skills and introducing strategies to increase these aspects of phonological awareness at preschool age significantly contribute to the development of literacy in children (Tafa, 2008).

The analysis of individual results indicated how developmentally ready each child is for learning to read and in which segments the child's development should be encouraged. Children who need more intensive support in this area, as well as children who need to be referred to a speech therapist (without already being included in the treatment) have been identified. The analysis at the level of the educational group gave clear guidelines to educators in defining a plan for further support.

Also significant is the finding that certain aspects of phonological abilities are associated with maternal education. This indicates that the family context, more precisely the interaction with mothers who probably spend more time with children and are more verbally open, can be a significant supportive factor in the development of phonological abilities. If we add to that the fact that the parents in the pre-school institution where the research was conducted already at this stage showed interest in the test material and motivation to do similar tasks with their children at home, there is no doubt that developing a partnership with parents in this area should be part of the plan further support.

It is especially important to note that the children, participants in the research, showed an exceptional interest in the test material, that the tasks were fun, stimulating, and that they encouraged learning in the social interaction of their peers.

The data collected in this phase of the research are also valuable for establishing cooperation with the school and realizing the transition in the area of literacy development.

Conclusion

Research on the development of phonological abilities at preschool age was the initial step in creating a support plan in preparing children for the acquisition of reading and writing in the Preschool institution "Plavi Chuperak" in Titel. The test material (FONT 2.1, Subotić, 2011) turned out to have great research and practical potential, and it would be useful to train as many professional associates and educators in preschool institutions as possible to give and analyze this test. Determining the development of non-phonemic and phonemic aspects of phonological abilities confirmed earlier findings in a research sense, and in a practical sense opened up more directions for the introduction and implementation of a support plan in this area, with the active participation of parents and school representatives. It is particularly important that testing can identify children who need additional support for the development of phonemic abilities, who are suspected of dyslexia (and dysgraphia), and determine timely intervention.

OER REPOSITORIES OF OPEN UNIVERSITIES IN INDIA: A STUDY

Sujan Bandhu Chakraborty

Librarian, Dept.of Allied Health Sciences, Brainware University, West Bengal, India

sujan.brain@gmail.com,

Dr. Pubalika Bhattacharya Maitra

Assistant Professor, Dept.of Library and Information Science, University of Calcutta, West Bengal, India

Solanki Chakraborty

Independent Researcher, West Bengal, India

Abstract

A key component of the current information-driven era is information and communication technology (ICT). The conventional methods of disseminating information have changed as a result of the Internet and modern IT, of technological research and development.

Increasing need of information in electronic format, the concept of simple access to electronic or digital information is gaining worldwide momentum. Information is now more easily accessible because of open access. Open accessible educational resources, to the students of all strata of the society is one of the blessings of this era of open movement.

Open Educational Resources (OER) have gained popularity and are therefore particularly useful for e-learning and other distance learning methods. In India, a number of OER efforts have been considerably aiding to distance learning, enabling students to access knowledge sources. There are fifteen open universities in India at present. Some of these universities have implemented OER for the benefit of the students successfully. E-Gyankosh, of Indira Gandhi National Open University, a celebrated Central University, and maintains a high-end OER in the country among others. The OER's offer a variety of knowledge transmission methods and courses through the platform of multimedia (audio, video and, textual lectures), aiding in the interactive nature of teaching and learning. Different OERs have different material uploaded with varying structure and policies.

The present study dealt with the basic concept of OER, through observation method of study, and gives a detailed finding in this regard, of the OERs of Open Universities in India. The motivation of this study is to find out the national ability to conceive, conserve and disseminate the open education for the future development of every education system based on research and development.

Keywords: Open Educational Resources (OER), Open Access, ICT, Information, Open Universities, India.

1. Introduction

Open Educational Resources (OER) have become an increasingly popular topic in education in recent years. OER refers to educational materials that are openly licensed and available for use and repurposing, often for free. The purpose of this literature review is to explore the benefits and challenges of OER, as well as the impact of OER on student learning outcomes.

The creation of Open Educational Resources (OERs) is currently taking place on a global scale, and members of the Open Ware Consortium come from every continent. Students and teachers are using open educational resources (OER) more frequently, which helps spread the idea of OER and expand the number of resources available. OERs are seen as a way to improve quality, cut prices, and increase access to educational materials as well as a way to address the various problems that developing nations' educational institutions face.

The usage of open educational resources is permitted by professors, institutions, and students alike and is made available for free online. Simulations, experiments, and demonstrations, as well as curricula and teacher resources, can all be found in open educational resources (OERs) (UNESCO 2002). It is the outcome of global efforts to make educational resources accessible everyone (Bissell, 2009). OER's, innovative approach to information sharing, which can result in economic success for both individuals and entire nations, is the biggest advantage for developing countries (McDowell, 2010).

2. OER Components, Benefits and Challenges

The Commonwealth of Learning (COL) defines Open Educational Resources (OER) as ‘materials offered freely and openly to use and adapt for teaching, learning, development and research’ (Open Educational Resources Policy - Commonwealth of Learning, 2021).

Open Educational Resources (OER) consist of several components that work together to create a complete educational resource. These components include:

- **Content:** This refers to the educational material itself, such as textbooks, videos, lesson plans, and quizzes. OER content is typically created with an open license that allows others to use, adapt, and share the material freely.
- **Licenses:** OER licenses are legal tools that allow content creators to specify how others can use and share their work. Creative Commons license are the most common types of licenses used for OER.
- **Metadata:** Metadata is information about the educational material, such as the author, subject, and date of creation. Metadata helps users find, evaluate, and use OER more effectively.

International Conference on Global Practice of Multidisciplinary Scientific Studies-IV
Turkish Republic of Northern Cyprus, April 28-30, 2023

- Tools: OER tools include software and platforms that facilitate the creation, use, and sharing of educational resources. For example, there are authoring tools that allow educators to create OER content, and repositories that allow users to find and share OER.
- Communities: OER communities include educators, students, and other stakeholders who collaborate to create and use OER. These communities provide support, feedback, and resources to help improve the quality and accessibility of OER.

These components work together to create a comprehensive and effective open educational resource that is accessible to all. Benefits of using OERs include:

- Expanded learning access is one benefit of using OERs.
- OERs are freely available to use at any time by students all around the world, many times.
- OERs are inexpensive or free to share broadly.
- The addition of new course content. Where there are glaring information gaps in textbooks and lectures, OERs can be used as a supplement.
- Improvement to the normal course material. For instance, multimedia content like videos can be used in conjunction with text. Information presented in a variety of formats could make it easier for pupils to understand what is being taught.
- When compared to information published in textbooks or journals, which may take months or even years to become accessible, information can be disseminated quickly. The timely and/or relevant nature of the information may rise with the rapid availability of

There are various challenges also when it comes to utilizing OER effectively. Some of these are

- Because there isn't a single repository for OER, this is a problem. They can be found all over the internet.
- Creative Commons open licenses and what they allow are not widely known.
- The practitioner needs practice editing and remixing resources in addition to fundamental ICT abilities in order to modify and repurpose OER.
- Many instructors choose to guard rather than share their own materials because they feel awkward or that it is improper to use other people's work.
- For OER access and adaptation, reliable internet connectivity and easy access to ICT are necessary.
- Due to competing objectives, many educators spend relatively little time creating their course materials because universities rarely offer incentives for course creation.

3. Background

India has several open universities that provide distance education. At present there are fifteen (15) open universities in India, namely: **2273**

International Conference on Global Practice of Multidisciplinary Scientific Studies-IV
Turkish Republic of Northern Cyprus, April 28-30, 2023

Table 1 List of Open Universities in India

Open University (Establishment Year)	Type	Website

Netaji Subhas Open University (NSOU), Kolkata, W.B. India (1997)	State	www.wbnsou.ac.in
U.P. Rajarshi Tandon Open University (UPRTOU), Allahabad, U.P. India (1998)	State	http://www.uprtou.ac.in/
Tamil Nadu Open University (TNOU), Chennai, Tamil Nadu, India (2002)	State	http://www.tnou.ac.in
Pt. Sunderlal Sharma Open University (PSSOU), Bilaspur, Chhattisgarh, India (2005)	State	http://www.pssou.ac.in
Uttarakhand Open University, Haldwani, Distt. Nainital, Uttarakhand, India (UOU) (2005)	State	http://uou.ac.in
Krishna Kanta Handique State Open University, Guwahati, Assam, India (KKHSOU) (2006)	State	http://www.kkhsou.in/web_new/index.php
Odisha State Open University (OSOU) (2015)	State	https://www.osou.ac.in

These open universities offer a wide range of courses, including undergraduate, postgraduate, diploma, and certificate programs.

Open universities in India are regulated by the University Grants Commission (UGC) and can be found in various forms, including a network of national and state institutions and online learning portals (Edu, 2023). These universities offer distance education programs and are particularly useful to people who cannot attend traditional universities due to various reasons such as financial constraints, location, or job commitments (Vaishak, 2020).

India has been working towards becoming an open knowledge society and has been exploring Open Educational Resources (OER) as a medium of education, research, and training (Padhi, 2018). OER are defined as teaching, learning, and research resources that are in the public domain or have been released under an intellectual property license that permits their free use or repurposing by others (Kumar, 2009). OER can be found in India through various sources such as Digital Library of India, National Digital Library, Shodhganga, NPTEL, Project OSCAR, NCERT, NIOS, and Agropedia (Vaishak, 2020).

Open Educational Resources (OER) provided by Open Universities in India have a significant impact on the education system. Governmental and private organisations in India have launched a number of programmes to provide free educational materials. There are several blogs, YouTube videos, and other content pieces created by people and groups that appear to contain valuable instructional resources.

Some of the Open Universities in India have already launch their OERs successfully and some are yet to take the initiatives on the same. Table 2 decited the list of Open Universities with the link to their Webportal for OER or OPEN Self Learning Materials

4. Related Literature

The Open Educational Resources (OER) movement has gained significant attention in recent years, with numerous studies analyzing the opportunities and challenges associated with it. Here's a brief literature review on OER:

Another study on the usage of OER compared the performance of groups of students who were taught using a blended learning method utilizing OERs to groups of students who were taught using a standard book in a face-to-face class. There were 605 students using the blended learning strategy as opposed to 2439 in the face-to-face class. There was no significant difference in the scores of the two groups, however students who used the blended learning technique and OERs scored somewhat higher than those who were taught using the traditional way (Bowen et al., 2014).

A study by Butcher et al. found that OER can help bridge the digital divide and provide access to education to marginalized populations. The study also highlighted the need for quality assurance mechanisms to ensure the credibility and relevance of OER (Butcher et al., 2015).

In a systematic review of 20 studies, Jhangiani et al. found that OER can have a positive impact on student learning outcomes, especially in terms of academic achievement and engagement. The review also highlighted the importance of faculty buy-in and institutional support for OER implementation (Jhangiani et al., 2016).

Another study by Hilton et al. found that OER had a positive impact on student retention rates and student success in courses (Hilton et al., 2016).

A study by Wiley and Hilton found that OER adoption can significantly reduce the cost of textbooks for students, while also improving their academic performance. The study also highlighted the need for faculty training and support to encourage OER adoption (Wiley and Hilton, 2018).

In a study it was found that OER can help improve the quality of education, especially in developing countries with limited resources. The study also highlighted the need for open licenses and sustainable funding models to ensure the long-term viability of OER (Mishra et al., 2018).

In a study Shukla opined that though the projects are still in their infancy, the time will come when it makes a difference and the entire population is educated and benefits from it. The Government of India had recognized the potential of OER and had therefore developed several large-scale projects (Shukla, 2020).

The, eGyanKosh, OER of IGNOU, provides a personal learning space, in which free digital learning resources are integrated with a high-end learning management system, suitable for anyone who wants to learn, regardless of their educational needs and experience. eGyanKosh, initially surfaced as a digital repository to archive digital learning content, evolved as a major platform for e-learning (Chakraborty & Chakraborty, 2021).

A study published in Springer found that converting entire degree programs to OER requires colleges to intentionally integrate OER work into their organizational strategies, policies, and practices, requiring coordinated efforts (Griffiths et al., 2022).

Bose and Vijayvargiya concluded in a study that majority of the users in the higher educational institutions have awareness about open access resources and their uses to fulfil their academic needs. More awareness and training programmes would definitely help to enhance their familiarity in use of open access resources effectively (Bose and Vijayvargiya, 2023).

Overall, the literature suggests that OER have the potential to improve access to education, reduce costs, and enhance learning outcomes. However, there are also challenges associated with OER adoption, including the need for faculty training and support, quality assurance mechanisms, and sustainable funding models.

5. Scope of the study

At present there are fifteen (15) Open Universities in India. Fourteen (14) State Open Universities and One (1) Central Open University. These fifteen Open Universities has been chosen for the present study.

6. Objective of the study

The main objectives of the study are

- i. exploring OER initiatives in the Open Universities in India
- ii. examining the open access full text availability of resources of the OERs
- iii. types of digital materials used in the OERs
- iv. Language of the resources in the OER
- v. software used to develop OER
- vi. facilities provided to the users by the OERs
- vii. study the policies of the OERs

7. Methodology

The information pertaining to the OER of the fifteen Open Universities in India gathered from their websites till May 01, 2023. From each website, information about the dedicated web portal for OER, repository software used for OER, accessibility, resource types, file formats, facility of e-SLM (self-learning materials), Language of the resources, searching facilities, OER Policies were retrieved and collected. The analysis has been performed using Microsoft Excel 2010.

8. Findings

The websites of the 15 Open Universities and their available OER has been accessed and the following observations were analyzed.

8.1 OER Web-portal status and Open Universities

Figure 1 Availability of dedicated web portal for OERs

8.2 Use of Repository software for OERs and Open Universities

Table 3 Type of Software used of OER

Open University	Repository Software used for OER	Open University	Repository Software used for OER

8.9 Searching Facility on the OER Repository/ Open e-SLM Web portals

Figure 9 Facility available for searching in the OERs

8.10 Defined OER Policy and Open Universities

Figure 10 Availability of OER policies in the Open Universities

9.Data Analysis

From the above observations, it has been found that:

- As Figure 1 revealed that out of 15 Open Universities, only 40% (6) have initiated their OER Repository for their students and they have dedicated URL for the OERs
- Figure 2 and Table 3 showed that majority of the Open Universities are not using specialized software like DSpace, ePrint etc. Specialised OER software has been used only by 20% of the Open Universities
- 94% Open Universities have been providing Open Access to their OERs or Open e-SLM (Figure 3)

- From Figure 4, it has been clear that the majority of the content is e-SLM in all the cases. Some of the OERs also contained Video lectures, Presentations etc.
- As Figure 5 is showing that .pdf file format is preferred for uploading resources along with AV (Audio-Visual files) file formats.
- Only in 47% cases the Self-Learning Materials are kept under the OER Web portal (Figure 6). Others have kept the link of the e-SLM in their University websites. Therefore, this can not be taken as a specialized and dedicated OER.
- As depicted in Figure 8, all the Open Universities are providing open access eSLM except one that is B.R.Ambedkar Open University (BRAOU) of Andhra Pradesh. In case of BRAOU, one need to have the login credentials.
- Only 6 Universities are providing searching facilities on the OER Repository/ Open e-SLM Weblinks (Figure 9)
- 40% of the total 15 Open Universities are providing resources in Vernacular Languages and 20% in both English and in Vernacular Languages (Figure 7).
- Only 6 Universities have defined OER Policies out of 15. Others either are in process or are yet to form a policy regarding the same (Figure 10).

All the available OER of Open Universities are using Open License system for providing educational resources freely.

It has also been observed during the study that E-Gyankosh of IGNOU is the most feature enriched and resourceful OER among the other OERs of Open Universities. IGNOU's OER includes course material, question papers, and e-books for students to access free of cost. The university also collaborates with other institutions to create OERs.

OER of Dr. B.R. Ambedkar Open University includes e-books, course material, and question banks. The university also has a YouTube channel where it uploads video lectures and other educational content.

Dr. Babasaheb Ambedkar Open University has a mobile app that allows students to access OER on their phones.

To summarise, the some of the Open Universities in India offer OER that includes e-books, course material, and video lectures. Some universities also have mobile apps that allow students to access OER on their phones. Almost all these universities have their YouTube channels where they upload video lectures and other educational content. However, the extent and quality of OER may vary by university.

10. Conclusion

Several studies have investigated the academic impact of Open Educational Resources (OER). According to a study published in PLOS One, it is necessary for researchers to consider textbook access rates prior to implementation of OER when measuring their impact on an entire sample of students (Grimaldi et al., 2019).

Initiation of OER Repository in the Open Universities in India are in a very budding stage though OER is an excellent tool for providing free access to the resources. Use of proper Repository software is an essential criterion for implementing OERs as this kind of software provide better facilities and workflow. Dedicated staff for maintaining the OERs is also an important factor. Any successful implementation requires a team with expertise. The Digital Divide, barrier of technology, infrastructure, access and non-familiarity with the system can be a threat to the use of OERs. OERs in local/ vernacular languages are also an important factor to popularize and to achieve maximum utilization of OERs. This would also be helpful to disseminate resources in local languages to all the strata of the society.

OER have the potential to improve access to education, reduce costs, and enhance learning outcomes. However, there are also challenges associated with OER adoption, including the need for faculty training and support, quality assurance mechanisms, and sustainable funding models. Proper policy implementation and technical expertise are required for a successful implementation of OER in all the cases.

ABSTRACT

I'm attempting to find out both the advantages and disadvantages of marijuana usage, as well as how it might lead to bad economic outcomes in a society. Cannabis offers a lot of advantages. Scientists are on the hunt for some that have yet to be discovered. Cannabis is a green mixture of dried sativa flowers, weeds, herbs, pots, grass buds, and a few other things. It's utilised for both recreational and therapeutic uses in granular form. Cannabis is the world's most misunderstood substance, yet it's perfectly safe because it's legal in some nations. Cannabis has been used by humans since the Paleolithic era, and it is profoundly interwoven in the traditions of the world's first civilizations. It is tied to religious beliefs and practises in India, dating back to the period when the Supreme was controlled by gods and goddesses. Since the illicit distribution and enforcement of marijuana seizures under the Narcotic Drugs and Psychotropic Substances Act, 1985, legalisation of marijuana has been a contentious issue in India. Even after it was employed in the medical business, no useful steps were done. After two American municipalities opted to legalise marijuana for recreational use, there has been a storm of liberal thinking in the United States. The goal of this research is to look at the use of marijuana in depth.

INTRODUCTION

“Every form of addiction is bad, no matter whether the narcotic be alcohol,
morphine or idealism.”¹⁸— Carl Gustav Jung

“Cannabis is listed as one of the "five kingdoms of plants that relieve us from concern" in the Atharvaveda, the Vedas' fourth book, and its uses are outlined in the Sushruta Samhita and the Bhava Prakasha. According to a passage in Panini's Ashtadhyayi, cannabis was known to Indians as early as 2,300 years ago. In the 10th century CE, it was nicknamed "lunch of the gods." Astringency, heat, inspiration, and the capacity to release wind and phlegm were among its features 500 years later. Dhurtasamagama, a Sanskrit comedy from the 16th century, depicts two vagabonds discussing in front of a corrupt judge. Before making a decision, the judge asks for money for his decree, which is swiftly delivered in the form of bhang. It was then connected with amrit, the elixir of life, according to the Rajvallabh, a 17th-century text.

After all, India's alcohol taxes brought in Rs 1.75 lakh crore in 2019-20. Tobacco goods bring in approximately Rs 53,000 crore to the Indian government each year. We have no restrictions on the sale of those items. Customers can't afford them because we make them expensive.

According to UNODC data, marijuana is the most widely manufactured narcotic in the world, and governments that legalise it for non-medical use risk catastrophic consequences. Marijuana is the most extensively produced drug in the world, according to UNODC data, and countries that legalise it for non-medical use risk market infection and diversification.

The Narcotics Drugs and Psychotropic Substances (NDPS) Act of 1985 now governs India's cannabis laws. Cannabis resin and flowers are unlawful to sell or eat, while seeds, stems, and leaves are permitted. In practise, bhang is lawful, but ganja and charas remain illegal. Do you think that's the case, though? After all, beer, wine, vodka, and whiskey all have different levels of alcohol. Beer has 5% alcohol, whereas wine includes 12 percent, vodka carries 45 percent, and whiskey contains 45 percent alcohol. Because of their potency, do we make one lawful and the other illegal?”

AIMS/OBJECTIVE:

- ❖ To examine the orthodox mentality regarding Weed.
- ❖ Analyse, and discuss the effects of Weed.

RESEARCH QUESTIONS:

- ❖ Why don't we legalise cannabis and tax it like alcohol and tobacco?
- ❖ Why cannabis should/should not be legalized?

- ❖ Pros and cons of usage of cannabis
- ❖ How it can affect once body?
- ❖ How does the legalization of weed affect the number of cannabis users?

HYPOTHESIS

- ❖ The usage of cannabis is very high.
- ❖ The laws regarding the usage & plantation of cannabis should be re-viewed.
- ❖ More you legalize the less the society will become corrupt.

STATEMENT OF PURPOSE:

- ❖ “First and foremost, the extremely significant concerns about marijuana legalisation must be thoroughly investigated and evaluated. The first is that legalising marijuana encourages both direct and indirect marijuana usage among current and future generations. Cannabis prohibition, on the other hand, has had little impact on the market. The right logical chain is the one that proceeds in the other way. The current craving for marijuana is fueled by its accessibility, and the most civilised atmosphere in which it may be obtained is most likely restricted. As a result, the structure's producers are the only ones who receive a true incentive. They will be compensated more if their losses mount. The right logical chain is the one that proceeds in the other way. The existing marijuana supply and control over the highly civilised environment are due to the current monkey-tight condition. As a result, the manufacturers who gain from the incentive system are those who are really moving. They will be charged greater premiums if their losses escalate. The likelihood of future criminals participating in this market will increase. As a result, the ban's actual effects may differ slightly from its stated goals.
- ❖ The second thing to keep in mind is that drug usage, particularly marijuana use, leads to strict drug use. According to research, those who take milder drugs have a larger proportion of illegal drug users than those who do not. However, this does not imply that using soft drugs leads to more strict drug approval. When exposed to both illicit soft and harsh drugs, some people choose to take hard drugs immediately away. People cannot be influenced in their lifestyle and consumption patterns, even if the concept of adopting stronger drugs later is permitted for a cause. Some politicians are unable to give up individual liberty because they do not share the interests of certain segments of society.
- ❖ Marijuana usage is hazardous not only to the user, but also to the community in which they live. In practise, it may result in a rise in crime and medical expenditures. This assumption, however, is frequently wrong for a variety of reasons. To begin with, someone cannot be punished only for committing a crime. Only the genuine nature of the

offence or provocation may be investigated. Otherwise, both city-zones will be sanctioned and will be allowed to commit future offences (theoretically). This logic's ramifications are manifestly incompatible with ostensibly democratic norms. Those who require more therapy should pay for it themselves, with no additional funding allocated to them.

- ❖ The fourth concern is that marijuana, since it is addictive, has a negative impact on people's capacity to think sensibly. This assertion is somewhat true since cannabis users' mental ability may be harmed. The consumer's selection is justified, however, when he or she uses marijuana for the first time, that is, when he or she picks the best option based on personal preferences. Other individuals have the right to express their thoughts and opinions if they so want. They cannot, however, order the user to quit using marijuana if he or she so desires.
- ❖ Last but not least, the government will not take any action that has a detrimental impact on the well-being of its population. The administration appears to be obsessed with ensuring that inhabitants are safe from both local and international threats. Despite the fact that marijuana usage might lead to addiction, the government should not make it illegal due to its negative consequences. People should be allowed to make their own decisions about their own health and well-being, with the government assisting but not interfering.”

REVIEW OF LITERATURE:

“According to an essay by 'Mrinalini Krishna' titled "The Economic Benefits of Legalizing Weed," despite several public campaigns in the United States to legalise marijuana for drug and recreational use, several states have previously taken similar moves. Marijuana's commercial supply is tightly controlled, providing a financial incentive for its legalisation. Increasing tax income, creating jobs, and increasing investment opportunities are all compelling reasons to pursue legal incentives.

According to Tathagata Satpathy's 2017 article in *The Hindu*, 5% of India's population uses cannabis for recreational purposes, while 95% uses it for therapeutic ones. It discusses the benefits of marijuana usage. Nipton, a tiny town in California, was recently bought by American Green with the purpose of turn it into a "smart marijuana" community where individuals may obtain drugs. Clothes and marijuana that has been smoked are prohibited. Odisha has legalised marijuana, and every Monday evening, a Puja Trinath Mela is hosted (where they sit under a big tree and pray for the three supreme beings and smoke marijuana). The law is founded on a way of life that must not be damaged.

According to Charles "cully" Stimson's paper "Why We Shouldn't Legalize Marijuana," cannabis is an addictive gateway drug (2012). Proponents of marijuana legalisation have ignored or downplayed the well-documented negative aspects of cannabis trafficking and consumption. Supporters of marijuana have had some success arguing that it is a "soft" drug similar to alcohol, and that it is fundamentally different from "hard" narcotics like cocaine or heroin. Finally, it states that marijuana is illegal under federal law, regardless of state law, and that inhabitants of the state do not have the right to authorise abortions. If a state could legalise marijuana, it would serve a function other than alleviating the drug issue.

The study looked at individuals between the ages of 13 and 20 who were determined to be connected to marijuana based on clinical indicators or a positive urine test on ED/UC visits from 2005 to 2015, according to Elizabeth Mechcatie's article "The Impact of Legalization of Medical and Recreational Marijuana." (2018). The number of marijuana-related ED/UC visits climbed from 161 in 2005 to 777 in 2015, with the number of such visits, which included mental health screens, increasing from 84 to 500 during the same time period. Sixty-two percent of the 4,202 instances involved cannabis use, abuse, or neglect. Seizures and bipolar disorder are diagnosed in 71 percent of instances, with depression (39 percent) and mood disorders (39 percent of total visits) following closely behind (22 percent).

"Should Marijuana Be Legal?" is a question that many people ask. Michael Gonchar is the author of this piece. Eighteen states, according to the *New York Times*, have legalised

marijuana for therapeutic use. Should it be permitted in all 50 states to use for therapeutic purposes? Should customers over the age of 21 be allowed to use it recreationally, as Washington and Colorado have done? Is the existing federal marijuana prohibition, in general, a good idea? Why? Randall c. Archibold addresses the Organization of American States' reference to nations legalising marijuana as "juice-how-to-drug-war" in "For a Debate on the Legitimacy of Cannabis in the American Alliance." "It adds to the discourse," said Ethan Nadelmann, executive director of the Drug Policy Alliance, a pro-loitering group.

According to many publications and UNODC data on marijuana, India's entire cannabis consumption is just 3,91,275 kg and 4298 tonnes. Afghanistan, Morocco, and the United States are the top three marijuana producers. In clinical trials, it has been found to increase lung capacity, combat cancer, aid in the treatment of glaucoma, lessen the adverse effects of hepato-arthritis, and improve therapeutic efficacy, among other things.”

ANALYSIS

The benefits of Marijuana are:

- * Helps to lose weight
- * Regulates and prevent diabetes
- * Fight's cancer
- * Can help children suffering from autism?
- * Mend bones
- * Treatment of Glaucoma
- * Helps with tremors associate with Parkinson's disease
- * Bring in tax revenue

“Millennials (born 1919–1997), Jean Gers (born 1965–1980), and Baby Boomers (born 1965–1980) all favoured marijuana legalisation, according to one server. It needs to be reaffirmed decades ago. Marijuana legalisation was opposed by the silent generation (born between 1928 and 1945). Consider how legal marijuana would be if there was a high demand for it after it was declared illegal. Can you image

how legal marijuana would be if there was a big demand in the market after it was deemed illegal? With 100,000 tonnes of marijuana produced annually throughout the world, can you imagine how legal it would be if there was a high demand in the market after it was made illegal? Legalizing marijuana is the most effective way to stabilise the economy of impoverished countries like Niger, Liberia, and Ethiopia.”

“In one study, a woman with glaucoma was given both a typical glaucoma pre-ejaculation medicine and marijuana. The eyes of the lady are subjected to significantly less dangerous stress. This does not, however, imply that a person should avoid heights at all costs to avoid eye problems. A person's tolerance to toxins builds up to the point that the patient feels relieved, even though he or she is not overweight, according to Paul Paulberg. Marijuana has also been demonstrated to aid in the prevention and treatment of neurological conditions. Marijuana should be made legal in general, and the current policy should be changed immediately. It's better not to give up on this plan. Many individuals are in favour of the change in policy, and the government should follow suit. Another reason for policy change now is the amount of money marijuana

brings in to the government's coffers and the legal system. It is hazardous even if purchased. Cannabis smoke has 50 to 70 percent more carcinogens than cigarette smoke. According to a huge study, smoking a single marijuana joint causes more lung damage than smoking five regular cigarettes one after the other. Bronchitis, a lung infection, is usually brought on by continuous joint smoking. Cannabis is one of the few drugs that has been shown to cause abnormal cell division, which can lead to serious genetic diseases. A pregnant woman who regularly smokes marijuana or hashish will have a premature kid with a low birth weight. In the last 10 years, many children of cannabis users have been born with poor aspirations and low abilities to focus and follow life goals. According to the study, prenatal (prenatal) medicines may increase the risk of birth abnormalities, mental impairments, and leukaemia (bone marrow cancer) in children. True, everything has both positive and negative aspects. This is also true with marijuana, which has both good and harmful social implications.”

While researching I came across some facts that why Marijuana should be legalized. Those facts are listed below:

1. It will eliminate illegal trade & associate crimes:

Legalization (or decriminalisation) of cannabis would add an over-the-counter market to the illegal market's production and sale. There will be regulations and limits in place, but the state, fishermen, businessmen, and retailers, rather than criminals or drug traffickers, will dominate commerce.

2. Marijuana addiction is rare:

According to the findings of the observational study, only 9% of those who use marijuana become chronically reliant on it. The 'similar concentrations' of cigarettes, alcohol, and cocaine were 32 percent, 20 percent, and 15 percent, respectively.

3. Taxing Marijuana will increase governments revenue:

By legalising and selling marijuana, the government would be able to make enormous profits that would otherwise go to Italian and Israeli criminal gangs. Around 500 economists signed an official declaration to US President George W. Bush urging for marijuana to be "legal but controlled and managed as other commodities," headed by Nobel winner Milton Friedman.

4. It will create job opportunities:

The legalisation of cannabis for recreational and medicinal uses in Colorado has resulted in the creation of 10,000 new jobs. The cannabis industry can provide a variety of solutions for lowering India's unemployment rate.

5. Marijuana use has medical benefits:

According to research, weed offers a wide range of medicinal benefits. Glaucoma can be addressed, cancer can't spread to other areas of the body, anxiety can be lessened, Alzheimer's disease can be sped up, digestion can be improved, and brain originality can be encouraged.

6. It will help the locals:

In locations like Himachal Pradesh and Tamil Nadu, where marijuana plants are grown, marijuana appears to be the only source of revenue for many communities. Individuals are encouraged to sell it to drug traffickers at a low price since it is a controlled substance, and they suffer further harassment from officials who are paid to destroy cannabis grows. The 'war on drugs,' which is being conducted against our own people, would come to an end if marijuana is legalised.

7. Marijuana has limited withdrawal symptoms & its use can't be fatal:

"I heard you have to smoke roughly 15,000 joints in 20 minutes to get a lethal dose of delta-9 tetrahydrocannabinol," says Dr. Paul Hornby, a biochemist and human pathologist. "I'm going to delegate it to someone." Not only is it practically difficult to overdose on marijuana, but it also causes little withdrawal symptoms in users.

8. Alcohol is more harmful than Marijuana:

Marijuana smoking, unlike the use of alcohol, has never been regarded a morally repulsive conduct. Keeping it lawful was considered as a "enlightened perspective" in reality. Marijuana has now been proven to be less dangerous than alcohol in medical studies. Unlike drinkers, stoners should avoid dangerous driving and violent fighting. They seem pale and kind while under the influence of cannabis."

CONCLUSION

"As a result, there is a compelling need to control the use of marijuana. Beginning in elementary school, governments should launch campaigns to create awareness among teenagers and youth by teaching them about the hazards of consuming drugs through literature and digital media. Countries should strictly limit the use of marijuana for medicinal purposes, with the goal of making medical marijuana only available to those who have gotten a doctor's prescription. The authorities should keep an eye on the amount of THC in marijuana since it is THC that causes cannabis addiction."

"Since the objective of commercialization is to produce money, marijuana should not be sold if it is legalised. Businesses are also aware that focusing on the youth assures that they will have long-term customers. Ice cream, candy, and even soft beverages containing cannabis are becoming more commonly available. Allowing unlimited access to Marijuana production,

distribution, and use poses a serious threat to the country and its citizens, which must be tackled methodically. Marijuana, drugs, cigarettes, and other chemical addictions have a terrible influence on daily life, but they may be overcome with the right counselling and commitment.”

“After 25 years of fighting Western pressure, India finally caved in to Western demands in 1986, clubbing but criminalising marijuana and other hazardous substances. On the other side, making it illegal has raised additional issues. Marijuana should certainly be kept out of the reach of youngsters, but it presents no risk to adults when used safely.”

“Why should our government go to the difficulty of apprehending marijuana traffickers and torching marijuana plantations instead of legalising a culturally acceptable commodity that may aid the country's socioeconomic development?

Due to the corrupt and unregulated system which contributes majorly to controlling the abuse,

1. Supports the unselfish use of marijuana and assists developing nations in attaining this aim, owing to the crooked and uncontrolled system that plays a big role in limiting its misuse;

2. Authorizing nations must employ the following techniques to guarantee that marijuana does not wind up in the hands of criminals or on the illegal market across the world:

Only government-approved (government regulating committee) companies should be able to cultivate or manufacture marijuana if it is legalised.

When maintaining marijuana for therapeutic purposes, special invoices must be issued.

Recommends that marijuana be made more freely available, that campaigns to encourage its use in medicinal settings be held, and that a worldwide drug-abuse law be enacted, taking into account the appropriate age range for each country. Strongly opposes the legalisation of marijuana for recreational use in any form.”

For concluding my research, I would like to quote the golden lines given by late Bob Marley:

“I do smoke, but I don't go through all this trouble just because I want to make my drug of choice legal. It's about personal freedom. We should have the right in this country to do what we want, if we don't hurt anybody.”¹⁹

ABSTRACT

Fibrosarcoma is a mesenchymal tumor of malignant fibroblasts in a collagen background. It was reported in all species, but most commonly in older dogs and cats. This tumor often occurs on the head and limbs, but may also occur anywhere on the body. A 6-year-old male Persian cat (3/5 kg) with a raised mass on the right anterior limb was referred to the veterinary hospital. Based on owner information, within the previous 2-month period, the mass had become evident and grew larger. Finally, complete surgical removal was selected. On gross examination, the mass was approximately 8×10×12 mm in size. Macroscopically, the mass was well circumscribed, ulcerated, firm and white to yellow. Tissue samples of the mass were fixed in 10% neutral buffered formalin and routinely processed, dehydrated, embedded in paraffin wax, sectioned at 5µm in thickness and stained with Hematoxylin and Eosin and Masson's trichrome. Immunohistochemical studies of the mass sections were performed using Vimentin, SMA and Desmin. Microscopically, the mass was encapsulated and the dermis and subcutaneous area were expanded by spindle-shaped to polygonal neoplastic cells in the interwoven pattern and contained a single ovoid to polygonal nucleus and a moderate amount of eosinophilic cytoplasm. Nucleoli were often prominent. Mitotic figures were infrequent. The sections were positive for Masson's trichrome and Vimentin and negative for Desmin and SMA. Based on histopathological features, a well differentiated fibrosarcoma was diagnosed. No new growth of the mass was observed six months following the surgical procedures. The incidence of fibrosarcoma in cats has been rising in the last 20 years, most likely associated with vaccination. Similar to this case, surgical excision is the treatment of choice in this tumor.

Keyword: Cat, Cutaneous, Fibrosarcoma, Pathology

INTRODUCTION

Fibrosarcoma is a mesenchymal tumor of malignant fibroblasts in a collagen background with immature proliferating fibroblasts or undifferentiated anaplastic spindle-shaped cells arranged in distinct interwoven patterns (Hendrick, 2017). These tumors occur commonly in all domestic animal species (Hendrick, 2017; Modiano & Breen, 2007) and have been reported in cats (Strong et al., 2016), dogs (de Paula et al., 2021) and horses (Bass et al., 2017). This paper is about the macroscopic, surgical, and histopathological findings of a well differentiated cutaneous fibrosarcoma in a Persian cat.

CASE DESCRIPTION

In December 2022, a 6-year-old male Persian cat (3.5 Kg) with a raised mass on the lateral side of its right hind limb was referred to the hospital. Based on owner information, within the previous 2-month period the mass had become evident and grew larger. On physical examination vital signs such as pulse rate and respiratory rate were normal. Further clinical examination revealed no other physical abnormalities and complete surgical removal of the mass was chosen. The cat was anaesthetized with intravenous injections of ketamine and diazepam and maintained with 1%-2% isoflurane in oxygen. Analgesia was provided by subcutaneous injection of ketoprofen (for 3 days). On gross examination, the mass was approximately 8×10×12 mm in size. It was well circumscribed, ulcerated, firm and white to yellow. Tissue samples of the mass were fixed in 10% neutral buffered formalin, routinely processed, dehydrated, embedded in paraffin wax blocks, sectioned at 5µm thicknesses (Rotary Microtome RM2 145; Leica, Wetzlar, Germany) and stained with Hematoxylin & Eosin and Masson's Trichrome (Luna, 1968). Immunohistochemical studies of the mass were performed using Vimentin (V9, mouse monoclonal, dilution: 1/50, Dako, Denmark) (Luna, 1968), SMA (1A4, mouse monoclonal, dilution: 1/50, Dako, Denmark), and Desmin (D33, mouse monoclonal, dilution: 1/50, Dako, Denmark) (Vascellari et al., 2006). Sections were examined using a light microscope (E600; Nikon, Tokyo, Japan) and representative images were taken. Hemorrhage, necrosis and peripheral aggregates of lymphocytes were observed in the histopathological sections. Microscopically, the mass was encapsulated and the dermis were expanded by spindle-shaped to polygonal neoplastic cells. These cells were arranged in an interwoven pattern and contained a single ovoid to polygonal nucleus. Nucleoli were often prominent. Mitotic figures were infrequent. Some neoplastic cells had cellular and nuclear pleomorphism (Fig 1). Masson's trichrome demonstrated the positive and blue staining of collagen. Immunohistochemically, the sections were uniformly positive for Vimentin and negative for Desmin and SMA. Based on

histopathological, histochemical and immunohistochemical features, a well differentiated fibrosarcoma was diagnosed.

Figure 1: Well differentiated fibrosarcoma in a Persian cat. (a): spindle-shaped to polygonal neoplastic cells in an interwoven pattern. (b): Severe Hemorrhage (*). (c): Mitotic figures (arrowheads). (d): bizarre cell (arrowhead), H&E.

DISCUSSION

fibrosarcomas occur in all domestic animal species, but most commonly occur in adult and aged cats and dogs and can appear anywhere on the body (Hendrick, 2017). These tumors can range from well differentiated to more aggressive, but metastasis is uncommon (Hendrick, 2017). A well differentiated fibrosarcoma is composed of spindle cells, collagen and rare mitotic figures in the herringbone pattern (Hendrick, 2017; Van den Top et al, 2008). FeSV can also induce a rare and aggressive fibrosarcoma in cats. FeSV-induced tumors are multicentric and are found most frequently in young cats (Hartmann, 2011). These tumors are characterised by rapid growth. Metastasis to the lungs or other organs occurs with approximately 30% of virally induced fibrosarcomas in cats. However, only 2% of fibrosarcomas in cats are virally induced (Vail et al. (2020). Fibrosarcoma is the most common tumor of the cat. Its incidence has increased over the past 20 years, most probably due to its association with vaccination. There is significant overlap between fibrosarcomas and leiomyosarcomas in histopathological findings, thus making the use of special stains and immunohistochemical identification, essential for the final diagnosis.

Microscopically, leiomyosarcomas, unlike fibrosarcomas, have elongated nuclei, with blunt rounded ends and eosinophilic cytoplasm. Spindle cells with red cytoplasmic stain were not found among the blue collagen bundles on Masson's trichrome staining. The mass also stained negative for Desmin and SMA and positive for Vimentin. These results prove that this tumor could not have originated from muscle cells and it is a well differentiated fibrosarcoma. (Hendrick, 2017; Roccabianca et al, 2020). Similar this case, surgical excision is the treatment of choice for well differentiated fibrosarcoma (Hendrick, 2017).

CONCLUSION

Surgical excision remains the treatment of choice for fibrosarcomas in cats with radiation therapy as secondary treatment, particularly if surgical removal is difficult.

ÖZET

Ülkelerin ekonomik gelişimlerini sürdürebilmeleri için düzenli olarak üretim kapasitelerini artırmaları gerekmektedir. Bu gaye ile yöneticiler teknoloji, sermaye ve emek unsurlarını son derecede verimli kullanılmaya çalışmaktadırlar. Bu prensip ile kooperatifçilik terimi birçok sektörde iş birliğini esas almakta ve günümüzde farklı ekonomi politikaları içerisinde yer almaktadır. Teknolojik, ekonomik, sosyal ve politik unsurların durumuna bağlı olmakla birlikte birçok ülkede ve çeşitli sektörlerde kooperatifleşmeler görülmektedir. Tarım sektöründe yer alan kooperatifler, çiftçi ürünlerinin üretim aşamasından pazarlamaya kadar olan süreçte çok önemli roller üstlenmektedir. Kooperatifler genellikle bilgi açığını ve piyasa belirsizliklerini azaltarak çiftçilere çeşitli ekonomik avantajlar sağlamaktadır. Küçük tarım üreticilerinin kooperatifleşirmeyi benimseme ölçeği ne olursa olsun, kooperatif planlamalarının sosyal, pratik, kişisel ve psikolojik avantajları bulunmaktadır. Bu derlemede tarımda kooperatifleşmenin önemi ve avantajları hakkında bilgilere yer verilmiştir.

Anahtar Kelimeler: Tarım kooperatifleri, İş Birliği, Ekonomi

**THE IMPORTANCE OF COOPERATIVIZATION IN THE AGRICULTURAL
SECTOR**

ABSTRACT

To continue their economic development, countries must regularly increase their production capacity. For this purpose, managers use technology, capital, and labor elements exceptionally efficiently. With this principle, the term cooperative is based on cooperation in many sectors and is included in different economic policies today. Depending on technological, economic, social, and political factors, cooperatives are seen in many countries and sectors. Cooperatives in the agricultural sector play very important roles in the process from the production stage of farmer products to marketing. Cooperatives generally provide various economic advantages to farmers by reducing the information gap and market uncertainties. Regardless of the scale at which small agricultural producers adopt cooperatives, cooperative planning has social, practical, personal, and psychological advantages. This review gives information about the importance and advantages of cooperatives in agriculture.

Keywords: Agricultural cooperatives, Cooperation, Economy

1. GİRİŞ

Toplum ve dünya arasındaki ilişki, modern çağda azalan kaynaklar, artan nüfus ve buna ek olarak çevrede uygulanan baskı, toplumun değişen beklentileri, yeni teknolojiler ve ayrıca büyüyen iklim değişikliğinin etkileri ile tarımın geleceğinin ve üreticiden tüketiciye gıda zinciri organizasyonlarının büyük ölçüde değişmesi beklenmektedir (Kalogiannidis, 2020). Ekonomik olarak sürdürülebilir tarımın sağlanabilmesi tarımsal yönetim ve üretim paradigmalarının değiştirilmesine bağlıdır (Yılmaz ve ark., 2021). Diğer taraftan gıda dışı tarım konuları da giderek fazla önem kazanmaktadır. Bu nedenle çiftçiler, daha akıllı ve daha sürdürülebilir üretim sistemleri geliştirip yönetebilmek için modern bilgi becerilerine ve yenilikçi fikirlere ihtiyaç duymaktadır (Kalogiannidis, 2020). Gelecekte artan tüketici duyarlılıkları ve daha sürdürülebilir olan tarımsal ürünlerin arzının artması beklenmektedir. Bu bağlamda, çiftçilerin sürdürülebilirlik için ekonomik, çevresel ve sosyal tüm boyutları uzlaştırarak sürdürülebilir üretim yapmaları gerekmektedir (Candemir ve ark., 2021).

Tarım sektöründe iş birliği ve ayrıca kooperatiflerin ve kooperatif şirketlerinin kurulması, küçük çiftçilerin artan rekabet koşullarında hayatta kalma çabalarını etkilemektedir. Çiftçiler, ekonominin diğer sektörlerindeki meslektaşlarına kıyasla genellikle "küçük" girişimciler olarak kabul edilir. Bu nedenle, hayatta kalma ihtiyacı, çiftçilerin çoğunu pazarlık gücü elde etmek için birleşmeye yönlendirmektedir (Kalogiannidis, 2020). Çiftliklerin sürdürülebilirliğine ve sürdürülebilirliğe dair faktörlere ilişkin değerlendirmelere birçok deneysel literatürde yer verilmiştir. Bu faktörler, çiftçilerin sosyodemografik özellikleri (ör. yaş, eğitim), çiftlik özellikleri (ör. organizasyon yapısı, büyüklük, borçluluk, ana üretim), tedarik zinciri türü, piyasa fiyatları ve devlet müdahaleleri gibi dış unsurlar ile ilgilidir. Bununla birlikte, tedarik zinciri organizasyonlarının rolü, özellikle çevresel ve sosyal sürdürülebilirlik açısından şimdiye kadar yeterince araştırılmamıştır (Candemir ve ark., 2021).

2. KOOPERATİFLEŞME

Kooperatif; kendi kendine yardım etme, beraberlik, birlik, ortakların menfaatini koruma, ortak hareket etme, dayanışma, bir araya gelme gibi anlamlar taşımaktadır. Ortakların ekonomik menfaatleri ve özellikle geçim ve meslekleri veya ihtiyaçlarını parasal ve işgücü katkılarıyla dayanışma, yardım ve kefalet suretiyle sağlayıp korumak amacıyla tüzel ve gerçek kişiler ile kurulan değişir sermayeli ve değişir ortaklı birlikteliklere kooperatif denmektedir (Aydın, 2021). Kooperatifçilik hareketi, 1800'lü yıllarda Avrupa ülkeleri tarafında ortaya atılmış ve sonrasında tüm Dünya'da yaygınlaşmıştır. Kooperatifçilik ortak hedeflere erişmek isteyen kişiler ile

oluşturulan ekonomik iş birliği çerçevesinde yürütülen örgütlenme modelidir. Mal ve hizmet sunumu ve üretiminde, piyasa yapısı ve işleyişini düzenlemede, ortakların pazarlık gücünü arttırmada kooperatifler; önemli roller üstlenen dayanışma ve yardımlaşmayı arttırmak ve yoksulluğu azaltmak amacıyla özellikle küçük üreticilerin birleşerek oluşturduğu örgütlenmelerdir. Kooperatiflerde asıl amaç, ekonomik sıkıntıları yaşamak istemeyen kişilerin geçim ve mesleklerine yönelik ihtiyaçlarını karşılıklı kefalet ile rasyonel olarak temin etmektir (Çelik ve ark., 2021). Kooperatifleşme ile üretim yapan üreticiler emeklerinin karşılığını tam anlamıyla alabilecekleri konusunda fikir birliğine varırlar. Buna rağmen üreticilerin kooperatiflere karşı ön yargıları da bulunmaktadır. Bazı üreticiler emeklerinin kooperatifçilik ile zayi olacağını düşünmekte ve karamsarlığa kapılmaktadırlar. Türkiye’de son zamanlarda yürütülen başarılı kooperatif uygulamaları bu yanılığın önüne geçilmesine neden olmuştur (Özyücel, 2021).

3. TARIMDA KOOPERATİFLEŞME

Tarım teknolojilerinin penetrasyonu, farklı bölgeler ve tarım sistemleri arasında önemli ölçüde farklılık göstermektedir. Birçok Afrika ve Asya ülkesindeki küçük çiftçiler, tarımsal üretim ve geçim kaynaklarının iyileştirilmesinden yararlanmalarını kısıtlayan, tarım teknolojilerini nispeten düşük benimseme oranlarına sahiptir. Tipik olarak, teknolojinin benimsenme oranlarının düşük olduğu bölgelerde tarımın gelişimi, teknik ve ekonomik potansiyellerden yararlanmada geride kalmaktadır. Bu da gıda güvenliğini tehdit etmekte ve tarım genellikle yerel ekonomilerin temel direği olduğu için yoksulluğun azaltılmasını engelleyememektedir (Zhang ve ark., 2020). Küresel yoksulların yaklaşık %80'i kırsal alanlarda yaşamaktadır. Bu durum yoksulluğun azaltılmasını, uluslararası düzeyde kırsal hanelerin savunmasızlığını azaltmak için önemli bir kalkınma hedefi haline getirmektedir (Gava ve ark., 2021).

Tarım sektöründe bilgi paylaşımı, öğrenme ve yenilikçiliğe yönelik yaklaşımlar hızla gelişmektedir. Eğitim, öğretim, araştırma, danışmanlık ve tarım sektörlerindeki tüm katılımcılar, bu değişen çerçeveye uyum sağlamada kaçınılmaz olarak belirli zorluklarla karşılaşmaktadır. Geçmişte, araştırmacılar tarafından çözümlerin geliştirilmesi ve ardından çiftçiye iletilmesi muhtemelen tatmin edici görünmekteydi. 21. yüzyılda ise tarım ve gıda üretiminin rekabet edebilirliğini ve kırsal alanların canlılığını sürdürmek için bilgi ve deneyim alışverişinin daha iyi uygulamaları, inovasyon modellerini, şirketleri, danışmanları, bilim adamlarını ve çiftçiler tarafından yürütülen çeşitli çalışmaları tanımamıza yardımcı olmaktadır (Kalogiannidis, 2020). Tarımda yaşanan sıkıntıların ortak çözümleri için etkili bir örgüt yapılanmasının oluşturulması gerekmektedir. Tarım örgütleri incelendiğinde, örgütlerin ortakları, sahipleri ya da üyeleri

üreticilerdir. Bu örgütlerin gelişmesinde ve etkin olmasında ise asıl önemli olan unsur üreticilerin kooperatifçilik bilinçleridir (Değer ve ark., 2020). Kooperatif kuruluşları tarımsal üretimi ve pazarlamayı geliştirmeyi amaçlasa da bazı ülkelerde, tüm üyeler ürünlerini tarımsal kooperatifler aracılığıyla satmamaktadır. Kooperatiflerin risk tutumu; çiftlik büyüklüğü, makine sahipliği, satış yeteneği ve demonstrasyon seviyesinin üyelerin tarımsal kooperatifleri bir pazarlama kanalı olarak kullanma kararlarını belirleyen ana faktörler olduğunu göstermektedir (Liu ve ark., 2019). Ekonomik bir bakış açısından, tarımda kolektivizasyonun temel amacı, büyüklük ekonomilerini ele geçirerek kaynakların daha verimli bir şekilde tahsis edilmesini sağlamak ve böylece tarımın, aynı doğrultudaki kaynak transferini en üst düzeye çıkararak ekonominin sanayileşmesine katkıda bulunmasını sağlamaktır (Schmitt, 2021).

Kooperatifleşme, tarım ürünlerinin ihraç edilmesi, tarım sektöründe tekelciliğin önüne geçilmesi ve dış piyasa ile rekabet edilebilmesi bakımından oldukça etkilidir. Tahminlere göre küresel tarım mahsullerinin %50'si kooperatifler ile pazarlanmaktadır (Çelik ve ark., 2021). Çiftçi kooperatifleri, tarımsal üretimde teknolojinin benimsenmesini teşvik etmekte ve bu da mahsul verimliliğini ve çiftçilerin gelirini artırmaktadır. Bununla birlikte, bir çiftçi tarafından çok çeşitli tarım teknolojilerinden benimsenen teknolojilerin sayısı olarak tanımlanan, kooperatiflerin teknoloji benimseme yaygınlığını nasıl ve ne ölçüde kolaylaştırdığına dair ampirik kanıtlar belirsizliğini korumaktadır (Zhang ve ark., 2020). Küçük çiftçiler, bilgi asimetrisi nedeniyle girdi piyasaları hakkında daha az bilgiye sahiptir. Genellikle girdi satıcılarıyla girdi fiyatları konusunda pazarlık yapmak konusunda zayıf bir konumdadırlar. Bu, küçük çiftçilerin pazara katılım kararlarını ve tarımsal üretimi olumsuz etkileyebilecek arama ve müzakere maliyetlerine ilişkin daha yüksek işlem maliyetlerine yol açmaktadır. Bu maliyetlerin bir kısmı, tarım kooperatifleri olarak da bilinen ve birçok gelişmekte olan ülkede geniş çapta teşvik edilen ve hızlı büyüme yaşayan çiftçi kooperatifleri tarafından tasarruf edilebilir (Zhang ve ark., 2020). Kırsal yoksulluktan çıkış yolu, küçük ölçekli çiftçilik sistemlerinin üretkenliğini, kârlılığını ve sürdürülebilirliğini iyileştirmektir. Savunmasız küçük çiftçileri hedef alan etkili araçların uygulanmasına bilgi sağlamak için belirli coğrafi ve sosyal bağlamlardan elde edilen bilimsel kanıtlara ihtiyaç duyulmaktadır (Gava ve ark., 2021).

Kısaca, tarımsal kooperatifler başta sürdürülebilir olması ve çiftçi gelirinin yükselmesi bakımından gerekliken diğer taraftan istihdam sağlaması, kırsal sanayinin kurulması, tarımın gelişmesi ve yerel düzeyde kırsal girişimciliğin artırılmasını sağlaması nedeniyle kırsal yörelerin sosyo-ekonomik olarak gelişmesi ve kalkınması ile bölgelerarası yoksulluk ve dengesizliğin giderilmesi bakımından önemlidir (Çelik ve ark., 2021).

4. SONUÇ

Tarım kooperatiflerinin kurulmasının kırsal yoksulluğun azaltılmasında etkili olduğu görülmektedir. Bugüne kadar, kapsamlı arařtırmalar, tarımsal kooperatiflerin çiftçilerin yoksulluğunu azaltabileceđi farklı mekanizmaları saptamıřtır. Kooperatifler, girdiler ve paylařılan makineler tedarik ederek çiftliklerdeki süreçlerin etkinliđini ve üretkenliđini artırabilmekte, daha geniş pazarlara erişimlerini kolaylařtırabilmekte ve çiftçilerin pazarlık gücünü artırabilmektedir. Ayrıca kooperatifleřmeler sayesinde çiftçiler ile tedarik zinciri aktörleri arasında bađlantılar kurulabilmekte ve yerel bilgi inřası ile sosyal sermayenin oluřturulması desteklenebilmektedir.

ABSTRACT

The aim of the current study is to examine the relationship between deviant behaviour and trust in employee productivity. This new research put up an approach for fostering a culture of trust among employees by identifying and eliminating undesirable behaviours. The self-designed questionnaire was given out to a total of 150 employees in order to collect the information that was required. We got 70 representative samples of people's genuine responses to the questionnaire. We worked with data using the spreadsheet programme Excel. The outcomes of the study indicate that trust has a positive and significant impact on employee productivity. Also, deviant behaviour has a negative impact on employee productivity. An organization's productivity suffers, often to a significant degree, when employees engage in deviant behaviour. An increase in trust in the organisation will result in a significant decrease in deviant behaviour which has an influence on employee productivity within the organisation. The findings of the study contribute to the existing literature of the body of knowledge on organisational behaviour.

Keywords: Deviant Behaviour, Trust, Productivity

1.INTRODUCTION

The study of deviant behaviours and trust is important for understanding why individuals engage in actions that violate social norms and rules, which can lead to improved social policies and interventions. It also sheds light on the reasons behind criminal activity and helps inform efforts to prevent it. Deviant workplace behaviour (DWB) is voluntary behaviour that violates significant organizational norms and is perceived as threatening to the organisation's or its members' well-being ([Bennett and Robinson, 2000](#)). Trust can greatly impact the effectiveness and efficiency of individuals and organizations, as it can lead to decreased motivation and lower levels of cooperation. By studying trust, researchers and organizations can gain insight into how to build and maintain trust, ultimately leading to better outcomes.

Deviant behaviour and trust are two important factors that significantly impact productivity in an organization. Deviant behaviour can have a negative effect on the workplace by creating distractions, decreasing morals, and increasing conflicts, while trust can have a positive impact on productivity by promoting open communication, reducing conflicts, and increasing job satisfaction and motivation. Trust can also facilitate the delegation of tasks and responsibilities, leading to a more efficient and effective workplace ([Fry 2003](#); [Milliman et al., 2003](#)). Understanding the importance of these factors can help organizations create a positive and productive workplace culture.

Deviant behavior has been extensively studied in the fields of sociology, psychology, criminology, and related disciplines. Researchers have used various methodologies to examine the causes and consequences of deviant behavior, such as social and economic conditions, peer pressure, and individual characteristics ([Cortina et al., 2017](#)). Trust and its influence on productivity has been studied in the fields of psychology, management, and organizational behavior. Researchers have investigated the impact of trust on various outcomes, such as job satisfaction, motivation, and collaboration. Additionally, there has been research into the effects of cultural and organizational factors on trust and productivity.

The goal of this research is to gain a better understanding of how deviant behavior and trust interact to affect productivity, and to inform efforts to promote positive and productive behaviors. Studies have found that deviant behaviour, such as theft, harassment, and absenteeism, can lead to decreased productivity in an organization ([Andersson and Pearson, 1999](#); [Collins and Rogers, 2017](#); [Cortina et al., 2017](#)). Trust in the workplace can lead to improved communication, reduced conflicts, increased job satisfaction and motivation, and improved decision-making processes. Deviant behaviour can lead to decreased trust among employees and between departments, which can have a negative impact on productivity. Organizational stress is positively related to

workplace deviant behaviour, organizational deviance, and interpersonal deviance. These findings highlight the importance of addressing deviant behaviour and creating a culture of trust in organizations to improve productivity and create a positive workplace environment.

The need for additional research on deviant behavior and the influence of trust on productivity is due to the dynamic and complex nature of these phenomena. Research is needed to understand how different factors, such as social and economic conditions, individual characteristics, and cultural differences, interact to influence deviant behavior. workplace bullying is typically described as repeated and enduring negative acts that are unwanted by the victim and which cause humiliation, offence, and distress and that may interfere with job performance or cause an unpleasant work environment ([Einar Sen and Raknes, 1997](#); [Rayner and Keashly, 2005](#)). Additionally, more research is needed to understand how trust and productivity are affected by cultural and organizational differences and technological changes. The need for additional research on deviant behaviour and trust and their influence on productivity is driven by the importance of these phenomena for individuals, organizations, and society. There are controversies in the existing literature on the relationship between deviant behaviour, trust, and productivity, such as the definition of deviant behaviour, the impact of deviant behaviour on productivity, the relationship between deviant behaviour and trust, the impact of trust on productivity, and the relationship between deviant behaviour, trust, and productivity. More research is needed to fully understand the impact of these factors on one another.

The purpose and contribution of deviant behaviour and trust and their influence on productivity in the existing literature is to gain a deeper understanding of these phenomena and their impact on individuals, organizations, and society. Employees in the hospitality industry are often exposed to a fast-paced work environment defined by long hours and immense pressure, which creates a physiological load and hinders their emotional regulation over time ([Goh and Lee, 2018](#)). The study of deviant behavior aims to explain why individuals engage in actions that violate social norms and rules. It also helps to shed light on the reasons behind criminal activity, which has implications for crime. The study of trust and its influence on productivity aims to understand the factors that contribute to building and maintaining trust in individuals and organizations. It helps to inform efforts to create positive work environments and foster collaboration, leading to increased productivity.

Additionally, it helps to shed light on how cultural and organizational differences can impact trust and productivity. The purpose and contribution of deviant behaviour and trust and their influence on productivity in the existing literature is to provide a better understanding of these complex and dynamic phenomena, and to inform efforts to promote positive and productive

behaviours. Recent studies by [Shahzad et al. \(2018\)](#) showed that decision making and employees participation eulogies probability of behaviour output. The contribution of research on deviant behaviour and trust and their impact on productivity varies across studies, but some common purposes and contributions include understanding the relationship between deviant behaviour, trust, and productivity, identifying best practices for addressing deviant behaviour, promoting a positive workplace culture, and providing evidence-based insights for organizations to inform their workplace practices. These studies have made a valuable contribution to the existing literature on deviant behaviour, trust, and productivity by providing a deeper understanding of the relationship between these factors and by identifying best practices for promoting a positive and productive workplace.

REVIEW OF LITERATURE

Our research makes the important contributions to the field deviant, trust, and workplace productivity. Employee deviant behaviour has always been a bane to organizations. DWB gained attention from organizational behaviour researchers with its negative psychological, social and tangible consequences for employees and organizations. Destructive behaviour and constructive behaviour are two types of DWBs discussed in literature ([Bennett and Stamper, 2001](#)). How we trust businesses, our employers, and our co-workers has changed substantially over the past two to three decades due to changes in the workplace. Deviant behaviour at work can take many different forms, such as verbal and physical abuse, violence, and corporate fraud. These aberrant behaviours are costly to organisations and individuals on a social, economic, and psychological level. The current study aims to comprehend how organisational stress affects the workplace. The study also examines emotional intelligence as a mediator between workplace misbehaviour and organisational stress.

Literature on organizations indicates potential for or presence of both negative and positive employee-related outcomes in organizations. The negative outcomes include prevalence of politics (e.g., [Gandz and Murray 1980](#)), workplace deviance (e.g., [Bennett and Robinson 2000](#)), and mental health problems ([Hosie et al. 2006](#)). Potential positive outcomes suggested in the literature include employee commitment, productivity (e.g., [Fry et al. 2005](#)), positive work adjustment ([Vandenberg et al., 2002](#)), sense of spiritual survival (e.g., [Fry 2003](#)), organization-based self-esteem ([Milliman et al. 2003](#)), and employees' performance of organizational citizenship behaviors (e.g., [Bolino and Turnley 2003](#)).

2.1 Trust and Deviant Behaviour

Changes in trust between workers, between employees and management, and between the company and its clients can be caused by deviant behaviour at work. When employees do things like steal, lie, or harass other employees, it can make it harder for other employees to trust them. This can make people less ready to work with or depend on co-workers who have done this, which can lead to less cooperation, lower confidence, and lower productivity. Also, inappropriate conduct can make it hard for workers and managers to trust each other. If workers think that management isn't doing enough to stop bad behaviour or is doing it themselves, they may stop trusting the company as a whole ([Shahzad et al., 2018](#)).

When employees act badly at work, it can hurt the company's image and make it harder for customers, suppliers, and investors to trust the company. This can cause sales to go down, business partners to leave, and investment to go down, all of which are bad for the organization's finances. Overall, deviant behaviour at work can make it hard for people inside and outside the organisation to trust each other. Organisations need to take steps to stop and deal with this kind of behaviour if they want to keep their workplaces healthy and productive. This can be done by setting clear standards and goals, giving workers training and support, and making sure there are good ways to report and deal with deviant behaviour when it happens.

H1: Trust is negatively related to workplace deviant behaviour

2.2 Deviant Behaviour and Productivity

Deviant behavior can have a negative impact on productivity in various ways. It decreases motivation when individuals engage in deviant behavior, such as theft or absenteeism, their co-workers may become demotivated and lose their sense of trust in the organization. This can result in decreased productivity and a decline in overall morale. Additionally, increased Costs, as they may need to invest in security measures to prevent theft or in human resources to manage absenteeism. Subsequently, decrease collaboration among co-workers, as they may feel less inclined to work together when they don't trust their colleagues ([Bennett and Robinson, 2000](#); [Hosie et al., 2006](#)). Deviant behaviour can also result in a loss of reputation for organizations, as customers and clients may be less likely to do business with companies that have a history of deviant behaviour among their employees.

Social and economic conditions, such as poverty, unemployment, and social inequality, can contribute to deviant behaviour by creating a sense of frustration and despair among individuals. Peer pressure can influence individuals to engage in deviant behaviour, as they may feel pressure to conform to the norms and values of their social group. Individual Characteristics: Individual characteristics, such as personality, cognitive abilities, and temperament, can also play a role in deviant behaviour. For example, individuals with impulsive or risk-taking personalities may be more likely to engage in deviant behaviour. Deviant behaviour can have a significant negative impact on productivity, as it can decrease motivation, increase costs, decrease collaboration, and harm the reputation of organizations.

H2: Deviant behaviour negatively related to employee productivity

2.3 Trust and Productivity

Trust can have a significant positive impact on productivity. When individuals trust their co-workers and the organization they work for, they are more likely to be motivated and engaged in their work. This can result in higher levels of productivity and a more positive work environment. Trust can also improve collaboration among co-workers, as individuals are more likely to work together effectively when they trust each other. This can result in increased efficiency and more effective problem-solving. Trust can also improve decision-making, as individuals are more likely to seek out and consider the opinions of others when they trust them. This can lead to better decision-making and more informed choices. Trust can also promote innovation, as individuals are more likely to share their ideas and take risks when they trust their co-workers and the organization they work for. This can result in new and improved products and services.

Communication plays a crucial role in building and maintaining trust. Transparency and openness in communication can promote trust, while secrecy and misinformation can erode it. Transparency refers to the extent to which individuals and organizations are open and honest about their actions, decisions, and intentions. High levels of transparency can promote trust and increase productivity (Milliman et al. 2003; Bolino and Turnley 2003). Accountability refers to the extent to which individuals and organizations are responsible for their actions and decisions. High levels of accountability can promote trust, as individuals are more likely to trust those who are responsible for their actions. Cultural differences can also impact trust and productivity. Organizational factors, such as the structure and policies of organizations, can also influence trust

and productivity. For example, hierarchical organizations may have lower levels of trust and productivity compared to flat, democratic organizations.

H3: Trust is positively related to productivity

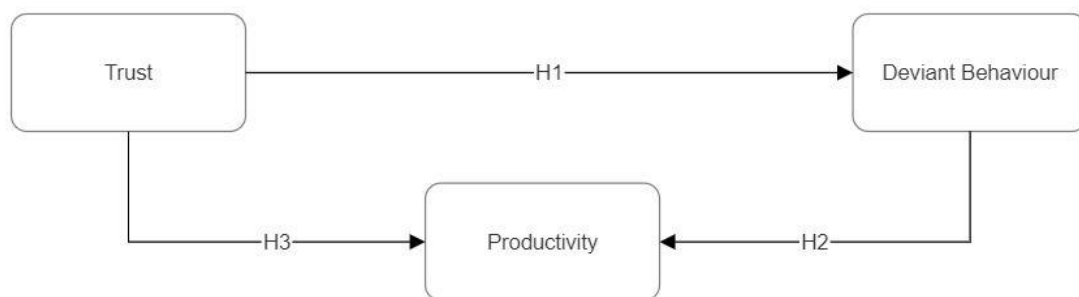

Fig 1. Hypothetical Framework

3. METHODOLOGY

The current study was a quantitative research study and used structured questionnaire to collect the data from the respondents. Quantitative research methods are used to test hypotheses and measure the impact of deviant behaviour and trust on employee productivity. This methodology involves collecting data through surveys or questionnaires to identify the significant factors of employee productivity. This new research put up an approach for fostering a culture of trust among employees by identifying and eliminating undesirable behaviours. The self-designed questionnaire was given out to a total of 150 employees in order to collect the information that was required. We got 70 representative samples of people's genuine responses to the questionnaire. We worked with data using the spreadsheet programme Excel. The outcomes of the study indicate that trust has a positive and significant impact on employee productivity. Also, deviant behaviour has a negative impact on employee productivity.

4. RESULTS AND ANALYSIS

Deviant behavior can have a negative impact on workplace productivity in several ways ?

80 responses

We received a total of 80 replies, and after reviewing them, we found that 52.5% of respondents strongly agreed with the statement in question, and the next highest response was recorded for those who agreed with the statement, which was 27.5%.

Deviant behavior can cause decreased motivation and engagement, which can result in decreased productivity.

80 responses

According to our data, 41.3% of respondents agreed with the aforementioned statement, with 40% recording themselves as strongly agreeing.

Deviant behavior can damage trust and relationships among coworkers, which are essential for effective collaboration and teamwork?

80 responses

International Conference on Global Practice of Multidisciplinary Scientific Studies-IV
Turkish Republic of Northern Cyprus, April 28-30, 2023

In accordance to the results of our research, 47.5% of respondents agreed that the aforementioned statement is true, and the next highest response was obtained for those who strongly agreed with the statement 37.5% of the time.

If employees don't trust each other, it can be difficult to work together effectively and productively?

80 responses

The analysis indicates that 56.3% of the people surveyed strongly agreed with the aforementioned statement, while the second highest response was recorded for the agree category, with a percentage of 35%.

Managers should communicate openly and honestly with their employees, even when the news is difficult or unpleasant?

80 responses

We concluded that 43.8% of those questioned strongly agreed with the statement in question, with 42.5% of respondents agreeing being the option that received the second highest percentage of votes.

Employees who are dissatisfied with their jobs may engage in deviant behavior as a way to cope with their negative feelings?

80 responses

We came to the conclusion that 47.5% of the people we asked agreed with the statement in question, with 35% of respondents strongly agreeing being the choice that got the second highest number of votes.

Lack of trust in the workplace can lead to more deviant behavior among employees?

80 responses

We came to the conclusion that 43.8% of those who were questioned strongly agreed with the statement in question, and the alternative that garnered the second largest proportion of votes was that 40% of respondents agreed.

When employees feel that they are not valued or respected, they may become more disengaged and less motivated to follow rules or norms?

80 responses

We found that 47.5% of respondents strongly agreed with the statement in question, and the next highest response was recorded for those who agreed with the statement, which was 41.3%.

Trust is an important foundation for a positive and productive work environment?

80 responses

International Conference on Global Practice of Multidisciplinary Scientific Studies-IV
Turkish Republic of Northern Cyprus, April 28-30, 2023

We observed that 51.2% of those polled strongly agreed with the aforementioned statement, with the second greatest answer being 38.8% agreeing.

Do you think support from higher officials will get rid of stress in work place ?

80 responses

In accordance to the results of our research, 45% of respondents agreed that the aforementioned statement is true, and the next highest response was obtained for those who strongly agreed with the statement 36.3% of the time.

Motivating and giving positive feed backs to employees helps in overcoming deviant behavior ?

80 responses

The analysis indicates that 48.8% of the people surveyed strongly agreed with the aforementioned statement, while the second highest response was recorded for the agree category, with a percentage of 38.7%.

Do you think importance of trust creates a positive and productive workplace culture?

80 responses

We observed that 46.3% of those polled agreed with the aforementioned statement, with the second greatest answer being 42.5% strongly agreeing.

Do you think pressure from higher officials depends on productivity? If yes, what do you think of that relation?

80 responses

We came to the conclusion that 57.5% of the people we asked negatively related with the statement in question, with 42.5% of respondents positively related being the choice that got the second highest number of votes.

Discussion

The pie chart shows that the majority of responses are recorded for neutral and agree. This indicates that the positive and negative impact on workplace productivity depends on individual's perspective. Most of the people agree that deviant behaviour can cause decreased motivation and engagement, resulting in decreased productivity. Motivation and productivity are directly proportional to each other, and team work plays a major role in achieving the goal. Trust and communication among the workers increase the rate of performance and unity in the team.

Trust is the most important factor in everyone's life, and studies have shown that there is a positive relationship between organizational trust and performance. Clear and open communication ensures everyone is on the same page about objectives, expectations, directions, and everyone knows where they stand. Job dissatisfaction can arise from a variety of professional and personal reasons, such as being under paid, lack of career growth, poor management, flexible working, proper communication, etc. Working in a trusting environment will make people feel energetic and productive, and building trust improves problem solving and comfort in the workplace. Trust is an important factor in the workplace, as it creates a sense of security, respect, and openness among people.

It is important to foster trust by being open, truthful, and dependable in your actions and communication, as well as acting with respect and empathy for others. Ultimately, getting feedback from the higher officials will help the employee to work better in the organization and enhances the motivation of the individuals. Getting feedback from the higher officials will minimize the communication gap between the employees and enhances the team work, which improves the performance in the workplace. The most important details in this text are that

employees may be motivated by acknowledging their accomplishments, giving chances for growth and development, and delivering incentives and prizes ([Collins and Rogers, 2017](#)) to encourage and redirect unwanted behaviour in a positive manner.

Trust is positively related to productivity in the work place, as it enhances communication, cooperation, dedication, and production. Pressure from higher officials has both positive and negative relation on productivity, with more than three-quarters of respondents viewed pressure as a means of boosting productivity ([Cortina et al., 2017](#)). It is important to keep in mind that being put under a certain amount of pressure may actually be motivating and lead to improved levels of productivity, but too much pressure may have a negative effect when it is applied over an extended period of time. Additionally, various people may react differently to pressure, so it is essential to achieve a balance that is appropriate for each individual.

Implications and contributions

The morale of teams and organizations can take a hit, along with their production and turnover rate, when deviant behaviour occurs. Getting beyond the deviation: Establishing concrete goals for performance and behaviour is essential. Ensure that everyone is aware of the expectations, as well as the consequences that come with not meeting them. Praise in a positive light may be an effective motivator for collaboration. To encourage the learning and development of team members. It may be possible to prevent abnormal behaviour by filling knowledge or skill deficiencies. An open exchange of ideas and prompt resolution of issues can be helpful in preventing aberrant behaviour. Encourage collaboration, provide training, and consistently enforce rules as a way for organisations to combat negative conduct and create a healthy and productive working environment. A successful business must first and foremost earn its customers' trust. Provide employees the flexibility and the tools they require to execute their jobs. Having more say over one's work environment increases both productivity and engagement. Creating an environment in which employees may openly discuss their thoughts, concerns, and observations without being concerned about consequences. Workers should be recognised for their accomplishments. Rewards like as rewards, promotions, and recognition are effective. Workers who feel appreciated are both more productive and loyal to their employers. Workers who are trusted and supported are more involved in their job and more committed to the success of the organisation.

Deviant behaviour is influenced by trust. Deviant behaviour violates societal norms, regulations, and values. Trust increases social conformity and acceptable behaviour. However, low trust increases deviance. Trust deters deviance. Deviant behaviour decreases when people believe their

behaviours will be watched and punished. They fear their acts will have terrible repercussions that exceed any rewards. However, if people don't feel their behaviours will be watched and penalised, they're more inclined to deviate. Trust also impacts decision-making. People are more inclined to behave socially acceptable when they trust others. They assume others will follow societal standards and values, and they don't want to be unusual or deviant. However, when people don't trust others to act socially, they're more inclined to deviate since they think others would too. Trust allows exploitation, which can lead to deviance. Trust makes people more vulnerable to abuse. Financial exploitation, abuse, and other damage can occur. Trust fosters an environment where people feel safe taking advantage of others. Thus, trust determines deviant behaviour. It can prevent, influence decisions, and generate exploitation possibilities. Understanding how trust affects deviant behaviour can help people and communities foster trust and reduce deviance.

Suggestions and Recommendations

Depending on the conduct and circumstances, deviant behaviour can boost or lower productivity. Deviant conduct can disrupt work processes, reducing productivity. Deviant conduct can produce a bad work atmosphere, lowering employee morale and motivation. Interpersonal conflict: Deviant behaviour can cause workplace friction and lower productivity. Deviant conduct can increase employee absenteeism, lowering productivity and costing more.

Creativity: Deviant conduct may lead to creative problem-solving and novel work methods, increasing productivity over time. ***Flexibility:*** Deviant conduct can boost work process flexibility, which improves productivity and adaptability.

Motivation: Deviant conduct might indicate great drive and devotion to work, increasing productivity and job satisfaction. Deviant conduct can inspire risk-taking and innovation. Deviant conduct usually outweighs its productivity gains. Yet, creative and risk-taking deviant behaviour may boost productivity if directed properly. Deviant conduct that is damaging and disruptive must be distinguished from unusual or non-conforming behaviour.

Collaboration: Trust promotes staff collaboration and resource sharing, increasing productivity. ***Communication:*** Trust helps employees and management communicate, improving problem-solving and efficiency. ***Innovation:*** Trust encourages risk-taking and experimentation, resulting to new work procedures and higher production. Trust boosts worker happiness and productivity.

Vulnerability: Employees may be afraid to offer ideas or take risks for fear of being appraised or rejected. ***Mistrust:*** Trusting teammates can lead to mistakes, missed deadlines, and lower productivity. ***Unfairness:*** Managers may favour trusted staff, causing resentment and lower

productivity. Overreliance: Trusting specific personnel can lead to burnout and lower productivity when they are absent or overburdened.

Trust increases productivity more than it hurts. Trust fosters teamwork, creativity, and motivation. Yet, trust and responsibility must be balanced to avoid misdirected or unfair trust.

Conclusion

In the workplace, dishonest behaviour and a lack of trust may be detrimental to a company's reputation, productivity, and bottom line. The general public has an expectation that businesses would give their employees with a workplace that is both safe and polite, as well as one in which they may advance their careers and contribute to the overall success of the organization. Interactions between professionals must be based on respect in order to be effective and efficient. The general public has high expectations that businesses would prevent and eliminate workplace deviance, as well as build trust. This may require defining rules to avoid deviant behaviour, training managers and personnel, and implementing a way of reporting that is both secure and confidential. Trust may be increased through encouraging clear and open communication at all levels of the organisation, recognising employees for their achievements, and providing opportunities for professional growth. Companies that do so have a better chance of increasing productivity, development of relations with both employees and customers, and gaining a reputation as a responsible and ethical employer.

A COMPARISON ANALYSIS OF SIMULATION TOOLS FOR INTERNET OF
THINGS

Sinchana S, Sagaya Aurelia
Department of Computer Science
CHRIST University
Bangalore

Sagaya.aurelia@christuniversity.in, sinchana.s@mca.christuniversity.in

Abstract The Internet of Things (IoT) paradigm promises to bring about substantial advancements in a variety of fields, including smart housing and infrastructure, smart agriculture, smart cities, smart energy, smart transportation and portability, smart manufacturing and retail, and so on. This study provides a thorough review and analysis of some Internet of Things (IoT) simulation tools, including IoTify, Cooja Simulator, Netsim, NS-3, Mat lab, J-Sim, and Omnet, to assist researchers and developers in selecting the best device for research investigations while navigating ongoing IoT application scenarios and addressing issues in the real world. This study also examines and compares IoT simulation tools in detail for the benefit of the future.

Index Terms—IOT, Simulation Tools, networks, pros, and cons, working

II. INTRODUCTION

The new Internet of Things worldview is one of the most recent developments and a hot topic in software engineering, communications, and construction. These Internet of Things (IoT) concepts were integrated into a variety of individual endeavors to enable improved living with individual prosperity. IoT links physical and digital objects through a variety of systems, enabling the useful use of the data such objects collect. The physical objects are equipped with key enabling factors, for example, implanted programming, detecting abilities, and information exchange capabilities, which portray them as "bright" objects.

III. SMART AQUARIUM

The current aquarium system available is a typical aquarium. With a variety of fish and plants in the tank, the aquarium system currently available on the market is already fascinating. However, if the aquarium is kept indoors, the manual distribution of fish food remains a problem. Aquarium owners must physically feed their fish at least once every day. An aquarium system that is both aesthetically pleasing and fully automated in terms of water-filling and fish feeding when necessary is needed to resolve the current problems. This is particularly problematic if the aquarium owner is very busy because the risk of forgetting to feed the fish is very high. A sophisticated aquarium setup that can support both aquarium hobbyists and the owner's daily activities. IoT technology is one of the tools created to make it simpler for people to keep an eye on and manage an

internet-based system. The Internet of Things (IoT) is a system in which objects are given distinct identities and the capacity to transfer data over a network without necessitating back-and-forth communication between people or computers.

IV IOT SIMULATION

IoT Device Simulator enables us to create, test, and deploy any type of configurable IoT application in the absence of physical devices. This makes it easier to almost perfectly replicate the original setting. We must concentrate on the heterogeneous nature of the sensor in the era of large-scale simulation. Despite combining several networks in one location, it insists on using highly developed tools and technology for effective simulation. Through both qualitative and quantitative factors, the internet of things simulation can occasionally result in a variety of technological problems. The next section will go over the main strategies used to increase scalability in large-scale IoT projects as they are simulated in the real world.

TO SIMULATE IOT ENVIRONMENT

- Install the necessary IoT devices and use them.
- Connect the existing system to the virtual framework and enable the repositories.
- Visualize the simulated environments by developing suitable software

EMULATE / SIMULATE IOT

The Cooja tool is utilized in IoT developments for simulation, and the Enzo Unified tool is used for emulation. Any real-time scenario can be created and analyzed with the use of these technologies. It is also prepared to add actual hardware to the testbed, if necessary, to confirm the network's behavior. We cannot observe technology and simulation tools for the internet of things that provide a comprehensive framework for successful implementation. The Internet of Things (IoT) features wonderful visions that are formed into various measurements used to utilize smart objects, sensors, and technologies with a system of communication and attestation of knowledge. Thus, before setting up an IoT application in the real-world scenarios depicted in figure 1, it is crucial to have a potent simulation tool that might be used in realistic formative and exploratory settings

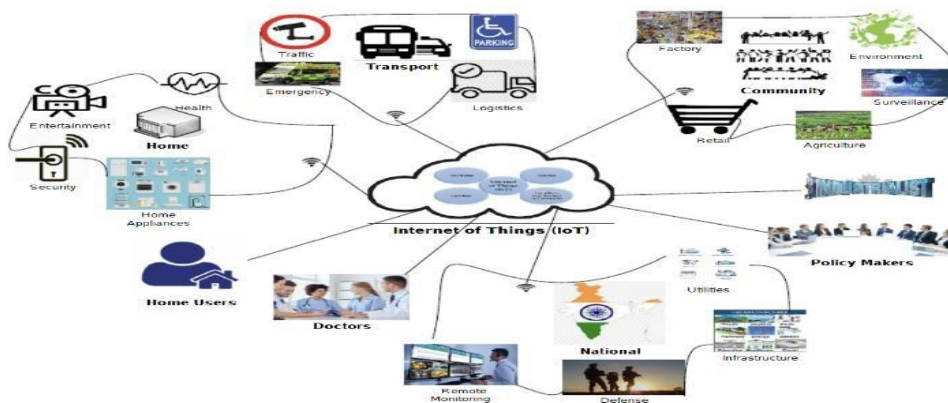

Figure 1: Quality Applications in IoT

IV. TOOLS FOR IOT SIMULATION

- IOTIFY

IoTify is a fantastic IoT test system that enables you to quickly build IoT configurations in the cloud. It is used on a broad scale in your own virtual IoT environment. To identify and address problems before presenting the final item, the tool may generate flexible traffic from a large number of virtual endpoints and test your foundation for scale, security, and unwavering quality.

- COOJA

A system test system that enables the imitation of authentic equipment stages exists, as demonstrated by COOJA. COOJA uses the Contiki OS with a focus on organized behavior. Without a specific bit, COOJA is capable of imitating remote sensor organizations. A series of standards, including TR 1100, TI CC2420, Contiki-RPL, IEEE 802.15.4, uIPv6 stack, and uIPv4 stack, were upheld by Cooja. Before starting a new rebuilding, one of the COOJA test system's four spread models must be selected.

- NETSIM

It's a simple network simulator. Give a graphical user interface (GUI) to simplify the coding process. Simple to create custom protocols for both real-world and hypothetical purposes.

- NS-3

Simulator for discrete event networks – 3. Encourage quick and effective prototyping.

- MATLAB

MATLAB features an exciting IoT module that enables you to develop and test smart devices as well as acquire and analyze IoT data on the cloud. IoT platforms receive data from clever devices, total it in the cloud, and then gradually analyze it. Following the separation of examples and calculations, experts can use this information to create model calculations and carry them out in the cloud.

V. A REVIEW OF IOTIFY, MATLAB AND COOJA IOT SIMULATION TOOLS

A. IOTIFY

This simulates high system traffic to show how planned inactivity affects your overall framework performance. Recreating an associated vehicle armada or a network of observation cameras has never been easier. The client allows you to develop your IoT models using JavaScript formats and send traffic continuously to any cloud platform provider via MQTT, HTTP, or CoAP.

Virtual Lab of IOTiFy:

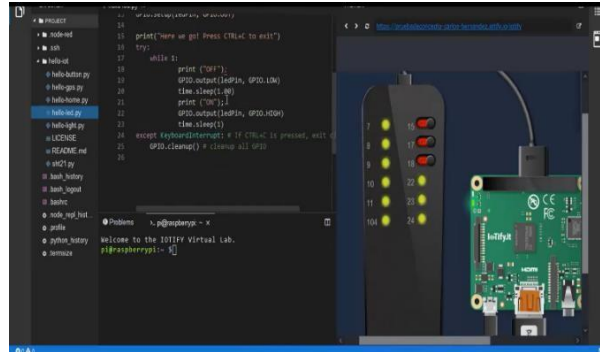

Figure 2 – Open simulator

Figure 3 – Connecting Sensor

carry them out in the cloud. The user can create and model IoT frameworks using MATLAB. Simulink allows you to generate calculations and then transfer them to your implanted technology. You may also use Arduino and Raspberry Pi to model your clever devices.

The detection of water level in the aquarium is detected with help of ultrasonic.

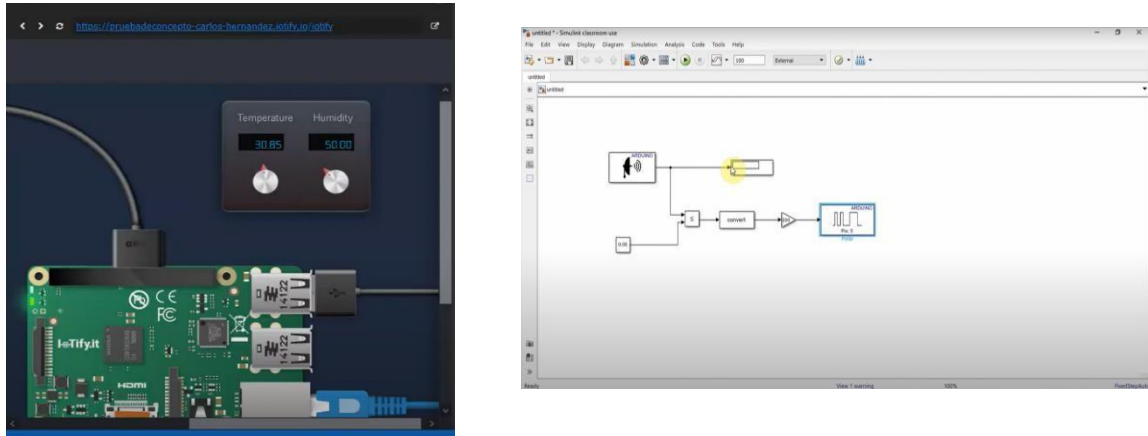

Figure 5 – water level detection using ultrasonic sensor in MATLAB

C. COOJA

COOJA is a system test system that enables the imitation of authentic equipment phases. COOJA uses the Contiki OS with a focus on organized behavior. Without a specific bit, COOJA is capable of imitating remote sensor organizations. A series of standards, including TR 1100, TI CC2420, Contiki-RPL, IEEE 802.15.4, uIPv6 stack, and uIPv4 stack, were upheld by Cooja. Before starting a new rebuilding, one of the COOJA test system's four spread models must be selected.

Voice command using MQTT to ON and OFF the feeder.

Figure 4 – Data reading

B. MATLAB

MATLAB features an exciting IoT module that enables you to develop and test smart devices as well as acquire and analyze IoT data on the cloud. IoT platforms receive data from clever devices, total it in the cloud, and then gradually analyze it. Following the separation of examples and calculations, experts can use this information to create model calculations and

Figure 7 – MQTT for voice command using COOJASimulator

VI.COMPARISON OF IOTIFY, MATLAB,COOJA

Features	IOTIFY	COOJA	MATLAB
License	GPL	BSD	GPL
Platform Support	Universal	Universal	Universal
Programming Language	Java, Java Script	Java	C/C++, HDL, PLC, GPU, .NET, or Java
Scalability	✓	✓	✓
Protocol Optimization	Possible	Possible	Possible
Mobile Network Support	Yes	Yes	Yes
Dynamic network topology	Dynamic	Dynamic	Dynamic
MAC, Routing support and Standards	MQTT, HTTP or CoAP	IPV4, IPV6, 802.15.4	
Network Support	Custom Development	Multicast N/W	Multicast N/W

VI. MERITS AND DEMERITS OF IOTIFY, COOJA, AND MATLAB SIMULATION TOOLS.

A. IOTIFY Merits:

- It can keep a strategic distance from danger and the death toll
- Critical circumstances may be studied without a chance thanks to the ability to vary the conditions and study the outcomes.
- It is sensible.

Demerits:

- To replicate something, one must have a thorough understanding of all the relevant factors and pay close attention to them all. A reenactment cannot be made without it.

B. COOJA Merits:

- We have shown that cross-level reenactment offers interesting aspects in terms of success and memory utilization.
- It enables a client to connect replicated hubs from several different deliberation levels.

Demerits:

- More Memory
- Simulation levels are high

C. MATLAB:

Merits:

- The computational codes may be created without any issues.
- Utilize a sizable repository of implicit computations

Demerits:

- Cross-collecting or converting Matlab code to another language is difficult
- Cost of License.

VII CONCLUSION

In this study, the simulation tools were selected by the criteria for locating appropriate IoT devices. The entrance using various interchange protocols is the key focus of IoT devices. This investigation offered the chance to solve some of the challenges in locating an IoT simulation stage. This study evaluated ten simulation tools and found that they were useful for both WSN and IoT. Regarding their suitability for IoT conditions and application replication, these devices were assessed. This study will assist the researcher and developer in selecting the best simulation tools for entertainment and problem-solving in the actual world.

Abstract

Non-cash payment through Automated Teller Machine (ATM) card service is a potential market and suitable for the development trend of the world economy especially in developing countries. Currently, the economy is showing signs of recovery after the Covid-19 pandemic with many advantages and also challenges. Accordingly, the banking sector is also facing enormous challenges, not only the fierce competition of domestic commercial banks but also foreign commercial banks. Therefore, in order to survive and develop in the market economy, it is essential to find ways to improve service quality to make a difference in the supply and distribution of services of banks in general and ATM cards in particular. This study was conducted by collecting data directly from 135 customers using ATM card services at MB Can Tho branch in Vietnam to assess their satisfaction with the bank's card services. This study employed Parasuraman's 5-distance model and had the appropriate adjustment for the Vietnamese market for analysis. Research results show that the number of customers satisfied with ATM card service is 83% and the percentage of customers who will definitely recommend this service to others is also quite high at 59.3%. Based on the research results, the author proposes relevant solutions to improve service quality in terms of facilities, human resources, culture, monitoring, and brand development, and improving service quality in order to expand this service.

Keywords: service quality model, developing countries, non-cash payment

Introduction

Currently, the use of ATM cards is a solution of modern civilization, a non-cash payment solution in Vietnam in particular and in the world in general, has developed rapidly, is popular, and is considered a trend. Therefore, the use of payment cards helps customers save time and make transactions faster and more convenient. In that common development, the contribution of the banking system is indispensable to the role of payment intermediary in the economy, where new business strategies and the latest products are introduced. attract more customers and play a decisive role in the development of world trade, including Vietnam.

Domestic banks are now competing with each other every day on ATM card services to meet the increasing needs of customers, so they have accelerated their rapid development. In Can Tho city, ATM cards are growing in number of cards issued, card payment sales, and other conveniences on the card. In which, according to Industry and Trade magazine, Military Commercial Joint Stock Bank is one of the top 7 joint stock commercial banks with the largest charter capital in Vietnam with a nationwide network of over 100 branches and over 200 transaction points. spread across the country. According to the information provided by Military Bank on its website, in 2019 MB Bank received 4 major awards from the Japanese international card organization JCB as the leading bank in card transaction sales, the Bank leads the number of new credit cards issued, the Bank leads the number of credit cards in circulation, and the Bank leads the growth rate of credit cards. Especially, the factors that help the Bank survive, develop and achieve today's achievements in the market are satisfying customers' needs and being trusted by customers, so MB always focuses on product quality, researching utility applications to make customer payment more convenient and modern to meet customer satisfaction when using the card.

Recognizing the role and benefits that card business brings, it is necessary to assess the individual customer satisfaction about ATM card service at Military Commercial Joint Stock Bank Can Tho branch in order to evaluate the quality of ATM card service of the Bank. Thereby helping the Bank to have a more objective view, offering better services, helping the Bank to develop more and more in ATM card services in particular and the Bank's development in general.

1. Literature review and theoretical model

In addition to the research mentioning factors about customers choosing to use ATM cards. Following the above studies, there are also studies on the utility of supporting customers in using cards. This is one of the important contributing factors in the use of ATM cards by customers.

Because when customers want to use cards, they will look to reputable and modern banks. When it comes to a modern bank, it is obvious that customers will immediately think of a bank with a modern information technology platform, diverse products and utilities, and good service for customers anytime and anywhere.

Some research models on ATM card service quality such as: Issues affecting customer behavior (First Annapolis, 2007); Factors affecting customers' decision to choose banks to use ATM cards (Sultan Singh & Ms Komal, 2009); ATM service quality in banks in Ghana (Narteh, 2013); Student assessment of e-service quality in Uganda (Katono, 2011); Popularity of ATMs by banks in India by analyzing ATM technology and teller replacement (Kumar et al, 2011); Development of card payment in Vietnam challenges and opportunities (Tran Mai Uoc, 2006); Sustainable development of payment card services in Vietnam (Dang Cong Hoang, 2012); Research solutions to improve customer satisfaction when using ATM cards (Nguyen Viet Hung, 2015); Evaluation of customer satisfaction when using the service (Tran Thi Bao Tran, 2016); Research on factors affecting the decision to use ATM cards (Le Gioi and Le Van Huy, 2015); Research on improving the quality of passenger transport services of Vuong Phu private enterprise (Le Truong Khanh, 2014).

Most of the research on behavior before buying and deciding to choose ATM card service has been conducted quite a lot both in the country and abroad. The topics have discovered the factors affecting customer behavior. Besides the same factors, each topic also brings new elements in the research, contributing to creating a special point for the topic as well as diversifying the factors affecting customer behavior. Through that, it is the basis for banks to build marketing strategies and policies in accordance with customer behavior and needs. Studies on service quality focus on measuring service quality or customer satisfaction using the SERVQUAL model (Sultan Singh & Ms Komal, 2009; Narteh, 2013; Katono, 2011; Nguyen Viet Hung, 2015); Tran Thi Bao Tran, 2016; Le Truong Khanh, 2014) based on each region, there are factors that change to fit the model. In addition, a few authors have used the CES (Constant Elasticity of Substitution) model (Kumar et al, 2011).

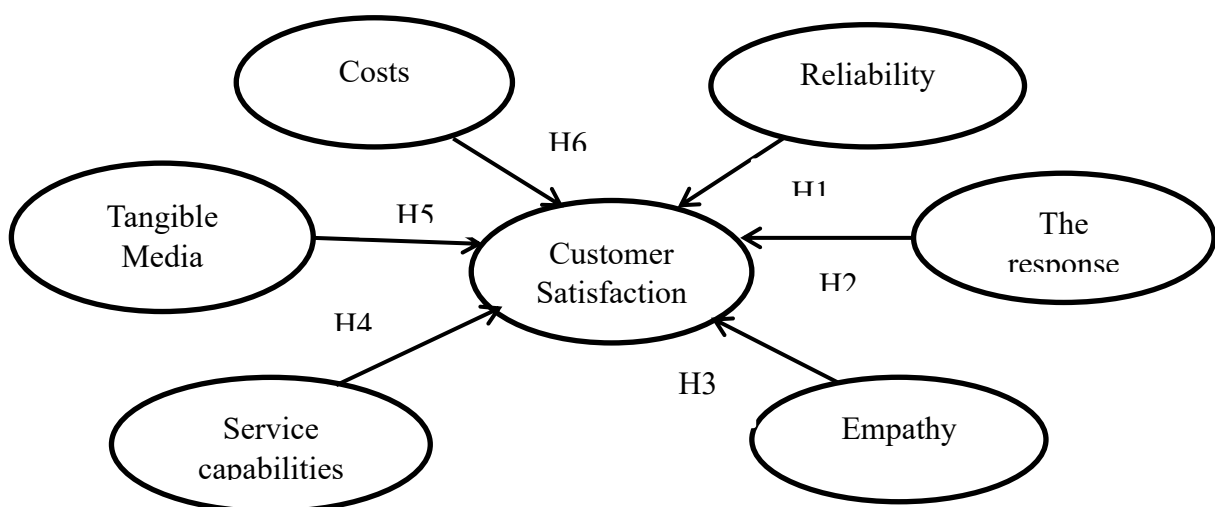

The results of the research model show that the factors affecting the service of using ATM card services such as safety (Tran Thi Bao Tran, 2016; Le The Gioi and Le Van Huy, 2015; Narteh, 2013; Katono), tangible means (Katono, 2011; Kumar et al, 2011; Tran Mai Uoc, 2006), reliability (Narteh, 2013; Katono, 2011; Tran Thi Bao Tran, 2016; Le Gioi and Le Van Huy, 2015; Le Truong Khanh, 2014; Sultan Singh & Ms Komal, 2009), cost (Sultan Singh & Ms Komal, 2009; Katono, 2011), responsiveness (Narteh, 2013; Tran Thi Bao Tran, 2016); Le The Gioi and Le Van Huy, 2015), the convenience of using the card (Narteh, 2013). In addition, age,

habits, marketing policies, and awareness also affect the behavior of using card services (Le Gioi and Le Van Huy, 2015).

Today, it can be said that the quality of service on ATM cards or ATMs has been recognized as a decisive factor in the success or failure of e-commerce. From the perspective of customers, the fact that banks have increased the quality of ATM services shows that customers are more and more interested in and enjoy the results of the latest modern scientific technology brought to them. As for banks, the increase in service quality at ATMs will help banks get a significant source of capital mobilized from deposits in customers' ATM accounts. Therefore, each bank needs to come up with its own service quality development strategy, especially paying attention to improving the quality of ATM services.

By synthesizing groups of factors affecting customers' decision to use ATM cards in the above models will be the basis for forming a research model to assess customer satisfaction when using ATM cards at Military Commercial Joint Stock Bank Can Tho Branch. From there, we propose a model in order to assess the level of satisfaction of individual customers about ATM card services at Military Commercial Joint Stock Bank Can Tho Branch including direct influencing factors such as: Reliability, Service Efficiency, Empathy, Service Competence, Interest and Tangibility.

To measure the quality of ATM card services, the author used Parasuraman's 5-distance model with a correction suitable for the card service sector in Vietnam. The factors affecting ATM card service quality are expressed by 6 factors and 27 observed variables.

Source: Compiled by the author, 2022

Figure 1. Research model of customer satisfaction for card services at MB Bank

Of the above six factors, cost is the factor that many customers are interested in. Through surveying and contacting customers at the card consultation counter, in addition to being concerned about safety, speed, and utility of card products, customers always ask questions about the cost. such as: Does this card have an annual fee? Is the initial issue fee and the reissue fee much different? Is the overdraft interest rate when using the card higher than the normal loan interest rate? When customers spend money to use ATM card services, they want to save costs as much as possible and receive as many benefits as possible. It is from that fact and through reference to a number of documents with research models that mention the cost of using ATM cards, so costs have been strongly incorporated into the research model.

Hypotheses testing

H1: The bank's reliability will be directly proportional to the level of customer satisfaction. When customers feel that the bank's reputation for them is always maintained and reached at the highest level, the higher the reliability appreciated by customers, the higher the customer satisfaction level and vice versa.

H2: Responsiveness is directly proportional to customer satisfaction. The fact that the bank solves questions and responds to customers' requests quickly and effectively makes customers appreciate the bank's responsiveness, which shows that the level of customer satisfaction will be high. and vice versa.

H3: Empathy is directly proportional to customer satisfaction. When customers feel the bank's sympathy, care and customer care, the customer's satisfaction level is higher and vice versa.

H4: Service capacity is directly proportional to customer satisfaction. When employees have a warm attitude, politeness and high professional level, customer satisfaction is higher and vice versa.

H5: Tangibles are directly proportional to customer satisfaction. The bank has a full range of polite clothes and equipment for the use of ATM cards, then the tangible means are appreciated, the customer satisfaction is also high and vice versa.

H6: Cost is inversely related to customer satisfaction. The lower the card service cost, the greater the customer satisfaction and vice versa.

In addition, the author also used SPSS to learn more about variables such as: gender, age, occupation, number of banks that customers transact with, banks that customers frequently transact with, and time of customers. A In the above 06 factors, cost is the factor that many customers are interested in. Through surveying and contacting customers at the card consultation counter, in addition to being concerned about safety, speed, and utility of card products,

customers always ask questions about the cost. such as: Does this card have an annual fee? Is the initial issue fee and the reissue fee much different? Is the overdraft interest rate when using the card higher than the normal loan interest rate? When customers spend money to use ATM card services, they want to save costs as much as possible and receive as many benefits as possible. It is from that fact and through reference to a number of documents with research models that mention the cost of using ATM cards, so costs have been strongly incorporated into the research model.

2. Research methodology

2.1 Data collection method

Primary data is collected from convenient random sampling surveys through face-to-face interviews. The research model in the thesis has 27 independent factors, to ensure that the sample is representative of the population, the lower the error, the higher the reliability, it is necessary to survey 135 observations ($27*5$). Sampling was randomly selected on the bank's database, 135 questionnaires were conducted to interview customers directly at the customer management department or by phone.

2.2 Data analysis method

Descriptive statistics: are used to describe the basic characteristics of the collected data, the description of the data by calculations and common statistical indicators such as the mean, the value of the data. maximum value (Max), minimum value (Min) for continuous variables and ratios for discontinuous variables. The aim is to determine the influence of differences between customer groups (gender, age group, income, service time) on satisfaction.

Likert scale: Likert scale is a scale invented by American psychologist Rensis Likert in 1932, the feature of the scale helps to determine the opinion or attitude of the respondent. The Likert scale is closed-ended and does not require respondents to provide ideas or counter-arguments for their opinions.

To build and test this scale, the following steps should be performed:

Step 1. Identify and name the variables the researcher wants to measure.

Step 2. Make a list of statements or questions that are indicated by the province.

Step 3. Determine the number and type of responses.

Step 4. Check all mined items from respondents.

Step 5. Perform a questionnaire analysis to find a set of items that make up a single-aspect scale that you want to measure.

Step 6. Use the newly built scale and re-analyze the questions to ensure the reliability of the scale.

To assess the level of perception, the author has proposed opinions and criteria based on the conventional 5-level Likert scale from 1: strongly disagree to 5: strongly agree. In addition, the author also uses the distance value to evaluate the meaning of each mean value for each scale in the most accurate way as follows:

$$\begin{aligned} \text{Distance value} &= (\text{maximum value} - \text{minimum value})/n \\ &= (5 - 1)/5 = 0.8 \end{aligned}$$

Average value = Meaning of scalde

Level 1: 1.00 – 1.80: Strongly disagree

Level 2: 1.81 – 2.60: Disagree

Level 3: 2.61 – 3.40: No opinion

Level 4: 3.41 – 4.20: Agree

Level 5: 4.21 – 5.00: Strongly agree

This article uses that Likert scale to assess customer satisfaction with factors affecting customer service quality. The Likert scale is a five-point scale commonly used in research studies to show the extent to which customers agree or disagree with a particular statement. Above all, the Likert scale also helps managers better understand the desires of customers and offer solutions to improve customer satisfaction.

Regression model:

Multivariate linear regression, or multiple linear regression, is used to examine the relationship between independent and dependent variables. To examine the effects of independent variables on the dependent variable under consideration. Specifically: The topic uses multivariable linear regression to measure the impact of dependent variables (customer satisfaction) and independent variables (factors affecting customer satisfaction).). In addition, some independent variables are also considered to be included in the model as control variables: empathy, service capacity, responsiveness, tangible means and trust.

3. Results and Discussion

3.1 Overview of customer characteristics

Table 1. Survey customer information according to the criteria

Indicators	Descriptions	Quantity	Percentage (%)
Gender	Male	67	49.6
	Female	68	50.4
Age	18-29	74	54.8
	30-49	53	39.3
	> 49	8	5.9
Occupation	Public officials	23	17.0
	Office staff	21	15.6
	Trader/Small Trader	26	19.3
	Student	32	23.7
	Army / Working in the army	8	5.9
	Household business	10	7.4
	Worker	15	11.1
Education	Secondary school	20	14.8
	High school	34	25.2
	College	27	20.0
	University	54	40.0
Income	Under 3 million VND	22	16.3
	From 3 to under 5 million VND	36	26.7
	From 5 to less than 10 million VND	49	36.3
	From 10 million or more	28	20.7

Source: Survey data, 2022

In the survey sample of customers by gender structure, 50.4% of female customers represent the population and 49.6% of male customers represent the population. With meaningful numbers above, managers need to pay attention to target customers to have business strategy in the future. aged from 18-29 years old accounted for 54.8%; aged 30-49 accounted for 39.3%; Those aged 50 and over account for 5.9%. Through the structure of customers by age group, we see that 2 groups aged 18-29 and 30-49 years old account for the highest proportion in the research sample, with the above ratio will help the research to have results with high accuracy. High confidence in the two groups of factors above and can be representative of the whole. At the same time, it shows that the majority of ATM card users are young, helping the bank to identify the target customers in its marketing strategy.

Most of the customers using ATM services have high university degrees 40.0% of this group of customers are mainly students and state of 23.45 who use ATM cards partly to receive living

expenses and to use ATM cards. using credit cards for personal expenses; followed by customers with upper secondary education, accounting for 25.2%; customers with college education accounted for 20.0% and the lowest proportion of customers with lower secondary education accounted for 14.8%. income from 3 to less than 5 million VND/month, accounting for 26.7%, the majority of customers are students; income from 5 to 10 million VND/month with the rate of 36.3%, the highest in the survey sample; Customers with incomes below 3 million/month and over 10 million/month have rates of 16.3% and 20.7% respectively, with this ratio showing the average income of people in the city Can Tho is quite high.

3.2 Customer satisfaction with ATM card service

Table 2. Customer satisfaction with ATM card service

Level	Qunatity	Percentage (%)
Dissatisfaction	0	0
Unsatisfied	3	2.2
Neutral	20	14.8
Satisfied	86	63.7
Very pleased	26	19.3

Source: Survery data, 2022

The number of customers with positive reviews about the ATM card service of MB CN Can Tho is 83%, accounting for a very high proportion. In which, the number of customers satisfied with the service accounted for 63.7%, very satisfied accounted for 19.3%. The number of unsatisfied customers accounted for a low rate of 2.2% and no customer was very dissatisfied with this service of the bank. Through this, we can realize that the quality of ATM card service of the bank is now quite good, has met most of the expectations of customers. However, there are also many limitations that banks need to overcome to improve customer satisfaction.

3.3 Evaluation of factors affecting customer satisfaction using ATM card services at MB CN Can Tho through descriptive statistics

Table 3. Evaluation factors for customers satisfaction

Factors	Sign	Variables	Mean	Total Mean	Level
Reliability	TC1	The bank always does exactly what it has introduced.	4.23	4,19	Agree
	TC2	Customer information is always strictly confidential.	4.18		
	TC4	When you have a question or complaint, the bank always solves it satisfactorily.	4.14		
	TC5	The Bank has clear, error-free transaction documents and related documents.	4.21		
	The response	DU1	Staff guides customers fully, easy to understand about transaction operations.		
DU2		Bank staff are always ready to help customers.	4.26	4,16	Agree
DU3		Card payment service always works accurately and quickly.	4.07		
DU4		The banking system is always in good working order.	4.10		
Service capabilities	NL1	Bank employees serve customers politely and courteously.	4.36		
	NL2	Professionally qualified staff to satisfactorily answer customers' questions.	4.27		
	NL3	Employees always have a high sense of responsibility at work.	4.23		
Tangible Media	PT1	The transaction counter is reasonably arranged and impressive.	4.17	4,25	Very agree
	PT2	Parking is very convenient and absolutely safe.	4.25		
	PT3	Services on ATMs are designed to be easy to use.	4.31		
	PT5	The place where the ATM is located is clean, the space is cool and safe.	4.26		
Expense	CP1	The cost per transaction is reasonable.	4.11	4,01	Agree
	CP2	No unreasonable transaction costs.	4.05		
	CP3	Reasonable and stable deposit interest rates.	3.08		

**International Conference on Global Practice of Multidisciplinary Scientific Studies-IV
Turkish Republic of Northern Cyprus, April 28-30, 2023**

Satisfaction	You are completely satisfied with the quality of ATM card service of Military Bank.	4.26		
HL1				
HL2	You feel satisfied and secure with the service provided by the Bank's staff	4.33	4,32	Very agree
HL3	You will continue to use the Bank's ATM card service.	4.37		

Source: Survey data, 2022

Through the above table, we can see that the average value of the factor ranges from 3.08 to 4.36, the perceived value of customers is quite high, affecting customer satisfaction when using ATM card service of the MB Can Tho branch. Specifically, we see that Service Capacity and Tangible Means have the highest level of agreement showing customer satisfaction at 4.29 and 4.25; The remaining Reliability, Responsiveness at the level of agreement showing customer satisfaction is 4.19, 4.16 and finally 4.01 is the cost factor, interest rate. The results show that customers do not really feel high about the factors affecting satisfaction when using ATM services. This is the basis for proposing solutions to improve customer satisfaction in the future.

3.4 Regression model results

From the results in the sample, we will determine the causal relationship between the dependent variables (HL) with the independent variables (TC, DU, DC, NL, PT, CP). The regression analysis model will describe the form of the relationship and thereby help us predict the degree of the dependent variable when the values of the independent variables are known in advance.

Table 4. Analysis of regression coefficients

R	R ²	Adjusted R ²	Adjusted R2 Estimated Standard Error
0.886 ^a	0.785	0.775	0.25251

Adjusted R2 Estimated standard error The model has R2 = 0.785 and adjusted R2 = 0.775, meaning that 77.5% of the change in HL is explained by 6 groups of factors: TC, DU, DC, NL, PT, The remaining CP 23.5% of the change in HL is due to other factors not included in the research model.

Table 5. Variation analysis – ANOVA

Model	Sum of Square	df	Std. Err.	F	Sig.
1					
Regression model	29,809	6	4,968	77,921	0,000 ^b
Residual	8,161	128	0,064		
Total	37,970	134			

We have the following hypothesis:

$H_0: \beta_0 = \beta_1 = \beta_2 = \beta_3 = \beta_4 = \beta_5 = \beta_6 = 0 \rightarrow$ unfit model

$H_1: \text{at least one } \beta_j \neq 0 (\beta_0 + \beta_1 + \beta_2 + \beta_3 + \beta_4 + \beta_5 + \beta_6 \neq 0) \rightarrow$ Fit model.

Hypothesis testing:

Based on the results in the table above, we see that the significance level = 0.000 < 0.05, so we reject hypothesis H_0 and accept hypothesis H_1 . Therefore, it is possible to conclude suitable model.

In addition, the variance inflation factor (VIF) is also used to determine multicollinearity, here we determine that $VIF < 2$ is satisfactory. Besides, the significance level of the factors ≤ 0.05 is statistically significant

Table 6. Regression model

Model	Unstandandized		Standar	t	P-value	Mul. En.	
	B	Độ lệch chuẩn	dized Beta			Std. Err.	VIF
(Constant)	-0.601	0.247		-2.435	0.016		
TC	0.300	0.059	0.276	5.122	0.000	0.577	1.732
DU	0.226	0.058	0.221	3.880	0.000	0.518	1.931
DC	0.045	0.039	0.050	1.133	0.259	0.851	1.175
NL	0.158	0.050	0.156	3.139	0.002	0.683	1.464
PT	0.180	0.057	0.175	3.135	0.002	0.539	1.855
CP	0.243	0.046	0.286	5.252	0.000	0.565	1.770

Through the above table, we can see that the coefficient of variance of the independent variables in the model are all < 2. Conclusion the model does not have multicollinearity. Based on the standardized Beta number, the factors TC, DU, DC, NL, PT, CP all have a linear relationship with HL. The significance level of TC, DU, NL, PT, CP are all < 0.05, while the significance level of DC = 0.259 is greater than 0.05, so we exclude this factor from the research model.

Thus, the regression results show that satisfaction is affected by 4 factors TC, DU, NL, PT, CP. The coefficient β indicates the degree of impact of each independent variable on the dependent variable. We have the following normalized regression equation:

$$HL = - 0,601 + 0,276TC + 0,221DU + 0,156NL + 0,175PT + 0,286CP$$

Through regression analysis method, we can conclude that customer satisfaction about ATM card service quality at MB Can Tho branch is currently influenced by 5 factors including: reliability, responsiveness, service capacity, tangibles, and costs. These factors have a positive impact on customer satisfaction at different levels, based on the standardized regression coefficient (Beta),

we find that the cost factor has the strongest impact on customer satisfaction because there is a system the standardized Beta is 0.286 followed by a confidence factor with a standardized Beta coefficient of 0.276; the response factor to Beta is normalized by 0.221; tangible means factor with standardized beta is 0.175 and service capacity factor with Beta is 0.156.

4. Conclusions

In the current period, the economy is showing signs of recovery after the epidemic with the advantages and opportunities available in the area. Accordingly, bank branches are also facing enormous challenges, not only the fierce competition of domestic commercial banks but also foreign commercial banks that will be present and compete in a playing field. fair. Therefore, in order to survive and stand firm in the market economy, it is essential to find ways to improve service quality. target to make a difference in the supply and distribution of services of banks in general and ATM cards in particular.

The ATM card market is a potential market, in line with the world economic trend and in line with the direction and policy of our State. The current ATM card has not really been used according to its functions and utilities. Local customers still mainly use cards to withdraw money or transfer money, but do not have the habit of paying via card. Therefore, it is necessary to promote the use of existing services by customers on ATM cards first, and then gradually improve the quality and utility of services and direct customers to more popular ATM card payments.

In recent years, Military Commercial Joint Stock Bank Can Tho branch has significantly contributed to the general economic development of Ninh Kieu district in particular and Can Tho city in general. As a currency trading unit serving all customers in the area, both doing business and serving banks, has really become a solid support in terms of finance for individual customers, production households, businesses. businesses, companies, helping customers feel secure to take care of their production and business activities.

Surveying the opinions of 135 customers using ATM card service at MB Can Tho branch shows that the number of customers satisfied with ATM card service is 83% and the percentage of customers will definitely recommend the service. This service is also quite high for everyone at 59.3%. This proves that customers appreciate and feel satisfied with the quality of ATM card services provided by MB Can Tho branch.

ABSTRACT

It is essential that women take part in improving Pakistan's rural communities' socioeconomic standing. In Pakistan's rural areas, women frequently experience various forms of discrimination and are excluded from essential amenities like education and healthcare. According to previous studies, the lives of rural women's families, communities, and themselves can all be significantly improved by providing them with resources, training, and education. In Pakistan, women are essential to improving the socioeconomic standing of rural communities. Women in rural regions have shown their potential as change agents and important contributions to local development while confronting major obstacles connected to gender discrimination and restricted access to resources. Women frequently help with farming tasks including planting, harvesting, and weeding. They also oversee a few small fish, cattle, and poultry farms. For future planting, women can also generate and save seeds. Women may help with soil and water conservation by controlling soil erosion, growing cover crops, and utilizing irrigation methods that use little water. Women can take part in agroforestry practices by maintaining forest resources and growing trees. A woman's ability to process and market agricultural goods can increase her income and aid the community's economy. Informing other farmers about sustainable farming methods and distributing knowledge about cutting-edge technology and best practices are vital roles that women may play. Women have shown their potential as change agents and important contributors to regional development via their involvement in agriculture, income-generating activities, and community-based organizations. Realizing women's full potential and fostering inclusive and sustainable rural development depend on removing the obstacles that prevent them from participating fully. In conclusion, women are essential to improving the socioeconomic standing of rural Pakistani areas. The essay will examine how women might improve socioeconomic conditions in rural Pakistan and highlight some of the research that has been done in this area.

Key words: Female, Gender equality, Farming, Income-generating, Village life

Enhancing Agricultural Productivity through Women's Empowerment:

Agriculture is one of the main ways that women in Pakistan contribute to rural development. Women in rural regions frequently engage in subsistence farming and livestock raising, which is essential to guaranteeing household income and food security [1]. One of previous research found that women's involvement in agriculture might boost agricultural output and boost food security in families, especially those headed by women [2].

Women in rural regions work in a variety of additional occupations that provide money in addition to agriculture, such as handicrafts, microfinance, and small businesses [3]. Particularly in places with few alternatives for conventional work, these activities may be significant sources of revenue and employment. Women in rural communities are essential for advancing.

Importance of education and training for women in agriculture:

Women in rural regions still encounter considerable obstacles to participating in development initiatives, despite their significant contributions. These obstacles include societal norms that restrict women's mobility and involvement in public life as well as limited access to education, financial resources, and decision-making capacity [1]. For women to be able to fully engage in and contribute to local development activities, these barriers must be removed.

Through entrepreneurship, women may make a significant contribution to Pakistan's rural communities' socioeconomic development. Women entrepreneurs may produce revenue, open up job possibilities, and help local economies thrive, according to studies [5]. But women business owners in Pakistan confront a number of obstacles, such as restricted access to financing, a lack of education and training, and social and cultural impediments [6].

Another crucial element in empowering rural Pakistani women is education. Studies have demonstrated that educating females may significantly improve social, economic, and health results. Women with greater levels of education are more likely to work and earn more money, as well as choose better options for their family' health and education [7].

Policymakers and stakeholders to prioritize women's empowerment in agriculture:

Participation of women in decision-making is essential for both their empowerment and the improvement of rural Pakistani living. According to studies, women's involvement in local government and organizations can improve conditions in fields including infrastructure, health, and education. Women in Pakistan, however, encounter a number of obstacles to involvement, such as restricted access to resources and social and cultural conventions that give preference to the opinions and experiences of males [8].

Rural women may benefit themselves, their families, and their communities by becoming more educated, entrepreneurial, and involved in decision-making processes. Government, civic

society, and other stakeholders must work together in a continuous and concerted effort to address the obstacles to women's empowerment.

In Pakistan, women play a crucial role in improving the socioeconomic standing of rural life. In Pakistan's rural areas, women frequently experience various types of discrimination and are excluded from essential amenities like education and healthcare. The lives of rural women's families, communities, and themselves may all be significantly improved by providing them with resources, education, and training.

For instance, one of the research carried out in rural Pakistan found that women's involvement in local government and community-based organizations may improve outcomes in fields like infrastructure, health, and education. Women in Pakistan, however, have a number of obstacles to involvement, such as restricted access to resources and social and cultural norms that give men's views and experiences priority.

Education and training for women in agriculture:

In Pakistan, education is also essential for empowering rural women. A research has found that educating girls can significantly improve social, economic, and health results [7]. Women with greater levels of education are more likely to work and earn more money, as well as choose better options for their families' health and education.

Another significant method that women may improve the socioeconomic conditions of rural Pakistani living is through entrepreneurship. Women business owners may boost local economies by generating revenue, creating jobs, and increasing employment prospects. But women business owners in Pakistan confront a number of obstacles, such as restricted access to financing, a lack of education and training, and social and cultural impediments [6].

The Pakistan Economic Survey 2020-21 states that women make up 49.2% of Pakistan's overall population, with 63.5% of them living in rural regions. Despite this, just 22% of women and 81% of males participate in the labor force respectively. With barely 14% of rural women engaging in the labor force, women in these areas are moreover at a distinct disadvantage [9].

With over 63% of Pakistan's female labor force working in agriculture-related jobs, women play a key part in the country's agricultural industry [9]. However, women's involvement in agriculture is frequently restricted to subsistence farming, and they encounter a number of difficulties, including a lack of resources, information, and markets. Women's access to resources, education, and training can significantly increase their ability to produce agriculturally.

Diversification of Agricultural Activities through Women's Participation:

Adopting contemporary farming methods is one-way women may contribute to Pakistan's agriculture industry. For instance, one of the research conducted in the Punjab province of

Pakistan discovered that women who got instruction in contemporary agricultural methods had considerable increases in production and revenue [10]. Women who got training also reported having better decision-making abilities and feeling more confident about engaging in agricultural activities.

Women may also improve rural living by working in non-traditional agricultural pursuits including horticulture, livestock raising, and fishing. Women's involvement in non-traditional agricultural pursuits can boost their income and contribute to the diversification of the rural economy [11].

Participation in agricultural value chains:

Women's involvement in agricultural value chains can help improve rural living. According to a research conducted in Pakistan, for instance, women who worked in the dairy value chain were able to raise their income and enhance their level of life [12]. However, there are a number of obstacles that prevent women from taking part in agricultural value chains, such as their restricted access to markets, knowledge, and financing.

Last but not least, women's involvement in agricultural decision-making may help improve rural living. Making sure that women's perspectives and experiences are heard and represented can result in more inclusive and equitable outcomes when they participate in decision-making processes [13].

CONCLUSION: As a result, women's involvement in agriculture can significantly improve rural living in Pakistan. Women's empowerment via education, training, and resource access can boost their agricultural production and support the expansion and improvement of rural economies. Government, civic society, and other stakeholders must coordinate and maintain their efforts to overcome the obstacles to women's empowerment in rural Pakistan. Rural women may benefit themselves, their families, and their communities by becoming more educated, entrepreneurial, and involved in decision-making processes.

ABSTRACT

Marketing activities and financial management in companies can be seen in the context of the existence of internal control mechanisms that are normatively introduced into the business of a large number of heterogeneous companies. It is of particular importance for the business of the public sector, but also other sectors in transition economies. The work of the authors stated the business of a large number of companies that introduced the introduces formal control as a mechanism by means of better business results, a given example of a more accurate development is given to an example of operations in the Republic of Serbia. Financial management in modern business conditions can be seen in the context of numerous influences on the adoption of top management business decisions. One way to improve total safety in the context of making business decisions is the introduction of internal controls in business management processes.

Keywords: introduction of financial management, marketing, operations of companies.

1. INTRODUCTION

Marketing activities and financial management in companies should be seen in the context of internal control mechanisms that are normatively introduced in the business of a large number of heterogeneous companies and which essentially affect the function of top management in order to achieve profits [1-5].

It is assigned particular importance for the operations of top management that brings numerous valid decisions in heterogeneous companies. The essence is that such a personal should be treated as normal and usually in the business of a large number of countries [6-10].

Thus, business in transition and countries that are small has a real need to introduce one of the forms of application of control in regular business. In such terms of business, the application of marketing is important, because its application can be affected by a large number of various businesses in size, activities, and commonly for the entire such business is to highlight the right and appropriate product that the company must be in law

Time, in the right place, in a real quantity, at the right price. The essentially observed product should be placed on the market [11-15].

2. THE BASIS FOR THE EXISTENCE OF INTRODUCED FORM OF CONTROL SUCH AS INTERNAL AUDIT IN HETEROGENEOUS COMPANIES IN DEVELOPING COUNTRIES

Internal audit should organize their work and its business in a way that will basically be in accordance with the adopted professional standards of the audit profession. In addition, the internal auditor within the course of the overall internal audit activities in companies should present its conclusions to the top management as follows:

- To be impartial,
- To be actual,
- To be delivered in a timely manner,
- To be brought in the best intention and
- To be adopted with the optimal use of available resources in the company.

A general diagram of internal audit in the company's in Figure 1.

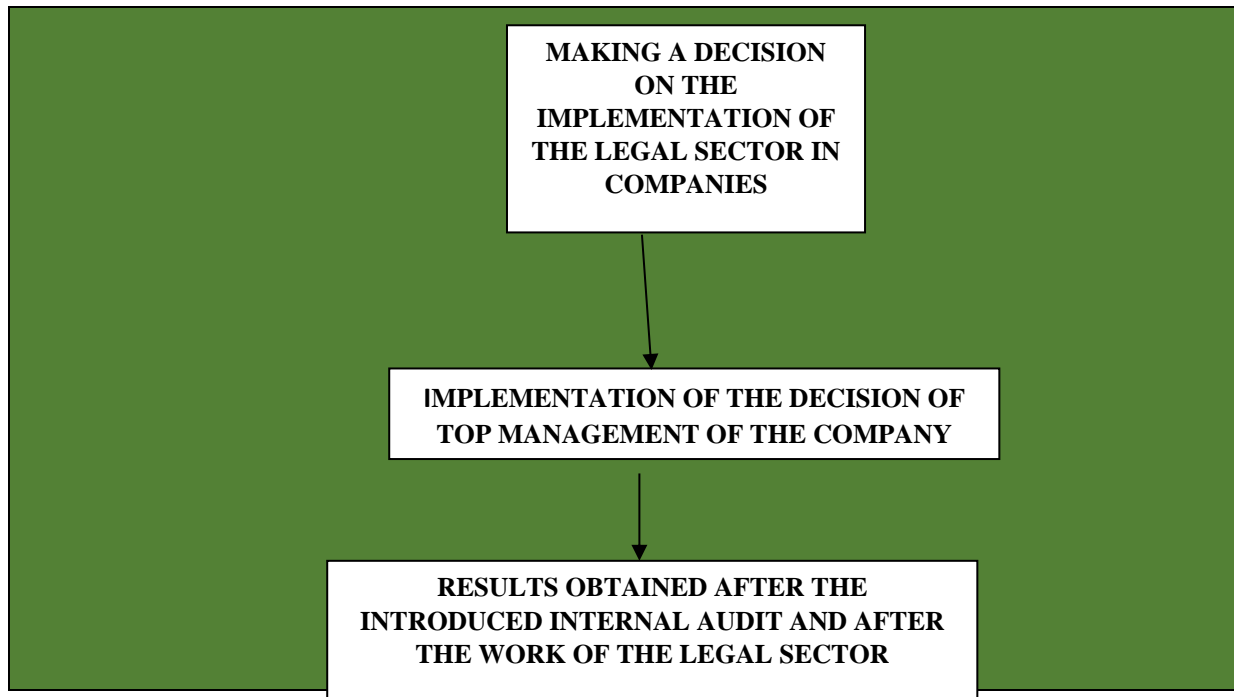

Figure 1: Presentation of what is necessary for the work of internal audit in companies.

3. THE IMPORTANCE OF MARKETING POSITIONING IN TOTAL MANAGEMENT ACTIVITIES IN COMPANIES

The importance of marketing marketing in total management activities in companies can be displayed through a display in Fig. 2 through the so-called.

Flow of activities that can be played in the existence of such a realistic application of the same.

The description of the activity is given by the author in the view of Figure 2.

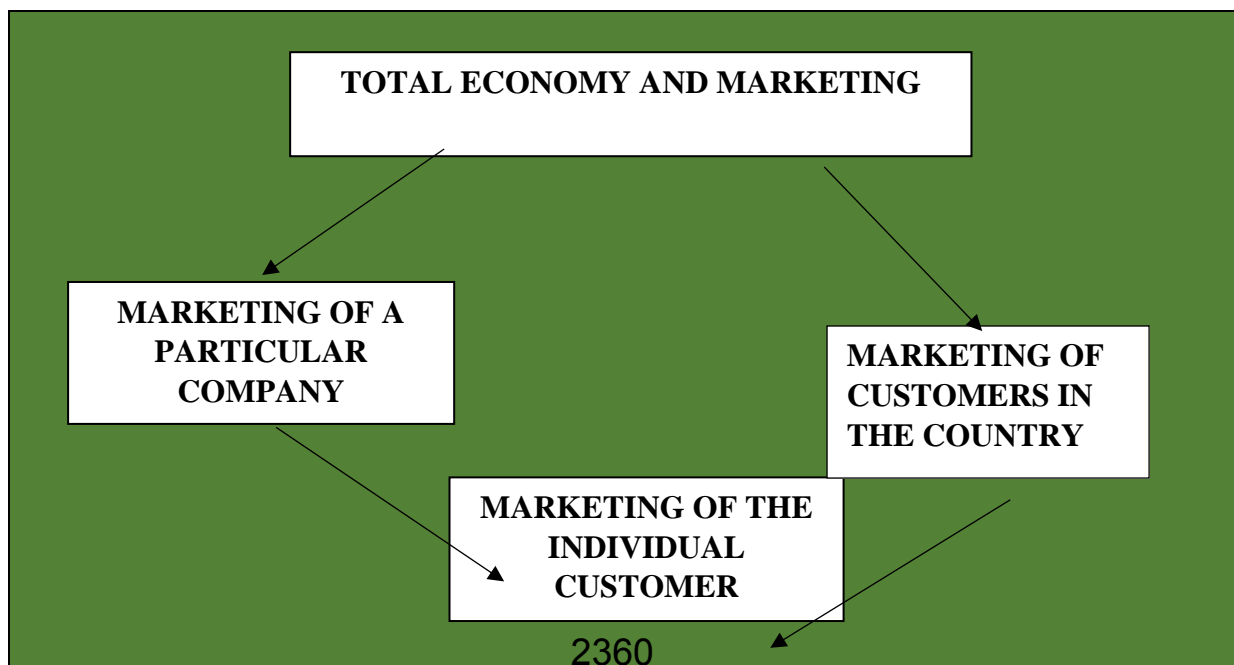

Figure 2: Presentation of marketing in business operations.

4. BASIC INTERNAL AUDIT ACTIVITIES IN THE WORK OF THE COMPANY

The most common activities in the work of internal audit that are entrusted to the internal auditor within the scope of work of internal audit are:

1. careful planning of each audit,
2. determine where activities are directed,
3. consider the risks and their significance,
4. take care that each audit is adjusted to the circumstances of the company's operations,
5. view each element of the audit as part of the company's operations,
6. adopt a constructive and positive approach to auditing,
7. encourage changes in the work of the audited entity,
8. perform a careful audit review,
9. provide an independent opinion of the internal auditor,

10. fulfillment of professional and legal obligations based on the audit of the company,
11. Regularly and appropriately reporting to management on material issues that arose during the preparation of the audit,
12. make appropriate recommendations for the implementation of corrective measures,
13. ensure that the audit adequately takes into account all issues identified during the audit and
14. activities of the top management of the company that it carries out after the internal audit.

The basic activities of the internal audit in the work of the company can be shown in a general scheme, which is also given in figure 3.

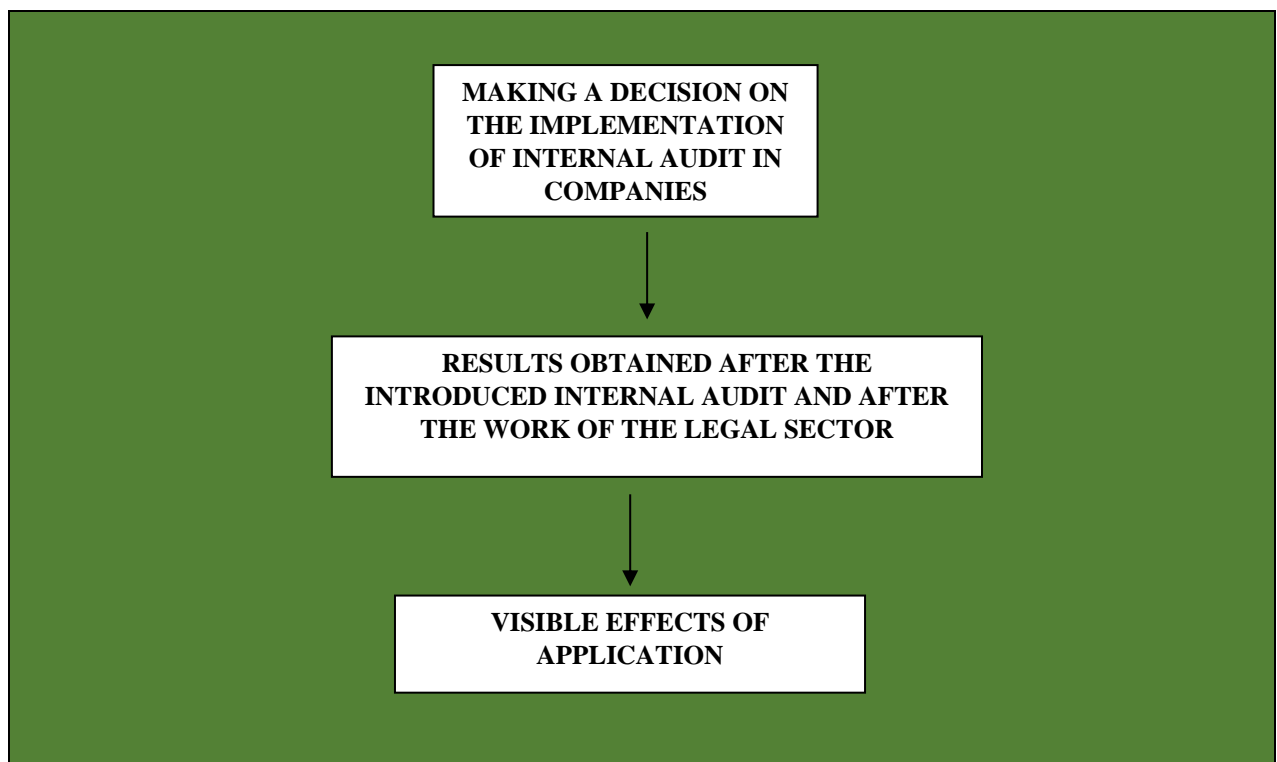

Figure 3: Presentation of the basic activities of internal audit work in companies

4.1. APPLICATION OF MARKETING MIXES IN COMPANIES THAT INTRODUCED CONTROL IN ITS BUSINESS

Application of marketing mix in companies that introduced control in its business is given in the Figure 4.

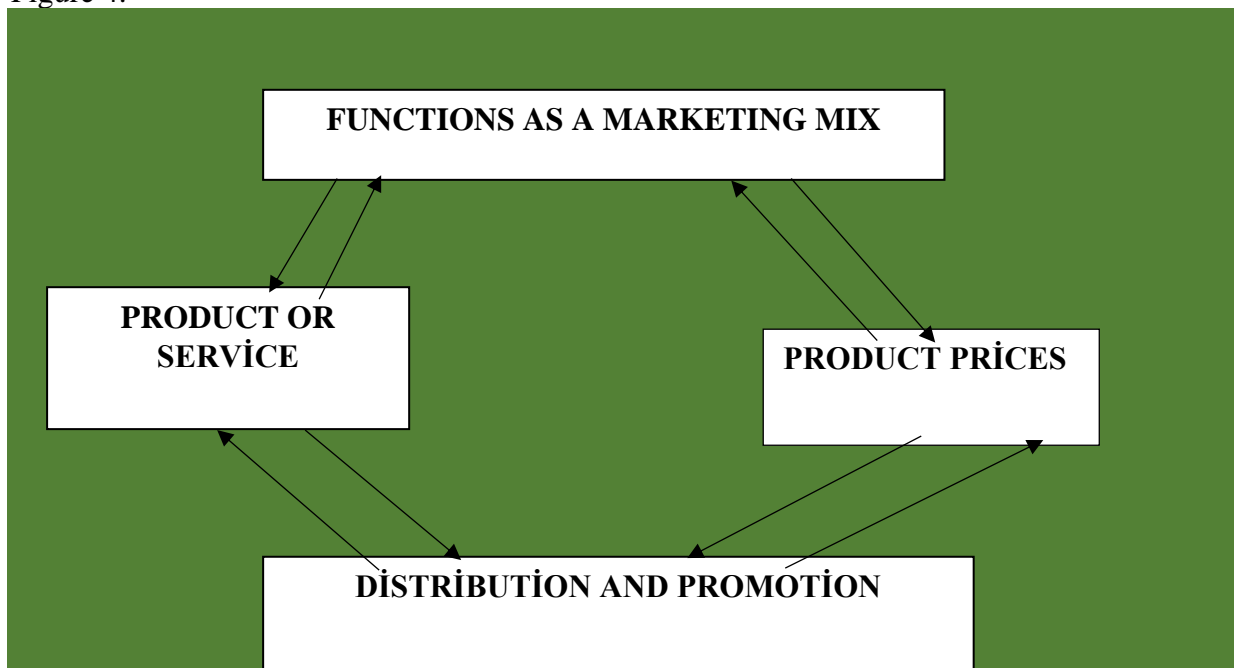

Figure 4: The impact of the marketing mix on the overall business in the economy.

5. CONCLUSION

Marketing activities and financial management in companies should be seen in the context of the existence of business improvement mechanisms, the overall business of the company. One way to enhance business is the process of introducing internal controls and internal audits in the company's representative operations. It should be seen as a continuous activity. It must be introduced through which are normatively introduced in the business of a large number of heterogeneous companies and which essentially affect the function of top management funds in order to achieve profits, but also the safety of total business decisions. The authors pointed out the existence of the flow of displayed activities in terms of control, marketing and management in companies. The application is possible in a large number of countries in transition, and everything was discussed on the example of the Republic of Serbia.

ABSTRACT

The use of internal audit as a form of control in creating and managing the marketing and financial management of numerous diverse companies in developing countries is one of the real forms of possible business improvement activities. Marketing activities and financial management in companies can be seen in the context of the mechanisms introduced by internal audit created by the rarely decision by the top management. The acts of establishment are adopted, the Code of Conduct between the Top Management and the Appointed Internal Auditor is signed. It is presented to the basis for introducing such business in a large number of heterogeneous companies. It is essential to the basis of normative organization of operations in terms of internal audit, marketing and financial management.

Keywords: internal audit, introduction of financial management, company.

1. INTRODUCTION

The use of internal audit can be multiple. It is one of the forms of control in creating and managing a marketing and financial management of numerous various companies. The application is universal both in developed countries and in developing countries [1-4].

It is one of the real forms of possible business improvement activities. Marketing activities and financial management in companies can be seen in the context of mechanisms introduced and the total business results can be positive if the internal audit control is used, which was introduced into regular business operations [5-9].

Internal audit occurs based on the decision made by the top management to introduce the same to regular business operations. The acts of establishment are adopted, the Code of Conduct between the Top Management and the Appointed Internal Auditor is signed. It is presented to the basis for introducing such business in a large number of heterogeneous companies.

It is essential, it is the basis of normative organization of operations in terms of internal audit, marketing and financial management [10-12].

The entire business was observed in such a combination of internal audit introduced as a large number of heterogeneous companies, to improve the business of raising operations by introducing marketing activities, and then financial management as a system of real activities in companies [13 -15].

2. USE OF CONTROLS IN THE CREATION AND MANAGEMENT OF MARKETING AND FINANCIAL MANAGEMENT IN COMPANIES

The use of controls in the creation and management of marketing and financial management in companies should be viewed in the long term.

Such observation should be in the context of making business decisions of top management in numerous companies.

The view of Figure 1 is given.

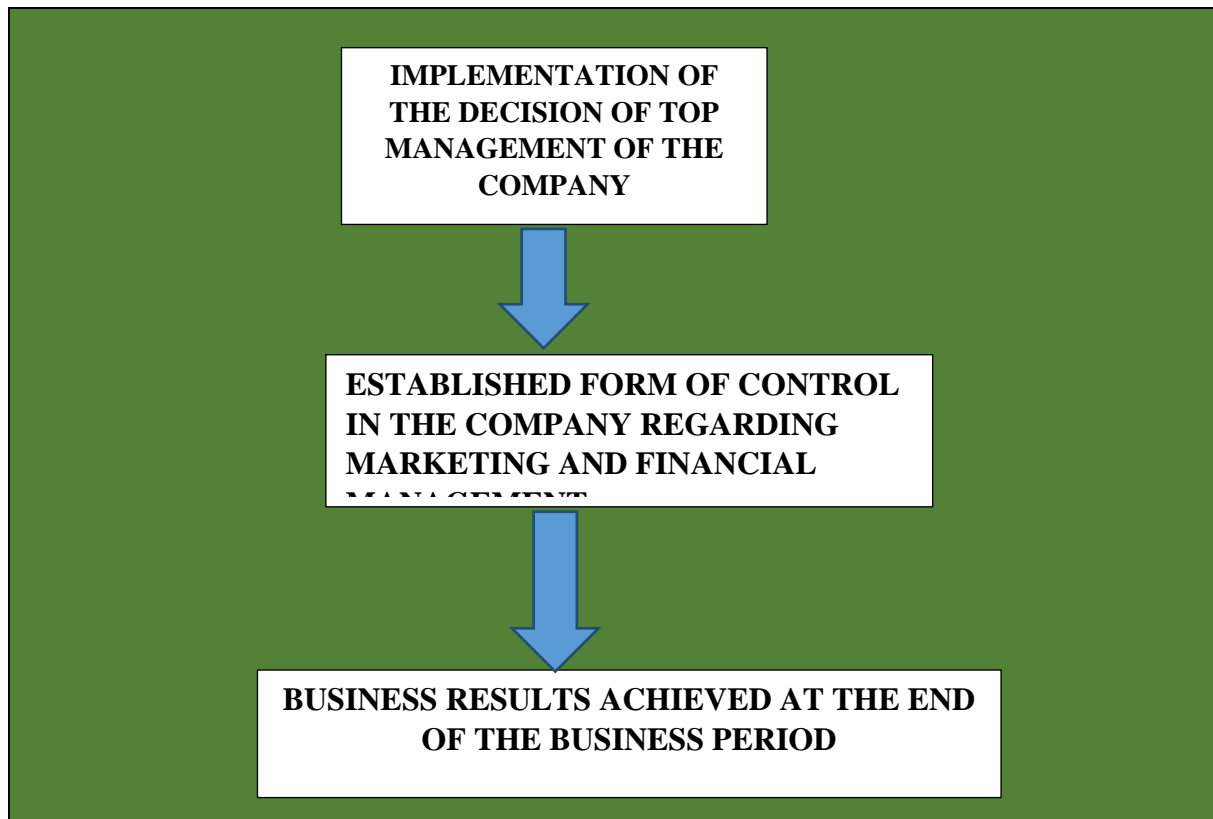

Figure 1: Flow of movement and business results after marketing implementation.

3. IMPROVING THE WORK FLOW AND FUNCTIONING OF INTERNAL AUDIT IN COMPANIES

The management effects of top management in companies should be focused on the company's operations, in which all management functions in the company can be improved in the right and essential way, and therefore the effects of management decisions are visible in a short time after making important decisions such as to introduce an internal audit in the company's operations.

The final effects of such management and decision-making in companies are visible in the financial statements, that is, in the profit and loss statements in each accounting period in which they were adopted in the company.

The authors presented an overview of internal audit activities in the form of Figure 2.

4. MANAGEMENT IN COMPANIES ORIENTED ON CUSTOMER RESPECT

Management in companies that is oriented to the appreciation of customers should be seen as a process of focusing on increasing the discovery of customers' desires and needs in shaping the marketing strategy and delivering superior value to target customers.

The management functions of the company are improved when the identification of numerous opportunities and the introduction of long-term strategies that have potential for the business of numerous legal entities are carried out in the right way.

An overview of management in companies that is oriented towards customer appreciation is shown in Figure 3.

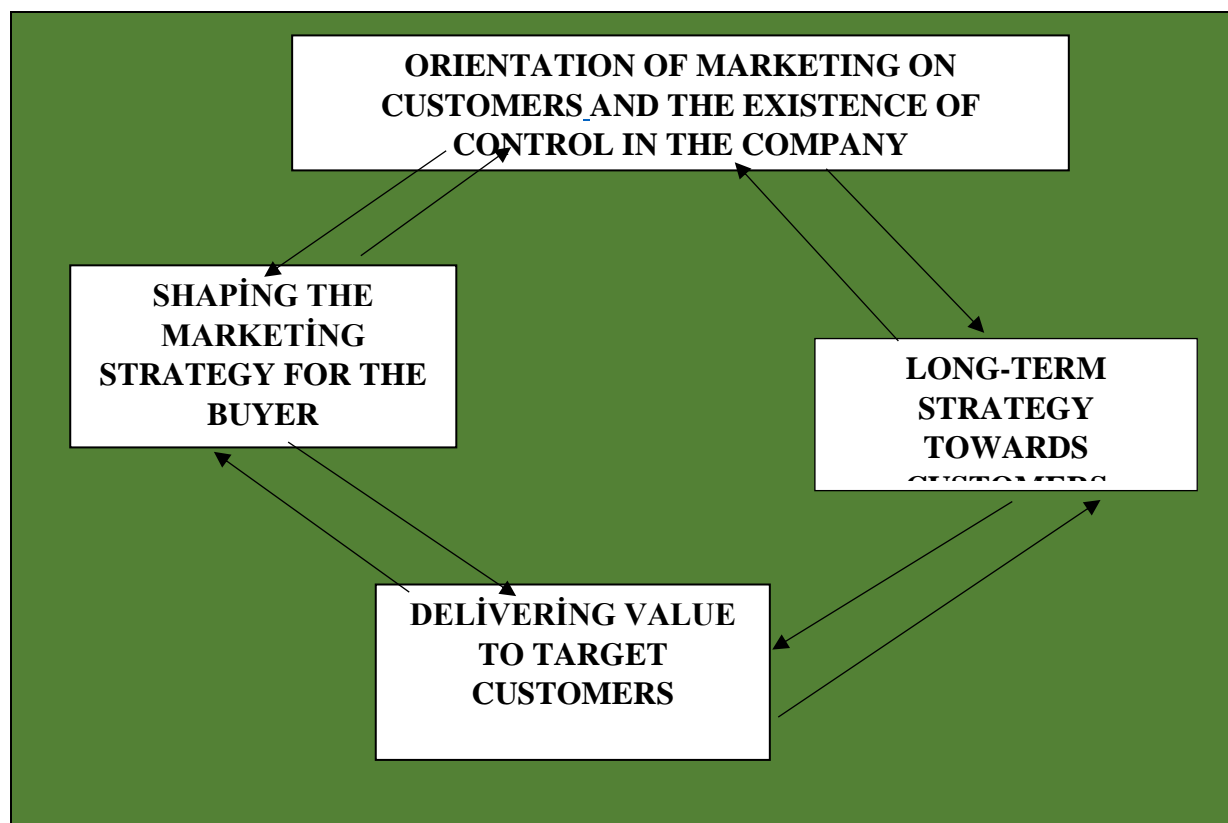

Figure 3: Presentation of management in companies that is oriented towards customer appreciation.

5. CONCLUSION

The use of internal audit as a form of control in creating and managing the marketing and financial management of numerous diverse companies in developing countries is one of the real forms of possible business improvement activities. It is the essence of highlighting the author, especially as marketing activities and financial management in companies can be seen in the context of the mechanisms introduced by internal audit created by the rarely decision by the top management. The authors pointed out the importance of the acts on the establishment of the same, the Code of Conduct between the Code between Top Management and the Appointed Internal Auditor is signed. It is presented to the basis for introducing such business in a large number of heterogeneous companies. It is essential to the basis of normative organization of operations in terms of internal audit, marketing and financial management. The application is possible in the business of a large number of companies that introduce a introducing form of control as a mechanism by means of achieving better business results, a given example of a more accurate development is a more precise example of business in the Republic of Serbia.

ABSTRACT

Fibrosarcoma is a mesenchymal tumor of malignant fibroblasts in a collagen background. It was reported in all species, but most commonly in older dogs and cats. This tumor often occurs on the head and limbs, but may also occur anywhere on the body. A 6-year-old male Persian cat (3/5 kg) with a raised mass on the right anterior limb was referred to the veterinary hospital. Based on owner information, within the previous 2-month period, the mass had become evident and grew larger. Finally, complete surgical removal was selected. On gross examination, the mass was approximately 8×10×12 mm in size. Macroscopically, the mass was well circumscribed, ulcerated, firm and white to yellow. Tissue samples of the mass were fixed in 10% neutral buffered formalin and routinely processed, dehydrated, embedded in paraffin wax, sectioned at 5µm in thickness and stained with Hematoxylin and Eosin and Masson's trichrome. Immunohistochemical studies of the mass sections were performed using Vimentin, SMA and Desmin. Microscopically, the mass was encapsulated and the dermis and subcutaneous area were expanded by spindle-shaped to polygonal neoplastic cells in the interwoven pattern and contained a single ovoid to polygonal nucleus and a moderate amount of eosinophilic cytoplasm. Nucleoli were often prominent. Mitotic figures were infrequent. The sections were positive for Masson's trichrome and Vimentin and negative for Desmin and SMA. Based on histopathological features, a well differentiated fibrosarcoma was diagnosed. No new growth of the mass was observed six months following the surgical procedures. The incidence of fibrosarcoma in cats has been rising in the last 20 years, most likely associated with vaccination. Similar to this case, surgical excision is the treatment of choice in this tumor.

Keyword: Cat, Cutaneous, Fibrosarcoma, Pathology

INTRODUCTION

Fibrosarcoma is a mesenchymal tumor of malignant fibroblasts in a collagen background with immature proliferating fibroblasts or undifferentiated anaplastic spindle-shaped cells arranged in distinct interwoven patterns (Hendrick, 2017). These tumors occur commonly in all domestic animal species (Hendrick, 2017; Modiano & Breen, 2007) and have been reported in cats (Strong et al., 2016), dogs (de Paula et al., 2021) and horses (Bass et al., 2017). This paper is about the macroscopic, surgical, and histopathological findings of a well differentiated cutaneous fibrosarcoma in a Persian cat.

CASE DESCRIPTION

In December 2022, a 6-year-old male Persian cat (3.5 Kg) with a raised mass on the lateral side of its right hind limb was referred to the hospital. Based on owner information, within the previous 2-month period the mass had become evident and grew larger. On physical examination vital signs such as pulse rate and respiratory rate were normal. Further clinical examination revealed no other physical abnormalities and complete surgical removal of the mass was chosen. The cat was anaesthetized with intravenous injections of ketamine and diazepam and maintained with 1%-2% isoflurane in oxygen. Analgesia was provided by subcutaneous injection of ketoprofen (for 3 days). On gross examination, the mass was approximately 8×10×12 mm in size. It was well circumscribed, ulcerated, firm and white to yellow. Tissue samples of the mass were fixed in 10% neutral buffered formalin, routinely processed, dehydrated, embedded in paraffin wax blocks, sectioned at 5µm thicknesses (Rotary Microtome RM2 145; Leica, Wetzlar, Germany) and stained with Hematoxylin & Eosin and Masson's Trichrome (Luna, 1968). Immunohistochemical studies of the mass were performed using Vimentin (V9, mouse monoclonal, dilution: 1/50, Dako, Denmark) (Luna, 1968), SMA (1A4, mouse monoclonal, dilution: 1/50, Dako, Denmark), and Desmin (D33, mouse monoclonal, dilution: 1/50, Dako, Denmark) (Vascellari et al., 2006). Sections were examined using a light microscope (E600; Nikon, Tokyo, Japan) and representative images were taken. Hemorrhage, necrosis and peripheral aggregates of lymphocytes were observed in the histopathological sections. Microscopically, the mass was encapsulated and the dermis were expanded by spindle-shaped to polygonal neoplastic cells. These cells were arranged in an interwoven pattern and contained a single ovoid to polygonal nucleus. Nucleoli were often prominent. Mitotic figures were infrequent. Some neoplastic cells had cellular and nuclear pleomorphism (Fig 1). Masson's trichrome demonstrated the positive and blue staining of collagen. Immunohistochemically, the sections were uniformly positive for Vimentin and negative for Desmin and SMA. Based on

histopathological, histochemical and immunohistochemical features, a well differentiated fibrosarcoma was diagnosed.

Figure 1: Well differentiated fibrosarcoma in a Persian cat. (a): spindle-shaped to polygonal neoplastic cells in an interwoven pattern. (b): Severe Hemorrhage (*). (c): Mitotic figures (arrowheads). (d): bizarre cell (arrowhead), H&E.

DISCUSSION

fibrosarcomas occur in all domestic animal species, but most commonly occur in adult and aged cats and dogs and can appear anywhere on the body (Hendrick, 2017). These tumors can range from well differentiated to more aggressive, but metastasis is uncommon (Hendrick, 2017). A well differentiated fibrosarcoma is composed of spindle cells, collagen and rare mitotic figures in the herringbone pattern (Hendrick, 2017; Van den Top et al, 2008). FeSV can also induce a rare and aggressive fibrosarcoma in cats. FeSV-induced tumors are multicentric and are found most frequently in young cats (Hartmann, 2011). These tumors are characterised by rapid growth. Metastasis to the lungs or other organs occurs with approximately 30% of virally induced fibrosarcomas in cats. However, only 2% of fibrosarcomas in cats are virally induced (Vail et al. (2020). Fibrosarcoma is the most common tumor of the cat. Its incidence has increased over the past 20 years, most probably due to its association with vaccination. There is significant overlap between fibrosarcomas and leiomyosarcomas in histopathological findings, thus making the use of special stains and immunohistochemical identification, essential for the final diagnosis.

Microscopically, leiomyosarcomas, unlike fibrosarcomas, have elongated nuclei, with blunt rounded ends and eosinophilic cytoplasm. Spindle cells with red cytoplasmic stain were not found among the blue collagen bundles on Masson's trichrome staining. The mass also stained negative for Desmin and SMA and positive for Vimentin. These results prove that this tumor could not have originated from muscle cells and it is a well differentiated fibrosarcoma. (Hendrick, 2017; Roccabianca et al, 2020). Similar this case, surgical excision is the treatment of choice for well differentiated fibrosarcoma (Hendrick, 2017).

CONCLUSION

Surgical excision remains the treatment of choice for fibrosarcomas in cats with radiation therapy as secondary treatment, particularly if surgical removal is difficult.

Abstract

In today's highly competitive job market, the demand for employable graduates who possess the necessary skills to succeed in their careers is on the rise. The aim of this study is to investigate the impact of employability skills on the career development of college students in Sangli district Maharashtra. The study employs a quantitative research design, utilizing surveys to collect data from college students. The study focuses on several key employability skills including communication skills, problem-solving skills, teamwork skills, leadership skills, and adaptability skills. These skills are widely recognized as critical for career success in various industries and are often sought after by employer. The research has conducted among a sample of 384 college students from diverse disciplines and academic backgrounds. The data has analyzed using statistical techniques such as regression analysis and correlation analysis to determine the relationship between employability skills and career development outcomes. The results of the study indicate that employability skills have a significant positive impact on the career development of college students in the Sangli district. The study further highlights the importance of specific employability skills. The findings of this study have important implications for educational institutions, policymakers, and employers in promoting the development of employability skills among college students and enhancing their career prospects.

Key words- Employability skills, career development, college students, educational institute.

Introduction

A strong academic record, along with the abilities and traits to adapt to and handle the ever-changing workplace environment, will increase your employability. For all employees nowadays, employability skills are crucial. The three key employability skills are fundamental abilities, personal development abilities, and time management. The employment market is more competitive today in a whole new way. The nature of technological abilities is evolving constantly. Basic knowledge is taught to students in institutions, but marketable skills are crucial for pupils. Employability is about a larger set of talents and traits that will enable a graduate to succeed throughout their work, not only about landing a job.

By choosing the Sangli District, we will assess the effect of employable skills on career development. We discovered that the researcher concentrates on the employability issue, which is now gaining a lot of attention, as well as the elements impacting employability abilities by critically assessing several literature reviews of different researchers from diverse fields of interest.

Research Problem

Here, we may observe different employability skills affect students' improvement in career development. Here, we can discover what kind of employability skills are needed by the industry. When students enhance skills that are useful for achieving targets and goals.

Statement of Research Problem

“A study on Impact of Employability Skill on Career Development of college students regarding Sangli District”

Objectives of the Study

1. To study the connection between career development and employability skills.
2. To learn more about employability skills' role in career progression.
3. To identify the impact of employability skills on job performance.
4. To examine the impact of employable skills on the degree of satisfaction.

Hypothesis

H0: There is a correlation between employability skills and career development.

H1: There is no correlation between employability skills and career development.

Importance of the study

The primary driving forces behind this study are students' perceptions of employability skills, their attitudes about career development, and whether or not they are aware of the kinds of skills that the market will want.

Research Methodology:

Type of Research: The social sciences frequently employ qualitative approaches to gather, contrast, and interpret data. These techniques include discourse analysis, interviews, surveys, records, and participant observation and have a linguistic-semiotic foundation. We are utilizing qualitative research in this study.

Data Required: For this study, primary or recent data have to be collected through a questionnaire, schedule, or interview.

Data Sources

Primary Data: Data are currently being gathered for research for the first time. It can be gathered using a variety of techniques, including in-person interviews, questionnaires, timetables, and observations. In this study, the main data collection tools were questionnaires and interviews.

Secondary Data: It is data that has already been released in publications such as books, journals, research papers, articles, periodicals, etc. Secondary data for this study was acquired through a review of earlier research papers.

Sampling:

A sample design is a predetermined strategy for choosing a population-representative sample. We employ the primary data and a snowball sampling strategy to collect the data for this study.

• **Qualitative research is a type of research.**

• **Primary and secondary data collection**

• **Number of Samples: 384**

Since it is hard to determine the precise number of responders in the Sangli District, we assume that there are an infinite number of persons. Therefore, we were going to use the following formula to determine the sample size:

The sample unit is equal to $Z^2 * P (1 - P) / e^2$.

We can get the sample size as **384** responders thanks to the formula.

Instrument: Several Excel formulas, graphs, and strategies will be used to analyze the data entered into an Excel spreadsheet once it has been collected using a questionnaire form. Excel and SPSS (Statistical Package for Social Sciences) are two of the best data analysis programs. It will be used under the guidance of qualified lecturers.

Data Analysis: SPSS and Excel is the greatest application for data analysis (Statistical Package for Social Sciences). I'll analyze the data with the help of this software. It is easy to operate.

Limitations of the study

1. The geographical area is vast and the total number of responses is limitless.
2. Time limit of research study.

3. Employer busy schedule they proper not responding on the questions.
4. Most of the student are not aware about employability skills how to developed.
5. Not easy to interact with all student personally.

Review of Literature

Kalbande and Handa (2015), and Mishra and Khurana (2017) Explaining selecting wisely employability abilities for graduates in engineering cannot be disregarded in terms of the global economy. The results of their investigation center on six crucial IT employment skills in industrial sectors like technological, individual, collective, general, and self-perceived skills.

Ahangar (2012) recognized that people with high emotional intelligence succeed more than persons with poor emotional intelligence because the former can manage people well, perform well under pressure, and adjust to organizational change. People with strong emotional intelligence also perform better under pressure.

Fajaryati, N.(2020) this study aimed to identify the employability skills needed in the targeted industry and how to incorporate them into the schooling process. In this study, a review of the literature showed that employability skills, including communication, teamwork, problem-solving, and technical aptitudes, are necessary for relation to future job needs, as decided by employers. The study found that integrating employability skills into all of the lessons students are taught in the classroom is the most effective way to educate them.

Fraser (2018) According to the report, it is becoming more crucial to understand how well higher education institutions prepare students for the workforce at all program levels. Vocational education training is one area where this is particularly clear. According to the study, the most important finding is that vocational educators are utilizing overt and covert strategies to improve their students' employability. This research has enhanced awareness of these strategies and intentionality.

S.K. Dhar (2012) it is irrelevant whether a business school receives the endorsement of government regulating authorities like the University Grant Commission (UGC) and the All India Council for Technical Education (AICTE). The organizations' offering of management degrees, diplomas, or certificate programs also ceases to matter. In the end, what matters is if the business school can alter the nature of learning through its cutting-edge course offerings, creative pedagogy, and andragogy. If students truly benefit from the MBA program, even if they do not receive campus placement, they will be able to join a reputable company through the procedure of off-campus placement.

S. Ravan (2016) did a study on the "Employability Skills Need of An Hour For MBA Students" and discovered that these days, employability skills are a must for all MBA students to land a job. Since just 10% of MBA students in India are reported to be employable, Therefore, these abilities are

taken into account by employers, and they include problem-solving abilities, interpersonal abilities, communication abilities, integrated and value-oriented abilities, result-oriented abilities, domain knowledge expertise, decision-making abilities, leadership abilities, team player abilities, etc. According to the findings mentioned above, there is a skills gap between the workforce and students as well as between the workplace and educational institutions. The university must adapt to meet industry needs and must respond to them.

K. A. Gowsalya (2016) found in their study "A study on the factors affecting employability skills among college students in Namakkal District of Tamil Nadu" that educators needed to incorporate employability skills into lessons and work more closely with employers to supplement academic learning while society and policymakers needed to ensure they had the proper data to make decisions and the stimulate economy and foster job creation as well as ensure young people. The curriculum continues to place more emphasis on academic than experiential learning.

Shah, Rajanibala J. (2014) the main determinants include self-awareness and analytical skills, general management and workplace culture, leadership, problem-solving skills, and communication. According to the report, management institutes should begin offering workshops and ongoing training to their students to familiarize them with the demands of the market and the many employers in various industries.

Bhatt (2011) noted that collaboration between business and academia is one way to address the issue of a lack of work readiness in the Indian IT sector. Many organizations have undertaken such initiatives to assist in bridging the training gap needed for the constantly shifting nature of the job market by helping to provide hopefuls with practical and soft skills as well as hands-on experience. However, there aren't many of these kinds of programs.

Rao (2010) (2010) argued that expert management of intellectual capital is essential for the Indian economy and might be a growth driver. Using pedagogy, evaluation procedures, and feedback systems, he advised the institutes to determine the employability skills needed by recent graduates and determine how they might provide value through effective knowledge management.

Data Analysis & Interpretation

i. Classification of responses based on gender

Gender	Respondents	Percentage
Male	210	55.00%
Female	174	45.00%
Total	384	100%

Interpretation:In this study it found that 55% respondents were male and remaining 45% respondents were female. Most of the respondents are students.

ii. Classification of responses based on age

Age	Respondents	Percentage
18-30	360	93.75%
31-40	24	6.25%
Total	384	100%

Interpretation:In this study it is found that 94% respondents are were between 13-30 age group and 6% respondents were between 31-40 age group.

iii. Classification of responses based on education

Education	Respondents	Percentage
Up to 10 th	0	0.00%
Up to 12 th	48	12.50%
Diploma	73	19.01%
Graduation	196	51.04%
Post-Graduation	67	17.45%
Total	384	100%

Interpretation:In this study it is found that out of 384 respondents, 51% respondents were graduated, 13% respondents were up to 12th, 19% respondents were Diploma pass, and remaining 17% were post-graduates. All were aware about employability skills.

iv. Classification of responses based on occupation

Occupation	Respondents	Percentage
Student	289	75.26%
Employee	71	18.49%
Businessman	24	6.25%
Total	384	100%

Interpretation:In this study it is found, students make up a significant portion of 384 respondents (75%, as shown in the following graph), 18% respondents were employee, and remaining 6% respondents were businessman.

v. Classification of responses based on awareness about industry needs

Awareness	Respondents	Percentage
Yes	337	87.76%
No	0	0.00%
Maybe	47	12.24%
Total	384	100%

Interpretation:In this study it is found 88% respondents were aware about the industry needs of employability skill and remaining 12% respondents are aware about industry needs but they don't know what type of skills are needed.

vi. Classification of responses based on work experience

Work Experience	Respondents	Percentage
Yes	215	55.99%
No	169	44.01%
Total	384	100%

Interpretation: In this study it is found that 56% respondents have a work experience, 26% respondents were don't have a work experience. Employe were aware about the industry need skills for career development.

vii. Classification of responses based on work experience impacts job performance

Impact on Job	Respondents	Percentage
Yes	311	80.99%
No	25	6.41%
Maybe	48	12.50%
Total	384	100%

Interpretation: In this study it is found that out of 384 respondent, 81% respondents were know employability skill impact on job performance, 6% respondents were choose no because skill are not impact on job performance, remaining 13% respondents were unaware about skills are impact on job performance.

viii. Classification of responses based on need skills of students by the industry

Satisfied with your Skill	Respondents	Percentage
Satisfied	264	68.75%
Neutral	25	6.51%
Unsatisfied	95	24.74%
Total	384	100%

Interpretation: In this study it is found that out of 384 respondent, 69% respondents were satisfied with their skills, 24% respondents were unsatisfied with their skills it want to improve their skills, and remaining 7% respondents were neutral.

ix. Classification of responses based on needs skills of students by the industry

Industry needs	Respondents	Percentage
Communication Skill	74	19.27%
Fundamental Skill	25	6.51%
Time management Skill	25	6.51%
People Management	3	0.78%
Problem-Solving Skill	25	6.51%
Technical Skill	0	0.005%
Leadership Skill	0	0.00%
All of the Above	232	60.42%
Total	384	100%

International Conference on Global Practice of Multidisciplinary Scientific Studies-IV
Turkish Republic of Northern Cyprus, April 28-30, 2023

Interpretation:In this study it is found that now a day in industry communication skill is must. 19% respondents were communication is must, 7% respondents were need fundamental skills, time management skill and problem solving skills, 1% respondents were need technical and people management skills and remaining 60% were all skill are prefeed as a industry need.

x. Classification of responses based on collage had organized any skill development program

Skill training	Respondents	Percentage
Yes	360	93.75%
No	24	6.25%
Total	384	100%

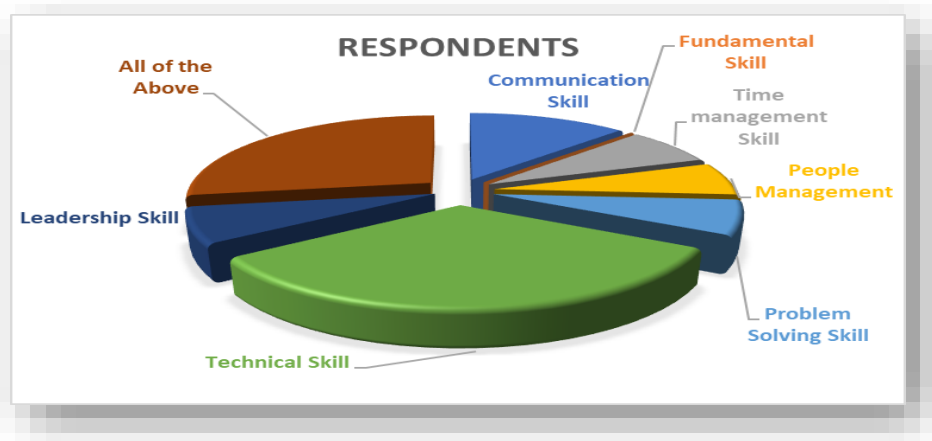

Interpretation:In this study it is found that out of 384 respondent, 94% respondents were colleges organized skill development program for students' career growth and remaining 6% were colleges are not organize skills development programs.

xi. Classification of responses based on the type of skill development program organized by the collage

Training Program	Respondents	Percentage
Communication Skill	45	11.72%
Fundamental Skill	0	0.00%
Time management Skill	26	6.77%
People Management	23	5.99%

International Conference on Global Practice of Multidisciplinary Scientific Studies-IV
Turkish Republic of Northern Cyprus, April 28-30, 2023

Problem Solving Skill	24	6.25%
Technical Skill	119	30.99%
Leadership Skill	25	6.51%
All of the Above	99	25.78%
Total	384	100%

Interpretation:In this study it is found that. 11% respondents were collages organize communication skills development program, 7% to 8% collages were organize time management skills, people management skills, leadership skill and problem solving skills for students, 31% collages were organize technical skill development programs for students, and remaining 26% collages were organize all type of employability skill program for student.

xi. Classification of responses based on the improvement of skill

Improvement in Skills	Respondents	Percentage
Communication Skill	211	54.95%
Experience	45	11.72%
Problem Solving Skill	51	13.28%
Technical Skill	72	18.75%
Total	384	100%

Interpretation: In this study it is found that out of 384 respondent, 55% respondents were improve the communication skill because industry need communication for interact with each other's, 13% respondents were improve problem solving skills, and 19% respondents were improve their technical skills for better performance in industry, remaining 12% respondents were need experience.

xii. Classification of responses based on time gives for personal development

Time	Respondents	Percentage
2 Hours	212	55.21%
more than 2 Hours	150	39.06%
more than 3 Hours	22	5.73%
Total	384	100%

Interpretation:In this study it found that 55% students and employes were send 2 hours for personal development, 39% students and employes were send more than 2 hours for personal development, and remaining 6% students and employes were send more than 3 hours for personal development.

xiii. Classification of responses based on importance of employability skill

Importance of skill	Respondents	Percentage
Improve efficiency	98	25.52%
build confidence	68	17.71%
Critical thinking and problem solving	35	9.11%
All of the Above	183	47.66%
Total	384	100%

Interpretation:In this study it is found that, 26% students were want to improve their efficiency, 18% students were want to build their confidence for face any type of problem, 9% students were want to improve problem solving skill and critical thinking skill, and remaining 47% student and employee want to enhance all type of employability skill for career growth.

xiv. Classification of responses based on improvement on employability skill

Improvement through	Respondents	Percentage
Taking challenges	50	13.02%
Think creative	97	25.26%
Job rotation	45	11.72%
Get opportunities	44	11.46%
All of above	148	38.54% ⁰⁰
Total	384	100%

Interpretation: In this study it is found that 13% student and employees were improve their skill through taking challenges, 25% students were improve their skill through creative thinking, 12% students were improve skills through job rotation and getting new opportunities, and remaining 39% were improve through all of above.

xv. Classification of responses based on relation between career development and skill development

Relation between carer and skills	Respondents	Percentage
Yes	384	100%
No	0	0.00%
Total	384	100%

Interpretation: In this study it is found that there is relation between skills development and career development.

xvi. Classification of responses based on skills helpful for growth

Skills helpful for growth	Respondents	Percentage
Strongly Disagree	0	0%
Disagree	26	6.77%
Neutral	24	6.25%
Agree	164	42.71%
Strongly Agree	170	44.27%
Total	384	100%

Interpretation: In this study it is found that, 44% respondents were strongly agreed skills helpful for career development, 43% respondents were agreed with skill helpful for career growth and 6% respondents were disagree and natural about the statement.

Hypothesis Testing

H₀ - There is a correlation between employability skills and career development.

H₁ - There is no correlation between employability skills and career development.

The sum of $(O - E^2)/E$	143.44
Square Root	11.95
Degree of Freedom	28
Significance level	0.05
χ^2 tabular value	41.33
χ^2 calculated value	11.95

Null Hypothesis (H₀): Calculated Value < Tabular Value

Alternative Hypothesis (H₁): Calculated Value > Tabular Value

Here, **11.95 < 41.33**

Through the above calculation, calculated value < Tabular value, so it is proved that Null hypothesis is accepted... There is a correlation between employability skills and career development.

Null (H₀) Hypothesis (Accepted): There is a correlation between employability skills and career development.

Alternative (H₁) Hypothesis (Rejected): There is no correlation between employability skills and career development.

Findings

- 1) Students make up a significant portion of 384 respondents (75%) 18% respondents were employee, and remaining 6% respondents were businessman.
- 2) 55% respondents were male and remaining 45% respondents were female. Most of the respondents are students.
- 3) 94% respondents are were between 13-30 age group and 6% respondents were between 31-40 age group.
- 4) 51% of respondents were graduated, 13% respondents were up to 12th, 19% respondents were Diploma pass, and remaining 17% were post-graduates. All were aware about employability skills.

- 5) 88% respondents were aware about the industry needs of employability skill and remaining 12% respondents are aware about industry needs but they don't know what type of skills are needed.
- 6) 56% respondents have a work experience, 26% respondents were don't have a work experience.
- 7) 81% respondents were know employability skill impact on job performance, 6% respondents were choose no because skill are not impact on job performance, remaining 13% respondents were unaware about skills are impact on job performance.
- 8) 69% respondents were satisfied with their skills, 24% respondents were unsatisfied with their skills it want to improve their skills, and remaining 7% respondents were neutral.
- 9) Now a day in industry communication skill is must. 19% respondents were communication is must, 7% respondents were need fundamental skills, time management skill and problem solving skills, and remaining 60% were all skill are prefeed as per industry need
- 10) As per the responses 94% respondents were colleges organized skill development program for students' career growth and remaining 6% were colleges are not organize skills development programs.
- 11) 11% respondents were collages organize communication skills development program, 7% to 8% collages were organize time management skills, people management skills, leadership skill and problem solving skills for students, 31% collages were organize technical skill development programs for students, and remaining 26% collages were organize all type of employability skill program for student.
- 12) As per the responses 55% respondents were improve the communication skill because industry need communication for interact with each other's, and 19% respondents were improve their technical skills for better performance in industry, remaining 12% respondents were need experience.
- 13) 55% students and employes were send 2 hours for personal development, 39% students and employes were send more than 2 hours for personal development.
- 14) As per the responses 26% students were want to improve their efficiency, 18% students were want to build their confidence for face any type of problem, 9% students were want to improve problem solving skill and critical thinking skill, and remaining 47% student and employee want to enhance all type of employability skill for career growth.
- 15) As per the responses, 13% student and employees were improve their skill through taking challenges, 25% students were improve their skill through creative thinking, 12% students were

improve skills through job rotation and getting new opportunities, and remaining 39% were improve through all of above.

16) As per the responses, 100% respondents are know there is relation between skills development and career development.

17) 44% respondents were strongly agreed skills helpful for career development, 43% respondents were agreed with skill helpful for career growth and 6% respondents were disagree and natural about the statement.

With the help of hypothesis testing, we are able to conclude that,

- There is a correlation between employability skills and career development.

Suggestions

1) Hold additional conference on employability skills development training programmer department will aid employees and assists business become more productive.

2) Lack of knowledge of employability skills programs and how it benefits both employer and students while working in the organization.

3) Student need improved their skills seriously

4) While college institution provides employability skills training program student have to attended need to mandatory from collages.

5) Most of the student are need to improved them communication skills because most of the organization needs good communication while presenting new idea.

6) According to student work skills strength student have to get these opportunities.

7) College institution need to motivated the all students by organizing motivational programmers

Conclusion:

When student get skills for the improving employability skill are given all of their legal rights and possibilities at work, the company will eventually expand. When a worker are fully skilled or student feel secure and comprehend the significance of the the task or job that has been assigned to them. By encouraging students to work hard for their jobs and the possibilities that are provided to them, you may gradually strengthen their resolve to put in even more effort for the firm. Provide career development opportunities. And student with high skills can easily get any opportunities for the career development. And get respect with in the organization equal opportunity will improve and competition increased in the organization that all helps to improved organization strengthen their resolve the problems and put in even more effort for the firm. giving all employees training

from the organization and improved organization's reputational society. Employability skills helps to improved individual strength. It will be helpful if they are aware of the issues that employees are having as result of not receiving training properly it is morally correct to do research on impact of employability skills on career development on students. In order to provide workers more training for skills development training. The company should provide more training session to newly joined employees. Proper career guidance can help to lead the student are not career focused when they lack the knowledge about the new and emerging careers and the factors around that could influence their career choice decisions.

INTERNET OF THINGS BASED PATIENT HEALTH MONITORING SYSTEM

Abhishek Anand , Sagaya Aurelia

Christ (Deemed to be University) Bangalore – 560029 abhishek.anand@mca.christuniversity.in,
sagaya.aurelia@christuniversity.in

Abstract

We live in a developing world. Nowadays everything is connected with technology. In this era, the Internet of things plays a significant role. Using the Internet of things makes technology very efficient. The Internet of Things (IoT) vision is increasingly being realized to facilitate convenient and efficient human living. To conduct effective IoT research using the most appropriate tools and techniques, we discuss recent research trends in the IoT area along with current challenges faced by the IoT research community. It is impossible to make things which we are thinking at one go so in this case the simulator plays a vital role. Developers use a simulator to structure their idea. Using a simulator makes their work productive and effective. Simulation helps them make critical changes without worrying too much. Using simulation reduces cost, wastage of time, modifies our product and stops the physical damage of product due to wrong connection.

Keywords: Internet of things, Sensor, health

INTRODUCTION

We can say technology is changing the world or we can say technology is ruling the world. In every field we use technology. We keep on depending on technology. Maybe in the future we will be depending on technology for everything. The Internet of things plays a key role in this part. IoT based systems are used for communication between sensed data and things and all other real-world objects/humans. So, it is impossible to make things which we are thinking at one go so in this case the simulator plays a vital role. Basically IoT simulators platform contains several types of virtual controllers' sensors /things so the developer can easily take all these things and design a circuit of the proposed system and write a code for all processing and execution. So, it can be quite easy to understand the requirements and manage cost efficiency and can know the real result of our proposed system.

According to that result the developer can easily modify and speed up the entire process of the system and develop a more powerful and effective system.

Domain

We all have heard somewhere that health is wealth from someone. But in this hectic era, we do not have time to take care of our health and our elder's health. Being healthy does not consist only of a healthy body but it also includes a healthy mind. Without being healthy you cannot get peace and a happy soul. Health is our treasure but we are losing it in present time. In this busy schedule people do not have time to keep track on their health that is why a health monitoring system that can automatically keep track on health status is a must. Nowadays technology is in every field. It will be better if we use technology in our health care system. Noticing all these points we develop a health monitoring system that automatically keeps track of our heart rate, temperature because due to heart attack many elder people die because no one feels this issue once the pain becomes various serious then people notice on that case people die so in this system one alarm system us about the condition of our health. That's why we use things speak. ThingSpeak is an open-source Internet of Things (IoT) application and API to store and retrieve data from things using the HTTP protocol over the Internet or via a Local Area Network. So the family member/Doctor can keep track of her/him health and decided to hospitalize or not or else take suggestion from family doctor. The traditional health monitoring system requires a lot of time like you have to go to hospital for your regular check up and then you have to wait for your turn. This takes a lot of time and effort. Sometime people do not want to see the doctor because they do not have time. The traditional health monitoring system is expensive too. But our proposed system is very efficient and does not take much time. You can check your status whenever you want. This proposed system will be extremely helpful for doctors too.

Because of this health monitoring system doctors will have more time to take care of other serious patient. Doctors can check patient's heart rate and temperature by our proposed health monitoring system.

Methodology

As we discussed previously, IoT simulator is used for creating a virtual circuit diagram and to write a program for all processes and execute it so the developer and researcher can simply test their hypothesis and develop a system without investing money and taking care of risk. If any kind of issue occurs then easily replicating and modifying also increases the performance of systems. Simulators have various simulation tools to develop a system and full-fill the research and customer recruitments. Simulators have sped up research and development in the field of cloud computing because it is difficult to gauge how well services are delivered in actual cloud settings. There are various open source IoT simulators available on the internet. Using those simulators we develop various systems after that we develop a real-world system. So, in simple words we can say that Simulation tools have also shown their significance in IoT systems and networks to bridge the gap between conceptual research and proof-of-concept execution.

In this paper we discussed three simulators

1. Tinkercad
2. Wokwi
3. Arduino on cloud

1. Tinkercad

Tinkercad is an open-source IoT simulators software. It is a one of the famous IoT simulators and user-friendly software which is used to design and develop a IoT based system. This software is quite easy to use and the beginners can also use this software to design a system. This software Facilitate the user to work on one side and all the list of components on another side of the screen so the user can easily drag and drop the components according to the recruitments for design our proposed system. So this system provides a web based user interface for interactive learning. It can be expressed as blocks, text options, or both in the code section. The simulation can begin, and the serial monitor will display the logs.

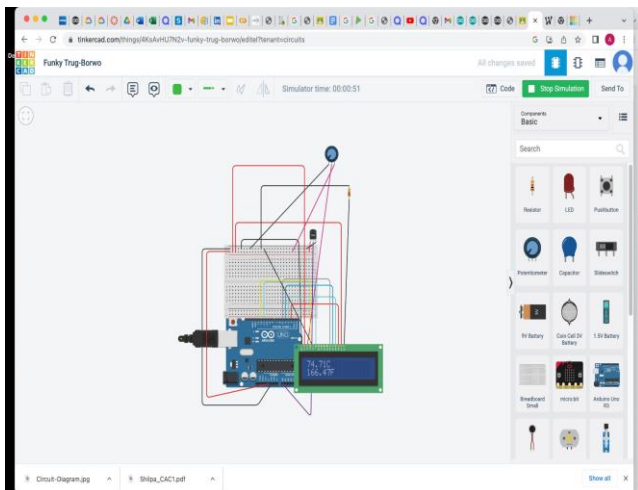

For Example: To implement patient health monitoring system requires a various sensor such as temperature sensor, pulse sensor, LCD(16X2) display, Buzzer and potentiometer..etc so some thesensor are available in this software.

Advantage

- It is user friendly
- It is easy to use
- It is open-source software
- Consist of various sensor
- It is very popular
- All the components are specified on a specific block.

Disadvantage

- It does not contain Pulse sensor
- It does not contain ESP 8266 wifimodule and esp 32

2. Wokwi

Wokwi is another open-source IoT simulator software. It is also trending software and also user-friendly. This software contains various controllers such as Arduino UNO, Mega, Nano, and several additional boards. This software is also easy to use by beginners because it does not require hardware. Just simply learn the Arduino programming language and design a circuit. In this software there are three buttons on top of the screen. The first one is play button for execution, the second one is the plus (+) button so clicking on that button we can easily select a controller, sensors, and things. ESP32 simulation on

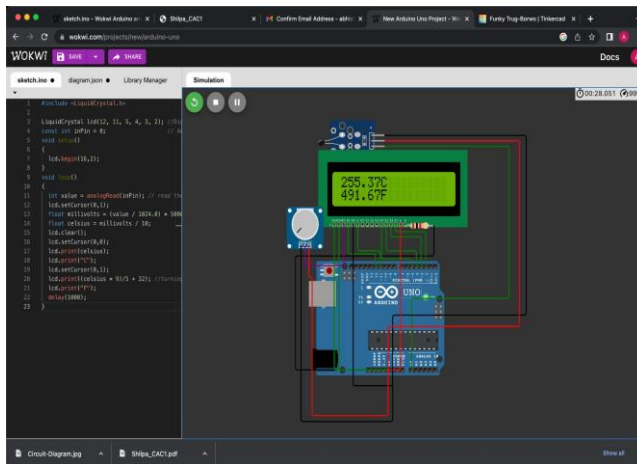

Micropython is now supported by WokwiArduino as well.

Advantage

- It is user friendly
- It is open-source software
- Consist of various sensor and boards
- It also support ESP32 board

Disadvantage

- It does not contain Pulse sensor
- It is difficult to use as compared toTinkercad

3. Arduino On Cloud

Arduino On Cloud is also a open-source IoT Simulator software powered by Arduino. This software have several controllers and sensors suchas Arduino UNO, Mega, and Nano. Keypads, LEDs, shift registers, buzzers, ultrasonic, temperature, humidity, and other sensors. In this software all the controllers and sensor categorizedin different block such as general, Controllers, Output, Input, Sources, Drivers and Miscellaneous. So the user can easily collect your recruitments on that specific block.

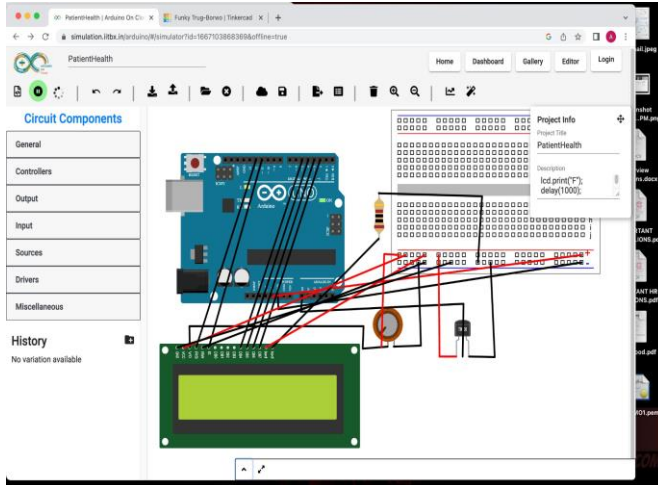

Advantage

- It is user friendly
- It is open-source software

- Consist of various sensor
- All the components are specified on aspecific block.

Disadvantage

- It does not contain Pulse sensor
- It is difficult to find a simulator firsttime.

Conclusion

This paper directly says that before applying concept on the hardware things first we need to use simulators then the developer can easily understand and implement without using hardware and also make it cost efficient and more powerful. This also says that each simulator has contain different component so the user can choose any of the best simulators for their own project and execute it.

J*P-IRRESOLUTE FUNCTIONS IN TOPOLOGICAL SPACES

Devayani J, Meenakshi PL

PG student, professor, Department of Mathematics,
Avinashilingam Institute for Home Science and Higher Education for women,
Coimbatore-641043, India.

E-mail: 21pma008@avinuty.ac.in

ABSTRACT:

The aim of this paper is to introduce some new class of functions called J*P-irresolute functions by using J*P-closed sets. The properties of J*P-irresolute functions are discussed. Different kinds of irresolute functions are introduced and characterized. Their interrelating properties are also obtained.

Keywords: J*P-irresolute, g-irresolute, J*P-closed, J*P-open, irresolute, δ g-irresolute, Contra J*P-irresolute.

INTRODUCTION:

Stone⁵³ (1937) defined the notion of regular open sets in his novel paper which related the theory of Boolean rings to General Topology. Mashhour et al³⁷ (1982) first studied the notion of pre open sets in topological spaces and obtained various properties. Levine³⁰ (1970) initiated the study of generalized closed sets in order to extend many of the important properties of closed sets to a larger family. Dunham¹⁸ (1982) has established a generalized closure using Levine's generalized closed sets as Cl^* . In 2016, Annalakshmi⁴ has introduced regular*-open (r^* -open sets) using Cl^* . Later in 2016, Meenakshi P L³⁸ has introduced a class of new sets namely η^* -open sets, a union of r^* -open sets, which is placed between δ -open set and open set. Meenakshi P L (2021) also introduced J-closed sets, J^* -closed sets, J^{**} -closed sets and J-irresolute functions. Its properties and characterization were established. Later, Malini R³⁶ (2022) has introduced J^*P -closed sets and their properties are studied. In this paper, J^*P -irresolute functions are introduced.

1. PRELIMINARIES

Definition 1.1

Let (L, ρ) be a topological space. If D is a non-empty subset of (L, ρ) then the intersection of all closed sets containing D is called closure of D and is denoted by $Cl(D)$.

The union of all open sets contained in D is called interior of D and is denoted by $int(D)$.

Definition 1.2

Let (L, ρ) be a topological space. A subset D of space (L, ρ) is called

- **regular closed set** (Stone, 1937) if $D = Cl(int(D))$
- **semi-closed set** (Levine, 1963) if $int(Cl(D)) \subseteq D$
- **α -closed set** (Njastad, 1965) if $Cl(int(Cl(D))) \subseteq D$
- **π -closed set** (Zaitsav, 1968) if it is the finite union of regular closed sets
- **pre-closed set** (Mashhour et al., 1982) if $Cl(int(D)) \subseteq D$
- **semi pre-closed set** (Andrijevic, 1986) if $int(Cl(int(D))) \subseteq D$

The complements of the above-mentioned sets are called **regular open, semi-open, α -open, π -open pre-open and semi pre-open sets** respectively.

The intersection of all **regular closed (resp. semi-closed, α -closed, π -closed, pre-closed and semi pre-closed)** subsets of (L, ρ) containing D is called the **regular closure (resp. Semi-closure, α -closure, π -closure, preclosure and semi pre-closure)** of D and is denoted by $rCl(D)$ (resp. $sCl(D)$, $\alpha Cl(D)$, $\pi Cl(D)$, $pCl(D)$ and $spCl(D)$).

Definition 1.3

The δ -interior (Velicko, 1968) of a subset D of L is the union of all regular open sets of L contained in D and is denoted by $\text{ints}(D)$. The subset D is called **δ -open** if $D = \text{ints}(D)$, i.e., a set is δ -open if it is the union of regular open sets, the complement of δ -open is called **δ -closed**.

Alternatively, a set $D \subseteq L$ is δ -closed if $D = \delta\text{Cl}(D)$, where $\delta\text{Cl}(D)$ is the intersection of all regular closed sets of (L, ρ) containing D .

Definition 1.4

A subset D of a topological space (L, ρ) is called **generalized Closed** (briefly **g-closed**) (Levine, 1970) if $\text{Cl}(D) \subseteq M$ whenever $D \subseteq M$ and M is open in (L, ρ) . The complement of g-closed is a **g-open set**.

Definition 1.5

[Pious Annalakshmi, 2016]: Let (L, ρ) be a topological space. A subset D of (L, ρ) is called **regular*-open (or r*-open)** if $D = \text{int}(\text{Cl}^*(D))$. The complement of regular*-open set is called **regular*-closed set**. The union of all regular*-open sets of L contained in D is called **regular*-interior** and is denoted by $r^*\text{int}(D)$. The intersection of all regular*-closed sets of L containing D is called **regular*-closure** is denoted by $r^*\text{Cl}(D)$.

Definition 1.6

[Meenakshi PL, 2019]: A subset D of a topological space (L, ρ) is called **η^* -open set** if it is a union of regular*-open sets (r^* -open sets). The complement of a η^* -open set is called a **η^* -closed set**. A subset D of a topological space (L, ρ) is called **η^* -Interior** of D is the union of all η^* -open sets of L contained in D . We denote the symbol by $\eta^*\text{-Int}(D)$. The intersection of all η^* -closed sets of L containing D is called **η^* -closure** and denoted by $\eta^*\text{-Cl}(D)$.

Definition 1.7

A subset D of a topological space (L, ρ) is called

1. **generalized semi-closed** (briefly **gs-closed**) (Arya et al., 1990) if $s\text{Cl}(D) \subseteq M$ whenever $D \subseteq M$ and M is open in (L, ρ) .
2. **regular generalized closed** (briefly **rg-closed**) (Palaniappan, et. al., 1993) if $\text{Cl}(D) \subseteq M$ whenever $D \subseteq M$ and M is regular open in (L, ρ) .
3. **regular weakly generalized closed** (briefly **rwg-closed**) (Nagaveni, 1999) if $\text{Cl}(\text{int}(D)) \subseteq M$ whenever $D \subseteq M$ and M is regular open in (L, ρ) .
4. **π -generalized closed** (briefly **π g-closed**) (Dontchev et.al., 2000) if $\text{Cl}(D) \subseteq M$ whenever $D \subseteq M$ and M is π -open in (L, ρ) .

5. **generalized δ -closed** (briefly **$g\delta$ -closed**) (Dontchev, 2000) if $sCl(D) \subseteq M$ whenever $D \subseteq M$ and M is δ -open in (L, ρ) .
6. **π -generalized semi-closed** (briefly **πgs -closed**) (Aslim et.al.,2006) if $sCl(D) \subseteq M$ whenever $D \subseteq M$ and M is π -open in (L, ρ) .
7. **π -generalized pre-closed** (briefly **πgp -closed**) (Park, 2006) if $pCl(D) \subseteq M$ whenever $D \subseteq M$ and M is π -open in (L, ρ) .
8. **π -generalized α -closed** (briefly **$\pi g\alpha$ -closed**) (Janaki, 2009) if $\alpha Cl(D) \subseteq M$ whenever $D \subseteq M$ and M is π -open in (L, ρ) .
9. **π -generalized semi pre-closed** (briefly **πgsp -closed**) (Sarsak,2010) if $spCl(D) \subseteq M$ whenever $D \subseteq M$ and M is π -open in (L, ρ) .
10. **generalized semi pre regular-closed** (briefly **$gspr$ -closed**) (Sarsak et.al.,2010) if $spCl(D) \subseteq M$ whenever $D \subseteq M$ and M is regular open in (L, ρ) .
11. **generalized pre regular-closed** (briefly **gpr -closed**) (Gnanambal, 1998) if $pCl(D) \subseteq M$ whenever $D \subseteq M$ and M is regular open in (L, ρ) .
12. **J-closed** [Meenakshi PL,2021] if $Cl(D) \subseteq M$ whenever $D \subseteq M$ and M is η^* -open in (L, ρ) .
13. **δ generalized -closed** (briefly **δg -closed**) (Dontchev, 1996) if $\delta Cl(D) \subseteq M$ whenever $D \subseteq M$ and M is open in (L, ρ) .
14. **δ generalized star -closed** (briefly **δg^* -closed**) (Sudha, 2014) if $\delta Cl(D) \subseteq M$ whenever $D \subseteq M$ and M is g -open in (L, ρ) .
15. **g^*s -closed** (Pushpalatha et al., 2000) if $Cl(D) \subseteq M$ whenever $D \subseteq M$ and M is gs -open in (L, ρ) .
16. **J^* -closed** [Meenakshi PL,2021] if $\eta^*Cl(D) \subseteq M$ whenever $D \subseteq M$ and M is η^* -open in (L, ρ) .
17. **J^{**} -closed** [Meenakshi PL,2021] if $\eta^*Cl(D) \subseteq M$ whenever $D \subseteq M$ and M is η^* -open in (L, ρ) .

The complements of the above-mentioned sets are called their respective open sets.

Remark 1.8

A topological space (L, ρ) is said to be a

1. **T_δ -space** (Dontchev, 2000) if every $g\delta$ -closed subset of (L, ρ) is δ -closed in (L, ρ) .
2. **$J^*P T_\delta$ -space** (Malini R,2022) when each J^*P - closed set is δ -closed in (L, ρ) .
3. **$g J^*P$ -space** (Malini R,2022) when each g - closed set is J^*P -closed in (L, ρ) .

4. $\alpha_g T_{J^*P}$ -space (Malini R,2022) when each α_g -closed set is J^*P -closed in (L,ρ) .
5. $g\delta T_{J^*P}$ -space (Malini R,2022) when each $g\delta$ -closed set is J^*P -closed in (L,ρ) .
6. $g_s T_{J^*P}$ -space (Malini R,2022) when each g_s -closed set is J^*P -closed in (L,ρ) .

Remark 1.9 [Meenakshi PL, 2019]:

- i. π -closed(open) \rightarrow regular closed (open) \rightarrow δ -closed (open) \rightarrow η^* -closed (open) \rightarrow closed(open) \rightarrow semi-closed(open) \rightarrow semi preclosed (open).
- ii. π -closed(open) \rightarrow regular closed(open) \rightarrow δ -closed(open) \rightarrow η^* -closed(open) \rightarrow closed(open) \rightarrow closed(open) \rightarrow α -closed(open).
- iii. π -closed(open) \rightarrow regular closed(open) \rightarrow δ -closed(open) \rightarrow η^* -closed(open) \rightarrow closed(open) \rightarrow g -closed(open).
- iv. π -closed(open) \rightarrow regular closed(open) \rightarrow δ -closed(open) \rightarrow η^* -closed(open) \rightarrow closed(open) \rightarrow pre-closed(open).

Definition 1.10

A subset D is said to be J^*P -closed if $\eta^*Cl(D) \subseteq M$, whenever $D \subseteq M$ and M is preopen in (L,ρ) .

Definition 1.11

A function $f: (L, \rho) \rightarrow (T, \sigma)$ is said to be

1. **strongly continuous** (Levine,1960) if the inverse image of every subset of (T,σ) is clopen in (L,ρ) .
2. **Continuous** (Levine,1970) if the inverse image of every closed set of (T,σ) is closed in (L,ρ) .
3. **J-continuous** (Meenakshi PL,2021) if the inverse image of every closed set of (T,σ) is J -closed in (L,ρ) .
4. **δ -continuous** (Noiri,1980) if for every δ -closed set V of (T,σ) , $f^{-1}(V)$ is a δ -closed set of (L,ρ) .
5. **totally continuous** (Jain,1980) if the inverse image of every open set of (T,σ) is clopen in (L,ρ) .
6. **Super continuous** (Munshi,1982) if for every closed set V of (T, σ) , $f^{-1}(V)$ is a δ -closed set of (L,ρ) .
7. **g -continuous** (Balachandran et al.,) if for every closed set V in (T,σ) , $f^{-1}(V)$ is a g -closed set in (L,ρ) .
8. **rg -continuous** (Palaniappan,et.al.,) if $f^{-1}(V)$ is a rg -closed set in (L,ρ) for every closed set V in (T, σ) .

9. **gs-continuous** (Devi et.al., 1993) if $f^{-1}(V)$ is a gs-closed set in (L, ρ) for every closed set V in (T, σ) .
10. **Contra continuous** (Dontchev, 1996) if the inverse image of every closed set of (T, σ) is an open set in (L, ρ) .
11. **δg -continuous** (Dontchev, 1996) if $f^{-1}(V)$ is a δg -closed set in (L, ρ) for every closed set V in (T, σ) .
12. **gpr-continuous** (Gnanambal, 1997) if $f^{-1}(V)$ is a gpr-closed set in (L, ρ) for every closed set V in (T, σ) .
13. **rwg-continuous** (Nagaveni, 1999) if $f^{-1}(V)$ is a rwg-closed set in (L, ρ) for every closed set V in (T, σ) .
14. **$g\delta$ -continuous** (Dontchev, 2000) if $f^{-1}(V)$ is a $g\delta$ -closed set in (L, ρ) for every closed set V in (T, σ) .
15. **\hat{g} -continuous** (Veerakumar, 2003) if $f^{-1}(V)$ is a \hat{g} -open set in (L, ρ) for every open set V in (T, σ) .
16. **πgp -continuous** (Park, 2004) if $f^{-1}(V)$ is a πgp -closed set in (L, ρ) for every closed set V in (T, σ) .
17. **πgs -continuous** (Aslim, 2006) if $f^{-1}(V)$ is a πgs -closed set in (L, ρ) for every closed set V in (T, σ) .
18. **$\pi g\alpha$ -continuous** (Park, 2004) if $f^{-1}(V)$ is a $\pi g\alpha$ -closed set in (L, ρ) for every closed set V in (T, σ) .
19. **πg -continuous** (Ekici et.al., 2007) if $f^{-1}(V)$ is a πg -closed set in (L, ρ) for every closed set V in (T, σ) .
20. **πgsp -continuous** (Park, 2004) if $f^{-1}(V)$ is a πgsp -closed set in (L, ρ) for every closed set V in (T, σ) .
21. **gspr-continuous** (Devi et.al., 1993) if $f^{-1}(V)$ is a gspr-closed set in (L, ρ) for every closed set V in (T, σ) .
22. **g^*s -continuous** (Pushpalatha et.al.,) if $f^{-1}(V)$ is a g^*s -closed set in (L, ρ) for every closed set V in (T, σ) .
23. **δg^* -continuous** (Pushpalatha et.al.,) if $f^{-1}(V)$ is a δg^* -closed set in (L, ρ) for every closed set V in (T, σ) .

Definition 1.12

A function $f: (L, \rho) \rightarrow (T, \sigma)$ is said to be

1. **irresolute** (Crossley, 1972) if for every semi-open set V in (T, σ) , $f^{-1}(V)$ is a semi-open set in (L, ρ) .
2. **g-irresolute** (Balachandran, 1991) if for every g-open set V in (T, σ) , $f^{-1}(V)$ is a g-open set in (L, ρ) .
3. **gs-irresolute** (Devi, 1995) if for every gs-open set V in (T, σ) , $f^{-1}(V)$ is a gs-open set in (L, ρ) .
4. **δ g-irresolute** (Dontchev, 1996) if for every δ g-open set V in (T, σ) , $f^{-1}(V)$ is a δ g-open set in (L, ρ) .
5. **contra irresolute** (Miguel Caldas Cueva, 2000) if for each semi-open set V in (T, σ) , $f^{-1}(V)$ is a semi-closed set in (L, ρ) .
6. **$g\delta$ -irresolute** (Dontchev, 2000) if for every $g\delta$ -open set V in (T, σ) , $f^{-1}(V)$ is a $g\delta$ -open set in (L, ρ) .
7. **g^*s -irresolute** (Pushpalatha, 2011) if for every g^*s -open set V in (T, σ) , $f^{-1}(V)$ is a g^*s -open set in (L, ρ) .
8. **δg^* -irresolute** (Sudha, 2014) if for every δg^* -open set V in (T, σ) , $f^{-1}(V)$ is a δg^* -open set in (L, ρ) .

2.J*P-IRRESOLUTE FUNCTIONS IN TOPOLOGICAL SPACES

2.1 Introduction

Crossley and Hildebrand introduced the concepts pre semi open and irresolute functions using semi open sets. Every continuous, open function is irresolute as well as pre semi open but not conversely. In 2021, Meenakshi PL has introduced J-irresolute functions. In this chapter, the concepts of a new type of functions namely J*P-irresolute functions are introduced. The study of independency and dependency of the J*P-irresolute functions with other existing functions in the literature is done. Furthermore, contra J*P -irresolute functions are introduced and the properties under composition of functions are analysed.

2.2 J*P-Irresolute Functions

The J*P-irresolute functions are studied and investigated here.

Definition 2.2.1

A function $f: (L, \rho) \rightarrow (T, \sigma)$ is said to be J*P-irresolute function if the inverse image of every J*P-open set in (T, σ) is J*P-open in (L, ρ) .

Example 2.2.2

Let $f:(L, \rho) \rightarrow (T, \sigma)$ be the identity function. consider $L=T=\{a,b,c\}$ with $\rho=\{L, \emptyset, \{a\}\}$ and $\sigma = \{T, \emptyset, \{a\}, \{a, b\}\}$. We have $J^*PO(L, \rho)= \{L, \emptyset, \{a\}\}$ and $J^*PO(T, \sigma)=\{T, \emptyset, \{a\}\}$. Then f is J^*P -irresolute function.

Proposition 2.2.3

A J^*P -continuous function $f:(L, \rho) \rightarrow (T, \sigma)$ is a J^*P - irresolute function but not conversely.

Proof:

Given that $f:(L, \rho) \rightarrow (T, \sigma)$ is a J^*P -continuous function. Let V be any open set in (T, σ) , Which implies that V is J^*P -open in (T, σ) . since f is J^*P -continuous function, $f^{-1}(V)$ is J^*P -open in (L, ρ) . Hence f is J^*P - irresolute function.

Counter Example 2.2.4

Let $f:(L, \rho) \rightarrow (T, \sigma)$ be the identity function. consider $L=T=\{a,b,c\}$ with $\rho=\{L, \emptyset, \{a\}, \{a,b\}, \{a,c\}\}$ and $\sigma = \{T, \emptyset, \{a\}, \{a, b\}\}$. We have $J^*PO(L, \rho)= \{L, \emptyset, \{a\}\}$ and $J^*PO(T, \sigma)=\{T, \emptyset, \{a\}\}$. Then f is J^*P -irresolute but not J^*P -continuous function.

Proposition 2.2.5

A totally J^*P -continuous function $f:(L, \rho) \rightarrow (T, \sigma)$ is a J^*P -irresolute function but not conversely.

Proof:

Given $f:(L, \rho) \rightarrow (T, \sigma)$ is a totally J^*P -continuous function. Let V be any open set in (T, σ) , Which implies that V is J^*P -open in (T, σ) . since f is a totally J^*P -continuous function, $f^{-1}(V)$ is J^*P -clopen in (L, ρ) . Then $f^{-1}(V)$ is J^*P -open in (L, ρ) . Hence f is J^*P -irresolute function.

Counter Example 2.2.6

In the **Example 2.2.2**, f is a J^*P -irresolute function but not totally J^*P -continuous function. Because for the open set $\{a\}$ in (T, σ) , its inverse image is not J^*P -clopen in (L, ρ) .

Proposition 2.2.7

A strongly J^*P -continuous function $f:(L, \rho) \rightarrow (T, \sigma)$ is a J^*P -irresolute function but not conversely.

Proof:

Given $f:(L, \rho) \rightarrow (T, \sigma)$ is a strongly J^*P -continuous function. Let V be a J^*P -open set in (T, σ) . since f is a strongly J^*P -continuous function, $f^{-1}(V)$ is J^*P -clopen in (L, ρ) . Then $f^{-1}(V)$ is J^*P -open in (L, ρ) . Hence f is J^*P -irresolute function.

Remark 2.2.8

The converse of the above Proposition 2.2.7 is not true. Let us see in the following Counter Example.

Counter Example 2.2.9

In the **Example 2.2.2**, f is a J^*P -irresolute function but not strongly J^*P -continuous function. Because for the subset $\{a\}$ in (T, σ) , its inverse image is not J^*P -clopen in (L, ρ) .

Proposition 2.2.10

A quasi totally J^*P -continuous function $f: (L, \rho) \rightarrow (T, \sigma)$ is a J^*P -irresolute function but not conversely.

Proof:

Given $f: (L, \rho) \rightarrow (T, \sigma)$ is a quasi totally J^*P -continuous function. Let V be any J^*P -open set in (T, σ) . since f is a quasi totally J^*P -continuous function, $f^{-1}(V)$ is clopen in (L, ρ) which implies that $f^{-1}(V)$ is J^*P -open in (L, ρ) . Hence f is J^*P -irresolute function.

Remark 3.2.11

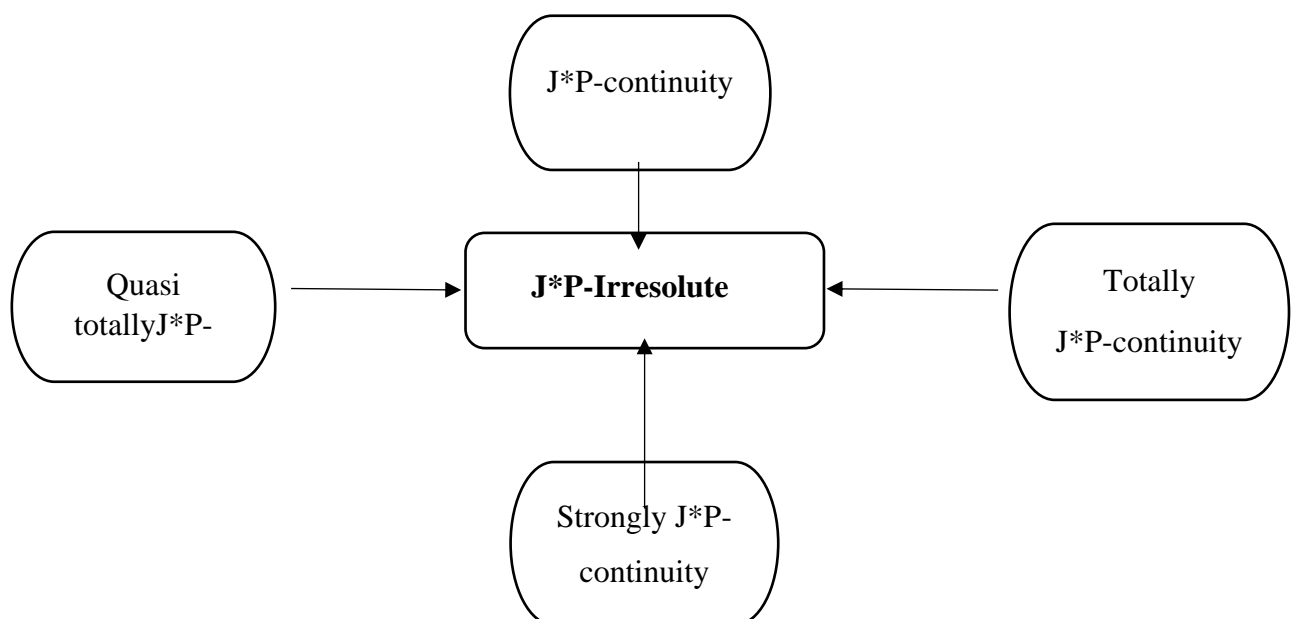

The converse of the above **Proposition 2.2.10** is not true. Let us see in the following Counter Example

Counter Example 2.2.12

In the **Example 2.2.2**, f is a J^*P -irresolute function but not quasi totally J^*P -continuous function. Because for the J^*P -open set $\{a\}$ in (T, σ) , its inverse image is not clopen in (L, ρ) .

Result 2.2.13

From the above discussion, we get the following diagram:

Note 2.2.14

In general J^*P -irresolute functions and irresolute functions are independent. It can be shown in the following Counter Examples.

Counter Example 2.2.15

Let $f: (L, \rho) \rightarrow (T, \sigma)$ be the identity function. consider $L=T=\{a,b,c\}$ with $\rho=\{L, \emptyset, \{a\}, \{b,c\}\}$ and $\sigma = \{T, \emptyset, \{a\}, \{a,b\}, \{a,c\}\}$. We have $J^*PO(L, \rho)=\{L, \emptyset, \{a\}, \{b,c\}\}$, $J^*PO(T, \sigma)=\{T, \emptyset, \{a\}\}$, $sO(L, \rho)=\{L, \emptyset, \{a\}, \{b,c\}\}$ and $sO(T, \sigma)=\{T, \emptyset, \{a\}, \{a,b\}, \{a,c\}\}$. Then f is J^*P -irresolute function but not irresolute function. Because for the semi-open sets $\{a,b\}$ and $\{a,c\}$ in (T, σ) , its inverse images are not semi-open in (L, ρ) .

Counter Example 2.2.16

Let $f: (L, \rho) \rightarrow (T, \sigma)$ be the identity function. consider $L=T=\{a,b,c\}$ with $\rho=\{L, \emptyset, \{a\}, \{b\}, \{a,b\}\}$ and $\sigma=\{T, \emptyset, \{a\}, \{b\}, \{a,b\}, \{a,c\}\}$. We have $J^*PO(L, \rho)=\{L, \emptyset, \{a\}, \{b\}, \{a,b\}\}$, $J^*PO(T, \sigma)=\{T, \emptyset, \{a\}, \{b\}, \{a,b\}, \{a,c\}\}$, $sO(L, \rho)=\{L, \emptyset, \{a\}, \{b\}, \{a,b\}, \{a,c\}, \{b,c\}\}$ and $sO(T, \sigma)=\{T, \emptyset, \{a\}, \{b\}, \{a,b\}, \{a,c\}\}$. Then f is irresolute function but not J^*P -irresolute function. Because for the J^*P -open set $\{a,c\}$ in (T, σ) , its inverse image is not J^*P -open in (L, ρ) .

Remark 2.2.17

The following Counter Examples shows that g -irresolute functions and J^*P -irresolute functions are independent.

Counter Example 2.2.18

Let $f: (L, \rho) \rightarrow (T, \sigma)$ be the identity function. consider $L=T=\{a,b,c\}$ with $\rho=\{L, \emptyset, \{a\}, \{a,b\}\}$ and $\sigma=\{T, \emptyset, \{a\}\}$. We have $J^*PO(L, \rho)=\{L, \emptyset, \{a\}\}$, $J^*PO(T, \sigma)=\{T, \emptyset, \{a\}\}$, $gO(L, \rho)=\{L, \emptyset, \{a\}, \{b\}, \{a,b\}\}$ and $gO(T, \sigma)=\{T, \emptyset, \{a\}, \{b\}, \{c\}, \{a,b\}, \{a,c\}\}$. Then f is J^*P -irresolute function but not g -irresolute function. Because for the g -open set $\{c\}$ in (T, σ) , its inverse image is not g -open in (L, ρ) .

Counter Example 2.2.19

Let $f: (L, \rho) \rightarrow (T, \sigma)$ be the identity function. consider $L=T=\{a,b,c\}$ with $\rho=\{L, \emptyset, \{a\}, \{a,b\}\}$ and $\sigma=\{T, \emptyset, \{a\}, \{b\}, \{a,b\}\}$. We have $J^*PO(L, \rho)=\{L, \emptyset, \{a\}\}$, $J^*PO(T, \sigma)=\{T, \emptyset, \{a\}, \{b\}, \{a,b\}\}$, $gO(L, \rho)=\{L, \emptyset, \{a\}, \{b\}, \{a,b\}\}$ and $gO(T, \sigma)=\{T, \emptyset, \{a\}, \{b\}, \{a,b\}\}$. Then f is g -irresolute function but not J^*P -irresolute function. Because for the J^*P -open set $\{b\}$ in (T, σ) , its inverse image is not J^*P -open in (L, ρ) .

Remark 2.2.20

The following Counter Examples shows that δg -irresolute functions and J^*P -irresolute functions are independent.

Counter Example 2.2.21

Consider the **Counter Example 3.2.18**, $\delta gO(L, \rho) = \{L, \emptyset, \{a\}, \{b\}, \{a,b\}\}$ and $\delta gO(T, \sigma) = \{T, \emptyset, \{a\}, \{b\}, \{c\}, \{a,b\}, \{a,c\}\}$. Then f is J^*P -irresolute function but not δg -irresolute function. Because for the δg -open set $\{c\}$ in (T, σ) , its inverse image is not δg -open in (L, ρ) .

Counter Example 2.2.22

Consider the **Counter Example 3.2.19**, $\delta gO(L, \rho) = \{L, \emptyset, \{a\}, \{b\}, \{a,b\}\}$ and $\delta gO(T, \sigma) = \{T, \emptyset, \{a\}, \{b\}, \{a,b\}\}$. Then f is δg -irresolute function but not J^*P -irresolute function. Because for the J^*P -open set $\{b\}$ in (T, σ) , its inverse image is not J^*P -open in (L, ρ) .

Remark 2.2.23

The following Counter Examples shows that δg^* -irresolute functions and J^*P -irresolute functions are independent.

Counter Example 2.2.24

Let $f: (L, \rho) \rightarrow (T, \sigma)$ be the identity function. consider $L=T=\{a,b,c\}$ with $\rho = \{L, \emptyset, \{a\}\}$ and $\sigma = \{T, \emptyset, \{a\}, \{a,b\}\}$. We have $J^*PO(L, \rho) = \{L, \emptyset, \{a\}\}$, $J^*PO(T, \sigma) = \{T, \emptyset, \{a\}\}$, $\delta g^*O(L, \rho) = \{L, \emptyset, \{a\}\}$ and $\delta g^*O(T, \sigma) = \{T, \emptyset, \{a\}, \{b\}, \{a,b\}\}$. Then f is J^*P -irresolute function but not δg^* -irresolute function. Because for the δg^* -open set $\{b\}$ in (T, σ) , its inverse image is not δg^* -open in (L, ρ) .

Counter Example 2.2.25

Consider the **Counter Example 3.2.19**, $\delta g^*O(L, \rho) = \{L, \emptyset, \{a\}, \{b\}, \{a,b\}\}$ and $\delta g^*O(T, \sigma) = \{T, \emptyset, \{a\}, \{b\}, \{a,b\}\}$. Then f is δg^* -irresolute function but not J^*P -irresolute function. Because for the J^*P -open set $\{b\}$ in (T, σ) , its inverse image is not J^*P -open in (L, ρ) .

Remark 2.2.26

The following Counter Examples shows that $g\delta$ -irresolute functions and J^*P -irresolute functions are independent.

Counter Example 2.2.27

Let $f:(L, \rho) \rightarrow (T, \sigma)$ be the identity function. consider $L=T=\{a,b,c\}$ with $\rho=\{L, \emptyset, \{a\}, \{b\}, \{a,b\}\}$ and $\sigma=\{T, \emptyset, \{a\}\}$. We have $J^*PO(L, \rho)=\rho$, $J^*PO(T, \sigma)=\sigma$, $g\delta O(L, \rho)=\{L, \emptyset, \{a\}, \{b\}, \{a,b\}\}$ and $g\delta O(T, \sigma)=P(T)$. Then f is J^*P -irresolute function but not $g\delta$ -irresolute function. Because for the $g\delta$ -open set $\{c\}$ in (T, σ) , its inverse image is not $g\delta$ -open in (L, ρ) .

Counter Example 2.2.28

Let $f:(L, \rho) \rightarrow (T, \sigma)$ be the identity function. consider $L=T=\{a,b,c\}$ with $\rho=\{L, \emptyset, \{a\}\}$ and $\sigma=\{T, \emptyset, \{a\}, \{b\}, \{a,b\}\}$. We have $J^*PO(L, \rho)=\{L, \emptyset, \{a\}\}$, $J^*PO(T, \sigma)=\{T, \emptyset, \{a\}, \{b\}, \{a,b\}\}$, $g\delta O(L, \rho)=P(L)$ and $g\delta O(T, \sigma)=\{T, \emptyset, \{a\}, \{b\}, \{a,b\}\}$. Then f is $g\delta$ -irresolute function but not J^*P -irresolute function. Because for the J^*P -open set $\{b\}$ in (T, σ) , its inverse image is not J^*P -open in (L, ρ) .

Remark 2.2.29

The following Counter Examples shows that g_s -irresolute functions and J^*P -irresolute functions are independent.

Counter Example 2.2.30

Let $f:(L, \rho) \rightarrow (T, \sigma)$ be the identity function. consider $L=T=\{a,b,c\}$ with $\rho=\{L, \emptyset, \{a\}, \{a,b\}\}$ and $\sigma=\{T, \emptyset, \{a\}\}$. We have $J^*PO(L, \rho)=\{L, \emptyset, \{a\}\}$, $J^*PO(T, \sigma)=\{T, \emptyset, \{a\}\}$, $g_s O(L, \rho)=\{L, \emptyset, \{a\}, \{b\}, \{a,b\}, \{a,c\}\}$ and $g_s O(T, \sigma)=\{T, \emptyset, \{a\}, \{b\}, \{c\}, \{a,b\}, \{a,c\}\}$. Then f is J^*P -irresolute function but not g_s -irresolute function. Because for the g_s -open set $\{c\}$ in (T, σ) , its inverse image is not g_s -open in (L, ρ) .

Counter Example 2.2.31

Let $f:(L, \rho) \rightarrow (T, \sigma)$ be the identity function. consider $L=T=\{a,b,c\}$ with $\rho=\{L, \emptyset, \{a\}, \{a,b\}\}$ and $\sigma=\{T, \emptyset, \{a\}, \{b\}, \{a,b\}, \{a,c\}\}$. We have $J^*PO(L, \rho)=\{L, \emptyset, \{a\}\}$, $J^*PO(T, \sigma)=\{T, \emptyset, \{a\}, \{b\}, \{a,b\}, \{a,c\}\}$, $g_s O(L, \rho)=\{L, \emptyset, \{a\}, \{b\}, \{a,b\}, \{a,c\}\}$ and $g_s O(T, \sigma)=\{T, \emptyset, \{a\}, \{b\}, \{a,b\}, \{a,c\}\}$. Then f is g_s -irresolute function but not J^*P -irresolute function. Because for the J^*P -open set $\{b\}$ in (T, σ) , its inverse image is not J^*P -open in (L, ρ) .

Remark 2.2.32

The following Counter Examples shows that g^*s -irresolute functions and J^*P -irresolute functions are independent.

Counter Example 2.2.33

Let $f:(L, \rho) \rightarrow (T, \sigma)$ be the identity function. consider $L=T=\{a,b,c\}$ with $\rho=\{L, \emptyset, \{a\}, \{b,c\}\}$ and $\sigma=\{T, \emptyset, \{a\}, \{a,b\}, \{a,c\}\}$. We have $J^*PO(L, \rho)=\{L, \emptyset, \{a\}, \{b,c\}\}$, $J^*PO(T, \sigma)=\{T, \emptyset, \{a\}\}$,

$g^*sO(L, \rho) = \{L, \emptyset, \{a\}, \{b, c\}\}$ and $g^*sO(T, \sigma) = \{T, \emptyset, \{a\}, \{a, b\}, \{a, c\}\}$. Then f is J^*P -irresolute function but not g^*s -irresolute function. Because for the g^*s -open set $\{a, b\}$ in (T, σ) , its inverse image is not g^*s -open in (L, ρ) .

Counter Example 2.2.34

Let $f: (L, \rho) \rightarrow (T, \sigma)$ be the identity function. consider $L=T=\{a, b, c\}$ with $\rho = \{L, \emptyset, \{a\}, \{b\}, \{a, b\}\}$ and $\sigma = \{T, \emptyset, \{a\}, \{b, c\}\}$. We have $J^*PO(L, \rho) = \{L, \emptyset, \{a\}, \{b\}, \{a, b\}\}$, $J^*PO(T, \sigma) = \{T, \emptyset, \{a\}, \{b, c\}\}$, $g^*sO(L, \rho) = \{L, \emptyset, \{a\}, \{b\}, \{a, b\}, \{a, c\}, \{b, c\}\}$ and $g^*sO(T, \sigma) = \{T, \emptyset, \{a\}, \{b, c\}\}$. Then f is g^*s -irresolute function but not J^*P -irresolute function. Because for the J^*P -open set $\{b, c\}$ in (T, σ) , its inverse image is not J^*P -open in (L, ρ) .

Remark 2.2.35

The following Counter Examples shows that rg -irresolute functions and J^*P -irresolute functions are independent.

Counter Example 2.2.36

Let $f: (L, \rho) \rightarrow (T, \sigma)$ be the identity function. consider $L=T=\{a, b, c\}$ with $\rho = \{L, \emptyset, \{a\}, \{b\}, \{a, b\}\}$ and $\sigma = \{T, \emptyset, \{a\}\}$. We have $J^*PO(L, \rho) = \{L, \emptyset, \{a\}, \{b\}, \{a, b\}\}$, $J^*PO(T, \sigma) = \{T, \emptyset, \{a\}\}$, $rgO(L, \rho) = \{L, \emptyset, \{a\}, \{b\}, \{c\}, \{a, b\}\}$ and $rgO(T, \sigma) = P(T)$. Then f is J^*P -irresolute function but not rg -irresolute function. Because for the rg -open set $\{a, c\}$ in (T, σ) , its inverse image is not rg -open in (L, ρ) .

Counter Example 2.2.37

Let $f: (L, \rho) \rightarrow (T, \sigma)$ be the identity function. consider $L=T=\{a, b, c\}$ with $\rho = \{L, \emptyset, \{a\}\}$ and $\sigma = \{T, \emptyset, \{a\}, \{b\}, \{a, b\}\}$. We have $J^*PO(L, \rho) = \{L, \emptyset, \{a\}\}$, $J^*PO(T, \sigma) = \{T, \emptyset, \{a\}, \{b\}, \{a, b\}\}$, $rgO(L, \rho) = P(L)$ and $rgO(T, \sigma) = \{T, \emptyset, \{a\}, \{b\}, \{c\}, \{a, b\}\}$. Then f is rg -irresolute function but not J^*P -irresolute function. Because for the J^*P -open set $\{b\}$ in (T, σ) , its inverse image is not J^*P -open in (L, ρ) .

Result 2.2.38

From the above discussion, we get the following diagram:

2.3 Contra J*P-Irresolute Functions

Definition 2.3.1

A function $f:(L, \rho) \rightarrow (T, \sigma)$ is said to be contra J*P-irresolute function if the inverse image of every J*P-closed set in (T, σ) is J*P-open in (L, ρ) .

Example 2.3.2

Let $f:(L, \rho) \rightarrow (T, \sigma)$ be the bijective function defined by $f(a)=b$, $f(b)=a$ and $f(c)=c$. consider $L=T=\{a,b,c\}$ with $\rho=\{L, \emptyset, \{a\}, \{b\}, \{a,b\}, \{a,c\}\}$ and $\sigma = \{T, \emptyset, \{a\}, \{b, c\}\}$. We have $J^*PO(L, \rho)=\rho$ and $J^*PC(T, \sigma)=\sigma$. Then f is contra J*P-irresolute function.

Proposition 2.3.3

A strongly J*P-continuous function $f:(L, \rho) \rightarrow (T, \sigma)$ is a contra J*P-irresolute function but not conversely.

Proof:

Given $f:(L, \rho) \rightarrow (T, \sigma)$ is a strongly J*P-continuous function. Let V be a J*P-closed set in (T, σ) . since f is a strongly J*P-continuous function, $f^{-1}(V)$ is J*P-clopen in (L, ρ) which implies that $f^{-1}(V)$ is J*P-open in (L, ρ) . Hence f is contra J*P-irresolute function.

Counter Example 2.3.4

Let $f:(L, \rho) \rightarrow (T, \sigma)$ be the function defined by $f(a)=c$, $f(b)=b$ and $f(c)=a$. consider $L=T=\{a,b,c\}$ with $\rho=\{L, \emptyset, \{a\}, \{b\}, \{a,b\}, \{a,c\}\}$ and $\sigma = \{T, \emptyset, \{a\}, \{b\}, \{a, b\}\}$. We have $J^*PC(L, \rho)=\{L, \emptyset, \{b\}, \{c\}, \{a,c\}, \{b,c\}\}$, $J^*PO(L, \rho)=\{L, \emptyset, \{a\}, \{b\}, \{a,b\}, \{a,c\}\}$ and $J^*PC(T, \sigma)=\{T, \emptyset, \{c\}, \{b,c\}, \{a,c\}\}$. Then f is contra J*P-irresolute function but not strongly J*P-continuous function. Because for the subset $\{b,c\}$ in (T, σ) , the inverse image $\{a,b\}$ is not J*P-clopen in (L, ρ) .

Remark 2.3.5

The following Counter Examples shows that J*P-irresolute functions and contra J*P-irresolute functions are independent.

Counter Example 2.3.6

Consider the **Example 3.2.2**, f is a J^*P -irresolute function but not a contra J^*P -irresolute function. Because for the J^*P -closed set $\{b,c\}$ in (T,σ) , the inverse image is not J^*P -open in (L,ρ) .

Counter Example 2.3.7

Consider the **Counter Example 3.3.4**, we have $J^*PO(T,\sigma)=\{T,\emptyset,\{a\},\{b\},\{a,b\}\}$. Then f is contra J^*P -irresolute function but not J^*P -irresolute function. Because for the J^*P -open set $\{a\}$ in (T,σ) , the inverse image $\{c\}$ is not J^*P -open in (L,ρ) .

Proposition 2.3.8

A function $f:(L,\rho) \rightarrow (T,\sigma)$ is a contra J^*P -irresolute function if and only if inverse image of every J^*P -open set in (T,σ) is J^*P -closed in (L,ρ) .

Proof:

It is true from the **Definition 2.3.1**.

Proposition 2.3.9

A totally J^*P -continuous function $f:(L,\rho) \rightarrow (T,\sigma)$ is a contra J^*P -irresolute function but not conversely.

Proof:

Given $f:(L,\rho) \rightarrow (T,\sigma)$ is a totally J^*P -continuous function. Let V be a J^*P -closed set in (T,σ) . since f is a totally J^*P -continuous function, $f^{-1}(V)$ is J^*P -clopen in (L,ρ) which implies that $f^{-1}(V)$ is J^*P -open in (L,ρ) . Hence f is contra J^*P -irresolute function.

Counter Example 2.3.10

Consider the Counter Example 2.3.4, f is contra J^*P -irresolute function but not totally J^*P -continuous function. Because for the subset $\{b,c\}$ in (T,σ) , the inverse image $\{a,b\}$ is not J^*P -clopen in (L,ρ) .

Proposition 2.3.11

A quasi totally J^*P -continuous function $f:(L,\rho) \rightarrow (T,\sigma)$ is a contra J^*P -irresolute function but not conversely.

Proof:

Given $f:(L,\rho) \rightarrow (T,\sigma)$ is a quasi totally J^*P -continuous function. Let V be any J^*P -open set in (T,σ) . since f is a quasi totally J^*P -continuous function, $f^{-1}(V)$ is clopen in (L,ρ) which implies that $f^{-1}(V)$ is J^*P -closed in (L,ρ) . Hence f is contra J^*P -irresolute function.

Remark 2.3.12

The converse of the above proposition is shown in the following Counter Example.

Counter Example 2.3.13

Consider the **Counter Example 2.3.4**, f is contra J^*P -irresolute function but not quasi totally J^*P -continuous function. Because for the J^*P -open set $\{a\}$ in (T, σ) , the inverse image $\{c\}$ is not clopen in (L, ρ) .

Remark 2.3.14

The following Counter Examples shows that J^*P -continuous functions and contra J^*P -irresolute functions are independent.

Counter Example 2.3.15

Let $f: (L, \rho) \rightarrow (T, \sigma)$ be the identity function. consider $L=T=\{a,b,c\}$ with $\rho=\{L, \emptyset, \{a\}, \{a,b\}\}$ and $\sigma=\{T, \emptyset, \{a\}\}$. We have $\sigma^c=\{T, \emptyset, \{b,c\}\}$, $J^*PC(L, \rho)=\{L, \emptyset, \{b,c\}\}$, $J^*PC(T, \sigma)=\{T, \emptyset, \{b,c\}\}$ and $J^*PO(L, \rho)=\{L, \emptyset, \{a\}\}$. Then f is J^*P -continuous function but not contra J^*P -irresolute function. Because for the J^*P -closed set $\{b,c\}$ in (T, σ) , its inverse image is not J^*P -open in (L, ρ) .

Counter Example 2.3.16

Consider the Counter Example 2.3.4, f is contra J^*P -irresolute function but not J^*P -continuous function. Because for the closed set $\{c\}$ in (T, σ) , the inverse image is not J^*P -closed in (L, ρ) .

Remark 2.3.17

The following Counter Examples shows that quasi J^*P -continuous functions and contra J^*P -irresolute functions are independent.

Counter Example 2.3.18

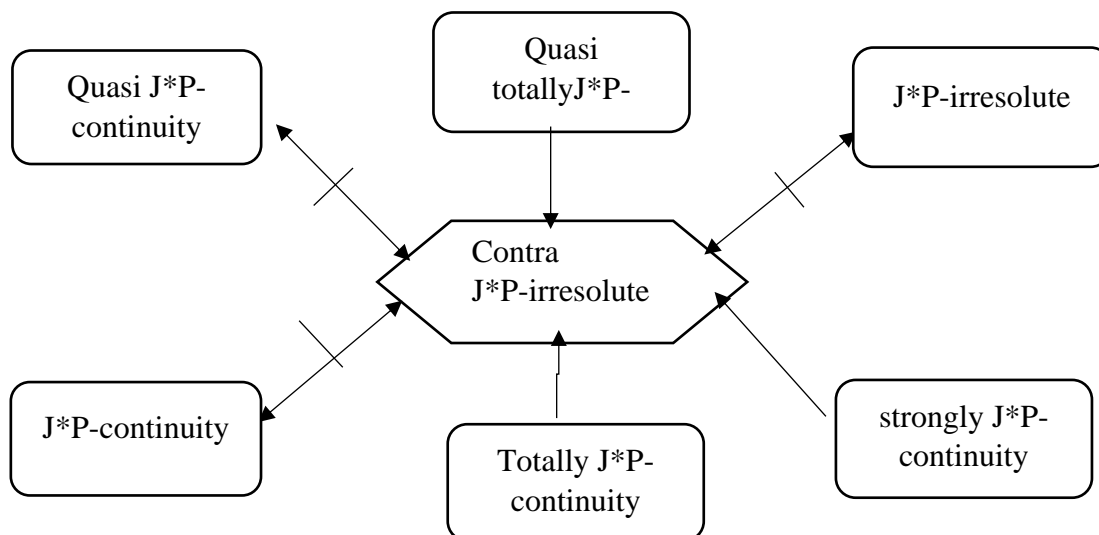

Consider the **Counter Example:2.3.15**, we $\rho^c=\{L, \emptyset, \{c\}, \{b,c\}\}$ and $J^*PC(T, \sigma)=\{T, \emptyset, \{b,c\}\}$. Then f is quasi J^*P -continuous function but not contra J^*P -irresolute function. Because for the J^*P -closed set $\{b,c\}$ in (T, σ) , its inverse image is not J^*P -open in (L, ρ) .

Counter Example 2.3.19

Consider the **Counter Example 2.3.4**, f is contra J^*P -irresolute function but not quasi J^*P -continuous function. Because for the J^*P -closed set $\{c\}$ in (T, σ) , the inverse image $\{a\}$ is not closed in (L, ρ) .

Result 2.3.20

From the above discussion, we get the following diagram:

Composition of Contra J*P-Irresolute Functions

Proposition 2.3.21

If $f:(L, \rho) \rightarrow (T, \sigma)$ is a contra J*P-irresolute function and $h:(T, \sigma) \rightarrow (Q, \mu)$ is a contra J*P-irresolute function, then their composition $h \circ f:(L, \rho) \rightarrow (Q, \mu)$ is a J*P-irresolute function.

Proof:

Let V be any J*P-closed set in (Q, μ) . Since h is contra J*P-irresolute, $h^{-1}(V)$ is J*P-open in (T, σ) . Since f is contra J*P-irresolute, $f^{-1}(h^{-1}(V))$ is J*P-closed in (L, ρ) . Hence $(h \circ f)^{-1}(V) = f^{-1}(h^{-1}(V))$ is J*P-closed in (L, ρ) . Therefore $h \circ f$ is a J*P-irresolute function.

Proposition 2.3.22

If $f:(L, \rho) \rightarrow (T, \sigma)$ is a J*P-irresolute function and $h:(T, \sigma) \rightarrow (Q, \mu)$ is a contra J*P-irresolute function, then their composition $h \circ f:(L, \rho) \rightarrow (Q, \mu)$ is a contra J*P-irresolute function.

Proof:

Let V be any J*P-closed set in (Q, μ) . Since h is contra J*P-irresolute, $h^{-1}(V)$ is J*P-open in (T, σ) . Since f is J*P-irresolute, $f^{-1}(h^{-1}(V))$ is J*P-open in (L, ρ) . Hence $(h \circ f)^{-1}(V) = f^{-1}(h^{-1}(V))$ is J*P-open in (L, ρ) . Therefore $h \circ f$ is a contra J*P-irresolute function.

Proposition 2.3.23

If $f:(L, \rho) \rightarrow (T, \sigma)$ is a contra J^*P -irresolute function and $h:(T, \sigma) \rightarrow (Q, \mu)$ is a J^*P -irresolute function, then their composition $h \circ f:(L, \rho) \rightarrow (Q, \mu)$ is a contra J^*P -irresolute function.

Proof:

Let V be any J^*P -closed set in (Q, μ) . Since h is J^*P -irresolute, $h^{-1}(V)$ is J^*P -closed in (T, σ) . Since f is contra J^*P -irresolute, $f^{-1}(h^{-1}(V))$ is J^*P -open in (L, ρ) . Hence $(h \circ f)^{-1}(V) = f^{-1}(h^{-1}(V))$ is J^*P -open in (L, ρ) . Therefore $h \circ f$ is a contra J^*P -irresolute function.

Proposition 2.3.24

If $f:(L, \rho) \rightarrow (T, \sigma)$ is a quasi totally J^*P -continuous function and $h:(T, \sigma) \rightarrow (Q, \mu)$ is a contra J^*P -irresolute function, then their composition $h \circ f:(L, \rho) \rightarrow (Q, \mu)$ is a quasi totally J^*P -continuous function.

Proof:

Let V be any J^*P -open set in (Q, μ) . Since h is contra J^*P -irresolute, $h^{-1}(V)$ is J^*P -closed in (T, σ) . Since f is quasi totally J^*P -continuous function, $f^{-1}(h^{-1}(V))$ is clopen in (L, ρ) . Hence $(h \circ f)^{-1}(V) = f^{-1}(h^{-1}(V))$ is clopen in (L, ρ) . Therefore $h \circ f$ is a quasi totally J^*P -continuous function.

SUMMARY AND CONCLUSION

A new type of g -closed set called J^*P -closed set is started using the ideas of n^* -closure and preopen set. J^*P -closed sets are demonstrated to be stronger than J^{**} -closed sets and weaker than δ -closed sets. The concept of J^*P -closed sets are studied for continuity and irresoluteness. Five new spaces are constructed using J^*P -closed sets, and their connections to other existing spaces are examined. The interrelations between J^*P -continuous function and other existing continuous functions are investigated. Furthermore, the relations between J^*P -Irresolute function and other existing functions are studied.

The following concerns are recommended for more research:

- It is possible to investigate homeomorphisms in topological spaces in the context of J^*P -closed sets.
- Fuzzy topological spaces and bitopological spaces can be related to J^*P -closed set concepts.
- For biminimal structures, ideal topological spaces, supra topological spaces, and nano topological spaces, the concepts of J^*P -closed sets can be characterised, and their applications may be learned.

- It is possible to examine J*P-closed sets in digital plane and digital n-space.
- J*P-closed sets are a useful tool for studying the operation.

Abstract

The most precious asset in a company is its people. With the help of ChatGPT, an AI-powered natural language processing tool, can communicate with the chatbot in a variety of human-like ways. The language model can provide information and support for tasks like writing emails, articles, and code. OpenAI, a corporation that conducts research in artificial intelligence, developed ChatGPT. ChatGPT was introduced on November 30, 2022, by the research company. By responding to inquiries from candidates regarding the job specifications, corporate culture, and application procedure, Chat GPT can be used to automate the hiring process. In addition to making sure that candidates have timely and correct information, this can free up HR workers to concentrate on other activities. The GPT-4 Chat has a huge impact on human resource specialists. It may help cut down on the time and effort required to complete typical HR duties, allowing HR employees to concentrate on more important projects. Additionally, it can give workers a more tailored experience, which can boost engagement and productivity. This study gathered data based on a survey of the literature and secondary sources for statistical information. Writing policies and procedures could be aided by ChatGPT. Again, even if this could be very helpful, nothing can replace years of experience or some of the subtleties that go into developing an HR policy and can only be understood by having actually done it. In conclusion, ChatGPT can be a useful tool for HR departments, offering a variety of advantages like improved applicant and employee experiences, increased efficiency, and streamlined operations. HR professionals may anticipate seeing additional opportunities as AI technology develops to use language models like ChatGPT to streamline their processes and propel corporate success.

Keywords: ChatGPT, openAI, human resource management, HR professionals, technology

Introduction

The impact of Artificial Intelligence (AI) on numerous businesses is growing increasingly pronounced as the world continues to adopt it. The GPT-4 Chat is a key AI development that has the potential to completely change the HR sector. The GPT-4 Chat is a conversational agent powered by AI that can mimic human conversations. This technology is intended to comprehend natural language, pick up knowledge from human encounters, and offer tailored responses. The GPT-4 Chat can be used by HR professionals to streamline a number of processes, including hiring, onboarding, training, and employee engagement.

The GPT-4 Chat has a huge effect on HR workers. It may assist cut down on the time and effort required to complete typical HR duties, allowing HR employees to concentrate on more important projects. Additionally, it can give workers a more tailored experience, which can boost engagement and productivity. Nevertheless, there might be drawbacks to using GPT-4 Chat in HR. The possibility of bias in the AI's decision-making process is one cause for concern. The GPT-4 Chat may produce biased results and engage in discriminatory HR practices if the data used to train the AI is biased. As a result, HR personnel need to make sure that the data being used to train the GPT-4 Chat is representative and diverse. The potential loss of the personal touch in HR is another issue. The sensitivity and emotional intelligence of a human HR expert cannot be replaced by the GPT-4 Chat, despite the fact that it may offer personalized responses. In order to keep a human touch in their contacts with employees while employing AI to expedite operations, HR professionals must strike a balance.

ChatGPT's unethical issues like considering that ChatGPT can produce conversational text, there are ethical questions about the likelihood that it won't produce false or misleading information. Serious consequences could result from this, including damage to reputations, the dissemination of untrue information, or even the incitement of violence. For those working in human resources, ChatGPT may change the rules of the game. Businesses can utilize ChatGPT to streamline activities, increase productivity, and enhance the entire work experience as the need for efficiency in the workplace grows.

Review of Literature

Yogesh K. Dwivedi et al. (2023), entitled "So what if ChatGPT wrote it? Multidisciplinary perspectives on opportunities, challenges and implications of generative conversational AI for research, practice and policy, Transformative artificially intelligent tools, such as ChatGPT, designed to generate sophisticated text indistinguishable from that produced by a human, are applicable across a wide range of contexts." The technology offers advantages as well as

frequent moral and legal difficulties, and it has the ability to have both good and bad effects on organizations, society, and individuals. Identifying the knowledge, tools, and resources required to handle generative AI; examining the biases of generative AI attributable to training datasets and processes; investigating business and societal contexts best suited for generative AI implementation; figuring out the best combinations of humans and generative AI for various tasks; figuring out how to assess the accuracy of text produced by generative AI; and discovering the ethical and legal implications.

Viriya Taecharungroj (2023). Titled “What Can ChatGPT Do? Analyzing Early Reactions to the Innovative AI Chatbot on Twitter”, the investigation also revealed that ChatGPT has the capacity to have both positive and bad effects on both technology and people. The quest for artificial general intelligence, the evolution of occupations, a new technical landscape, and the progress-ethics problem are the four major concerns that the author identifies as needing to be addressed while a outcome of this AI advancement.

Tufan. Adiguzel, et al. (2023) in this research “Revolutionizing education with AI: Exploring the transformative potential of ChatGPT” In the educational setting, artificial intelligence (AI) brings new tools that have the potential to revolutionize the way that lessons are taught and learned. This paper provides a thorough overview of AI technology, including possible uses in education and associated challenges. We cover chatbots and associated algorithms that can mimic human interactions and produce text that appears human, depending on input from natural language. Modern chatbots like ChatGPT have many benefits, but they also present significant ethical and practical problems when used in education. In order to assist instructors and students and to advance responsible and ethical use, the authors hope to offer valuable information on how AI may be successfully introduced into the educational environment.

ChatGPT

'Artificial Intelligence Chatbot' ChatGPT was created by OpenAI, a research facility that specializes in 'AI' research. It builds on the GPT 3.5 model from OpenAI by using a 'large language model' that has been improved through supervised reinforcement-based training. The GPT, or "Generative Pre-trained Transformer," offers thorough responses to user inquiries. The responses might not always be factually accurate, but they always offer thorough explanations, and they can even recall what they previously said and make corrections if necessary.

Impact of ChatGPT on Human Resource Management

Technology professionals have been in awe of ChatGPT ever since it was released. It makes sense why the clever chatbot has evolved into a sort of demi-god among digital applications because its skills are so all-encompassing. As technology has recently become more important to human resources, chatGPT is prepared to take over this division as well. However, it remains to be seen whether the AI chatbot can actually produce results given that human volition and judgement are needed in human resources to select the best candidate or interact with them for the advancement of the business and the individual as well. Because chatGPT makes it simple for HR professionals to quickly generate texts, create effective responses, and analyse user data to derive insightful conclusions, it is vital to consider the other side of the coin as well. Beyond what is apparent, chatGPT's effects on HR are possible.

Advantages of using chatGPT

- **Effectiveness:** It is clear that chatGPT can handle tedious and routine HR operations like scheduling interviews and composing mass emails, allowing users to concentrate on things that create value.
- **Efficiency:** By offering feedback and filling out the appraisal forms with candidate information, it helps hasten the process and allows management to make judgments more quickly.
- **Better communication:** ChatGPT can assist HR leaders in honing their communication tactics. The software serves as a knowledge base and trustworthy human-like Wikipedia.
- **Improved data management:** ChatGPT's real-time updates and insights will significantly relieve HR of their workload. It can carry out all the labor-intensive tasks in data-driven processes that enhance HR operations.

Cons of using chatGPT

- **Limitations in difficult situations:** While chatGPT continues to struggle to offer accurate factual information, there is little hope for helping HR executives in circumstances when empathy and judgement are needed.
- **Privacy compromised:** There is a good probability that AI programmes may act erratically. Saving private employee data in that situation is virtually impossible.

- **Technology dependence:** ChatGPT is so compulsive that HR recruiters rely on it a lot. As a result, the entire reason the department exists—the human touch—may be lost in HR operations. The USP of HR leaders, the ability to balance, will be lost in the race to be agile.

Relevance of ChatGPT for the HR Department

As a general-purpose AI chatbot, ChatGPT has a variety of applications. Because it is interactive, it can quickly offer top-notch employee support. The chatbot can therefore address the majority of employee inquiries, relieving HR personnel from having to continuously respond to the same queries. Using ChatGPT to resolve queries can also cut down on the expense, time, and effort needed to maintain employee engagement. The AI chatbot can quickly and intelligently respond to staff questions. It might even offer insightful conclusions that boost business productivity. Because of its adaptability, ChatGPT can be utilized in a variety of circumstances. Therefore, ChatGPT can be applied in a number of ways to help the HR department perform its duties.

Advantages of ChatGPT for the HR Department

ChatGPT deployment has a number of benefits, including increased cost-effectiveness, employee engagement, simpler management, improved insights, and more. So let's go into detail about the various benefits of implementing ChatGPT for the HR department.

❖ Simplified Query Resolution

Because ChatGPT is so adept at demystifying complicated ideas, it is the ideal chatbot for answering these kinds of questions. Given that the employee won't have to remember complicated menu paths, it will speed up the query resolution process.

❖ Improved Employer Branding

It guarantees that the staff members are happy with their work and actively support the business. Having a chatbot also aids in recruiting because candidates get to interact with an AI-based chatbot and learn something new and exciting. The aforementioned factors aid in motivating workers effectively, which in turn raises the calibre of their output. As a result, the company's goods and services are of much higher quality, which boosts both its employer brand and its own brand.

❖ AI-based Analytics

The personnel database can be examined using ChatGPT to draw insightful results. Additionally, AI-based analytics can assist in comprehending minute details that affect an organization success. It can, for instance, assist you in understanding the patterns of employee

absence, attendance, and breaks and alert you to any instances of workplace laziness. These in-depth insights can assist you in streamlining your operations by retaining your workforce and improving their job performance.

How to reduce bias in the Chat GPT-4 results with AI and equality in HR: To guarantee that the technology is applied fairly and ethically, it is critical to reducing bias in the findings produced by the Chat GPT-4 in Human Resources. The following actions can be taken by HR professionals to lessen bias in the outcomes produced by the Chat GPT-4.

- ❖ **Ensure diverse training data:** HR professionals should make sure that the training data used to teach the AI is diverse and representative in order to reduce bias in the Chat GPT-4. To eliminate biases based on gender, race, ethnicity, or any other demographic aspect, the training data should represent a diverse spectrum of voices, opinions, and experiences.
- ❖ **Continually audit and update training data:** HR professionals should continuously review and update the training data used to train the Chat GPT-4. By doing this, any biases in the training data will be discovered and swiftly fixed.
- ❖ **Utilized numerous data sources:** When training the Chat GPT-4, HR professionals should make use of multiple data sources to lessen the potential for bias. Using a wider variety of data sources, will ensure that any specific biases or flaws in one dataset are balanced out.
- ❖ **Track findings:** To spot any biases or inaccuracies, HR professionals should constantly track and assess the results produced by the Chat GPT-4. By doing so, they will be able to fix any problems and raise the fairness and accuracy of the conclusions drawn.
- ❖ **Take into account various viewpoints:** When using the Chat GPT-4, HR professionals should take various viewpoints from various stakeholders into account. To make sure that the technology is utilized in a fair and equitable manner, this includes requesting feedback from staff members, managers, and other stakeholders.

These actions can be taken by HR professionals to ensure that the technology is applied fairly and ethically in the human resources sector and to help reduce bias in the results produced by the Chat GPT-4.

Conclusion

This article, discuss how the GPT-4 Chat has the ability to transform the HR sector by reducing processes and giving workers individualized experiences. However, when

interacting with employees, HR professionals need to keep a human touch and be aware of any potential biases. HR executives may maximize the advantages of the GPT-4 Chat while ensuring fair and compassionate treatment of employees by finding a balance between AI and human contact. Effective employee engagement ensures devoted staff members who actively work to lead the business toward success. Finally, OpenAI's ChatGPT, one of the most sophisticated publicly available chatbots, will be ideal for assisting the HR team in taking care of the employees.

Xülasə:Məlum olduğu kimi hazırda ölkədə dövlətin apardığı siyasətin əsasını neft-qaz sektorundan gələn gəlirlərin qeyri neft sektorunun inkişafına yönəltməkdir.Qeyri neft sektoruna daxil olan sahələrin əsası da turizm sektorudur. Digər xidmət sahələri kimi, turizm sferasının inkişafı, ölkədə digər sahələrin inkişafına da stimül verir. Bu biznes əsasən sahibkarları turist

xidmətlərinə günü-gündən artan tələbat, yüksək rentabellilik, xərclərin qısa zaman kəsiyində ödənilməsi kimi xüsusiyyətləri ilə özünə cəlb edir.

Azərbaycanda turizmin inkişafı dövlət siyasətidir. Ölkəmizdə turizmin inkişafı təkcə mərkəzi şəhərlərə turistlərin cəlb edilməsi ilə məhdudlaşmayıb. Regionların turizm potensialından maksimum istifadə də dövlətin prioritetlərindəndir. Ümummilli liderin siyasi kursunun layiqli davamçısı Prezident İlham Əliyevin 2004-cü ildən ardıcıl olaraq imzaladığı "Azərbaycan Respublikası regionlarının sosial-iqtisadi inkişafı Dövlət Proqramı haqqında" Sərəncamlar (2004-2008, 2009-2013, 2014-2018, 2019-2023-cü illər) ölkə iqtisadiyyatının, o cümlədən regionlarda turizmin inkişafı istiqamətində mühüm addımlar oldu. Azərbaycan Respublikası regionlarının inkişafı ölkədə uğurla həyata keçirilən davamlı sosial-iqtisadi inkişaf strategiyasının mühüm tərkib hissəsidir.

Bu proqramların icrası nəticəsində regionlarda ardıcıl bir neçə beynəlxalq standartlara cavab verən kurort-sanatoriya, otel və istirahət mərkəzləri yaradıldı. 44 günlük müharibədən sonra, torpaqlarımızın düşmən tapdaqları altından azad edilməsi nəticəsində həmin regionların turizm potensialından maksimum yararlanması üçün ölkədə sürətli yenidənqurma işləri gedir.

Bu baxımdan da tədqiq olunan mövzu mövcud şəraitdə çox aktualıq kəsb edir. Məqalədə ölkədə regionlarda, xüsusilə azad edilmiş ərazilərdə turizmin inkişaf səviyyəsi təhlil edilmiş, onun postpandemiya dövründə mövcud və həlli yolları müəyyənləşdirilmişdir.

Açar sözlər: Turizm sektoru, turizmin inkişafı regional turizm, regional inkişaf.

Assessment of The Current State Of Tourism Development In The Regions

Summary: As it is known, the basis of the state's policy in the country is to direct the revenues from the oil and gas sector to the development of the non-oil sector. The basis of the areas included in the non-oil sector is the tourism sector. Like other service areas, the development of the tourism sphere stimulates the development of other areas in the country. This business mainly attracts entrepreneurs with its features such as daily increasing demand for tourist services, high profitability, and payment of expenses in a short period of time. The development of tourism in Azerbaijan is a state policy. The development of tourism in our country is not limited to the attraction of tourists to the central cities. The maximum use of the tourism potential of the regions is one of the state's priorities. The Decrees "On the State Program for the Socio-Economic Development of the Regions of the Republic of Azerbaijan" signed by President

Ilham Aliyev, a worthy follower of the national leader's political course, have been signed since 2004. (2004-2008, 2009-2013, 2014-2018, 2019-2023 years) were important steps towards the development of the country's economy, including tourism in the regions. The development of the regions of the Republic of Azerbaijan is an important component of the sustainable socio-economic development strategy successfully implemented in the country.

As a result of the implementation of these programs, several resorts-sanatoria, hotels and recreation centers that meet international standards were created in the regions. After the 44-day war, as a result of the liberation of our lands from the enemy, rapid reconstruction is underway in the country in order to make the most of the tourism potential of those regions.

From this point of view, the researched topic is very relevant in the current conditions. In the article, the level of development of tourism in the regions of the country, especially in the liberated areas, is analyzed, and the existing and solutions for it in the post-pandemic period are determined.

Keywords: Tourism sector, tourism development, regional tourism, regional development.

Azərbaycanda qeyri-neft sektorunun əsas sahələrindən biri olan turizm sahəsinin inkişafı İlham Əliyev prezident seçildikdən sonra yeni müstəviyə qədəm qoydu. Belə ki, ölkədə, o cümlədən regionlarda turizmin inkişafı üçün müxtəlif Dövlət proqramları, strateji yol xəritəsi və s normativ hüquqi aktlar qəbul edilmişdir. Təməlu ulu öndər tərəfindən qoyulan bu inkişafı İlham Əliyev fəaliyyətə başladığı gündən indiyədək imzaladığı dörd regionların sosial-iqtisadi inkişafı ilə əlaqədar Dövlət Proqramları (2003-2008, 2009-2013, 2014-2018, 2019-2023-cü illər) regionlarda turizmin inkişafına böyük təkan verdi.

2009-cu ildə Kurortların inkişafına dair 2009-2018-ci illər üçün Dövlət Proqramı, , 2010-cu ildə Turizmin inkişafına dair 2010-2014-cü illər üçün Dövlət Proqramı qəbul edilmişdi.

Bundan əlavə 2011-ci il turizm ili elan edildi. Bununla da ölkəmizdə turizmin inkişafı üçün lazım olan sosial-iqtisadi və hüquqi baza yaradıldı.

Qəbul edilən proqramların əsas məqsədi, sənaye və dünya turizminin infrastrukturuna inteqrasiya, yüksək səviyyəli turizm xidməti göstərmək və milli turizm modelinin yaradılmasına yönəldilmişdir.

Bu proqramların əsas məqsədləri bunlardır:

- ❖ turizmin inkişafındakı nailiyyətlər;
- ❖ turizm sahəsində kiçik və orta sahibkarlığın inkişafı;
- ❖ rəqabətə davamlı turizm bazarının yaradılması;
- ❖ turistlərə göstərilən xidmətlərin keyfiyyətinin yaxşılaşdırılmasının təmin edilməsi;
- ❖ kurort müəssisələrinin planlı şəkildə inkişafı və təmin edilməsi onların effektiv istifadəsi.

Dövlətin inkişaf istiqamətində apardığı məqsədyönlü siyasət nəticəsində Azərbaycanın bölgələrindəki turizm böyüməsi bu sahədəki iqtisadi göstəricilərin inkişafından açıqca görünür. Otel infrastrukturunda iqtisadi göstəriciləri aşağıdakı cədvələ əsasən təhlil edək;

Cədvəl 1

Azərbaycan Respublikasında otellərin, motellərin və ümumi iqtisadi göstəriciləri bölgələrə görə turistlərin digər yerləşmə yerləri

Turizm bölgəsi	Köhnə otaqlar		Yeni otaqlar	
	2016	2017	2018	2019
1. Abşeron	11843	11866	1004422	1107625
2. Gəncə-Qazax	2842	3080	82231	31113
3. Şəki-	2203	2374	62751	64871
4. Yuxarı Qarabağ	2153	2245	31655	45286
5. Quba-	8119	8703	279439	194871
6. Kəlbəcər-	1130	1320	67423	8361

Mənbə: <https://aw.s tat, gov. az/>

Cədvəldən görüldüyü kimi, hesablamalar göstərir ki, ümumi iqtisadi göstəricilərin dinamikasında, otaq sayı və yataq sayı habelə, otellər, motellər və s. ən böyük pay Abşeron iqtisadi rayonuna düşür. Belə ki, 2016-2017-ci ilin müqayisəsində otaq sayı turizm bölgəsi üzrə ən böyük göstərici Abşeron, Gəncə-Qazax, Şəki-Zaqatala iqtisadi rayonlarının payına düşür və ümumi göstərici bu illər üzrə 1.135 dəfə artmışdır. 2017-2018-ci illərin müqayisəsində bölgələr üzrə turizmin yerləşmə yeri 1.589 dəfə artmışdır. 2018-2019-cu illər üzrə artım təmomi isə 2.454 dəfə artmışdır. Ümumi olaraq 2017-ci ildən 2019-cu ilə qədər isə 1.565 dəfə artmışdır. Belə ki, iqtisadi bölgə olaraq sırasıyla 2017-ci ilə əsasən, 36.4% və yəzdə 69.3% təşkil edir. Abşeron bölgəsinin belə bir hakim mövqeyi sahənin təmsil etdiyi böyük maraqla izah edilə bilər. Turistlər üçün, yəni: memarlıq və tarixi zəngin abidələr, bölgənin Xəzər dənizinin sahilindəki yeri, mərkəz və dünyanın hər yerindən iş adamlarını cəlb etmək və s. bütün bu amillər lazımi yerləşmə qurumlarının meydana gəlməsinə və eləcə də müəyyən bir iqtisadi bölgədə turizmin inkişafına zəmin yaradır. Daxili turizm müxtəlif bölgələrdə inkişaf etdikcə Azərbaycanda istirahət üçün lazım olan infrastruktur yaradılır.

Amma rekreasiya zonalarının yaranma prosesi qeyri-bərabər paylanmışdır. Ölkəmizin bəzi mənzərəli guşələri hələ unudulmaqda qalır, digərləri isə əksinə, turizmin inkişafı müşahidə olunur. Bu zonalara dəniz kənarı, xüsusən Quba-Xaçmaz iqtisadi rayonun bir hissəsi olan Nabran bölgəsi ümumi iqtisadi dinamikasında ikinci sırada turistlərin yerləşməsi üçün müvafiq olaraq 26,7% və 12,2% olan göstəricilər iştirak etdi. Hələ 80-ci illərdə bu yerlərin dövlət əhəmiyyətli bir turizm zonası kurortuna çevrilməsi lazım idi. Ancaq bu proyektə, əhəmiyyətli səbəblərdən investisiya yatırımı həyata keçirilmədi. İndi suverenliyin əldə edilməsi və bazar münasibətlərinin inkişafı ilə, yerli iş adamları, xüsusi şirkətləri məmnun etməyə çalışır.

Regionlarda turizmin sürətli inkişafı digər sosial-iqtisadi göstəricilərə də, böyük müsbət təsirini göstərmişdir. Bunları ayrı-ayrılıqda aşağıdakı cədvəldə aydın şəkildə izah edək.

Cədvəl 2

**Azərbaycan Respublikasının regionlarda turizmin sürətli inkişafına təsir
 edən digər sosial-iqtisadi göstəricilər (min.manat)**

Göstəricilər	2010	2015	2016	2017	2018	2019

1.Regionların sosial-iqtisadi inkişaf proqramı 2009-2013

2.Regionların sosial-iqtisadi inkişaf proqramı 2014-2018

3.Regionların sosial-iqtisadi inkişaf proqramı 2019-2021

Cədvəldən görüldüyü kimi, regionlarda turizmin inkişafına təsir edən sosial-iqtisadi göstəricilər əhalinin xərcləri, 2010-2015-ci illərin müqayisəsində 2.124 dəfə artım olmuşdur. Balans dəyəri ilə iqtisadiyyatda əsas fondlar (ilin sonuna) 2015-2016-cı illin müqayisəsində isə 8,936 dəfə artım müşahidə edilir. 2016-2017-ci illərin müqayisəsində 6.875 dəfə artım qeydə alınıb. Əsas kapitalla yönəldilmiş vəsaitlər 2017-2018-ci ilin müqayisəsində 4.475 dəfə artım qeyd olunur. Əsas fondların istifadəyə verilməsi 2018-2019-cu illərin müqayisəsində isə 3.688 dəfə artım müşahidə edilib. Ümumi olaraq regionlarda turizmin sürətli inkişafına təsir edən digər sosial-iqtisadi göstəricilər üzrə 2010- 2019-cu illər üzrə 2.737 dəfə artım qeydə alınıb.

Təsadüfi deyil ki, turizmin inkişafının əsas istiqamətləri hökumətin ümumi iqtisadi siyasətinin ayrılmaz hissəsi, yoxsulluğa və iqtisadi böyüməyə qarşı mübarizə proqramı, işsizlərin sayının azaldılması üçün bir fəaliyyət planı müəyyənləşdirir, böyük ölçüdə bu sənayedəki inkişafın sayəsində kiçik sahibkarlığın inkişafı və regional infrastrukturun yaxşılaşdırılmasını həyata keçirir. Öz növbəsində, bölgələrin sosial-iqtisadi inkişafı dövlət proqramı da turizm mərkəzləri, evlər və istirahət zonaları şəbəkəsinin inşasını stimullaşdırmaq, sanatoriyalar, xəstəxanalar və s. nəzərdə tutulmuşdur. Bir-birini qarşılıqlı şəkildə tamamlayan bütün bu tədbirlər nəticədə turizm biznesinin inkişafına təkan verən olmalıdır. Xarici təcrübənin də göstərdiyi kimi kənd turizmi onsuz da inkişaf edir və bir neçə onillik və xüsusilə son bir neçə ildə aktivdir.

Qeyd etmək lazımdır ki, Azərbaycanca kənd turizmi turizm sahələrindən biridir. Kəndin iqtisadi inkişaf yolları, əlavə imkanı sakinləri üçün qazandır. Hal hazırda Şəkiddə “ailə səyahəti birliyi” yaradılıb. Şirkət Göyçaya kiçik turist qruplarından mövcud olan və göndərilən turistlər burada yerləşən villada

istirahət edir. Bu cür qruplar üçün şirkət fərdi evlərdə tətillər təşkil edir (gündəlik səhər yeməyi və digər xidmətlər ilə adam başına dollar). Avropanın ucuz kənd təsərrüfatı təcrübəsini tətbiq edərsə və ekoloji turizm düzgün təşkil edildiyi təqdirdə, yeni iş yerləri açacaq və bununla da problemi həll edəcəkdir. Bundan əlavə fikrimizcə, Azərbaycan iqtisadiyyatı, xeyli fayda götürər. Regional məşğulluq və yoxsulluğun azaldılmasına da, müsbət təsir göstərəcək. Bu, şübhəsiz ki, yalnız yerli turistləri deyil, həm yalnız kənd istirahəti ilə, həm də, orijinal həyat tərziləri ilə kəndlərimizin həyat tərziləri və adətləri maraqlanan xariciləri cəlb edəcəkdir. Bununla yanaşı, ölkənin sənaye inkişafına baxmayaraq bir çox təbii mənzərələr orijinal görünüşünü və ekoloji təmizliyini qoruyub saxlamışdır. Son bir il yarımında qorunan təbiət zonalarının sahəsi 8-dən artırılmışdır. Azərbaycan ərazisinin 7% -ə qədər bir neçə milli park yaradılmışdır, ekoturizmin təşkili üçün böyük imkanlara malik olunmuşdur. Qeyd olunduğu kimi, 2009-cu ilin aprel konfransında "ölkəmizdə davamlı ekoturizm və milli parklar sistemi", ölkənin bunun üçün bütün imkanlarını yaratdı. Bunun təsdiqində bu günü dağlarda aktiv, sərgüzəştli bir sərvət, tətillər olduğunu orta hesabla da olsa bir ailə üçün olduqca əlverişli bir zövqdür. Tətillərini dağlarda mənzərəli yerlərdə keçirməyi sevənlər üçün Kiçik və Böyük Qafqazın yerləri, ərazidə istirahət zonaları var. Misal üçün, Quba, Zaqatala, Qax, Masallı, Şamaxı və Qusar rayonlarını göstərə bilərik. Əsasən bu istirahət zonaları yaxınlıqdadır və dağların ətəkləri turistlərə xidmətlər təklif edilir. Qusar rayonunda yerləşən turistik Ekstremal yüksək hündürlük 4 ildir fəaliyyət göstərir.

Gələcəkdə turizm biznesinin daha da inkişaf etdirilməsinin bütün istiqamətləri ilə eyni zamanda, kurort biznesinin inkişafı, otel biznesi, yeni turizm komplekslərinin yaradılması, ixtisaslı kadrların hazırlanması, infrastrukturun inkişafı, xüsusən otellərdə, mərkəzlər, tətillər evləri, sanatoriyalar, restoranlar, əyləncə mərkəzləri yerli əhalinin mədəniyyəti və yaşayış şəraiti

turistlərdə yüksək keyfiyyətli xidmət göstərilməsi ilə eyni vaxtda getməsi tamamilə aydındır. Ancaq müşahidələrimizə görə, müstəqillik illərində kurortlar nəinki ölkə iqtisadiyyatına ciddi bir töhfə vermiş, əksinə dövlətin subsidiyalarını alaraq aşağı gəlirliliklə fəaliyyət göstərirlər. Lakin cədvəllərdən də görüldüyü kimi, 2019-cu ildən bəri başlayan Covid-19 pandemiyası bütün dünyada o cümlədən Azərbaycanda turizm sahəsini iflic etdi. Artıq indi yavaş yavaş bu sahə özünə gəlməyə başlayır. Azərbaycanda isə turizmin inkişafı üçün yeni mərhələ başlayır. Belə ki, 44 günlük Vətən müharibəsi nəticəsində Ali Baş komandanın rəhbərliyi altında rəşadətli ordumuz uzun illər ermənilərin əsarəti altında olan torpaqlarımızı azad etdi. Hazırda orada böyük quruculuq işləri gedir. Məlum olduğu kimi Qarabağın turizm potensialı həddindən artıq çoxdur. Bu səbəbdən də qeyd olunanların hamısı və Qarabağ və Şərqi zəngəzur iqtisadi rayonlarında yenidən təşkil olunmalıdır:

- turizm məkanlarının çox hissəsinin özəlləşdirilməsini təşkil etmək;
- turizm məkanlarının iqtisadi və maliyyə müstəqilliyini təşkil etmək;
- turizm məkanlarında mülkiyyət növündən asılı olmayaraq turizm məkanlarını tam iqtisadi və maliyyə müstəqilliyi ilə təmin etmək;
- turizm məkanlarında mülkiyyət növündən asılı olmayaraq, göstərilən xidmətlər üçün müvafiq strukturların cəlb edilməsi ilə “Gənclər və İdman Nazirliyi” və Turizm Agentliyi tərəfindən hazırlanmalı olan keyfiyyət standartlarını tətbiq etmək;
- xarici investisiyaların cəlb edilməsi və kurort işinin yaxşılaşdırılması üçün istənilən mülkiyyət formasında birgə müəssisələr yaratmaq;
- İdarəetmənin demokratikləşməsi, müstəqilliyin daha da genişləndirilməsi, iqtisadi idarəetmə metodlarının dərinləşdirilməsi.

ÖZET

İnternetin ve internet platformlarının hayatımıza girmesi insanların yaşamında birçok kolaylık sağlamıştır. Dijitalleşme sosyal hayatımızın her köşesinde önemli bir olgu halindedir. Bu kadar kolaylaştırıcı ve fayda sağlamanın yanında derin bir bilinmezlik de barındırmaktadır. Dijital ortamda yaptığımız her faaliyet kayıt altına alınmakta ve bilgiler saklanmaktadır. Bazen bu bilgiler olumlu amaçlar için kullanılsa da kötü niyetli amaçlar için kullanılma ihtimali de olmaktadır. Bu kayıtları kullanıcıyı daha iyi tanıma ve analiz etmek amaçlı birçok kurum kullanmaktadır. Kayıt altına alınan bilgiler, kısaca internetteki her adım dijital ayak izi olarak adlandırılmaktadır. Dijital ayak izi; internet kullanırken gerçekleştirilen site ziyaretleri, e-postalar ve çevrim içi hizmetlere gönderilen tüm bilgileri içermektedir. Bu çalışmada dijital ayak izinin turizm faaliyetleri çerçevesinde bilinçli veya bilinçsiz bırakmış olduğumuz izlerin ne şekillerde bırakılabildiği bu bilgilerle turizm sektöründe bizlere geri dönüşlerin ne şekilde olduğu, bu dijital ayak izlerinin turizm için ne ifade ettiği ve dijital izlerimizin güvenliği için neler yapılması gerektiği hakkında literatürden toparlanan bilgilerle ve daha önce bu konu ile ilgili yazılmış belli başlı alan yazın çalışmalarının incelenmesi ile dijital ayak izinin anlamından bahsedilmiştir. Araştırmanın amacı turizm sektörü açısından dijital ayak izinin ne amaçla kullanıldığı sektördeki rolünün öneminin ne gibi temel sorular üzerinden oluştuğuna yüzeysel bir biçimde cevap vermektir. Sonuç olarak, yapılan çalışmalardan yola çıkarak geniş bir veri kütüphanesine sahip olan internet ağlarına kaydedilen adımlar turizm sektöründe oldukça önemlidir. Dijital ayak izinin turizmde büyük verileri kullanarak popüler destinasyonların, yerel yönetimlerin alt yapı yatırımlarının, işletme konseptlerinin ve hizmet beklentisinin belirlenmesin de ciddi rol aldığı görülmektedir. Tüketicilerin dijital ayak izi ile ilgili farkındalığın artırılmasına yönelik çalışmaların sayısının artırılması tavsiye edilmektedir.

Anahtar Kelimeler: Dijital Ayak İzi, Veri, Turizm, İnternet

DIGITAL FOOTPRINT IN TOURISM INDUSTRY

ABSTRACT

The existence of the Internet and Internet platforms in our lives has provided many conveniences in people's lives and digitalization is an important phenomenon in every aspect of our social lives. Despite the many benefits and conveniences that it provides, the Internet also has a profound obscurity. Every activity we carry out in the digital environment is recorded and stored. There is a chance that this information may be used maliciously, even if it is occasionally utilized for good. These records are also used by many organizations to better understand and analyse users. The information recorded is referred as digital footprint, which includes all website visits, emails, and information sent to online services while using the internet. In this study, it is mentioned how the digital footprint can be left consciously or unconsciously within the framework of tourism activities, how the returns to us are in the tourism sector with this information, what these digital footprints mean for tourism and what needs to be done for the safety of our digital footprints and the meaning of the digital footprint with the information collected from the literature and the examination of the major field literature studies previously written on this topic. The research's aim is to provide a superficial response to some fundamental issues about how important a role the digital footprint plays in the industry and how it is employed in the travel and tourism industry. Therefore, the actions recorded in online networks that provides an extensive data library, are crucial in the tourism industry. the digital footprint plays a significant role in determining popular destinations, infrastructure investments of local governments, business concepts and service expectations by using the wide range of data in tourism. It is seen that the digital footprint plays a key role in deciding popular locations, local government infrastructure investments, company conceptions, and service expectations by utilizing the vast amount of data in the tourism industry. Finally, it is recommended to increase the number of studies to increase the awareness of consumers about digital footprint.

Keywords: Digital Footprint, Data, Tourism, Internet

1. GİRİŞ

Sosyal paylaşım siteleri, kullanıcı profillerini arttırmak için özelleştirilmiş hizmetler sunmakta ve çeşitli fırsatlar geliştirmektedir. (Deeva, 2019) Bu sebeple sosyal medya bireyler için buldukları toplumda zaman ve mekan tarafından kısıtlanmadan, özgürce, nasıl davranmak istediklerini ve ne paylaşmak istediklerini seçme fırsatı sunmak durumunda olduklarını iyi bilinmektedir. (Camacho vd., 2012) Böylece insanlara bu özgürlüğü sunan sosyal medya devamlı yükselen katılımcı oranı ile kişilerin demografik özelliklerini ve kişiler bilgileri gibi özel verilere erişilebileceği dijital ayak izini meydana getirmiştir. Dijital ayak izleri bireylerin sanal ortamlarda hareketlerinin geride bırakmış olduğu izlerdir. Ayrıca dijital ayak izi bireylerin sosyal medya platformlarındaki sanal kimliklerini oluşturmaktadır. (Taş ve Bülbül, 2021) Turizm de yeni teknolojilerin kullanımı farklı boyutlara ulaşmıştır. Özellikle seyahat bilgilerinin araştırılması en sık online organizasyonlarından biri haline almaktadır. Ayrıca çok sayıda birey online seyahat önerileri kullanmakta ve kendileride birçok birey için çevrim içi önerilerde bulunmaktadır. Çok fazla seyahat eden kişilerin, bir başka turiste oranla çevrim içi içeriklerle ilgilenme olasılığı daha yüksektir. Bazı kullanıcılar tarafından sosyal medya uygulamaları üzerinden yayınlanan içerikler farklı turistlerin tüketim tercihlerini tutum ve davranışlarını etkilediği gözlenmektedir. (Dediu, 2017)

Bu araştırmada turizmde dijital ayak izine dair çalışma sayısı sınırlı olduğundan ulusal ve uluslararası yazından incelemeler doğrultusunda bir literatür çalışması oluşturmaktır. Çalışma kavramsal bir çerçeve kapsamında pilot çalışması olmuş ve dijital ayak izinin nasıl bırakıldığı ve turizmde büyük veri kavramlarından söz edilmiştir. Çalışma kapsamında farklı araştırmalar incelenerek kısa bir literatür cetveli oluşturulmuş ve sonuçları değerlendirilmiştir.

2. YÖNTEM

Dijital ayak izi, popüler destinasyonların belirlenmesinin ve çevrimiçi hareketlerle altyapı sistemlerinin oluşumunun büyük bir parçası olmaktadır. Bu nedenle turizm faaliyetlerinin internet ortamındaki varlığını, dijital ayak izinin belirlenmesiyle turistlerin seyahat tercihlerine etkisi önemine dikkat çekilmesi sağlanmaktadır. Bu çalışmanın amacı dijital ayak izinin turizm faaliyetleri açısından ele alınan araştırmaların analizini yapmaktır. Bu çalışma kapsamında evrensel literatür incelenmiş olup, dijital ayak izinin kavramı açığa çıkarılarak turizm de dijital ayak izinin ne şekilde kullanıldığının tespiti için literatür çalışması yapılmıştır ve konu kapsamında belli başlı yerli ve yabancı kaynaklarla sınırlandırılıp kaynak taraması yapılmıştır. Kaynak taramalarının temel gerekçeleri geçmiş kaynakların çalışma sürecinde ulaştığı sonu kavramak, kaynaklardaki kısıtlılık ve ertelemelerin erişilen noktadaki

eksiklerinin tespit edip yeni çalışmanın düzeninin ve seyrinin oluşumuna katkı sağlamaktır. (Demirci, 2014) Literatür taraması sonucunda birçok çalışmadan farklı kullanım örnekleri toplanmış ve kullanım amaçları çalışmanın sorularını destekler nitelikte açığa çıkarılmıştır. Fakat kısıtlı zaman zarfından ve kaynak yetersizliğinden araştırmamız kavramsal çerçevede incelenmiş literatür taraması sonucu derleme yapılmıştır.

3. KAVRAMSAL ÇERÇEVE

Dijital ayak izi interneti kullanan herkesin aktif hareketleri doğrultusunda arkasında bıraktığı izlerden oluşmaktadır. Sanal ortamda bilgiyi araştırırken, sosyal paylaşım profillerinden anlık durum paylaşırken veya mobil cihazlara bir uygulama indirip deneyimlerken bile dijital iz bırakılmış bulunmaktadır. Basın yayın organlarında etkileşim halindeyken arkamızda bıraktığımız tüm izler her zaman bizim yararımıza olmaktan çıkıp bize olumsuz etkilerde bırakabilmektedir. Örneğin akıllı telefonlar aracılığı ile online bir alışveriş sitesinden bir kitap aratırken veya satın alırken daha sonra farklı bir web sitesinde kitaplar ile ilgili reklamlar ve öneriler karşımıza gelebilmektedir. Bu durum sanal camiadan ayak izlerimizin takip edildiğini göstermektedir. Ancak bu izler her zaman düzgün karşımıza çıkmaz paylaştığımız fotoğraflardan kişisel hesap bilgilerine ulaşılabilir (RTÜK, 2020)

Aktif ayak izi, kullanıcının arkasında kendi izni ile bıraktığı veriler olarak söylenmektedir. Pasif ayak izi ise, kullanıcının dijital platformlardaki farkın ve izni olmadan bırakmış olduğu izlere denilmektedir. Aktif ayak izi, birine e-posta göndermek, blog yazıları yayınlamak, sosyal medya platformlarında paylaşımlar, örneğin; tweet, facebook durumları ve instagram fotoğrafı paylaşımları ve e-postalara abonelik veya metin güncellemelerini içeren formları doldurmak anlamındadır. Pasif ayak izi, kullanıcıların konumlarını belirlemek için kullandıkları konum uygulamaları ve web siteleri, reklam verilen ürünlerin bağlantılarını kullanmaktır. (Uğurdağ, 2019)

Web siteleri, online alışveriş siteleri ve ürün geliştirme adresleri genellikle sanal sitelerden web sitelerine geçişleri takip edebilen ve yakın zamanda araştırdığınız veya satın aldığınız ürünleri karşınıza çıkaracak reklamlarla olanak sağlayan depolanan bilgiler bırakmaktadır. (Kabacan, 2020)

Sosyal medya platformlarındaki retweetler ve sosyal medyadaki kullanıcı yorumları “dijital kayıt” olarak adlandırılmaktadır. Sosyal medya hesaplarındaki önerilen gizlilik ayarlarının eksiksiz yapıldığından emin olmak gerekmekte ve bunların güncellenmesine özen gösterilmesi önerilmektedir ve online paylaşım siteleri çoğunlukla bilgilerin şeffaflığını

belirten yenilenmiş politikalar ve ayarlar geliştirmektedirler. Cep telefonları, tabletler ve dizüstü bilgisayarlar ve web siteleri genellikle sitelerin ziyaret edildiği sırada erişim sağlanan cihazları kayıt altına almaktadırlar (Kabacan, 2020)

Turistlerin dijital ayak izlerinin belirlenmesinde en büyük etken çok fazla fotoğraf çekiyor ve bunları paylaşıyor olmaları ilk sıralarda bulunmaktadır. Banka kartlarını kullanarak alışveriş yapılması, cep telefonlarıyla konuşulması ve mesajlaşması, sosyal ağlarda çevrim içi (aktif) olunması gibi dijital faaliyetlerle tespiti ve analizleri yapılabilmektedir. Ayrıca turistlerin hareketlerinin belirlenmesinde farklı ekenlerde bulunmaktadır (Liviu, 2017)

Turistler en çok fotoğraflanan mekanlara gitmeyi ve kendilerinin de oralarda fotoğraflarının olmalarını istemektedir. Aynı zamanda en meşhur alışveriş noktalarında alışveriş yapmakta ve bilindik mekanlarda yemek yemektedirler. Gezilecek bölgelere yakın yerlerde konaklamakta ve böylelikle ayak izlerini her bir noktada bırakmış olmaktadır. İlâveten konakladıkları otellerin çevresinde ve otellerde bulunan internete bağlanmakta, ortamdaki wifi ağlarındaki boşluklar etkisiyle bilgileri kolaylıkla yansıtılabilmektedir (Walden vd., 2018) Bu alandaki çalışmalar kitle kaynaklı coğrafi bilgileri belirlemede, turizm kaynaklı bilgi toplamakta, sosyal alanda turist izlemesi ve hareketleri bu hareketlerin yönetilmesiyle ilgili konular geneline yayılmaktadır (Jiawei vd., 2020).

Bu alanda yapılan çalışmalara yer verilirken popüler destinasyonlarda tarama gerçekleştirilmiş ve bu çalışmalar kapsamında turistlerin turistik faaliyetlerini gerçekleştirdikleri sırada nereleri tercih ettikleri bu alanda hangi faaliyetleri sürdürdükleri nerelerde yemek yedikleri hangi sokaklarda alışveriş yaptıkları hepsi tespit edilmektedir. Bu tespitlerin hem popüler mekanların belirlenmesinde hem de araştırmanın yapıldığı destinasyonların yerel yönetimlerinde şehircilik faaliyetlerine katkı sağlayacakları düşünüldüğü belirtilmektedir (Olmedo vd., 2018).

Girardin vd. (2008) yılında yapmış oldukları çalışmada turizm alanında yapılan dijital ayak izi çalışmalarının çoğunluğunun büyük veri kaynaklarının karşılaştırılması üzerine yapılmış olduğu ve dijital ayak izinin belirlenmesinde büyük veri (Big Data) kaynaklarının önemli rol oynamakta olduğu belirtilmiştir. Turizm araştırmalarında da kullanılan çok sayıda verinin turistlerin uzay-uzamsal örüntülerinin analizi sonucunda elde edilmekte olduğu ve büyük verinin birçok farklı alanı da kapsamakta olduğu ayrıca turistlerin dijital ayak izi bırakmakta, büyük veri ise turistlerin şehirdeki ziyaretleri sırasında davranışlarının dokümanını oluşturmakta olduğu savunulmuştur.

Büyük verinin tanımı ile ilgili birçok görüş bulunmaktadır. Ancak genel olarak büyük veri ile ilgili tanımlar yapılırken ne olduğu ya da ne işe yaradığıyla ilgili tanımlar ortaya çıkmaktadır. Çoğu çalışmada ne için kullanıldığına göre tanımlanan büyük veri kullanım biçimine göre de şekillenmektedir. Büyük verinin tam açıklanamamasının sebebi kullanımında büyük payı olan uluslararası arama motorlarının üzerine yüklediği anlamdan kaynaklanmaktadır (Şen ve Ünlüöner, 2021, s. 278)

Son yıllarda güvenilir veri kaynağı olarak görülen büyük veri bilginin elde edilmesinde önemli katkılarda bulunmaktadır. İnternet teknolojileri; web sistemleri, sosyal paylaşım siteleri, iletişim araçları ve dahası ile veri toplamak, toplanan verilerin içerisinden uygun olanların ayrıştırılıp işe yarar olanların depolanması gerekmektedir. Büyük veri sayesinde de elde edilen ve saklanan bu veriler turizm alanında ciddi boyutlarda kullanılmaktadır (Ercan, 2020, s. 5233-5234)

4. LİTERATÜR ÇALIŞMALARI: DİJİTAL AYAK İZİ

Bu bölümde dijital ayak izinin turizm araştırmaları kapsamında hangi konuları ele aldığı ve hangi alanlarda araştırıldığına dair literatürdeki ilgili çalışmaların bir kısmı aşağıdaki gibi derlenmiştir.

Tablo 1. Turizmde Dijital Ayak İzi ile İlgili Çalışmalar

	Yazar/ Yazarlar	Çalışmanın Amacı, Yöntemi, Sonucu
1	Salas-Olmedo vd. (2017)	Çalışmada kentlerdeki turistlerin mekânsal davranışları hakkındaki bilgileri ve ziyaretleri sırasında üretilen verileri ve bu veri kaynaklarını araştırmaktadır. Çalışmanın amacı şehirli turistlerin dijital ayak izini büyük veri aracılığı ile analiz etmektir. Tek bir kaynak kullanan diğer makalelerden farklı olarak bu makalede şehirlerdeki farklı turizm faaliyetlerini yansıtmak için üç veri kaynağı incelenmektedir. Bu kaynaklar sosyal paylaşım sitelerinden oluşur Panoramio (gezi), Foursquare(konum) ve Twitter (bağlantı-konaklama) bu siteler incelenerek turistlerin şehir hareketlerinin analizleri keşfedilmiştir. Araştırmanın sonucun da bu üç platform aracılığı ile verilerin kısmen mekânsal olarak gereksiz kısmen de tamamlayıcı olduğunu ve çok işlevli turistik mekânların çeşitliliğini, aktivitelerini mekanların kategorizasyonuna izin verildiğini göstermektedir. Şehirlerdeki turistik faaliyetlerini analiz edebilmek için tek bir kaynağın kullanımının yetersiz olduğunu birkaç tamamlayıcı kaynaktan elde edilen verilerle sağlıklı bir araştırmanın ortaya konulabileceğidir.

2	Stienmetz ve Fesenmaier (2016)	<p>Bu çalışmada düşük maliyetli ve kolayca erişilebilen gönüllü coğrafi bilgi (VGI) araçlarının turist davranışlarındaki güvenilirliğine ilişkin bir vaka çalışması yapılmıştır. Çalışmanın amacı bir turizm destinasyonundaki ziyaretçilerin hareket modellerini tanımlamak amacıyla VGI verilerinin kullanımını değerlendirmektir. Bir vaka çalışması olarak St. Augustine, Florida'yı kullanan bu araştırmada Instagram'dan elde edilen ve geleneksel çevrimiçi anket metodolojisi kullanılarak toplanan verilerle ziyaretçi akış ağları incelenmiş ve ardından sonuçlar karşılaştırılmıştır. Makalenin sonucunda turizm araştırmaları için VGI verilerinin kullanılmamanın avantajları vurgulanmış ancak aynı zamanda le alınması gerek potansiyel tehditlere de dikkat çekmektedir.</p>
3	Önder vd. (2014)	<p>Çalışma kapsamında turizm araştırmalarında güncel veri toplama araçlarının pahalı, zaman alan ve gecikmelerin olabileceği yöntemler olduğundan bahsedilmektedir. Verilerin toplanması ve analizi sırasında belli bir zaman kaybının olabileceği fakat günümüzde tüm bireylerin internette turizm araştırmaları içinde kullanabilecek dijital izler bıraktıklarını bu izlerin araştırmalar kapsamında kullanılabileceği öngörülmüştür. Dijital ayak izinin kullanılabileceği bazı uygulamaların olduğundan bu uygulamaların Flickr adı verilen bir web sitesi gibi sitelerinden oluştuğundan bahsedilmektedir. Çalışmanın amacı Flickr'daki, dijital ayak izlerinin turizm için yararlı bir veri akışı sağlayıp sağlamadığını belirlemek i.in 2007 ve 2014 yılları arasında "Avusturya" da etiketlenen fotoğraflar Flickr kullanılarak toplanmıştır. Bu veriler kullanılarak bölge sakinleri ile turistler birbirinden ayrılmış turistler tarafından oluşturulan verilerin mekânsal analizleri yapılmıştır. Araştırmanın sonucunda Avusturya'daki coğrafi etiketli fotoğrafların şehir düzeyindeki gerçek turist sayılarını bölgesel düzeyden daha fazla olduğu sonucuna varılmıştır.</p>
4	Pang vd. (2018)	<p>Çalışma kapsamında turizmin imaj algısına yönelik bir araştırma yapılmıştır. Destinasyonlar ve imajları turizm araştırmalarında önemli bir konu olduğu vurgulanmıştır. Araştırmanın kapsamını Çin'in Xi'an şehri oluşturmaktadır. Seyahat noktalarını ve dijital ayak izinin veri kaynağı olarak belirlenmesinde Roast ContentMing yazılımı kullanılmış Xi'an ın turizm imajının yüksek frekanslı özellikleri ve anlamsal ağı oluşturulmuştur. İçerik analizi yöntemini benimser ve bilişsek imajı analiz etmek için temellendirilmiş teori ve Xi'an ın turizminin duysal örüntüsü oluşturulmuştur. Sonuç olarak Xi'an daki turistlerin kültürel ve bireysel turist oldukları gözlenmiştir. Xi'an ın turizm imajının genel taşıyıcının bin yıllık tarihi ve eski başkentinin olduğu, Güçlü kültürel atmosferinin köklü insanlık duygularının ve seçkin tarihinin turizm çekiciliğine sahip olduğu tespit edilmiştir. Turistlerin Xi'an a karşı genel</p>

International Conference on Global Practice of Multidisciplinary Scientific Studies-IV
Turkish Republic of Northern Cyprus, April 28-30, 2023

		duyularının pozitif olduğu bu algısında turizm unsurlarından kaynaklandığı olumsuz algılarının da manzara ve yönetim hizmetlerinden kaynaklandığı sonucuna varılmıştır.
5	Marti vd. (2021)	Çalışma kapsamında kentsel turizm ile ilgili fenomenler hakkında fikir vermektedir. Açık ve gönüllü katılımcılar tarafından oluşturulan içeriği analiz etmektedir. Referans çerçeve yöntemi ve açıklayıcı vaka çalışması uygulanmıştır. Turistik faaliyet merkezlerinin belirlenmesinde ve kentsel bağlamda dinamik bölgelerin güncel kategorizasyonunu elde etmek için sosyal ağlardan alınan veriler turistik kentsel aktiviteleri belirlemek için kullanılmıştır. Bu yöntem ile turizm ile ilgili ilgi çekici yerlerin analizini kolaylaştırır ve dijital ayak izleri sayesinde açığa çıkan kullanıcı tercihleri arasındaki boşluğu doldurmada ilerleme sağlamaktadır. Araştırma sonucunda kullanılan yöntem ile kentsel planlamada karar verme sürecinde tamamlayıcı bir araç olarak dijital ayak izi potansiyelini göstermektedir.
6	Girardin vd. (2008)	Bu çalışmada toplu dijital ayak izlerinin büyük kümeler analizi yoluyla ortaya çıkan kalıpları, insanların şehri nasıl deneyimledikleri bu kalıpla arasındaki itici güçleri hakkında bilgiler sağlayabildiği gösterilmektedir. Çalışma New York şehri şelaleleri alanında bir vaka çalışmasıdır. Özellikle kentsel mekânın çekiciliğinin evrimini ölçme kapasitesini araştırmaktadır. Araştırma kapsamında farklı zamanlarda çekilen fotoğrafların yoğunluk ve dağılımı gibi ziyaretçilerin oluşturduğu dinamik verilerden yararlanılmaktadır. Sonuç olarak çalışma halka açık cazibe ve etkinlik alanlarının ziyaretçiler açısından dağılımı üzerindeki etkisini ölçmenin yeni yollarını savunmaktadır. Ulaşılan bilgiler yerel yönetimler ve araştırmacılar ve mobil ağ operatörleri gibi hizmet sağlayıcıları tarafından da kullanılabilir yapıdadır.
7	Kasinathan vd. (2017)	Çalışma kapsamında karma gerçekliğe dayalı prototip turizm arama uygulaması inşa etmek ve denemek amacıyla hazırlandığı bildirilmiştir. Telefon uygulaması kapsamında cep telefonu kamerasının odaklandığı görüntünün üzerine turizmle ilgili bilgileri yerleştirildiği, karma gerçeklik ortamında android tabanlı bir turizm bilgi arama uygulaması oluşturulduğu buna "Footprint"i adının verildiği belirtilmiştir. Uygulamanın kullanımından bahsedilmiş ve kullanıcının uygulamayı, yalnızca cep telefonu kamerasını ile belirli bir noktaya doğrultmasıyla bilgi alması yeterli olacağı ve Footprint uygulamasının 30 metreye kadar uzaktaki coğrafi etiketli turizm nesnelere tüm bilgileri kapsayacağını belirtmektedir. Kullanıcıların ayrıca arama bilgilerini bilgi kaynağına (Google veya Wiki gibi) veya kategoriye (Yiyecek veya Yer İşareti gibi) göre filtreleyebileceği ve bu deneyimin bir gün bir trend haline

	geleceğinin umut edildiği belirtilmektedir. Sonuç olarak daha fazla gerçeklik ortamı nesnelerin internet aracılığıyla gerçeküstü, ancak sanal alternatiflere dönüştürülecek ve birçok cihaz, ağ ve uygulamanın kullanıcı içeriği oluşturulmasında dijital kaynaklar yardımıyla turizm faaliyetlerini kolaylaştıracağı düşünülmektedir.
--	--

4. SONUÇ

Turizm sektörü gerek yerli gerekse yabancı turistlerin seyahatleri sırasında gördükleri ve deneyimledikleri her olayın her dakikasının pozitif yönlü gelişmesini amaçlamaktadır. Bu amaç doğrultusunda gelişerek ve yenilenerek bünyesine yeni teknolojiler eklendiği görülmektedir. Teknolojinin gelişmesiyle seyahat sırasında deneyimlerimizi internet ve sosyal platform ağları aracılığı ile her yerden paylaşabiliyor olmamız kolay erişilebilir olduğunu göstermektedir. Bu paylaşımlar aslında hiç kaybolmayacak bir sistem sayesinde dijital ayak izi terimi ile (büyük veri) depolanmakta ve hiçbir zaman silinmesi mümkün olmayan bir sistemin içine dahil olmaktadır.

Araştırma kapsamında görülmektedir ki bir destinasyonda en fazla gezilen, fotoğraflanan ve turistlerin vakit geçirmekten hoşlandığı noktalar tek tek kayıt altına alınmakta ve büyük veri uzay-uzamsal zamanda depolanarak turistlerin her hareketi belirlenmektedir. Bu verileri bireylerin kendi izinleri doğrultusunda ya da haberleri olmadan arkalarında bıraktıkları izler ile sağlanmaktadır. Bireylerin izinleri olmadan alınan bilgiler genellikle dijital ortamdaki kimliklerinde güvenlik açıkları sebebiyle belirlenmektedir. Bireylerin dijital platformlardaki güvenlik aşamalarına dikkat etmeleri gerekmektedir. Bu çalışmada dijital ayak izi kavramından ve turizmde dijital ayak izinin kullanımından bahsedilmiştir. Dijital ayak izi kaynaklarının çoğunun büyük veri (big data) ve sosyal medya uygulamaları aracılığıyla verilerinin toplandığı ve bir kısım kişilerin verilerinin kullanıldığından haberdar olmaması ile bir kısım kullanıcıların kendi rızaları doğrultusunda ulaşılabilir olduğu görülmüştür. Araştırma kavramsal çerçevede kalmış bir literatür araştırmasıdır. Bu konudaki çalışmaların sayısının arttırılarak literature katkı sağlanması tavsiye edilmektedir.

ÖZET

Bu çalışma, okul öncesi dönemdeki çocukların bilişsel gelişim göstergelerinden biri olan parça-bütün ilişkisini teknolojik materyal kullanarak kazandırmayı amaçlamaktadır. Araştırmanın katılımcılarını Amasya ili Milli Eğitim Bakanlığı (MEB)'na bağlı bir köy okulunda okulöncesine devam eden 6 çocuk (4 kız, 2 erkek) oluşturmaktadır. Katılımcıların yaşları 48 ile 72 ay arasında değişmektedir. Bu çalışmada çocuklar akıllı tahta ve Jigsaw Planet Web 2.0 uygulamasıyla 9 parçalı yapbozu tamamlama sürelerine göre puanlandırılmıştır. Deneysel yöntemle yapılan bu çalışmada aynı gruba ön test- son test puan karşılaştırmaları yapabilmek için İlişkili Örneklem t Testi kullanılmıştır. Çalışmanın analizinde Microsoft Excel ve SPSS 20.0 istatistik paket programı kullanılmıştır. Verilerin normal dağılım gösterip göstermedikleri Kolmogorov- Smirnov testi ile kontrol edilmiş ve normal dağılım gösteren verilere nonparametrik testler uygulanmıştır. Sonuçlar $p=0.05$ anlamlılık düzeyine göre yorumlanmıştır. Araştırma sonucunda dijital bir oyun olan puzzle web 2.0 aracının çocukların parça- bütün ilişkisini kavramalarında anlamlı bir etkisinin olduğu sonucuna ulaşılmıştır. Ayrıca bu dijital oyunun telefon ile ve akıllı tahta ile oynandığında yapbozun tamamlanma sürelerinde telefon lehine değişiklik görülmüştür. Çocukların bu uygulamadan sonra dijital olmayan 24 parçalı yapbozu önceki sürelerine oranla daha kısa sürede tamamladıkları görülmüştür ve bu uygulamanın çocukların yapboz oyununa karşı olumlu tutum geliştirdikleri sonucuna ulaşılmıştır. Sonuç olarak, okul öncesi öğretmenleri öğretim sürecini Web 2.0 teknolojileriyle destekledikleri takdirde çocuklar okul öncesi dönemin bilişsel gelişim basamağının bir kazanımı olan parça-bütün ilişkisini kavramış olurlar.

Anahtar Kelimeler: Parça-bütün ilişkisi, okul öncesi, teknolojik materyal, Web 2.0 araçları.

**EVALUATION OF PRESCHOOL CHILDREN'S PERFORMANCE OF
TECHNOLOGICAL MATERIAL WITH PUZZLE CREATION FOR THE
ACQUISITION OF THE PART-WHOLE RELATIONSHIP**

ABSTRACT

This study aims to gain the part-whole relationship, which is one of the cognitive development indicators of preschool children, by using technological material. The participants of the study consist of 6 children (4 girls, 2 boys) attending preschool in a village school affiliated to the Ministry of National Education (MEB) in Amasya province the ages of the participants ranged from 48 to 72 months. In this study, children were scored according to their time to complete the 9-piece puzzle with the smart board and Jigsaw Planet Web 2.0 application. In this experimental study, the Related Samples t-Test was used to compare the pre-test and post-test scores of the same group. SPSS 20.0 statistical package program was used in the analysis of the study. Whether the data showed normal distribution was checked with the Kolmogorov - Smirnov test and nonparametric tests were applied to the data showing normal distribution. The results were interpreted according to the $p=0.05$ significance level. As a result of the research, it was concluded that the puzzle web 2.0 tool, which is a digital game, has a significant effect on children's understanding of the part-whole relationship. In addition, when this digital game is played with a phone and a smart board, a change was observed in the completion times of the puzzle in favor of the phone. After this application, it was observed that the children completed the non-digital 24-piece puzzle in a shorter time than before, and it was concluded that this application developed a positive attitude towards the puzzle game. As a result, if preschool teachers support the teaching process with Web 2.0 technologies, children will understand the part-whole relationship, which is an achievement of the cognitive development step of the preschool period.

Keywords: Part-whole relationship, preschool, technological material, Web 2.0 tools.

1.GİRİŞ

Okul öncesi eğitim günümüzde önemi tartışılmayacak şekilde alınması gereken ilk eğitim olarak karşımıza çıkar. Aileden sonra çocuğun karşılaştığı, kaynaştığı, bilgi ve beceri ile donandığı yerdir. Zeka gelişiminin en önemli olduğu 0-6 yaş aralığında çocuk algıları açık, öğrenmeye hazır ve yeni bilgiler almaya isteklidir. Bu nedenle sınıf ortamının çocuğun yeteneklerini keşfedici, merakını giderici, problemlere çözüm üretebileceği zengin uyarılardan oluşması gerekmektedir (Büyükkaragöz, 1993).

Okul öncesine yönelik hazırlanan oyun ve oyuncaklar, öykü kitapları eskiden az sayıda iken günümüzde çocuklar için hazırlanan materyallerin çeşitleri artmış ve birçoğu yaş gruplarına göre ayrılarak sorgulama ve düşünme temelli oyun, oyuncaklar, çocuk kitapları hazırlanmaya başlamıştır. Günümüzde oyuncularda da çeşitliliğe gidilerek plastik legolardan, yapı-inşa oyuncaklarından, dramatize (evcilik) oyuncaklarından ziyade günümüzde ahşaptan yapılmış akıl- zeka oyunları, satranç, ritm aletleri, montessori uygulamaları, bulyap oyun ve oyuncakları, yapboz oyuncakları kullanılmaya başlanmış hatta dijital öyküler ve web 2.0 teknolojisiyle hazırlanan e öğrenme oyun ortamları eğitime entegre edilmiştir (Usta, 2020; Yesilyurt, 2021).

Okul öncesi eğitimi yeni yaklaşımlarından biri de yapboz tekniğidir. İlk olarak Elliot Aronson ve arkadaşları tarafından geliştirilen bu teknikle çocukların parça-bütün ve bütün-parça ilişkisini kavrayarak görsel-uzamsal zekalarını geliştirmek amaçlanmıştır. Bu amacı gerçekleştirirken de sıradan eğitim anlayışından ziyade daha etkileşimli, farklı, 21. Yüzyıl becerilerini geliştirmeye yatkın, zaman, mekan ve somut materyalden bağımsız teknolojik uygulama tercih edilmiştir.

Yapboz (puzzle) yapmanın katkılarında biri sağ ve sol beyni aynı anda çalıştırmasıdır. Bu da çocuklarda problem çözme ve dikkat becerilerini geliştirir. Kısa süreli belleği de geliştirerek hafızayı kuvvetlendirir. Ayrıca puzzle tekniği görsel-mekansal akıl yürütme becerilerini de geliştirir, stres giderir (Master, 2018; Küçük, Palabıyık, Ersoy & Yeşilyurt, 2020; Yüksel, Yılmaz & Yeşilyurt 2022).

Bu dönemde çocukların yaşama dair sorumluluk ve disiplin kazanmaları, sosyal duygusal, psikomotor, bilişsel ve dil gelişimi, öz bakım becerileri gibi alanlarda kendi yeteneklerini ortaya çıkarabilmeleri ve buna uygun ortamlarda kendilerini geliştirebilmeleri için okul öncesi eğitimi programı hazırlanmıştır (MEB, 2013).

Buna göre bilişsel gelişim göstergelerinden biri olan K15, “Parça--bütün ilişkisini kavrar.” kazanımının göstergesi olan “G1 Bir bütünün parçalarını söyler, G2 Bir bütünü parçalara böler, G3 Bütün ve yarımı gösterir, G4 Parçaları birleştirerek bütün elde eder.” Göstergeleri teknolojik materyal kullanılarak okul öncesinde değerlendirilmiştir.

Bu çalışmada 4-6 yaş grubu okul öncesi öğrencilerinin yaşlarına uygun olarak Jigsawplanet Web 2.0 teknolojisiyle hazırlanan 9 parçalı puzzle öğrencilere uygulanmıştır. Uygulama sonunda bilişsel gelişim göstergelerinden biri olan K15, “Parça--bütün ilişkisini kavrar.” kazanımı değerlendirilmiştir.

1.1 Problem Durumu

Okul öncesinde eğitim farklılaştırma yoluna gidilerek oyun temelli, dijital e öğrenme ortamlarıyla öğrenciler tanıştırılarak eğitimde yeniliğe gidilmiştir. Parça-bütün ilişkisini kazandırmayı amaçlayan yapboz tekniği, jigsawplanet uygulamasıyla öğrencilere sunulmuştur.

Bu çalışmanın problem cümlesi ise yapboz oluşturma teknolojik materyalin okul öncesinde parça-bütün ilişkisini geliştirmeye etkisi nedir?

1.2 Alt Problemler

Yukarıda belirtilen problem kapsamında bu araştırmada aşağıda belirtilen alt problemlere yanıt aranmaktadır. Bunlar:

- 1.Yapboz oluşturma içerikli teknolojik materyalle yapılan öğretimin öğrenci motivasyonuna etkisi nedir?
2. Yapboz oluşturma içerikli teknolojik materyalle yapılan öğretim, öğrencileri etkinlik sırasında ne kadar aktifleştirmektedir?
- 3.Bu teknolojinin etkinlik sırasında kullanımın öğrenim sürecini kolaylaştırmaya etkisi nedir?
- 4.Etkili öğretim açısından bakıldığında yapboz oluşturma içerikli teknolojik materyalin önemi nedir?

1.3 Araştırmanın Amacı

Bu araştırmanın amacı okul öncesi öğrencilerinde, bilişsel gelişim kazanımı olan ‘Parça-bütün ilişkisini kavrar’ kazanımını, yapboz oluşturma teknolojik materyalle öğretim yaparak öğrencilerin kazanıma ne oranda ulaştığı incelemektir.

1.4 Araştırmanın Önemi

Okul öncesi dönem öğrencilerin yaşları ve gelişim özellikleri itibariyle somut yollarla öğrendiği, dikkat süresinin kısa olduğu ve bu nedenle çok yönlü materyallere en çok ihtiyaç duyduğu dönemdir. Bu nedenle çocuklar bu dönemde en çok yaparak-yaşayarak öğrendiği,

anında geri bildirim alabildiği, ilgi çekici görsel ve işitsel uyarıcılara ihtiyaç duyar. 21. yy teknoloji çağı da birçok alana yenilik getirmiştir. Farklılaştırılmış yöntem tekniklerden olan teknolojik eğitim okul öncesi dönemdeki çocukların belirlenen kazanımlara ulaşmasında aracı olmuştur. Nitekim bu çalışmada okul öncesi dönemdeki çocukların teknolojik materyalle yapılan öğretim sonucu bilişsel gelişim kazanımına katkısı olduğu görülmüştür.

1.4 Araştırmanın Sınırlılıkları

- Bu araştırma Amasya’da bir devlet okulunda anasınıfına giden 6 öğrenci ile sınırlıdır.
- Bu araştırma 2022-2023 eğitim öğretim yılı ikinci yarısı ile sınırlıdır.
- Bu araştırma ‘Parça-bütün ilişkisini kavrar’ kazanımıyla sınırlıdır.
- Bu araştırma ön test ve son test uygulaması ile sınırlıdır.

2. YÖNTEM

Bu bölümde araştırmanın modeli, evreni ve örneklemini, veri toplama aracı ve veri toplama süreci yer almaktadır.

2.1 Araştırma Modeli

Bu çalışmada nicel araştırma yöntemlerinden yarı deneysel desen kullanılmıştır. Nicel araştırma yöntemleri gözlem ve ölçmeye dayandığı için tekrarlanabilir verilerdir. Bu çalışmada, belirli sınıflardaki okul öncesi öğrencilerine ön test son test uygulanarak yarı deneysel araştırma modeli kullanılmıştır. Yarı deneysel desenlerin tam deneysel desenden farkı iç ve dış geçerlik yönünden eksikliklerinin olmasıdır (Can, A. 2022).

2.2 Çalışma Grubu

Araştırmanın çalışma grubunu 2022-2023 eğitim öğretim yılının ikinci döneminde Amasya il merkezine bağlı köy okulunun anasınıfında öğrenim gören 4 kız, 2 erkek olmak üzere toplam 6 okul öncesi öğrencisi oluşturmaktadır.

2.2.1 Öğrenen Analizi

Araştırmada seçilen örneklem grubu araştırmacının sınıfında olmak üzere 4-6 yaş aralığındadır. Yaşlar genel olarak birbirine yakındır ve 5 yaş civarındadır. Öğrenciler daha önce akıllı tahta ile dijital eğitsel oyun oynadıkları için nasıl kullanıldığını bilirler. Ancak jigsawplanet yapboz içerikli oyun tüm öğrencilere kısaca tanıtılmıştır. Öğrenciler oyunu oynamada istekli ve yapbozu tamamlama sırasında heyecanlı ve meraklıdırlar.

2.2.2 Kazanım Sıralaması

Bu çalışmada okul öncesi öğrencilerinde, bilişsel gelişim kazanımı olan ‘Parça-bütün ilişkisini kavrar’ kazanımını, yapboz oluşturma teknolojik materyalle öğretim yaparak

öğrencilerin kazanıma ne oranda ulaştığı incelenmektedir. Bu çalışmada <https://www.jigsawplanet.com/> web sitesindeki yapboz oyunları kullanılmıştır.

2.2.3 Öğretim Teknikleri

Bu araştırmada yaşları 48-72 ay arasında değişen çocuklara 6 hafta boyunca her gün 20 dk akıllı tahta yardımıyla puzzle oluşturma teknolojili 4,9 ve 12 parçalı yapboz tamamlanmıştır. Akıllı tahta ile daha önce dijital oyun oynayan çocuklar ilk kez yapboz yapmışlardır. Buna göre çocuklara ön test ve son test uygulanmış ve yapboz tamamlama süreleri ölçülmüştür.

2.2.4 Uygulanan Öğretim Modeli

Bu araştırmada akıllı tahta-bilgisayar destekli öğretim kullanılmıştır. <https://www.jigsawplanet.com/> web sitesinden kazanıma ve öğrencilerin yaşlarına uygun yapbozlar seçilmiştir.

Görsel 1: 4 parçalı etkinlik örneği Görsel 2: 6 parçalı etkinlik örneği Görsel 3: 9 parçalı e.ö

Görsel 4: 16 parçalı etkinlik örneği

2.3 Veri Toplama Aracı

Araştırma okul öncesi öğrencilerine yönelik olduğu için kazanım değerlendirme başarı testinden ziyade öğrenci performansını ölçen ön test ve son test süreleri ile veri toplanmıştır. Bilişsel gelişim ‘Parça-bütün ilişkisini kavrar.’ kazanımı performansı değerlendirilmiştir.

2.4 Veri Analizi

Toplanan verilerin analizi Microsoft Excel 2016’da t-testi: ortalamalar için iki örnekle yapılmıştır. Öğrencilerin almış olduğu puanlar tek tek girilip Değişken 1’e ön testten alınan puanlar Değişken 2’ye son testten alınan puanlar eklenmiştir. Ortalamalar ve standart sapmalara bakılmıştır.

3. ARAŞTIRMA VE BULGULAR

Çizelge 1. Öğrencilerin dijital yapbozu tamamlama süreleri

Yaş grupları	Ön Test (Süre/sn)	Son Test (Süre/sn)
	180	160
	150	120
48-60 Ay	120	90
	145	115
60-72 Ay	95	80
	164	128

Veriler Excel üzerinden analiz edildikten sonra t-Testi sonuçları elde edilmiştir. Elde edilen bu veriler aşağıda sunulmuştur.

Çizelge 2. Yaş gruplarına göre t Testi Karşılaştırması

	Yaş Grubu		Gruplar		Anlamlılık
	48-60 Olan Öğrenciler	Grubu Ay	60-72 Olan Öğrenciler	Grubu Ay	
Ön Test	\bar{x} 150	SS 30	\bar{x} 134	SS 35	P 0,000188
Son Test	123	35	107	24	0,000376

3.1 ÖN TEST VE SON TESTİN KARŞILAŞTIRILMASI

‘Parça-bütün ilişkisini kavrar’ kazanımını, dijital puzzle oyunuyla tamamlama sürelerine bakılarak yapılan ön test-son test sonucu çizelge 3’de gösterilmiştir.

Çizelge 3. Ön Test ve Son Testin Karşılaştırılması

t-Test: Ortalamalar İçin İki Örnek

	<i>öntest</i>	<i>sontest</i>
Ortalama	142,3333	115,5
Varyans	938,6667	813,5
Gözlem	6	6
Pearson Korelasyonu	0,968135	
Öngörülen Ortalama Farkı	0	
df	5	
t Stat	8,473684	
P(T<=t) tek-uçlu	0,000188	
t Kritik tek-uçlu	2,015048	
P(T<=t) iki-uçlu	0,000376	
t Kritik iki-uçlu	2,570582	

Buna göre son teste ait p değeri 0,00 çıkmıştır. Son test p değeri 0.05’ten küçük olduğu için çocuklar akıllı tahta ile dijital puzzle oyunu oynadıktan sonra yaş grupları arasında oyunu bitirme süresi kısalarak dijital oyun ile yapbozu kısa sürede bitirme arasında anlamlı bir fark olduğu görülmüştür.

4. SONUÇ

Bu araştırma ön test ve son test gruplu yarı deneysel bir araştırmadır. Elde ettiğimiz bulgulara baktığımızda dijital puzzle oyunu ile parça-bütün öğretiminin öğrencilerin performansı üzerinde olumlu yönde katkı sağladığı sonucuna varılmıştır ($p < 0,05$).

Araştırmanın alt problemlerine ait sonuçlar ve tartışma aşağıda aktarılmıştır:

1. Yapboz oluşturma içerikli teknolojik materyalle yapılan öğretimin öğrenci motivasyonuna etkisi nedir? sorusuna cevap aranmıştır. Bu doğrultuda dijital puzzle oyunu ile öncelikle öğrencinin dikkati toparlanmıştır. Sıradan puzzle oyunlarından farklı olan bu içerikle öğrenci motivasyonu aktif kılınmış ve öğrenci yapbozu tamamladıkça oyun oynamaya olan ilgisi ve isteği artmıştır.

2. Yapboz oluşturma içerikli teknolojik materyalle yapılan öğretim, öğrencileri etkinlik sırasında ne kadar aktifleştirmektedir? sorusuna cevap aranmıştır. Bu doğrultuda öğrencilere uygulama imkanı sağlayan teknolojiyle öğretim öğrencide ilgi, istek ve merak uyandırdığı için öğrenciyi etkinlik sırasında daha fazla aktifleştirmiştir. Yapbozu tamamlama süresinin farkına varan öğrenci çabuk ve daha kısa sürede bitirmek isteyerek eğitici dijital oyunu oynamaya olan isteğinde artış gözlenmiştir.

3. Bu teknolojinin etkinlik sırasında kullanımının öğrenim sürecini kolaylaştırmaya etkisi nedir? sorusuna cevap aranmıştır. Bu doğrultuda dikkatini toplamada zorluk çeken öğrenciler yapbozu tamamlamada daha istekli davranarak oyunu bitirmeye karşı olumlu güdülenmişlerdir.

4. Etkili öğretim açısından bakıldığında yapboz oluşturma içerikli teknolojik materyalin önemi nedir? sorusuna cevap aranmıştır. Bu doğrultuda çocuklar düzeylerine uygun ve adım adım ilerleme yoluyla hem seviyelerine uygun ilerleme imkanı buldular hem de kısa sürede çeşitli içeriklerle tanışma fırsatı yakalamış oldular. Ayrıca birbirlerinin oyununu sırası gelene kadar takip ederek dikkatlerini beklenenden daha uzun süre sürdürerek birbirlerinden de öğrenmiş oldular. Kağıt puzzle oynarken çabuk sıkılan ya da puzzle tamamlamayı sevmeyen öğrencilerde yapboz oyunlarına karşı olumlu tutum oluşmuş ve eskisine oranla 24 parçalı yapbozu daha kısa sürede tamamladıkları görülmüştür.

Araştırmadan elde edilen sonuçlara göre aşağıdaki önerilerde bulunulabilir:

21. yy eğitim-öğretim anlayışında daha çok duyu organına hitap eden, günlük hayatla ilişkili, zaman ve mekan sınırlaması olmayan, eğitici dijital ortamlarla iç içe yapılan eğitimler önem kazanmaktadır. Yapılan bu çalışmada olduğu gibi öğrenciler bu şekilde etkinliklere daha motive olarak katılmakta ve dikkatlerini uzun süre sürdürebilmektedir.

Eđitici e öğrenme ortamlarıyla öğrenciler eğlenerek, takip ederek ve aktif şekilde katılarak dakikalar içinde birbirinden farklı çalışmalarını tamamlama fırsatını bulmaktadır.

Bu nedenle bundan sonra yapılacak çalışmalarda teknolojiyi eğitim hayatımıza entegre ettiğimizde eğitimden alınacak verimin kalitesi artmaktadır. Bu çalışma öğrencilerin ‘Parça-bütün ilişkisini kavrar.’ Kazanımına nasıl ulaşıldığını açıklar niteliktedir. Ancak çalışmada kullanılan kişi sayısının ve tekniklerin artırılması ve okul öncesi dışında farklı alanlarda kullanılması önerilir.

ÖZET

Nervus alveolaris inferior, ağız ve çene cerrahisinde hekimler açısından son derece büyük bir önem arz etmektedir. Alveolar sinir, mandibulanın posterior bölgesinde yapılan implantlarla birlikte farklı işlemlerin planlanmasında, cerrahi işlemlerde ve işlem sonrasında büyük önem taşımaktadır. Çalışmamızın amacı, inferior alveolar sinir hasarında, elajik asitin etkisini göstermektir. Çalışmada, sağlıklı 20 sıçana genel anestezi koşullarında unilateral sinir kesisi uygulandı. Sıçanlar rastgele iki gruba ayrıldı. Her iki gruptaki sıçanların sol inferior alveolar sinirleri kesildi. Sağda yer alan sinirlere ise herhangi bir işlem uygulanmadı. İşlemden sonra gruplardan birine gavaj yoluyla 14 gün boyunca 10 mg/kg/gün dozda elajik asit verildi. Ardından sıçanlar sakrifiye edilerek alveolar sinirleri alındı. Sol inferior alveolar sinirler, deney grubu olarak kabul edilirken, sağdakiler kontrol grubu olarak kabul edildi. Alınan örnekler immünohistokimyasal olarak incelendi. İnfior alveolar sinir kesitleri, S100 beta antikoru ile immün boyanarak, ışık mikroskobu altında değerlendirildi. Sinir hasarı oluşturulan gruba ait kesitlerin incelemesinde, sinir fasiküllerinde dejenerasyon ve yoğun S100 beta ekspresyonu izlendi. Elajik asit verilen grubun S100 beta immün boyamasında ise, sinir fasiküllerinin dejenerasyonunda ve S100 beta ekspresyonunda azalma görüldü. Ayrıca sinir fasiküllerinde histolojik görünüm, normale yakın olarak izlendi. Elajik asitin farklı biyolojik aktivitelerinin olduğu bilinmektedir. Elajik asitin antioksidan, antiinflamatuvar, immünomodülatör, antimikotik, antimutajenik, antidepresan, antidiyabetik, antimikrobiyal, antikanserojenik ve antihiperlipidemik etkileri ortaya konulmuştur. Çalışmamızda sinir hasarı sonrası, elajik asit tedavisinin iyileştirici etkisinin olması, bu bileşiğin nöroprotektif özelliğini göstermesi açısından önemlidir. Ayrıca S100 beta ekspresyonu, sinir hasarının derecesinin gösterilmesinde bir marker olarak kullanılabilir.

Anahtar Kelimeler: N. alveolaris inferior, Sinir hasarı, Elajik asit, S100 beta

EFFECT OF ELLAGIC ACID ON ALVEOLAR NERVE DAMAGE

ABSTRACT

N. alveolaris inferior is of great importance for physicians in oral and maxillofacial surgery. The alveolar nerve is of great importance in the planning of different procedures with implants in the posterior region of the mandible, in surgical procedures, and after the procedure. The aim of our study was to show the effect of ellagic acid on inferior alveolar nerve injury. In the study, 20 healthy rats underwent unilateral nerve incisions under general anaesthesia. The rats were randomly divided into two groups. Left inferior alveolar nerves of rats in both groups were dissected. No procedure was performed on the right nerves. After the procedure, one of the groups was given ellagic acid at a dose of 10 mg/kg/day for 14 days by gavage. The rats were then sacrificed, and the alveolar nerves were removed. The left inferior alveolar nerves were considered as the experimental group, while the right ones were considered as the control group. The samples were analysed immunohistochemically. Inferior alveolar nerve sections were immunostained with S100 beta antibody and evaluated under light microscope. In the examination of the sections of the group with nerve damage, degeneration and intense S100 beta expression were observed in the nerve fascicles. In the S100 beta immunostaining of the group given ellagic acid, a decrease in the degeneration of nerve fascicles and S100 beta expression was observed. In addition, the histological appearance of nerve fascicles was close to normal. It is known that ellagic acid has different biological activities. Antioxidant, anti-inflammatory, immunomodulatory, antimycotic, antimutagenic, antidepressant, antidiabetic, antimicrobial, anticarcinogenic, and antihyperlipidemic effects of ellagic acid have been demonstrated. In our study, the curative effect of ellagic acid treatment after nerve damage is important in terms of demonstrating the neuroprotective property of this compound. In addition, S100 beta expression can be used as a marker to indicate the extent of nerve damage.

Keywords: N. alveolaris inferior, nerve injury, ellagic acid, S100 beta

1. GİRİŞ

Hekimler açısından nervus alveolaris inferior, ağız ve çene cerrahisinde büyük önem taşımaktadır. Alveolar sinir mandibulanın posterior bölgesinde yapılacak olan implantların planlanmasında, cerrahi safhasında ve gerçekleştirilen ameliyat sonrası durumlarda son derece önemlidir (1).

İnferior alveolar sinir, mandibular sinirin arka bölümünden gelir ve pterygoideus externusun mediali ile ramusun iç tarafı ve pterygomandibular ligamentin arasından aşağıya doğru iner. Buradan da ramusun medialindeki pterygomandibular aralığın içerisinden foramen mandibulaya girer. Kanalin içerisinden dental pulparların innervasyonunu sağlayan, alt çenede bulunan dişlerin foramen apikalelerinden içeriye doğru giren dallar verir. Bazı dallarıysa periodontal membran, alveolar duvar ile diş etlerine gider. Ardından Inferior alveolar sinir mental foramene ulaşarak bu bölgede mental sinir şeklinde uç dallar verir. Söz konusu sinir dalları çene ucunun derisine, alt dudağın derisi ile birlikte mukozasına, alt bölgede bulunan kesici dişlerin vestibülünde yer alan dişeti ile birlikte bölgedeki yumuşak dokuya dağılır. Sinir dallarının bir kısmıysa kemiğin içerisinde çenenin ucuna doğru dağılır ve alttaki ön dişlerin pulparlarının innervasyonunu sağlar (2). Gerek yapısal özelliklerinden gerekse de konumundan kaynaklı olarak inferior alveolar sinirin lokal olarak uygulanan basit anestezi enjeksiyon uygulamalarından çene cerrahisi ameliyatlarına kadar uygulanan işlemler esnasında veya sonrasında hasarlanabilmektedir (3). Periferik sinirlerde meydana gelen yaralanmaların Seddon (4) ile Sunderland'ın (5) geliştirmiş oldukları sınıflandırma metoduna göre incelenmesi mümkündür.

Elajik asit bitkilerde, bitkilerin hücre duvarlarının ve hücre zarlarının yapısal bileşenlerinden bir tanesi olan elaji tanen formunda bulunmaktadır (6). Elaji tanenler, polifenollerin hidrolize edilebilen tanen sınıfına mensup elajik asidin kompleks türevleridir (7). Ellajik asit, gallik asidin dimerik türevi şeklinde bilinmektedir. Fizikokimyasal olarak değerlendirildiğinde; erime noktasının 360°C'nin üzerinde olduğu, kaynama noktasının 796,5°C olduğu, molekül ağırlığının 302.197 g mol⁻¹ olduğu görülür. Koyu sarı renkli kristal toz formunda olan elajik asit, termal stabilite bakımından son derece kararlı olan fenolik maddelerden bir tanesidir (8). Elajik asit birçok bitkide bulunmakla birlikte böğürtlenlerde, çilekte, narda, ahududu, kırmızı üzüm çekirdeklerinde, bademlerde, cevizde ve yeşil çayda bol miktarda bulunmaktadır (9). Birçok biyolojik aktivitesinin bulunduğu yapılan bilimsel araştırmalar ile ortaya konulmuştur. Ellajik asidin sağlık açısından da son derece önemli etkileri bulunmaktadır. Bu etkiler arasında

antioksidan, antiinflamatuvar, antimikotik, antimutajenik, antidepresan, antidiyabetik, antimikrobiyal, antikanserojenik ve antihiperlipidemik gibi etkiler sayılabilir. Elajik asidin yıkıcı olan serbest oksijen radikallerini temizleme ya da bağlama özelliği bulunmaktadır (10). Çalışmamızın amacı, inferior alveolar sinir hasarında, elajik asitin etkisini göstermektir.

2. MATERYAL VE METOT

2.1. Hayvan Deneyi

Çalışmamızda, sağlıklı olan 20 adet sıçana genel anestezi koşullarında unilateral sinir kesisi uygulandı. Ardından sıçanlar rastgele iki gruba ayrılarak grupların ikisinde de sıçanların sol inferior alveolar sinirleri kesildi. Sağ tarafta bulunan sinirlere ise herhangi bir işlem uygulanmadı. İşlemden sonra gruplardan birine gavaj yoluyla 14 gün boyunca 10 mg/kg/gün dozda elajik asit verildi (11). Ardından sıçanlar sakrifiye edilerek alveolar sinirleri alındı. Alınan sol inferior alveolar sinirler, deney grubu olarak kabul edilirken, sağdakiler ise kontrol grubu olarak kabul edildi. Alınan örnekler immünohistokimyasal olarak incelendi. İnfierior alveolar sinir kesitleri, S100 beta antikoru ile immün boyanarak, ışık mikroskobu altında değerlendirildi.

2.2. İmmünohistokimya Boyama Protokolü

Parafinden arındırılmak için 5 µm kalınlıktaki kesitler ksilolde iki seri şeklinde 15 dakika boyunca bekletildikten sonra azalan alkol serilerinin içerisinde 5'er dakika boyunca bekletildi ve ardından distile suya kondu. PBS ile iki seri şeklinde 5'er dakika boyunca yıkanan dokulara 30 dakika kadar endojen peroksit blokajı uygulandı ve yeniden 2x5 dakika boyunca PBS'te yıkandı. Ultra V Blok solüsyonu ile 7 dakika boyunca inkübasyonu gerçekleştirilen kesitlere S100 beta antikoru uygulandı ve geçe boyunca beklendi. Daha sonra PBS ile yıkanan dokulara sekonder antikor damlatıldı ve yeniden PBS ile yıkandı. Bu işlemin ardından kesitlerin üzerine 30 dakika kalacak şekilde Streptavidin peroksidaz uygulandı. PBS ile yıkanan dokulara DAB damlatılarak reaksiyon takip edildi. Reaksiyon gösteren dokular, PBS ile yıkandı ve ardından çeşme suyu ile yıkandı. İşlemin sonunda kesitlere 1 dakika boyunca hematoksilen uygulandı ve daha sonra artan alkol serilerinden geçirilen kesitler, 15'er dakika boyunca ksilolde bekletilerek üzerleri kapatıldı.

3. BULGULAR

Sinir hasarı oluşturulan grubun S100 beta immün boyamasında; sinir fasiküllerinde hasar (sarı ok) ve S100 beta ekspresyonunda yoğun (kırmızı ok) boyanma izlendi. Ayrıca hasar sonrası sinir fasiküllerinde dejenerasyon izlendi (Şekil 1).

Şekil 1. Sinir hasarı oluşturulan grupta S100 beta ekspresyonu.

Elajik asit verilen grubun S100 beta immün boyamasında ise, sinir fasiküllerinin dejenerasyonunda (sarı ok) ve S100 beta ekspresyonunda azalma (kırmızı ok) görüldü. Ayrıca sinir fasiküllerinde histolojik görünüm, normale yakındı (Şekil 2).

Şekil 2. Elajik asit verilen grupta S100 beta ekspresyonu.

4. TARTIŞMA

Herhangi bir nedenden dolayı inferior alveolar sinirlerde meydana gelen disfonksiyonlar hastaları son derece tedirgin eden durumlardan biridir. Duyularda meydana gelen değişiklikler ya da ortaya çıkan ağrı, hastaların bu durumdan yakınmalarına sebebiyet verir. İnfior alveolar sinirlerin hasarlanması sonucu ortaya çıkan bu durumlar mandibulada, dudaklarda

yananın belli bir kısmında ve oral mukozada fonksiyonun zarar görmesine neden olabilir. Ortaya çıkan duyuşal deęişikliklerin sonucu olarak hastalarda ağrı, istemsiz bir şekilde dudaklarını ya da ısırma ları, besinleri ve sıvıları ağızda tutamamaları gibi çeşitli semptomların ortaya çıkması söz konusu olabilir (12).

Zarar görmüş olan sinirlerin tamirlerinin başarılı olabilmesi için çeşitli faktörler söz konusudur. Sinirlerin hasarlanması ve cerrahi operasyonla tamir edilmeleri arasında geçmiş olan süre, sinirde meydana gelmiş olan hasarın tipi, hasar görmüş olan bölgede kanlanmanın olup olmaması, greft uygulanmışsa eęer kullanılan greft ile sinir arasında uyumun olması, greft atılmışsa bu greftin uzunluęunun ne kadar olduęu, greftin nasıl hazırlandıęı, cerrahi operasyon sırasında oluşmuş olan gerilim, hastanın genel durumu gibi birçok etkeni bu faktörler arasında saymamız mümkündür (13).

Coulthard ve arkadaşları yapmış oldukları çalışmada, inferior alveolar sinir sinir hasarlarından sonra uygulanabilecek tedavi yöntemlerini üç başlık altında toplamıştır. Bunlardan ilki sinirin açığa çıkarılması, eksternal ve internal nöroliz, nöromada eksizyon, greft atılması ve lazer uygulaması, nöromada eksizyon gibi cerrahi uygulamalardır. İkincisi ise çeşitli analjezik, antiepileptik, anestetik ve benzeri ilaçlarla uygulanacak olan medikal tedavi, üçüncüsü ise çeşitli danışmanlık ve terapi yöntemlerini içerisinde barındıran psikolojik yöntemlerdir (14). Doğada fazlasıyla bulunan ve çoęu hastalığın tedavi edilebilmesi için geleneksel olarak uzun yıllardır kullanılan bitki kaynaklı olan bileşikleri, fitokimyasallar olarak tanımlayabiliriz. İnsan saęlığını tehdit eden yönlerinin son derece sınırlı olması ya da hiç olmaması bunların dikkat çekici özelliklerinden bir tanesidir. Son yıllarda yapıları çalışmaları ile Hussain ve arkadaşları yaptıkları çalışmalarda alkaloid, flavonoid ve tanen benzeri fitokimyasalların beyin hastalıklarındaki iyileştirici etkisini tanımlamışlardır. (15,16). Bu çalışmada, elajik asitin inferior alveolar sinir yaralanması sonrası atılmış olan greftin iyileşme sürecine olumlu katkı sağladığının gösterilmesi, literatürü desteklemesi açısından önemlidir.

5. SONUÇ

Çalışmamızda sinir hasarı sonrası, elajik asit tedavisinin iyileştirici etkisinin olması, bu bileşiğin nöroprotektif özelliğini göstermesi açısından önemlidir. Ayrıca S100 beta ekspresyonu, sinir hasarının derecesinin gösterilmesinde bir marker olarak kullanılabilir..

ÖZET

Kemik dokusu iskelet sisteminin temelini oluşturmaktadır ve çeşitli organik ve inorganik komponentlerin oluşturduğu bir bağ dokusudur. Kemiğin sahip olduğu mineralize ekstraselüler yapı onu diğer bağ doku türlerinden ayırmaktadır. Frontal kemiklerle birlikte parietal kemiklerin tamamının ve oksipital kemikle temporal kemiğin az bir kısmının oluşturduğu yapı kalvaryum olarak isimlendirilir. Bu yapı beyin dokusunu çevreler. Çeşitli travmalar, enfeksiyonlar, neoplazmalar ile konjenital anomaliler, kalvaryal kemiklerde kusurların gelişmesine sebebiyet verebilir. Kalvaryal kemiklerde meydana gelen defektler çeşitli yöntemlerle tedavi edilebilmektedir. Lazer ve ozon uygulamaları ile birlikte çeşitli kemik greftleri kullanılmak suretiyle, kemiklerde meydana gelen defektler iyileştirilebilmektedir. Çalışmamızda, kalvaryal defekt oluşturulmuş olan sıçanlarda, greft sonrası gallik asitin etkilerini göstermek amaçlanmıştır. Çalışmamızda sıçanlar iki gruba (n:8) ayrıldı. İlk grupta kalvaryal kemikte 5 mm'lik defekt oluşturuldu, ardından oluşturulan defekte allogreft uygulanarak yara dikildi. Kalvaryal kemikte 5 mm'lik defekt oluşturularak allogreft uygulanan ikinci gruba 14 gün boyunca oral yoldan 20 mg/kg gallik asit (GA) verildi. Ardından kurban edilen hayvanların kalvaryal kemikleri çıkarıldı. Alınan örnekler histopatolojik inceleme için hematoksilen eozin ile boyanarak, ışık mikroskobu altında değerlendirildi. Defekt + greft grubu hematoksilen eozin boyamasında, defekt alanında kemik trabeküllerinde artış, periosteum da yoğun kollajen lif artışı, osteositlerde azalma ve vasküler dilatasyon izlendi. Defekt + greft + GA grubu hematoksilen eozin boyamasında, defekt alanında gallik asit tedavisi sonrası kemik trabeküllerinin birleştiği, endosteumda yoğun kemik iliği, osteositlerde artış ve vasküler dilatasyonda azalma izlendi. Gallik asit gerek farmasötik gerekse de biyomedikal endüstrilerinde kullanılmakta olan temel bir doğal biyoaktif bileşendir. Ayrıca antifungal, antioksidan ve antiviral etkileri yapılan çalışmalarla ortaya konulmuştur. Çalışmamızda, kalvaryal defekt sonrası greft uygulamasında, gallik asitin oluşan kemik patolojisini histolojik olarak onardığının gösterilmesi, bu bileşenlerin kemik defektlerinin tedavisinde kullanılabileceğini düşündürmektedir.

Anahtar Kelimeler: Kalvaryal defekt, Kemik grefti, Gallik asit

**THE EFFECT OF POST-GRAFT GALLIC ACID IN RATS WITH CALVARIAL
DEFECT**

ABSTRACT

Bone tissue forms the basis of the skeletal system and is a connective tissue composed of various organic and inorganic components. The mineralised extracellular structure of bone distinguishes it from other types of connective tissue. The structure formed by all of the parietal and frontal bones and a small portion of the occipital and temporal bones is called the calvarium. This structure surrounds the brain tissue. Various traumas, infections, neoplasms, and congenital anomalies can cause defects in the calvarial bones. Defects in the calvarial bones can be treated with various methods. Defects in the bones can be improved by using various bone grafts together with laser and ozone applications. In our study, we aimed to investigate the effects of gallic acid after grafting in rats with calvarial defects. In our study, rats were divided into two groups (n:8). In the first group, a 5 mm defect was created in the calvarial bone, then allograft was applied to the defect and the wound was sutured. The second group, in which a 5 mm defect was created in the calvarial bone and allograft was applied, received 20 mg/kg gallic acid (GA) orally for 14 days. The calvarial bones of the sacrificed animals were then removed. The samples were stained with haematoxylin and eosin for histopathological examination and evaluated under light microscope. In the defect + graft group, hematoxylin-eosin staining showed an increase in bone trabeculae, dense collagen fiber increase in the periosteum, decrease in osteocytes, and vascular dilatation in the defect area. In the defect + graft + GA group hematoxylin-eosin staining, after gallic acid treatment, bone trabeculae merged in the defect area, dense bone marrow in the endosteum, increase in osteocytes and a decrease in vascular dilatation were observed. Gallic acid is an essential natural bioactive component used in both pharmaceutical and biomedical industries. In addition, its antifungal, antioxidant and antiviral effects have been demonstrated by studies. In our study, the demonstration that gallic acid histologically repaired the bone pathology in graft application after calvarial defect suggests that these components can be used in the treatment of bone defects.

Keywords: Calvarial defect, Bone graft, Gallic acid

1. GİRİŞ

Kemik dokusu iskelet sisteminin temelini oluşturan çeşitli organik ve inorganik komponentlerin bir araya gelmesiyle oluşmuş olan özel bir bağ dokusu türüdür. Sahip olduğu mineralize ekstrasellüler matriks, kemiği diğer bağ doku türlerinden ayıran ön önemli

özelliğidir (1). Bağ dokularının tamamında olduğu gibi kemik dokusu da yapısında hücreler barındırmaktadır. Bununla birlikte yapısında barındırdığı inorganik maddeler, kemiği dış minesinden sonra vücuttaki en sert doku haline getirmiştir. Kemikler, kalsiyum ve fosfat gibi elementler için depo görevi görmektedir ve ihtiyaç halinde bu elementleri kana vermek suretiyle vücudun ihtiyaçlarını karşılar (2,3).

Frontal ile parietal kemiklerin tamamıyla, oksipital ile temporal kemiklerin küçük bir kısmının oluşturduğu ve beyin dokusunu çevreleyen yapı kalvaryum olarak isimlendirilmektedir [4,5]. Çeşitli travmalar, enfeksiyonlar, neoplazmalar ve konjenital anomaliler kalvaryal kemiklerde çok çeşitli kusurların gelişmesine neden olabilmektedir. Kemiklerde ortaya çıkan kusurların onarılması son derece önemli klinik problemlerden biridir. Bundan dolayı kraniyal bölgede yer alan kemiklerde meydana gelen kusurlardan kaynaklanan bozuklukların üstesinden gelebilmek ve o bölgede yer alan kemiklerdeki rejenerasyonun uyarılmasını sağlamak için çok sayıda tedavi yöntemi uygulanmaktadır (6). Kalvaryal defektleri tedavi edebilmek amacıyla lazer ve ozon uygulamaları kullanılmaktadır. Bunun yanı sıra alloplastik greft gibi çok çeşitli kemik greftleri de ortaya çıkmış olan kemik kusurlarının iyileşmesine katkıda bulunmaktadır (7).

Gallik asit (GA; 3,4,5-trihidroksibenzoik asit), doğal bir biyoaktif bileşendir. Farmasötik ve biyomedikal endüstriler başta olmak üzere çok çeşitli alanlarda kullanılmaktadır (8). Bitkilerin birçoğunda bulunmakla birlikte en çok mazıda, üzümde, çayda ve meşe kabuğunda bulunmaktadır. Meyvelerin olgunlaşmaya başladığı ilk zamanlar gallik asidin en yoğun olarak bulunduğu dönemdir (9). Yapılan araştırmalarda gallik asidin, antifungal, antioksidan ve antiviral çeşitli etkilerinin bulunduğu ortaya konulmuştur. Ayrıca kanser hücreleri üzerinde sitotoksik bir etkide bulunduğu ve bunu yaparken de normal olan hücrelere zarar vermediği gösterilmiştir. Kanama durumlarında damar yapılarının büzülmesini sağladığı ve diyabetin tedavisinde kullanıldığı çalışmalar da mevcuttur (10,11). Gallik asit bu özellikleri sayesinde yaygın bir şekilde alternatif tıpta, besinlerde ve ilaç yapımında kendisine kullanım alanı bulmuştur (12).

Çalışmamızda, kalvaryal defekt oluşturulmuş olan sıçanlarda, greft sonrası gallik asitin etkilerini göstermek amaçlanmıştır.

2. MATERYAL VE METOT

2.1. Hayvan Deneyi

Rastgele bir şekilde sekizerli iki gruba ayrılan sıçanlardan (n:8), ilk gruba 5 mm çapında olacak şekilde kalvaryal kemik defekti oluşturuldu. Ardından oluşturulan defekte allogreft

uygulandıktan sonra yara bölgesi dikildi. İkinci gruba ise 5 mm çapında olacak şekilde kalvaryal kemik defekti oluşturulduktan sonra defekte allogreft uygulanarak yara bölgesi dikildi ve 20 mg/kg olacak şekilde 14 gün boyunca oral yoldan gallik asit verildi. Uygulama sonunda sıçanlar sakrifiye edildi ve kalvaryal kemik çıkarıldı. Ardından alınan örnekler histopatolojik inceleme için hematoksilen eozin ile boyanarak ışık mikroskobu altında değerlendirildi.

2.2. Hematoksilen Eozin Boyama Protokolü

Ksilolün içerisinde deparafinize edilen parafin kesitler bu işlemin ardından azalan alkol serilerinden geçirildi ve daha sonra distile suyun içerisine alındı. Distile sudan alınan kesitler Harris hematoksilen solüsyonunda 8 dakika boyunca bekletildi. Daha sonra kesitler, 5 dakika akar suda bekletildi. Bu sayede dokuların üstünde bulunan fazla miktardaki hematoksilenin uzaklaştırılması sağlandı. Bu işlemin ardından kesitler zıt boyama için eozin solüsyonuna alındı ve burada 2 dakika boyunca bekletildi. Artan alkol serilerinden geçirilen kesitler daha sonra ksilolde bekletilerek şeffaflaşmaları sağlandı ve ardından entellan yardımıyla kapatılarak ışık mikroskobu altında incelendi.

3. BULGULAR

Çalışmamızda, Defekt + greft grubu hematoksilen eozin boyamasında, defekt alanında kemik trabeküllerinde artış, periosteum da yoğun kollajen lif artışı, osteositlerde azalma ve vasküler dilatasyon izlendi (Şekil 1).

Şekil 1. Defekt + Greft grubu hematoksilen-eozin boyama görüntüsü.

Defekt + greft + GA grubu hematoksilen eozin boyamasında, defekt alanında, gallik asit tedavisi sonrası kemik trabeküllerinde birleşme, endosteumda yoğun kemik iliği, osteositlerde artış ve vasküler dilatasyonda azalma izlendi (Şekil 2).

Şekil 2. Defekt + greft + GA grubu hematoksilen-eozin boyama görüntüsü.

4. TARTIŞMA

Kişilerde bulunan konjenital defektler, oral veya maksillofasiyal bölgedeki cerrahi operasyonlar sonucu meydana gelen defektler, geçirilmiş travmalar sonucu ortaya çıkan defektlerin ortadan kaldırılması ve defekt oluşmuş olan bölgedeki kemik dokusunun rekonstrükte edilmesi son derece önemlidir. Boyutları sınırlı kemik defektlerinin kendiliğinden iyileşmeleri söz konusu iken boyutları geniş olan defektlerin iyileşebilmeleri için farklı biyomateryallerden yararlanılması gerekmektedir. Kemir greftleri bu maksatla en çok kullanılan biyomateryallerdendir. Kemik greftlerinin nasıl daha başarılı olabileceğini ve ossöz yapıya katılmalarının sağlanabileceğini anlayabilmek için çok sayıda çalışma yapılmıştır (13). Defektlerin iyileşmelerinin hızlandırılması ile birlikte oluşturulmuş olan greftin etkinliğinin artırılması için, son zamanlarda yapılan çalışmalarda sıklıkla bifosfonatlardan, lazer uygulamalarından, antibiyotiklerin etkinliğinden, ozon uygulamalarından ve trombosit zengin plazmadan yararlanıldığı görülmektedir (14).

Literatürde deneysel olarak oluşturulmuş olan kalvaryal kemik defektleri üzerinde yapılmış olan çalışmalarda farklı kemiklerin replasman materyallerinin etkinliği belirlenmeye çalışılmış ve bunların kemik otogreftleriyle birlikte üstün olan yanları ya da zayıf tarafları araştırılmıştır. Bahse konu araştırmalarda kullanılmış olan materyallerle kemiklerin iyileşmeleri ve yeni kemik oluşumları değerlendirilmiştir (15). Mokbel ve arkadaşları sıçanlar üzerinde yaptıkları çalışmada kalvaryal kemiklerde 8mm'lik defektler oluşturmuş ve bu defektlerin iyileştirilmesinde farklı greft materyallerinin iyileşme üzerindeki etkisini araştırmışlardır. Yapılan bu çalışma ile kullanılan materyalin kemik rejenerasyonuna etki ederek oluşan kemik miktarını arttırabildiği sonucuna varmışlardır (15).

Defektlerin iyileşebilmeleri için oluşturulmuş olan greftin etkinliğini arttırmak için, hangi etken maddelerin kullanılabileceği ile alakalı yapılmış çok sayıda çalışma vardır. Yapılan bir çalışmada kalsiyum sülfatla kombine bir şekilde uygulanan simvastatinin kemik rejenerasyonunun uyarılmasında etkili olup olmadığı incelenmiştir. Söz konusu çalışmada sıçan kalvarisinde kritik boyutlu olan kemik defektleri oluşturulmuş ve ardından bir gruba kalsiyum sülfat uygulanırken diğer gruba ise 1 mg simvastatinle birlikte kalsiyum sülfat kombinasyonu uygulanmış, böylelikle hayvanlar tedavi edilmeye çalışılmıştır. Yapılan incelemenin neticesinde simvastatin ve kalsiyum sülfattan oluşturulmuş olan kombinasyonun kemiklerde rejenerasyonu inflamatuvar cevaba rağmen uyardığı görülmüştür (16).

Gallik asitin en dikkat çekici özelliği antioksidan etkisidir. Bunun yanında gallik asidin çok farklı etkilerinin de olduğu yapılan çalışmalar ile ortaya konulmuştur. Gallik asidin,

antikanser, anti-HIV, antiülser, anti-inflammatuar, antimikrobial ve antifungal benzeri farmakolojik etkilerinin de olduğu yapılan çalışmalar ile tespit edilmiştir. Son zamanlarda yapılmış olan çalışmalar, gallik asidin Alzhemir hastalığının ilk evresinde görülen amyloid plaklara karşı etki gösterdiğini ortaya koyulmuştur (17). Gallik asidin serbest ve lipozom formlarının, kemik rejenerasyonuna katkıda bulunduğu ve bu sayede kalvarial kemiklerde oluşmuş olan yaraların iyileşmelerine yardım ettiği tespit edilmiştir (18). Çalışmamızda da gallik asidin greft atılmış olan kalvaryal kemiklerde rejenerasyona katkıda bulunduğu ve bu sayede kemiğin onarımına katkıda bulunduğunun tespit edilmesi, literatürdeki bu bilgiyi desteklemektedir.

5. SONUÇ

Çalışmamızda, kalyvaryal defekt sonrası greft uygulamasında, gallik asitin oluşan kemik patolojisini onardığı, kemik hücre ve matriksini arttırdığı ve kemik oluşumunu hızlandığı tespit edilmiştir. Bununla birlikte farklı canlı ve kemik türlerinde deneysel olarak oluşturulacak olan defektlere uygulanacak greftlerde de, gallik asidin etkinliğini görmek için yeni bilimsel çalışmaların yapılması son derece önemlidir.

Xülasə: Maliyyə sistemi kompleks bir quruluşa malikdir. Bu sistem banklar, sığorta şirkətləri, müştərək fondlar, maliyyə şirkətləri, investisiya bankları və qarşılıqlı fondlar kimi bir çox müxtəlif növ özəl sektor maliyyə institutlarından meydana gəlir. Maliyyə institutları, maliyyə bazarının işləməsini təmin edən qurumlardır. Bu institutların olmaması maliyyə bazarlarının vəsaitləri yığıcı edənlərdən məhsuldar investisiya imkanları olan insanlara köçürülə bilməməsi ilə nəticələnə bilər. Beləliklə, maliyyə institutları iqtisadiyyatda mühim rol oynayır.

Bəzən maliyyə sistemi maliyyə və qeyri maliyyə şirkətlərinin uğursuzluğu və aktivlərin qiymətlərindəki kəskin enişlə xarakterizə edilən maliyyə böhranlarını yaradır ki, buda maliyyə bazarında ciddi pozuntulara səbəb olur. Maliyyə böhranları yüz illərdir ki, kapitalist iqtisadiyyatlarının bir xüsusiyyəti kimi çıxış edib və adətən ardından ciddi iç böhranı gətirir. 2008-ci ildə başlayan maliyyə böhranları və eləcə də Covid-19 pandemiyasından sonra yenidən inkişaf edərək hələ də davam etməkdə olan böhranlar bu mövzunun aktuallığını qoruyur.

Bu məqsədlə də məqalədə maliyyə institutları və bu institutların fəaliyyətinə təsir edən xarici effektlərin təsiri araşdırılmışdır.

Açar sözlər: Maliyyə institutları, maliyyə böhranları, xarici effektlər, maliyyə bazarları

**THE IMPACT OF FINANCIAL CRISES ON THE ACTIVITIES OF FINANCIAL
INSTITUTIONS**

Summary: The financial system has a complex structure. This system consists of many different types of private sector financial institutions such as banks, insurance companies, mutual funds, finance companies, investment banks and mutual funds. Financial institutions are institutions that ensure the functioning of the financial market. The absence of these institutions could result in financial markets failing to transfer funds from hoarders to people with productive investment opportunities. Thus, financial institutions play an important role in the economy.

Sometimes the financial system creates financial crises, characterized by the failure of financial and non-financial companies and sharp declines in asset prices, which cause serious disruptions in the financial market. Financial crises have been a feature of capitalist economies for hundreds of years and are usually followed by a serious internal crisis. The financial crises that started in 2008, as well as the crises that have redeveloped after the Covid-19 pandemic and are still ongoing, maintain the relevance of this topic.

For this purpose, the article examines financial institutions and the influence of external effects affecting the activities of these institutions.

Keywords: Financial institutions, financial crises, external effects, financial markets

Giriş

İqtisadçılar maliyyə böhranlarının üç əsas növünü fərqləndirirlər: valyuta böhranı (buna pul böhranı da deyirlər), borc böhranı və sistematik bank böhranı. Bəzən bu siyahıya dördüncü də əlavə olunur – “qəfil dayanma” (sudden stop) effekti.

Valyuta böhranı – iqtisadiyyatda xarici valyutaya tələbin kəskin artması nəticəsində yaranan stress vəziyyəti kimi izah edilir. Əlbəttə, hər tələb artımı böhran anlamına gəlmir. Xarici valyutaya “axın” baş verdiyi halda, o zaman 2 valyuta böhranı diaqnozu qoyulur.

Borc böhranı - ölkənin öz xarici və ya daxili borclarını ödəmək iqtidarında olmadığı (və ya ödəmək istəmədiyi) vəziyyəti ifadə edir. Uyğun olaraq, birinci hal xarici borc böhranı, ikincisi isə daxili borc böhranı adlanır. Xarici borc böhranı həm dövlət borcu, həm də özəl sektor borclarının ödənməməsi ilə bağlı ola bilər. Daxili borc böhranı isə, əsasən dövlətin öz daxili fiskal öhdəliklərini yerinə yetirə bilməməsi və ya açıq-aşkar ödəməməsi, borcunu azaltmaq üçün inflyasiya və ya yerli valyutanın ucuzlaşdırılması, həmçinin maliyyə repressiyasının digər formalarından istifadə etməsi kimi izah olunur.

“Qəfil dayanma” effektinə gəlincə, burada söhbət ölkəyə xaricdən kapital axınının qəfil dayanması və bunun iqtisadiyyata – həm maliyyə bazarlarına, həm də birbaşa real sektora – neqativ təsirlərindən gedir. “Qəfil dayanma”nın ilk neqativ təsiri valyuta bazarında hiss olunur ki, bu təsirlər valyuta böhranı əlamətləri ilə üst-üstə düşür. Bu səbəbdən bir çox iqtisadçılar ölkəyə xarici kapital girişlərinin dayanmasının yaratdığı effekti ayrıca böhran növü kimi yox, valyuta böhranının bir forması kimi qeyd edirlər. Ancaq “qəfil dayanma”, digər səbəblərdən ortaya çıxan valyuta böhranlarından fərqli olaraq real sektora daha tez təsir edə bilər.

Həmçinin, nəzəri olaraq, “qəfil dayanma”nın maliyyə və real sektorlarına təsiri ölkəyə gələn xarici investisiyaların hansı hissəsinin maliyyə vəsaiti, hansı hissəsinin avandlıq şəklində olmasından birbaşa asılıdır. Əgər vəsaitlər ölkəyə, əsasən avadanlıq şəklində gətirilsə, “dayanma” ilk növbədə real sektorda buraxılışın həcmənin azalması ilə müşayiət olunacaq, yox əgər pul şəklində gətirilsə, təbii ki, bunun təsiri ilk növbədə valyuta bazarında hiss olunacaq. Təcrübədə “qəfil dayanma”, əsasən valyuta böhranı kimi təzahür etdiyindən (məsələn, 1994-cü ildəki Meksika peso böhranı – digər adı ilə “tekila böhranı”) buradakı təhlillərdə ayrıca böhran tipi kimi nəzərdən keçirilməmişdir.

Maliyyə institutları və bazarları bir-biri ilə sıx bağlı olduğundan bir çox hallarda maliyyə böhranının iki, bəzənsə hətta üç növü də eyni anda müşahidə olunur. Məsələn, valyuta böhranı bank sektorunun balansına mənfi təsir etməklə valyuta-bank, dövlət borcunu (əsasən xarici borcu) kəskin şəkildə artırmaqla valyuta-borc böhranlarına və ya bank sektorunun balansına

və dövlət borcunun 4 dayanıqlılığına eyni vaxtda təsir etməklə valyuta-bank-borc böhranına səbəb ola bilər.

Cədvəl 1. Bank böhranlarının iqtisadi nəticələri (1970-2011-ci illər)

*Qeyd: QİK – qeyri-işlək kreditləri ifadə edir.

Geridə qalan 40 ildən artıq bir müddətdə baş vermiş bank böhranlarının digər vacib iqtisadi nəticəsi iqtisadiyyatın borc yükünün artması olmuşdur. Burada da ən çox təsirlənən İEÖ olmuşdur. Qeyd olunan dövrdə bank böhranları nəticəsində İEÖ-in borc yükü ÜDM-in 21.4%-i , İEOÖ-də 10.9%-i, FBÖ-də 9.1%-i qədər olmaqla, ümumilikdə bütün bank böhranları müşahidə olunan ölkələrdə ÜDM-in 12.1%-i qədər artmışdır. İnkişaf səviyyəsinə görə müxtəlif ölkə qrupları bank böhranları zamanı istifadə olunan tənzimləmə alətlərinə görə də bir-birindən fərqlənir. Belə ki, bank sektorundakı maliyyə stressini neytrallaşdırmaq üçün İEÖ daha çox monetar genişlənmədən istifadə etdiyi halda, FBÖ və İEOÖ vəziyyəti, əsasən fiskal xərclər vasitəsilə nəzarət altına almağa çalışmışlar. Həmçinin, qeyd olunan ölkə qrupları arasında böhran zamanı banklara likvidlik dəstəyinin həcmində də əhəmiyyətli fərqlər müşahidə olunmuşdur. Böhran zamanı banklara ən az likvidlik dəstəyi İEÖ-də, ən çoxu isə

İEOÖ-də göstərilmişdir. Banklara göstərilən likvidlik dəstəyinin depozit və xarici öhdəliklərə nisbəti İEOÖ-də 12.3%, FBÖ-də 11.1%, İEO-də isə cəmisi 5.7% təşkil etmişdir.

Sözsüz ki, təhlil olunan dövrdə həm əhatə dairəsinə, həm də dərinliyinə görə ən güclü maliyyə böhranı 2008-2009-cu illərdə müşahidə edilən qlobal maliyyə böhranı olmuşdur. Maliyyə sarsıntılarının nəticəsində böhranın episentridə (ABŞ-da) 400-ə yaxın bank müflisləşmişdir. Ümumilikdə böhranın ən kəskin fazasından bugünə qədər keçən dövrdə (2009-2015-ci illərdə) ABŞ-da 488 bank müflis elan olunmuşdur. Təbii ki, sözügedən ölkədə son iki-üç ildə müflisləşmələrin sayı kəskin şəkildə azalmışdır və qeydə alınan iflas faktları daha çox bazarın normal dövrdəki iş mexanizminin nəticəsi kimi ortaya çıxmışdır.

2007-ci ilin ikinci yarısında ABŞ-da başlayan və dünyanın əksər ölkələrində yayılan Qlobal Maliyyə böhranı 2008-2009-cu illərdə ABŞ-da, Avropa və Asiya ölkələrində dərinləşən maliyyə böhranına gətirib çıxarmışdır. Daşınmaz əmlak köpüyünün artan təhlükəsini əvvəlcədən görə bilməmə və dövlətlər arasında qeyri-müəyyənlik qlobal böhranı daha da dərinləşdirdi. Böhranın dərinləşməsi nəticəsində dünyanın qabaqcıl sənaye müəssisələri, avtomobil şirkətləri istehsal həcmi kəskin dərəcədə azaltmış və ya dayandırmışlar, inkişaf etmiş ölkələrin maliyyə-bank sistemlərini sarsıtmış, iri banklar iflasa uğramışlar və bəzi ölkələrdə isə bankların milliləşdirilməsinə səbəb olmuşdur. Böhran qlobal səviyyədə investorlara böyük itkilərlə-trilyon dollarla başa gəldi və milyonlarla iş yerləri itirildi. Qlobal maliyyə böhranının yaratdığı çətinliklər inkişaf etmiş ölkələrin iqtisadiyyatının real sektoruna ciddi təsir göstərməklə, iqtisadi artım templərinin aşağı düşməsinə və nəticə etibarilə dünya iqtisadi artım tempinin enməsinə səbəb olmuşdur.

Bank müflisləşmələri təkcə ABŞ-da yox, digər inkişaf etmiş və inkişaf etməkdə olan ölkələrdə, o cümlədən tranzitiv iqtisadiyyatlarda da müşahidə edilmişdir - böhran, ticarət, maliyyə və psixoloji kanallarla bütün dünya iqtisadiyyatına yayılmışdır. 2009-2015-ci illərdə Rusiyada 385 bankın lisenziyası ləğv olunmuşdur. Onlardan 166-sı son siyasi-iqtisadi çalxantılar dövrünə (2014-2015-ci illərə) təsadüf edir ki, bu həm sanksiyalar, həm də neft qiymətindəki kəskin azalma nəticəsində Rusiya iqtisadiyyatının, eyni zamanda bank sisteminin üzleşdiyi çətinliyin miqyasını ifadə edir.

Gürcüstanda 2008-2009-cu illərdə kommersiya banklarının sayı 22-dən 19- a düşmüş, qlobal böhranın təsiri keçdikdən sonra, 2013-cü ildə ölkədə bankların sayı 21-ə yüksəlmişdir. ABŞ dollarının bahalaşma dalğası və Rusiya iqtisadiyyatındakı böhranın təsiri ilə 2015-ci ildə Gürcüstan bank sistemi müəyyən çətinliklərlə üzleşmişdir. Nəticədə cari ildə Gürcüstanda 2

bankın lisenziyası ləğv edilmişdir və hazırda ölkədə 19 kommersiya bankı fəaliyyət göstərməkdədir.

Qazaxıstanda da bənzər proseslər müşahidə olunmaqdadır. Gürcüstandan fərqli olaraq, Qazaxıstan həm də neftlə zəngin ölkə olduğundan onun iqtisadiyyatı regional böhranın digər amilləri (xüsusilə, Rusiya böhranı) ilə yanaşı, həm də neft qiyməti şokundan da təsirlənmişdir. Cari ildə Qazaxıstanda 1 bankın lisenziyası ləğv edilmiş və kommersiya banklarının sayı 38-dən 37-ə düşmüşdür. Eyni zamanda, digər banklar ciddi likvidlik və kredit riskləri ilə üzləşmişlər.

Azərbaycana gəlincə, burada istər 2008-2009-cu illər qlobal maliyyə böhranı, istərsə də 2014-cü ilin sonuncu rübündən başlayan, hazırda da davam edən proseslər (neft qiymətindəki kəskin azalma, valyuta bazarında turbulens, əsas qeyri-neft ixrac partnyoru, həmçinin ölkəyə pul transfertlərinin başlıca mənbəyi olan Rusiya iqtisadiyyatındakı maliyyə-iqtisadi böhran) bank sistemində müəyyən çətinliklər yaratsa da, ciddi sarsıntılara səbəb olmamışdır.

Bu böhranlı vəziyyətdən Azərbaycan dünya iqtisadiyyatının ayrılmaz hissəsi kimi minimum itkilərlə çıxıb bilmişdir. 2009-cu və 2010-cu illərin sosial-iqtisadi yekunları göstərdi ki, uğurla həyata keçirilən qabaqlayıcı tədbirlər sayəsində Azərbaycan iqtisadiyyatı qlobal böhrana yüksək dayanıqlıq nümayiş etdirərək artım dinamikasını və əldə olunmuş sosial inkişaf səviyyəsini qoruyub saxlamışdır. Ölkədə gerçəkləşdirilən antiböhran siyasəti maliyyə sabitliyinin qorunmasında etibarlı zəmin yaratmışdır. Beynəlxalq Valyuta Fondunun məlumatlarına əsasən, 2009-cu ildə dünya iqtisadiyyatının artımı 1,1 faiz səviyyəsinə enməsi, ticarət dövriyyəsinin isə 11 faizdən çox azalması fonunda Azərbaycanda ümumi daxili məhsulun 9,3 faizlik, iqtisadiyyatımızın 5 faizlik artımı ilk növbədə, həyata keçirilən səmərəli iqtisadi siyasətin nəticəsidir. Böhranlı 2008 -2010-cu illərdə iqtisadiyyatımız 25,8 faiz artmış, son 7 ildə isə ümumi daxili məhsul 3 dəfə artmışdır, bu da ölkə iqtisadiyyatının maliyyə likvidliyi problemləri ilə üzləşmədiyini göstərir. Böhranlı illərə baxmayaraq, 2009-cu ildə əhalinin pul gəlirlərinin artım tempi 10%, 2010-cu ildə isə 13,3 faiz olduğu bir şəraitdə inflyasiya aşağı səviyyədə olmuş, real artım tempi müvafiq olaraq 8,5 və 7,6 faiz təşkil etmişdir. Böhranlı il üçün bu artım inkişaf etmiş və inkişaf etməkdə olan ölkələr arasında fərqli bir göstəricidir. Bir sözlə ölkə İqtisadiyyatı qlobal maliyyə böhranın mənfə təsirlərindən qorunmuş və yüksək valyuta ehtiyatları hesabına maliyyə dayanıqlığı təmin edilmiş, ölkənin makroiqtisadi sabitliyi qorunub saxlanmışdır. MDB ölkələrinin bütün mərkəzi banklarından milli valyutanın dollara qarşı qəti müəyyən edilmiş (fiksasiya edilmiş) məzənnəsini qoruyub saxlamağa tək cə Azərbaycanın Mərkəzi Bankı müyəssər oldu.

Azərbaycan Prezidenti İlham Əliyevin sədrliyi ilə Nazirlər Kabinetinin 2015-ci ilin sosial-iqtisadi inkişafının yekunlarına və qarşıda duran vəzifələrə həsr olunan iclasda göstərdiyi kimi 2015-ci ildə Azərbaycan iqtisadiyyatı inkişaf etmişdir. Bu da çox müsbət haldır. Əlbəttə ki, əvvəlki illərdə olan inkişaf əldə edilməmişdir. Bu da mümkün deyildi. Çünki qeyd etdiyimiz kimi, neftin qiyməti 3-4 dəfə aşağı düşmüşdür. Manatın məzənnəsi devalvasiyaya uğramışdır. Bu da qaçılmaz idi. Çünki neftin qiymətinin 3-- 4 dəfə aşağı düşməsi imkan vermirdi ki, manatın məzənnəsi əvvəlki səviyyədə qalsın”.

Azərbaycanın xarici dünya ilə ticarət əlaqələrinin gedişatı valyuta siyasətində ciddi dəyişiklik edilməsinə zərurət yaratmışdır. Statistik məlumatların təhlili göstərir ki, xarici ticarət əlaqələri mürəkkəb bir şəraitdə cəryan edir. Belə ki, 2011- ci ilin statistikasına əsasən, xarici ticarət dövriyyəsi özündən əvvəlki ilə nisbətən 103,9 təşkil etdiyi halda, 2012- ci ildə 89,3; 2013- cü ildə 106,3; 2014-cü ildə isə 94,1 faiz təşkil etmişdir. İxrac əməliyyatları müvafiq dövrdə 145,3; 96,9; 109,1; 85,4; idxal əməliyyatları isə müvafiq olaraq 88,7; 86,2; 105,1; 98 faiz təşkil etmişdir. 2014- cü ildə ixarc olunan malların içərisində neft- qaz məhsullarının payı 91,97 faiz olmuşdur. Qeyri- neft sektorunun payı isə 8,03 faizdir.

Mərkəzi bankın məlumatlarına görə, tədiyə balansı 2014-cü ildə xarici iqtisadi əməliyyatlarda neft- qaz sektoru üzrə müsbət, qeyri- neft sektoru üzrə isə mənfi saldolmuşdur. Tədiyə balansının ümumi saldosu (ölkənin ehtiyat aktivlərinin dəyişməsi) müsbət 4194,2 milyon dollar olmuşdur.

2015-ci ilin 9 ayı ərzində isə xarici iqtisadi əməliyyatlarda 9141,2 milyon dollar mənfi saldo yaranmışdır. Bütün bunlar xarici ticarət əlaqələrinin mühüm tənzimlənmə vasitəsi kimi valyuta siyasətində dəyişiklik edilməsinə, yəni devalvasiya siyasətinin tətbiq edilməsinə ehtiyac yaratmışdır. Onlarla banklar fəaliyyətini dayandırmışdır. Azərbaycanda 2015-ci il devalvasiyasından sonra bankların sayı yarımçıq azalıb: “Devalvasiyadan öncə ölkədə 44 bank fəaliyyət göstərirdi. Milli valyutanın iki dəfə dəyər itirməsindən sonra onların bir çoxu müflisləşdi. Hazırda Azərbaycanda lisenziyalı 25 bank fəaliyyət göstərir. Mərkəzi Bankın bəyanatlarına baxsaq, qalan bankların kifayət qədər etibarlı olduğuna dair gözlənti var.

Dünyada iqtisadi böhrana səbəb ola biləcək ən böyük faktorlardan biri də pandemiya. Yaxın keçmişdə Covid-19 pandemiyası dünya iqtisadiyyatına da olduqca böyük ziyan vurub. Ölkələrin iqtisadiyyatı böyük tənəzzüllə üz-üzə qalıb. Bir çox ölkənin iqtisadi inkişafı geriləyib, işsizliyin sayı artıb. Koronavirus pandemiyası insanların sağlamlığına təhlükə yaratmaqla yanaşı, tarixin ən böyük iqtisadi böhranını da bizə yaşatmışdır. Bu böhran turizm, geyim, avtomobil sənayesi, xidmət sahəsi, enerji sektoru və digər bir çox sahəyə təsir edib.

Nəticədə aviasiya şirkətlərindən tutmuş geyim istehsalçılarına, enerji şirkətlərinə qədər, bütün sektorlar çətinliklə üzləşib. Artıq bir çox şirkət müflis olduğunu, bir çoxu isə gəlirlərinin azalması səbəbindən işçilərini ixtisar etdiyini açıqlamışdır.

Tarix bizə göstərir ki, böhranlar daim yaşanacaqdır. Bir neçə gün əvvəl, "Silicon Valley Bank"ın (SVB) ardınca Nyu-Yorkda yerləşən Signature Banka da qayyum təyin edilib. "Signature Bank"-in 31 dekabr 2022-ci il tarixinə təxminən 110,4 milyard dollar aktivi və təxminən 88,6 milyard dollar depoziti var və bank ABS Federal Əmanətlərin Sığortalanması Korporasiyasında (FDIC) sığortalıdır.

ABŞ-da "Silicon Vadisi Bankı"nın müflisləşməsinin əsas səbəbi kimi, uçot dərəcəsinin artırılması göstərilir. Son illər ABŞ-da inflyasiya kəskin artıb. Bu durumda isə uçot dərəcəsinə artırmaq mərkəzi bankların tətbiq etdiyi əsas mexanizmdir. Belə olduğu halda da kredit faizləri yüksəlir və iqtisadi aktivlik aşağı düşür.

Faiz dərəcələrinin artması daha çox texnoloji şirkətlərlə işləyən "Silicon Vadisi Bankı"nın bahalı kredit götürmək istəməyən müştərilərinin pula olan ehtiyaclarını ödəmək üçün bankdan öz depozitlərini çıxarmaqla nəticələnib. Beləliklə bank müflis olub.

Azərbaycanda banklar "Silicon Vadisi Bankı" kimi məhdud sektor üzrə fəaliyyət göstərirlər. Başqa sözlə, bankların gəlirlərinin əsas hissəsini xüsusən vətəndaşlara verilən istehlak kredit faizləri təşkil edir. Kredit faizlərinin yüksəlməsi və iqtisadi aktivliyin aşağı düşməsi bankları əsas gəlir pəncərəsindən məhrum edir.

Qeyd edək ki, SVB bu il iflas edən ilk FDIC sığortalı qurum idi. Kaliforniyada yerləşən SVB 21 milyard dollarlıq istiqraz mövqeyini təxminən 1,8 milyard dolla itki ilə bağladıqdan və 2 milyard dollardan çox kapital cəlb edəcəyini elan etdikdən sonra səhm qiyməti 60 faizdən çox düşdü. Bəzi vençur kapitalı investorları şirkətlərə pullarını bankdan çıxarmağı tövsiyə etdikdən sonra bank itirməkdə davam etdiyi üçün onun fəaliyyəti dayandırıldı. FDIC martın 10-da SVB-yə müvəkkil təyin edildiyini açıqlasa da, bu, bazarlarda enişə səbəb oldu və SVB-nin bu il iflas edən ilk FDIC sığortalı qurum olduğu qeyd edildi. SVB-nin iflası 200-ci il qlobal maliyyə böhranından sonra ABŞ-da qeydə alınan ən böyük iflaslarda biri idi.

Bundan başqa, ən böyük iflas 2008-ci il böhranı zamanı Washington Mutual şirkətindən yaşanıb. Martın 13-ü "Signature Bank" üçün oxşar sistem risk vəziyyətini elan edilib.

Cədvəl 2. Azərbaycan Respublikası Mərkəzi Bankının 2015-2023-cü illər uçot faiz dərəcəsi

Tarix	Dəyər
2023	8,75%
2022	7,88%
2021	6,92%
2020	6,89%
2019	9,57%
2018	10,93%
2017	15%
2016	8,7%
2015	3%

Qeyd: Bəzi illərin uçot faiz dərəcəsi aylıq dəyişdiyi üçün illik hesablamada orta dəyər tapılmışdır.

Azərbaycan Respublikası Mərkəzi Bankının İdarə Heyətinin qərarı ilə uçot dərəcəsi 0.25 faiz bəndi artırılaraq 9%-ə, faiz dəhlizinin aşağı həddi 0.5 faiz bəndi artırılaraq 7.5%-ə, faiz dəhlizinin yuxarı həddi isə 0.25 faiz bəndi artırılaraq 10%-ə qaldırılmışdır.

Bu qərar daxili və xarici mühitdə inflyasiya proseslərinə təsir göstərən amillərin dəyişimi və yenilənmiş makroiqtisadi proqnozlar nəzərə alınmaqla verilmişdir.

İdarə Heyətinin pul siyasətinə həsr edilmiş ötən iclasından bəri illik inflyasiya tempi azalmışdır. Mart ayında illik inflyasiya 13.6% təşkil etmişdir ki, bu da ötən ilin sentyabr ayında qeydə alınmış pik səviyyə ilə müqayisədə 2 faiz bəndi aşağıdır. Qlobal iqtisadi aktivliyin azalmasının, əksər ölkələrdə pul siyasətinin sərtləşdirilməsinin və dünya əmtəə qiymətlərində aşağı düşmə meylinin təsiri ilə əsas ticarət tərəfdaşlarında faktiki inflyasiya nisbətən səngimişdir. Dünya Bankının əmtəə bazarları haqqında aprel hesabatına əsasən martda aylıq əsasda enerji qiymətləri 6.3%, qeyri-enerji qiymətləri 2.2% azalmışdır. BMT-nin Ərzaq və Kənd Təsərrüfatı Təşkilatının (FAO) məlumatına görə dünya ərzaq qiymətləri indeksi 2023-cü ilin martında aylıq 2.1% azalmışdır. Tədiyə balansının cari əməliyyatlar hesabının profisitli olması qiymət sabitliyinin əsas lövbəri olan məzənnə sabitliyini

dəstəkləyir. Əsas ixrac əmtələri üzrə dünya qiymətlərinin əlverişli qalması və qeyri neft-qaz ixracının artımı cari əməliyyatlar hesabının ilin sonuna da profisitli olacağını gözləməyə əsas verir. Bu özünü valyuta bazarında da göstərir. Belə ki, 2023-cü ilin 4 ayında valyuta hərəraclarının 97%-də təklif tələbi üstələmişdir. Manatın nominal effektiv məzənnəsinin möhkəmlənməkdə davam etməsi inflyasiyanın xarici amillərinə azaldıcı təsir edir. Manatın nominal effektiv məzənnəsi 2022-ci ildə 8.4%, 2023-cü ilin 4 ayında 4.8% möhkəmlənmişdir. Bununla bərabər, monetar şəraitə dair qəbul edilmiş qərarlar da inflyasiyanın tələb amillərini məhdudlaşdırır.

Qlobal və milli iqtisadiyyatda inflyasiya amillərilə bağlı yüksək qeyri-müəyyənliklər qalır. Faktiki inflyasiya səviyyəsi azalmaya meyil etsə də mart ayında inflyasiya hədəfinin yuxarı həddini 2 dəfədən çox üstələmişdir.

Nəticə

Bütün bu bənzərliklər hazırki dövrün yeni uzun dalğanın ilkin mərhələsi – yüksəliş dövrünün başlanğıcı ola biləcəyini düşünməyə əsas verir. Yəni, son bir neçə ildəki qlobal, regional və lokal xarakterli maliyyə-iqtisadi böhranlar heç də mövcud sistemin çökməsi deyil, əksinə özü-özünü yeniləməsi və yeni yüksəliş dalğası üçün starta hazırlaşması kimi qiymətləndirilə bilər. Yüksəlişin nə dərəcədə uğurlu alınması isə bazarın “yaradıcı məhvetmə” fəaliyyətinin nə qədər az kənar müdaxilə ilə gerçəkləşməsindən asılı olacaq. Ona görə də qarşıdakı illər üzrə bütün mənfi təsirlərin qarşısını almaq üçün Mərkəzi bankın nəzarət və tənzimləmə prioritetləri aşağıda kimi həyata keçirilməlidir :

- Bank sisteminin dayanıqlığının təmin edilməsi
- Kapital və likvidlik tələblərinin Bazel III-ə uyğunlaşdırılması
- Korporativ idarəetmə, risk idarəetməsi və daxili nəzarət funksiyasının gücləndirilməsi
- Nəzarət hesabatlığının təkmilləşdirilməsi, yeni texnoloji imkanların tətbiqi və s.

ÖZET

Bu araştırmada İlkokul 4. Sınıf Matematik dersi, kesirlerde sıralama ve karşılaştırma konusunun öğretiminde Millî Eğitim Bakanlığı Talim Terbiye Kurulunun (TTKB) öğretim yöntem teknikleri ve teknolojik uygulama materyali olan Geogebra yazılımı ile yapılan öğretimin, öğrencilerin akademik başarılarına etkisi araştırılmıştır. Araştırmanın modeli ön test- son test kontrol gruplu deneysel araştırma modelidir. Araştırmanın örneklemini 2022-2023 Eğitim-Öğretim yılında Sivas ili Koyulhisar ilçesinde bir ilkokulda 4.Sınıfta eğitim gören 12 öğrenci ve Amasya ili Göynücek ilçesinde bir ilkokulda 4. Sınıfta eğitim gören 12 öğrenci oluşturmaktadır. Örneklem seçiminde araştırmaya hız ve pratiklik kazandırması açısından Kolay Ulaşılabilir Örneklem Yöntemi kullanılmıştır. Her iki gruba araştırma öncesinde Millî Eğitim Bakanlığı'nın yardımcı kaynaklarında bulunan geçerliliği ve güvenilirliği test edilmiş çoktan seçmeli 10 adet sorudan oluşan ön test uygulanmıştır. Ön test sonucunda aritmetik puan ortalaması diğer gruba göre düşük olan grup deney grubu, aritmetik puan ortalaması yüksek olan grup kontrol grubu olarak belirlenmiştir. Kontrol grubunda Millî Eğitim Bakanlığı Talim Terbiye Kurulunun (TTKB) müfredatına uygun olarak ve bu müfredatın yöntem teknikleri kullanılarak öğretim devam etmiştir. Deney grubunda teknolojik uygulama materyali Geogebra yazılımı kullanılarak araştırma yürütülmüştür. Öğretim sonunda ise deney ve kontrol gruplarına son test uygulanmıştır. Ön Test ve Son Testlerden elde edilen verilerin karşılaştırılması için İlişkili Örneklem t- Testi ve Mann Whitney U testi uygulanmıştır. Araştırma verilerinin analizinde SPSS 20.0 istatistik paket programı kullanılmıştır. Araştırmanın sonucunda, Teknolojik Uygulama Materyali Geogebra yazılımı kullanılarak öğretimin yapıldığı deney grubuyla, müfredata uygun olarak öğretimin yapıldığı kontrol grubu başarı puanları arasında deney grubu lehine anlamlı bir fark ortaya çıkmıştır ($p<0,05$). Bu sonuca göre Teknolojik uygulama materyali Geogebra yazılımı kullanılarak yapılan öğretimin öğrencilerin akademik başarılarına olumlu katkıda bulunduğu söylenebilir. Bu materyal ve yazılımların matematik derslerinde daha çok uygulanması önerilebilir.

Anahtar Kelimeler: Matematik, Kesirler, Sıralama, Karşılaştırma, Teknolojik materyal, Geogebra

**EFFECT OF GEOGEBRA SOFTWARE ON STUDENTS' ACADEMIC
ACHIEVEMENT ON ORDERING AND COMPARISON OF FRACTIONS**

ABSTRACT

In this study, the effect of teaching with Geogebra software, which is the teaching method techniques of the Board of Education of the Ministry of National Education (TTKB) and technological application material, on the academic achievement of the students in teaching the 4th-grade mathematics lesson, ordering and comparison in fractions was investigated. The research model is an experimental research model with a pretest-posttest control group. The sample of the research consists of 12 students studying in the 4th grade in a primary school in the Koyulhisar district of Sivas province and 12 students studying in the 4th grade in a primary school in Göynücek district of Amasya province in the 2022-2023 academic year. In the selection of the sample, the Convenience Sampling Method was used in order to provide speed and practicality to the research. Both groups were administered a pre-test consisting of 10 multiple-choice questions whose validity and reliability were tested in the auxiliary resources of the Ministry of National Education before the research. As a result of the pre-test, the group with a lower mean arithmetic score compared to the other group was determined as the experimental group, and the group with a higher mean arithmetic score was determined as the control group. In the control group, teaching continued in accordance with the curriculum of the Board of Education of the Ministry of National Education (TTKB) and using the methods and techniques of this curriculum. In the experimental group, the research was conducted using the technological application material Geogebra software. At the end of the instruction, a post-test was applied to the experimental and control groups. Paired Samples t-test and Mann Whitney U test were applied to compare the data obtained from the pretest and posttest. SPSS 20.0 statistical program was used to analyze the research data. As a result of the research, there was a significant difference in favor of the experimental group between the achievement scores of the experimental group, which was taught using the Technological Application Material Geogebra software, and the control group, which was taught in accordance with the curriculum ($p < 0.05$). According to this result, it can be said that teaching using the technological application material Geogebra software contributed positively to students' academic achievement. It can be suggested that these materials and software should be applied more in mathematics lessons.

Keywords: Mathematics, Fractions, Ordering, Comparison, Technological material, Geogebra

1. GİRİŞ

Matematik; insanların dünyayı anlamasına ve belirli bir dil aracılığıyla kendilerini ifade etmesine yarayan güçlü bir araçtır. Günlük hayatta karşılaşılan problemleri çözmek ve daha verimli bir şekilde kaynakları kullanmak için matematiksel yöntemlere ihtiyaç duyulmaktadır. Ünlü matematikçi David Hilbert, 1930 yılında Paris'te yaptığı bir konuşmada matematiği "bilimin kraliçesi" olarak nitelendirmiştir (Hilbert, Mantık ve Aritmetiğin Temelleri Üzerine, 1934). Ayrıca matematik; fizik, kimya, mühendislik, ekonomi gibi birçok alanda önemli bir rol üstlenmektedir. Bu bağlamda matematiği tek başına bir bilim dalı olarak görmek yerine diğer bilimlerle dünyanın anlaşılmasına yarayan güçlü bir araç olarak görmek daha yerinde olacaktır.

Musk (2019) matematiğin evrensel bir dil olduğunu ve farklı varlıklarla bile iletişim kurmanın yolunu sağlayabileceğini ifade etmiştir. Günümüz bilim ve teknoloji dünyasında da matematiğin yeri oldukça önemlidir. Matematik ve teknolojinin birbirleriyle yakından ilişkili olduğu artık kabul edilen bir gerçektir (Sarıtış, 2020, s. 64). Matematik, bilim ve teknolojinin ilerlemesinde temel bir araç olarak kullanılmaktadır. Özellikle yapay zekâ, veri bilimi, kriptografi, nümerik analiz gibi alanlarda matematiksel modellerin geliştirilmesi, problem çözüme ve yeni teknolojilerin keşfedilmesinde büyük bir rol oynamaktadır.

Teknoloji günümüzde hayatın vazgeçilmez bir parçası haline gelmiştir. İnsanlar artık iletişim kurmak, bilgiye erişmek, günlük işlerini halletmek, eğlenmek, alışveriş yapmak gibi birçok günlük aktivitelerini teknoloji sayesinde gerçekleştirmektedirler. Bu bağlamda eğitimin de teknolojiden uzak kalması, eğitimde teknolojinin yer almaması, günümüzde eğitimin gereksinimleri açısından yetersiz kalmasına yol açabilir. Teknolojinin hızla ilerlemesi, eğitimde de dönüşümü zorunlu hale getirmiştir. Artık eğitimde teknolojinin kullanımı sadece bir tercih değil, kaçınılmaz bir gerekliliktir (Çetin & Karataş, 2020). Teknolojinin kullanımı eğitim sürecini daha etkili, verimli ve keyifli hale getirerek öğrencilerin öğrenme sürecine daha fazla katılımını sağlayabilir. Bu nedenle, eğitimde teknoloji kullanımı artarak devam etmektedir ve günümüzde dijital araçlarla desteklenen eğitim de giderek yaygınlaşmaktadır.

Bu araçların eğitimde kullanımı öğrencilerin yaparak ve yaşayarak öğrenmelerine olanak sağlamaktadır. Güngören ve Çakıroğlu'nun (2020) belirttiği gibi, dijital araçlar öğrencilerin öğrenme sürecinde daha aktif ve etkili olmalarına yardımcı olur (Yeşilyurt, 2021). Öğretmenler de dijital araçlar sayesinde öğrencilerin öğrenme düzeylerini ve ihtiyaçlarını

daha iyi anlayabilir, bu doğrultuda ders planlarını ve öğretim yöntemlerini daha etkili bir şekilde oluşturabilirler (Karal & Kokoc, 2021; Yüksel, Yılmaz & Yeşilyurt 2022).

Bahsedilen dijital araçlardan eğitimde matematik öğretiminde sıklıkla kullanılan araçlardan biri de Geogebra'dır. İlk olarak 2001 yılında Avusturyalı matematik öğretmeni Markus Hohenwarter tarafından geliştirilmiştir (Özdemir, 2019). Geogebra, matematik öğretmenlerinin ve öğrencilerinin matematik problemlerini çözmelerine ve matematiksel kavramları keşfetmelerine yardımcı olmak için kullanılır (Koçak, 2015). Geogebra yazılımı etkileşimli etkinlikleriyle matematik öğretiminde öğrenciler ve öğretmenler tarafından tercih edilmektedir. Günümüzde hemen hemen her sınıfta kullanılan etkileşimli tahtalar sayesinde bu tür yazılımlar sayesinde matematik öğretimi başta olmak üzere tüm disiplinlerde bu yazılımlar kullanılmaktadır.

Matematik dersi ilkökul öğrencilerinin zorlandıkları derslerin başında gelmektedir. Cai & Wang (2018) yaptıkları araştırmada öğrencilerin matematiksel düşünme becerileri konusunda sorun yaşadıklarını, problem çözme stratejilerinde güçlük çektiklerini, matematiksel kavramların öğrenilmesi konusunda da zorlandıklarını göstermişlerdir. Bu çalışmada, ilkökul 4. sınıf matematik dersinin kesirler ünitesinde yer alan "Paydaları eşit olan en fazla üç kesri karşılaştır" kazanımının öğretiminde Geogebra yazılımının kullanılmasının öğrencilerin akademik başarılarına etkisi araştırılmıştır.

1.1 Problem Durumu

Matematiğin doğası gereği soyut kavramlar içermesi nedeniyle, ilkökul öğrencilerinin matematik derslerinde bazı konularda zorlanmaları yaygın bir durumdur. Bu zorlukların başında kesirler konusu gelmektedir. Bu konunun zorluğu, kesirleri soyut kavramlar olarak anlamlandırma ve gerçek hayat problemleriyle ilişkilendirme zorluğundan kaynaklanmaktadır. İlkökul öğrencilerinin kesirleri anlamaları için somut materyallerle desteklenen ve görsel öğeler içeren öğretim yöntemleri, artık birçok matematik uygulamasında kullanılan etkileşimli yazılımlar ve diğer teknolojik araçlar sayesinde daha etkili bir şekilde sunulabilmektedir. Bu nedenle, teknoloji temelli öğrenme yöntemleri, kesirler gibi soyut konuları öğretmek için özellikle yararlı olabilir. Kesirlerde sıralama ve karşılaştırma öğretiminde öğrencilerin yaşadığı güçlükler bu çalışmanın problemini oluşturmaktadır.

Problem Cümlesi: Kesirlerin öğretiminde Geogebra yazılımı kullanılmasının öğrencilerin akademik başarılarına etkisi var mıdır?

1.2 Alt Problemler

Çalışmada araştırılacak alt problemler şu şekildedir:

Deney ve kontrol grubunda bulunan öğrencilerin ön testten aldıkları puan ortalamaları arasında istatistiksel olarak anlamlı bir fark var mıdır?

Deney ve kontrol grubunda bulunan öğrencilerin son testten aldıkları puan ortalamaları arasında istatistiksel olarak anlamlı bir fark var mıdır?

1.3 Araştırmanın Amacı

Bu araştırma, İlkokul 4. Sınıf Matematik dersi Kesirler konusunda yer alan "Paydaları eşit olan en fazla üç kesri karşılaştırır" kazanımının öğretiminde Geogebra yazılımının kullanılmasının öğrencilerin akademik başarılarına etkisini incelemek amacı ile yapılmıştır. Geogebra yazılımında yer alan etkileşimli öğrenci çalışmaları, testler, sorular ve konu anlatımlarından faydalanılarak öğrencilerin ilgili konuyla alakalı akademik başarılarındaki değişim incelenecektir.

1.4 Araştırmanın Önemi

Kesirler, matematik öğreniminde oldukça önemli bir konudur ve özellikle ilkokul 4. sınıf öğrencileri için öğrenilmesi gereken temel matematik konularından biridir. Bu nedenle, kesirlerin öğretiminde kullanılan yöntemler ve araçlar, öğrencilerin matematik başarılarını etkileyebilir.

Bu bağlamda, Geogebra yazılımı gibi görsel ve etkileşimli araçların kullanımı, matematik öğreniminde önemli bir yer tutar. Geogebra, matematik öğreniminde öğrencilerin kesirleri daha iyi anlamalarına ve öğrenmelerine yardımcı olabilecek bir araçtır. Öğrenciler, Geogebra ile interaktif bir şekilde kesirleri inceleyebilir, görsel olarak görebilir ve bu sayede kesirleri daha iyi kavrayabilirler.

1.5 Sınırlılıklar

Araştırma İlkokul 4. Sınıf düzeyinde matematik dersinde yer alan kesirler konusunun bir kazanımı ile sınırlıdır. Araştırma 2022-2023 Eğitim Öğretim yılında Sivas ili Koyulhisar ilçesinde bir devlet okulunda bulunan 12 öğrenci ve Amasya ili Göynücek ilçesinde bir devlet okulunda bulunan 12 öğrenci ile sınırlıdır. Araştırma ön-test ve son-test ile sınırlıdır.

2.YÖNTEM

Bu bölümde araştırmanın modeli, evren ve örnekleme, veri toplama aracı, verilerin toplanma süreci ve verilerin analizi yer almaktadır.

2.1 Araştırma Modeli

Bu araştırma nicel araştırma yöntemlerinden Ön Test- Son Test kontrol gruplu yarı deneysel araştırma modeli kullanılarak yürütülmüştür. Ön test-son test kontrol gruplu yarı deneysel araştırma modeli, araştırmacıların bir değişkenin sebep-sonuç ilişkisini belirlemek amacıyla kullandığı bir araştırma modelidir (Sarıçam & İlhan, 2016). Araştırmacılar tarafından seçkisiz atama yöntemiyle seçilen şubelerden ön test puanı daha yüksek olan kontrol grubu, ön test puanı düşük olan grup deney grubu olarak belirlenmiştir. Deney grubunda konu anlatımı derslikte bulunan etkileşimli tahtadan Geogebra desteği ile yapılmış, öğrenciler derste aktif olarak görev almışlardır. Kontrol grubunda Millî Eğitim Bakanlığı Talim Terbiye Kurulunun müfredatına uygun şekilde öğretim yapılmıştır. Araştırma süreci Tablo 1’de kısaca özetlenmiştir.

Tablo 1. Araştırma Süreci

Gruplar	Öğretim Öncesi	Öğretim Yöntemi	Öğretim Sonrası
Deney Grubu N=12	Kesirler Başarı Testi (Ön Test)	Geogebra destekli öğretim	Kesirler Başarı Testi (Son Test)
Kontrol Grubu N=12	Kesirler Başarı Testi (Ön Test)	Mevcut Müfredatın gerektirdiği şekilde öğretim	Kesirler Başarı Testi (Son Test)

2.2 Araştırmanın Örnekleme

Araştırmanın çalışma grubunu, 2022-2023 Eğitim-Öğretim yılında Sivas ili Koyulhisar ilçesinde bir devlet okulunda bulunan 12 4.sınıf öğrencisi ve Amasya ili Göynücek ilçesinde bir devlet okulunda bulunan 12 4. Sınıf öğrencisi oluşturmaktadır. Örneklem seçiminde araştırmaya hız ve pratiklik kazandırması açısından Kolay ulaşılabilir örnekleme yöntemi kullanılmıştır. Araştırmaya katılan öğrencilerin demografik özellikleri Tablo 2’de verilmiştir.

Tablo 2. Öğrencilerin Demografik Özellikleri

	Deney Grubu		Kontrol Grubu		Tümü		
	N	%	N	%	N	%	
Cinsiyet	Kız	3	25	6	50	9	37,5
	Erkek	9	75	6	50	15	62,5
	Toplam	12	100	12	100	24	100

Araştırmaya katılan öğrencilerin tamamı 4. Sınıfta eğitim görmektedir.

2.3 Veri Toplama Aracı

Araştırmada veri toplama aracı olarak 2022-2023 Eğitim-Öğretim yılında kullanılan Millî Eğitim Bakanlığı tarafından öğrencilere dağıtılmış matematik ders kitabı ve MEB yardımcı kaynaklar kitaplarından, “Paydaları eşit olan en fazla üç kesri karşılaştır” kazanımına uygun sorulardan oluşturulmuş 10 soruluk “Kesirler Başarı Testi” kullanılmıştır. Araştırmada kullanılan ön test ve son test aynı testlerdir. Testler deney ve kontrol gruplarında araştırmacılar tarafından uygulanmıştır.

2.4 Verilerin Analizi

Araştırmada toplanan verilerin analizinde SPSS 20.0 istatistik paket programı kullanılmıştır. Ön test ve son test yoluyla elde edilen veriler Mann Whitney U testi kullanılarak analiz edilmiştir. Mann Whitney U testi, parametrik olmayan bir testtir ve normal dağılmayan veriler için kullanılır. Bu test, iki bağımsız örneklem arasındaki farkın anlamlı olup olmadığını belirlemek için kullanılır (Mann & Whitney, 1947). Örneklem sayısı 30’un altında olduğunda, Mann Whitney U testi t-testine göre daha uygun olabilir, çünkü t-testi normal dağılım varsayımına dayanır. Mann Whitney U testi ise sadece örneklem dağılımlarının aynı şekil ve yayılıma sahip olduğunu varsayar. Bu nedenle, örneklem sayısı az olduğunda veya normal dağılım varsayımı sağlanmadığında Mann Whitney U testi daha güvenilir sonuçlar verebilir (Conover, 1999). Test istatistiği, iki örneklem arasındaki sıraların farkını belirleyerek hesaplanır ve ayrıca U olarak adlandırılır. Eğer test istatistiği, kritik değerden büyükse, fark anlamlı kabul edilir (Wilcoxon, 1945).

3. BULGULAR

Bu bölümde araştırmanın amacına yönelik elde edilen bulgular tablo şeklinde gösterilmiş ve bu tablolara göre yorumlanmıştır.

Deney ve kontrol grubunda bulunan öğrencilerin ön test ve son testlerden adlıkları puanların aritmetik ortalama ve standart sapma değerleri Tablo 3’de verilmiştir.

Tablo 3. Deney ve Kontrol Grubu Ön Test ve Son Test Puan Ortalama ve Standart Sapma Değerleri

Kesirler Başarı Testi	Ön test		Son Test	
	\bar{X}	S	\bar{X}	S
Deney Grubu	45,75	24,85	64,08	18,52
Kontrol Grubu	45,83	14,19	54,66	14,52

Tablo 3 incelendiğinde Birinci gruptaki öğrencilerinin Kesirler Başarı Testi (ön test) puanları ortalaması 45,75 olarak, ikinci gruptaki öğrencilerin Kesirler Başarı Testi (ön test) puanları ortalaması 45,83 olarak hesaplanmıştır. Grupların ön test puan ortalamaları birbirine yakın olarak bulunmuştur. Ön test puanı yüksek olan grup kontrol grubu, ön test puanı düşük olan grup deney grubu olarak belirlenmiştir.

“Deney ve kontrol grubunda bulunan öğrencilerin ön testten aldıkları puan ortalamaları arasında istatistiksel olarak anlamlı bir fark var mıdır?” sorusu için Mann Whitney U testi sonuçları Tablo 4’de verilmiştir.

Tablo 4. Deney ve Kontrol Grubu Öğrencilerinin Ön Test Puanlarına Ait Mann Whitney U Testi Sonuçları

Puan	Gruplar	N	$\bar{X}_{\text{sıra}}$	$\sum_{\text{sıra}}$	U	z	p
Ön Test	Deney	12	12,54	150,50	72,500	-,301	,764
	Kontrol	12	13,42	174,50			
	Toplam	24					

Tablo 4 incelendiğinde deney ve kontrol grubu öğrencilerinin Ön test puanlarının anlamlı düzeyde farklılaşmadığı belirlenmiştir. (U= 72,500; P>,05). Bu sonuç deney ve kontrol gruplarının öğretim süreci öncesinde ön bilgileri açısından istatistiksel olarak anlamlı bir fark olmadığını ortaya koymaktadır.

“Deney ve kontrol grubunda bulunan öğrencilerin son testten aldıkları puan ortalamaları arasında istatistiksel olarak anlamlı bir fark var mıdır?” sorusu için Mann Whitney U testi sonuçları Tablo 5’de verilmiştir.

Tablo 5. Deney ve Kontrol Grubu Öğrencilerinin Son Test Puanlarına Ait Mann Whitney U Testi Sonuçları

Puan	Gruplar	N	$\bar{X}_{\text{sıra}}$	$\sum_{\text{sıra}}$	U	z	p
Ön Test	Deney	12	14,42	173,00	49,000	-1,329	,184
	Kontrol	12	10,58	127,00			
	Toplam	24					

Tablo 5 incelendiğinde deney ve kontrol grubu öğrencilerinin Son test puanlarının anlamlı düzeyde farklılaşmadığı belirlenmiştir. (U= 49,000; P>,05). Deney ve kontrol grubu son test puanları arasında anlamlı fark olmamasına rağmen deney grubu öğrencilerinin kesirler başarı testinden aldıkları puan ortalamasının (64,08), kontrol grubu öğrencilerinin kesirler başarı

testinden aldıkları puan ortalamasından (54,66) yüksek olduğu söylenebilir. Bu durum Geogebra destekli öğretimin akademik başarıya pozitif yönde etkisini göstermektedir.

TARTIŞMA VE SONUÇ

Bu araştırmada İlkokul 4. Sınıf Matematik dersi kesirler konusunun öğretiminde Geogebra yazılımının öğrencilerin akademik başarılarına etkisi incelenmiştir. Deney ve Kontrol grupları, ön test ve son test puanları arasında anlamlı bir fark bulunamamıştır. Buna rağmen ön test sonucu daha düşük olan deney grubunun son test puan ortalamasının (64,08), kontrol grubu puan ortalamasından (54,66) daha yüksek olduğu görülmektedir. Bu durum Geogebra desteğiyle yapılan öğretimin öğrencilerin akademik başarısını artırdığını açıklamaktadır. Geogebra yazılımının öğrencilerin akademik başarısına olumlu etkisini destekleyen bulgulara literatürde rastlanmaktadır. (Chen ve diğerleri, 2016; Işık ve diğerleri, 2021; Aydın, 2017; Göktürk & Başar, 2015)

Teknoloji destekli matematik dersleri, öğrencilere farklı öğrenme stillerine uygun çeşitli öğrenme materyalleri sunar. Örneğin, matematiksel kavramları görselleştirmek için interaktif simülasyonlar, videolar ve animasyonlar kullanılabilir. Bu materyaller, öğrencilerin soyut matematik kavramlarını daha iyi anlamalarını ve bağlantılar kurmalarını sağlar. Teknoloji destekli öğretimin öğrencilerin akademik başarısına olumlu etkileyen çalışmalar ilgili literatürde mevcuttur (Ünal & Yeşilyurt, 2021; Akar & Yeşilyurt, 2020; Turhan & Yeşilyurt, 2020).

Araştırmadan elde edilen sonuçlara göre araştırmacılara, eğitimcilere ve öğretmenlere şu önerilerde bulunulabilir:

1. Matematik öğretmenlerinin, Geogebra yazılımını kullanarak öğrencilerin kesirler konusundaki sıralama ve karşılaştırma becerilerini geliştirmeleri önerilir.
2. Geogebra yazılımının, matematik öğretmenleri tarafından derslerde aktif olarak kullanılması ve öğrencilerin interaktif olarak katılımının sağlanması önerilir.
3. Öğrencilere, Geogebra yazılımının kullanımı konusunda yeterli eğitim verilmesi ve yazılımın doğru bir şekilde kullanılması konusunda destek sağlanması önerilir.
4. Geogebra yazılımının öğretim materyalleri ve etkinlikleri geliştirmek için kullanılması önerilir.
5. Öğrencilerin, Geogebra yazılımını kullanarak kendi kendine öğrenme süreçlerini geliştirmeleri için desteklenmeleri önerilir.
6. Benzer araştırmaların yapılması ve farklı öğretim materyalleriyle karşılaştırmalı çalışmaların yapılması önerilir.

ÖZET

Bu çalışmada ilkokul 4. sınıf matematik dersi paydası eşit olan kesirlerle toplama ve çıkarma işlemlerinin öğretiminde Milli Eğitim Talim Terbiye Kurulunun (TTKB) yöntem teknikleri ve Web 2.0 araçlarının öğrenci başarısına etkileri incelenmiştir. Araştırmanın modeli ön test–son test kontrol gruplu deneysel araştırma deseni olarak tasarlanmıştır. Araştırmanın örneklemini 2022-2023 Eğitim-Öğretim yılında Amasya ili Suluova ilçesinde olan bir ilkokuldaki 4. sınıfta bulunan 27 öğrenci ve Kocaeli ili Gebze ilçesinde olan bir ilkokuldaki 4. Sınıfta bulunan 27 öğrenci oluşturmaktadır. Örneklem kolay ulaşılabilir örnekleme yöntemiyle belirlenmiştir. Çalışma, Milli Eğitim Talim Terbiye Kurulu tarafından hazırlanan müfredata uygun yöntem ve tekniklerin kullanıldığı kontrol grubu ve Web 2.0 araçlarıyla öğretimin uygulandığı deney grubu olmak üzere 2 grup ile yürütülmüştür. Deney ve kontrol gruplarına araştırmacılar tarafından hazırlanan ve Milli Eğitim Bakanlığı'nın güvenilirlik geçerliliği test edilmiş açık uçlu beş sorudan oluşan ön test ve son testler uygulanmıştır. Ön test ve son testlerden elde edilen verilerin karşılaştırılması için ve veri analiz için Microsoft Excel 2017'de t-testi kullanılmıştır. Araştırma sonucunda, Web 2.0 araçları ile öğretimin matematik dersi kesirlerde toplama ve çıkarma işlemi öğretiminde öğrencilerin başarısına anlamlı etkisi olduğu saptanmıştır. Bu yöntemin öğrenci başarısı üzerine etkilerine bakıldığında istatistiki olarak anlamlı bir fark çıkmıştır ($p<0.05$). Elde edilen bulgulara göre Web2.0 araçları ile öğretimin öğrenci başarı puanlarını olumlu yönde etkilediği söylenebilir. Matematik dersi kesirler ünitesinin öğretilmesinde Web2.0 araçlarıyla öğretim yönteminin daha fazla kullanılması önerilebilir.

Anahtar Kelimeler: Kesirlerde toplama ve çıkarma, teknolojik materyal, Web 2.0 araçları.

**THE EFFECT OF TECHNOLOGICAL MATERIAL ON THE SUCCESS OF
PRIMARY SCHOOL 4TH GRADE STUDENTS IN THE PROCESS OF ADDITION
AND SUBTRACTION WITH FRACTIONS**

ABSTRACT

In this study, the methods and techniques of the National Education Board of Education (TTKB) and the effects of Web 2.0 tools on student achievement in the teaching of addition and subtraction operations with fractions with equal denominators in primary school 4th grade mathematics lesson were examined. The research model was designed as an experimental research design with pretest-posttest control group. The sample of the study consists of 27 students in the 4th grade of a primary school in the Suluova district of Amasya province in the 2022-2023 academic year and 27 students in the 4th grade in a primary school in the Gebze district of Kocaeli province. The samples were determined by the easily accessible sampling method. The study was carried out with two groups, the control group, in which methods and techniques suitable for the curriculum prepared by the National Education Board of Education and Discipline were used, and the experimental group, in which teaching with Web 2.0 tools was used. Pre-test and post-tests consisting of five open-ended questions prepared by the researchers and tested by the Ministry of National Education were applied to the experimental and control groups. Microsoft Excel 2017 t-Test was used to compare the data obtained from the pre-test and post-test. As a result of the research, it was determined that teaching with Web 2.0 tools had a significant effect on the success of students in teaching addition and subtraction in fractions. Considering the effects of this method on student achievement, there was a statistically significant difference ($p < 0.05$). According to the findings, it can be said that teaching with Web2.0 tools affects student achievement scores positively. It can be suggested that the teaching method with Web2.0 tools should be used more in teaching the units of fractions of the mathematics lesson.

Keywords: Addition and subtraction in fractions, technological material, Web 2.0 tools.

1.GİRİŞ

Dünyadaki teknolojik gelişmeler her alanda olduğu gibi eğitim ve öğretim alanını da etkilemektedir. Teknoloji alanındaki değişimler, öğretim anlayışındaki değişimlere neden olup günümüz öğretiminde yeni teknik ve yöntemlerin kullanımını gerektirmektedir (Alakoç, 2003:1). Eğitimin her alanında olduğu gibi matematik öğretiminde de bilişim teknolojilerindeki gelişmelerin yansımalarını yoğun bir şekilde görmekteyiz (Karal ve Abdüsselam, 2009). Matematik öğretiminde teknolojinin kullanılması konulara somut yaşantılar kazandırarak, öğrencilerin soyut ve sembolik yaklaşımı içeren başarılar edinmesini sağlamaktadır. (Flores 2002; akt:Tatar, Kağızmanlı ve Akkaya, 2013; Yeşilyurt, 2021).

Matematik gündelik hayatın hemen her alanında karşımıza çıktığından, günlük hayatta matematiği uygulayabilme ihtiyacı önem kazanmaktadır. Matematik birçok bilimin temeli olduğu ve diğer birçok bilimle ilişkili olduğu için bilim ve teknolojiye gelişebilmek matematikte başarılı bireyler yetiştirmeye bağlıdır. Çünkü sürekli bir değişim ve gelişim içinde olduğumuz bu yüzyılda, matematikten daha iyi anlayan ve matematikle uğraşanlar geleceğe yön vermede etkin rol alacaklardır (MEB, 2005; Yüksel, Yılmaz & Yeşilyurt 2022). Matematik soyut içerikli bir ders olduğundan matematik kavramların öğretiminde ve öğrenmesinde zorluklar yaşanmaktadır. Öğrenciler matematik dersini başaramayacaklarını düşündüklerinden matematik dersi için kaygı düzeyleri genel itibari ile yüksektir. Matematik öğretiminde kullanılan yöntemler ve araçlar bunun sebepleri arasındadır (Bulut, 1994; Baki, 1996; Kemertaş, 1997; akt: Akın ve Canan, 2007:2).

Teknolojik alanlardaki değişim ve gelişimler matematik öğretimini ve öğrenimini kolaylaştıracak, somutlaştıracak ve başarıyı artıracak çeşitli araç-gereç, yazılım ve programlarla bizi buluşturmaktadır. Bilgisayar, akıllı tahta, Web 2.0 araçları ve eğitim bilişim ağı (EBA) bu teknolojik araçlardan bazılarıdır. Bu teknolojik araçlar, matematik dersini zengin görsel ve etkileşimli içerikleri ile somutlaştırarak öğrencilerin matematik kavramlarını daha kolay anlamasına ve kalıcı öğrenme gerçekleştirmesine katkı sağlamaktadır (Ünal & Yeşilyurt, 2021; Turhan & Yeşilyurt, 2020).

Matematik öğretiminde amaç bilgiyi üretebilen, uygulayabilen ve günlük hayata entegre ederek kullanabilen matematiksel düşünme yeteneğine sahipler bireyler yetiştirmektir. Bu amaçla öğrencileri süreçte aktif kılan, onları düşünme ve problem çözme becerilerini kazanmaya yönlendirecek öğretim uygulanmalıdır. Bu çalışmada 4.sınıf öğrencilerine matematik dersi kesirler konusu kazanımlarından biri olan ‘‘Paydası eşit olan kesirlerde

toplama ve çıkarma işlemi yapar.” kazanımı Web 2.0 araçlarıyla desteklenmiş yöntemle öğretim yaparak teknolojik materyalin ders başarısına etkisine bakılmıştır.

1.1 PROBLEM CÜMLESİ

Matematik kavram ve kazanımlarının soyut olması kavramların öğretilmesi ve öğrenilmesini zorlaştırmaktadır. Kesirler konusu soyut bir konu olduğu için sadece ders kitaplarına bağlı kalarak ve geleneksel öğretim yöntemleriyle öğretilmesi, öğrencilerde konuyu tam kavrayamama ve düşük başarı gösterilmesine neden olmaktadır. Kesirler konusunun tam olarak kavranamamasından kaynaklanan yüksek başarı gösterilememesi bu araştırmanın problemini oluşturmaktadır.

Problem Cümlesi:

İlkokul 4.sınıf öğrencilerine kesirlerde toplama ve çıkarma işleminde teknolojik materyalle öğretim yönteminin ders başarısına etkisi nedir?

1.2 ALT PROBLEMLER

1. Teknolojik materyalle öğretimin öğrenci motivasyonuna etkisi nedir?
2. Teknolojik materyalle öğretiminin öğrencinin derste aktifleşmesine etkisi nedir?
3. Teknolojik materyalle desteklenmiş öğretim yönteminin etkili öğretim açısından önemi nedir?
4. Matematik dersinde teknolojik materyalle desteklenmiş öğretim yönteminin ders başarısına etkisi nedir?
5. Derslerde teknolojik materyallerin kullanılmasının öğrenme düzeyine etkisi nedir?

1.3 ARAŞTIRMANIN AMACI

Bu araştırmanın amacı; 4.sınıf öğrencilerinde, matematik kazanımlarından “Paydası eşit olan kesirlerle toplama ve çıkarma işlemi yapar.” kazanımını teknolojik materyallerle desteklenmiş öğretim yöntemiyle öğretim yaparak teknolojik materyallerin ders başarısına etkisini incelemektir.

1.4 ARAŞTIRMANIN ÖNEMİ

Matematikteki soyut kavramlardan biri de kesirler konusudur. Kesirler konusunun öğretiminde geleneksel yöntemle ders kitabının işlenmesi öğrencilerin konuyu anlamasını zorlaştırmaktadır. Öğrenciler soyut kavram olarak kesirler konusunu zihninde

canlandıramamakta ve bilgilerin kalıcı olmasını sağlayamamaktadır. Gelişim dönemleri düşünüldüğünde ilkokul 4.sınıf öğrencileri somut işlemler döneminde olduğu için soyut kavramları öğrenmekte zorlanmaktadır. Öğrenciler bu zorlanmalar sonucunda derse karşı ilgisiz olabilmekte hatta derse karşı olumsuz tutum geliştirebilmektedir. Matematik öğretiminde öğrencinin dersi sevmesi, ilgi göstermesi ve olumlu tutum göstermesinde öğretmenlere büyük roller düşmektedir. Öğretmenin konuyu öğrenci gelişim seviyesine göre somutlaştırması ve uygun öğretim yöntemini kullanması ders başarısını artırmada oldukça önemlidir. Kesirlerde toplama ve çıkarma işlemlerinin öğretilmesinde teknolojik materyallerin kullanılmasının ders başarısının artıracağı düşünülmektedir.

1.5 ARAŞTIRMANIN SINIRLILIKLARI

1. Bu çalışma Amasya ili Suluova ilçesinde olan bir ilkokuldaki 4. sınıfta bulunan 27 öğrenci ve Kocaeli ili Gebze ilçesinde olan bir ilkokuldaki 4. Sınıfta bulunan 27 öğrenci ile sınırlıdır.
2. Bu çalışma ‘‘Paydası eşit olan kesirlerle toplama ve çıkarma işlemi yapar.’’ Kazanımıyla sınırlıdır.
3. Bu çalışma ön test ve son test uygulamasıyla sınırlıdır.

2. YÖNTEM

2.1 ARAŞTIRMA DESENİ

Bu araştırma bir nicel araştırmadır. Yarı deneysel araştırma türüdür ve yarı deneysel desen kullanılmıştır. Araştırmanın modeli ön test–son test kontrol gruplu deneysel araştırma deseni olarak tasarlanmıştır. Bu modelde iki grup bulunmaktadır. Bu gruplardan biri deney, diğeri kontrol grubu olarak kullanılmıştır.

Çalışmada araştırmanın amacına uygun olarak 34 tane ilkokul 4.sınıf öğrencisiyle çalışılmıştır. Her iki gruba önce ön test uygulanmış, bu testin sonucuna göre deney ve kontrol grubu belirlenmiştir. Deney grubuna teknolojik materyal destekli öğretim yapılmış, kontrol grubuna Milli Eğitim Talim Terbiye Kurulu tarafından hazırlanan ders kitaplarında uygun görülen yöntemlerle öğretim yapılmıştır. Yapılan eğitimlerden sonra son test uygulanmış ve öğrencilerin konuyla ilgili öğrenme düzeyleri araştırılmıştır.

2.2 ARAŞTIRMANIN ÖRNEKLEMİ

Araştırmanın örneklemini 2022-2023 Eğitim-Öğretim yılında Amasya ili Suluova ilçesinde olan bir ilkokuldaki 4. sınıfta bulunan 27 öğrenci ve Kocaeli ili Gebze ilçesinde olan bir ilkokuldaki 4. Sınıfta bulunan 27 öğrenci oluşturmaktadır.

2.2.1. Deney Grubu

Çalışmanın deney grubunu 2022-2023 Eğitim-Öğretim yılı Kocaeli ili Gebze ilçesinde olan bir ilkokuldaki 4. Sınıfta bulunan 27 öğrenci oluşturmaktadır.

2.2.2. Kontrol Grubu

Çalışmanın kontrol grubunu 2022-2023 Eğitim-Öğretim yılında Amasya ili Suluova ilçesinde olan bir ilkokuldaki 4. sınıfta bulunan 27 öğrenci oluşturmaktadır.

2.3 VERİ TOPLAMA ARAÇLARI

Araştırmanın verileri araştırmacılar tarafından hazırlanan ve Milli Eğitim Bakanlığı tarafından güvenilirlik geçerliliği test edilmiş açık uçlu beş sorudan oluşan ön test ve son test ile elde edilmiştir. Veri toplama aracında kesirler konusu ‘‘Paydaları eşit kesirlerle toplama ve çıkarma işlemi yapar.’’ kazanımıyla ilgili 5 tane açık uçlu soru bulunmaktadır. Çalışmada uygulanan ön test ve son testteki soru maddeleri aynıdır.

2.4. VERİLERİN TOPLANMASI

Hazırlanan veri toplama aracı belirtilen gruptaki 4.sınıf öğrencilerine 1 ders saati süresince uygulanmıştır. Verilerin daha sağlıklı ve güvenilir bir şekilde toplanması için araştırmacılar veri toplama sürecine bizzat katılmışlardır.

2.5. VERİLERİN ANALİZİ

Uygulanan eğitimler sonucunda ön test ve son test ile elde edilen veriler Microsoft Excel 2017’de t-testi kullanılarak analiz edilmiştir.

3. BULGULAR

Veriler analiz edildikten sonra t-Testi sonuçları elde edilmiştir. Elde edilen bu veriler aşağıda sunulmuştur.

	Gruplar				
	Kontrol Grubu		Deney Grubu		Anlamlılık
	\bar{x}	SS	\bar{x}	SS	P
Ön Test	83,70	16,67	74,81	13,11	0,116000643
Son Test	86,66	14,67	90,37	11,59	0,007755559

Çizelge 1. Kontrol Grubu-Deney Grubu t-test Karşılaştırması

3.1 ÖN TEST BULGULARI

“Paydaları eşit kesirlerle toplama ve çıkarma işlemi yapar.” kazanımını, teknolojik materyallerle desteklenmiş yöntemle öğretim yaparak ders başarısına etkisini ölçmek için kazanımı öğretmeden önce ön test uygulanmıştır. Uygulanan ön testin sonucu çizelge 2’de gösterilmiştir.

Çizelge 2. Ön Test t-test Bulguları

t-Test: Ortalamalar İçin İki Örnek		
	DENEY GRUBU	KONTROL GRUBU
Ortalama	74,81	83,70
Standart sapma	13,11	16,67
Gözlem	27	27
Pearson Korelasyonu	0,302165312	
Öngörülen Ortalama Farkı	0	
Df	26	
t Stat	-2,590304503	
P(Anlamlılık)	0,116000643	
t Kritik tek-uçlu	1,70561792	

Çizelgeye göre öğrenciye “Paydaları eşit kesirlerle toplama ve çıkarma işlemi yapar.” kazanımı kazandırılmadan önce öğrencilerde kazanım hakkında bir hazırbulunuşluklarının olduğu ortaya çıkmıştır.

3.2 SON TEST BULGULARI

“Paydaları eşit kesirlerle toplama ve çıkarma işlemi yapar.” kazanımını, teknolojik materyallerle desteklenmiş yöntemle öğretim yaparak ders başarısına etkisini ölçmek için

çalışma tamamlandıktan sonra öğrencilere son test uygulanmıştır. Uygulanan son testin sonucu çizelge 3’de gösterilmiştir.

Çizelge 3. Son Test t-test Bulguları

t-Test: Ortalamalar İçin İki Örnek		
	DENEY GRUBU	KONTROL GRUBU
Ortalama	90,37	86,66
Standart sapma	11,59	14,67
Gözlem	27	27
Pearson Korelasyonu	0,301328776	
Öngörülen Ortalama Farkı	0	
df	26	
t Stat	1,223803846	
P(Anlamlılık)	0,007755559	
t Kritik tek-uçlu	1,70561792	

Analiz sonucunda son teste ait p değeri 0,007 çıkmıştır. Son test p değeri 0,05’ten küçük olduğu için eğitim verildikten sonra deney grubu ve kontrol grubu arasında anlamlı bir fark olduğu görülmüştür. Diğer verilerle birlikte sonucu incelediğimizde teknolojik materyallerle desteklenmiş yöntemle eğitiminin, geleneksel yöntem eğitimine göre daha iyi sonuçlar verdiği ifade edilebilir.

4. SONUÇ, TARTIŞMA ve ÖNERİLER

4.1 SONUÇ VE TARTIŞMA

Araştırma bulguları incelendiğinde teknolojik materyalle desteklenmiş öğretim uygulamalarının uygulandığı deney grubunun, düz anlatım yönteminin uygulandığı kontrol grubunun son test akademik başarı test puanları arasındaki farkın p değeri 0,05’den küçük olduğu görülmüş ve sonuçların deney grubu lehine istatistiksel olarak anlamlı olduğu bulunmuştur.

Araştırmanın alt problemlerine ait sonuçlar ve tartışma aşağıda aktarılmıştır:

1. Teknolojik materyalle desteklenmiş öğretimin öğrenciyi derste aktif kıldığı için öğrenci motivasyonunu arttırdığı görülmüştür.
2. Teknolojiyle öğretim öğrencide istek ve merak uyandırdığı için öğrencinin derse katılımını artırmıştır. Derse katılım öğrencinin dersten keyif almasını da sağladığı için

öğrencilerin motivasyonları artmış ve teknolojiyle öğretimin hem öğretmen hem de öğrenci üzerinde pozitif etkilerinin olduğu görülmüştür.

3. Teknolojinin derste kullanımının dersi anlamakta zorluk çeken öğrencilerin öğrenme hızını artırdığı gözlemlenmiştir.

4. Teknolojik materyalle öğretim ile öğretilen konu akılda daha kalıcı olmaktadır. Bilgiler öğrencilerin zihninde daha çok anlamlandırılmaktadır.

5. Derste teknolojinin kullanılması öğrenmeyi kolaylaştırmaktadır. Öğrenmekte güçlük çeken öğrencilerin bile dersi daha kolay anlamasını sağlamaktadır.

4.2 ÖNERİLER

Araştırmadan elde edilen sonuçlara göre aşağıdaki önerilerde bulunulabilir:

Araştırmadan elde edilen sonuçlara göre “Paydaları eşit kesirlerle toplama ve çıkarma işlemi yapar.” kazanımı için teknolojik materyalle öğretim yapılan öğrencilerin akademik başarısının yükseldiği görülmüştür. Sınıf içerisinde, öğretim yaparken kalıcılığı sağlamak için öğretmenler, teknolojiyi takip etmeli ve sınıfta uygulama yapmalıdırlar. Derse karşı ilgisiz ve dersi öğrenmekte güçlük çeken öğrencileri simülasyonlardaki eğlenceli etkinlikler ve oyunlarla derse çekilmesi sağlanabilir. Kazanımların somutlaştırılması, oyun ve etkinliklerle desteklenmesi öğrencilerin eğitimde aktif rol alması, tüm derslerde olduğu gibi matematik eğitiminde de kullanılmalıdır.

**THE EFFECT OF GENDER STRUCTURE AND FEMALE EMPLOYMENT ON
ORAL AND MAXILLOFACIAL SURGERY AND ORTHODONTIC TREATMENTS**

Dr. Dt. İ. SANCAR ŞİMŞEK (Orcid ID: 0000-0003-1245-4723)

Mersin İdealdent Clinic, Mersin, Turkey.

E-mail: dr.sancarsimsek@gmail.com

ABSTRACT

In this retrospective descriptive study, it was aimed to examine the relationship between oral and maxillofacial surgery and orthodontic treatments and gender structure in Turkey since 2002. The datasets of Turkey from 2002 to 2020, were examined from the datasets of TÜİK National Health Indicators, Turkish Dentists Association and Public Hospitals Association. Dependent variables in the study were taken as the number of applicants for oral and maxillofacial surgery and orthodontic treatment. The independent variables were defined as the number of dentists, the number of dental applications, male participation in healthcare and female participation in healthcare. The rate of female employment in Turkey from the World Bank Country Reports and the year variables were used as control variables. A horizontal course was observed with a low upward trend until 2012. In 2013 and 2017, there was a sharp increase in oral and maxillofacial surgery operations in Turkey. Spearman's rho correlation analysis showed that the number of oral and maxillofacial surgery operations and the percentage of male participation in health services ($r=0.901$; $p<0.01$), the percentage of female participation ($r=0.941$; $p<0.01$) and the female employment rate (0.870 ; $p<0.01$) contribution was statistically significant. The contribution of the number of orthodontic treatments and the percentage of male participation in health services ($r=0.672$; $p<0.01$), the percentage of female participation ($r=0.770$; $p<0.01$) and the female employment rate (0.842 ; $p<0.01$) were statistically significant. Male participation in health services ($B=111809.72$; $p<0.01$), female participation ($B=-238574.84$; $p<0.01$) and female employment rate ($B=-400725.59$; $p<0.05$) had significant contribution on the number of oral and maxillofacial surgery operations. However, the effect of all three variables on orthodontic treatments was not statistically insignificant ($p>0.05$). The effect of employment on women's participation in health services has an impact on the increase in the number of operations in oral and maxillofacial surgery.

Keywords: Oral and maxillofacial surgery, orthodontics, gender

1. Introduction

Oral health is an important issue that affects both the quality of life of individuals, as well as nutrition and other diseases. Although its mortality and morbidity is not high like other health services, orthodontic and maxillofacial surgery procedures in oral and dental health may cause undesirable results in the long run, which also affect other health conditions of individuals (Dickson-Swift and Crocombe, 2022; Poirier et al, 2022; Poudel et al, 2022; Petersen et al, 2020). In this respect, it is possible to state that jaw surgery and orthodontic treatments have an important place in terms of individuals' quality of life and public health.

There are factors that affect the health treatment processes of jaw surgery and orthodontic treatments, but it is necessary to focus on some factors that affect the level of health in the social sense. Among these, the gender structure and especially the participation rates of women and men in employment and the level of women's use of health services are important. Although women's participation in social life and their inclusion in the social security system are encouraged on the one hand, the health services provided should also be examined according to gender balance in this process (Amoah et al, 2022; Sfeatcu et al, 2022; Wang et al, 2020; de Silva et al, 2016). In this respect, the level of benefit of men and women from jaw surgery and orthodontic treatments is important.

Although the effects of men and women, or more generally, gender, have been examined in studies in the fields of maxillofacial surgery and orthodontics, no study has been found examining gender structure and female employment in the social context. Therefore, in this study, it was aimed to examine the effects of participation in health services in terms of gender and female employment rates on maxillofacial surgery and orthodontic treatments.

2. Methods

The research was designed in descriptive scanning model. In this method, the researcher can make inferences on a specific subject by using the available qualitative and quantitative data. In the descriptive survey model, the researcher does not interfere with the current situation and describes the situation as it is (Karasar, 2012). In this context, in this study, it was aimed to describe the effect of gender structure and employment on maxillofacial surgery and orthodontic treatments.

In the research, the data sets of Turkey from 2002 to 2020, which is the most recent year, were examined from the datasets of the Turkish Statistical Institute National Health Indicators, the Association of Dentists of Turkey and the Public Hospitals Association. Dependent variables

in the study were taken as the number of patients who applied for maxillofacial surgery and orthodontic treatment. The independent variables were chosen as the number of dentists, the number of dental applications, male participation in healthcare and female participation in healthcare. The rate of female employment in Turkey from the World Bank Country Reports and the year variables were used as control variables (Employment to population ratio, 15+, female (%)) (national estimate).

Parity analysis, Spearman's rho correlation analysis and Generalized Linear Model (Logit) analysis were used to analyze the data. All analyzes were performed in SPSS 25.0 for Windows, with 95% confidence interval and 0.05 significance level.

3. Results

According to the change in the number of operations for maxillofacial surgery over time, a horizontal course was observed with a low upward trend until 2012. There was a sharp increase in maxillofacial surgery operations in Turkey in 2013 and 2017 (Figure 1).

Figure 1. Change in the number of maxillofacial surgery operations in Turkey by years

Although there was an increasing trend in orthodontic treatment over the years, there was a decrease in 2014 and 2018. Although there was a serious decrease in 2017 compared to the previous year, there has been an increase since 2002 in general (Figure 2).

Figure 2. Change in the number of orthodontic treatments in Turkey by years

According to the results of Spearman's rho correlation analysis, the percentage of male participation in health services ($r=0.901$; $p<0.01$), the percentage of female participation ($r=0.941$; $p<0.01$) and the contribution of female employment rate (0.870 ; $p<0.01$) with the parameter of the number of jaw surgery operations were statistically significant. The relationship between the number of orthodontic treatments parameter and the percentage of male participation in health services ($r=0.672$; $p<0.01$), the percentage of female participation ($r=0.770$; $p<0.01$) and the contribution of female employment rate (0.842 ; $p<0.01$) was statistically significant (Table 1).

Table 1. Spearman's rho correlation analysis results for the relationship between the number of maxillofacial surgery operations and the number of orthodontic patients and research variables

	Number of jaw surgery operations		Number of orthodontic patients	
	r	p	r	p
Number of dentist applications	0.354	0.559	0.354	0.559
Number of dentists	0.707	0.182	0.707	0.182
Percentage of male participation in health services	0.901**	0.000	0.672**	0.012
Percentage of female participation in health services	0.941**	0.000	0.770**	0.002
Female employment rate	0.870**	0.000	0.842**	0.000

**p<0.01

According to the results of the Generalized Linear Model (Logit) analysis for the effect of female and male healthcare participation and female employment on the number of jaw surgery operations and orthodontic patients, The effects of male participation in healthcare services on the number of jaw surgery operations (B=111809.72; p<0.01), female participation (B=-238574.84; p<0.01) and female employment rate (B=-400725.59; p<0.05) were statistically significant. However, the effect of all three variables on orthodontic treatments was not statistically significant (Table 2).

Table 2. Results of the Generalized Linear Model (Logit) analysis for the effect of female and male health care participation and female employment on the number of maxillofacial surgery operations and orthodontic patients

4. Discussion

In this study, the effect of women's and men's participation in health services and women's employment on the number of jaw surgery and orthodontic treatments for women and men were examined. The number of dentist applications and the number of dentists were taken as control variables in the study.

According to the results of the correlation analysis, the effects of women's and men's participation in health services and employment of women on both the number of maxillofacial surgery and the number of orthodontics were statistically significant and high. However, correlation analysis coefficients showed that all three parameters had a higher contribution on maxillofacial surgery. In the internal evaluation, the effect of female participation in the number of maxillofacial surgeries was higher than the male participation in health services. The same was true for orthodontics, and women's participation in health care had a higher impact on orthodontic treatment. However, in multivariate analysis, while participation in maxillofacial surgery had a significant effect on women's participation in health care and employment, the same was not accepted for orthodontics.

5. Conclusion

The results show that women's participation in health services significantly affects their oral and dental health. The effect of employment on women's participation in health services has an impact on the increase in the number of operations in oral and maxillofacial surgery. For this reason, in order to increase the level of oral health and increase the quality of life of individuals, women's participation in the health system should be ensured on the one hand, and on the other hand, studies should be carried out to reach the female population who could not enter the employment structure.

Özet

Amaç: Bu çalışmanın amacı gebe kadınlarda bel ağrısı ve yaşam kalitesinin incelenmesidir.

Gereç ve Yöntem: Bu çalışmaya 152 gebe ve 52 asemptomatik gebe olmayan kadın dahil edildi. Kadınların sosyodemografik özellikleri demografik bilgi formu ile kaydedildi. Kadınların Ağrı şiddeti VAS ile yaşam kaliteleri Kısa Form 36 (SF-36) ile değerlendirildi.

Bulgular: Çalışmaya katılan bireylerin yaş ortalamaları 28.95 ± 5.5 yılıdır. Yaşam kaliteleri incelemeleri sonucu fiziksel fonksiyona bağlı rol kısıtlılığı, emosyonel sorunlara bağlı rol kısıtlılığı, ağrı ve genel sağlık alt başlıklarında gruplar arasında istatistiksel olarak anlamlı değişimler gözlemlendi. Gebe kadınların bel ağrılarında ise fark görülmedi ($p>0.05$).

Sonuçlar: Gebe kadınlarda yaşam kalitesi ve bel ağrısını incelemeyi amaçlayan bu çalışmada gebelikle birlikte gebelerin yaşam kalitelerinin azaldığı, bel ağrılarında ise fark olmadığı bulundu. Gebenin iyi olma halinin pek çok parametre tarafından etkilenmektedir. Bu nedenle gebelikte gebenin yaşam kalitesini etkileyen diğer faktörlerinde incelenerek daha geniş popülasyonda çalışmalar yapılması önerilmektedir.

Anahtar kelimeler: Gebelik, bel ağrısı, yaşam kalitesi

EXAMINATION OF LOW BACK PAIN AND QUALITY OF LIFE LEVEL IN
PREGNANT WOMEN

Abstract

Objectives: The aim of study is to investigate the changes on low back pain and quality of life in pregnant women.

Materials and methods: This study included 152 pregnant women and 52 asymptomatic non-pregnant women. Sociodemographic characteristics of women were recorded by demographic information form. Pain severity was evaluated with VAS and quality of life was evaluated with Short Form 36 (SF-36).

Results: The mean age of the study participants was 28.95 ± 5.5 years. . As a result of quality of life analyzes, statistically significant changes were observed between the groups in terms of role limitation due to physical function, role limitation due to emotional problems, pain and general health. No difference was observed in low back pain of pregnant women ($p>0.05$).

Discussion: In this study, which aimed to examine quality of life and low back pain in pregnant women, it was found that the quality of life of pregnant women decreased with pregnancy, while there was no difference in low back pain. The well-being of pregnant women is affected by many parameters. Therefore, it is recommended that other factors affecting the quality of life of pregnant women during pregnancy should be examined and studies should be conducted in a larger population.

Keywords: Pregnancy, quality of life, low back pain

GİRİŞ

Fetüsün büyüme ve gelişimini kapsayan süre olarak bilinen gebelik son menstruel siklusun ilk gününden itibaren 37-42 haftalık süreyi kapsamaktadır. Ortalama 40 hafta süren gebelik dönemindeki kadında anatomik, fizyolojik ve psikolojik yönden birçok değişiklik görülür (Tan EK, 2013). Gebelikte vücut fizyolojik bir karmaşaya sahiptir. Gebenin vücudunda büyük oranda fizyolojik bir stres oluşmaktadır (Longo 2018). Gebeliğin kadınlar üzerindeki etkileri fizyolojik, anatomik, psikolojik ve postür yönünden görülmektedir. Gebe kadınlarda meydana gelen farklılaşmalar gebelik sırasında ve sonrasında pek çok problem yaşanmasına neden olmaktadır. Özellikle oluşan postür değişimlerinin sonucu olduğu düşünülen bel ağrısı, pelvik kuşak ağrısı, alt ekstremitelerde meydana gelen problemler ve üriner inkontinans gibi pek çok semptom görülmektedir (Okanishi vd. 2012).

Gebelikte bel ağrısının etiyojisi çok faktörlüdür ve sıklıkla biyomekanik, hormonal ve vasküler değişikliklerle ilişkilidir. Hamilelikte bel ağrısı için bildirilen risk faktörleri: annenin yaşı, sosyoekonomik sınıf, hamilelikten önce veya önceki gebeliklerde bel ağrısı varlığı, ağır işlerde çalışma, doğum sayısı, vücut kitle indeksi, ailede bel ağrısı öyküsü, hipermobilité tanısı ve ailede hipermobilité öyküsüdür (Mota, 2015). Gebelikte görülen bel ağrısının etiyojisi ve patogenezi net olarak açıklanamamış olsa bile bunun multifaktöriyel olduğu varsayılmaktadır (Kokic IS, 2017). Gebelik sırasında yaygın olarak görülen bel ağrısı, gebelerin yaklaşık olarak yarısını etkilemektedir (Sehmbi H, 2017).

Yaşam kalitesi, bireyin yaşamı olumsuz veya olumlu öznel değerlendirmesine atıfta bulunan çok boyutlu bir kavram olarak tanımlanır (Lui, 2019). Bu kavram bireyin fiziksel sağlığı, psikolojik durumu, kişisel inançları, sosyal ilişkileri ve bu sosyal ilişkilerin çevrenin belirgin özellikleriyle ilişkisinden etkilendiği geniş bir aralığa sahiptir (World Health Organizaton 1998). Sağlıkla ilişkili yaşam kalitesinde düşüş ve depresyonun sık rastlanabileceği dönemlerden biri gebeliktir (Tendais vd. 2011). Çalışmalar, kadınların yaşam kalitesinin gebelik sırasında gebelik öncesine göre önemli ölçüde daha düşük olduğunu ortaya koymuştur. Bu düşüşün başlıca sebepleri, kadınların gebelik döneminde fiziksel, psikolojik ve sosyal sorunlar yaşamalarıdır. Gebelikte değişen beden algısı, muskuloskeletal yapılarıdaki değişim ve buna bağlı oluşan ağrı öyküsü, gebelik komplikasyonları, gebenin yeni sosyal bir role adapte olması vs. pek çok faktör bireylerin sağlıkla ilişkili yaşam kalitesini olumsuz etkilemektedir (Calou vd. 2014, Ünver ve Aylaz 2017). Ayrıca ilerleyen gebelikle birlikte sağlıkla ilişkili yaşam kalitesinde düşüş miktarının artabileceği bildirilmiştir (Da Costa vd. 2010, Chang vd. 2014).

GEREÇ VE YÖNTEM

Gebelik süresince vücutta meydana gelen değişikliklerden; yaşam kalitesi ve bel ağrısını incelemeyi amaçlayan bu çalışmaya gebe ve gebe olmayan asemptomatik kadınlar arasından dahil edilme kriterlerine uygun ve gönüllü bireyler dahil edildi. çalışma grubu çalışmaya dahil edilme kriterleri 18 yaşından büyük olmak, okuma-yazma bilmek, araştırmaya katılmaya gönüllü olmak ve gebe olmak olarak belirlendi. çalışma dışı tutulma kriterleri ise çoğul gebelik, iskli gebelikler (preeklamsi, gestasyonel diyabet, intrauterin gelişme geriliği, kronik rahatsızlığı bulunmak, lumbal disk hernisine sahip olmak, ölçümler sırasında aktif üst solunum yolu enfeksiyonu geçiriyor olmak ve sigara kullanmak olarak belirlendi. Çalışmada birinci trimesterde 49 gebe kadın (Grup 1), ikinci trimesterde 51 gebe kadın (Grup 2), üçüncü trimesterde 52 gebe kadın(Grup 3) ile gebe olmayan semptomatik 52 kadın(Grup 4-kontrol) olmak üzere toplamda 204 birey analiz edildi.

Çalışmaya katılan bireylerin sosyo-demografik bilgilerini ve tıbbi özgeçmişlerini incelemek için Değerlendirme Formu oluşturuldu. Bu formun kapsamında ad-soyad, meslek, yaş, boy, ağırlık, medeni hal, öğrenim durumu, gebelik haftası, gebelik öncesi kilo ve diğer parametrelere ait veriler kaydedildi. Ağrı şiddeti Vizüel Analog Skalası (VAS) ile değerlendirildi yaşam kalitesini değerlendirmek için ise Kısa Form 36 (SF-36) ölçeği kullanıldı.

Ağrının Değerlendirilmesi

Ağrının değerlendirmesinde kullanılan farklı ölçekler arasında duyarlılığı ve güvenilirliği en iyi olan ölçümlerden biri olan VAS literatürde sıklıkla kullanılmaktadır (Ferreira-Valente vd. 2011). Tek maddelik bir ölçek olan VAS ta 10 cm lik bir çizgi bulunmaktadır. Bu çizginin başlangıcında 0 'ağrı yok' yönergesi ve çizginin sonunda ise 10 'en kötü ağrı' yönergesi bulunmaktadır. Katılımcılardan ağrılarına karşılık gelen kısmı işaretlemeleri sözel yönerge ile anlatılmaktadır. İşaretlenen noktanın 0 noktasına uzaklığı ölçülerek skor hesaplanır. Yüksek değer yoğun ağrı şiddetini temsil etmektedir (Hawker vd. 2011).

Yaşam Kalitesinin Değerlendirilmesi

Yaşam kalitesini değerlendirmede Kısa form SF -36 anketi kullanılmıştır. Ware ve ark. tarafından 1992 yılında geliştirilen bu ölçek yaşam kalitesini değerlendirmek için sıkça kullanılmaktadır. Test 36 maddeden oluşmakta ve 8 farklı boyutu değerlendirmektedir. Sosyal fonksiyon (2), fiziksel fonksiyon (10), fiziksel sorunlara bağlı oluşan rol kısıtlılığı (4), emosyonel sorunlara bağlı oluşan rol kısıtlılığı (3), mental sağlık (5), enerji (4), ağrı (2) ve sağlığın genel algılanması (5) testin alt boyutlarıdır. Değerlendirmeler çoğunlukla Likert tipi

4. ve 5. sorular ise evet/hayır şeklinde yanıtlanmaktadır. Testin cevapları son 4 haftayı kapsayıcı yöndedir. Skorlama 0-100 arası değer almakta ve 0 kötü sağlık durumunu, 100 ise iyi sağlık durumunu bildirmektedir.

İstatistiksel Analiz

Veriler SPSS 25.0 (IBM SPSS Statistics 25 software (Armonk,NY: IBM Corp.) paket programıyla analiz edilmiştir. Sürekli değişkenler ortalama \pm standart sapma, ortanca (en küçük-en büyük değerler) ve kategorik değişkenler sayı ve yüzde olarak ifade edilmiştir. Verilerin normal dağılıma uygunluğu Shapiro-Wilk testi ile incelenmiştir. Parametrik test varsayımları sağlandığında bağımsız grup farklılıklarının karşılaştırılmasında Tek Yönlü Varyans Analizi kullanılmıştır. Tüm analizlerde $p<0,05$ istatistiksel olarak anlamlı kabul edilmiştir.

BULGULAR

Çalışmaya birinci trimesterde 49, ikinci trimesterde 51, üçüncü trimesterde 52 gebe kadın ile asemptomatik 52 gönüllü kadın dahil edildi. Çalışmaya katılan kişilerin VKİ değerleri incelendiğinde 4 grup arasında istatistiksel olarak anlamlı fark olmadığı görüldü ($p>0.05$). Üçüncü grupta bulunan kişilerin VKİ değerleri diğer gruplarda bulunan kişilere göre anlamlı şekilde yüksek bulundu ($p<0.05$) Bireylerin demografik özelliklerine ilişkin veriler Tablo .1' de gösterildi.. Bel ağrısı şiddeti gruplar arasında karşılaştırıldığında istatistiksel olarak anlamlı bir fark olmadığı görüldü ($p> 0.05$) (Tablo 2). Çalışmaya katılan kişilerin sosyal fonksiyon değerlerin 4 grup arasındaki farklılıkları incelendiğinde; Fiziksel fonksiyon incelemelerinde, kontrol grubundaki kişilerin değerlerinin diğer 3 grupta bulunan kişilere göre anlamlı şekilde yüksek olduğu ayrıca 1. gruptaki kişilerin değerlerinin de 3. gruptaki kişilere göre anlamlı şekilde yüksek olduğu görüldü ($p< 0.005$) (Tablo 3).

TARTIŞMA

Gebe kadınlarda yaşam kalitesi ve bel ağrısını incelemeyi amaçlayan bu çalışmada gebelikle birlikte gebelerin yaşam kalitelerinin azaldığı, bel ağrılarında ise fark olmadığı bulundu. Gebeliklerinin 13. ve 36. haftaları arasında olan 139 kadın ile yürütülen bu kesitsel bir çalışmada bel ağrısı ve yaşam kalitesi arasındaki ilişki incelenmiştir. Bel ağrısı Roland Morris Engellilik Anketi ile, yaşam kalitesi WHOQOL-Bref anketi ile değerlendirilmiştir. Bel ağrısı ve yaşam kalitesi anketleri arasında anlamlı korelasyon bulunmuştur. Gebelik haftaları ve bel ağrısı anketi arasında da anlamlı korelasyon bulunmuştur (Ibanez G, 2017).

Gebelikte yaşam kalitesi skorlarını trimesterlere göre inceleyen bir çalışmada gebenin yaşından bağımsız olarak en düşük genel sağlık skoru üçüncü trimesterde elde edilirken, en yüksek skorun ise ikinci trimesterde olduğu bildirilmiştir. Bu bulgular bizim çalışmamızdan elde edilen genel sağlık alt başlığına ait skorlar ile uyum göstermektedir (Rofé vd. 1993). Gebelik trimesterlerinde görülen genel sağlık alt başlığındaki bu dağılımın gebenin yaşadığı fizyolojik değişimlerden kaynaklandığı görüşü öne sürülmüştür. Çalışmamızda ikinci

trimester gebelerde lumbal ağrı şiddetinin emosyonel fonksiyon ve emosyonel iyilik hali üzerinde olumsuz etkisi olduğu sonucuna varıldı.

218 gebe kadın üzerinde yapılan bu çalışmada, gebelik sırasında bel ağrısı olan ve olmayan kadınların yaşam kalitelerini karşılaştırmak amaçlanmıştır. Yaşam kalitesi Kısa Form-12 anketi ile değerlendirilmiştir. Çalışmaya dahil edilen 218 gebe kadından 137'si bel ağrısı bildirmiştir. Bel ağrısı grubunda ortalama ağrı yoğunluğu, 0-10 aralığında numerik skala ile değerlendirilmiş 5.04 ± 1.73 olarak bulunmuştur. Bel ağrısı olan kadın grubu ile bel ağrısı olmayan kadın grubu arasında ruh sağlığı, fiziksel sağlık ve sosyal ilişkiler alanlarında anlamlı bir yaşam kalitesi farkı bulunmuştur. Ruh sağlığı ve sosyal ilişkiler boyutlarının, fiziksel puanlardan daha fazla etkilendiği görülmüştür (Lima, 2017).

Bireysel farklılıkların etkisini ortadan kaldırmak için gebelerin gebeliğin birinci trimesterinden itibaren takip edilmesi ve postpartum dönemde de farklı zamanlarda ölçümlerin tekrarlanması bireylerde oluşan farklılığı daha iyi yansıtabileceğini düşünüyoruz. Gebenin iyi olma halinin pek çok parametre tarafından etkilenmektedir. Bu nedenle gebelikte gebenin yaşam kalitesini etkileyen diğer faktörlerinde incelenerek daha geniş popülasyonda çalışmalar yapılması önerilmektedir.

**INVESTIGATION OF SILICONE INSULATOR SURFACE RESISTANCE BY
USING EMPIRICAL MODE DECOMPOSITION METHOD**

Res. Assist. Dr. Fatih ATALAR (Orcid ID: 0000-0002-0179-3108)

ABSTRACT

Silicone insulators have widely usage area in electrical high voltage transmission systems. This insulator protects the conductive parts of the systems from excessive electrical discharges. However, during its service life, electrical, thermal and mechanic stresses result in surface degradation with tracking. Insulation resistance of surface loss its durability against especially excessive electrical stress. Tracking occurs on the surface of silicone insulator. As a result of continuous discharges on the surface, carbonized pathways are formed. Insulation resistance is so reduced that carbon particles can break off from the material surface and cause erosion. In this case, power outages may occur and may cause financial losses. In order to prevent these losses, the formation of traces on the surface should be followed carefully. In order to examine the surface distortion, the insulating material is tested with the Inclined Plane Test setup. As a result of this test, an important evaluation is made about the durability of the material. In this study, 6 silicon insulators with the same properties were tested in the IPT plane. Although this test was carried out in accordance with the IEC 60587 standard, leakage current signals flowing from the material surface were also recorded. Although the waveform of the current is sinusoidal, it contains too many disturbances and peaks. By analyzing these points correctly, the resistance loss of the material surface can be measured dynamically. In this study, leakage current signals were analyzed by Empirical Mode Decomposition method. Modes were observed more smoothly in the EMD decomposition of the sample that lasted longer under extreme electric field stress.

Keywords: Silicone insulators, IPT test, surface resistance, leakage current, EMD method.

1. INTRODUCTION

Dynamically monitoring the dielectric performance of solid insulators used in high voltage insulation systems is essential for uninterrupted electrical energy. The surfaces of solid insulators under electrical, thermal, mechanical and environmental stress lose their dielectric resistance over time [1-3]. Trackings occur in a solid insulator that gradually loses its surface hydrophobes [4-5]. These traces consist of the formation of dry bands on the surface by electrical discharges that occur as a result of ionization along the surface [6-7]. These dry paths consist of the complete evaporation of moisture and water vapor on the surface due to the electrical arc [8-9]. Carbon traces begin to form on the gradually drying surface and decrease as the surface resistance decreases. After a certain moment, carbonized particles begin to break off from the surface, that is, erosion occurs. After erosion has occurred, completely conductive zones are formed in some parts of the solid insulator. Therefore, electrical energy may be interrupted due to the electrical arcing of the conductive areas. In this case, especially industrial organizations that benefit from energy suffer financially. Therefore, the surface tracking formations of solid insulators should be analyzed thoroughly. Many different types of solid insulators are used in electrical energy transmission distribution systems. Glass, ceramic, porcelain, polyurethane, polyethylene, cross-linked polyethylene and silicone are the most commonly used solid insulators. Glass, ceramic and porcelain insulators were the first used insulators. However, as the technology developed, the use of silicon insulators became widespread [10]. Silicon insulators are used as high voltage insulators due to some of their superior properties;

- long term on outdoor use,
- exhibits high acid resistance,
- a long lifetime even on use in serious pollution areas,
- their light weight,
- low installation cost,
- easy handling compared to porcelain and glass insulators all over the world.

There are many academic studies examining the surface resistances of silicon insulators, the use of which is increasing day by day. Arshad A. et. al. investigates the surface resistance of silicone rubber sheets under polluted and dry band conditions [11]. The experiments were performed on silicone rubber sheets with different thicknesses, and the surface resistance was measured using the two-point DC method. The pollution level was simulated by applying a uniform layer of sodium chloride (NaCl) on the surface of the sheets, while the dry band

condition was created by a needle point electrode. The results show that the surface resistance of silicone rubber sheets increases significantly under both polluted and dry band conditions. The increase in surface resistance is more significant for thinner sheets. The authors also observed that the surface resistance increases with the pollution level and the duration of the dry band condition. Under polluted conditions, the surface resistance of the sheets increases from $10^{11} \Omega/\text{sq.}$ to $10^{14} \Omega/\text{sq.}$ as the pollution level increases from 0 to $1 \text{ mg}/\text{cm}^2$. Similarly, under dry band conditions, the surface resistance increases from $10^{11} \Omega/\text{sq.}$ to $10^{13} \Omega/\text{sq.}$ as the duration of the dry band increases from 0 to 24 hours. The authors concluded that the increase in surface resistance of silicone rubber sheets under polluted and dry band conditions can significantly affect the insulation performance of high voltage equipment. Therefore, it is essential to consider the effects of pollution and dry band conditions when designing and maintaining high voltage equipment.

Morteza Ghayedi and et. all investigated a dynamic theoretical and experimental model for AC flashover of silicone rubber insulators under fan-shaped and longitudinal pollution [12]. The experiments were conducted on silicone rubber insulators with different lengths and diameters, and the pollution was simulated using a uniform layer of sodium chloride (NaCl) and kaolin particles. The authors found that the AC flashover voltage of the silicone rubber insulator decreases significantly under polluted conditions. The decrease in flashover voltage is more significant for longer insulators and under fan-shaped pollution. The experimental results were in good agreement with the theoretical model, which was based on the Weibull distribution and the creeping discharge model. Under fan-shaped pollution, the AC flashover voltage of the insulator decreased from 48 kV to 8 kV for a 300 mm long insulator. Similarly, under longitudinal pollution, the AC flashover voltage decreased from 54 kV to 19 kV for a 300 mm long insulator. The authors also observed that the insulators under fan-shaped pollution were more susceptible to flashover than those under longitudinal pollution. The authors concluded that the proposed theoretical and experimental models can provide a better understanding of the AC flashover behavior of silicone rubber insulators under polluted conditions. The models can be used to optimize the design and maintenance of high voltage equipment and improve the reliability of power systems.

As can be seen, there are very detailed studies on measuring the surface resistivity of silicon insulators. However, leakage current signals passing through the surface were not recorded in these studies. In this study, pure silicones were exposed to high tensile stress in an inclined plane test (IPT) setup. The experiments were carried out in accordance with the IEC 60587

standard and the leakage current signals flowing on the surface of the silicon insulator during the experiment were collected on a resistor. The obtained leakage current signals were first analyzed with classical methods. Then, the current signal is decomposed by the Empirical Mode Decomposition (EMD) method, which is a new method. In the results obtained, it has been seen that the EMD method provides a successful evaluation opportunity in monitoring the surface resistances of silicone insulators.

2. EXPERIMENTAL SET-UP AND PROCEDURE

In order to measure the surface resistivity of silicon insulators, an IPT test setup was established within the scope of the IEC 60587 standard [13]. In this experimental setup, silicon insulator is placed between two electrodes at an angle of 45 degrees. All these placements and the dimensions of the electrodes are explained in detail in the standard content. Accordingly, electrolyte liquid flow, called polluting liquid, was provided to the silicon insulator surface through the high voltage electrode through an 8-layer filter. Electrolyte liquid is used to simulate adverse environmental conditions in a laboratory environment. The electrolyte liquid contains $0.1 \pm 0.002\%$ NH_4Cl (Ammonium Chloride) and $0.2 \pm 0.002\%$ Triton-X100 materials. The electrolyte liquid flows onto the sample surface at a rate of 36 ml/h. During the liquid flow, electrical arcs occur between the high voltage electrode and the ground electrode. In order to obtain high voltage a voltage transformer with 220/10000 V turn ratio and 1 kVA apparent power is used by supplying with the help of variac between 0-220 V. According to the standard, constant tracking voltage method is used. So, the high voltage value of 4,5 kV is applied to the silicone surface during the 6 hours. The schematic representation of the experimental setup is shown in Figure 1.

Figure 14. Schematic Representation of the Experimental Setup

It is important to monitor and evaluate the leakage current signals passing through the surface in order to better analyze the surface discharges of the silicon material. In the experimental

studies in the literature, only the surface resistance was examined within the scope of the standard. In this study, leakage current signals were recorded with a Fluke 190-504S oscilloscope over a 94 k Ω and 200 W resistor connected to the ground electrode.

3. RESULTS and DISCUSSIONS

3.1. Leakage Current Analysis

In the experimental study, a total of 10 pure/neat silicone insulators were tested. Among these insulators, the samples that lasted the longest and lasted the shortest were selected for analysis. The sample most resistant to the high electric field arc remained intact for 6 hours. On the other hand, the weakest specimen lasted only 30 minutes and serious erosions occurred on its surface. In Figure 2, the leakage current signal waveform of the intact sample is given.

Figure 15. Leakage Current Signal of Non-Degraded Sample

As can be clearly seen from Figure 2, there are no disturbing points on the leakage current signal of the non-degraded sample. The peaks experienced at some points are actually caused by the electrical arc that occurs during the flow of the electrolyte liquid over the surface. Although this electrical arc caused stress on the surface, it did not cause complete breakdown. In Figure 3, the time dependent leakage current waveform of the degraded sample is given.

Figure 16. Leakage Current Signal of Degraded Sample

The current signal of the degraded sample has a very different structure from the pure sinusoidal form. In addition, the amplitude value of the current has reached approximately 80 mA levels and is approximately 8 times higher than the non-degraded sample at this value. According to the IEC 60587 standard, it is stated that the material starts to deteriorate when a current of more than 60 mA is passed through a sample. However, this value must be seen for 2 seconds or longer. Although the current value in the deteriorated sample exceeded the maximum level, 2 seconds were not exceeded. In this case, an evaluation with additional analysis methods is required.

3.2. Noise Frequency and Partial Discharge Analysis

Signals found outside the natural frequency in a waveform are called noise. By analyzing these noises, information can be obtained about the resistance of an insulator to high voltage stress from the current waveform. Any point that disrupts the sine waveform is likely to produce noise. These noisy spots produced actually show that there are forcing effects on the insulator whose signal is being measured. The amount of noise in the current waveform passing through the surfaces of solid dielectric materials with poor insulation performance is always higher. However, the frequencies at which these noises are concentrated should be well analyzed. The noises between 0-8 kHz frequency range are examined in the scope of this study. The noise graphs of non-degraded and degraded silicone specimens are shown Figure 4 and Figure 5, respectively.

Figure 17. Noises of Non-Degraded Sample between 0-8 kHz

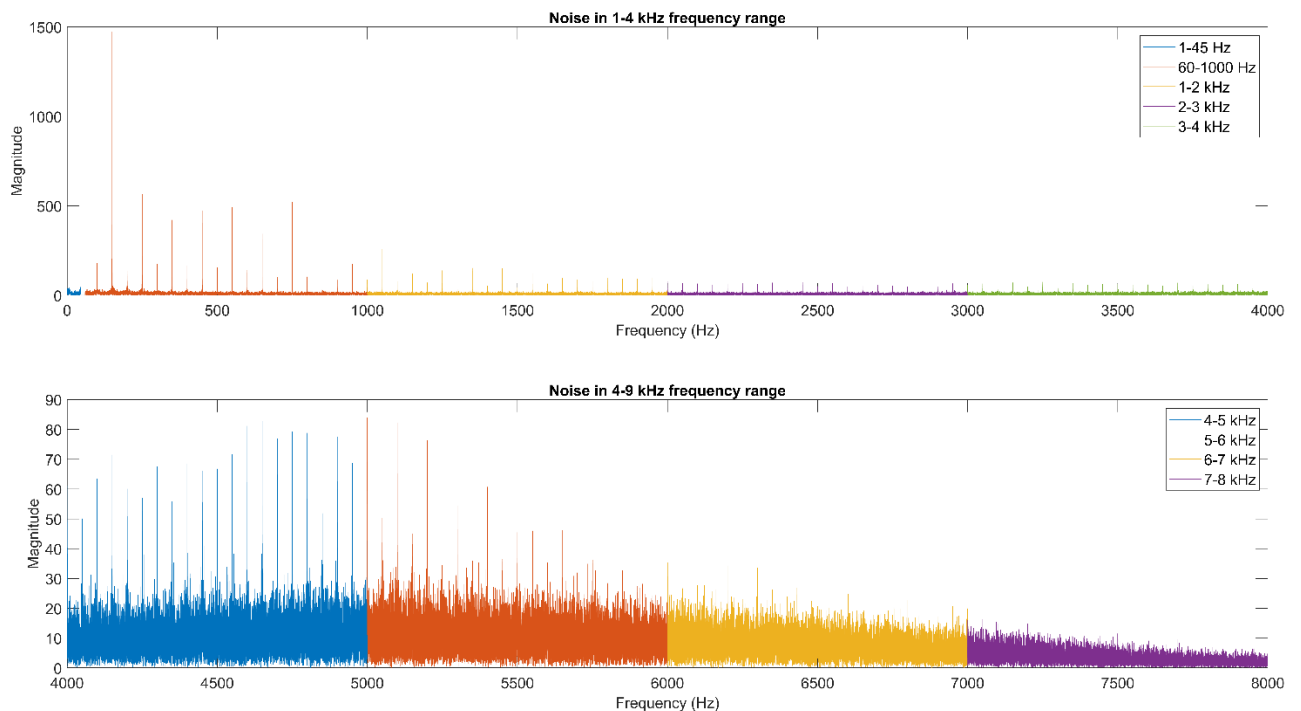

Figure 18. Noises of Degraded Sample between 0-8 kHz

As it can be seen Figure 4 that the highest noises are observed between 0-1200 Hz. Especially at 550 Hz, the noise reached its peak. Noises generally occurred at single (not double) frequency values. It is seen that the amplitude values of the noises are relatively low at very high frequency values. When it comes to examine of degraded sample for noise analysis, more pulse-shaped noise is seen at high frequencies. These pulses show that the sample surface is

much less resistant to arc. Especially the pulses between 4 kHz-5.5 kHz continued regularly. Such a situation was not observed in the non-degraded sample. Noise analysis alone is not sufficient for evaluation. At the same time, partial discharge analysis should be done.

Partial discharges are known as incomplete electrical discharges in the material. In this type of electrical discharges, the amount of charge is not high enough to cause total breakdown. However, the presence of partial discharges can give information about whether there is a problem in the material content. Having too many partial discharges in an insulator does not mean that the dielectric resistance is low. Therefore, all measurements need to be evaluated in a combined way. In some cases, the very low resistance insulator breakdown suddenly without sufficient partial discharge. Therefore, leakage current, noises in different frequency bands and partial discharges should be analyzed together. In addition, test termination criteria within the scope of the standard followed in the experiment should be considered. In Figure 6, the partial discharge patterns of most durable silicone sample are demonstrated.

Figure 19. Partial Discharge Patterns of Most Durable Specimen

Partial discharges in the sample with high surface resistance showed a regular flow in certain places. The regularity of these partial discharges actually shows that the surface resistance remains stable. If partial discharges had accumulated excessively at a certain point, then the process of electrical complete breakdown would have accelerated. However, in order to make an accurate comparison, the partial discharge patterns of the electrically degraded sample need to be analyzed. Partial discharge patterns of weakest specimen are illustrated in Figure 7.

Figure 20. Partial Discharge Patterns of Weakest Specimen

Partial discharges are directly proportional to the amount of charge. Therefore, the increased charge amount can result in increment of the number of partial discharges. Although the amount of current passing through the deteriorated material is high, it is difficult to interpret those partial discharges are less common. It is therefore essential to make an assessment with noises and leakage current. The analyzes made so far consist of classical methods, and each of them alone could not reveal a clear dielectric behavior. However, surface resistance conditions can be interpreted by means of a combined evaluation or analysis with a different method.

3.3. Empirical Mode Decomposition Application

In the EMD method, after the peaks in the upper and lower parts of the signal are detected, upper and lower curvatures are produced to make cubic interpolation at these points [14]. After calculating automatically, the average between the two curvatures, a signal with amplitude and modulation is extracted as a result of many cycles for IMF calculation. An $x(t)$ signal is decomposed according to equation 1 in the EMD method afterwards [15].

$$x(t) = \sum_{k=0}^K c_k(t) + r(t) \quad (1)$$

$c_k(t)$ denotes the amplitude and frequency modulated signal, and $r(t)$ shows the residual value as a result of the decomposition. $c_k(t)$ is a quantity dependent on the phase angle (equation 2).

$$c_k(t) = a_k(t) \cdot \cos(\phi_k(t)) \quad (2)$$

$a_k(t)$ represents the instantaneous positive amplitude magnitude of the frequency-dependent signal resulting from modulation, and, $\phi_k(t)$ is the instantaneous phase. Since a frequency-dependent decomposition is carried out, the instantaneous frequency value $w_k(t)$ is much smaller than the instantaneous phase value, but it is obtained from the time-dependent derivation of this phase value. EMD decomposition continues until the residual value become a monotonic function. No more IMFs are produced after this state is reached. The termination criterion for the predefined threshold value is determined by the normalized standard difference (NSD) (equation 3).

$$NSD = \sum_{j=1}^R \frac{|b_{k-1}(t) - b_k(t)|^2}{b_j^2(t)} \quad (3)$$

Where $b_k(t)$ represents the IMF values at each step. When performing a signal decomposition in the EMD method, it is mandatory to have a stopping criterion based on interpolation. This situation has a built that constantly renews itself. The EMD application of non-degraded sample is shown in Figure 8.

Figure 21. Leakage Current Signal Decomposition of Non-Degraded Specimen with EMD Method
 When the leakage current signal of the non-degraded sample is decomposed by EMD, the waveforms in the modes IMF 1- IMF 6 show similarity to each other. The intense and peaked points of the signal actually show the moments when the electrolyte liquid flows across the surface. This fact proves how valid the method is for a correct analysis. Starting from IMF 7 mode, the signal is well decomposed. Earlier and more decomposition of a signal is one of the

indicators of high dielectric performance of the material concerned. The superiority of the EMD method can be demonstrated by making a comparison with the degraded sample (Figure 9).

Figure 22. Leakage Current Signal Decomposition of Degraded Specimen with EMD Method
As can be clearly seen in the Figure 9, the residual signal has a more distinct waveform than the intact sample. Relatively more dissociated signals are seen in IMF 9 and IMF 10 modes. The fact that the signal is not decoupled at lower modes indicates that the leakage current has a disruptive and high amplitude waveform. Thus, the instantaneous examination of the leakage current signal, even for a short time, by dynamically decomposing it with the EMD method, will give important information about the surface resistance of the material. In addition, more detailed information can be obtained by evaluating at the power spectral densities (PSD) of the modes. The PSD signals of each modes of non-degraded sample EMD application are shown in Figure 10. Also, the PSDs belongs to weakest sample are shown in Figure 11.

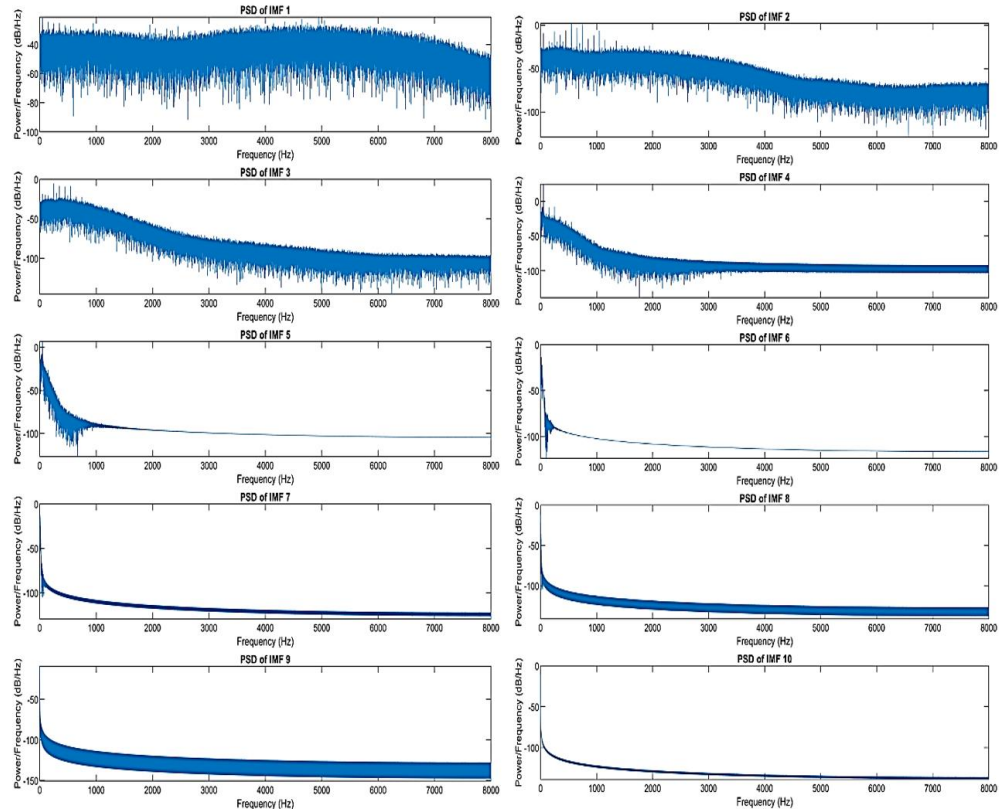

Figure 23. Power Spectral Densities of IMFs for Non-Degraded Sample

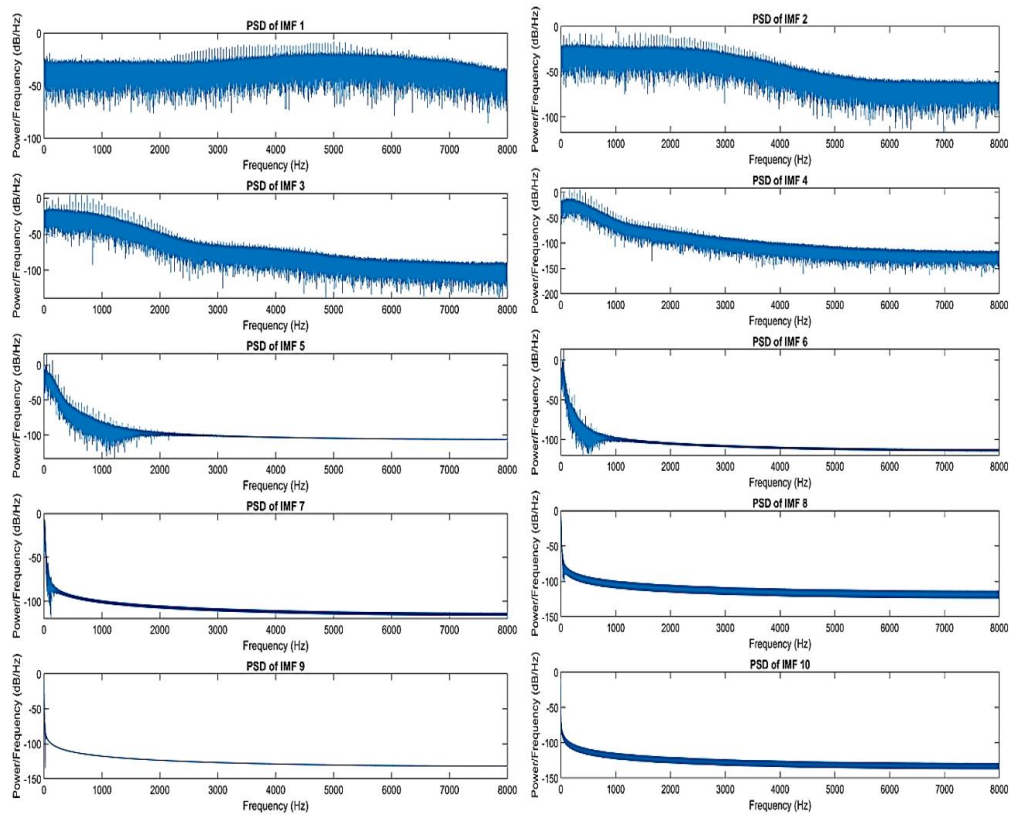

Figure 24. Power Spectral Densities of IMFs for Degraded Sample

A Power Spectral Density (PSD) is a measure of the power content of the signal versus frequency. A PSD is typically used to characterize broadband random signals. The amplitude of the PSD is normalized with the spectral resolution used to digitize the signal. In the non-degraded sample, the PSD value was generally measured higher at low modes. The important thing here is to measure the lowest powers in the highest mode. Also, by making a comparison with the degraded silicon sample, it can be analyzed how much information the PSDs give about the dielectric behavior.

In the deteriorated sample, a narrower PSD signal appears in IMF 6 and IMF 9 modes. In contrast, IMF 4, IMF 5 and IMF 10 have slightly more power-intensity signals. The main thing to note here is that the PSD signal of the IMF 10 mode has a slightly larger amplitude and waveform for the distorted silicon sample. This indicates that the signal is not fully decoupled in the latest mode. Thus, an analysis can be made about the dielectric resistance of the material, especially by looking at the PSD signal of the last mode.

4. CONCLUSIONS

Measuring and evaluating the surface resistance of silicon insulators, which are frequently used in high voltage systems, is important in terms of providing sustainable energy. In this study, leakage current signals passing through the surface of silicon insulators subjected to IPT test were analyzed. The waveform of the leakage current signal is distorted, indicating that there is a problem with the surface resistance. However, this alone is not enough. Therefore, noises in different frequency bands are analyzed. In addition, surface partial discharge patterns were also evaluated. These methods stand out as classical evaluation methods in the literature. An analysis of material surface resistance can be made by making a combined evaluation of these methods. However, many methods complicate correct analysis of surface insulator durability. Therefore, there is a need to analyze the surface resistance of silicone material with a new and precise method. The EMD method allows us to perform a more accurate surface resistance analysis by decomposing a signal into lower frequency modes. Accordingly, the different characteristics of the intrinsic modes and the delayed completion of the weathering stand out as a feature of a material with low surface resistance. Thanks to the EMD method applied to the leakage current signals obtained as a result of the experimental study, the fact that the signal waveforms of the residual and IMF 10 modes are less frequent and weak indicates strong surface resistance.

ÖZET

Gülüş tasarımı, bir bütün olarak güzel bir gülümseme yaratabilen birçok bilimsel ve sanatsal ilkeyi ifade eder. Bu ilkeler, hastalardan toplanan veriler, teşhis modelleri, bilimsel ölçümler ve temel sanatsal güzellik kavramları aracılığıyla oluşturulmuştur. Dolayısıyla, iyi bir gülüş tasarımı, estetik ve fonksiyonel bir bütün oluşturmak için yüzün geri kalanıyla doğal ve zahmetsizce bütünleşir. Estetik restorasyonlarda güncel parametrelere baktığımızda; yüz kompozisyonu içeriğindeki gözbebekleri hattı ve dudaklar değerlendirilir. Dental kompozisyon ayrıca değerlendirilir ve bu kapsamda diş bileşenleri ve yumuşak doku bileşenlerine bakılır. Diş bileşenlerinde; orta hat, insizal uzunluklar, diş ebatları, zenith noktaları, aksiyal eğimler, interdental kontaklar, insizal embraşurlar, cinsiyet, yaş, kişilik, simetri ve denge olarak bakılır. Yumuşak doku bileşenlerinde ise diş eti sağlığı, diş eti seviyeleri ve uyumları, interdental embraşurlar ve gülümseme çizgisi olarak bakılır. Bu parametreler temel estetik kurallardır ve gülüş tasarımlarının temelini oluşturur. Ancak son yıllarda estetik beklentinin artmasıyla birlikte hastanın kişiliği de göz önünde bulundurularak kişiye özel gülüş tasarımları yapılmaktadır. Bu makalenin amacı son 5 yıl içerisinde yapılan gülüş tasarımlarının incelenerek güncel parametrelerin değerlendirilmesidir.

Anahtar Kelimeler: Estetik restorasyonlar; Gülüş tasarımı; Estetik parametreler

GİRİŞ

Gülüş tasarımı, bir bütün olarak güzel bir gülümseme yaratabilen birçok bilimsel ve sanatsal ilkeyi ifade eder. Bu ilkeler, hastalardan toplanan veriler, teşhis modelleri, bilimsel ölçümler ve temel sanatsal güzellik kavramları aracılığıyla oluşturulmuştur¹. Diş estetiğinde temel amaç; doğal orantılı, birbirleriyle bir harmoni içinde olan dişler ve etrafındaki diş eti, dudak gibi dokularla uyumdur. Yüz oranlarıyla belli bir orantıyı takip etmelidir. Tabii olarak bu harmoni estetik, fonksiyonel ve doğal olmalıdır. Gülüş tasarımı gülüşün sınıflandırılmasıyla beraber, sınıflandırmaya müdahil parametreler olan kas çekişleri, dudak konumu, dişlerin dizilimi, diş eti yapı konum ve görünürlüğü, yüz şeklini içerir². Bu derleme son 5 yıl içinde kabul görmüş gülüş tasarımlarının güncel parametrelerini içermektedir.

ARAŞTIRMA VE BULGULAR

Son yıllarda kullanılan dijital gülüş tasarımı estetik teşhis yeteneklerini güçlendirebilir, tedavi aşamaları boyunca öngörülebilir bir sistem oluşturmuştur³. İdeal gülüş tasarımı için⁴

Gülüşün Sınıflandırılması

1.) Komissür gülümseme:

- En yaygın desen
- Nüfusun çoğunluğunda görülür
- Komissürün ortalama hareket yönü 40 derecedir.
- Gülümseme hareketlerinin yönü heliks-scalp birleşimine yöneliktir.

2.) Karmaşık gülümseme:

- Gülümsemede, Levator Labii Superioris'in baskınlığı mevcuttur.
- Tipik olarak, diş etinin şeklini taklit eden üst dudak

3.) Cuspid gülüşü:

- Nüfusun az bir kısmında gözlenir.
- Paralel köşeli bir görünüm
- Gülümsemenin temel özellikleri güçlü kas çekmesi ve alt dudağın aşağı ve geriye doğru çekilmesidir

Gülümseme Sırasında Diş, Diş eti ve Mukozanın Durumu(solomon,99)

- **Diş gülüşü (Düşük Gülüş):**Yalnızca maksiller ön dişlerin dudak yüzeyinin açığa çıkarılması

➤ **Dişeti gülüşü / Papilla gülüşü (Ortalama Gülüş):** Dişlerin dudak yüzeyinin ve interdental papilla/diş etinin açığa çıkması.

➤ **Mukoza gülüşü (Yüksek Gülüş):** Dişlerin dudak yüzeyinin, interdental papillanın, serbest marjinal dişetin ve labial ve bukkal mukozanın açığa çıkarılması.

ESTETİK GÜLÜŞÜN PARAMETRELERİ

Gülüş tasarımı fasiyal ve dental kompozisyonunu ikisini birden içerir⁵

Yüz kompozisyonu

1. **Gözbebekleri hattı:** Yüzün orta hattına dik ve oklüzal düzleme paralel olmalıdır.

2. **Dudaklar:** Dudaklar gülüş tasarımının sınırlarını oluşturduğu için önemlidir.

1. Horizontal bakış

▪ Yüzün genişliği beş göz genişliği kadar olmalıdır.

2. Vertikal

▪ Yüz yüksekliği alından kaş çizgisine, kaş çizgisinden burun tabanına ve burun tabanından çene tabanına kadar üç eşit parçaya bölünür

▪ Tam yüz, gözler orta hat olmak üzere iki bölüme ayrılmıştır.

Önden bakıldığında yüzün temel şekli aşağıdakilerden biri olabilir:

1. Kare
2. Açılı
3. Kare açılı
4. oval

Dental Kompozisyon

Gülüş tasarımının önemli parametreleri^{6,7}

1. Diş bileşenleri

a) Diş orta hattı

- b) İnsizal uzunluklar
- c) Diş boyutları
- d) Zenith noktaları
- e) Aksiyal eğimler
- f) İnterdental kontaklar
- g) İnsizal embrasür
- h) Cinsiyet, kişilik ve yaş
- i) Simetri ve denge

2. Yumuşak doku bileşenleri

- a) Diş eti sağlığı
- b) Diş eti seviyeleri ve uyumu
- c) interdental embrasür
- d) Gülümseme çizgisi

Gülüş Tasarımının Diş Bileşenleri

Diş orta hattı

Orta hat, İnsizal düzleme dik ve yüzün orta hattına paralel olmalıdır.

1. Kabul edilebilecek maksimum tutarsızlık 2 mm olabilir
2. Orta hat, gözbebekleri hattına diktir.
3. Burnun orta hattı, alın, çene, filtrum, gözbebekleri arası düzlem gibi çeşitli anatomik işaretler değerlendirme için kılavuz olarak kullanılabilir⁸
4. Dudak filtrumu, bu anatomik kılavuz direklerin en doğru olanlarından biridir. Filtrumun merkezi cupid yayı merkezidir ve merkezler arasındaki papilla ile eşleşmelidir.

Cupid yayı; aşk tanrısı Eros'un yayı anlamına gelir ve üst dudağın ortası ve hemen üstünde burna uzanan aralıktaki çıkıntıyı ifade eder. Hem kadınlarda hem erkeklerde makbul olan çekici görünen çıkıntının belirgin olmasıdır.

Maksiller insizal kenar pozisyonu gülümseme oluşturmada en önemli parametredir.

Genç bir bireyde ağız rahat ve hafif açık durumdayken maksiller orta kesici dişin 3.5 mm'lik kısmı görünmelidir. Yaş ilerledikçe kas tonusundaki azalma dişlerin daha az görünmesine neden olur.

Estetik bir gülümsemede doğru orantıları oluşturmak için çeşitli parametreler:

- 1.) **Altın Oran:** Yüzden bakıldığında her bir ön dişin genişliği komşu dişin genişliğinin %60'ıdır (matematiksel oran 1.6:1:0.6)⁹

2.)**Tekrarlayan Estetik Diş Oranı** Yüz açısından bakıldığında ardışık genişlik oranı, orta hattan arkaya doğru hareket ettikçe sabit kalmalıdır

Bukkal koridor

Ağız köşeleri ile maksiller dişlerin bukkal yüzeyleri arasında gülümseme oluşumu sırasında görülen karanlık boşluğu ifade eder. Gülümsemenin genişliği ve maksiller ark,

2. Yüz kaslarının tonusu,
3. Üst küçük azı dişlerinin labiyal yüzeyinin konumlandırılması,
4. Köpek dişlerinin özellikle distal yüz hattı açısındaki çıkıntısı
5. Küçük azı dişleri ile altı ön diş arasındaki değer farkı.

Zenith noktaları

Zenith noktaları, servikal diş kenarının en apikal pozisyonudur. Dişin merkezinden aşağıya doğru çizilen vertikal çizginin biraz distalinde yer alır.¹⁰

Diş eğimleri

Santralden köpek dişine doğru, sonraki her bir ön dişin mezial eğiminde doğal, progresif bir artış olmalıdır.

Cinsiyet, Yaş ve Kişilik

Maksiller dişlerin uzunluğu, şekli ve pozisyonundaki küçük farklılıklar, karakterizasyonu mümkün kılar.¹¹

•**Yaş**–Maksiller orta kesici diş

Genç dişler: Aşınmış kesici kenar, belirgin kesici kenar kaplaması, düşük kroma ve yüksek değer

Yaşlı dişler: Daha kısa; bu nedenle daha az gülümseme görüntüsü, minimum insizal embrasür, yüksek kroma ve düşük değer

•**Cinsiyet**–Maksiller kesici dişler

Kadın formu: yuvarlak pürüzsüz, yumuşak narin

Erkek formu: küboidal, sert kuvvetli

•**Kişilik**–maksiller köpek

Agresif: sivri uçlu uzun

Pasif, yumuşak: küt, yuvarlak, kısa sivri form.

Simetri ve Denge

•**Statik simetri:** Ayna görüntüsü, üst orta kesici dişler

•**Dinamik simetri:** Birbirine çok benzeyen fakat aynı olmayan iki nesne. Lateral ve köpek dişlerinde mükemmel kusurlarla şekillendirme daha canlı, dinamik, yegane ve doğal bir gülümseme sağlar.

İnterdental embrasür (servikal embrasür)-

Ağız boşluğunun koyuluğu, diş eti ile temas alanı arasındaki interproksimal üçgende görünmemelidir.¹²

Gülümseme Hattı

Gülümseme çizgisi, maksiller ön dişlerin kesici kenarları boyunca uzanan ve gülümserken alt dudağın üst kenarının eğriliğini taklit etmesi gereken hayali bir çizgiyi ifade eder. Ters gülümseme çizgisi veya ters gülümseme çizgisi, insizal düzlem boyunca santraller köpek dişlerinden daha kısa görüldüğünde oluşur.

SONUÇ

Bu derleme son yıllarda kabul görmüş ideal gülüş tasarımının güncel parametrelerini başlıklar altında anlatmıştır. Doğal, benzersiz, estetik, fonksiyonel bir gülümsemeyi elde etmek için kullanılması gereken güncel parametreler bir bütün olarak ele alınmıştır ve kullanılma iş akışı anlatılmıştır.

ABSTRACT

Postoperative pain is a condition experienced intensely by patients undergoing cardiovascular surgery. This felt pain interferes with sleep quality, deep breathing and daily activities. 75% of patients who had open heart surgery have sleep problems after surgery. Sleep is among the primary needs of human beings in protecting body energy and supporting the regeneration process. Sleep quality is an important indicator of physical and mental health. It is one of the most basic needs of the individual, which is affected by biological, psychological, economic and environmental factors. Teamwork is required to minimize the sleep problems that occur in patients in the post-surgical period. A treatment plan that will increase the patient's sleep quality should be prepared, only mandatory care interventions should be applied at bedtime, a quiet environment should be created in the intensive care unit at bedtime, and a sleep-wake pattern should be maintained. The aim of the study is to systematically examine nursing practices for sleep quality of patients in intensive care after cardiovascular surgery. The keywords "cardiovascular surgery", "sleep", "nursing", "intensive care" were searched in Pubmed, Science Direct and Google Scholar databases between 2000-2023. Of the 988 studies reached, 3 studies that met the inclusion criteria were included in the study. It has been found that nursing interventions in intensive care units after cardiovascular surgery reduce the anxiety and depression levels of patients and have positive effects on self-efficacy, sleep quality and quality of life. It has been determined that nursing interventions for sleep quality in the intensive care unit in patients undergoing cardiovascular surgery have positive results for the patients.

Key words: Cardiovascular surgery, sleep, nursing, intensive care

**KARDİYOVASKÜLER CERRAHİ SONRASINDA YOĞUN BAKIMDA
HASTALARIN UYKU KALİTESİNE YÖNELİK HEMŞİRELİK UYGULAMALARI:
SİSTEMATİK DERLEME**

ÖZET

Ameliyat sonrası ağrı kardiyovasküler cerrahi geçiren hastaların yoğun yaşadığı bir durumdur. Hissedilen bu ağrı uyku kalitesini, derin nefes almayı ve günlük aktiviteleri engellemektedir. Açık kalp ameliyatı olan hastaların ameliyat sonrası %75'i uyku problemi yaşamaktadırlar. Uyku vücut enerjisini korunmasında, yenilenme sürecinin desteklenmesinde insanın birincil ihtiyaçları arasında yer almaktadır. Uyku kalitesi fiziksel ve mental sağlığın önemli bir göstergesidir. Biyolojik, psikolojik, ekonomik ve çevresel faktörlerden etkilenen bireyin en temel ihtiyaçlarından biridir. Cerrahi girişim sonrası dönemde hastalarda meydana gelen uyku sorunlarını en az seviyeye indirmek için ekip çalışması gerekmektedir. Hastanın uyku kalitesini arttıracak bir tedavi planı düzenlenmeli, uyku saatinde sadece zorunlu bakım girişimleri uygulanmalı, uyku vaktinde yoğun bakımda mümkün olduğunca sessiz bir ortam oluşturulmalı ve uyku uyandırma düzeni sağlanmalıdır. Çalışmanın amacı kardiyovasküler cerrahi sonrasında yoğun bakımda hastaların uyku kalitesine yönelik hemşirelik uygulamalarını sistematik olarak incelemektir. 2000-2023 yılları arasında Pubmed, Science Direct ve Google Scholar veri tabanlarında "cardiovascular surgery", "sleep", "nursing", "intensive care" anahtar kelimeleri taranmıştır. Ulaşılan 988 araştırmadan dahil edilme kriterleri uyan 3 araştırma çalışmaya dahil edilmiştir. Kardiyovasküler cerrahi sonrası yoğun bakımda hemşirelik girişimlerinin hastaların anksiyete ve depresyon düzeylerini azalttığı, öz-yeterlilik, uyku kalitesi ve yaşam kalitesi üzerinde olumlu etkileri olduğu bulunmuştur. Kardiyovasküler cerrahi geçiren hastalarda yoğun bakımda uyku kalitesine yönelik hemşirelik girişimlerinin hastalar için olumlu sonuçlar olduğu belirlenmiştir.

Anahtar Kelimeler: Kardiyovasküler cerrahi, uyku, hemşirelik, yoğun bakım

GİRİŞ

Uyku; vücut enerjisini korunmasında, yenilenme sürecinin desteklenmesinde insanın birincil ihtiyaçları arasında yer almaktadır. Uyku kalitesi fiziksel ve mental sağlığın önemli bir göstergesidir. Biyolojik, psikolojik, ekonomik ve çevresel faktörlerden etkilenen bireyin en temel ihtiyaçlarından biridir. (Şara ve diğ., 2022).

Ameliyat sonrası ağrı kardiyovasküler cerrahi geçiren hastaların yoğun yaşadığı bir durumdur. Hissedilen bu ağrı uyku kalitesini, derin nefes almayı ve günlük aktiviteleri engellemektedir. Açık kalp ameliyatı olan hastaların ameliyat sonrası %75'i uyku problemi yaşamaktadırlar (Tüfekçi ve diğ., 2022).

Sağlık problemleri ve hastane yatışları kişinin uyku düzenini değiştiren, uyku kalitesini olumsuz yönde etkileyen önemli faktörlerden olup insanın uyku ihtiyacını karşılama konusunda engel oluşturmaktadırlar (Şara ve diğ., 2022). Cerrahi müdahaleler bireyin yaşam aktivitelerinde ve vücut bütünlüğünde değişiklikler meydana getirir. Birey olumsuz ve acı veren durumlar içerisinde kalabilir. Bu açıdan yoğun bakımlarda tedavi gören hastalarda ağrı, bulantı, stres, ışık, hasta üzerinde fazla ekipmanın bulunması, hastaya tedavi ve bakım için fazla ve sık müdahale edilmesi, ventilasyon ve diğer yoğun bakım ünitesi cihazlarından kaynaklanan ajitasyon, yoğun bakım gürültüsü gibi durumların varlığı uyku kalitesini olumsuz olarak etkilemekte, uyku uyanıklık döngülerinin kısmen veya tamamen kaybına sebep olabilmektedir (Şara ve diğ., 2022) (Fontaine ve diğ., 2020).

Yoğun bakım ünitesinde tedavi gören hastalarda çoğunlukla uyku problemleri ve sirkadiyen ritimlerdeki bozulmalar, yoğun bakımda kalış süresini arttırabilir ve hastayı deliryuma sokabilir (Fontaine ve diğ., 2020). Hastaların kendi uyku düzenlerini devam ettirememeleri genel sağlık düzeyini olumsuz yönde değiştirmekte, hastaların daha fazla kaygı hissetmelerine sebep olmakta, yara iyileşmesini olumsuz yönde etkilemekte, ağrı şiddetini arttırmakta ve ağrı toleransını düşürmektedir (Şara ve diğ., 2022)

Cerrahi girişim sonrası dönemde hastalarda meydana gelen uyku sorunlarını en az seviyeye indirmek için ekip çalışması gerekmektedir. Hastanın uyku kalitesini arttıracak bir tedavi planı düzenlenmeli, uyku saatinde sadece zorunlu bakım girişimleri uygulanmalı, uyku vaktinde yoğun bakımda mümkün olduğunca sessiz bir ortam oluşturulmalı ve uyku uyanıklık düzeni sağlanmalıdır (Yanık ve Gürdil Yılmaz, 2019).

GEREÇ VE YÖNTEM

Çalışmanın amacı kardiyovasküler cerrahi sonrasında yoğun bakımda hastaların uyku kalitesine yönelik hemşirelik uygulamalarını sistematik olarak incelemektir. 2000-2023 yılları

arasında Pubmed, Science Direct ve Google Scholar veri tabanlarında “cardiovascular surgery”, “sleep”, “nursing”, “intensive care” anahtar kelimeleri taranmıştır. Ulaşılan 988 araştırmadan dahil edilme kriterleri uyan 3 araştırma çalışmaya dahil edilmiştir. Dahil edilen çalışmalar Tablo 1’de özetlenmiştir.

BULGULAR

Anderson ve Cutshall tarafından kardiyak cerrahi geçirmiş ve kardiyovasküler cerrahi yoğun bakımda yatan bir hastaya masaj tedavisi uygulanmıştır ve klinik vaka örneğini paylaşmışlardır. 48 yaşında erkek hasta 3 koroner arterin tıkanması sebebiyle koroner arter bypass greft ameliyatı olmuştur. Ameliyatın 2. gününde omuz, sırt ve sternumda sürekli ağrı şikayeti olmuştur. Hastaya fentanil infüzyonu ve hasta kontrollü bir ağrı kesici verilmiştir. Farmakolojik yöntemlere rağmen hastanın ağrısı devam etmiştir. Hasta uyuyamadığını, kendisini yorgun ve bitkin hissettiğini ifade etmiştir. Hastanın da izniyle hastaya masaj terapisi uygulanmıştır. Sırtın üst kısmı, boyun ve omuz bölgelerine masaj uygulanmıştır. Masaj sırasında dinlemesi için müzik hasta tarafından seçilmiştir. Hastaya 20 dakikalık masaj terapisi uygulanmıştır. Bir sonraki gün hasta boyun ve omuz ağrılarının geçtiğini ve rahat bir gece uykusu uyuyabildiğini ifade etmiştir. Daha önce sırt ve omuz ağrıları nedeniyle dolaşamayan hastanın masaj terapisi sonrası yoğun bakım etrafında birkaç kez dolaşabildiğini, spirometreyi rahatça kullanabildiğini belirtmiştir. Sol kol ve parmaklarında uyuşma şikayetinin geçtiğini söylemiştir. Ağrı ölçeğinde daha önce 7 olan ağrısının 2 puana düştüğünü ifade etmiştir. Hasta masaj terapisini tekrar almak istemiş ve kısmen masaj sayesinde beklenen günden bir gün önce yoğun bakımdan transferi sağlanmıştır (Anderson and Cutshall, 2007).

Zeng ve Guan tarafından yapılan bir çalışmada, kardiyovasküler cerrahi yoğun bakım ünitesinde yatan hastalara insanlaştırılmış bakım uygulayarak hastaların öz-yeterlilik, uyku kalitesi ve yaşam kalitesi üzerindeki etkisini araştırmayı amaçlanmaktadır. Kardiyovasküler cerrahi yoğun bakımda yatmakta olan toplam 134 hasta ile çalışmayı gerçekleştirmişlerdir. 134 hastayı rastgele kontrol ve gözlem grubuna ayrılmıştır. Kontrol grubundaki 64 hastaya rutin hemşirelik bakımı verilirken, gözlem grubundaki 70 hastaya ek olarak insanlaştırılmış bakım uygulanmıştır. Hemşirelik uygulamasından sonra, gözlem grubundaki hastalar, daha iyi uyku kalitesi göstermiştir. Sonuç olarak insanlaştırılmış bakım, kardiyopulmoner fonksiyonun iyileşmesine katkıda bulunduğu ve kardiyovasküler cerrahi yoğun bakımda yatan hastaların anksiyete ve depresyon düzeylerini azalttığı, öz-yeterlilik, uyku kalitesi ve yaşam kalitesi üzerinde olumlu etkileri olduğu bulunmuştur (Zeng and Guan, 2021).

Soltanpura ve arkadaşları tarafından yapılan bir çalışmada koroner arter baypas ameliyatı geçiren 80 hasta yer almıştır. Çalışma grubundaki hastalara bitkisel ilaç olarak 500 mg Melissa officinalis L. kurutulmuş yaprak tozu kullanılmıştır. Kontrol grubundaki hastalara ise plasebo olarak buğday nişastası içeren kapsüller verilmiştir. Her iki gruba da günde üç kez uygulanmıştır. Anksiyete ve uyku kalitesinin ölçülmesi amaçlanmıştır. Çalışmanın sonucu olarak koroner arter baypas ameliyatı sonrası hastalarda 7 günlük 1,5 g/gün kurutulmuş Melissa officinalis yaprağı tozu tedavisinin hastalarda anksiyete düzeyini azalttığı, uyku kalitesini arttırdığı belirlenmiştir (Soltanpour ve diğ., 2019).

SONUÇ

Araştırmaya dahil edilen çalışmalardan elde edilen sonuçlara göre kardiyovasküler cerrahi geçiren hastalarda yoğun bakımda uyku kalitesine yönelik hemşirelik girişimlerin hastalar için olumlu sonuçlar olduğu belirlenmiştir.

ABSTRACT

The aim of the study is to systematically examine the digital nursing care applied in orthopedic surgery. Between 2000-2023, 'digital', 'orthopedic nurse', 'tele-nursing', 'nursing care', 'technology' keywords in Pubmed, Scopus, Google Scholar and Science Direct databases between 2000-2023 scanned. Of the 2,059 studies reached, 3 studies that met the inclusion criteria were included in the study. It has been determined that digital nursing care applied in orthopedic surgery increases the comfort of patients and nurses, saves time in the care applied, nurses can be original in the care of patients, and the feeling of trust in the patient-nurse relationship increases. It has been determined that digital nursing care is preferred because patients have easy access to care due to the limitation of movement experienced by patients in orthopedic surgery. According to the results obtained from the included studies, it was determined that the digital nursing care applied in orthopedic surgery had positive results for the patients.

Keywords: Digital, orthopedic nurse, tele-nursing, nursing care, technology

**ORTOPEDİK CERRAHİDE DİJİTAL HEMŞİRELİK BAKIMI: BİR SİSTEMATİK
DERLEME**

ÖZET

Çalışmanın amacı ortopedik cerrahide uygulanan dijital hemşirelik bakımlarını sistematik olarak incelemektir. 2000-2023 yılları arasında 2000-2023 yılları arasında Pubmed, Scopus, Google Scholar ve Science Direct veri tabanlarında 'digital', 'orthopedic nurse', 'tele-nursing', 'nursing care', 'techonology' anahtar kelimeleri taranmıştır. Ulaşılan 2,059 araştırmadan dahil edilme kriterleri uyan 3 araştırma çalışmaya dahil edilmiştir. Ortopedik cerrahide uygulanan dijital hemşirelik bakımlarının, hastaların ve hemşirelerin konforunu arttırdığı, uygulanan bakımda zamandan tasarruf edildiği, hemşirelerin hastaların bakımı konusunda özgün olabildikleri ve hasta-hemşire ilişkisinde güven duygusunun arttığı belirlenmiştir. Ortopedik cerrahide hastaların yaşadığı hareket kısıtlılığı nedeniyle hastaların bakıma kolay erişebilir olması nedeniyle de dijital hemşirelik bakımının tercih edilir olduğu belirlenmiştir. Dahil edilen araştırmalardan elde edilen sonuçlara göre, ortopedik cerrahide uygulanan dijital hemşirelik bakımının hastalar için olumlu sonuçlarının olduğu belirlenmiştir.

Anahtar Kelimeler: Dijital, ortopedi hemşiresi, tele-hemşirelik, hemşirelik bakımı, teknoloji

GİRİŞ

Son birkaç yılda teknoloji etkileşim kurma, iletişim kurma, eğlenme ve çalışma şeklimizi değiştirdi. Dünyadaki sağlık iş gücünün %50'sini oluşturan hemşirelik mesleği, yeni sağlık teknolojilerinin sektörde uygulanmasından doğrudan etkilenmektedir (Booth et al., 2021).

Dünya Sağlık Örgütü, sağlık teknolojilerini “Bir sağlık sorununu çözmek ve yaşam kalitesini iyileştirmek için geliştirilen cihazlar, ilaçlar, aşular, prosedürler ve sistemler şeklinde organize bilgi ve becerilerin uygulanması” olarak tanımlamaktadır. Bu tür teknolojiler arasında uzaktan izleme ve iletişim cihazları, sensörler ve giyilebilir cihazlar, mobil uygulamalar, Yapay Zeka (AI) ve Sanal Gerçeklik (VR) yer alır. Bu teknolojiler, sağlık hizmetlerinin sunulma biçimini yeniden şekillendirmekte, yeni ortamlarda ve gelişmiş yaklaşımlarda hizmet sunulmasını mümkün kılmaktadır. Bu teknolojiler sayesinde hemşireler izole ve uzak bölgelerdeki popülasyonlara ulaşabilmektedirler (Booth et al., 2021).

Sağlık hizmetlerinin sağlanmasına yönelik bu haber yolları ve alanları, hemşirelerin şu anda sağlık hizmetine ihtiyaç duyan bireylerle nasıl etkileşim kurduğunu etkilemektedir ve bu etkilerin gelecekte artması beklenmektedir. Bu etki, hemşirelerin, geleneksel olmayan ortamlarda daha fazla sağlık ve önleyici bakım sunma dürtüsünün yanı sıra, küçülen bir işgücünün zorluğuna hitap eden yeni roller keşfetmesine ve geliştirmesine yol açacaktır (Barbosa ve ark., 2021).

Ortopedi hastalarında bakımı bir uzmanlık alanı olarak ele almak önemlidir. Ortopedi hastaları çok çeşitli kas-iskelet yaralanmaları ve hastalıklarından muzdariptir, bu nedenle yüksek nitelikli hemşireler tarafından büyük ölçüde karşılanabilecek özel sağlık bakımına ihtiyaçları vardır. Ortopedi hemşireleri hastalarla fazlaca zaman geçirmekte ve bakım koordinatörü olarak hareket etmektedir (Gupta ve ark., 2018; Jansson ve ark., 2020).

GEREÇ VE YÖNTEM

Bu çalışmanın amacı ortopedi cerrahisinde kullanılan dijital hemşirelik uygulamalarını sistematik olarak incelemektir. 2000-2023 yılları arasında Pubmed, Scopus, Google Scholar ve Science Direct veri tabanlarında ‘digital’, ‘orthopedic nurse’, ‘tele-nursing’, ‘nursing care’, ‘techonology’ anahtar kelimeleri taranmıştır. Ulaşılan 2,059 araştırmadan dahil edilme kriterleri uyan 3 araştırma çalışmaya dahil edilmiştir. Çalışmaya dahil edilen araştırmalar Tablo 1’de verilmiştir.

BULGULAR

Jepsen ve arkadaşları tarafından bir ortopedi servisinde hemşirelere gerçek zamanlı dökümantasyon uygulaması çalışması yapılmıştır. Bu nitel olarak tasarlanan ve örneklemini

18 hemşirenin oluşturduğu bir çalışmadır. Gerçek zamanlı dökümantasyon uygulamasında mobil bilgisayarlar kullanılarak elektronik sağlık kaydına ulaşım sağlanmıştır ve vardiyalar arasında devir teslim yerine hastaların durumları, tanıları ve hemşirelik planlarının kısa bir özetini elde etmek için planlama ekranları kullanılmıştır. Uygulama hemşireler arasında desteği gerektirmekte, hastalar ile geçirilen zamanın artırılması daha iyi ilişkilere yol açmaktaydı. Gerçek zamanlı dökümantasyon ortopedi hemşireliğine daha entegre hale gelmiştir (Jepsen et al., 2022).

McGinley ve arkadaşları, diz enjeksiyonu olan otuz hastanın taburculuğu sonrası telefon ile görüşme sağlayarak hastalara tele-hemşirelik sunmuştur. Hastalar taburculuk sonrası hareket kabiliyetlerinin azalması nedeni ile kısa süre içinde klinik ziyareti tercih etmek yerine telefon ile görüşmeyi daha güvenli bulmuştur. Tele-hemşireliğin zaman kaybını azaltmanın etkili bir yol olduğu ve tercih edildiği bildirilmiştir (McGinley et al., 2006).

Flanagan ve arkadaşları, diz atroskopisi ameliyatı olan hastaların taburculuk sonrası telefon ile takip edilmesinin sonuçlarını incelemek amacıyla örneklemini 77 hastanın oluşturduğu nitel bir çalışma yapmıştır. Araştırma sonucunda hasta ve hemşire arasındaki sürekli iletişimin iyileşme dönemine yardımcı olduğu belirtilmiştir (Flanagan et al., 2009).

SONUÇ

Dahil edilen araştırmalardan elde edilen sonuçlara göre, ortopedik cerrahide uygulanan dijital hemşirelik bakımının hastalar için olumlu sonuçlarının olduğu belirlenmiştir.

ABSTRACT

Operating rooms are stressful spaces where complex applications compete with time. All surgical team working in this complex area should work in coordination. Safe Surgical Checklists are an important tool for ensuring this coordination and preventing situations that threaten possible patient safety. Successful implementation of the Safe Surgery Checklist must embrace the importance of the checklist to ensure patient safety. At this point, first of all, it is necessary to draw attention to the attitude and awareness of the surgical team towards the Safe Surgery Checklist. The aim of this study is to systematically examine the attitude and awareness of the team in the use of the Safe Surgery Checklist. Between 2010-2023, 318 studies were reached using the keywords "Safe Surgery Checklist", "surgical team", "attitude" and "awareness" in Turkish and English in Pubmed, Science Direct and Google Scholar databases. Of these studies, 6 studies that met the inclusion criteria were reviewed. It has been determined that the use of the Safe Surgery Checklist by the surgical team improves teamwork. The surgical team was largely familiar with the Safe Surgery Checklist and was thought to be effective in improving cooperation and communication in the operating room team. Indifference of health professionals, lack of manpower in the surgical team, and long completion of the checklist were identified as barriers to the use of the Safe Surgery Checklist. **Keywords:** Safe Surgery Checklist, Communication, Surgical Team, Collaboration, Operating Room

GÜVENLİ CERRAHİ KONTROL LİSTESİ KULLANIMINDA EKİBİN TUTUM VE
FARKINDALIĞI: SİSTEMATİK DERLEME

ÖZET

Ameliyathaneler, zamanla yarışan ve karmaşık uygulamaların gerçekleştiği stresli alanlardır. Bu karmaşık alanda görev alan tüm cerrahi ekibin koordinasyon halinde çalışması gerekir. Güvenli Cerrahi Kontrol Listeleri, bu koordinasyonu sağlamada ve olası hasta güvenliğini tehdit eden durumları önlemeye yönelik önemli bir araçtır. Güvenli Cerrahi Kontrol Listesi'nin başarılı bir şekilde uygulanmasında hasta güvenliğini sağlamak için kontrol listesinin önemini benimsemesi gerekir. Bu noktada da öncelikle cerrahi ekibin Güvenli Cerrahi Kontrol Listesi'ne yönelik tutum ve farkındalığına dikkat çekmek gerekir. Bu çalışmanın amacı Güvenli Cerrahi Kontrol Listesi kullanımında ekibin tutumu ve farkındalığını sistematik olarak incelemektir. 2010-2023 yılları arasında Pubmed, Science Direct ve Google Scholar veri tabanlarındaki Türkçe ve İngilizce olarak "Safe Surgery Checklist", "surgical team", "attitude" ve "awareness" anahtar kelimeleri kullanılarak 318 çalışmaya ulaşılmıştır. Bu çalışmalardan dahil edilme kriterlerine uyan 6 çalışma incelenmiştir. Cerrahi ekibin Güvenli Cerrahi Kontrol Listesi kullanımının ekip çalışmasını geliştirdiği belirlenmiştir. Cerrahi ekip büyük oranda Güvenli Cerrahi Kontrol Listesi'ni bilmekte ve ameliyathane ekibindeki iş birliğini ve iletişimi geliştirmede etkili olduğu düşünülmektedir. Güvenli Cerrahi Kontrol Listesi'nin kullanımında engeller olarak sağlık profesyonellerinin ilgisizliği, cerrahi ekipte insan gücünün eksikliği, kontrol listesinin tamamlanmasının uzun sürmesi kontrol listesinin kullanımının önündeki engeller olarak belirlenmiştir.

Anahtar kelimeler: Güvenli Cerrahi Kontrol Listesi, İletişim, Cerrahi Ekip, İş birliği, Ameliyathane

GİRİŞ

Dünya Sağlık Örgütü (WHO) tarafından 2008 yılında “Güvenli Cerrahi Hayat Kurtarıcı” projesi oluşturulmuştur. Proje kapsamında dünya çapında cerrahiye bağlı ölüm sayısının azaltılması hedeflenmiştir. Hedefe bağlı olarak yetersiz anestezi güvenliği uygulamaları, yanlış hasta ve taraf cerrahileri, önlenebilir cerrahi enfeksiyonlar ve ekip üyeleri arasındaki zayıf iletişim dahil önemli güvenlik konuları belirlenerek politikaların oluşturulması amaçlanmıştır. Bu amaçlar doğrultusunda dünya çapında ameliyathanelerde kullanılması için 2009 yılında Dünya Sağlık Örgütü tarafından Güvenli Cerrahi Kontrol Listesi yayınlanmıştır (WHO, 2009).

Ameliyathaneler, zamanla yarışan ve karmaşık uygulamaların gerçekleştiği stresli alanlardır. Bu karmaşık alanda görev alan tüm cerrahi ekibin koordinasyon halinde çalışması gerekir. Güvenli Cerrahi Kontrol Listeleri, bu koordinasyonu sağlamada ve olası hasta güvenliğini tehdit eden durumları önlemeye yönelik önemli bir araçtır. Bu aracın kullanımı ve etkinliğine yönelik cerrahi ekip arasında genellikle görüş birliği yoktur. Güvenli Cerrahi Kontrol Listesi'nin başarılı bir şekilde uygulanmasında hasta güvenliğini sağlamak için kontrol listesinin önemini benimsemesi gerekir. Bu noktada da öncelikle cerrahi ekibin Güvenli Cerrahi Kontrol Listesi'ne yönelik tutum ve farkındalığına dikkat çekmek gerekir (Gökay ve ark., 2016; Soyer ve Yavuz Van Giersbergen, 2017).

GEREÇ VE YÖNTEM

Çalışmanın amacı Güvenli Cerrahi Kontrol Listesi kullanımında ekibin tutumu ve farkındalığını sistematik olarak incelemektir. Güvenli Cerrahi Kontrol Listesinin kullanımının cerrahi ekip üzerine etkisini inceleyen, 2010-2023 yılları arasında Pubmed, Science Direct ve Google Scholar veri tabanlarındaki Türkçe ve İngilizce olarak “Safe Surgery Checklist”, “surgical team”, “attitude” ve “awareness” anahtar kelimeleriyle 318 çalışmaya ulaşılmıştır. Bu çalışmada kullanılmaya uygun 6 araştırma çalışmaya dahil edilmiştir. Dahil edilen çalışmalar Tablo 1’de özetlenmiştir.

BULGULAR

Gürlek Kısacık ve Cigerci tarafından 102 ameliyathane hemşiresinin Güvenli Cerrahi Kontrol Listesi kullanımına yönelik görüşlerini inceleyen bir çalışma yapılmıştır. Çalışmada hemşirelerin tamamının Güvenli Cerrahi Kontrol Listesini bildiklerini ve ameliyathanelerinde kullandıklarını belirtirken, %80,4’ü Güvenli Cerrahi Kontrol Listesini hastane hizmet içi eğitimlerinde öğrendiğini belirtmiştir. Çalışmaya katılan hemşirelerin %68,6’sı Güvenli Cerrahi Kontrol Listesi kullanımının ameliyathane ekibindeki iş birliğini ve iletişimi geliştirmede etkili olduğunu belirtmiştir. Elde edilen bir diğer sonuç ise hemşirelerin %64,7’si kontrol listesini uygularken sorun yaşamakta ve bu sorunun %40’ını cerrahların kontrol aşamalarını bekleme konusunda isteksiz olmaları oluşturmaktadır. Kontrol listesinin kullanımını etkileyen faktörler hakkında görüşleri incelendiğinde büyük oranda ameliyathanede yoğun çalışma şartları ve cerrahi ekibin kontrol listesi kullanımı ve önemi konusunda anlaşmazlık olduğu görülmüştür (Gürlek Kısacık ve Cigerci, 2017).

Sharma ve arkadaşları, Güvenli Cerrahi Kontrol Listesi'nin kullanımına yönelik bilgi, tutum ve uygulamayı inceleyen bir çalışma yapmıştır. 104 katılımcı ile yaptıkları çalışmaya göre, cerrahi ekibin %92,3’ü Güvenli Cerrahi Kontrol Listesinden haberdardı ve yarısından fazlası (%54,17) da iyi düzeyde bilgiye sahipti. Cerrahi ekip, Güvenli Cerrahi Kontrol Listesinin amaçlarını, bileşenlerini ve uygulama protokollerini çok iyi biliyorlardı. Cerrahi ekibin kontrol listesine yönelik genel tutumu olumluydu. Ekibin çoğu, kontrol listesinin tüm cerrahi prosedürler için kullanılmasını istedi ve kullanımının ameliyathanedeki ekip arasındaki iletişimi ve iş birliğini geliştireceği fikrindeydi. Ekibin sadece beşte biri, kontrol listesi olmadan verimli bir şekilde çalışabileceklerini belirtmiştir. Ekip üyelerinin dörtte üçü,

ameliyat ekibinin tüm üyelerini ad ve soyad bazında tanıdığını bildirdi ve yaklaşık aynı oranda yanıt veren kişi, ameliyathanede ekip koordinasyonunun iyi olduğunu belirtmiştir. Ayrıca, katılımcıların üçte ikisi, ekip üyelerinin önerilerine ve fikirlerine açık olduğunu bildirmiştir (Sharma ve ark., 2020). Böhmer ve arkadaşları çalışmada Güvenli Cerrahi Kontrol Listesi'nin uyarlanmış hali olan 19 maddelik bir anket geliştirerek toplam 71 cerrahi ekip üyesi ile hasta güvenliği ve ekip çalışmasının kalitesini inceleyen bir çalışma yapmıştır. Çalışmada anketin uygulanmasının ardından kurumdaki ameliyathane ekibinin; ekipteki kişilerin adlarının ve görevlerinin bilinmesi, hastanın ameliyatı için yazılı onamın doğrulanması, cerrahi insizyondan önce antibiyotik endikasyonunun kontrolü ve meslekler arası iş birliğinin kalitesinin arttığı ve olumlu tutum geliştiği sonucuna ulaşılmıştır (Böhmer ve ark., 2012). Danyangs ve arkadaşları ameliyathane ekibinin Güvenli Cerrahi Kontrol Listesi kullanımına yönelik bilgi, tutum ve farkındalıklarını inceleyen bir çalışma yapmıştır. Çalışmaya katılan 68 cerrahi ekip üyesinin %47'si genellikle güvenlik hazırlığı için yeterli zamanlarının olmadığını ve %72,1'i güvenliği sağlamak için yeterli kaynağının bulunmadığını belirtmiştir. Ekibin %92,7'si kontrol listesinin kullanılmasını istediğini, ekibin iletişimini ve iş birliğini artıracaklarını düşündüğünü bildirmiştir. Ancak yarısından fazlası (%54,4), kontrol listesinin, uygulanmadan önce zaten uygulanmakta olan mevcut güvenlik prosedürlerine herhangi bir ek değer getirmeyebileceğini belirtmiştir. Kontrol listesinin kullanımının önündeki engeller olarak; yönetimin yaptırımının olmaması, sağlık profesyonellerinin ilgisizliği, cerrahi ekipte insan gücünün eksikliği ve ekip anlayışının olmaması olarak bildirilmiştir (Danyangs, 2016). Fourcade ve arkadaşları Güvenli Cerrahi Kontrol Listesi'nin benimsenmesine yönelik engelleri inceleyen çok merkezli bir çalışma yapmıştır. Çalışma yapılan merkezlerin %90,2'sinde Güvenli Cerrahi Kontrol Listesi'nin kullanıldığı ve kontrol listesinin %61 oranında tamamlandığı sonucuna ulaşılmıştır. Engellere yönelik bulunan sonuçlar arasında cerrahi ekibin iş yükünün fazla olması nedeniyle kontrol listesinin doldurulmasının zaman aldığı; ekibin kontrol listesine uyum konusunda ilgili olmadığı; kontrol listesinin faydalarını ve kontrol listesindeki bazı adımların zaman kısıtlaması nedeniyle herhangi bir değerlendirme yapılmadan ve sadece hastane direktiflerine uyulması amacıyla doldurulduğu; bazı maddelerin kontrollerinin anlaşılmadığı ve cerrahi ekip arasındaki zayıf iletişim olduğu görülmüştür. (8)

Gürkan ve arkadaşları cerrahi ekibin Güvenli Cerrahi Kontrol Listesi'ne yönelik tutum ve görüşlerini inceleyen bir çalışma yapmıştır. Bu çalışmaya 561 cerrahi merkezden cerrahi ekip üyeleri katılmıştır. Çalışma sonucunda cerrahi ekibin; %98'i kontrol listesinin kullanımının zorunlu olduğunu ve %57,8'i yalnızca günlük pratikte rutin bir uygulama olduğunu belirtmiştir. Ekibin %95,2'si komplikasyonları önlemede etkili olduğu için her hastada kullanılması gerektiğine inandığını ve %78,4'ü hasta güvenliğini artırdığını bildirmiştir. Ek olarak %69'u kontrol listesi ile ilgili eğitim aldığını bildirirken; %50,8'i bu eğitimlerin faydalı olmadığını düşünmektedir. (9)

SONUÇ

Güvenli Cerrahi Kontrol Listesinin kullanımı cerrahi ekip tarafından genellikle kabul görmektedir. Çalışmalarda, sağlık profesyonellerinin ilgisizliği, cerrahi ekipte insan gücünün eksikliği, kontrol listesinin tamamlanmasının uzun sürmesi kontrol listesinin kullanımının önündeki engeller olarak belirlenmiştir. Bununla birlikte yapılan çalışmalarda Güvenli Cerrahi Kontrol Listesinin ekip iletişimi ve iş birliğini geliştiren bir etken olduğu görülmüştür.

ÖZET

Güç sistemlerinde gerilim değişimleri, istenmeyen olay ve arızalar sonrası yaşanabilmekte olan en önemli güç kalitesi sorunları arasındadır. Bu çalışmada, güç kalitesi problemlerinden biri olan gerilim düşümü/yükselmesi olayına çözüm sağlayan özel güç cihazı Dinamik Gerilim/Voltaj Regülatörü (DVR) ele alınmaktadır. DVR yapısı gereği hem gerilim düşümü hem de gerilim yükselmesi olayında başarı sağlayarak yük tarafındaki gerilimi nominal seviyede tutmak için düzeltme işlemi yapar. Bu çalışmada, şebekede yaşanmış gerçek gerilim değişim olay kayıtlarına göre oluşturulmuş 5 farklı senaryo eşliğinde benzetim çalışmaları gerçekleştirilmiştir. Bu amaçla tasarlanan DVR sistemdeki dengeli ve dengesiz gerilim değişimlerini istenilen seviyede tutma kabiliyetine sahiptir. Elde edilen benzetim sonuçlarında DVR'in gerilim telafisi yaparak yükü koruduğu ve yük gerilimini nominal seviyede tuttuğu görülmüştür.

Anahtar Kelimeler: Güç kalitesi, Dinamik gerilim regülatörü, Gerilim yükselmesi, Gerilim düşmesi

**DESIGN AND SIMULATION OF DYNAMIC VOLTAGE REGULATOR FOR
REGULATION OF VOLTAGE DISTURBANCES EVENTS**

ABSTRACT

In power systems, voltage disturbances can occur after undesired events and faults that is among the most important power quality problem. In this study, a special power device Dynamic Voltage/Voltage Regulator (DVR), which provides a solution to the voltage drop/swell phenomenon, is discussed. Due to its structure, it corrects the voltage on the load side, which is successful in both voltage drop and voltage rise, and keeps it at the nominal level. Simulation studies were carried out with 5 different scenarios created according to the voltage change event recorded in the power system network. The DVR designed for this purpose has the ability to keep the balanced and unbalanced voltage disturbances in the system at the desired level. In the simulation results obtained, it has been seen that the DVR protects the load by voltage compensation and keeps the load voltage at the nominal level.

Keywords: Power quality, Dynamic voltage regulator, Voltage swell, Voltage sag

1. Giriş

Elektrik enerji sistemlerinde güç kalitesi önemli bir çalışma alanı içerisinde değerlendirilmektedir. Güç kalitesi elektrik şebekesine bağlı cihaz, ekipman, elektriksel yüklerin önemli bir performans ve ömür kaybı yaşamadan çalışmasını sağlayan düzenlemelerin bütünüdür. Elektrik şebekesinde meydana gelebilecek gerilim, akım ve frekans değişimlerinden kaynaklı sorunlar güç kalitesi problemi olarak tanımlanmaktadır. Gerilim düşmeleri, yükselmeleri, titreme, gerilim çentiği, harmonik bozulmalar, geçici akımlar ve anlık kesintiler endüstriyel müşterileri etkileyen en yaygın güç kalitesi sorunlarıdır (Brumsickle ve diğ., 2001 ve Abhijee ve Kumar, 2014). Üretim süreçlerinde bulunan hassas elektronik ekipmanlar, kritik ve doğrusal olmayan yükler, güç kalitesi problemlerinden olumsuz etkilenmektedir. Parasal kayıplara, ekipmanların hasar görmesine ve ürün kalitesinin düşmesine vb. sorunlara neden olmaktadır (Remya ve diğ., 2018). Temel olarak kaliteli elektrik enerjinde gerilimin dalga şeklinin sinüzoidal formda, frekans değerinin sabitli ve yük geriliminin istenilen seviyede olması bu şartların başında gelmektedir. Aynı zamanda tüketicinin talep ettiği elektrik enerjisi istenilen düzeyde ve kesintisiz olarak karşılanabilmelidir.

Güç sistemlerinin üretimi, iletimi ve dağıtım gibi her aşamalarda meydana gelebilecek bir takım istenmeyen olaylar enerji kalitesi açısından sorunlar oluşturabilmektedir. Bu iç ve/veya dış kaynaklı olaylara; kısa devre hataların oluşması, yıldırım düşmesi, yüksek başlangıç akımlarına ihtiyaç duyan büyük yüklerin enerjilendirilmesi, aşırı yüklenmeler ve büyük yüklerin devreden çıkması vb. durumlar örnek olarak gösterilebilir (Özdemir, 2020 ve Damaraju ve Lalitha,2015). Sistem koşullarına ve arıza yerine bağlı olarak gerilimde düşme, yükselme veya kesintiler oluşabilmektedir. Bu olumsuz etkilerden dolayı güç sisteminde gerilim düşümü ve gerilim yükselmesi olayları elektrik enerjinin kullanıldığı tüm noktalarda önem arz etmekte ve en önemli güç kalitesi problemi olarak değerlendirilmektedir. Elektrik şebekesine bağlı çok sayıda bilgisayar ve diğer hassas elektrik yükleri, şebeke bozulmalarından doğrudan etkilenir. Bu bozulmaların büyük çoğunluğu, gerilim düşüşleri gibi gerilim geçişleri ile ilgilidir. Mevcut senaryoda, hassas yükler, özellikle gerilim düşüşü nedeniyle güç kalitesi sorunlarının yaklaşık %80'inden muzdariptir (Brito ve diğ., 2014 ve Kassarwani ve diğ., 2018).

Gerilim çökmesi, güç dağıtım sistemlerinde en fazla yaşanan güç kalitesi sorunudur. Bu problem ekipman arızalarına yol açabildiği gibi endüstriyel tüketicinin yanı sıra kamu hizmeti

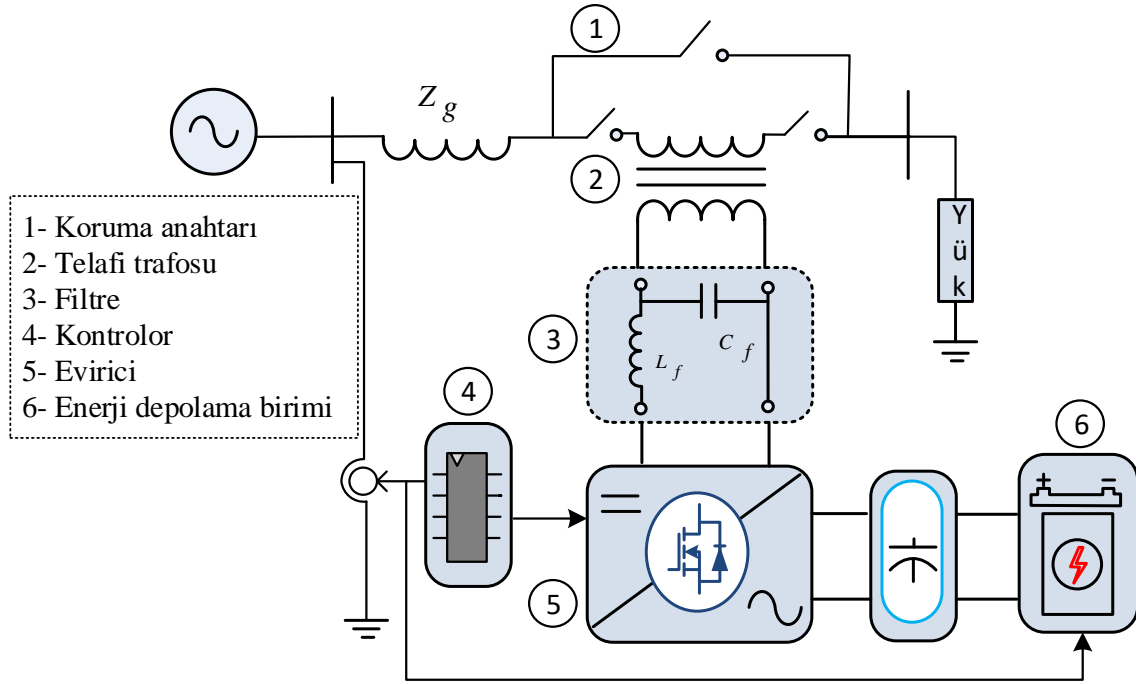

şirketi içinde mali kayıplara neden olur. Geçmişte bu sorunların çözümünde şönt kompanzasyon cihazları kullanılmaktaydı. Ancak yüksek hizmet maliyeti, zor bakım, gerekli geniş alan ve küçük gerilim düşüş değerini telafi etme şönt kompanzasyon cihazlarının eksiklikleri arasında yer almaktadır. DVR'nin maliyetinin düşük, küçük boyutlu ve teknik olarak geliştirebilir bir cihaz olması hem gerilim düşümü ve hem de gerilim yükselmesini telafi etmesi nedeniyle günümüzde tercih edilen bir güç cihazıdır (Vasudevan ve Prasad, 2017 ve Soomro ve diğ., 2021). En iyi ve en uygun maliyetli çözüm sunan DVR gerilim olaylarını telafi etmek için güç elektroniği tabanlı bir çözümdür. Yapılan bir çalışmada, DVR topolojilerinin kapsamlı bir tartışmasını ve incelemesi yapılmıştır. Özellikle güç dönüştürücülerine dayalı DVR kontrol topolojileri, kontrol birimleri ve bunların her bir çalışma modu ayrıntılı olarak açıklanmaktadır (Moghassemi ve Padmanaban, 2020). Diğer bir çalışmada DVR için Geliştirilmiş Senkron Referans Çerçevesine dayalı yeni bir referans oluşturma yöntemi sunulmuştur. Önerilen yöntem, dengesiz gerilim düşüş/yükselişini ve dengesiz gerilim harmoniklerini aynı anda kompanze etmek için hem tek fazlı hem de üç fazlı sistemler için kullanılabilir (İnci ve diğ., 2016).

DVR'nin amacı gerilim düşmesi ve yükselmesi olayında yük gerilimini istenilen seviyede tutmaktır. Herhangi bir gerilim düşümü ve yükselmesi durumunda devreye girerek, ihtiyaç olan gerilimi telafi transformatörü ile yük gerilimine aktarmaktadır. Bu çalışmada gerilim düşümü ve yükselmesi olaylarına karşı yükü korumak ve gerilimi regüle etmek için kullanılan özel güç cihazı olan bir DVR tasarlanmıştır. Gerilim olaylarının benzetimi güç sisteminde yaşanan gerçek gerilim değişimlerini temsil eden farklı arıza kayıt örnekleri kullanılmıştır. Bu arıza senaryoları MATLAB/Simulink ortamında tasarlanan DVR ile simüle edilmiştir. Gerilimdeki değişimlerin miktarı, faz açısının ve genliğin vektörel kontrolü yapılarak tespit edilmiştir. Simülasyonda PI kontrolör ve PWM genlik modülasyonu kullanılmıştır. Benzetim sonuçları istenen seviyede yük gerilimi elde edildiği ve gerilim regülasyon işlemi yapıldığını göstermiştir. Tasarlanan sistem dengeli/dengesiz gerilim değişimlerinin telafi edilmesinde başarılı bir performans göstermektedir.

2. DVR'nin Genel Yapı ve Prensip Şeması

DVR güç sisteminde meydana gelen anlık gerilim düşmeleri ve yükselmelerine karşı hassas yükleri korumak için tasarlanmış, sisteme seri bağlı özel güç cihazlardan biridir. DVR'nin çalışma prensibi gerilim düşümü veya yükselme olayında yük gerilimini nominal seviyede tutmak için sisteme telafi gerilimi aktarmasına dayanmaktadır (Ağalar ve Kaplan, 2017).

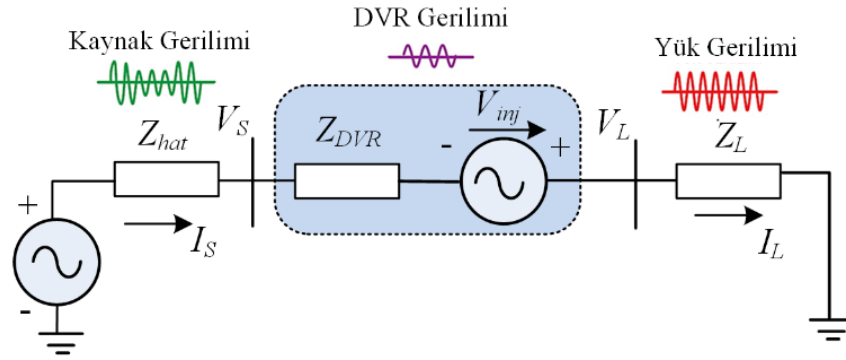

Telafi gerilimi kaynak geriliminin genliđi, açısı referans alınarak oluşturulur. Sistemde oluşan gerilim deđişimleri DVR tarafından sürekli olarak izlenmektedir. Kaynak gerilim seviyesinin deđişmesi DVR aktif edecek ve yük gerilimini istenen seviyeye getirecektir. DVR'nin temel prensip şeması Şekil 1'de gösterilmektedir. Gerilim olaylarının düzenlenmesi için kullanılan DVR aygıtı beş ana bileşenden meydana gelmektedir. Bunlar enerji depolama birimi, evirici birimi, filtre birimi, bağlantı (telafi) transformatörü ve koruma anahtarından oluşmaktadır (Özdemir, 2020).

Şekil 1. DVR'nin temel prensip şeması.

Gerilim düşümü sırasında yük geriliminin dengelenmesi için gerekli olan enerji yardımcı bir kaynaktan veya şebekenin kendisinden kullanılabilir. Güç sistemdeki gerilim düşümü fazla olduğunda performansı artırmak ve yüke aktif güç sağlamak için yardımcı besleme yöntemi uygulanır. Enerji depolama ünitesi, gerilim düşmesi sırasında yük geriliminin dengelenmesi için gerekli olan potansiyel gücü sağlamaktadır (Ağalar ve Kaplan, 2017). Gerilim kaynaklı evirici (VSI), enerji depolama cihazı tarafından sağlanan DC gerilimi AC gerilime dönüştürmek için kullanılır. Bu şekilde istenmeyen gerilim deđişimleri için gerekli olan frekans, genlik ve faz açısındaki sinüzoidal gerilim bu cihaz tarafından üretilir. Gerilim, bağlantı transformatörü ile istenilen seviyeye yükseltilir. Filtre, evirici biriminin DC'den AC dönüşüm esnasında üretilen telafi geriliminde yüksek dereceli harmonik bileşenlerin filtre edilmesi amacıyla kullanılır. Pasif filtreler evirici biriminin çıkış tarafına yerleştirilebilir.

Bağlantı transformatörünün görevi ise evirici biriminden elde edilen gerilimi istenilen seviyesine yükseltmektir. Ayrıca transformatör DVR'nin sistemden izole olmasını da sağlamaktadır. DVR sisteme seri bağlı bir güç cihaz olduğundan, sistemden gelen bir arıza nedeniyle oluşacak hata akımı, yapısı gereği evirici birimine ulaşacaktır. Bu durumda birimdeki ekipmanlar zarar görebilir. Bu nedenle, evirici birimini koruma altına almak için DVR sistem yapısına bir koruma anahtarı (by-pass) dâhil edilmektedir. Koruma devresinin temel işlevi, şebekedeki geçen akımı algılamaktır. Eğer eviricinin zarar göreceği akım seviyesinde ise; anahtar kapalı pozisyona geçerek DVR devre dışı bırakır. Böylelikle DVR yüksek akımlara karşı koruma altına alınmış olunur. Yüksek bir akım geçmediği sürece koruma anahtarının pozisyonu açık devre olacaktır (Ghosh ve diğ., 2004, Taiwo ve diğ., 2018 Abhijee ve Kumar, 2014, Chandrasekaran ve Ramachandaramurthy, 2016, Sadigh ve diğ., 2016).

Şekil 2. DVR'in eş değer devre şeması (Moghassemi ve Padmanaban, 2020, 19. Boonchiam ve Mitholananthan, 2006).

Bilindiği gibi kaynak tarafında meydana gelen gerilim bozulmasını telafi etmek için gerekli gerilim DVR tarafından üretilir. DVR'ye ait eşdeğer devre şeması Şekil 2'de verilmiştir. Gerilim düşmesi/yükselmesi meydana geldiğinde, DVR bu gerilim düşümünü algılayarak telafi transformatörü aracılığıyla şebekeye seri gerilim (V_{inj}) enjekte eder. Böylelikle yük tarafının bu gerilim değişimlerinden etkilenmesi önlenir (Pal ve Gupta, 2020). Bu durumda yük gerilimi;

$$V_L = V_S + V_{inj} \quad (1)$$

şeklinde oluşur. Burada V_L yük gerilimi, V_S sarkık besleme gerilimi ve V_{inj} ise sisteme enjekte edilen gerilimi göstermektedir.

Telafi gerilimi V_{DVR} Denklem 2'de gösterildiği gibi tanımlanır.

$$V_{DVR} = V_L + Z_{th}I_L - V_{th} \quad (2)$$

Burada Z_{th} sistem empedansı, I_L yük akımını, V_{th} hata durumunda meydana gelen sistem gerilimini göstermektedir. Sistemdeki yük akımı Denklem 3'deki gibi yazılır.

$$I_L = \frac{P_L + jQ_L}{V_L} \quad (3)$$

Burada, P_L yükün aktif gücünü, Q_L yükün reaktif gücünü temsil eder. Yük gerilimi V_L referans büyüklük olarak alındığında DVR gerilim Denklem 4'teki gibi tanımlanır.

$$V_{DVR}\angle\alpha = V_L\angle 0 + Z_{th}I_L\angle(\beta - \theta) + V_{th}\angle\delta \quad (4)$$

Burada, α DVR'nin açısını, β hat empedansın açısını, δ kaynak gerilimin açısı ve θ güç açısını ifade eder. Güç açısı Denklem 5 ile tanımlıdır.

$$\theta = \tan^{-1} \frac{Q_L}{P_L} \quad (5)$$

DVR'nin kompleks güç ifadesi Denklem 6 ile tanımlanır.

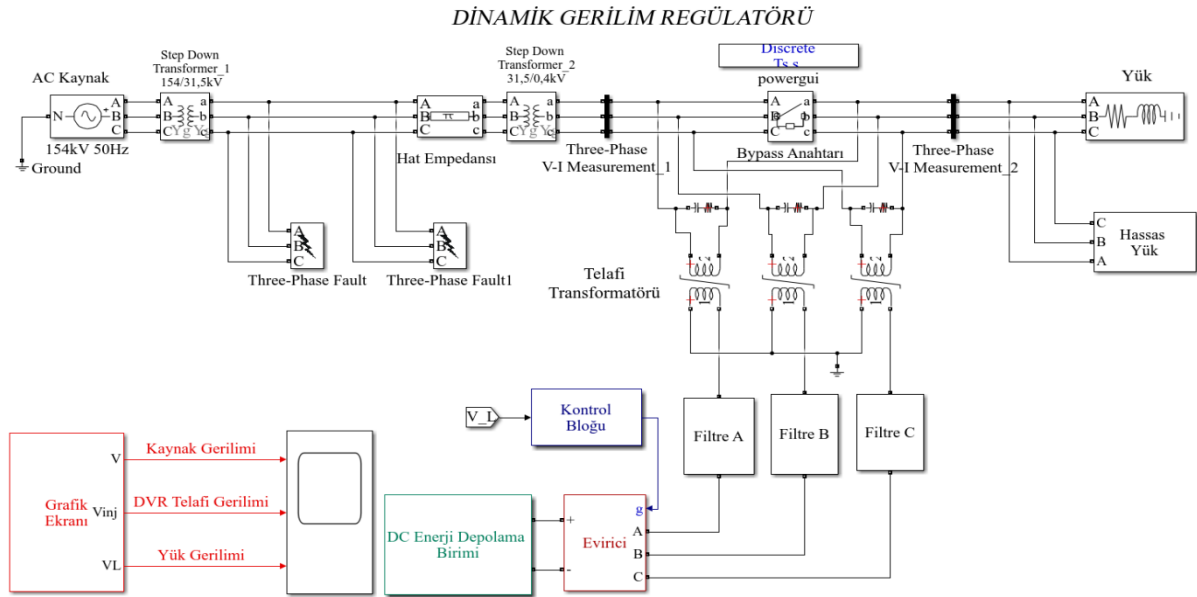

$$S_{DVR} = V_{DVR}I_L^* \quad (6)$$

Burada I_L^* yük akımının eşleniğini ifade etmektedir.

3. DVR'nin Benzetim Modeli

Bu çalışmada alçak gerilim şebekesinde oluşan gerilim değişimlerinin (gerilim düşümü ve yükselmesi) giderilmesi için bir DVR modeli tasarlanmıştır. Tasarlanan DVR modeli hem dengeli ve hem de dengesiz gerilim değişimlerinde etkili olacak şekilde çalışmaktadır. Bu amaçla sisteme ilişkin modelleme çalışmaları MATLAB/Simulink ortamında gerçekleştirilmiştir.

Oluşturulan DVR ve güç sistemi modeli bütünleşik olarak değerlendirilmiştir. Yani sistem parametreleri tanımlanırken güç sistemine ilişkin elektrik dağıtım şebekesi ve unsurlarına da yer verilmiştir. Oluşturulan tümleşik DVR benzetim modelinin MATLAB/Simulink gösterimi blok şeması Şekil 3'te, sistem parametreleri ise Çizelge 1'de verilmiştir. Dinamik bir analiz için, DVR'nin ana bileşenleri modellenmiştir. Görüldüğü üzere her sistem donanımı; gerilim kaynaklı evirici, telafi transformatörü, filtre devresi, kontrol sistem bloğu vb. ayrı ayrı modellenerek DVR'nin tümleşik devre yapısı elde edilmiştir.

Şekil 3. Tümüleşik DVR benzetim modelinin MATLAB /Simulink gösterimi blok şeması

Çizelge 1. DVR benzetim modeli için sistem parametreleri

Sistem Birimleri		Birim Değeri					
AC Gerilim Kaynağı							
Gerilim / Frekans		154 kV (Faz-Faz, RMS, Faz Açısı=0°) / 50 Hz

4. Benzetim Sonuçları ve Tartışma

Güç sisteminin alçak gerilim tarafında da birçok gerilim düşümü ve yükselme olayları oluşmaktadır. Bu gerilim değişim hataları; genellikle şebekeden meydana gelen hata olaylarından, kapasitesi yüksek bir yükün veya büyük güçlü kapasitelerin devreye girip çıkması gibi durumlardan kaynaklanmaktadır. Güç sisteminin alçak gerilim şebekesinde yaşanmış ve şebekeye bağlı bir tüketici tarafından kayda geçmiş gerilim düşümü ve yükselmesine ait gerçek gerilim olayları Şekil 4'te gösterilmiştir. Benzetim çalışmalarında DVR'nin performans değerlendirilmesini yapmak amacıyla gerçek bir güç sisteminde yaşanmış arıza olayları ele alınmıştır.

Şekil 4. Alçak gerilim şebekesinde yaşanmış gerilim düşümü ve yükselme olay verileri.

Çalışmada gerçek bir güç sisteminde gözlenen gerilim değişimi olaylarına ait beş farklı durum ele alınmıştır. Birinci durumda şebekede kesinti, ikinci durum dengeli gerilim düşümü, üçüncü durum dengesiz gerilim düşümü, dördüncü durum A fazında gerilim düşümü C fazında gerilim yükselmesi ve beşinci durum ise dengeli gerilim yükselmesidir. Gerçek bir sistemden gözlemlenen bu gerilim değişimi olaylarına bakıldığında gerilim değişimlerinin hem dengeli hem de dengesiz şekilde oluştuğu görülmektedir. Dengeli gerilim düşümleri genellikle üç fazlı simetrik hatalarda oluşmaktadır. Dengesiz gerilim düşümleri ise faz-toprak hatası veya iki faz kısa devre durumlarından kaynaklanmaktadır. Bu çalışmada alçak gerilim şebekesi tarafında yaşanan toplam 5 farklı gerilim olayı simüle edilmiş ve benzetim sonuçları toplu olarak Şekil 5’de verilmiştir. Şekil 5’de 1 enerji kesintisini, 2 dengeli gerilim düşümünü, 3 dengesiz gerilim düşümü, 4 yine farklı genlik değerlerine sahip dengesiz gerilim düşümü, 5’te ise dengeli bir gerilim yükselmesi olayına karşı kaynak gerilimi, DVR gerilimi ve yük üzerinde düzenlenmiş gerilimlerinin sonuçları gösterilmiştir. Sonuçlara bakıldığında sistem üzerinde tüm hata durumlarına karşı önerilen DVR ile gerilim değişimleri başarılı bir şekilde telafi edilmiştir. Alçak gerilim şebekesinde yaşanan 5 farklı durum bazlı çalışmanın benzetim sonuçları tartışılmıştır.

Şekil 5. Alçak gerilim şebekesinde yaşanan gerilim olaylarının benzetimi a) kaynak gerilimi b) DVR telafi gerilim c) yük gerilimi.

Durum 1: Bu olay şebekede yaşanan 100ms süreli bir kesintiye karşılık gelmektedir. Kesinti durumunda kaynak gerilimi 0 V'tur. DVR kaynak gerilimi 0.1-0.9 pu değeri arasında telafi gerilimi oluşturacak şekilde tasarlanmıştır. Dolayısıyla bu durumda DVR aktif olmayıp yük tarafına herhangi bir telafi gerilimi aktarmamıştır. Kesinti 100 ms sonra sonlanmış ve şebeke yeniden nominal değerine ulaşmıştır.

Durum 2: Şebekede 150 ms süreli, 0.55 pu'lık orana sahip üç faz dengeli bir gerilim düşümü olayı yaşanmıştır. Bu durumda sistem gerilimi 220 V'a düşmüştür. Gerilimin nominal değere ulaştırılması için gerekli telafi gerilim değeri 180V'tur. DVR gerilim düşümünü algılayarak aktif hale gelmiş ve gerekli telafi gerilimini yüke sağlamıştır. Şebekede yaşanan gerilim düşümü sona erdiğinde DVR bekleme moduna geçmiştir.

Durum 3: Şebekede 300 ms süreyle dengesiz bir gerilim düşümü yaşanmış ve gerilim düşümü oranları A fazı için 0,61pu, B fazı için 0,67pu ve C fazı için 0.71pu'tir. Gerilimin nominal değere ulaştırılması için gerekli olan gerilim değeri A fazı için 157 V, B fazı için 130 V ve C fazı için 114V'tur. DVR tarafından her fazın gerilim düşümü ayrı ayrı olarak algılanarak ihtiyaç olan telafi gerilimi üretilmiştir. Böylelikle bu süre zarfında yük gerilimi nominal değere ulaştırılmıştır.

Durum 4: Şebekede 350 ms süreli durum 3'e benzer şekilde yine dengesiz bir gerilim düşümü yaşanmıştır. Bu gerilim düşümü olayı iki faz ve toprak hatası olayı sonrası gerçekleşmiş olup karakteristik değerleri farklıdır. Hata olayı, A fazında gerilim düşümüne, C fazında gerilim

yükselmesine neden olmuş B fazında ise her hangi bir gerilimin değişimi oluşmamıştır. Fazlar arası gerilim düşümü oranları A fazı için 0.88 pu, B fazı için 1 pu ve C fazı için 1.05 pu'tir. Gerilimin nominal değere ulaştırılması için gerekli olan gerilim değeri A fazı için 49 V, B fazı için 0 V ve C fazı için -21V'tur. DVR dengesiz bu gerilim düşümünü algılayarak A fazına telafi gerilim aktarırken, C fazında bir yük gibi çalışarak fazla olan gerilimi telafi etmiştir.

Durum 5: Bu olayda, şebekede 200 ms süreli 1,66 pu'luk üç fazlı dengeli bir gerilim yükselmesi yaşanmıştır. Gerilimin nominal değere ulaştırılması için gerekli olan telafi gerilim değeri 240V'tur. Yük tarafında gerekli olan nominal telafi gerilimi DVR tarafından oluşturulmuş ve yük tarafına aktarılmıştır. Şebekede yaşanan gerilim düşümü sona erdiğinde DVR bekleme durumuna geçmiştir.

Alçak gerilim şebekesinde yaşanan beş farklı gerilim olaylarına ait kaynak gerilimi, gerilim olaylarının karakteristik değerleri ve telafi gerilimi sonuçları Çizelge 2'de özetlenmiştir.

Çizelge 2. Alçak gerilim şebekesinde yaşanan gerilim olaylarına ait karakteristik değerler ve benzetim sonuçları.

Olay Durumu	Tanım Faz Türü	Kaynak Gerilimi (V)	Gerilim Düşümü			Telafi Gerilimi (V)
			Sistem Gerilim Değeri (V)	Oranı	Süresi (ms)	
1	A	0	0	1pu	100	0
	B	0	0	1pu	100	0
	C	0	0	1pu	100	0
2	A	400	220	0.55pu	150	180
	B	400	220	0.55pu	150	180
	C	400	220	0.55pu	150	180
3	A	400	243	0.61pu	300	157
	B	400	270	0.67pu	300	130
	C	400	286	0.71pu	300	114
4	A	400	351	0.88pu	350	49
	B	400	400	1pu	350	0
	C	400	421	1.05pu	350	-21
5	A	400	640	1.6pu	200	-240
	B	400	640	1.6pu	200	-240
	C	400	640	1.6pu	200	-240

5. Sonuçlar

Bu makale çalışmasında, şebekede yaşanan gerilim değişim olaylarının düzenlenmesi için DVR tasarımı ve benzetimi gerçekleştirilmiştir. DVR'nin benzetimde, güç sisteminde arıza kayıtlarına geçen gerçek gerilim düşümü ve yükselme olaylarına yer verilmiştir. Dağıtım şebekesi alçak gerilim kısmında meydana gelen hatalar sonucu oluşan gerilim değişimlerine ilişkin şebekede yaşanan beş farklı durum olayını benzetimi yapılmıştır. Dağıtım şebekesi alçak gerilim kısmında meydana gelen; dengeli/dengesiz gerilim düşümü ve yükselmesi

durumların benzetim alıřmaları yapılarak incelenmiřtir. DVR'nin gerilim dūřümü ve yükselmesi durumunda etkin, verimli ve dinamik bir gü cihazı olduėu simülasyon sonuçlarından görölmektedir. Sonuç olarak tasarlanan DVR sistemdeki dengeli ve dengesiz gerilim deėiřim olaylarını düzenleme kabiliyetine sahiptir. Elde edilen benzetim sonuçları göstermektedir ki DVR'in gerilim telafisi yaparak yükü korumakta ve yük gerilimini nominal seviyede tutmaktadır.

ÖZET

Konaklama işletmeleri içerisinde önemli bir yere sahip olan oteller, nitelikli insan gücüne ihtiyaç duyan işletmelerdir. Bu kapsamda işletmeler, nitelikli çalışanların işe alınmasının yanı sıra mevcut çalışanların işletme ile olan ilişkisinin sürekliliğine de eğilim göstermek durumundadırlar. Otel işletmelerinde iş tatmini ve performans üzerinde etkili olan unsurların incelenmesi insan kaynakları stratejileri geliştirilmesinde işletmelere önemli ipuçları sunacaktır. Örgütsel adaletin, örgütsel değişkenler üzerindeki etkisine yönelik literatürde araştırmalar yer almaktadır. Özellikle rekabetin yoğun olduğu sektörlerde örgütsel adalet araştırmalarının sayıca artırılması yararlı olacaktır. Araştırma, örgütsel adaletin iş tatmini ve öz değerlendirme performansı üzerindeki etkisine odaklanmaktadır. Araştırmada performans ölçümü, çalışanların öz değerlendirmelerine bağlı olarak ölçülerek bağımsız bir ölçüm geliştirilmek istenmiştir. Araştırmanın evrenini Antalya'daki beş yıldızlı otel işletmelerinin çalışanları oluşturmaktadır. İşletmelerin seçiminde kolayda örneklem yöntemi kullanılmıştır. Araştırmada önerilen model doğrultusunda belirlenen hipotezler test edilmiştir. Araştırmanın örneklem sayısı 389 anket formunda yer alan verilerden yola çıkarak değerlendirilmiştir. Önerilen yapısal modeli test etmek için Smart PLS kullanılmıştır. Yol analizi sonuçları incelendiğinde, örgütsel adaletin iş tatmini ve öz değerlendirme performansı üzerinde anlamlı pozitif etkisi olduğu sonucuna ulaşılmıştır (H₁ ve H₂). Araştırmada ayrıca örgütsel adaletin dağıtım, etkileşim ve prosedür adaleti boyutlarının hem iş tatmini (H1a, H1b, H1c) hem de öz değerlendirme performansı (H2a, H2b, H2c) üzerinde anlamlı pozitif etkisi olduğu sonuçlarına ulaşılmıştır. Araştırma sonuçları ile otel işletmelerine birtakım öneriler sunulmaya çalışılmıştır.

Anahtar Kelimeler: Örgütsel adalet, iş tatmini, performans.

THE EFFECT OF ORGANIZATIONAL JUSTICE ON JOB SATISFACTION AND PERFORMANCE: AN APPLICATION ON 5-STAR HOTEL EMPLOYEES

ABSTRACT

Hotels, which have an important place in accommodation businesses, are businesses that need qualified manpower. In this context, businesses have to tend to the continuity of the relationship of existing employees with the business, as well as hiring qualified employees. Examining the factors that affect job satisfaction and performance on hotel businesses will provide important clues to businesses in developing human resources strategies. There are researches in the literature on the effect of organizational justice on organizational variables. It would be beneficial to increase the number of organizational justice researches, especially in sectors where competition is intense. The research focuses on the effect of organizational justice on job satisfaction and self-assessed performance. In the research, it was desired to develop an independent measurement by measuring the performance measurement depending on the self-evaluation of the employees. The population of the research consists of the employees of the five-star hotel businesses in Antalya. Convenience sampling method was used in the selection of the enterprises. The hypotheses, determined in line with the model proposed in the research, were tested. The sample number of the study was evaluated based on the data in the questionnaire form of 389. Smart PLS was used to test the proposed structural model. When the path analysis results were examined, it was concluded that organizational justice had a significant positive effect on job satisfaction and self-assessed performance (H1 and H2). In the research, it was also concluded that the distributive, interactional and procedural justice dimensions of organizational justice had significant positive effect on both job satisfaction (H1a, H1b, H1c) and self-assessed performance (H2a, H2b, H2c). With the results of the research, some suggestions were tried to be presented to the hotel businesses.

Keywords: Organizational justice, job satisfaction, performance.

1. GİRİŞ

Bir çalışan ile görev yaptığı işletme arasındaki ilişkinin temelinde karşılıklı fayda sağlamak amacı vardır. Buna göre bir çalışan işletmesinden kendileri için değer yaratacak faaliyet ve düzenlemeler arzularken işletmeler, çalışanlarından işletmeyi amaçlarına ulaştıracak güçlü bir performans beklentisi içerisindedirler. Günümüzde birçok işletme, amaçlarına ulaşmak adına, çalışan performansının, tatminin ve adanmışlığın önemini kabul etmektedirler (Shmailan, 2015). Ayrıca literatürdeki araştırmalar, iş tatmini ile performans arasındaki ilişkiyi ortaya koymaktadır (Ziegler vd., 2012; Bakotić, 2016). İş tatmini, bir çalışanın beklentilerine uygun çalışma koşullarının yanı sıra değer ve eşitlik değerlendirmelerini de kapsamaktadır (Liu vd., 2016). Diğer ifadeyle iş tatmini, çalışma ortamındaki doğru ve adil uygulamalara yönelik değerlendirmeleri de içeren geniş bir konseptte dayanmaktadır. Literatürde örgütsel adalet-iş tatmini (Clay-Warner vd., 2005; Al-Zu'bi, 2010; Ghnan vd., 2019) ve örgütsel adalet-performans (Wang vd., 2010; Conlon vd., 2013; Yu vd., 2020) arasındaki ilişkilere yönelik araştırmalar yer almaktadır. Bu araştırmaların artırılması önemlidir. Zira örgütsel araştırmaların (örgütlerin kültür, çalışma prensipleri, yönetim anlayışı, kamu-özel statüleri, sektör özellikleri gibi birçok açıdan birbirlerinden farklı olmaları nedeniyle) farklı sektör ve kültürlerde araştırılması ve sonuçların öncül çalışmalarla karşılaştırılması hem uygulayıcılara hem de araştırmacılara önemli bilgiler sağlayacaktır. Ayrıca çalışanların iş tatmini ve performanslarının rekabetin yoğun olduğu sektörlerde daha fazla incelenmesi ve sonuçlarının ortaya konulması önem taşımaktadır.

Bu doğrultuda araştırma, örgütsel adaletin iş tatmini ve performans üzerindeki etkisine odaklanmaktadır. Araştırmada, örgütsel adalet, literatürle uyumlu olarak, dağıtım, prosedür ve etkileşim boyutlarıyla ele alınmıştır. Performansın ölçümünde ise çalışanların kendilerini değerlendirmesine dayanan öz değerlendirme yöntemi kullanılmıştır. Araştırma sonuçlarının başta otel işletmeleri olmak üzere hizmet sektöründe yer alan işletmelere önemli katkılar sağlayacağı düşünülmektedir.

2. KAVRAMSAL ÇERÇEVE

2.1. Örgütsel Adalet

Örgütsel adalet, bireyin içerisinde yer aldığı örgütüne ilişkin adalet algılarını yansıtmaktadır (Greenberg, 1996; Hoy ve Tarter, 2004: 250; Colquitt vd., 2013: 4). Örgütsel adalet, bir çalışanın, yönetim kararlarının ve uygulamalarının ne derece adil olduğuna ilişkin algılarına atıfta bulunur. Bu algılar, çalışanların yönetime karşı tutumları üzerinde etkili olabilmektedir (Yean ve Yusof, 2016: 798-799). Örgütsel adalet ayrıca güven, bağlılık, iş performansı ve

müşteri tatmininin artması, daha yardımsever vatandaşlık davranışları sergilenmesi ve örgütsel çatışmanın azaltılması gibi örgütler ve çalışanlar açısından potansiyel faydalar oluşturabilir (Cropanzano vd., 2007). Literatürde örgütsel adaletin yaygın olarak dağıtım, prosedür ve etkileşim adaleti olmak üzere üç boyutta incelendiği görülmektedir (Colquitt ve Greenberg, 2003; Jafari ve Bidarian, 2012). Buna göre dağıtım adaleti, bir çalışanın örgütünden elde ettiği sonuçların algılanan adaletini yansıtmaktadır (Al-Zu'bi, 2010: 103). Diğer ifadeyle bir çalışan, işyerinden “elde ettikleri” ile “verdiklerinin” adillğini kıyaslamaya başvurur ve bu kıyaslama sonuca ilişkin beklenti değerlendirmesine dayanır. Buna göre dağıtım adaleti esasen mübadele prensibine dayanmaktadır (Lambert, 2003: 156-157). Prosedür adaleti ise sonuçları belirlemek için kullanılan prosedürlerin adillğinin sorgulanmasına dayanmaktadır. Bir çalışan, prosedürlerin işleyişine ilişkin sahip olduğu inançlar doğrultusunda adalet değerlendirmesi yapmaktadır (Karriker ve Williams, 2009: 114). Prosedür adaletinde çalışan, kararların ve sonucu belirlemek için kullanılan süreç ve araçların doğruluğuna ve adillğine odaklanır (Fernandes ve Awamleh, 2006: 703). Dağıtım adaleti, sonucun kendisinin algılanan adaletini yansıtırken, prosedür adaleti, sonucu belirlemek için kullanılan araç ve prosedürlerin algılanan adaletine dayanmaktadır (Viswesvaran ve Ones, 2002: 193). Son olarak etkileşim adaleti, kişilerarası ilişki süreçlerinin kalitesine, kuruluşun bireylere yönelik davranışlarına ve sonucun arkasındaki nedenlerin ne ölçüde açıklandığına yönelik algıları yansıtmaktadır (Bies and Moag, 1986, Ghosh vd., 2014).

2.2. İş Tatmini

Bir çalışanın işinden tatmin ya da tatminsizlik yaşaması muhtemeldir. İş tatmini, çalışanın beklentileri ile elde ettiği sonuçların karşılaştırmasına dayanmaktadır. Bu karşılaştırma neticesinde çalışanın olumlu duygulara sahip olması iş tatminini yansıtmaktadır (Jalagat, 2016: 37). İş tatmini, bir çalışanın işine yönelik duygusal değerlendirmelerini içermektedir (Zhu, 2013: 294). İş tatmini ayrıca bir çalışanın iş deneyimlerindeki değer ve eşitliğe ilişkin değerlendirmelerini ve bunun sonucunda beklentilerini karşılayan çalışma koşullarına ilişkin olumlu duygusal tepkilerini yansıtmaktadır (Liu vd., 2016: 87). Abou Elnaga ve Imran (2014), işyerinde iş tatmini ve yüksek düzeyde verimlilik açısından çalışanların güçlendirilmesi yoluyla özgüvenlerinin ve güven seviyelerinin artırılması gerektiğini ifade etmişlerdir. Koustelios (2001), çalışanların iş tatminini daha iyi açıklayabilmek için bireysel faktörlerin yanı sıra örgütsel değişkenlerin etkilerinin dikkate alınması gerektiğine işaret etmiştir. Weiss (2002: 173) iş tatmininin, işin değerlendirilmesi, işe yönelik inançlar ve işe yönelik duygusal deneyimler olmak üzere birbirleriyle ilişkili ancak birbirlerinden farklı üç temel yapıyla

açıklanabileceğini savunmaktadır. İş tatmini, bireyin gelecekte elde edilmesi veya kaçınılması gereken olumlu ve olumsuz sonuçların etkileyciliğiyle ilişkili anlayışa atıfta bulunabilir. Ayrıca bir çalışanın iş tatmini veya tam tersi tatminsizlik yaşamaları işletme içerisinde bazı etkiler ortaya çıkarabilir. Örneğin devamsızlık, şikayet, sağlık sorunları ve işten ayrılma niyeti genellikle tatminsizlikle ilişkilendirilmektedir (Schmidt, 2007: 483).

2.3. Öz değerlendirme Performansı

Performans, örgütlerin amaçlarına ulaşmak adına minimum kaynak kullanımı ile hedefe ulaşmalarını ifade etmektedir (Ghalem vd., 2016). Hedeflere ne ölçüde ulaşıldığı ise performansın ölçümüne bağlıdır. Literatürde performans ölçümüne yönelik araştırmaların bir kısmında öz değerlendirme performans ölçüm yönteminin incelendiği görülmektedir (Truxillo vd., 2008; Engelberg vd., 2011; Kifor vd., 2022). Öz değerlendirme, kişinin kendisine yönelik algılarını yansıtmaktadır. Örneğin, kişi yetenekli olduğuna ilişkin bir algıya sahipse bunu kendi iç dünyasında raporlayacaktır (Lorini vd., 2020). Öz değerlendirmede kişiler beklentileri ile performanslarını karşılaştırarak görevdeki ilerlemeleri konusunda içsel değerlendirmeler yapmaktadırlar (Andrade ve Valtcheva, 2009: 14). Panadero vd. (2019: 152), performans üzerine düşünme eyleminin sonraki performans üzerinde olumlu etkiler oluşturmasının muhtemel olduğunu bu durumun kişinin kendisini değerlendirmesinin kendi performansı üzerine düşünmesinden ve kendisine verdiği skorları zihninde bir puanlama tablosuna yerleştirmesinden kaynaklandığını belirtmişlerdir. Öz-değerlendirme, davranışın içsel gözlemlenmesi, değerlendirilmesi ve tepki verilmesi sürecidir. Bu yöntem, performansın sadece ölçülmesiyle sınırlı olmayıp, bununla birlikte performansın yorumlanmasını da içermektedir (Bose vd., 2001).

3. KURAMSAL ÇERÇEVE

Al-Zu'bi (2010), çok sayıdaki elektrik sanayi şirketinin 229 çalışanı ile gerçekleştirdikleri araştırmada, örgütsel adalet ile iş tatmini arasında pozitif bir ilişki olduğu sonucuna ulaşmış ve ayrıca örgütsel adaletin iş tatmininin önemli bir belirleyicisi olduğu değerlendirmesini yapmıştır. Fernandes ve Awamleh (2006), örgütsel adalet boyutlarının iş tatmini ve öz değerlendirme performansı üzerindeki etkilerini incelemişlerdir. Araştırmaya Birleşik Arap Emirlikleri vatandaşları ile yabancı çalışanlar katılmış, değişkenler arasındaki etkiler her iki katılımcı grubu için ayrı ayrı raporlaştırılmıştır. Araştırmada, Birleşik Arap Emirlikleri vatandaşları için, dağıtım ve etkileşim adaletinin iş tatminini anlamlı olarak etkilediği, prosedür adaleti ile iş tatmini arasında ise anlamlı ilişkiye rastlanılmadığı sonucu elde edilmiştir. Araştırmada ayrıca yabancı çalışanlar için örgütsel adaletin her üç boyutunun iş

tatmini üzerinde anlamlı etkilere sahip olduğu sonuçları paylaşılmıştır. Sia ve Tan (2016), Metropolitan Cebu/Filipinler’de dokuz otelin 13 farklı departmanından toplanan verilere dayanarak, örgütsel adaletin dağıtım ve etkileşim adaleti boyutlarının çalışanların iş tatminini pozitif yönde etkilediğini, prosedür adaletinin ise iş tatmini üzerinde anlamlı bir etkiye sahip olmadığını ifade etmişlerdir.

Buna göre aşağıdaki hipotezler geliştirilmiştir.

H1: Örgütsel adaletin iş tatmini üzerinde anlamlı pozitif etkisi bulunmaktadır.

H1a: Örgütsel adaletin dağıtım adaleti boyutunun iş tatmini üzerinde anlamlı pozitif etkisi bulunmaktadır.

H1b: Örgütsel adaletin etkileşim adaleti boyutunun iş tatmini üzerinde anlamlı pozitif etkisi bulunmaktadır.

H1c: Örgütsel adaletin prosedür adaleti boyutunun iş tatmini üzerinde anlamlı pozitif etkisi bulunmaktadır.

Elamin ve Alomaim (2011), Suudi Arabistan vatandaşları ile yabancı işçilerin örgütsel adalet algılarının iş tatmini ve performans (kişisel algılanan performans) üzerindeki etkilerini farklı kuruluşlarda Suudi vatandaşı olan ve olmayan 793 çalışandan topladıkları verilere göre incelemişlerdir. Araştırmada performansa ilişkin sonuçlar incelendiğinde, Suudi çalışanlar için örgütsel adaletin hiçbir boyutunun kişisel algılanan performansla bir ilişki göstermediği, buna karşılık yabancı çalışanlar için tüm örgütsel adalet boyutlarının kişisel algılanan performansını anlamlı şekilde etkilediği sonuçları paylaşılmıştır. Fernandes ve Awamleh (2006), Birleşik Arap Emirlikleri vatandaşları için, dağıtım ve etkileşim adaletinin öz değerlendirme iş performansı üzerinde anlamlı etkiye sahip olduğu buna karşılık prosedür adaletinin öz değerlendirme iş performansı ile anlamlı bir ilişki göstermediği sonuçlarını paylaşmışlardır. Araştırmada yabancılar için örgütsel adaletin hiçbir boyutunun öz değerlendirme performansı üzerinde anlamlı bir etki ortaya çıkarmadığı sonuçları elde edilmiştir.

Buna göre aşağıdaki hipotezler geliştirilmiştir.

H2: Örgütsel adaletin öz değerlendirme performansı üzerinde anlamlı pozitif etkisi bulunmaktadır.

H2a: Örgütsel adaletin dağıtım adaleti boyutunun öz değerlendirme performansı üzerinde anlamlı pozitif etkisi bulunmaktadır.

H2b: Örgütsel adaletin etkileşim adaleti boyutunun öz değerlendirme performansı üzerinde anlamlı pozitif etkisi bulunmaktadır.

H2c: Örgütsel adaletin prosedür adaleti boyutunun öz değerlendirme performansı üzerinde anlamlı pozitif etkisi bulunmaktadır.

4. YÖNTEM

Çalışma örgütsel adalet ve boyutlarının (dağıtım, etkileşim, prosedür) iş tatmini ve öz değerlendirme performansı üzerindeki etkilerini ölçmek amacıyla gerçekleştirilmiştir. Araştırmanın evrenini Antalya'daki beş yıldızlı otel işletmelerinin çalışanları oluşturmaktadır.

Şekil 1: Araştırma Model Önerisi

Araştırmada, verilerin toplanması anket tekniği kullanılarak gerçekleştirilmiştir. Araştırmada veri toplamak için Antalya'da yer alan beş yıldızlı otel işletmelerinin çalışanları seçilmiştir. Bu işletmelerin seçilmesinde kolayda örneklem yöntemi kullanılmış ve çalışmaya katılmak için gerekli izinler alınmıştır. Verilerin toplanması için araştırmanın detayları çalışanlara anlatılmış ve tüm soruların yanıtlanması sağlanmıştır. Anketler yüz yüze gerçekleştirilmiştir. Hair vd. (2018) gözlemlenen her ifade için en az 5 katılımcıya sahip olunması gerektiğini belirtmişlerdir. Bu nedenle 31 ifadeden oluşan 5 yapı için gereksinimi karşılayan bir örneklem büyüklüğünü hedeflenmiş ve örneklem sayısı 400 anket formunda yer alan verilerden yola çıkarak değerlendirilmiştir. Eksik ve hatalı veriler neticesinde 11 anket değerlendirmeden çıkartılmış ve çalışmada 389 anket analize tabi tutulmuştur. Çalışma kapsamında veriler, modelde belirlenen örgütsel adalet ve boyutları (dağıtım, etkileşim, prosedür) iş tatmini, öz değerlendirme performansı ve demografik soruları kapsayan bir anketle oluşturulmuştur.

	Kategoriler	n	%
Cinsiyet	Kadın	182	46.8
	Erkek	207	53.2
Yaş	18-24	131	33.7
	25-34	173	44.5
	35-44	68	17.5
	45-54	17	4.4
Eğitim	İlköğretim	17	4.4
	Lise	79	20.3
	Ön lisans	159	40.9
	Lisans	125	32.1
	Lisansüstü	9	2.3
Gelir Algısı	Çok Düşük	143	36.8
	Düşük	127	32.6
	Orta	107	27.5
	Yüksek	8	2.1
	Çok Yüksek	4	1.0

Katılımcıların %46,8'i kadın (n: 182), %53,2'si erkektir (n: 207). Katılımcıların yaş aralığının %44,5'i (n: 173) 25-34 aralığındadır. Çalışanların %40,9'u (n: 159) ön lisans mezunudur. Katılımcıların gelir algılarına bakıldığında, %36,8'i (n: 143) kendisinin çok düşük düzeyde gelire sahip olduğunu belirtmiştir.

4.1. Ölçekler

Anket ifadeleri daha önceki araştırmalarda doğrulanmış ve güvenilir olduğu gösterilen çok maddeli ölçümlerden oluşturulmuştur. Dağıtım, etkileşim ve prosedür adaleti, Niehoff ve Moorman (1993) tarafından geliştirilen ölçekler kullanılarak ölçülmüştür. Dağıtım adaleti boyutu 5 ifadeden oluşmaktadır. Prosedür adaleti boyutu benzer şekilde 5 ifadeden oluşmaktadır. Örgütsel adaletin son boyutu olan etkileşim adaleti ise 9 ifadeden oluşmaktadır. Bağımlı değişkenleri ölçmek için iki değişken benimsemiştir. Bu değişkenler Fernandes ve Awamleh (2006) tarafından geliştirilmiş ve doğrulanmıştır. İş tatmini, örgütsel davranış araştırmalarında kullanılan alanları kapsayan 7 ifadelik bir ölçekle değerlendirilmiştir. Öz değerlendirme performans ölçeği ise 5 ifadeden oluşmaktadır. Bu ölçeklerin tamamı bir ankete dahil edilmiştir. İfadelerin tamamında beşli likert tipi ölçek kullanılmıştır.

4.2. Veri Analizi

Araştırmanın veri analizi için SmartPLS4 istatistik analizi kullanılmıştır. PLS ölçüm modeli değerlendirilirken iç tutarlılık güvenilirliği, yakınsak geçerlilik ve ayırt edici geçerlilik analizleri kullanılmıştır (Çavuşoğlu, 2021a). İç tutarlılık güvenilirlik analizi için Cronbach Alpha (α), bileşik güvenilirlik (rho_c ve rho_a) kullanılmıştır. Yakınsaklık geçerliliği için faktör yükleri (λ), Ortalama açıklanan varyans (AVE), diskriminant (ayrım) geçerliliği için Fornell-Larcker Kriteri kullanılmıştır. Yapısal model değerlendirilirken InnerVIF ve yol analizi yapılmıştır (Çavuşoğlu, 2021b).

4.3. Ölçüm Modeli Sonuçları

Modelde yer alan ölçümlerin α , rho_c ve rho_a değerlerinin 0,70'in üzerinde olduğu (Hair vd., 2019) ve modelin iç tutarlılık ve güvenilirliğe sahip olduğu görülmüştür.

Tablo 1: Güvenirlik ve Geçerlik

<i>Ölçekler</i>	λ	<i>t-</i> <i>statistics</i>	rho_c	rho_a	AVE
Dağıtım Adaleti($\alpha=0.87$)

3 ÖDP3	0.789	24.721			
4 ÖDP4	0.827	31.146			
5 ÖDP5	0.802	29.966			

NFI=0,88; SRMR=0,036; $\chi^2=1336.108$

Yakınsak geçerliliği belirlemek için AVE değerleri hesaplanmıştır. AVE değerleri (Hair vd. 2019) 0,50'nin üzerindedir. Böylece araştırma modeli yakınsak geçerliliğe sahiptir. Ayrıca maddelerin faktör yükleri 0.50'nin üzerindedir (Kaiser, 1974). Böylece, araştırma modeli yapı geçerliliğine sahiptir (bkz. Tablo 1).

Ayrt edici geçerliliği değerlendirmek için temel bir kural olarak, Fornell ve Larcker (1981), 0,50 veya daha fazla puanla AVE'nin kullanılmasını önermiştir. Yeterli ayrt edici geçerliliği elde etmek için, AVE'nin karekökü, gizli yapılar arasındaki korelasyonlardan daha büyük olmalıdır (Fornell ve Larcker, 1981). Tablo 2'de, yapılar arasındaki korelasyonlar, çıkarılan ortalama varyansların karekökü ile karşılaştırılmıştır (değerler kalın harflerle yazılmıştır). SmartPLS'den elde edilen sonuç, çıkarılan ortalama varyansların karekökünün, gizli yapılar

arasındaki korelasyonlardan daha büyük olduğunu ve bu da yeterli ayırt edici geçerliliği olduğunu göstermektedir (Garson, 2016).

Tablo 2: Ayrışma Geçerliliği (Fornell-Larcker)

Değişkenler	1	2	3	4	5
Dağıtım Adaleti	0,800				
Prosedür Adaleti	0,612	0,818			
Etkileşim Adaleti	0,587	0,623	0,781		
İş Tatmini	0,593	0,608	0,547	0,761	
Öz Değerleme Performansı	0,542	0,621	0,598	0,608	0,806

4.4. Yapısal Model Sonuçları

Araştırma modelinde yer alan iki veya daha fazla gizil değişkenin çoklu bağlantı probleminde olmadığını ve varyansı artırmadığını belirlemek için InnerVIF değerleri incelenmiştir. InnerVIF 5'ten düşük çıkmıştır ve çoklu bağlantı sorunu bulunmadığı tespit edilmiştir (Smith vd., 2020) (bkz. Tablo 3). Hipotezler yapısal eşitlik modellemesi ile analiz edilmiştir.

Tablo 3: Yapısal Eşitlik Modeli Sonuçları

Hipotezler Model	β	S.S.	t-değeri	VIF	p-değeri
H ₁ Örgütsel Adalet>>>İş Tatmini	0,783	0,050	9,875	2.362	0,000***
H _{1a} Dağıtım Adaleti>>>İş Tatmini	0,439	0,035	5,810	3.123	0,000***
H _{1b} Etkileşim Adaleti>>> İş Tatmini	0,524	0,040	7,154	1.054	0,000***
H _{1c} Prosedür Adaleti>>> İş Tatmini	0,647	0,045	8,124	2.449	0,000***
H ₂ Örgütsel Adalet>>> Öz Değerleme Performansı	0,771	0,034	9,456	3.014	0,000***
H _{2a} Dağıtım Adaleti>>> Öz Değerleme Performansı	0,643	0,031	8,115	2.168	0,000***
H _{2b} Etkileşim Adaleti>>> Öz Değerleme Performansı	0,489	0,030	5,984	3.478	0,000***
H _{2c} Prosedür Adaleti>>> Öz Değerleme Performansı	0,578	0,042	7,269	2.235	0,000***

$p < 0.001$ ***, $p < 0.01$ ** , $p < 0.05$ *

Yol analizi sonuçları incelendiğinde, örgütsel adaletin iş tatmini ve öz değerlendirme performansı üzerinde anlamlı pozitif etkisi olduğu sonucuna ulaşılmıştır (H₁ ve H₂). Araştırmada ayrıca örgütsel adaletin dağıtım, etkileşim ve prosedür adaleti boyutlarının hem iş tatmini (H_{1a}, H_{1b}, H_{1c}) hem de öz değerlendirme performansı (H_{2a}, H_{2b}, H_{2c}) üzerinde anlamlı pozitif etkisi olduğu sonuçlarına ulaşılmıştır.

5. SONUÇ, TARTIŞMA ve ÖNERİLER

Araştırmada, örgütsel adaletin ve örgütsel adaletin dağıtım, prosedür ve etkileşim adaleti boyutlarının iş tatmini ve öz değerlendirme performansı üzerindeki etkileri incelenmiştir. Model önerisi doğrultusunda oluşturulan hipotezler yapısal eşitlik modellemesi ile analiz edilmiştir. Araştırmada örgütsel adaletin ve örgütsel adaletin dağıtım, prosedür ve etkileşim adaleti boyutlarının iş tatmini üzerinde anlamlı pozitif etkiye sahip olduğu sonuçlarına ulaşılmıştır. Elde edilen sonuçlar literatürle kısmen tutarlılık içermektedir (Fernandes ve Awamleh, 2006; Al-Zu'bi, 2010; Sia ve Tan, 2016). Sonuçlar ayrıca örgütsel adaletin iş tatmininin önemli bir belirleyicisi olduğunu ortaya koymaktadır. Buna göre bir çalışan, çalışma programının, iş

yükünün ve işle ilgili alınan kararların tüm çalışanlara adil ve tutarlı şekilde uygulandığına inandığında, alınan kararlara karşı itiraz hakkına sahip olduğunda ve işletmede alınan her türlü kararda çalışanın kişisel ihtiyaçlarına eğilim gösterildiğinde bu durum iş taminini olumlu yönde etkileyecektir.

Araştırmada, örgütsel adaletin ve üç boyutunun (dağıtım, prosedür ve etkileşim adaleti) öz değerlendirme performansı üzerinde anlamlı pozitif etkiye sahip olduğu sonuçları elde edilmiştir. Sonuçlar, literatürle kısmen tutarlılık içermektedir (Fernandes ve Awamleh, 2006; Elamin ve Alomaim, 2011). Buna göre bir çalışanın işyerinde örgütsel adalete ilişkin olumlu algılara sahip olması, kendi performans değerlemesi üzerinde olumlu bir etki ortaya çıkarmaktadır. Diğer ifadeyle örgütte çalışanlara saygılı davranıldığında, tüm kararlar çalışanlara açık ve net olarak aktarıldığında ve çalışan tarafından talep edilmesi durumunda onlara kararlar hakkında ilave bilgi paylaşıldığında, iş yükü, maaş ve çalışma programı konularında herkese adil davranıldığında bu durum çalışanın öz değerlendirme performansını olumlu yönde etkileyecektir. Araştırmada elde edilen sonuçlara bağlı olarak, otel işletme yöneticilerinin örgütsel adaletin sağlanması açısından duyarlı davranmaları yararlı olacaktır. Zira araştırmada örgütsel adalet ve örgütsel adaletin tüm boyutları hem iş tatmini hem de performansı üzerinde anlamlı bir etki ortaya çıkarmıştır. Bu kapsamda otel işletme yöneticilerine maaş, işyükü, fazla çalışma saatleri ve çalışma programlarının düzenlenmesinde herkese adil davranmaları, işe ilişkin kararlarda çalışanların fikirlerine önem vermeleri ve çalışanların alınacak kararlara dahil edilerek görüşlerinin alınması önerilmektedir. Bununla birlikte yöneticilere alınan ve uygulanan her türlü kararda tarafsız davranmaları, görev dağılımında şeffaf ve adil olmaları önerilmektedir. İşyerinde yetki ve sorumluluk denkliliğinin sağlanması, çalışan kaygılarının dikkate alınması ve onlara karşı nazik ve anlayışlı davranılması, işyerinde kararların tartışılabilmesi demokratik platformlar oluşturulması, her türlü kararın çalışan hakları gözetilerek uygulanması yararlı olacaktır. Yöneticilere son olarak çalışanların tatmin ve performanslarına odaklanmaları önerilmektedir. Bu kapsamda tatmin ve performansı olumsuz etkileyen bireysel ve örgütsel tüm faktörlerin araştırılması, tatminsizliğe neden olan ya da performansı olumsuz etkileyen unsurların tespit edilerek düzeltici önlemlere başvurulması yararlı olacaktır. Bu kapsamda yöneticilere etkili insan kaynakları stratejileri geliştirmeleri ve çalışan sorunlarına daha fazla eğilim göstermeleri önerilmektedir.

6. ARAŞTIRMANIN SINIRLILIKLARI VE GELECEK ARAŞTIRMALAR İÇİN ÖNERİLER

Arařtırma birtakım sınırlılıklar içermektedir. Arařtırmanın ilk sınırı arařtırmanın deęiřkenlerine iliřkindir. Arařtırmada iř tatmini ve performansın belirleyicisi olarak örgütsel adalete odaklanılmaktadır. Daha sonra yapılacak arařtırmalarda farklı deęiřkenlerin etkisinin incelenmesinin yararlı olacağına inanılmaktadır. Arařtırmada ayrıca performansın ölçümü, çalışanların öz deęerlendirmelerine baęlı olarak elde edilmiřtir. Daha sonra gerçekleştirilecek arařtırmalarda performans ölçümünün farklı bir ölçüm teknięi ile ölçülmesi yararlı olacaktır. Son olarak arařtırmanın farklı kültür, coęrafya ve sektörlerde gerçekleştirilmesinin arařtırma sonuçlarının karşılaştırılması açısından yararlı olacağına inanılmaktadır.

ÖZET

Küreselleşme ve artan teknolojik imkanlar neticesinde ivme kazanan yüksek yapılar, kullanıcı sayısının fazla olması sebebiyle bulunduğu alanda yoğunluğu arttırmaktadır. Bu durum kentler üzerinde *büyük etkilere* sebep olmaktadır. Teknik anlamda bu yapıların zorunlu olarak sağlanması gereken performans sınırlarının denetim altına alınması ise ilgili yönetmeliklerle sağlanmaktadır. Ancak bu yapıların kent ölçeğindeki etkileri düşünüldüğünde; tek tipleşme, kent kimliklerini değiştirme, kamusal açık alanların yok olması gibi problemlerle karşılaşmaktadır. Bahsedilen yüksek yapı ve kent ilişkisindeki sorunlarla başa çıkmak adına ise özellikle gelişmiş ülkelerde yüksek yapıların kente ve kentliye etkilerini kontrol altına alabilmek adına *yüksek yapı tasarım rehberleri* hazırlanmakta ya da bu konu *kentsel tasarım rehberleri* içerisine dahil edilmektedir. Bu rehberlerin amacı kentlerin karakterine zarar vermeyen, çevresindeki yapılardan farklılaşarak kentin işleyişinde önem kazanan yüksek yapıların tasarlanmasına yönelik yol gösterici kriterler ortaya koymaktır. Bu araştırmada bahsedilen rehberlerin kent yaşamı için ihtiyaç duyulan kamusal açık alanlara etkisi, bu yapıların kentlilere aktardığı mesajlar, bu yapıların yaya düzleminde kente müdahaleleri kapsamında bir değerlendirme yapılması hedeflenmiştir. Nitel araştırma yöntemlerinden veri toplama ve iz sürme metotları kullanılarak yurtdışında hazırlanmış yüksek yapı tasarım rehberleri ve yüksek yapılar hakkında veri içeren kentsel tasarım rehberleri incelenmiştir. Sonrasında ise Türkiye’de yüksek yapı üretimi konusunda uygulamada olan yönetmelik ve kanunların içerikleri derlenmiştir. Bulgular kısmında ise farklı ülkelerden derlenen 40 rehber kapsamında elde edilen tasarım başlıklarının Türkiye’den 7 adet yönlendirici doküman kapsamında mevcut olma durumları tartışılmıştır. İnceleme sonucunda farklı disiplinlere hitap eden ulusal dokümanlarda kentsel yaşamın gerekliliklerini barındıran kamusal açık alanlar, insan ölçeği, canlı sokaklar, sokak dokusu, karakter, manzara gibi konuların olmadığı gözlemlenmiştir. Bu çalışmanın özellikle tasarımcı aktörler için yararlı olacağı düşünülmektedir.

Anahtar Kelimeler: Yüksek yapılar, tasarım rehberleri, yönetmelikler, kentsel tasarım

DESIGN GUIDELINES FOR HIGH-STRUCTURES AND ASSESSMENT OF THE
SITUATION IN TURKEY

ABSTRACT

Tall buildings, which gain momentum as a result of globalization and increasing technological opportunities, increase the density in the area where they are located due to the high number of users. This situation has *great effects* on cities. Technically, the control of the performance limits that these structures must necessarily provide is provided by the relevant regulations. However, considering the effects of these structures on the urban scale, they encounter problems such as uniformization, changing urban identities, and the disappearance of public open spaces. To cope with the problems in the relationship between the high-rise building and the city, especially in developed countries, high-rise design guidelines are prepared, or this subject is included in the urban design guidelines in order to control the effects of high-rise buildings on the city and the citizens. The aim of these guidelines is to reveal guiding criteria for the design of high-rise buildings that do not harm the character of cities and gain importance in the functioning of the city by being different from the surrounding structures. In this research, it is aimed to make an evaluation within the scope of the effects of the guidelines mentioned in the public open spaces needed for urban life, the messages these structures convey to the citizens, and the interventions of these structures to the city on the pedestrian level. Tall building design guidelines prepared abroad and urban design guidelines containing data about high-rise buildings were examined by using data collection and tracing methods from qualitative research methods. Afterwards, the contents of the regulations and laws in practice on the production of high-rise buildings in Turkey were compiled. In the findings part, the availability of the design titles obtained within the scope of 40 guides compiled from several countries within the scope of 7 guiding documents from Turkey is discussed. As a result of the examination, it has been observed that there are no subjects such as public open spaces, human scale, active streets, street texture, character, landscape, which contain the requirements of urban life, in national documents addressing different disciplines. It is thought that this study will be especially useful for the actors who design.

Keywords: Tall buildings, design guidelines, regulations, urban design

GİRİŞ

Kent planlaması, sosyal, doğal ve fiziksel çevre arasındaki ilişkilerde meydana gelen sorunlara sistemli bir çözüm bularak, kentin ekonomik, fiziksel, toplumsal ve çevresel olarak gelecekte erişilmesi beklenen düzeye ulaşması için teorik ve uygulama çalışmalarının yapılması olarak ifade edilebilir (Aydemir vd., 2004: 357). İnsanların içinde yaşadıkları çevreye müdahale ederek şekillendirmeleri ilkel yerleşimlerden itibaren görülen bir durumdur ve kent planlamasının temellerini oluşturan bu davranışlar zaman içerisinde evrilerek günümüzdeki sanat ve bilimsel verilerle desteklenen bir disiplin haline almıştır. İkel dönemlerde yalnızca yakın çevresine müdahale eden insan, nüfus artışı ve artan yapıli çevreye kentsel tasarım ile tepki vermiştir. İnsanlar için mekan üretme sanatı olan kentsel tasarım, insanlar ile mekanlar, ulaşım ile kent formu, doğa ile yapıli çevre arasındaki bağlantıları ve başarılı kent ve alt yerleşimlerinin meydana gelme süreçleri ile ilintilidir (CABE, 2000). Kentsel tasarım yer, insan, nesne ve birçok diğeri ögenin etkileşim halinde olması neticesinde oluşan bir tasarım tavrıdır ve farklı dinamikleri barındırması sebebiyle kentlerin kendiliğinden oluşumuna fırsat verecek mekanizmalara olanak sağlamaktadır (Ulusoy ve Tokol, 2001).

Sanayi devriminin ardından ortaya çıkan üretim biçimleri ve küreselleşme, kent kimlikleri üzerinde farklı yapı tipleri ile kalıcı etkiler yaratmış, şehir merkezlerinde binaların kat adetleri artarak farklı fonksiyonların bir arada kullanıldığı karma kullanımlı yapılar üretilmiştir. Özellikle kentlerde yapılaşma alanları azaldıkça küçük arazi kullanımına sahip yüksek yapılar inşa edilmeye başlanmıştır. Yapılarda yükseklere ulaşmak; güç, itibar göstergesi olarak karşımıza çıktığı için her geçen gün sayıları daha çok artan bu tip yapılar geleneksel dokuya zarar vermekte ve kentlerde yoğunluğun artmasına sebep olmaktadır. Bu gelişmeler ardından “kentsel tasarım kavramının gelişerek önem kazanmasıyla beraber kentlerin birbirleri ile rekabet içine girmeleri ile sürdürülebilir, yaşanılabilir ve gelecek nesillere bırakılabilir kentlerin ortaya çıkmasını sağlamak için kentsel tasarımda kontrol ve uygulayıcı olarak kentsel tasarım rehberlerinin ortaya çıkması gerekliliği” gündeme gelmektedir (Arısu, 2018). Gelişmiş ülkelerde bu gereklilikler için ise kamusal alanlardaki değişimlerin yönetilmesi konusu üzerinde çalışmalar yapılmaya başlanmıştır (Özer ve Özer, 2021: 175).

Kentsel tasarımın yalnızca çekme mesafeleri, kat yükseklikleri, otopark sayıları gibi zorunlu olan yönetmeliklerde ve imar planlarında bulunan sayısal verilerle ifade edilemeyecek genişlikte bir kapsama sahip olması ve imar kanunları ile yönetmeliklerin kentlerin hızlı

gelişimi hakkında yeterli içeriğe sahip olmadığına anlaşılması üzerine kentsel tasarım kavramı altındaki bilgileri aktaracak destekleyici belgelerin oluşturulması gereksinimi doğmuştur. Böylelikle kanun ve yönetmelikler gibi yaptırımları olmayan ve tavsiye niteliğinde olan tasarım rehberleri ortaya çıkmıştır.

Yönlendirici standartlar veya tasarım rehberleri olarak ifade edebilecek, yerel yönetimler tarafından hazırlanan, tasarımsal hayal gücünü kısıtlamayan fakat kentteki yapıları belirli bir standardın üzerinde tutmayı amaçlayan yönlendiriciler, özgün ve kimlikli kentler yaratmak için kavramsal düzenleyicileri kullanan bir yöntemdir. İşlevsel, erişilebilir ve sürdürülebilir kentler yaratarak, yaşam kalitesinin arttığı, fiziksel ve psikolojik tüm gereksinimlere cevap verebilen yapılı çevre ve açık alanların kentsel tasarım rehberlerinin yardımıyla üretilmesi hedeflenmektedir (CABE, 2007). Tasarım rehberlerinin temel amaçları yaşanabilir, topluluk hissine sahip, kaliteli kamusal alanlar içeren, insan ölçeğine uygun, verimli, dayanıklı, uyarlanabilir, kimlikli, karakter sahibi, estetik, farklı etkinlikler içeren, karma kullanımlı, güvenli, erişilebilir, ulaşılabilir ve sürdürülebilir bir kent yaratmaktır. Bahsedilen bu amaçlar daha sonra farklı kentlerin bağlam ve yorumlamaları doğrultusunda ilkeler ve tasarım kriterlerine evrilmiştir (Asaad, Khalifa & Abd Elrahman, 2019)

Bir bütün yaratmak için cephe, malzeme, ulaşım, kamusal açık alan ve kent mobilyası gibi kenti oluşturan elementlerin birbirleriyle olan ilişkileri üzerinde durarak mekan tasarımında ortak bir dil kullanılmasını sağlamaya çalışan tasarım rehberleri, yerel olarak hazırlanmaları ve bölgenin ihtiyaçları doğrultusunda içeriklere sahip olmaları hasebiyle içerik olarak birbirinden ayrılmaktadır. Kentsel tasarım gibi geniş bir alana ait bilgiler içeren rehberlerin yanında açık kamusal alan tasarımı, yeşil alan tasarımı, kıyı bölgesi tasarımı, konut tasarımı ve yüksek yapı tasarımı gibi direkt olarak detaylara yönelik çözüm üreten rehberler mevcuttur. Bu rehberlerden kısaca bahsetmek gerekirse;

- En genel kapsamlı olan kentsel tasarım rehberleri (Urban Design Guidelines); kentin kimliği, özgünlüğü, kalitesi gibi yere ait özellikleri korurken, çevresel sürekliliği sağlayıp, yapılı çevre ve açık alanların birbirini destekleyerek bir bütünü oluşturması amacıyla hazırlanmaktadır (Arisu, 2018). Canlı kamusal alanlar ve kullanılan sokaklar sayesinde daha güvenli bir çevre oluşturmak ve bunlara katkı sağlayacak yapıların üretilmesi kentsel tasarım rehberlerinin diğer amaçlarındandır.
- Açık kamusal alan tasarım rehberleri (Public Open Spaces Design Guidelines); kentli ve gelen turistlerin sosyalleşme ihtiyaçlarının karşılanması ve özgün, nitelikli kamusal alanlar oluşmasına yöneliktir.

- Yeşil alan tasarım rehberleri (Green Spaces Design Guidelines); doğal yeşil alanların korunması ve kent içinde yeşil alanların oluşturulması amacıyla hazırlanmaktadır.
- Kıyı bölgesi tasarım rehberleri (Coastal Area Design Guidelines); kıyı şeridi ve o bölgeye hizmet eden bölümlerin planlanması ve gelişimi hakkında bilgiler barındırmaktadır.
- Konut tasarım rehberleri (Housing Design Guidelines); konut kullanıcılarının yaşam kalitesini arttırmak için yapı elemanlarına odaklanmaktadır.
- Yüksek yapı tasarım rehberleri (Tall Building Design Guidelines); yüksek yapıların çevreleriyle ilişkileri, komşu yapılara veya açık alanlara etkileri gibi konuları ele almaktadır.

Bu çalışmada yüksek yapı tasarımında yönlendirici özelliğe sahip tasarım rehberleri ve yönetmelikler araştırma odağına alınarak, nitel araştırma yöntemlerinden veri toplama ve iz sürme metotları kullanılarak dünyadan 40 ve Türkiye'den 7 adet yönlendirici belge incelenmiştir. İnceleme sonucunda Türkiye'de yüksek yapılar ve tasarım rehberleri hakkında veri içeren yönlendirici belgelerin içerikleri karşılaştırılmıştır.

DÜNYANIN FARKLI YERLERİNDE YAYIMLANMIŞ YÜKSEK YAPI TASARIMINA YÖNELİK REHBERLER

Yüksek yapılar, kent ile ilişki kurmaması, kendi başına var olarak çevresinden soyutlanması, ulaşım ve altyapılarda yoğunluk oluşturması, yüksekliği nedeniyle insan ölçeğinde ezici etki oluşturması gibi pek çok eleştiriye maruz kalan bir yapı tipidir. Bu nedenle içinde buldukları bağlama uygun tasarlanarak kentsel peyzaja, kalıplara, ölçeğe, sokak dokusuna, karaktere ve silüete uyumlu olarak ele alınmalıdırlar. Oluşabilecek sorunlara çözüm arayan yapılar, başarılı örnekler olup buldukları kente katkı sağlama potansiyeline sahiptir (Al-Kodmany, 2012). Dünyada pek çok metropol kent için yüksek yapıların çevresiyle uyumlu bir şekilde tasarlanmasını sağlayacak nitelikte kılavuzlar yayınlanmaktadır. Bu kılavuzlardaki içeriklerin yönlendirmeleri ile yüksek yapı tasarım sürecinde yapının kentle uyum sağlayarak bütünleşeceği mimari çözümler yapılabilmektedir. Bu kılavuzların amacı kentlerin karakterine zarar vermeyen, çevresindeki yapılardan farklılaşarak kentin işleyişinde önem kazanan yüksek yapılara yönelik yol gösterici bilgiler ortaya koymaktır.

Dünyada Amerika, Avustralya, Çin, Galler, Güney Afrika, İngiltere, Kanada ve Yeni Zelanda gibi pek çok ülkede örnekleri görülen kentsel tasarım ve yüksek yapı rehberleri, zorunlu olarak uyulması gereken yasalardan ziyade yol gösterici birer rehber niteliği

taşımaktadır. Bu sebeple hayal gücünü kısıtlamayıp daha iyiye ve güzele ulaşmayı amaçlarken yapıyı çevre ve açık alan tasarımının belirli bir standardın altına düşmesini engellemektedir. Yüksek yapıların tasarımı, 19. yüzyılın sonlarından bu yana kapsamlı bir şekilde gelişirken, günümüzde görülen en yaygın uygulamanın bir kule ve bir bazadan oluşan biçimlenme olduğu gözlemlenmektedir. Her ne kadar en yaygın kullanım alanı bulan biçimlenme bazalı yüksek yapılar olsa da yalnız kuleden oluşan yüksek yapılar da mevcuttur. Bazalı veya bazasız yüksek yapıların yapı zemini/baza, kule ve bitiş noktası olarak üç bölümden oluştuğunu kabul ederek incelemek daha net veriler elde edilmesini sağlamaktadır. Bütün yüksek yapılarda bu üç bölüm ayrı ayrı görülememekte, yapının tasarım özelliklerine bağlı olarak bu ayrımlar belirginleşip kaybolmaktadır. Yüksek bir yapının zemin katı ile bitiş noktasından beklenen tutum ve kaynaklanan sorunlar aynı değildir, bu nedenle de ayrı ayrı ele alınması çevre ilişkilerini kavramak açısından en faydacıl yöntemdir.

Çalışma kapsamında Dünyanın farklı yerlerinde yerel yönetimlerce yayınlanmış olan yüksek yapı tasarım rehberleri ve yüksek yapı tasarımlarını kentsel tasarım rehberleri içinde ele alan yönlendiriciler araştırılarak 40 adet rehberle ulaşılmıştır. Çin, Galler, Yeni Zelanda, Güney Afrika, Avusturalya, Amerika, İngiltere ve Kanada'da yapılmış olan bu yönlendirici standartların 21 tanesi kentsel tasarım rehberi olup içinde yüksek yapı tasarımına yönelik maddeler içermekteyken 19 tanesi yalnızca yüksek yapı tasarımına yönelik olarak hazırlanmıştır (Tablo 1).

Tablo 1. Ulaşılan Tasarım Rehberlerinin Ülke Bazındaki Sayısına Göre Sıralaması

Şehir/Bölge	Ülke	Tür	Yüksek Yapı Değerlendirmesi	Tarihi	Rehberlerdeki Konular
Hong Kong	Çin	Kentsel	bütüncül	2013	Cephe, Form, Yaya, Çevre ile İlişkiler, Kamusal
Cardiff	Galler	Yüksek Yapı	bütüncül	2013	Cephe, Form, Yaya, Çevre ile İlişkiler, Kamusal

Araştırma esnasında tasarım rehberlerinin bir kısmında yüksek yapıyı incelemek amacıyla yapı zemini/baza, kule ve bitiş noktasına ayırarak inceleme yönteminin kullanıldığı gözlemlenmiştir. Ulaşılan 40 tasarım rehberinden 14 tanesi yüksek yapıyı yapı zemini/baza, kule ve bitiş noktası olarak ele almış ve parçacıl bir yaklaşım ile daha doğru bir değerlendirme yapılabileceğini belirtmiştir. Geriye kalan 26 rehberin ise bütüncül bir yaklaşım ile yüksek

yapıyı inceleme yolunu tercih ettiği tespit edilmiştir. Ek olarak, detay başlıklar gruplandırıldığında kentsel ölçekte referans verilen konu kapsamı Cepheyi, Yapı Formunu, Yayıları, Çevre ile İlişkileri ve Kamusal Kullanımı Etkileyen Faktörler olarak karşımıza çıkmaktadır. Rehberlerin teknik niteliğinin yanında insan ölçeğine uygun tasarıma yönelik tavsiyeler içermesi yüksek yapı tasarımının etki ettiği konu başlıklarını da ortaya çıkarmaktadır.

Kent ile kuracağı ilişki ve çevre yapılar ile etkileşimi bakımından farklı ölçeklerde farklı etkilere sahip olan yüksek yapılar, kendilerinden beklenen tavır ve çevre ilişkileri bakımından bir bütün olarak her seviyede aynı tepkiyi vermemekte, üç ana bölüm olarak değerlendirilerek her kısımda bağımsız tutumlar sergilemektedir (Şekil 1). Örneğin yüksek yapıların silüete etki eden bitiş noktaları şehrin uzak mesafelerinden algılanırken, kent ile ilişki kuran zemin katlar yalnızca yapının yakın çevresinden görülebilmektedir. Bu nedenle hem farklı mesafelerden algılanışları hem de kente katılım biçimleri bakımından çeşitli etkilere sahip olan yüksek yapıların, yapı zemini, kule ve bitiş noktası olmak üzere üç parçadan oluştuğu kabul edilmektedir (Al-Kodmany, 2012). Kentteki etkileri ve neden olduğu sorunlar bakımından farklı çözümlere ihtiyaç duyan ve bir bütünü oluşturan parçaların ayrı ayrı ele alınması sayesinde detaylı bir inceleme yapılabilen, böylelikle daha iyi alternatiflerin üretilmesi sağlanmaktadır.

Şekil 1. Bitiş noktası, kule ve yapı zemini gösterimi ve etki alanları (Watford Borough Council, 2016).

Yurt dışında hazırlanan rehberlerde görülen ve yüksek yapılar incelenirken kullanılan üç bölüme ayırarak inceleme yöntemi sayesinde yapının farklı bölümlerinden beklentiler, ortaya çıkan sorunlar ve çözümleri kılavuzlarda daha net bir şekilde ifade edilmektedir. Binanın üç ayrı ölçeğe hitap eden bu üç bölümü kısaca, yapı zemini/bazası yaya alanına, bina kulesi çevredeki yapılara ve bitiş noktası da silüete etki etmektedir (Planning Staff of City of Hamilton, 2018) (Şekil 1). Biraz daha detaylandırmak gerekirse;

- **Bitiş Noktası;** Yüksek yapıların bitiş noktası uzak mesafeden görülen ve kent silüetine etki eden bölümdür (Şekil 2. a). Tepe noktası kule tasarımı ile bütünleşmeli ve tasarımı

güçlendirici özelliklere sahip olmalıdır. Yapının markasını, şehrin imajını ve silüetini doğrudan etkileme yetisine sahip olduğu için oldukça büyük önem taşımaktadır (Bristol City Council, 2018).

- **Kule;** Kulenin konumu, ölçeği, taban oturma alanı, yönü ve çekme mesafeleri çevresine karşı etkileri bağlamında gökyüzü görünümünü, mahremiyeti, rüzgarı ve kamusal alan ve çevre yapılarına ulaşan güneş ışığı miktarını ve gölge düşme sürelerini etkilemektedir (Toronto City Council, 2013). Bunlara ek olarak simgesel rol oynadığı için kule tasarımı yakın çevredeki kamusal alana ve uzak mesafede ufuk çizgisine etki etmektedir (Şekil 2. b) (Burlington City Council, 2017).
- **Yapı Zemini/Bazası;** Yapının sokak ve insan ile ilk temas kurduğu, ilk izlenimlerin oluştuğu bağlantı noktası olmakla beraber çevresiyle nasıl bütünleştiği ve nasıl etkileşime geçtiğini ifade ettiği bölümdür (Şekil 2. c) (Tower Hamlets City Council, 2018). Yapının zemindeki biçimlenişi, konum, yükseklik, hacim olarak insan ölçeği ve çevre yapılarla pozitif ilişki kurmalı, bina ile kamusal alan arasında etkileşim sağlamalıdır. Yüksek yapıların zeminle buluştukları noktada insan ölçeğinde nasıl algılandığı ve deneyimlendiği yapının başarılı ya da başarısız olarak sayılmasındaki en önemli etkidir, bu nedenle amaç insan ölçeğinde bir kamusal alan yaratmak olmalıdır (Bristol City Council, 2018).

Şekil 2. Yüksek yapıların (a) bitiş noktası; (b) kule; (c) Yapı zemini (URL-1)

TÜRKİYE'DE YÜKSEK YAPI TASARIMI İLE İLGİLİ YÖNETMELİKLER

Bugün Türkiye'de kullanılan yönetmeliklerde yüksek yapılar oldukça basit tanımlamalarla ifade edilmektedir. Yönetmelikler incelendiğinde bahçe çekme mesafeleri, binalar arası olması gereken mesafe, silüet etkisi, yapı strüktürü, çevresel etkisi, jeolojik ihtiyaçları, hava trafiği etkisi, genel ulaşım, yangın etkisi, deprem etkisi, altyapı etkisi, güneş ve rüzgara göre

çekme mesafeleri hakkında ifadeler yer aldığı görülmektedir. Yurt dışı örneklerinde kentsel tasarım rehberlerinin yüksek yapılar hakkında veri içermesi Türkiye'de yapılmış kentsel tasarım rehberlerinin araştırılması gerekliliğini doğurmuştur. Ancak görülmüştür ki bu konu hakkında yerel yönetimler herhangi bir çalışma yapmamıştır. Bu sebeple kentsel tasarım rehberleri hakkındaki durumun incelenmesi de bu araştırmanın konusuna dahil edilmiştir. Türkiye'de henüz kentler için hazırlanmış kentsel tasarım rehberlerinin yapılmamış olması sebebiyle yönetmeliklerde geçen kentsel tasarım rehberleri hakkındaki ifadelere yer verilmiştir.

Planlı Alanlar İmar Yönetmeliği (2017)

“Plan, fen, sağlık ve sürdürülebilir çevre şartlarına uygun yapı ve yapılaşma ile projelendirmeye ve denetime ilişkin usul ve esasları” belirlemek için yapılan bu yönetmelik uygulama imar planı bulunan alanları kapsamaktadır. Bu yönetmelikte bulunan Madde 4’ün, aaaaa Bendinde; “Yüksek Bina: Bina yüksekliği 21,50 metreden veya yapı yüksekliği 30,50 metreden fazla olan binaları (Bina yüksekliği 51,50 metreden veya yapı yüksekliği 60,50 metreden daha yüksek olan binalar çok yüksek yapılardır) ifade eder” denilerek yüksek bina tanımı yapılmıştır.

Yönetmelik dahilinde yüksek yapı tasarımı hakkında tesisat katlarının katlar alanına dâhil edilmeyeceği, ön, arka ve yan bahçe çekme mesafeleri, bazalı olması durumunda parsel yaklaşma mesafesi, bazanın kat sayısı ve büyükşehir tarafından siluet onayı alınması gerektiği bilgileri yer almaktadır.

Deprem Yönetmeliği, Ek, Deprem Etkisi Altında Binaların Tasarımı İçin Esaslar (2018)

Bu Yönetmelik, “yeni yapılacak binaların deprem etkisi altında tasarımı ile mevcut binaların değerlendirilmesi ve güçlendirme tasarımı” amacıyla hazırlanmıştır. Yüksek yapı tanımı “Tipik bir yüksek bina, genellikle zemine gömülü bodrum katlarının üstünde yer alan az katlı bir baza (podyum) ve onun üstünde yükselen bir kule bölümünden oluşur. Yüksek binaların çok büyük bir bölümü bu tanıma uymaktadır, ancak bazı yüksek binalarda baza olmayabilir” şeklindedir.

Yönetmelik dahilinde yüksek yapı tasarımı hakkında deprem ve rüzgar yüklerini karşılamak üzere sahip olması gereken taşıyıcı sistemi hakkında bilgiler içermektedir.

İzmir Büyükşehir Belediyesi Yüksek Yapı Yönetmeliği (2013)

Bu Yönetmelik, “Yüksek Yapıların tasarım, yapım ve denetim aşamalarında İzmir Büyükşehir Belediye Başkanlığı'nın kent bütününde eşgüdümlü ve uyumlu uygulamayı sağlamak üzere, ilgili kurum, kuruluş ve kurullar ile bu konudaki görev, yetki ve yöntemleri” belirlemek üzere

hazırlanmıştır. Yüksek yapı tanımı hakkında “Yüksek yapılar: Yüksek yapı, genel olarak yakın ve uzak çevresini, fiziksel çevre, kent dokusu ve her türlü kentsel altyapı yönünden etkileyen bir yapı (bina) türüdür. Son kat tavan döşeme kotu 30,80 metreyi ve/veya bodrum kat dahil olmak üzere toplam kat adedi 13’ü aşan (13 kat hariç) yapılar Yüksek Yapı olarak kabul edilir” ifadesi yer almaktadır.

Yönetmelik dahilinde yüksek yapı tasarımı hakkında çevresel ve şehir silueti etkisi, jeolojik yapının incelenmesi, hava trafiğinin incelenmesi, genel ve yangın ulaşım planlarının incelenmesi, altyapı bağlantısı ve kapasite durumunun incelenmesi, güneşin açılarına ve rüzgara göre çekme mesafelerinin incelenmesi, parsel çekme mesafeleri hakkında hükümler içermektedir.

İstanbul Yüksek Binalar Deprem Yönetmeliği (2008)

Bu Yönetmelikte “İstanbul Büyükşehir Belediyesi sınırları içinde yapılacak yüksek binaların, depreme karşı tasarımı için uygulanacaktır. Yüksek binalar, tamamı yer altında olan ve binayı tümü ile kuşatan yüksek yatay rijitlikli çevre perdelerine sahip bodrum katları hariç olmak üzere, en düşük yer seviyesinden itibaren yüksekliği en az 60 metre olan binalardır” ifadeleri yer almaktadır.

Yönetmelik dahilinde yüksek yapı tasarımı hakkında deprem hareketleri altında oluşabilecek farklı hasar türleri ve hesaplanması hakkında bilgiler içermektedir.

Bahsedilen yönetmelik maddeleri incelendiğinde yüksek yapıların mimari tasarım ve kentsel tasarım kararlarına yönelik çok kısıtlı ifadeler yer aldığı görülmektedir. Buradan anlaşılmaktadır ki Türkiye’de kullanılan yönetmelikler imar durumu, kat yüksekliği, çekme mesafeleri gibi yalnızca yapı performansına yönelik maddeler içermektedir. Türkiye’de görülen yüksek yapılar ile ilgili bu bilgi ihmali durumu kentsel tasarım rehberleri ile benzer kaderi paylaşmaktadır. Kent planlamaları yapılırken kentsel tasarım rehberlerinin hazırlanması konusunda bir gelişim gerçekleşmemiştir. Kentsel tasarım rehberleri hakkında da yönetmeliklerde kısıtlı veri yer almaktadır.

Mekânsal Planlar Yapım Yönetmeliği (2014)

Bu yönetmelik “fiziki, doğal, tarihi ve kültürel değerleri korumak ve geliştirmek, koruma ve kullanma dengesini sağlamak, ülke, bölge ve şehir düzeyinde sürdürülebilir kalkınmayı desteklemek, yaşam kalitesi yüksek, sağlıklı ve güvenli çevreler oluşturmak üzere hazırlanan, arazi kullanım ve yapılaşma kararları getiren mekânsal planların yapımına ve uygulanmasına ilişkin usul ve esasları” belirleme amacıyla hazırlanmıştır. Yönetmelik dahilinde kentsel tasarım rehberleri hakkında “İdare gerekli gördüğü alanlarda mekânın imge, anlam ve kimlik

kazanmasını, estetik ve sanat değerinin yükseltilmesini, yapıların bir uyum içerisinde ve bütünlük oluşturacak şekilde düzenlenmesini amaçlayan ve mekânsal planlama sistematığı içerisinde uygulamaya yönelik kılavuz ve tavsiye niteliğinde kararları içerecek şekilde kentsel tasarım rehberi hazırlayabilir” ifadesi yer almaktadır.

İmar Kanunu (1985)

Bu Kanun, “yerleşme yerleri ile bu yerlerdeki yapılaşmaların; plan, fen, sağlık ve çevre şartlarına uygun teşekkülünü sağlamak” için hazırlanmıştır. Kentsel tasarım rehberleri hakkında “Yerleşme ve yapılaşma özellikleri, mimari doku ve karakteri, gelişme düzey ve potansiyeli açısından önem arz eden köylerde bu özellikleri korumak, geliştirmek ve yaşatmak amacıyla muhtarlık katılımı ile ilgili idarelerce köy tasarım rehberleri hazırlanabilir. Köy tasarım rehberleri ilgili idare meclisi kararı ile onaylanır ve uygulanır” ifadesine yer verilmiştir.

Çevre ve Şehircilik Bakanlığınca Onaylanacak Kentsel Tasarım Projelerinin Hazırlanmasına ve Değerlendirilmesine İlişkin Yönerge (2018)

Bu Yönergenin amacı; “644 sayılı Çevre ve Şehircilik Bakanlığının Teşkilat ve Görevleri Hakkında Kanun Hükmünde Kararnamenin 2nci maddesi birinci fıkrasının (ğ) bendi uyarınca Bakanlıkça belirlenen finans ve ticaret merkezleri, (1) bendinde belirlenen alanlar, 6306 Sayılı Afet Riski Altındaki Alanların Dönüştürülmesi Hakkındaki Kanun ve bu Kanunun Uygulama Yönetmeliğinde tanımlanan uygulama alanları ile Çevre ve Şehircilik Bakanlığınca onaylanan imar planlarında kentsel tasarım projesi onay yetkisinin Bakanlık uhdesine alındığı alanlarda, ilgililerince mevzuat hükümleri doğrultusunda hazırlanarak Bakanlığa sunulacak Kentsel Tasarım Projelerinin incelenmesi, değerlendirilmesi ve onaylanmasına ilişkin usul ve esasları belirlemektir.” Kentsel tasarım rehberleri hakkında “Kentsel Tasarım Rehberi: Mekânın; imge, anlam ve kimlik kazanmasını, estetik ve sanat değerinin yükseltilmesini, yapıların bir uyum içerisinde ve bütünlük oluşturacak şekilde düzenlenmesini amaçlayan, kılavuz ve tavsiye niteliğinde kararları içeren belgeyi ifade eder” şeklinde bir tanım yapılmıştır.

İmar kanunu ve belediyelerin düzenlediği parsellerdeki yapılaşma, yalnızca hukuki anlamda veri sunarak tek yapı özelinde kalmakta ve yapılar veya kamusal alanlar arasında kurulması beklenen ilişkiler hakkında veri sağlamamaktadır. Arazi kullanım planları çevre kalitesi yönetiminde etkili veriler sağlasa da kentsel tasarım planları olmadan kaliteli kamusal alanlar yaratılması için yeterli olmamaktadır (Aydemir vd., 2004: 370). Yüksek yapıların sahip olduğu olumsuz etkileri azaltmak ve şehrin karakterini ve ambiyansını koruyabilmesi böylelikle özgün nitelikleri korunarak gelişmesi için kentsel ve mimari tasarım rehberleri yol

göstermektedir (Al-Kodmany, 2012). Başarılı ve sürdürülebilir şehirlerin meydana gelmesi için kentsel tasarım ve kent planlamasının birbirini tamamlayan parçalar olduğunu kabullenen bir yaklaşım gereklidir (Aydemir vd., 2004: 371). Türkiye’de şehirler planlı veya plansız bir şekilde değişip dönüşürken birbirinin aynısı, özgün karaktere sahip olmayan mekanlar ortaya çıkmaktadır. Yaşanılan bu durumun sebebi kentlerin özgün özelliklerinin belirlenerek planlar dahilinde korunması eksikliğidir (Kiper, 2021: 139). Türkiye’de yalnızca imar planları tarafından yol genişlikleri, bina yükseklikleri ve bahçe çekme mesafeleri gibi yapılanma ile ilgili çok kısıtlı bilgiler dahilinde yapılan şehirler tek tipleşerek yerel kimliklerini kaybetmektedir (Özer ve Özer, 2021: 171).

2015 yılında T.C. Çevre ve Şehircilik Bakanlığı ve Mimar Sinan Güzel Sanatlar Üniversitesi, Kentsel Tasarım Uygulama ve Araştırma Merkezi arasında imzalanan protokol çerçevesinde hazırlanan Kentsel Tasarım Rehberleri 2016 yılında yayımlanmıştır. Bu çalışma kapsamında şehirlerin özgün mimari dokusuna uygun tasarım rehberlerinin hazırlanabilmesi amacıyla bir altlık oluşturması böylelikle yerel yönetimlere tasarım rehberi hazırlama yönteminin öğretilmesi hedeflenmiştir (Kentsel Tasarım Rehberleri, Cilt 1, 2016). Bu çalışmada Almanya, Fransa, İngiltere, Yeni Zelanda, Japonya, Barselona, Miami gibi farklı ülkelerden örneklerin konu özelinde incelenerek tasarım rehberlerinin oluşturulması ve uygulaması konusunda faydalanılmıştır. Bu rehberlerde yüksek yapılar hakkında kent imajı ve silueti bağlamında önem teşkil etmesi nedeniyle yüksek yapılar hakkında ek rehberler oluşturulması gerektiği belirtilmiştir (Kentsel Tasarım Rehberleri, Cilt 2, 2016). Üç ciltten oluşan bu rehberlerde yüksek yapılar hakkında başka bilgiye yer verilmemiş, ek olarak araştırılması ve hazırlanması gerekliliği vurgulanmıştır.

SONUÇ

Küreselleşmenin etkileri teknoloji, sanat, haberleşme gibi pek çok alanda olduğu gibi mimaride de görülmektedir. Gündelik hayatı kolaylaştıran etmenlerden olan teknoloji gerek tek yapı özelinde gerekse kentsel alanda büyük değişimler yaşanmasına sebep olmaktadır. Teknoloji yapı üretimine büyük bir ivme kazandırırken hızla inşa edilen yapılar kent yaşamı üzerinde büyük etkilere sebep olmaktadır. Küreselleşmenin etkileri ile üretimi hızlanarak artan, şehirler üzerinde insan, ulaşım, alt ve üst yapı bağlamında oldukça fazla yoğunluk yaratan yüksek yapılar, sebep olacağı etkiler farklı bağlamlarda incelenmeden ve yeterli planlama yapılmadan inşa edildiğinde az katlı bir yapıya kıyasla çok daha fazla olumsuz etkiye sebebiyet vermektedir. Parseller üzerinde yapıların çekme ve yükseklik değerlerine ilişkin veri sağlayan yönetmelikler ışığında gelişen kentler tek tipleşme, kimliklerini

kaybetme, yaşıyanların ihtiyalarına cevap verememe, kamusal aık alanların yok olması gibi problemlerle karşı karşıya kalmaktadır. Bahsedilen bu sorunlarla başa çıkmak adına dünyada İngiltere, Amerika, Çin gibi pek ok lke kent planlamasına katkı saėlaması adına kentsel tasarım rehberleri hazırlanmaktadır. Bu rehberler kent yaşıamı iin ihtiya duyulan kamusal aık alanlar ve ticari alanlar gibi konulara deėinirken farklı yapı tipolojilerinin tasarımı ve kente katılımı hakkında veriler iermektedir. Yerel ynetimlerce hazırlanan tasarım rehberleri blgenin ihtiyaları doėrultusunda deėişiklikler gstermektedir.

Kente katılımı konusunda byk sorunlar yaşıanan yksek yapılar hakkında kentsel tasarım rehberleri ierisinde veriler yer almakta ya da *yksek yapı tasarım rehberleri* hazırlanmaktadır. Bylelikle yaşıanabilecek sorunların tasarım aşıamasında nlenmesi hedeflenmektedir. Kentler iin byk etkiye sahip olan yksek yapılar hakkında yapılan bu alıřmalar kaliteli ve zgn bir Őehir yaşıamı yaratmak iin yapılmaktadır. Yalnızca kanun ve ynetmelikler doėrultusunda tasarlanan yksek yapılar kentsel yaşıamın gerekliliklerini barındıran kamusal aık alanlar, insan leėi, canlı sokak, sokak dokusu, karakter, manzara gibi birok kavramın gzden kaırılarak inřa edilmesine sebebiyet vermektedir.

Dnyada bu konuyu merkeze alan rehberler yaygın olarak kullanılmaktadır. alıřma kapsamında dnya zerindeki yksek yapı tasarımına iliřkin veri saėlayan 40 adet rehberin incelenmesi ile temel bařlıklar; Cepheyi Etkileyen, Yapı Formunu Etkileyen, Yayıları Etkileyen, Kamusal Kullanımı Etkileyen ve evre ile İliřkileri Etkileyen Faktrler kapsamında st bařlıklar ile sınıflandırılabilir.

Arařtırma kapsamında incelenen ve Trkiye’de yrrlkte olan ynetmelikler ierisinde yksek yapılar ve kentsel tasarım rehberleri hakkında tanım ve ynlendirici olan sylemler ieren ynetmeliklerin tasarım rehberlerinin temel konu bařlıklarına gre daėılımı Tablo 2’de gsterilmiřtir.

Tablo 2. Türkiye’deki yönetmeliklerde geçen başlıkların tasarım rehberlerinde geçen konulara göre dağılımı

	Cepheyi Etkileyen Faktörler	Yapı Formunu Etkileyen Faktörler	Yayaları Etkileyen Faktörler	Kamusal Kullanımı Etkileyen Faktörler	Çevre ile İlişkileri Etkileyen Faktörler
Planlı Alanlar İmar Yönetmeliği		3			1
Deprem Yönetmeliği		1			
İzmir Büyükşehir Belediyesi Yüksek Yapı Yönetmeliği		3	1		4
İstanbul Yüksek Binalar Deprem Yönetmeliği		2			
Mekânsal Planlar Yapım Yönetmeliği	2	2			2
İmar Kanunu					2
ÇŞB Yönerge	2	1			4

Bu yönetmelikler dahilindeki yüksek yapı ve tasarım rehberleri hakkında veri içeren ifadelerde yer alan başlıklar tasarım rehberlerinde yer alan konu başlıkları altında gruplandırılmış ve karşılaştırmalı olarak başlıkların konular altındaki dağılımı ifade edilmiştir (Tablo 3).

Tablo 3. Türkiye’deki yönetmeliklerde geçen başlıkların tasarım rehberlerinde geçen konular altında gruplanması

Cepheyi Etkileyen Faktörler	Yapı Formunu Etkileyen Faktörler	Yayaları Etkileyen Faktörler	Kamusal Kullanımı Etkileyen Faktörler	Çevre ile İlişkileri Etkileyen Faktörler
Estetik Sanat	Kat alanı Çekme mesafeleri Güneş ve rüzgara göre çekme mesafesi Baza parsel yaklaşımı Taşıyıcı sistem Mekânsal planlama Jeolojik yapı Hasar türleri İmge	Ulaşım		Baza kat sayısı Siluet etkisi Çevresel etki Hava trafiği Mimari doku Uyum Bütünlük Kimlik Altyapı Anlam

Temel hedef doğrultusunda Türkiye’de uygulamada olan yönetmelikler incelenerek daha verimli kullanımlarının sağlanması için eksiklikleri ifade edilmiştir. Türkiye’de yapılaşma oranları yüksek olsa da yeterli yönetmelik ve denetim olmaması nedeniyle yüksek yapılar, kent, siluet ve çevre etkisi tam olarak planlanıp, denetlenmeden üretildiği için yapıldığı yere ve zamana yönelik çözüm sunamayıp sorunlara neden olmakta; bu da aslında küçük alanda büyük çözümler sunma potansiyeline sahip yüksek yapıların yanlış bir şekilde değerlendirilmesine neden olmaktadır. Türkiye’de yüksek yapılar özelinde hazırlanmış herhangi bir yönlendirici rehber olmadığı gibi kentsel tasarım rehberleri de bulunmamaktadır. Yüksek yapıların kent ile bütünleşmesi kapsamında bilgi içeren kaynak eksikliğinin Türkiye’de görüldüğü bu çalışma kapsamında kanıtlanmıştır. Bu konu hakkında yapılması

gereken; yurt dıřında eřitli lkelerde kentsel veya yksek yapı trne zel olarak hazırlanan tasarım rehberleri gibi yapı ve kent tasarımlarını en iyi sonular vermeye ynlendirecek rehberlerin oluřturulmasıdır. Yksek yapı tasarımına ynelik hayal gcn kısıtlamayan fakat kentteki yapıları belirli bir standardın zerinde tutmayı amalayan tasarım rehberlerinin oluřturulması sayesinde evreye saygılı, ekonomiye katkı saėlayan yapılar tasarlanmış olacaktır. Kent dokusunun, imajının ve silüetinin olumsuz etkilenmemesi saėlanarak, tasarımcılar, yatırımcılar ve denetleyiciler iin bir dizi veri paketi elde edilmiş olacaktır.

**DEFINITION OF BRAND ARCHITECT THROUGH PRITZKER
ARCHITECTURE PRIZE-WINNING ARCHITECTS**

ABSTRACT

The concept of brand is defined as symbols, signs and features that introduce a product or service and distinguish it from other competitors. Today, the concept has evolved into a significant trend not only for companies but also for buildings in the built environment. Certain designs, buildings or structures are identified with their architects; thus, it is possible to presume the architect of a structure once one sees it, without receiving any additional information. This circumstance equals the recognition of a product thanks to its high brand value even if it has not been imprinted with a logo. The aim of the study is to investigate the notion of brand identity and its reflections in the field of architecture. The definition of “brand architect” has been established through examining the characteristics and identifiable design language of architects who can be regarded as brands considering their projects. To institute an effective platform, the research population of the study was formed by Pritzker Award winner architects having contributed immensely to community and architecture with their talents and intuitions and sense of responsibility. In the realm of the study, applying data collection and tracing methods within the framework of qualitative research methods, an evaluation table was formed involving their websites, philosophies, architectural project theme distribution, varying basic design parameters, approaches towards formatting buildings and materials utilized. Making inferences regarding “becoming a brand” given the table involving the selected samples by the awarded architects and the parameters, the attitude through which brand identity is projected via architecture was endeavored to be attained. Consequently, it has been noticed that these architects, who have reached highest levels in their careers with the awards they have won, sign their buildings metaphorically employing a unique and recognizable design language; thus, they are consistent within themselves complying with all the requirements of the “brand architect” concept.

Keywords: brand architect, design identity, Pritzker Architecture Prize

PRITZKER MİMARLIK ÖDÜLÜ KAZANAN MİMARLAR ARACILIĞIYLA MARKA MİMAR TANIMI

ÖZET

Marka kavramı bir ürün ya da hizmeti tanıtan, rakiplerden ayrılmasını sağlayan simge, işaret ve özellikler olarak tanımlanmaktadır. Günümüzde bu kavram artık sadece şirketler için değil yapıları çevredeki binalar için de önemli bir trend haline gelmiştir. Bazı binalar mimarlarıyla özdeşleştirilir. Yapıyı görünce hiçbir ek bilgiye gerek duymadan mimarını tahmin etmek mümkündür. Bu durum marka değeri yüksek bir ürünü logosu olmadan tanımak ile eşdeğerdir. Bu çalışmanın hedefi marka kimliğinin tasarımını ve mimarlık alanındaki yansımalarını araştırmaktır. Marka olarak adlandırılacak mimarların inşa ettikleri tasarımların özellikleri ve tasarım yaklaşımları, projeleri üzerinden incelenerek “marka mimar” tanımı ortaya konulmuştur. Etkin bir tartışma ortamı oluşturmak için çalışmanın evreni; yetenekleri, önsözleri ve sorumluluk bilinciyle, topluma ve mimarlığa anlamlı katkılar sağlayan Pritzker Mimarlık Ödülü’ne sahip mimarlar ile oluşturulmuştur. Çalışmada nitel araştırma yöntemlerinden veri toplama ve iz sürme metotları kullanılarak; web siteleri, felsefeleri, mimari proje konu dağılımları, farklılaşan temel tasarım parametreleri, binaları biçimlendirme yaklaşımları ve projelerde kullanılan malzemeler başlıkları altında bir değerlendirme tablosu oluşturulmuştur. Seçilen ödüllü mimarların örneklerinin bulunduğu tablo ile parametreler gözetilerek marka olma yönünde çıkarımlar yapıp, marka kimliğinin mimari yardımıyla yansıtılmasındaki tutum elde edilmeye çalışılmıştır. Sonuç olarak, kazandıkları ödüller ile kariyerlerinde gelinebilecek en üst seviyede bulunan bu mimarların yapılarını kendine özgü ve ayırt edilebilir bir tasarım dili kullanarak metaforik olarak imzaladıkları, böylece marka mimarlar olarak kavrama ait tüm gereksinimler bakımından kendi içlerinde tutarlı oldukları fark edilmiştir.

Anahtar Kelimeler: marka mimar, tasarım kimliği, Pritzker Mimarlık Ödülü

INTRODUCTION

Branding, a major keystone of marketing, is evolving and has become a part of almost all domains of business life. It is gaining more and more significance day by day. Being a brand can not be defined as a result, it is a process.

It is probable to recognize the brand of some product just via its package, color or font, which means there is no need to look at the logo or an imprint displaying the name of the brand on the product. This is a result of the continuity and awareness of the brand identity. Branding process has begun to come to the fore in the construction sector and design as well as making a difference in every product or service field. Some structures introduce themselves with their specific features, granting a chance to guess or know the architect of it. The specific features can be considered as signatures. The architect's signature can be discerned through clues such as the design language, form, positioning, material selections and joints, space division, circulation, and even the graphics of the structure. This signature is formed by brand architects. The aim of this study is to investigate the design language of brand architects and to discuss criteria behind being a brand as an architect.

Becoming a brand architect entails the fact that the branding of the architect adds value not only to him/herself, but also to his/her designs. Thanks to the strong associations between these values inscribed and the inscribed designs that can be figured out, the awareness regarding and memorability of their designs increase. In addition, this situation increases the demand for such brand architects in the construction sector, increases the permanence of the brand created by the architect and strengthens the business networks and customer portfolio. The field of architecture is intertwined with many sectors, and the effect of recognition is apprehended in many structures designed and built. There exist several famous architects known as starchitects. The recognition of an architect as a brand depends on many different parameters such as his/her network in working and social life, his/her relations with media, power of his/her customer(s), the location of the structures s/he has designed, his/her working partners and institutions etc. However, the study focuses on the branding of the architect instead of recognition. The formation and development of a brand in architecture stands out with designs and construction methods. Thus, a brand can be examined through the light shed by his/her consistency with regard to the continuity of designs, such as the line of designs and his/her orientation related with the design approach by the discipline of architecture.

Within the scope of the study, first, literature review on the development of the brand concept and the branding process was conducted, and the concept of branding since 1920 was discussed, as 1920 was when it started to gain prominence, and the issue was researched over a period of about 100 years. Studies in the field of design and architecture were examined. The term "brand architect" was handled through the world-renowned Pritzker Architecture Award-winning architects. To keep it up to date, the architects chosen for the case were limited to the award recipients of 2021 and 2022. 2 distinct projects and websites of each architect were examined. The case was conducted for both architects, and upon the acquisition of the findings for the individual architects, each corresponding finding obtained was compared. Finally, the common results acquired from the case study were discussed, and the criteria(s) underlying the concept of brand architect were endeavored to be revealed.

CONCEPTUAL FRAME

The Definition to “Brand”

There appear various definitions some of which are similar to one another while there exist some diverging from each other to specify the concept of brand. Most of the definitions focus on recognizability, identifiability or differentiability of a product, place, or service.

According to Hirsch, a brand is an identification symbol formed by characteristic signs (Hirsch, 1948). Preston defines brand as encompassing both observable and inherent characteristics, such as its visual design, measurable capabilities, packaging, and any assurances or agreements associated with it (Preston, 1996). Moreover, there is also the view asserting that a brand, beyond its tangible features, includes aspects attributed to it by the consumer such as emotional connections, beliefs, and other intangible aspects (Farquhar, 1989).

Besides, a brand is essentially a seller's commitment to consistently deliver a specific set of features, benefits, and services to buyers. The brand name associated with a quality product is one of the most valuable assets a company can have (Kotler & Keller, 2014). Like Kotler and Keller, Etzel argues that a brand should include a name, term, sign, symbol, or design, or even a combination of these, intended to identify the goods or services of a seller or group of sellers and distinguish it from its competitors and establish a unique identity (Etzel, 2007). In this context, as an indicator of this value, the brand should be able to prove its uniqueness. Therefore, a brand can command a high price in the market and is the only element of a product that competitors sometimes cannot copy even if they try (Rachman & Mescon, 1996).

The prominence of the brand concept can be associated with the change in the focus of marketing since the 1970s. Marketing strategies which were only product-oriented have turned into consumer-oriented ones. This situation has led to the development of brand value, identity, and image, which are the cornerstones of the brand concept. The mentioned values are the most important factors considering the recognition, differentiation, and most importantly the association the brand arouses. Recognition of the brand or brand recognition is the consumer's familiarity with a product that s/he has experienced or seen, heard of, and perceived utilising the products in the same category. Recognition of the brand transitions into being permanent through the recall of the product or service. This means that the brand is associated with the consumer in a situation related to the product or service (Keller, 2012). Brand association constitutes an eminent element regarding the differentiation of the brand from its competitors.

“Brand” in the Discipline of Design

The discipline of design has been greatly influenced by the concept of branding. As buildings gained prestige with their designs in the 19th century, architects started to focus on creating unique designs that would bring recognition and prestige to their work. However, today, it is not just the design of the building that brings recognition and prestige, but also the signature of the architect. This has led to the emergence of the concept of the architect as a brand. (Rybczynski, n.d.). Researchers have applied various methods to comprehend how branding occurs in the process of architectural design. One of these methods has been investigating the processes that star architects go through to reach their level of success.

For instance, Michael o'Brien chose an architect (Frank Lloyd Wright) to research how the architect progressed towards stardom. Having looked into his biography, he analyzed the formal strategy of his works between 1982-1900 (milestone) with sketch plans and diagrams. In the conclusion section, Wright's process of creating his own spatial formation language with practice-based research in architectural design was briefly discussed and his strengths and weaknesses could be determined in this process.

Hakan Sağlam selected and examined the architects that are known by everyone, based on the covers of the times magazine. The conclusion of the study is while architects become starchitects, their design approaches have a crucial effect on this. However, their communication with firms, political power, economic situation, and self-promotion efforts pose almost the same impact as their creativity

Another study was carried out by Tuğba Cestel. The reflections of art movements on architecture were examined through examples by including the views of architectural critics. It is clear that the branding process of architects in architecture and architectural design generally emerges with the effect arising from the location of their buildings, promotion, environment, and what buildings they have built.

Architecture Awards

High-quality award programs allow to reflect the course of architecture, our architectural culture and what is valued. Awards can be considered as a backdrop to discuss, support, and publicize emerging thoughts of the profession (Mihaly, 2019). They can be shaped in harmony with current demands, concerns, and developments.

When it comes to architecture awards granted across the world, the most significant one that springs to mind is the Pritzker Architecture Prize, which has an international status. The Pritzker architecture awards are international awards having been given annually to the best architects since 1979. It was started to be given to strong, responsible, socially conscious architects with the aim of showing that their success is supported (“The Pritzker Architecture Prize,” n.d.).

THE METHODS EMPLOYED IN THE RESEARCH

First, the basic concepts that make up a brand were determined by the literature scrutiny. To examine the concept of brand in the field of architecture, it was decided to elaborate certain architects. For the selection of the architects whose works would be analyzed during this study to be objective and to reflect the present, the architects who received the globally accepted Pritzker Prize in 2021 and 2022 were selected. A case study was conducted by considering the structures on the architects' pages on Pritzker Prize's website., where the awarded architects are introduced, along with their philosophies and architectural project theme distributions. Furthermore, the architects' approach to design, the form and material choices they created were analyzed in detail. According to the analysis, a table was created examined architects, and common and distinctive aspects in their projects were determined. In the conclusion part, a possible set of criterias was determined via discussing the implications of branding with regard to both architects upon the study.

CASE STUDY

1. Kere Architecture (2022)

Francis Kéré, who was born in Burkina Faso, is an internationally renowned architect and the 2022 Laureate of the Pritzker Architecture Prize. Burkina Faso is one of the least educated and poorest countries in the world, and lacks clean drinking water, electricity, and infrastructure. His aim in architecture was influenced and inspired by his personal commitment to serving the society he grew up in and his belief in the transformative potential of beauty. He is known for his pioneering approach to design and construction sustainability.

Website

The architect reflects the simplicity of his designs onto his logo. The logo, which consists of simple lines and a clear and simple font selection, reveals the principle of “less is more” (Fig.1).

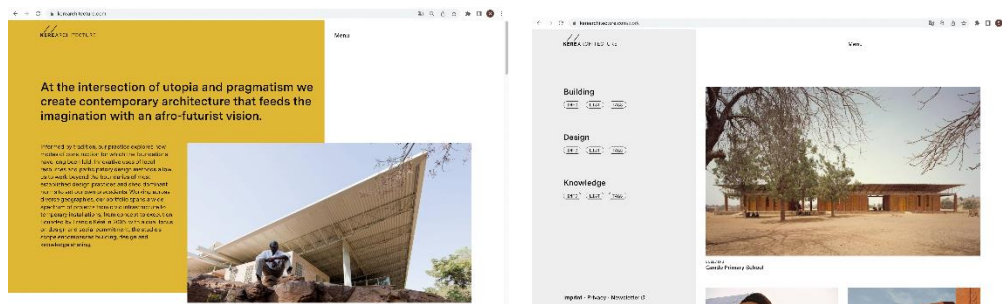

Figure 1. Images from Kere Architecture Website

The design of the website is simple, has an easy-to-understand interface. Only three different colors were preferred in the design of the website. Color choices have soft tones and are evocative of nature. Solid-void balance and the use of rhythm in his architectural approach are reflected on the design of the website.

The Philosophical Approach of The Architect

He defines his own philosophy as follows; "Architecture is primarily a service to humanity, to create an environment where a human being, whether s/he is rich or poor, can develop itself, can be happy, can have what I call wellbeing." I want my building to inspire the user and to make the user happy." (Ravenscroft, 2022). He focuses on the benefit of society and structures being environmentally friendly rather than expensive/luxury or eye-catching. He aims to raise the welfare of the community by means of his works.

He spread his approach in his designs to every part of his professional life. He is inspired by nature, uses natural materials, and realizes his designs in collaboration with the society. He

shares his knowledge with the society and his colleagues. In addition, he regularly follows innovations in architecture and related disciplines and constantly improves himself.

Architectural Project Theme Distribution

He is known for designing numerous schools and medical centers in Africa, particularly in Burkina Faso. All of these structures are compatible with the region and the people of the region and respond to their needs. Apart from these, he has designed many permanent and temporary installations and structures in various countries. His designed buildings or structures are not private like a house; they are designed to be used by the public and society.

Selected Works

1- Gando Primary School

It is a 520 sqm building which was built in Gando/Burkina Faso in 2001 with the collaboration of the community of Gando (Fig.2) (ArchDaily, 2016). It tries to solve the main problems, which are lighting and ventilation, of the educational buildings in the close environment.

Figure 2. Gando Primary School (Duchoud, n.d.)

The building is a quintessence of sustainable architecture employing local construction methods. The design of the school exhibits an integration of local and contemporary approaches. The integration is not only related with construction methods but also the collaboration of the architect with the local community.

A modest design language is marked. The building, which seems to be in harmony with its environment, has a simple design exempt from decorations. To describe it in the simplest way, the building consists of a simple rectangle, a sloping roof, and narrow openings. It is a single-storey building with rhythmic and symmetric openings.

The choice of materials directly reflects the region. Clay, which is abundant in the region and used in traditional house construction, was preferred as the main material. Clay-cement admixture was used for increasing structural strength (ArchDaily, 2016). The choice of material also determines the roof form. A wide and sloping roof was preferred to prevent rain damage.

2- Health and Social Welfare Center

The center, which is located at Laongo, Burkino Faso, encompasses 1340 sqm and was completed in 2014 (Fig. 3). It is constituted of three separated areas for different departments connected with each other by courtyards. Courtyards have a strong relation with the outside of the building. The facade has rhythmic openings to create a dynamic motif on the walls and to preserve the communication with environment.

Figure 3. An Overview of the Health and Social Welfare Center

The building was designed in a harmony with the region and is in constant interaction with the environment. This approach is supported by both the plan and the choice of materials.

While planning the building, natural ventilation was prioritized. Cold air enters through low openings in the outer walls and exits the courtyards through openings. In the simplest explanation, it consists of 4 orthogonal parts 3 of which are used as indoor spaces with courtyards and 1 of which as an open space. The structure, which has a basic form, is diversified via openings.

Locally produced clay bricks were utilized as the main construction material. Laterite stones found in the area were applied to pave the floor. Materials such as eucalyptus wood, which are easily found in the region, were used for the roof.

For Kere Architecture, as it can be realized, the architect has a design approach that has simple forms and cares for function. In addition, the buildings harmonize with the region from many perspectives such as solid-void relations and material selection. The harmony between design and region was also supported by the scale of the buildings and their functions. The minimalist and sustainable design approach is also reflected on the website, which is the architect's gateway to the world.

In short, the architect's buildings reflect his design approach, architectural choices and brand identity given every detail. In this case, it can be mentioned that the architect reveals the recognizability of the brand created by him.

1. Lacaton-Wassal Architects (2021)

The office was founded in Paris in 1987 by Anne Lacaton and Jean-Philippe Vassal. The team designing private and social housing, cultural and academic institutions, public spaces and urban strategies prioritizes ensuring free space utilizing economic and ecological materials. Their designs have traces of social justice and sustainability (“Anne Lacaton and Jean-Philippe Vassal,” 2021) .

Website

The website has a simple and formal interface. There are a few colours, texts and shapes applied. It is functional rather than aesthetic, as its design is based more on concern for functionality rather than aesthetics (Fig. 4).

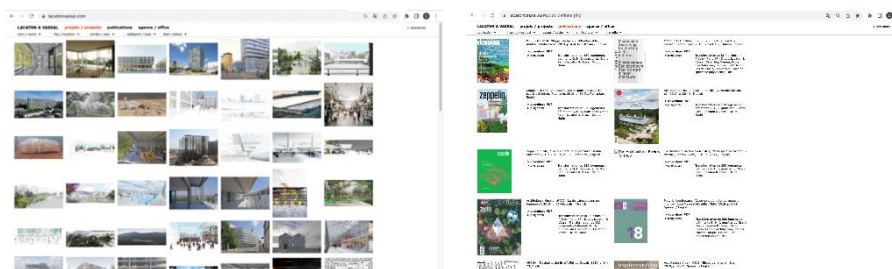

Figure 4. An Image from Lacaton-Wassal Architects website

Philosophical Approach of The Architect

They explain their philosophy as an approach to architecture based on principles of generosity, economy, serving life and usage (“Anne Lacaton & Jean-Philippe Vassal: Design Approach

and Process,” 2018). They regard architecture as a reflection of freedom on the use of space. They prioritize the creation of innovative and functional space. The users can be organizing spaces to allow many types of functionalities in their designed buildings of the architectural office.

The project must also be efficient and smart in its innovative approach to sustainability – an approach based not only on an economy of material and energy, but also on the superior quality of space and the engagement of the users in sustainable relations to their comfort within the building. Another focus of their philosophical approach regards physical entities and continuous relationship. They not only wish to ensure sustainability in terms of the issues such a materials and energy, but also the relationship and communication among the people utilizing the building.

Architectural Project Theme Distribution

Lacaton-Vassal Architects work on social and private housing in general. They do not only design new buildings but also renew old ones. They attach importance to transformation projects pursuing an innovative perspective. Besides social housing, they have been designing projects for urban strategies, public space, and cultural-academic institutions.

Selected Works

1- Maison Latapie

The house, which synchronizes with the street it is on, was planned for a small family with a low budget based on the aim to facilitate the transformation of the facades in terms of residential needs. The house, constructed in 1993, is 185 sqm and located in Floirac, France (Fig.5).

Figure 5. Maison Latapie (Philippe Ruault, n.d.)

The house, which can adapt to all seasons, can be opened in hot weather in the summer and closed in the winter. It means the house has a flexible design. In this way, energy saving methods were further provided as an addition to comfort. It can be stated that the house built

on a low budget allows the inhabitants to lead a life continuously saving money as it reduces the costs of living.

The house can be described as two intertwined rectangles. The fact that its façade is mobile provides a dynamic and variable appearance. It can even be described as a mass alive.

Metal frame, opaque fiber-cement sheeting, transparent polycarbonate, and wood materials were employed in the construction of the building. In line with the different parts of the house and their varying functions, the materials were chosen specifically for each part and combined considering function.

2- 53 habitations HLM

It is a collective housing project built in 2011. The Project is located in Saint-Nazaire, France. The housing project, designed for low-income groups, covers an area of 6013 sqm (Fig. 6).

Figure 6. 53 Habitations (Philippe Ruault, n.d.)

The aim of the architects is to create a flexible, modern and spacious place that is far from standard apartments despite its nature as a collective living space. It intends to offer the opportunity to escape collective spaces equipping each home with its individual space through verandas and exterior spaces that expand the rooms. Usage capacity, variety of space and climatic atmosphere can be altered in synchrony with arisen needs.

Rectangularly planned houses organize residential blocks in a way to resemble strips, which creates an instantly recognizable dynamic rhythm ensured via variable space sizes and terrace use. The cycle breaks the formal and straight form of the structure.

The building system is composed of steel frame and concrete slab flooring. Transparent polycarbonate creates exterior façade and sliding aluminum joinery creates interior faces. And also, thermal curtains are used as insulation material at windows.

For Lacaton-Wassal Architects; rectangular form, flexible façade and space designs are the main properties regarding the projects under examination. Besides concrete and metal, they are noted to also opt for making use of glass in their constructions. Just as their structures have the same rhythm, their website designs have a single interface on almost every page. Another foreground detail noticed is that the photographs were taken by the same photographer, which allows seeing these projects from a similar perspective. In this case, we can assume that the team embeds a similar design language into its structures and prefers employing the same materials. Those having viewed different structures will probably recognize the owner of the design owing to the fact that the team, which has consistent choices within itself, has transformed into a brand.

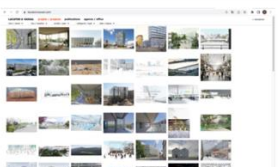

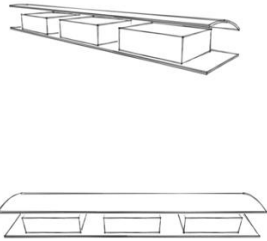

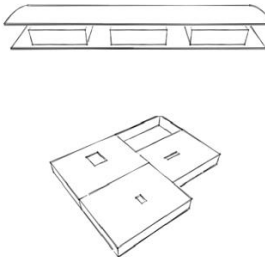

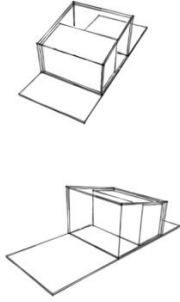

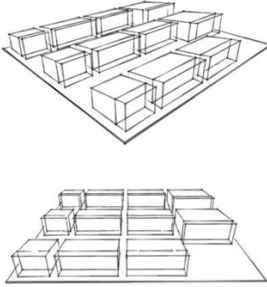

CONCLUSION

The concept of brand architecture and its role in the field of architecture have been examined in the realm of this article. The study has revealed that the branding of an architect is a significant factor in creating a unique identity for their designs and in increasing the demand for their work. The Pritzker Architecture Award-winning architects were analyzed as case studies, and commonalities and differences with respect to their approach to design were determined. This study also proposed a set of criterias to be a brand architect including continuity of pursued design decisions, and increased awareness and memorability of designs. It is important to note that this study focused on the branding of an architect, not on their recognition. The recognition of an architect as a brand depends on various parameters such as their work and social environment, media personality, and the institutions they work with (Table 1). However, the branding of an architect adds value not only to themselves but also to their designs, strengthens their business networks and increases their customer portfolio.

Upon the examination of both cases, it was found that they have common and different aspects when they are compared to each other. First of all, both cases agree on issues such as design language, material selection, and unit scale. For instance, Kere prefers building his buildings utilizing the natural materials of the region, while Lacaton-Wassal chooses to use today's construction materials such as metal, glass, and concrete together. While Kere Architecture designing fixed spaces for needs, Lacaton-Wassal Architects creates flexible spaces that can be altered in accordance with different and instant needs. Moreover, what they are designing

have similarities with their other works. Another point is the website; Kere design reflects its architectural understanding which has inspirations of nature, Lacaton-Wassal reflects their minimal and function focused design concept. The mentioned points have in line with their own philosophical approaches.

Table 1. Comparison of the cases

	Kere Architects		Lacaton-Wassal Architects	
Website	 color choices are evocative of nature, simple and holistic design that created via small parts		 least color selection (b-w), purely functional, simple	
Philosophy	attaches importance to function in harmony with nature collaborative approach with community local		flexible space ergonomic and economic design sustainability unornamented	
Project Distribution	schools medical centers gathering places installations		social housing public spaces cultural-academic institutions renovation	
Abstraction of Form	Gando Primary School 	Centre for Health and Social Welfare 	Maison Latapie 	53 habitations 
	forms are created by combining small parts balanced solid-void relation repetitive rhythmic spaces		double-walled entire form orthogonal design	
Facade				
	continuous connection between indoor and outdoor rhythmic openings natural texture		adaptive facade double-skin gridal	
Material	clay-cement hybrid	locally produced clay bricks, laterite stones, eucalyptus wood	metal, fiber-cement, polycarbonate, wood	steel, concrete, transparent polycarbonate, aluminum

The consistency and continuity discussed here are not only related to the establishment of the architectural language, but also to the formation of the brand. Anyone who knows about these architects can guess whom these structures are by upon viewing one of them. Also, they are aware of whom they may be confused by.

Consequently, the findings of this study suggest that the branding of an architect is a crucial factor in creating a unique identity for their designs and increasing their demand in the construction sector. Therefore, architects should focus on developing a distinct design language and style that reflects their unique perspectives and approaches, as this will help them build strong brands that are recognized and valued by clients and peers alike. To conclude, while architects transform into a brand, they create similar recall features in their designs to create similar spatial cognition.

ABSTRACT

The air cathode and electrolyte play an important role in metal air batteries. The air cathode is one of the essential components of a metal air battery. It usually consists of a gas diffusion layer, current collector and active catalyst. The gas diffusion layer consists of a carbon material and a binder. The diffusion layer only needs to be made air permeable and prevent water permeability. Current collectors are usually external. The catalytic active layer is where an electro catalyst, carbon material and binder are located, where the reduction reaction of oxygen takes place. We have demonstrated that graphite sheets coated with activated carbon (AC), manganese dioxide (MnO₂) and other additives are a promising cathode for metal air batteries. We achieved superior performance at significantly higher than the liquid alkaline electrolyte by using gel electrolyte. Gel electrolyte production containing different additives have been studied in order to increase the efficiency of aluminum air battery. Soft and firm gels have been obtained depending on the water retaining polymer ratio.

Keywords: Metal air battery, air cathode, graphite, current collector, gel electrolyte

INTRODUCTION

Metal-air batteries have attracted considerable attention for the last five decades due to the fact that they have a much higher specific energy than most currently available primary and secondary batteries as the cathodic reaction-oxygen comes from the air rather than inside the battery (Li and Lu, 2017). A typical metal-air battery (Rahman et al., 2013) is composed of a metal or metal alloy anode, an air cathode and an alkaline or brine electrolyte.

The cathode and electrolyte play an important role in these batteries (Danner et al., 2016). The materials used in the air-breathing conductive layer of air cathodes must have a porous structure allowing the passage of air and be lightweight (Pino et al., 2015). In metal-air batteries, although the cathodic oxygen reactions are airborne, there must be an air permeable cathode in order to support the fast kinetics of oxygen reduction reaction (ORR) (Flegler et al., 2016; Cao et al., 2003; Gao et al., 2014; Ge and He, 2015; Wu et al., 2016; Yang et al., 2017; Zhang et al., 2009; Zhang et al., 2014; Fu et al., 2016; Li et al., 2016; Songa et al., 2015; Zhang et al., 2017). Generally, in these batteries the cathode constitutes the highest percentage of the total cost and the structure of the cathode limits higher power production. For this reason, it is important to improve the performance of air cathodes using low-cost and environmentally-friendly materials.

The fundamental components of the future energy network are electrochemical energy storage devices. It is important for supporting unaccounted for energy production and supply from renewable sources. Lithium-ion batteries have played an important role since their creation. they entered all areas of our lives. Efforts are made to continually improve energy and power densities despite significant performance. This need has become increasingly important in recent years to electrify transport and increase stationary energy storage. (Dunn et al., 2011; Lue et al., 2016). Traditional Li ion technology is now approaching the limits of 15 performance. Recent developments to the Li ion battery may supply up to an extra 30% rise in energy density (Van Noorden, 2014). If traditional Li ion batteries are utilized to power electrical vehicles, the top of express that it can be competitive to receive extended driving distance. Thus, new systems and new chemistry are being searched for an aimed energy density actively.

Metal air batteries have gotten stimulated interest between a few potential applicants. Metal air batteries are collected with a metal anode, an air cathode and an electrolyte. The alkali metals can be metal anode such as Lithium (Li), Sodium (Na) and Potassium (K) or such as Zinc (Zn) and Iron (Fe) which are first row transition metals. And electrolyte can be aqueous

or non aqueous (Li and Lu, 2017). According to structure of the anode the air cathode frequently has a light spongy structure that allows permanent oxygen providing from enclosure air.

Air catalyst and cathode design plays important role to increasing battery performance. In metal air batteries, air cathode determines performance of electrode since ORR is a highly severe reaction. This reaction fundamentally becomes the three stage at the air cathode where the solid electrode is at the same time interfaced with liquid electrolyte and O₂. As a result, producing active air catalysts to accelerate the ORR kinetics and designing proper electrode structures to expand the three stages would properly advantage the battery efficiency.

RESEARCH AND FINDINGS

Construction of Air Cathode

The air cathode is one of the essential components of an Al air battery. It usually consists of a gas diffusion layer, current collector and active catalyst. The gas diffusion layer consists of a carbon material and a binder such as hydrophobic Polytetrafluoroethylene (PTFE). The diffusion layer only needs to be made air permeable and prevent water permeability. Current collectors are usually external. It can made of a Ni metal mesh that can be connected to the circuit and enhances the electron transfer process. The catalytic active layer is where an electro-catalyst, carbon material and binder are located, where the reduction reaction (ORR) of oxygen takes place.

Air electrode has major problems. The slowing down of the oxygen reduction reaction will lead to inefficiency of the electrode. This problem can be improved by choosing the appropriate catalyst. Closing the air-permeable pores of the air cathode cuts the contact with air, so the battery stops working, so a gas diffusion layer should be created so as not to block the system. Carbonate precipitation is another problem. Atmospheric CO₂ can react with alkaline solution and precipitate. It reduces the conductivity of the electrolyte and the air cathode activity. Using pure oxygen or low-CO₂ air reduces this risk. One of the most important problems is leakage of battery solution into the outside environment. It will cause the solution to evaporate and the battery to stop working. If it is can be prevented by hydrophobic air cathode (Mutlu, 2018).

Air cathodes, fuel cells, metal air cells and some have been proven that they are essential electrodes in electrolyzers (Siroma et al., 2003), (Kliskic et al., 1998), (Shibata et al., 2003). In the gas diffusion electrode, the contact zone with the reactant, electrolyte and catalyst as

the three-phase zone is named. Porous electrode structure, binder such as PTFE spread on high surface area carbon black held with materials It consists of an electrocatalyst.

The air cathode for a metal air battery is one of the necessary component. In this study, graphite-based cathode has been used.

In this work, the air cathode consists of a conductive layer, a catalytic layer providing the formation of reactions, and a layer that allows gas passages but does not allow water passage. The material to be used in the conductive layer used in air cathodes must have a porous structure allowing air passages and be lightweight. The catalyzer shows the layer containing activated carbon, manganese dioxide. This layer is made on the surface of the conductive plate which will come into contact with the electrolyte.

The catalyzer to be made (activated carbon, manganese dioxide) is weighed on a precision scale and placed in a container of the appropriate size according to the amount of material is shown that in Figure 1. Add 1 ml of the previously prepared powdered polyvinyl alcohol (PVA) for each gram of material and mix with glass mixer for 1 hour. The cabin mouth is closed and left to rest for 5 hours. During this time, it is stirred for 10 minutes every 1 hour.

Figure 1. PVA adhesive in the syringe is added to the container with AC and MnO₂.

The previously prepared conductive graphite is placed on a properly placed plate. the prepared solution is sprayed on the graphite sheet by dropping and allowed to dry for 24 hours at room temperature is shown in Figure 2. Solvents that dry at room temperature form a thin film on the graphite sheet.

Figure 2. Prepared solution is sprayed on the graphite sheet by dropping.

Construction of Gel Electrolyte

Such power sources are basically an alkali or a saline electrolyte uses. Regarding alkali electrolytes, solutions of Potassium hydroxide (KOH) and Sodium hydroxide (NaOH) at 3,5 M concentrations have been shown to be the best in terms of the solubility of the reaction product $Al(OH)_3$. NaOH is recommended as the preferred electrolyte because it does not allow the KOH solution to be recovered by the industrial Hall Hérault process, because potassium ions have deleterious effects on the cathode of the electrolysis cell (Doche et al., 1997). Air cells powered by such electrolytes provide higher power / energy density compared to saline electrolytes.

Gel electrolyte production containing different additives have been studied in order to increase the efficiency of aluminum air battery. Soft and firm gels have been obtained depending on the water retaining polymer ratio.

Solutions containing sodium hydroxide (NaOH) and zinc oxide (ZnO) in an aqueous solution were prepared and added with water retaining polymer for gelation. A commercially available water-retaining polymer to be used in agriculture is used here.

Alkaline gel electrolyte was obtained by preparing a mixture of 6M NaOH solution containing ZnO additive (Liu et al. 2016) as a corrosion inhibitor and water retainer. NaOH (3.148 g) was dissolved in 12 ml of distilled water is shown in Figure 3, and ZnO (10% of NaOH weight) was then added.

Figure 3. Images of weight of NaOH in distilled water, after addition ZnO in solution (before mixing of solution), and then one hour mixing of solution.

The solution is transferred to a glass or plastic container that does not react with NaOH. For the gel agent, 0.6 g of water-retaining grains were added. After water-retaining grains were added, solution began to become gel form. That solution transferred to syringe for using easily on metal-air battery. And the solution took the form of a gel was shown in Figure 4.

Figure 4. The gelling process of solution.

CONCLUSION

Metal air batteries, which take their place among the energy storage systems, are in the development stage. Air cathode and electrolyte are two very important elements for metal air batteries. The aluminum air cell, which is one of the metal air cells, has promising results for the air cathode and gel electrolyte we have prepared.

In this study, a simple method for producing cheap and environmentally-friendly air cathode and NaOH gel electrolyte were prepared for metal air batteries.

The cathode was cost-effective, easy to produce, time-saving and environmentally-friendly, thus meeting the basic requirements for scaling up air cathode technology.

Gel electrolyte based on water-retaining polymer was prepared to improve the capacity and energy densities of the alkaline metal air cell by avoiding leakage of electrolyte from the cell. The softness or hardness of the gel electrolyte depends on the amount of water-retaining polymer used.

ABSTRACT

Aluminum (Al) air batteries use ambient air that reduces their weights have a significant role in energy storage with their high energy density. Aluminum based batteries that convert chemical energy into electrical energy. Al anode is light, high energy density, safe, inexpensive, abundant, non-toxic, high energy storage capacity, high theoretical power density and easily recycled. We have demonstrated that promising cathodes for metal air batteries. Several low-cost, environmentally-friendly air cathodes were fabricated and their performances were tested by constructing Al air batteries whose electrolyte was gelled by adding a cost-effective water retainer. The results obtained from the measurements made using the battery testers. At all measurements discharge current is $1.5\text{mA} / \text{cm}^2$. The experimental results showed that this new Al air battery had a good discharge performance.

Keywords: Aluminum air battery, cathode, electrolyte, discharge

INTRODUCTION

Al air batteries are devices that produce electrical energy from chemical energy. Al air batteries are superior to other recently popular batteries has properties. The biggest factors in this; easy design, durability, safety concerns, environmental friendliness, aluminum resources are abundant and can be considered to be recycled. Studies have been going on for many years. Al air battery is a device that converts chemical energy of the reaction between oxygen present in the air with Al as fuel into electrical energy. In an Al air battery, all energy is stored at the anode, and oxygen is usually it is provided from the surrounding air. A cell consists of three main components. The first one is anode which oxidized during discharge and generates electrons to transmit them to an external circuit. The second one is cathode with reduction reactions during discharge and the part that accepts electrons from the external circuit. The last one is electrolyte that provides the medium for the transfer of ions between the anode and cathode.

Once discharge of the battery was activated Al anode was oxidized, provided the required electrons generates electric energy as shown in Figure 1. Due to reaction of Al(OH)_3 and NaOH , aluminate was also produced and cause passivation of anode and end of battery life because of accumulation of aluminate on the surface of the anode (Pino et al., 2015).

Figure 1. Schematic illustration of Al-air battery

The importance of aluminum as an anode was first described in the late 19th century. It was realized when it was used in Buff Cell (Tommasi, 1889). Alkaline Al-air One of the vital properties of an anode to be used in the battery system is that impurities are features. An example of this is iron which can cause rapid corrosion in open circuits. can be given (Zhao and Frankel, 2007). Doche et al., 1997 different purity degrees of aluminum anodes and iron impurity in 1 M NaOH showed that aluminum anode causes higher corrosion rate. As a result, aluminum as pure as possible it is recommended to use. However, by Souza and Vielstich, (2003) As stated, due to the high cost and corrosion of this grade pure aluminum, the overall thermodynamic efficiency of the battery they said. According to the same authors, significantly reducing the cost of the battery high purity (99.8%) water resistant metal anode instead of super purity it is recommended to use.

Aluminum alloys as anode materials in energy sources they are widely used and are also the most widely used alloys for cathodic protection of ships and other marine metallic structures. Considering the use of aluminum alloys in power supplies applications, it should be noted that Al air batteries are the most tested power supplies as described.

Aluminum anode in a battery application must have some properties. It should have high electronegativity to ensure a sufficient current flow. There must be a high electricity production per gram of anode consumed and the metal should have a low cost. Also it must be resistant to open circuit corrosion must have a low hydrogen density ratio during discharge should supply high voltage to the battery (Reding et al., 1966).

Aluminum alloys are also widely used for cathodic protection in sea water. An alloy anode material for an Al-Air battery in seawater electrolyte, it can also be used for cathodic protection in sea water. Pure aluminum is partially suitable for alkaline batteries, but in salt water It never ensures proper use and therefore each application requires the development of a specific alloy range (Mutlu, 2018).

DESIGN OF AL AIR BATTERY

In this work, many studies have been conducted to obtain an efficient Al air battery. In the first phase of the work, a great deal of time is devoted to design. There have been many design attempts made by us. After deciding on the design, our second focus was on electrolyte. We have designed many batteries using liquid electrolyte but we could not get the result we wanted from this electrolyte. As a result of this, we made gel electrolyte and greatly contributed to our efficiency. Our third important work topic was air cathode construction. The air cathode for an Al air battery is one of the necessary component. In this study, graphite-based cathode has been used. On the graphite-based cathode, different types of additives for catalyzer have been made as thin film. Additives are; Active Carbon (AC), Manganese Dioxide (MnO_2), Carbon Black (CB), Borax, Phosphour (P), Nickel (Ni).

1050 aluminum alloy sheets were used as anodes is shown in Figure 2. Aluminum plate is used rectangular form and gel electrolyte part is used in circular form for our test battery in Figure 2.

Figure 2. Anode part of test battery, gaskets and the air-contact face is covered with commercial teflon tape film.

First, the gaskets were glued to the front and back of the electrolyte reservoir is shown in Figure 2. An aluminum anode and back support plate were mounted in the electrolyte chamber. 0.30ml of gel electrolyte was placed in the electrolyte reservoir in Figure 3. An air layer and front support plate were placed on the front of the electrolyte reservoir is shown in Figure 3. The bolts were then fastened.

Figure 3. Contact moment of the air cathode, air intake part and test battery.

RESULTS AND DISCUSSIONS

The developed cathode is produced by making a thin film with Polyvinyl alcohol (PVA) in different proportions of additives (Active Carbon (AC), Manganese Dioxide (MnO_2), Carbon Black (CB), Borax, Phosphour (P), Nickhel (Ni)) on a graphite plate containing current collecting tip and by covering the air contacting surface with a thickness of $25\mu\text{m}\sim 75\mu\text{m}$ of teflon tape. The produced gel electrolytes and cathodes have been tested by design in Al air battery. The masses of each additive used in Table1 are given. If the catalyst density is too high, the weight of the battery increases and the gas permeability of the cathode decreases. If the catalyst concentration is low, the reaction rate decreases and the capacity of the battery decreases.

Table 1. Masses of additives for catalyzer

	AC	MnO ₂	CB	Borax	P	Ni	Ag
Cathode 1	1g						
Cathode 2		1g					
Cathode 3	0,5g	0,5g					
Cathode 4			1g				
Cathode 5	0,5g	0,4g	0,1g				
Cathode 6	0,5g	0,4g		0,1g			
Cathode 7	0,4g	0,4g	0,1g	0,1g			
Cathode 8	0,5g	0,4g	0,1g				1 drop
Cathode 9	1g	0,4g	0,2g		0,2g		
Cathode 10	0,9g		0,1g				
Cathode 11	1g		0,2g		0,3g		
Cathode 12						1g	
Cathode 13	0,5g					0,5g	

Discharge experiments were carried out for 13 different cathodes. Each experiment was repeated 2 times. All the batteries used gel electrolyte containing 6M NaOH. The results obtained from the measurements made using the battery tester. At all measurements discharge current is 1.5mA / cm².

Figure 4. Discharge curves for Cathode 1, Cathode 2, Cathode 3, Cathode 5 and Cathode 6.

Cathode 1 includes 1g AC and its capacity is 10.8 mAh/cm² energy density is 10.62mWh/cm² and discharge time 7,2 hours. Cathode 2 includes 1g MnO₂, its capacity is 7,8 mAh/cm² energy density is 7,72mWh/cm² and discharge time 5,2 hours. And cathode 3 is 0,5 g AC and 0,5 g

MnO₂ its capacity 10,8 mAh/cm² energy density is 12,30 mWh/cm² and discharge time 7,2 hours. These batteries did not drop below 1 volt. From the graph we can see third cathode has good result. Combining AC and MnO₂ contributed to energy density is 12,30 mWh/cm². When CB used alone, battery life and constant voltage value are not promising for cathode 4. Therefore, we used this additive with others.

Figure 5. Discharge curves for Cathode 3, Cathode 5, Cathode 6, Cathode 7, Cathode 8 and Cathode 9.

Cathode 5 includes 0,5g AC and 0,4g MnO₂ and 0,1g CB. Its capacity is 7,8 mAh/cm² energy density is 9,55 mWh/cm² and discharge time 5,2 hours. Cathode 6 includes 0,5g AC, 0,4g MnO₂ and 0,1g borax. Its capacity is 3,45mAh/cm² energy density is 4,63 mWh/cm² and discharge time 2,3 hours. Borax additive contributed to constant voltage value but battery life is shorter than before. Figure shows that when AC and MnO₂ are used on the cathode the result is promising for long battery life. CB and Borax contributed constant voltage value but their battery life effects are short. In this experiment effect of Borax, one drop silver adhesive and P has been examined. Ag is effective for constant voltage value in Figure 5. Cathode 7 includes 0,4g AC, 0,4 g MnO₂ 0,1g, CB 0,1g borax. Its capacity is 10,05 mAh/cm² energy density is 9,70 mWh/cm² and discharge time 6,7 hours. Cathode 8 includes 0,4g AC, 0,5g MnO₂ 0,1g, CB and one drop silver adhesive. Its capacity is 7,2 mAh/cm² energy density is 9,03 mWh/cm² and discharge time 4,8 hours. Cathode 9 includes 1g AC, 0,4g MnO₂, 0,2g CB, 0,2 g P. Its capacity is 5,7mAh/cm² energy density is 6,78 mWh/cm² and discharge time 3,8 hours. In this experiment effect of Borax, Ag and P has been examined. Ag is effective for constant voltage value. According to cathode 7, CB and Borax are more effective when used together on that Cathode 7. Cathode 8 and cathode 9 have a higher voltage plateau but lower capacity and energy density.

Figure 6. Discharge curves for Cathode 10, Cathode 11, Cathode 12 and Cathode 13.

Cathode 10 includes 0,9g AC 0,1g CB. Its capacity is 7,63mAh/cm² energy density is 8,4 mWh/cm² and discharge time 4,7 hours. Cathode 11 includes 1g AC 0,2g CB and 0,3g P. Its capacity is 7,82 mAh/cm² energy density is 9,39 mWh/cm² and discharge time is 5 hours. Figure 6 shows that CB and P contributed constant voltage value but CB battery life effect is shorter than P. Cathode 10 and Cathode 11 have same voltage plateau. According to Cathode 11, phosphor raised the energy density from 8,4 mWh / cm² to 9,39 mWh / cm². Cathode 12 includes 1g Ni. Its capacity is 4,8mAh/cm² energy density 7,9 mWh/cm² and discharge time 4,7 hours. Cathode 13 includes 0,5g AC and 0,5g Ni. Its capacity is 6,75mAh/cm² energy density is 8,38 mWh/cm² and discharge time 4,5 hours. Ni contributed constant voltage value but Ni battery life effect is short. When using Ni alone, the voltage plateau is quite high, but the energy density and capacity are low. It has been observed that the capacitance and energy density increase from 7,90 4 mWh / cm² to 8,38 4 mWh / cm² when Ni and AC are used together. All results are given in Table 2.

Table 2. Al-air battery capacity, voltage plateau and energy density for all cathodes with additives.

Cathodes with Additives	Capacity (mAh/cm ²)	Voltage Plateau	Energy Density (mWh/cm ²)	Discharge Time (Hours)
Cathode 1	10,8	1,5 volt ~1 volt	10,62	7,2
Cathode 2	7,8	1,6 volt ~1 volt	7,72	5,2
Cathode 3	10,8	1,6 volt ~1,1 volt	12,30	7,2
Cathode 4	1,5	1,48 volt ~1,2 volt	1,82	1
Cathode 5	7,8	1,45 volt ~1,2 volt	9,55	5,2
Cathode 6	3,45	1,6 volt ~1,3 volt	4,63	2,3
Cathode 7	10,05	1,6 volt ~1 volt	9,70	6,7
Cathode 8	7,2	1,5 volt ~1,2 volt	9,03	4,8
Cathode 9	5,7	1,5 volt ~1,1 volt	6,78	3,8
Cathode 10	7,05	1,6 volt ~1,2 volt	8,4	4,7
Cathode 11	7,5	1,6 volt ~1,2 volt	9,39	5
Cathode 12	4,8	1,9 volt ~1,6 volt	7,90	3,2
Cathode 13	6,75	1,5 volt ~1,2 volt	8,38	4,5

CONCLUSION

The production of Al based batteries will be aligned along a research-development-production-market chain, from physics to chemistry, from chemistry to material science and from material science to technology. Innovation chain should also include recycling, component and system developments. This chain is completed by a patenting strategy that is necessary for a market placement.

A simple method for producing cheap and environmentally-friendly air cathodes and NaOH gel electrolyte were prepared.

Cathode 1 and Cathode 3 have the same capacitance. Cathode 1 contains only AC, and Cathode 3 contains 50% AC and 50% MnO₂ by weight. The MnO₂ cathode catalyzer increased the potential plateau and the energy density increased from 10,62 mWh / cm² to 12,30 mWh / cm². Cathode 2 only contains MnO₂, the energy density is lower than the Cathode 1. AC and MnO₂ are effective additives for efficiency Al air battery.

ÖZET

1988 yılından beri yapılan Hükümetlerarası İklim Değişikliği Panellerinde (Intergovernmental Panel on Climate Change, IPCC) belirlendiği üzere, küresel iklim sisteminin ısınması, deniz seviyesinin yükselmesi, azalan buz ve kar miktarları ve artan okyanus ve atmosfer sıcaklıkları ile ilişkilendirilmiştir. Küresel ısınma ile gıda yetersizliği ve açlık, küresel yağış düzenindeki değişiklikler, bitki ve hayvan popülasyonlarındaki değişiklikler ile ciddi sağlık etkileri de dahil olmak üzere zaman içinde önemli sonuçlara yol açan tehditli bir süreçtir. Yaşadığımız yüzyılda sera gazı üretimine bağlı olarak, son 40 milyon yılın en sıcak periyodunu yaşamamız beklenmektedir. Küresel ısınmanın enfeksiyon hastalıklarında önemli etkiler oluşturacağı ön görüldüğünden, özellikle vektör kaynaklı hastalıklar, gıda ve su kaynaklı hastalıklar, bakteriyel ve viral enfeksiyonlar üzerine araştırmalar yoğunlaşmıştır. Bu tür iklim değişiklikleri, toksijenik mantar gelişimine ve oranları üzerinde önemli bir etkiye de sahiptir. Konakçı direncini ve konakçı-patojen etkileşimlerini değiştirebilir. Ayrıca her bir patojen için değişen mikotoksin üretimi koşullarını da fazla bir şekilde etkileyebilir. Bu nedenle son yıllarda mikotoksinler/konakçı bitkiler/coğrafi alanlar ilişkileri bilim insanlarının dikkatini çekmektedir. Özellikle yeni analizler ve toksijenik mantarların hem biyolojisi hem de genetiği hakkında daha güncel bilgiler edinilmektedir. Bu tebiğde gıda güvenliği açısından özellikle Avrupa'da üretilen mısırlarda *Aspergillus flavus* riski ve yine Avrupa'da buğday üzerindeki mikotoksijenik *Fusarium* türlerinin profili, *F. graminearum* kontaminasyonunun iklim değişikliği ile ilişkisi irdelenmiştir. Diğer yandan mikotoksin mücadelesinde kullanılan pestisidler yükselen sıcaklıklarla buharlaşmasına yol açarak etkinliklerini azaltır. Zararlıların artmasıyla beraber, pestisid kullanımının söz konusu yetersizliği ile tarımsal üretimde daha fazla pestisit kullanımını teşvik edebileceği de ayrıca değerlendirilmiştir.

Anahtar Kelimeler: İklim değişikliği, Mikotoksin, mikotoksijenik küf, toksin

IMPACT OF CLIMATE CHANGE ON MYCOTOXIN RISK

ABSTRACT

As determined by the Intergovernmental Panel on Climate Change since 1988, warming of the global climate system has been associated with rising sea levels, decreasing amounts of ice and snow, and increasing ocean and atmospheric temperatures. Global warming is a threatening process with significant consequences over time, including food shortages and hunger, changes in global precipitation patterns, changes in plant and animal populations, and serious health effects. Depending on the greenhouse gas production in the century we live in, we are expected to experience the hottest period of the last 40 million years. Since it is predicted that global warming will have significant effects on infectious diseases, research has focused on vector-borne diseases, food and water-borne diseases, bacterial and viral infections. Such climatic changes also have a significant impact on toxigenic fungal growth and rates. It can alter host resistance and host-pathogen interactions. It can also greatly influence the varying conditions of mycotoxin production for each pathogen. Therefore, in recent years, mycotoxins/host plants/geographical areas relationships have attracted the attention of scientists. In particular, new analyzes and more up-to-date information are obtained on both the biology and genetics of toxigenic fungi. In this paper, the risk of *Aspergillus flavus* in corn produced in Europe, the profile of mycotoxigenic *Fusarium* species on wheat in Europe, and the relationship of *F. graminearum* contamination with climate change were examined in terms of food safety. On the other hand, pesticides used in mycotoxin control cause evaporation with rising temperatures, reducing their effectiveness. Along with the increase in pests, it has also been evaluated that the insufficiency of pesticide use can encourage more pesticide use in agricultural production.

Keywords: Climate change, Mycotoxin, mycotogenic molds, toxin

GİRİŞ

İklim deęişiklięi hepimizin bildięi üzere gezegenimize ve yařamımıza çok büyük bir tehdit oluřturan karmařık bir sorundur. Artan sıcaklıklar, okyanusların ısınması, asidifikasyonu, kuraklıklar, kontrol edilemeyen yangınlar, zamansız yoğun yaęıřlar ve asit yaęmurları, eriyen buzullar ve buna baęlı olarak yükselen deniz seviyeleri ve ekstrem hava olaylarının artması bizim gıda sistemlerimize de ciddi hasarlar vermektedir (FAO, 2020). Dünya genelinde gıdanın % 14’u tüketicilere ulařmadan üretim basamaęında kaybolmaktadır. Bu kaybın önemli bir kısmı gıda kontaminasyonu ile iliřkilidir. Dünya Saęlık Örgütü 1 yıl içinde 600 milyon insanın çeřitli nedenlere baęlı olarak gıda kaynaklı hastalıklara yakalandıęını ve bunun 420 bininin ölümlerine sonuęlandıęını belirtmiřtir (FAO, 2019).

İklim deęişiklięi

İklim deęişiklięi, Hükümetlerarası İklim Deęişiklięi Panellerinde (Intergovernmental Panel on Climate Change, IPCC) iklimin ortalama durumunda veya bu deęişkenlikte, uzun süre devam eden (tipik olarak on yıl veya daha uzun) istatistiksel olarak anlamlı bir deęişiklik olarak tanımlanmaktadır. İklim deęişiklięi konusu dünya nüfusunun en önemli üçüncü küresel sorunu olarak kabul edilmektedir (Tang, 2019). En etkili iklim deęişiklięi faktörleri, küresel ısınma, aşırı ısınma ve aşırı soęuma periyodları, kalıcı ve yoğun yaęıřlar, doęal afet seviyesinde hava olayları (kasırgalar, siklonlar, seller) kuraklık, kötü hava kalitesi, stratosferik ozon tabakasının incilmesi ve ultraviyole (UV) radyasyonundaki deęişikliklerdir (Mateeva, 2020).

Dünyamızın ortak problemi olan küresel ısınma, ilk kez 1896 yılında Kimyager Svante Arrhenius tarafından öngörölmüřtür. Küresel ısınma yeryüzündeki sıcaklık artışı olarak tanımlanmaktadır. Küresel ısınma başta olmak üzere sera gazlarındaki artışa neden olan her türlü etkinin, iklim deęişiklięine neden olduęu bilinmektedir. Güneřten gelen sıcaklık sera gazları aracılıęıyla tutularak, yerkürenin ısınmasını saęlanmaktadır. Atmosferde tutulan sera gazlarının ve özellikle CO₂ gazı konsantrasyonundaki artış iklim olaylarında deęişiklięe sebep olmaktadır (Hatipoęlu ve ark. 2019).

Karbondioksit salınımı genel olarak fosil yakıtlar, insan aktiviteleri, ormansızlařma, kentleřme, tarım ve endüstriyel süreçler sonucunda oldukça yüksek seviyeye ulařmıřtır. Günümüzde atmosferik CO₂ gazı konsantrasyonu 441 ppm ile geętięimiz 800.000 yıl içerisindeki en yüksek seviyeye ulařmıřtır. Son on yıldakiyle aynı oranda devam eden sera gazı emisyonları ile küresel ısınmanın 2030 ve 2052 yılları arasında 1,5°C’lik bir sıcaklık

artışına ulaşacağı tahmin edilmektedir. Önümüzdeki 2100 yılına kadar 1.1°C ile 6.4°C sıcaklık artışı beklenmektedir. Yine 2100 yılında atmosferdeki CO₂ gazı konsantrasyonun 421-936 ppm arasında olması öngörülmektedir. Ayrıca 1961 yılından beri, deniz seviyesinde her yıl 1,8 mm artış görülmüştür Hükümetler iklim değişikliğinin insan sağlığı ve refahı için büyük riskler oluşturduğu giderek daha fazla kabul etmektedir (Dumont et al., 2015).

Mevcut küresel ısınmanın bir sonucu olarak; 1993-2019 yılları arasında dünya yaklaşık 148 milyar ton buz kaybetti, buna bağlı olarak deniz seviyesi 20 cm yükselmiş ve okyanus 0,33°C'den fazla ısınmıştır. Gelecek 100 yılda 1,4-5,5°C'lik ısınmanın gerçekleşeceği ve CO₂ konsantrasyonunun artacağı beklenmektedir (IPCC, 2007). Bu nedenle önümüzdeki 25-50 yılda gerekli nitelik ve miktarda gıda sağlama kapasitesinin sorgulanması kapsamında Dünya Gıda Güvenliği Otoritesi (EFSA) iklim değişikliğinin Avrupa'daki etkisini incelemiş ve etkilerin coğrafi bölgeye bağlı olarak zararlı veya avantajlı olacağını öne sürmüştür (Medina et al., 2017).

Bu yönde;

- Kuzey Avrupa'da iklim değişikliğinin etkilerinin olumlu olabileceği,
- Akdeniz havzasında ise gıda üretimini olumsuz etkileyen yağış ve kuraklık miktarındaki aşırı değişiklikler, yüksek sıcaklık ve artan CO₂'e bağlı olarak olumsuz etkiler sonucu sıcak nokta oluşabileceği,
- Güney ve Orta Avrupa'da iklim değişikliğinin bitkilerdeki olgunlaşma sürecini kısaltacağından bunun tahıllar üzerinde önemli zararlı etkilere neden olacağı düşünülmektedir.

Bu temel değişiklikler küresel bazda temel mallarda farklı kıtalarda gıda güvenliği üzerinde derin etkiler yaratacaktır. Mevcut verilere göre iklim değişikliği sonucunda gelecek 25-50 yılda atmosferik CO₂ miktarının 2-3 katına çıkması beklenmekte (350-400 ppb'den 800-1200 ppb'ye). Bu nedenle Avrupa'nın bahsedilen farklı bölgeleri hem artan CO₂ hem de 2-5°C'lik sıcaklık artışından etkilenecektir. Bu durum da zararlılar, hastalıklar ve sonuçta verim üzerinde derin etkiler yaratacaktır. Küresel bazda gıda ve yem açısından çok önemli olan buğday, mısır, soya fasulyesi üreticisi olan Asya'nın bazı bölgeleri ve Orta ve Güney Amerika içinde benzer etkiler öngörülmektedir. İklim değişikliği etkilerinin gelecek yakın bir zamanda hem beslenme, hem kalite kayıpları, hem de mikotoksinlere maruziyet açısından özellikle düşük ve orta gelirli ülkelerde daha da büyük önem taşıyacağı düşünülmektedir (Medina et al, 2017).

MİKOTOKSİNLER

Mikotoksinler bazı küf türleri tarafından sentezlenen insan ve hayvanlarda çeşitli hastalıklara neden olabilen sekonder metabolitlerdir. İnsanlar mikotoksinlere ya toksinli gıdanın tüketimiyle veya toksinli yemle beslenen hayvanların et, süt, yumurta gibi ürünlerinin tüketimiyle maruz kalırlar. Dünyada bilinen 300'den fazla mikotoksin bilinmektedir. Bunların insan ve hayvan sağlığı açısından en önemli olanları *Aspergillus*, *Penicillium*, *Alternaria*, *Fusarium* gibi küf cinslerin tarafından sentezlenirler.

Mikotoksijenik küfler arpa, mısır, pirinç gibi temel gıda maddeleri ve ayrıca fındık, kahve, tahıllar, kuru meyveler, baharatlar, yem bitkileri, meyveler ve sebzeleri enfekte edebilir ve gıda güvenliğini etkileyen toksinler üretebilirler. Bu küfler tarlada verim kaybına neden olmak yanında, aynı zamanda besin zincirine toksinlerin de dahil olması ile sağlık açısından da çok önemli bir tehlikeyi gündeme taşımaktadır.

Tablo 1'de dünyada gıda zincirinde en çok rastlanan bazı mikotoksinler, bunların en yaygın olduğu gıda grupları ve insanlarda neden oldukları hastalıklar verilmiştir.

Tablo 1. Önemli bazı mikotoksinler, sentezleyen küfler ve insan ve hayvanlarda neden olduğu hastalıklar.

Mikotoksin	Sentezleyen küfler	Ürün çeşidi	Neden olduğu hastalıklar
Aflatoksinler (B1, B2, G1, G2)	<i>Aspergillus</i> , <i>Penicillium</i>	Tahıllar, yemler, yağlı tohumlar, kuru meyve	Karaciğer hasarı ve kanseri, sarılık, immun sistemin baskılanması
Alternariol	<i>Alternaria</i>	Domates, ketçap, pekan cevizi	İmmun sistemin baskılanması
Ergot alkaloidleri	<i>Claviceps</i>	Tahıllar, sorgum	Uyku, uyuşukluk, kuru kangren, abort, nörotoksosite
Fumonisinler	<i>Fusarium</i>	Mısır, tahıl	Ensefalomalazi, karsinojenite, nörotoksosite, karaciğer hasarı, kalp yetmezliği
Fusarik asit	<i>Fusarium</i>	Tahıllar	Karaciğer hasarı, mutajenite
Kojik asit	<i>Aspergillus</i>	Mısır	Kalp kası hasarı
Okratoksinler	<i>Aspergillus</i> , <i>Penicillium</i>	Tahıllar, yağlı tohumlar, incir, kurutulmuş et, kurutulmuş meyveler	Böbrek ve karaciğer hasarı, iştah kaybı, immun sistemin baskılanması, Balkan Endemik Nefropatisi
Patulin	<i>Aspergillus</i> , <i>Penicillium</i>	Silaj, elma, elma ürünleri, buğday, yemler	Sinirsel sendromlar, beyin kanaması, deri kanseri, mutajenite
Sitrinin	<i>Aspergillus</i> , <i>Penicillium</i>	Tahıllar, mısır, arpa, karma yemler	Sinirsel belirtiler, gelişme geriliği, karaciğer, böbrek nekrozu, mutajenite
Trikotesenler (T2, HT2, DON, DAS)	<i>Fusarium</i> , <i>Sefalosporium</i> , <i>Trikoderma</i>	Tahıllar, silaj, yemler, baklagiller, meyve, sebze	Dermatit, deri nekrozu, anemi, kanamalar, hemapoetik etki, alimentaria toksik aleukia, immun sistemin baskılanması
Zearalenon	<i>Fusarium</i>	Tahıllar, mısır, silaj, çayırotu saman	Östrojenik etki, reproduktif problemler, abort,

İKLİM DEĞİŞİKLİĞİNİN MİKOTOKSİNLER ÜZERİNE ETKİSİ

İklim şartlarında meydana gelen değişiklikler mikotoksijenik fungal patojenler için; mikotoksin baskılayıcı koşullardan, mikotoksin sentezi için elverişli koşullara geçişle sonuçlanabilir. Çevresel stres sekonder metabolitlerden özellikle mikotoksinler için önemli sonuçlara neden olabilecektir. (Pitt and Miller, 2017).

Mikotoksijenik küflerin oluşumu ve yaygın hale gelmesinde temel iklimsel faktörler sıcaklık, nem ve yağıştır. Ayrıca sıcaklığın yükselmesi ve nemin artışı, biraz yüksek bir CO₂ seviyesi de benzer etkiye sahiptir. Çalışmalar yüksek CO₂ varlığının, bitkilerin mantar duyarlılığında artış oluşturabileceğini göstermiştir. Yüksek CO₂ koşulları altında mısırın *Fusarium verticillioides* saldırısına karşı savunmasızlığını arttırdığı gösterilmiş, 800 µmol CO₂/mol hava koşulunda *Fusarium* biyokütle üretiminde 2,5 kat artış olduğu bulunmuştur. Diğer

yandan iklim deęişikliğine baęlı olarak meydana gelen sellerin de özellikle silo hasarına neden olma sonucu ürün hasarı ve toksin oluşumu için uygun ortam hazırladığı da bildirilmektedir (Vaughan ve ark., 2014).

Mikotoksin oluşumunu etkileyen sıcaklık, kısmi nem, bitki zararlıları ile ürünün zarar görmesi gibi faktörler, iklim deęişikliğinden etkilenmektedir. Sıcaklıkların artması ile birlikte soęuk bölgeler tarıma elverişli hale gelmektedir ki; bu durumda bitki zararlıları ve fungal türler için yeni habitatlar açılmaktadır. Daha önce kontamine olmayan bölgelerde mikotoksin oluşumuna ilişkin olarak vakalar görülmektedir. Yerel ekonomi ve halk saęlığı bu durumdan olumsuz etkilenmektedir. İklim deęişikliği koşulları altında yetersiz depolama ve uygun olmayan nakliye faaliyetleri mikotoksin oluşumu ve yayılımında çok önemli olmaktadır (FAO, 2020). İklim deęişikliğine baęlı olarak bitki için oluşan olumsuz koşullar (kuraklık stresi, sıcaklık stresi, haşere saldırısının neden olduęu stres, zayıf besin durumu, vb.) küflerin bitkide daha fazla gelişmesini teşvik etmektedir. Bu durum da mikotoksinlerin daha fazla sentezlenmesi olasılığını ortaya çıkarır. Nemli koşullar küf gelişimini desteklese de, bu koşullar konakçının gücü ile bu durum hafifletilebilir. Ancak üretilen mahsullerin coęrafi ve iklim koşullarındaki deęişiklikler, yeni mantar bitki birliklerinin ortaya çıkması için fırsat sağlayabilir ve belki de şu anda halk saęlığı için bir tehdit olarak görülmeyen mikotoksinler, örneğin sterigmatocystin, cyclopiazonic asit, moniliformin veya *Penicillium* türleri tarafından üretilen nörotoksinler için yeniden bir deęerlendirme gerektirebilir. (Tirado ve ark, 2010)

Büyüme sezonunda çok fazla veya çok az su varlığı, sıcaklıklardaki deęişimler, zararlılar, kurutma ve depolama esnasında hijyenik olmayan koşullar fungal enfeksiyonların çoęalması; sonuç olarak da mikotoksin oluşumu için en temel faktörlerdir. İnsanların mikotoksinlere maruziyeti gıdalar yolu ile olmaktadır. Global popülasyonun beslenmesinde en temel gıdalar olan nişasta içeren ürünler ve yağlı tohumlar; mikotoksinlere karşı da oldukça hassastırlar. Bu durum gıdalarda ve yemlerde en önemli mikotoksinleri sentezleyen türler olan *Aspergillus*, *Fusarium*, *Penicillium*, *Claviceps*'i temel bir gıda güvenliği sorunu haline getirmektedir (Marras et al 2008).

Tarımsal olarak en önemli 5 tane mikotoksin aflatoksinler, okratoksin A, fumonisinler, deoxynivalenol ve zearalenone'dur. Yemlerdeki durum da benzerdir. Genel olarak mikotoksinler gıda işleme esnasında elimine edilemezler yalnızca seyreltilirler. Bu durum gıda güvenliği açısından işin ciddiyetini ortaya koymaktadır. Mevcut mikotoksinlere ilaveten modifiye olan ve yeni ortaya çıkan mikotoksinler de mevcuttur. Bunlar ilk hallerine kıyasla farklı kimyasal yapılara, fizikokimyasal özelliklere, biyokimyasal hareket mekanizmalarına

sahip olabilir. Artan CO₂ seviyelerinin buğday ve mısırdaki hastalıklara olan hassasiyet yaratması, mikotoksin oluşumunu ve enfeksiyonların şiddetini artırdığı görülmüştür. Bu durum gıda güvenliği açısından önemli bir tehdittir. Sonuç olarak mikotoksin oluşumu insanların güvenli ve yeterli gıdaya ulaşımını engellemektedir (FAO, 2020).

Hükümetlerarası İklim Paneli'nde iklim sisteminin ısınmasının kesin olacağı belirtilmiş, gelecekte sıcaklığın 2-6°C artacağı ve bu durum yükselen deniz seviyesi, azalan buz ve kar miktarları ve artan okyanus ve atmosfer sıcaklıkları ile ilişkilendirilmiştir. Bu tür iklim değişiklikleri toksijenik mantarların da gelişimleri üzerine önemli etkiye sahiptir ve mikotoksin oluşumunu da derinden etkileyecektir. Örneğin Güney ve Orta Avrupa'da mısırdaki aflatoxin kontaminasyon riskinin önümüzdeki 30 yıl içinde artma olasılığı dikkat çekmektedir. Ayrıca Avrupa'da mısır ve buğday gibi küçük daneli tahıllardaki *Fusarium* türlerinin Kuzey, Orta ve Güney Avrupa'da endişe verici boyutta artacağı da ön görülmektedir. Orta ve Kuzey Avrupa'da *F. graminearum*, Güney Avrupa'da *F. verticillioides* önemli riskler olarak değerlendirilmektedir. (Moretti, 2021)

Çalışmalar farklı mikotoksinlerin farklı bölgelerdeki ürünlerde yüksek miktarda bulunduğunu göstermektedir. Orta ve Güney Amerika, Afrika, Orta Doğu ve Güney Asya'nın nemli ve sıcak iklimi mısır, yer fıstığı ve baharatlar gibi gıda ürünlerinde sıkça aflatoxin oluşumuna dikkat çekmektedir. Yine Kuzey Avrupa ve Kuzey Amerika'nın daha soğuk ve nemli iklimlerinde özellikle *Fusarium culmorum* tarafından üretilen deoksinivalenolün bulunduğu; İtalya, Sırbistan ve Macaristan'da özellikle mısırdaki aflatoxin kontaminasyonunda artış olduğu rapor edilmiştir. (Dobolyi vd., 2013; Giorni vd., 2007; Kos vd., 2020). Ürünlerde mikotoksin kontaminasyonu çok ciddi bir sağlık sorunu olup, uluslararası ticarete engel oluşturmaktadır. Avrupa'daki Gıda ve Yemler için Hızlı Uyarı Sistemi (RASFF, Rapid Alert System for Food and Feed) mikotoksinlerin yalnızca Avrupa Birliği ülkeleri için değil; üye olmayan ülkeler için de gıdalarda bildirilen ilk 10 tehlike arasında yer aldığını ortaya koymuştur (RASFF, 2019). Diğer yandan Kugu ve ark., (2022) 2021 yılı RASFF bildirimlerinde gıda ve gıda ile temas eden veri analizinde aflatoxin ve okratoksinlerin, pestisit kalıntısı ve gıdalarda mikrobiyal problemlerden sonra 3. sırada yer aldığını bildirmişlerdir.

Geleceğe dair +2°C'lik sıcaklık artışı senaryosunun Orta ve Güney İspanya, Güney İtalya, Yunanistan, Kuzey ve Güneydoğu Portekiz, Bulgaristan, Arnavutluk, Kıbrıs ve Türkiye gibi bölgelerdeki aflatoxin riskinde de ciddi bir artışa neden olacağı öngörülmektedir. Bu ülkelere ilave olarak dünyada önemli mısır üreticisi ülkeler olan Romanya, Fransa, Macaristan ve

Kuzeydoğu İtalya’da düşük hasat ve orta düzeyde aflatoksin riski de öngörülmektedir (Moretti vd 2019).

SONUÇ

Küresel iklim değişikliğinin dünya genelinde önlenmesi için tüm ülkelerin katılımını sağlayacak şekilde aşağıda sıralanmaya çalışılan önemli noktaların dikkate alınması gereklidir.

- ✓ Sürdürülebilir tarıma destek olmak.
- ✓ Yeşil alanları korumak
- ✓ Petrol, karbon, doğal gaz gibi fosil yakıtları kullanımını sınırlamak
- ✓ Yenilenebilir ve temiz enerji kaynaklarına yönelmek
- ✓ Rüzgar ve güneş enerjisinden daha fazla yararlanmak
- ✓ CO₂ salınımını azaltmak
- ✓ İsrafi önleyerek daha az tüketmek

Yapılan çalışmalar iklim değişikliğinin etkileyeceği bilimsel olarak ortada olan mikotoksin oluşumunun engellenmesinin de çok önemli olduğunu ortaya koymaktadır. Mikotoksinlerin giderilmesi bağlamında dünyada şu ana uygulanmakta olan geçerli bir yöntem maalesef yoktur. Bu nedenle önemli olan mikotoksin oluşumunun önlenmesidir. Bu amaçla tarlada hasat öncesi ve özellikle hasat sonrası kurutma ve depolama aşamalarında mikotoksin oluşumunun önlenmesi amacıyla öncelikle sıcaklık ve nem koşullarının dikkate alınması, optimize edilmesi ve kontrol altında tutulması çok önemlidir.

Gelecek yıllarda gıda ürünlerinde artması muhtemel mikotoksin oluşumuna karşın Avrupa’da bu konuda aşağıdaki başlıklara önem verilmesi planlanmıştır;

1. Mikotoksinlerin surveyansının ve izlenmesinin iyileştirilmesi.
2. Mikotoksinlerin coğrafi dağılımı ve önleme yöntemlerine ilişkin veri tabanlarının iyileştirilmesi ve geliştirilmesi.
3. Yeni biyocoğrafi tarım senaryolarında tahmini mikotoksin kontaminasyonu için modellemeler yapılması.
4. Tarıma ve çiftçiye desteğin artırılması.
5. Kontrol ve analiz yöntemlerinin geliştirilmesi.

Abstract

FDM 3D printing is one of the most popular and widely used methods, allowing the construction of lightweight products with various filling densities. In this study, fatigue tests were applied to pure PLA and PLA reinforced with carbon fibers to study key 3D printing parameters that affect the fatigue of PLA products. The pattern was designed using a fill density percentage of 70% and three materials: pure PLA, 15% carbon fiber-reinforced PLA, and PLA reinforced with 20% carbon fiber. The results of the study concluded that using PLA reinforced with 15% carbon fiber provides the highest mechanical properties, while when the carbon fiber content reaches 20%, the mechanical performance of the material deteriorates due to the effect of carbon fibers on the adhesion of material layers in 3D printing.

Keywords: PLA, Polylactic Acid, Fatigue, 3D Printer

1- Introduction:

Additive Manufacturing (Additive Manufacturing) is the process of creating a 3D pattern by adding layers of materials. It has been successfully used in numerous technical applications. (Gupta, V.2019).

Fatigue Testing is a test where a material is subjected to structural change, which can lead to cracks or fracture. It involves repeated loading and unloading in pressure, contraction, bending, torsion, or combinations of these stresses. (Raoult, I.2020).

Polylactic Acid (PLA) is the most widely used 3D printing material due to its odorless and safe use, environmental friendliness, and lower energy consumption. It is made from renewable resources and requires less energy for processing. (Deshmukh, K.2017).

our study aims to learn about the effects of adding carbon fiber to PLA 3D printing materials. Determine optimal carbon-fiber tension ratio.

2-MATERIALS AND METHODS

Samples were made using the following three types of 1.75 mm diameter Filament material:

- Pure PLA (With 0% carbon fiber).
- PLA reinforced with 15% carbon fiber.

PLA reinforced with 20% carbon fiber. The fatigue samples were designed at the Solidworks program. Then extracted it by STL format. STL Files opened by slicing 3d printing software Cura.

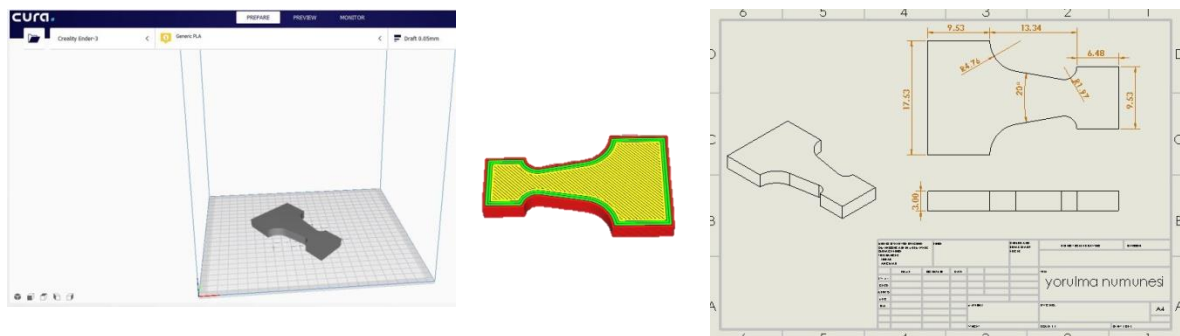

Figure 1 Drawing samples through SolidWorks

3-RESULTS

Fatigue test was done at room temperature and SEM images were taken of the PLA samples printed by 3D printer by “FDM” method.

3-1 Fatigue RESULTS

In table 1, the results of the Fatigue test were taken, and the values of:

E: Young's modulus [N/m²].

δ: Maximum amount of bending deformation [m].

b: Width of the sample [m].

h: Thickness of the sample [m].

L: Distance between supports [m].

$$\sigma = E \frac{6\sigma h}{L^2}$$

4- DISCUSSION

The sample with the highest fatigue strength is (15% cf), and The sample with the lowest fatigue strength is (20% cf).

The main reason for the low mechanical properties of PLA with 20% carbon fiber, is the poor adhesion of the plastic layers during printing. Where carbon fibers cause weaknesses in the adhesion of the layers.

In other words, the increase in the ratio of carbon fibers in the material led to weak interfacial bonding between the layers.

This scientific explanation is consistent with several other studies such as Nabeel's et al paper study (Maqsood, N.2021).

5- CONCLUSION

Through the results of the tests that we obtained and after referring to books, sources, research papers and reference studies, we recommend the following

Using PLA reinforced with 15% carbon fiber in 3D printing leads to obtain and higher stress amplitude.

We do not recommend using of PLA reinforced with 20% carbon fiber in 3D printing (with the parameters we used) because a weakness of the mechanical properties of the material in fatigue tests.

Using pure PLA (without carbon fibres) in 3D printing (with the parameters we used) has better results than sample (20% cp) and weaker than sample (15% cp).

Based on this study, we recommend:

Studying the tensile and fatigue properties of 3D printed PLA samples, with different percentages of carbon fibers (>15% and <20%) in order to determine the highest efficiency ratio.

Study of fatigue properties of 3D printed PLA material, with changing infill pattern and infill density ratios.

Study of the same material (PLA) and the same ratios of carbon fibers, but with the change of carbon fiber pattern from short fibers to continuous fibers.

Studying other polymeric materials used in 3D printing other than PLA (such as ABS and PETG), with the addition of different ratio of carbon fibers to it.

Studying the factors affecting the adhesion of layers in 3D printing on polymeric materials reinforced with carbon fibres.

Abstract—With the increasing population, more and more people are affected by brain tumor disease. When compared to other diseases, survival rate is extremely less. Also brain tumor disease affects people's daily life and mortality rate of brain tumor is very high. This study presents a dynamic image scaling for brain MR image segmentation problem. Recently, deep learning models are widely used for brain tumor segmentation task because manual segmentation of brain tumor is hard and false positive rate is high. Also image processing part is so important for deep learning tasks. This study focused on image processing part with the dynamic image scaling algorithm. Proposed method contains two parts, the first part of the proposed method is designed for finding the minimum coordinates of all labels, second part of the proposed model is designed for deciding the global minimum coordinates and finally proposed method finds the left-bottom corner's coordinate, image is rescaled with this starting coordinate. This proposed method both figures out imbalanced dataset problem and increases the deep learning model success rate. Proposed method is compared with traditional image scaling algorithms such as inter cubic, inter nearest and inter linear. Inter cubic offers %67 average dice score, inter nearest offers %75 average dice score and inter linear offers %69 average dice score. Proposed method offers %77 dice coefficient score. When compared to proposed method with other traditional image scaling algorithms, proposed method offers better results.

Keywords — Image Scaling, Image Processing, Deep Learning, Brain Tumor Segmentation.

I. INTRODUCTION

Today, humans struggle with a lot of important diseases. This type of diseases affects human daily life like brain tumors. Brain tumor disease directly affects human brains. The brain of each person is considered a complicated part of his physique. Information is recalled, gathered and assessed by the brain [1]. Once a disease occurs, the mortality and disability rate is extremely high. In China, the annual incidence of gliomas is 50,000 to 100,000 [2]. Also, brain tumor segmentation is a critical task in medical imaging because it allows physicians to accurately identify the location and size of tumors. When physicians use traditional segmentation methods, it is extremely hard and exhausting. Moreover, this may result in a high false rate because physicians use a screen for detecting tumor areas [3].

Accurate and reliable brain tumor segmentation is a critical component in cancer diagnosis, treatment planning, and treatment outcome evaluation [4]. With the advent of machine learning, the process of MR images to have a fast and accurate detection of brain tumors has become a matter [5]. To this end, some research in literature uses machine learning and deep learning models for increasing the accurate detection rate. Also, while some researches emphasize that hybrid models are increasing the machine learning and deep learning models' success rate [6,7], other researches take attention to the importance of preprocessing and feature extraction phases [8,9].

In this study, some traditional image scaling methods are tested on brain tumor segmentation images and observed their contribution to the segmentation model's success rate. Also, a dynamic image scaling method is proposed and some image scaling methods are compared with our dynamic image scaling method on brain MR images dataset called "BRATS". This paper is organized as follows: material and methods are described in Section 2, results are described in section 3 and finally, a conclusion is given in Section 4.

II. MATERIAL AND METHODS

A. Dataset

The BraTS20 (Brain Tumor Segmentation Challenge 2020) dataset is a publicly available dataset of multi-modal magnetic resonance imaging (MRI) scans for the segmentation of brain tumors. The dataset was created for the 2020 edition of the BraTS challenge, which aims to promote research in the development of automated methods for brain tumor segmentation. BraTS utilizes multi-institutional pre-operative MRI scans and focuses on the segmentation of intrinsically heterogeneous brain tumors, namely gliomas [10].

The BraTS20 dataset includes 369 cases of MRI scans, each consisting of T1-weighted, T1-weighted contrast-enhanced, T2-weighted, and T2-weighted fluid-attenuated inversion recovery (FLAIR) MRI images. The scans were acquired from multiple centers and have been manually annotated by experts to provide ground truth segmentations of the brain tumors.

The BraTS20 dataset include 4 type of label; 0 is not a tumor region, 1 is enhancing tumor, 2 is tumor core and 4 is whole tumor. Also MR images have 155 slices shown in Fig 1.

Fig. 1. MR images structure in BraTS20 dataset

B. Dynamic Image Scaling Algorithm

BraTS20 dataset contains 4 different type of label and these labels unevenly distribute. 0 label is sign that this region is not a tumor region and also indicate the background. For this reason, this label most common label in all labels. %85 percent of all data is 0 label so that BraTS20 is imbalanced dataset. Also our MR images shape are 240 x 240 x 155 so we have 155 slices in one MR image and totally we have 369 MR images.

We need to apply image scaling method for some reasons; firstly we don't have any powerfull gpu device for running deep learning model with this dataset, secondly we have to decrease the time consuming while model training, and finally we can increase the model success rate with image scaling methods. So that, we proposed a dynamic image scaling methods for increasing the model success rate and figure out to imbalanced dataset problem.

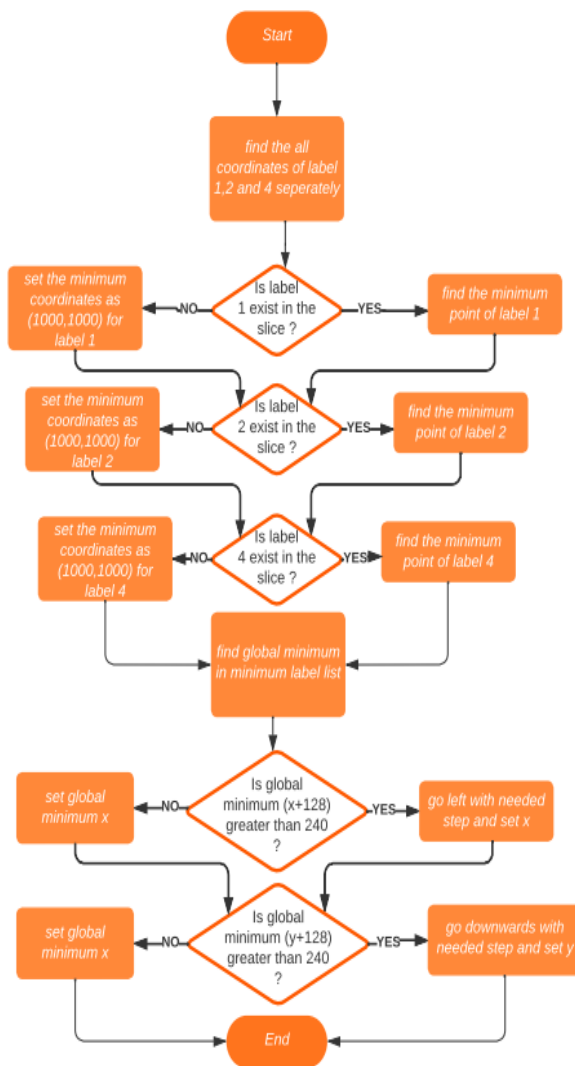

Fig. 2. Flowchart of proposed dynamic image scaling algorithm.

Proposed method is shown in Fig. 2. as flowchart. Proposed algorithm is contains if-else statements and firstly check that the label 1 exist in the slice, if yes we find the minimum point of label 1, if no we set (1000, 1000) as minimum point for label one because our image has 240x240 shape so global minimum never be (1000,1000) and repeat this step for all labels. Then we find global minimum in the minimum points list. Our scaled image will have 128x128 so we add 128 to our global minimum point and finally check whether this result is bigger than 240. If this result bigger than 240, we rearrange our result point.

Fig. 3. One slice in MR image before dynamic image scaling

Our proposed method contains 2 part, the first part of the method is used for finding the minimum coordinates of all labels. For this purpose we divide our image into two dimension as x and y shown in Fig. 3. We search minimum x and y coordinates for each label and save the results in two different array, first array for minimum x coordinates and other for minimum y coordinates.

After first part of proposed method is done, the second part is used for finding the minimum of minimum x and y coordinates. After finding the global minimum x and y coordinate, we choose our starting point shown in Fig. 4. Then we go through up and right with given new image size (we use 128 x 128 for this study) and finally new image is created. As a result of this we can find a most concentrated part of image and discard the background label 0 as soon as possible.

Fig. 4. One slice in MR image after dynamic image scaling.

After two step is done, we obtained new scaled imaged shown in Fig. 5.

Fig 5. Dynamically scaled 128x128 MR image.

C. Evaluation Metrics

Dynamic image scaling algorithm is designed for brain tumor segmentation problem. When we evaluate our proposed algorithm, we used dice coefficient metric that is the most popular metric for segmentation problems.

Dice coefficient is a statistical measure used to compare the similarity of two samples. It is commonly used metric for evaluating the performance of image segmentation, where it is used to compare the similarity of the segmentation result to a ground truth.

The Dice coefficient is defined as the ratio of the size of the intersection between two sets to the size of their union [11]. Mathematically, it can be expressed as:

$$\text{Dice coefficient} = 2 * |A \cap B| / (|A| + |B|) \quad (1)$$

where A and B are the two sets being compared, |A| and |B| represent their respective sizes, and |A ∩ B| represents the size of their intersection.

The Dice coefficient ranges between 0 and 1, with 1 indicating perfect overlap between the two sets and 0 indicating no overlap. BraTS20 dataset has 4 different labels so that we use dice coefficient metric for each labels and avg dice coefficient score for these 4 labels, these can be expressed as:

$$\text{Dice coefficient nontumor} = 2 * |A(0) \cap B(0)| / (|A(0)| + |B(0)|) \quad (2)$$

$$\text{Dice coefficient necrotic} = 2 * |A(1) \cap B(1)| / (|A(1)| + |B(1)|) \quad (3)$$

$$\text{Dice coefficient edema} = 2 * |A(2) \cap B(2)| / (|A(2)| + |B(2)|) \quad (4)$$

$$\text{Dice coefficient enhancing} = 2 * |A(4) \cap B(4)| / (|A(4)| + |B(4)|) \quad (5)$$

$$\text{Dice coefficient average} = 2 * |A(0,1,2,4) \cap B(0,1,2,4)| / (|A(0,1,2,4)| + |B(0,1,2,4)|) \quad (6)$$

III. RESULTS

BraTS20 dataset has 369 MR images and each image has 240x240x155 dimensions. Proposed dynamic scaling method decrease the first two dimension with given size and figure out the imbalanced label problem.

TABLE I. LABEL COUNT BEFORE SCALING

Instance Slice	Label 0 before scaling	Other label before scaling	Rate before scaling
1	47499	299	0,99
2	49536	354	0,99
3	50189	315	0,99
4	49884	338	0,99
5	44984	333	0,99

Some label counts selected randomly in MR images are listed in table 1 before scaling process. Table 1 show that 0 label is cover %99 percent of one slice before scaling process. This is an example of imbalanced dataset problem. For instance; we have 47499 as 0 labels and 299 as 1,2 and 4 labels.

After applying the proposed dynamic image scaling method we obtain 128 x 128 image and decrease the 0 label count while preserving other 1,2 and 4 labels. In this way we decrease the rate of 0 label in all pixels. Table 2 shows that after applying the proposed dynamic image scaling algorithm, 0 rate is dropped from %99 to %95 for image slace 1.

TABLE II. LABEL COUNT AFTER SCALING

Instance Slice	Label 0 after scaling	Other label after scaling	Rate after scaling
1	6283	299	0,95
2	8320	354	0,95
3	8973	315	0,96
4	8668	338	0,96
5	4705	299	0,94

Proposed dynamic image scaling algorithm is compared with other traditional image scaling algorithm. We used dice coefficient scores for metric evaluations. The results are shown in table 3.

TABLE III. MODEL PERFORMANCES WITH DIFFERENT IMAGE SCALING ALGORITHMS

Algorithm	Average Dice Score	Dice Score for label 0	Dice Score for label 1	Dice Score for label 2	Dice Score for label 4
INTER_CUBIC	0.67	0.99	0.41	0.67	0.61
INTER_NEAREST	0.75	0.99	0.60	0.74	0.67
INTER_LINEAR	0.69	0.99	0.44	0.69	0.64
PROPOSED DYNAMIC IMAGE SCALING	0.77	0.99	0.63	0.77	0.69

Proposed dynamic image scaling algorithm is the best compared to other traditional image scaling algorithms. It reached the best dice coefficient score for each label.

IV. CONCLUSION

Brain tumor diseases is spreading rapidly around the world therefore avoiding this type of diseases is important for physicians however segmentation of brain tumors is too hard task. Recently, deep learning models are widely used for brain tumor segmentation. This study proposed a novel dynamic image scaling algorithm for brain MR images. Proposed method aims to reduce imbalanced data problem and allows the model to focus only on the region of tumor area.

There are a lot of traditional algorithms for image scaling. Proposed method is differ from traditional image scaling algorithm because proposed method reduces the imbalanced data set affect while focusing the related tumor area. Traditional image scaling algorithm is achieved an average %72 dice coefficient score using BraTS20 dataset for same deep learning model. On the other hand proposed method is achieved %77 dice coefficient score. Proposed method not only increase the model performance but also figure out imbalanced dataset problem.

ABSTRACT

The developments in technology and informatics at the beginning of the 20th century also positively affected the machinery industry. With the discovery of controllers, machines that can perform mathematical and logic operations were invented and took their place in factories. With the integration of wireless internet and embedded systems into machines, machine parks that can communicate with each other and operate autonomously have started to be used. The use of large number of machines with high added value in factories has increased the costs of maintenance performed using classical maintenance methods (planned and preventive maintenance), and alternative strategies have begun to be explored. The concept of just-in-time maintenance (predictive maintenance) has emerged in order to prevent the change of still usable valuable materials in periodic maintenance. Thanks to this method, some inferences can be made and actions can be taken by observing the running system data. Observing systems manually poses a threat to sustainability and objectivity. To develop this approach and to eliminate these threats, sensors are placed at critical control points of the systems and numerical data is obtained. These numerical data can enable us to make more objective and consistent observations using the Internet of Things (IoT) and Machine learning algorithms, and can help users for just-in-time maintenance. This approach was also used in previous studies, by observing the parameters, analyzing the collected data with analytical methods, predicting their useful life and taking action by the maintenance teams. In this study, we will be able to make an effective maintenance plan by processing the data we receive from the sensors measuring different values that we place at the critical control points of the system in machine learning algorithms, comparing the relationships between the parameters.

Keywords : Internet of Things (IoT), Embedded Systems, Cloud, Endustriy 4.0, Predective Maintaince, Machine Learning

INTRODUCTION

The beginning of the industrialisation race in order to meet the needs of human beings has led to the development of machine technology and as a natural consequence, the concept of machine maintenance has taken its place in the literature. In the early periods, maintenance and repair activities, which were carried out as incidental without being connected to any system, were systematically applied to reduce downtime in production lines in facilities that had difficulty in meeting the demand for fast-moving consumer goods; statistical and experience-based maintenance strategies began to be created.

Following the invention of the PLC and the adoption of communication protocols in the machinery industry, machine parks that can work autonomously together have led to a significant increase in production quantities. This situation has made it more difficult to compensate for downtimes in production lines and has increased spare parts and machine maintenance costs. In order to reduce line downtimes and maintenance costs, the importance of design and applications for maintenance is increasing and even taking its place in university curricula.

During maintenance and repair work in case of failure, production plans are disrupted and the amount of rework product increases. Although maintenance work performed at the time of failure is one of the maintenance techniques, today's conditions have gained popularity in the understanding of intervention before the machine fails. In this way, it is aimed to get the highest efficiency from the machine and to prevent time and production losses in unexpected failures. The method of predicting the time of failure for condition monitoring in machines by processing and interpreting the data we receive from the operating system is called predictive maintenance technique.

Predictive Maintenance Related Works

In the predictive maintenance approach, the failure time is estimated by monitoring the status of the running machines. Intervention is made by making a maintenance and stock plan. In this approach, it is necessary to evaluate the data received from the machines correctly. There may be an increase in maintenance work due to incorrect evaluation of data.

Arslan (2007), recorded and processed the defects formed on the working surfaces of the ball bearing elements and the shaft vibrations in the radial direction. He created a theoretical model for the system. According to this model, a simulation program has been developed that can analyze the vibration spectra of intact and defective bearings.

Orhan et al. (2010), investigated the operability of bearings of a centrifugal pump with the help of vibration analysis. Due to the increase in the vibration amplitudes in the pump bearings, the pump bearings have changed and it has been determined that the useful life of the bearings is almost completed as expected.

Wakiru et al. (2019), have included hybrid approaches in their studies of maintenance approaches. Hybrid approaches have been applied in several studies using a combination of two or more approaches:

- Statistical + Artificial intelligence
- Statistical + Model-based
- Model-based + Artificial intelligence
- Model-based + Artificial intelligence + Statistics

Li et al. (2020), studied cross-modality medical image synthesis between MR images and Computed Tomography. He modulated using U-Net and CycleGAN methods, which are typical networks of supervised and unsupervised learning in image processing, to generate MR/CT images. Experimental results were analyzed using the U-Net (Supervised Learning) method with lower error and higher accuracy. In this study, it was seen that supervised learning method performed better than unsupervised learning in MR/CT synthesis.

S. Parul et al. (2015), compared the performance of K-NN and SVM algorithms to find the most efficient method with the classification technique. He wanted to keep the causes of chronic kidney disease under control by using machine learning algorithms. By using the classification techniques of data mining, KNN and SVM, the estimated accuracy and precision were compared and the F-score was checked. It was seen that the K-NN algorithm gave better results.

Vishwanath Bijalwan et al. (2014), compared Naive Bayes classifier, Term Graph model and K-NN algorithms to automatically classify text documents in different categories. It classifies according to the relationship between the probability operations taught in the naive bayes algorithm and the new test data presented to the system.(Saritas et al. 2019), The Term Graph model, on the other hand, does not perform as well as K-NN in text documents.

R. Dündar et al. (2021), conducted a literature review examining machine learning and deep learning algorithms to improve predictive maintenance work in industrial facilities. In modern production systems, studies on keeping the system in the best working condition have been examined. Fault monitoring and data processing techniques are explained and machine learning algorithms are examined.

G. Calayır et al. (2021), and his colleagues tried to estimate the remaining machine life calculation studies by using the linear regression method by processing the data they received from the machine.

H.Ceyhan et al. (2022), processed the spectrum values obtained from PLC to predict mixer motor driver failure and created a model using random forest algorithm for calculation of time to failure.

Bülbül et al. (2016), examined the working principles of industrial vacuum pumps and vacuum pump types. Ünal et al. (2015), examined the performance criteria of the vacuum pump in the milking machine.

They observed that the vacuum performances decrease as they rise above sea level. Regression relationships were found for airflow-altitude and airflow-pump vacuum altitude levels.

R. Minaz et al. (2021), examined the short-circuit fault analysis of brushless direct current motor with classification methods. For fault diagnosis, k-NN, decision tree (RT) and multilayer perceptron (MLP) classification methods are used. Although the K-NN algorithm needs a larger learning data set, it has been seen that it works with a higher percentage of accuracy.

MATERIAL and METHOD

Vacuum Pumps

Vacuum pumps, which are widely used in the industrial sector today, are tools that have a wide application area and are used to evacuate the gas in a region. Vacuum pumps draw gas molecules from an enclosed volume to leave a partial vacuum, within capacity a relative vacuum; It is used to produce negative pressure or low pressure. A mechanism inside the pump expands a small cavity in order to reduce the pressure below the atmosphere, and the air molecules filled in the expanding volume are discharged from the exhaust with the narrowing of the width.

Vacuum Pumps can be generally categorized into three types of vacuum techniques. These are positive displacement, momentum transfer and trapping vacuum pumps. Positive displacement pumps expand a cavity, allowing the gases in the chamber to flow through that cavity, closing the cavity again and venting the gas in the chamber to the atmosphere. It uses mechanism to do this process over and over. Momentum transfer pumps, also called molecular pumps, use high-speed jets of dense liquid or high-speed rotating blades to remove gas molecules from the chamber. Trap pumps catch solid or adsorbed gases; this includes cryopumps, receivers and ion pumps.(F. Adams, 2015)

Most modern vacuum pumps are positive displacement pumps. They remove air molecules, or other gasses, from a vacuum chamber to create vacuum.(Vakum Pompaları: Busch R5 RA 1000/1600 B Rotorlu Yağlı Tip Vakum Pompası, n.d.)

Figure 1: Positive Displacement Pump
Operating Principle

- The Machine Works on the rotary vane principle (Types of Positive Displacement Pump).
- The oil seals the gaps, lubricates the vanes and takes away compression heat.
- The oil filter cleans the circulating oil.
- Exhaust filters separate the oil from the discharged gas.

Sensors

In order to realize the machine learning predictive maintenance project, we had to collect data on the system we would use. Analog sensors are used to measure temperature, vibration, pressure and flow spectra from the machine. As a result of our research, we have seen that industrial type sensors are not suitable for the project budget. That's why we started researching cost-effective sensors that could provide the same data range and resolution.

Vibration sensor is also called piezoelectric sensor. These sensors are flexible devices used to measure various processes. A piezoelectric sensor is a device that uses the piezoelectric effect to measure changes in pressure, acceleration, temperature, strain, or force by converting it to an electrical charge. The sensor converts the physical size it measures into a digital signal. The DFRobot Piezo Vibration Sensor is a piezoelectric sensor that responds to voltage changes by producing a measurable output voltage difference that is proportional to the vibration intensity. Therefore, you can measure the size of the vibration via the sensor. Unlike its digital counterparts, it is possible to measure the intensity and length of vibration. It is preferred because its supply voltage (3.3V-5V) and interface are suitable for the system. (O. Oral et al. 2019)

Pressure sensor, with volumetric magnitude; It is a device used to measure the pressure degree of gas and liquid components. Today, it has a very common usage area in production and control stages. With this type of sensor, the pressure is converted into electrical signals and the collected data is converted into tracking, analysis and statistical data. The pressure of components in a confined space can be both monitored and controlled by pressure sensors. It is used in the project to observe the negative pressure in the vacuum chamber. It has been observed that we can make our measurements that the MPS20N0040D sensor, which has a measuring range of 0-40kPa, to use in the project, the ambient and storage temperature (-40 °C ~ + 125 °C) parameters are also suitable.

Current sensors are a type of sensor that creates a signal suitable for the purpose by measuring the current passing through a conductor. With the current sensor connected in series with the motor phase, it is observed how much current the motor draws. It has been measured that our system draws up to 5 Amps. To monitor current changes, the ACS712 Current Sensor Board is an inexpensive and reliable solution for current control. (İsmail Arıcı, 2014) The card can read current up to 5 amps. Since hall sensor is used in this product, which you can use in motor control circuits, power management and power supply

circuits, electrical and electronic circuits are separate from each other. Therefore, the possibility of interference is minimized. The product can be used in both DC and AC circuits and is designed to allow bidirectional current flow.

The temperature sensor measures the amount of heat energy produced by the system, allowing us to detect the physical change in temperature producing an analog output. In this way, the operation of the fans and the engine load can be monitored. AHT10 sensor operating voltage (1.8V-6V) compatibility and operating temperature range (-40 °C - 85 °C) we choose because it is suitable for our system.

The Experimental Setup

We make use of sensors and controller to establish the maintenance strategy of the vacuum pump based on condition monitoring. The places where the sensors are mounted are shown in Figure 2.

Figure 2: Placement of Sensors on the Pump

It is the vibration sensor marked with the number 1. We need to place the vibration sensor in the bearing of the motor shaft. However there was no suitable place, it was placed on the filters, which was the most suitable place for the sensor.

It is the pressure sensor used for vacuum measurement marked with number 2. We mounted the pressure sensor to the vacuum chamber with a socket connection. In this way, the pressure sensor will be able to measure negative pressure.

The temperature sensor used for temperature measurement is marked with number 3. The temperature sensor mounted on the motor stator windings is used to measure the motor temperature.

The current sensor we use to measure the change in the amount of current passing through the motor is marked with number 4. Motor currents are measured by the current sensor connected in series to one of the motor phases. (İ. Çolak and R. Bayındır, 2005)

The Data Collection

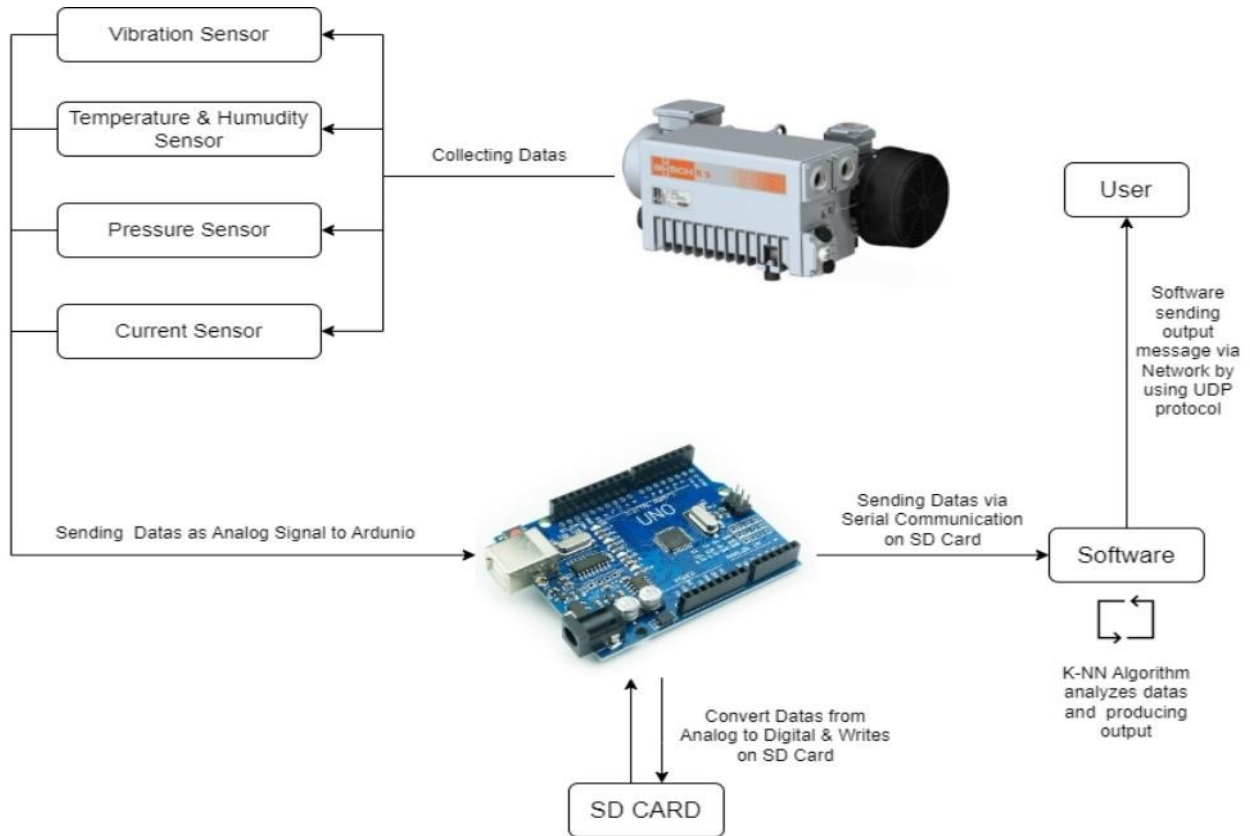

Figure 3: Diagram of Data Collection

In order to realize this project, data was collected from the system through 4 different types of sensors. These sensors are vibration, pressure, temperature & humidity and current sensors. These sensors produce analog signal as output. The range of the analog signal is (0-5)V. Analog signals are transmitted to the arduino by cable. Arduino converts incoming analog signals to digital signals by using the ADC module. It saves digital signals in a text file and stores it on the SD card. It transmits the data stored on the SD card to the computer where the K-NN algorithm is running with the RS232 serial communication protocol. The K-NN algorithm processes the incoming data and creates an output state. This status is transmitted to the user as a message via the UDP protocol.

Predictive Maintenance

In predictive maintenance, the machines in the factory are monitored from certain points. For this, a number of measuring devices are used. Periodic observation is made with the inspection and record monitoring system. It determines the maintenance-repair requirements for intervention without causing major malfunctions. Predictive maintenance data processing steps are given in Figure 3.

Figure 3 : Predictive Maintenance Flow Chart

Different methods are used to use the predictive maintenance technique in the business. (G. Yaman and H. Karadayı, 2014) The most commonly used of these methods are;

- 1- Thermal Monitoring
- 2- Oil Analysis
- 3- Ultrasonic Monitoring
- 4- Motor Current Monitoring
- 5- Trap Monitoring
- 6- Vibration Analysis

Machine Learning

It uses machine learning, mathematics and statistical science. It is modeling with computers by processing the data taken from the machine. The model uses algorithms to make predictions from the processed data.

Three types of machine learning approaches can be used to predict with maximum performance depending on the "signal" or "feedback" available to the learning system:

Supervised learning: Sample inputs given to the computer by a "teacher" and their desired outputs are presented, and the goal is to learn a general rule that maps inputs to outputs.

Unsupervised learning: No labels are given to the learning algorithm. It leaves the algorithm alone to find structure in its input. Unsupervised learning can be a goal in itself (discovering hidden patterns in data) or a means to an end (feature learning).

Reinforced learning: A computer program interacts with a dynamic environment that must accomplish a specific goal (such as driving a vehicle or playing a game against an opponent). As

the program navigates the problem space, it provides feedback similar to the rewards it seeks to maximize.

Frequently used Machine Learning algorithms;

1. Linear Regression :

Regression determines the relationship between one dependent variable and several other independent variables. Regression analysis helps to understand how the dependent variable changes when some of the independent variables change. This method is used to predict and find the cause and effect relationship between variables.

2. Support Vector Machines:

Support Vector Machines are one of the supervised learning techniques and are very useful for data classification. SVM was developed from statistical learning theory. SVM builds a model based on the training set and this model predicts the targeted values for the test data.

3. Decision Trees

Decision trees classification is a classification method that creates a model in the form of a tree structure consisting of decision nodes and leaf nodes according to feature and target. The decision tree algorithm is developed by dividing the data set into smaller or even smaller pieces. A decision node may contain one or more branches. The first node is called the root node. A decision tree can consist of both categorical and numerical data.

4. Random Forest Algorithm

The algorithm aims to increase the classification value during the classification process by producing more than one decision tree. Random forest algorithm is the process of choosing the highest score among many decision trees that work independently of each other. As the number of trees increases, our rate of obtaining a precise result increases. The main difference between the decision tree algorithm and the random forest algorithm is that the process of finding the root node and splitting the nodes is random.

5. Convolutional Neural Network (CNN)

CNN is a deep learning algorithm that is generally used in image processing and takes images as input. This algorithm, which captures and classifies the features (features) in the visuals with different operations, consists of different layers. The visual, which passes through these layers, which are Convolutional Layer, Pooling and Fully Connected, is subjected to different processes and reaches the consistency to enter the deep learning model.

6. k Nearest Neighbor Algorithm (k-NN)

It is one of the simplest Machine Learning algorithms based on the Supervised Learning technique. The algorithm is used by making use of the data in a sample set with certain classes. K-NN can be used for both classification and regression. In implementations for regression, the output is calculated by $y^2 R$ and the mean of k nearest neighbors. In classification with K-NN, the output y is the name of the most encountered class, that is, the new data point is assigned to the most common class among the k nearest neighbors. K-NN does not make any assumptions about the underlying data distribution, so it is a non-parametric algorithm. The training phase of k -NN is fast. However, the time and memory requirement for the testing phase is high due to the use of all training data. The algorithm assumes the similarity between the new state/data and the existing states and puts the new state in the category most similar to the existing categories. All existing data is stored and classifies a new data point based on similarity. This means that when new data emerges, it can be easily classified into an appropriate category using the K-NN algorithm. Data points are numbers or multidimensional vectors. Training data includes both data points and classes. Data points are in a metric space and generally 3 types of distance functions are used for distance calculations between points:

“Euclidean” Distance

“Manhattan” Distance

"Minkowski" Distance.

Figure 3: k Nearest Neighbor Distances

The training set, test point, and k are the inputs of the algorithm. k is the number of neighbors that are influential in determining the outcome. k should be chosen carefully. If k is chosen high, the computational cost increases. If k is chosen small, the noisy part in the data will be decisive in the result. A simple and widely used choice for k is \sqrt{n} .

K-NN study can be explained on the basis of the following algorithm:

Step-1: Choose the K number of neighbors

Step-2: Calculate the Euclidean distance of K neighbors.

Step-3: According to the calculated Euclidean distance, get the K nearest neighbor.

Step-4: Count the number of data points in each category among these k neighbors.

Step-5: Assign the new data points to the category with the maximum number of neighbors.

Step-6: The model is ready.

METHOD

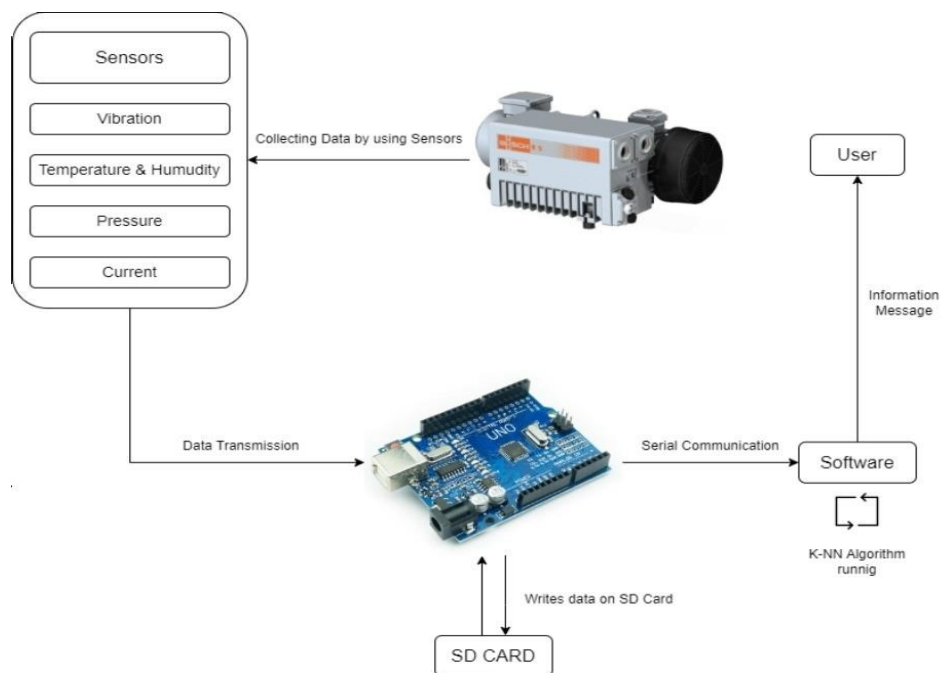

Figure 4: Overall Diagram of prediction maintenance system

Predictive maintenance is the interpretation of the data obtained from condition monitoring and estimating the exact time of required maintenance. Sensors will be placed at critical points of the machine for condition monitoring.

The vibration sensor will be positioned on the motor shaft bearing in order to measure the machine vibration; Estimation will be made according to the amount of increase in vibration spectra. One of the important parameters for the healthy operation of the pumps is engine oils. The reduction of engine oil, which affects the heating rate in the engine, may be caused by mechanical wear or the deterioration of the fan. If the motor is not drawing excessive current and there is no obvious increase in the vibration specs, we will understand that it is possible that the engine oil may be low. With the current sensor connected to the motor, we will be able to monitor the current values drawn by the motor. The data received from the sensors will be processed in the machine learning algorithm and the user will be informed about the operation of the vacuum pump.

Data Processing Methods

When the oil level is normal, Pressure sensor measure the pressure on vacuum pump between 0-5 pascals. As the vacuum pump oil level decreases, the vacuum pump decreases power of the and the pump so that pump cannot vacuum. According to graph, when the vacuum oil decreased, the pressure value measured increased from 0-5 to 35-40 pascal levels.

In the graphics, the temperature values when the cooling fans of the pump are intact and when they are broken are compared. The pump temperature has increased due to the fan impeller broken. It has been observed that when the pump power is cut off, the pump temperature still increasing while the main fan try to cool it.

The graph shown above depicts the relationship between vibration and bearing. When comparing these vibration data, it is evident that as the bearing degrades, it puts additional stress on the rotating joints of the system, which in turn causes a disturbance in the axis balance of the mechanism. Due to this disturbance in the axis balance, an increase in vibration has been observed in the mechanism.

The graph shown above illustrates the relationship between current and bearing. When comparing the collected data, an increase in current has been observed from the moment the bearing starts to degrade. This is due to the fact that as the bearing degrades, it causes a disturbance in the axis balance of the mechanism. By analyzing the data in the graph, it is possible to see that the electric motor begins to struggle to maintain movement due to the disturbance in the axis balance.

Supervised learning technique will be used for machine learning algorithm. All data will be collected and recorded from the moment of healthy operation until the pump switches to a complete failure state. The collected data will be grouped according to 1 independent and 4 dependent variables affecting the performance of the pump. The K-NN algorithm was chosen to use the grouped data. The data will be evaluated as teacher data in the algorithm.

In the new case, the pump will process the values it receives from the sensor at the time of operation and assign them to the algorithm. The distances between the values processed in the algorithm and the teacher data will be calculated as vectors. The new data will be included in the closest distance group.

The user will be informed by e-mail in order to intervene in the determined malfunctions and causes.

RESULT AND DISCUSSION

The accuracy of the data received from the sensors is important for the success of the project. Since the vacuum pump works in combination with the machines, the machines in the machine park may be affected by sound and vibration frequencies. We do not think that the current sensor connected in series to the motor phases and the pressure sensor connected to the vacuum chamber will be affected by this situation. Vibration and temperature sensors can be affected by the noise and temperature difference in the outside environment. We have chosen to take discrete samples instead of continuous samples due to these reasons and the time required for the recording process. The main reason for this is the time required to record the collected data. In addition, taking into account that the sensors may send incorrect values due to external factors or a momentary anomaly, we predicted that it would be efficient to associate consecutive data with each other and provide information to the user according to the situation resulting from the association. Filters can be used to block out interference frequencies. Data from the vibration sensor may give inaccurate results as it is affected by other machines. We are

considering designing a filter to prevent this situation and to improve the project. Thanks to the filter, we aim to prevent being affected by other machine sounds. Even though the temperature and vibration sensors are filtered, we had to take this precaution due to the external factor. However, it is not enough to make a filter in our system, as it will be affected by the temperature increase of the pump motor. If the temperature increase is critical, an external cooling unit can be added to the system if there is no change in other parameters. High vibration values can be harmful for the machine's construction. A vibration damper can be designed so that the high vibrations on the machine construction do not damage the pump.

After receiving the data from the sensor, it was taught to the k-NN algorithm. Serial port communication was used when sending the data to the algorithm. From this situation and saving the data to the memory card required us a long processing time. For this, we set our data acquisition interval to 6 seconds. The reason we did this was that when we set the time to less than 6 seconds, the system could not meet the required speed and the algorithm was executing itself. As a result, when we ran this algorithm, we analyzed the data we obtained in 4 different clusters. These; the fan is broken, the bearing is broken, it is working properly and the vacuum oil is missing. Some of these data are shown in the table below.

Bearing Fault

Vibration	Pressure	Temperature	Humidity	Current
829.0	43.0	56.46	12.52	3.14
808.0	41.0	56.4	12.54	3.12
872.0	34.0	61.31	13.26	4.16
919.0	38.0	62.41	14.07	4.52
930.0	39.0	63.78	14.62	4.54
777.0	33.0	64.59	14.8	4.54
982.0	32.0	68.89	10.57	4.81

Fan Impeller Broken

Vibration	Pressure	Temperature	Humidity	Current
315.0	23.0	51.7	15.22	2.29
278.0	24.0	50.58	16.07	2.25
293.0	25.0	54.41	13.8	2.19
350.0	26.0	55.12	13.44	2.23
379.0	18.0	64.34	9.09	2.27
406.0	18.0	64.95	8.89	2.29

Vacuum Oil Decreased

Vibration	Pressure	Temperature	Humidity	Current
514.0	19.0	67.17	8.06	2.27
522.0	27.0	51.7	15.67	2.27
377.0	27.0	54.24	13.92	2.27
520.0	27.0	55.0	13.49	2.31
194.0	27.0	55.73	12.98	2.27
499.0	27.0	56.77	12.41	2.29

Pump Working Properly

Vibration	Pressure	Temperature	Humidity	Current
204.0	5.2	25.07	55.19	2.78
365.0	6.1	25.67	54.22	2.74
297.0	5.4	26.13	53.7	2.69
425.0	4.8	26.67	52.78	2.65
381.0	5.3	27.07	51.9	2.55
341.0	6.0	29.96	45.66	2.44

Note: Pressure datas measured as negative. So when the value increase, it means pressure decreased.

When we examined the above table for bearing error, it was observed that vibration, temperature and current data increased. Due to the increase in temperature, the humidity in the system decreased.

When we examined for the fan impeller error, an increase in temperature was observed. Due to the increase in temperature, there was a decrease in humidity and pressure. It was observed that the vibration and current were constant.

Finally, when we examined for the vacuum oil error, it was observed that the temperature data increased and the pressure and humidity data decreased. This is mainly due to the inability to apply pressure and cooling due to the lack of oil in the pump.

H.Gürsoy et al. (2021), tried to detect bearing damage by vibration and noise analysis. However, this study was done on limited parameters and a single bearing type and tried to find the useful life. In our study, we analyzed the temperature and current values of the approach and examined the effects of different parameters on the bearing life. While doing this review,

we developed it using the k-NN algorithm, which is a machine learning algorithm. Our work, together with the improvements we have made, has enabled us to get more detailed and consistent results from the work of Habibe Gürsoy and her friends.

Parul Sinha et al. (2015), aimed to make an early diagnosis with machine learning using kidney disease symptoms to compare the effect of classification techniques. Although the KNN and SVM algorithms gave close results, the KNN algorithm gave more successful results. While choosing the k value, Parul experimentally determined a k value and used the same value in all test data. However, giving the same k value to the entire data set will reduce the efficiency of the algorithm. To avoid this situation, we can use the correlation matrix. Thus, we can benefit from the entire data set with maximum efficiency. In order to develop this project, we aim to work on the correlation matrix and put it into use.

CONCLUSION

In this Project, rotary vane vacuum pump working with positive displacement technique was investigated mechanically and electrically. It is purposed to ensure production continuity by getting maximum efficiency from the pump, to obtain quality standards and to minimize downtime. At the same time, it is aimed to reduce spare part costs by performing machine maintenance on time. For this purpose, frequent and instantaneous failures of the vacuum pump have been determined based on experimentation and experience. The determined faults cause changes in the vibration, temperature, current and pressure parameter values of the machine. The locations (critical point) where we can best measure the changes in each parameter were determined and the sensors were placed.

Sensor data was accumulate and recorded for the duration of pump efficiency reduction and degradation. The values collected from the sensors were organized and classified for fault codes. A machine learning algorithm was determined to evaluate the sensor data in the system. Machine learning algorithm and controller were selected to process the sensor data in the system. the system was engaged and it was estimated correctly 85 percent. The possible faulty part was reported to user via e-mail about the probable cause of failure.

ÖZET

Arbutus unedo L., Akdeniz Bölgesine özgü, Anadolu, Yunanistan, Lübnan, İrlanda ve Güney Avrupa'da yetişebilen, *Ericaceae* familyasında yer alan bir meyve türüdür. 400-1200 m rakımda, yamaçlarda, silisli veya karbonatlı kurak topraklarda yetişebilmektedir. Gelişmesi özellikle ilk gençlik yıllarında oldukça yavaştır. Hafif kurak topraklarda tek gövdeli ağaç şeklinde gelişirken, daha kurak topraklarda çalı şeklinde gelişir. Meyveleri sonbaharda olgunlaşır. Yabani orman meyvelerinden biri olarak yerel halk için ekonomik değer taşımaktadır. Meyveleri alkollü içecek, reçel, jöle ve marmelat yapımında kullanılır. Meyvelerin yerel toplulukların sağlığına ve endüstriyel tıbbı birçok katkısı vardır. Halk hekimliğinde antiseptik, diüretik, müshil, antioksidan, tansiyona karşı etkili olarak iyi bilinir. Türkiye, *Arbutus unedo* L'nin zengin genetik kaynaklarına sahiptir. Ülkenin çeşitli yerlerinde maki ormanlarında yetişen büyük popülasyonu vardır. Bu derleme makalesinde *Arbutus unedo*'nun genel özellikleri, ıslahı ve yetiştiriciliğine yönelik çalışmalar incelenmiştir. Kültürel koşulların daha uygun olması durumunda daha verimli ağaçların ve daha iyi meyve kalitesinin nasıl artırılarak ekonomiye katkı sağlanabileceği konusunda öneriler yapılmıştır.

Anahtar Kelimeler: *Arbutus unedo* L., ıslah, *Ericaceae*, seleksiyon, çoğaltma

NEW TRENDS IN *A. unedo* L. (STRAWBERRY TREE) BREEDING

ABSTRACT

Arbutus unedo L., the strawberry tree (Ericaceae family), is a fruit species native to the Mediterranean, growing in Anatolia, Greece, Lebanon, Ireland, and Southern Europe. It grows at altitudes ranging from 400 to 1200 m on silicious or carbonated dry soil. Development is very slow and grows in the form of single trunk tree in light-arid lands, while developing in the form of a bush in more dry land. Fruits mature in autumn. Locally grown wild edible fruits are important for local cultures, especially in the Mediterranean region. Fruits are used for production of alcoholic beverages, jams, jellies, and marmalade. Fruits have many contributions to the health of local communities and industrial medicine. It is well-known in folk medicine as antiseptics, diuretics, laxatives, depurative and antihypertensive purposes. Turkey has rich genetic resources of *Arbutus unedo* L. There is a large strawberry population in various parts of the country which grow in the maquis forests. Therefore, in this review article, general properties of *A.unedo* and studies on breeding and cultivation were investigated. Suggestions were obtained in case of more appropriate cultural conditions how could be increased more productive trees and better fruit quality to contribute to the economy.

Keywords: *Arbutus unedo* L., breeding, *Ericaceae*, selection, propagation

1. GİRİŞ

Kocayemiş Akdeniz iklimine sahip ekolojilerde popülasyonlar oluşturan yetişen bir maki bitkisidir. Her dem yeşil, genellikle 2-8 m kadar boylanabilen çalı ya da ağaç formunda gelişen bir türdür. Yaprakları üst yüzü parlak koyu yeşil, alt yüzü açık yeşil, kenarları dişli yapıda, orta büyüklüktedir (İslam ve Pehlivan, 2002). Kocayemiş çiçekleri beyaz, beyazımsı pembe renkte, çan şeklinde ve salkımlar halinde oluşmaktadır. Çiçeklenme döneminde yeni açan çiçekler ve olgun meyveler aynı anda bitki üzerinde bulunmaktadır (Pekdemir, 2010). Çiçekler geç sonbahar-kış döneminde açar, bu nedenle diğer meyve türlerine göre iklim koşullarından daha çok etkilenir. *A.unedo* maki topluluğu içinde hızlı gelişen bitki grubu içinde sınıflandırılmıştır (Paraskevopoulos ve diğ.,1994). Kuraklık stresine son derece dayanıklı bir türdür (Munne-Bosch ve Penuelas, 2004). *A.unedo* silisli, alkali ve nispeten asidik topraklarda yetişebilmektedir (Takrouni ve Boussaid, 2010). Meyveleri yumuşak çekirdekli olup, klimakteriktir (Ogaya ve Peñuelas, 2004). Kocayemişin olgunlaşmış meyveleri kırmızı renkte, üzerleri girintili çıkıntılı, yuvarlak, oval veya kalp şeklindedir (Sulusoglu ve diğ., 2011). 0.96-13.63 g ağırlığındaki meyveleri çok sayıda taş hücresi içerir (Şeker ve diğ., 2004; Sulusoglu ve diğ., 2011).

2. KOCAYEMİŞİN ANAVATANI VE TARİHÇESİ

Kocayemiş meyvesinin tarihi çok eskilere dayanmaktadır. 1. yy'da Roma'da varlığından bahsedilmektedir. Bitki orijininin bir kısmının Ortadoğu kökenli, bir kısmının Çin kökenli olduğu düşünülmektedir (Malcolm, 2019). Akdeniz Bölgesinde, Kuzey Batı ve Orta Amerika'da, Batı ve güney Avrupa'da, kuzeydoğu Afrika, Kanarya Adaları ve Batı Asya'da yayılım göstermektedir. Türkiye, Yunanistan, Lübnan, İrlanda, Tunus gibi Akdeniz'e kıyısı olan ülkelerde yetişmektedir (Torres et al., 2002, Blanco et al, 2005).

İspanya Madrid Bölgesinde tarihsel değer taşıyan *Arbutus unedo*, Madrid Bayrağında Büyük Pençe olarak bilinen ayı figürü ile birlikte yer almaktadır (Anonim 1, 2019). Kocayemişin 1980'lerden itibaren popüler hale geldiği ve ilginin 2000'lerde artarak çalışmaların hızlandığı görülmektedir (Şekil 1).

Popularity of *Arbutus unedo* over time

Şekil 1. Kocayemiş konusundaki çalışmaların yıllara dağılımı (1926-2006)

(Kaynak: http://www.worldagroforestry.org/treedb2/AFTPDFS/Arbutus_unedo.PDF)

3. *A.unedo*'nun FAYDALARI VE KULLANIMI

Meyvelerinin antioksidan değeri yüksektir (Garcia-Alonso ve diğ., 2004). Meyveleri karbonhidrat içermekte olup, fruktoz yüksektir; ayrıca vitamin C ve fenolik bileşiklerce zengindir (Barros ve diğ., 2010). Salatalarda çiğ olarak kullanılmakta, reçel yapılmaktadır (Lentini ve Venza 2007). Gösterişli yapraklı dalları çiçekçiler tarafından özellikle aranjman ve çelenk yapımında tercih edilmektedir. Ağaçları çok dekoratif olduğu için süs bitkisi olarak da kullanılabilir (Pekdemir, 2010). Birçok hastalığa karşı faydaları vardır. Böbrek taşlarına karşı kullanılmaktadır (Maxia ve diğ., 2008). Kardiyovasküler hastalıkların tedavisinde etkilidir (Abidi ve diğ., 2016).

4. *A. unedo*'nun ÇOĞALTILMASI

Tohumlarıyla ve çelikle çoğaltılabilmektedir. Doğal ekosisteminde meyvelerini tüketen kuşlar ve hayvanlar vasıtası ile tohumlar dağılmaktadır (Aparicio ve diğ. 2008). Yangınlar sonrasında toprakta tohum rezervi kalmadığı durumda toprak altı organları lignotuberlerden yeniden sürmektedir (Gomes, 2011). Tohum çimlenmesi üzerine birçok çalışma gerçekleştirilmiştir (Tilki, 2004; Pipinis et al. (2017). Tohumların çimlenmesi genotiplerde farklılık gösterir. Çimlenme ortamı koşullarından etkilenmektedir. Doğrudan çimlenmeye alınan tohumlarda %18 çimlenme oluşurken (Hammami ve diğ., 2005), soğuklaması karşılanan tohumlarda çimlenme oranı artmış, %80-90'a kadar çıkmıştır (Tilki, 2004; Ertekin ve Kırdar

2010). Sıcaklık ve ışık tohum çimlenmesini etkilemektedir (Mesleard and Pepart, 1991). İn vitro koşullarda da tohum çimlenmesi çalışılmış, çimlenme oranı %85-%99 arasında belirlenmiştir (Ertekin ve Kırdar (2010), Pipinis ve ark.,2017, (Smiris ve ark.,2006),Giordani et al., 2005,Papafotiou et al. (2013),). GA₃ uygulaması ve soğuklama çimlenmeyi artırmaktadır. *A.unedo* çelikleri ile de çoğaltılmaktadır (Şeker ve ark.,2010; Sülüoğlu,2012). Köklenme oranı ve kök sayıları genotiplere göre değişim göstermektedir. Bazı genotiplerde köklenme olmazken veya çok düşük oranda gerçekleşirken, bazı genotiplerde %100 başarı sağlanmıştır (Metaxas ve diğ., 2008; Sulusoglu 2012). *A. unedo*'nun mikro çoğaltımı başarılı sonuçlar vermiştir (Mereti ve diğ., 2002; Gomes 2011; Sulusoglu ve Memis, 2022). Mikro çoğaltımda başarı genotiplere göre farklılık göstermektedir. %36-81 yaşama oranı sağlanmıştır. Mikro sürgünlerde %97'ye varan köklenme sağlanmıştır. Besin ortamının bileşimi, kullanılan hormon çeşidi ve dozu oldukça etkilidir (Gomes ve Canhato 2009). Aklimatizasyon aşamasının geliştirilmesi konusunda çalışmalar devam ettirilmelidir (Sulusoglu ve Memis 2022). İn vitro yaprak eksplantlarından farklı hormon kombinasyonlarını içeren ortamlarda somatik embriyo elde edilmiş, embriyolarda çimlenme sağlanmıştır (Gomes ve diğ., 2009; El-Sayed El-Mahrouk ve diğ, 2010).

5. ISLAH ÇALIŞMALARI

Genetik dağılımı, seleksiyonu ve morfolojik özellikleri konusunda birçok çalışma yürütülmüştür (Sulusoglu ve diğ, 2011; Çelikel ve diğ, 2008). Portekiz'de kocayemiş tiplerinin genetik özellikleri belirlenerek kültüre alınmasına yönelik çalışmalar başlamıştır. Türkiye'de Kocaeli, Samsun ve Çanakkale ekolojisinde bu konuda çalışmalar mevcuttur (Şeker ve diğ, 2004, Çelikel ve diğ., 2008, Sulusoglu ve diğ, 2011). İspanya-Katalonya'da *Arbutus unedo*'da doğal bir popülasyonda sürgünlerin etrafındaki bitkilerle rekabet etme durumu değerlendirilmiş, hızlı gelişen bir tür olduğu sonucuna varılmıştır (Vilà et al., 1994). Meyve türlerinin ıslahında verim önemli bir kriterdir. Kocayemiş ağaçları genellikle dağınık ağaçlar şeklide yetiştiğinden ve kapama bahçe olmadığından verim değerli bulunmamaktadır. İspanya'da yapılmış bir modelleme çalışması ile verim değeri tahmini yapılmıştır. Çalışma sonuçlarına göre bitki verimi 2.6 ile 6.4 kg/ağaç aralığındadır (Molina et al., 2011). 2009-2011 yılları arasında Marmara Bölgesi Samanlı Dağları Bölgesinde yetişen *A.unedo* popülasyonlarında seleksiyon çalışması yürütülmüştür. Seçilen genotiplerin yer aldığı, Kocaeli Üniversitesi Ziraat Fakültesi Bahçe Bitkileri Araştırma ve Uygulama Bahçesinde verim ve

kalite çalışmalarına devam edilmektedir (Sulusoglu ve diğ., 2011). Yunanistan’da yürütülen bir çalışmada, tıraşlama kesimlerden sonra bitkinin yeniden büyüme durumu incelenmiştir. Tahminlere göre *A. unedo* maksimum büyüme hızına 10 yaşında erişmekte, maksimum biyokütleye ise 23 yaşında erişmektedir. Bu sonuca göre hızlı gelişen tür olarak adlandırılmaktadır. Sonraki yıllarda da oransal büyüme hızında minimum azalma ile daha uzun süreli yaşayan bitkidir ve bulunduğu toplulukta baskındır (Paraskevopoulos et al. 1994). Kocayemişlerin büyüme modeli çalışmalarında bir yıl içinde iki büyüme dönemi belirlenmiştir. Herhangi bir zararlanma durumunda lignotuberlerde biriktirdiği nişastayı kullanarak yeniden gelişebilmektedir (Canadell and Lopez-Soria, 1998; Konstantinidsi ve diğ., 2006). Yangın sonrasında lignotuberlerden gelişme gerçekleşmektedir (Mesleard and Lepart, 1991, Gomes, 2011). Kocayemiş dayanıklı bir tür olarak tanınmaktadır. *Arbutus unedo* kuraklığa son derece toleranslı olduğundan kuraklığın mekanizmasının ortaya konmasında model bir bitkidir (Munne-Bosch ve Penuelas, 2004). Kocayemiş küresel iklim değişikliğinin etkisini giderek artırması nedeniyle günümüzde önemli türler arasındadır. Dağılımının ortaya konması ve korunması önemli bir çalışma alanını oluşturmaktadır. *Arbutus unedo* populasyonlarının genetik dağılımı ve yapısı moleküler tekniklerle incelenmiştir (Takrouni ve Boussaid 2010; *A. unedo*’da populasyonlar arasındaki farklılıkların rakım, yağış durumu gibi ekolojik faktörlerle ilişkileri değerlendirilmiştir. Çiçeklenme zamanı, olgunlaşma dönemi, bitkinin yaşam süresi gibi faktörlerdeki değişimin daha çok ekolojik koşullara göre farklılaştığı ortaya konmuştur (Takrouni ve Boussaid, 2010). Bertsoouklis ve Papafotiou 2016). Akdeniz ormanlarında yer alan populasyonlarda büyüme formları, fenolojileri ve morfolojik özellikleri (Ribeiro ve diğ., 2017), kimyasal ve biyolojik özellikleri incelenmiştir (Miguel ve diğ., 2014).

6. SONUÇ VE ÖNERİLER

Kültüre alınmış meyve türlerinin yanında kocayemiş yetiştiricilik açısından büyük katkılar sağlayacak bir tür olarak önem taşımaktadır. Bu nedenle seleksiyon çalışmalarına ağırlık verilmesi, belirlenen genotiplerle çalışmalara devam edilmesi önerilmektedir. Bitkisel materyalin temini bakımından kocayemişin çoğaltımı konusunda çalışmalar artırılmalıdır. Tohum ile çoğaltım ıslah çalışmaları açısından büyük yarar sağlayacaktır. Ticari olarak yetiştiriciliğinin gelişmesi açısından tüm bu öneriler dikkate alınmalıdır. Bu meyve türlerinin besin madde içeriği, en az kültüre alınmış meyvelerinki kadar değerlidir ve bunların kültürünün gelişmesi ile insan beslenmesine önemli katkılar sağlanabilecektir.

ÖZET

Japon ayvası (*Chaenomeles japonica* Thunb) Lindl. *Rosaceae* familyası, *Maloidea* alt familyasında yer alan, az bilinen, ama bir o kadar da önemli bir türdür. Doğu Asya orjinlidir; anavatanı Çin, Kore ve Japonya olup, ılıman iklim kuşağında yetişmektedir. Yumuşak çekirdekli bir meyvedir, meyve yapısı elma ve ayvaya benzer. Bitkileri alçak ve orta boylu çalı şeklinde gelişmektedir. İlk olarak Japonya dağlık kesiminde 1784 yılında keşfedilmiştir. Kültürü artan bir ilgi görmektedir. Endüstride iyi bir hammaddedir. Farmakolojik olarak ilaçların üretiminde faydaları fazladır. Besin olarak da değerlendirilmektedir. Fidan üretimi sınırlı olup, adına doğru, verimli fidan bulmak sorundur. Burada sunulan çalışmada Japon ayvasının genel özelliklerinin yanı sıra, değerlendirme şekilleri ele alınmıştır. Sunulan çalışma genetik kaynakların değerlendirilmesi bakımından çok önemlidir.

Anahtar Kelimeler: *Chaenomeles japonica*, seleksiyon, meyve kalitesi, titre edilebilir asitlik, pomoloji

AN OVERVIEW OF JAPANESE QUINCE (*Chaenomeles japonica*)

ABSTRACT

Chaenomeles japonica (Thunb.) Lindl. is one of the lesser-known fruit species belonging to the *Rosaceae* family *Maloidea* subfamily. The homeland of Japanese quince is China, Korea, and Japan in East Asia, and it can be grown in almost every region of temperate climate. It is a shrub-shaped plant that belongs to the group of pome plants such as quince, pear and apple according to its fruit characteristics. The first specimens of *Chaenomeles japonica* were found in the mountains of Japan in 1784, with conspicuous colors such as red, pink, white and orange. Europe met this plant in 1869 and its cultivation as fruit began in northern countries and continue to produce today. *Chaenomeles japonica* L. has a great interest in the world because of common uses in the industrial, pharmaceutical, and nutritional fields. Sapling is limited because of the lack of selection and culture of this fruit. In this work, the properties of *C. japonica* types were evaluated, and differences were got out different characters with other *Chaenomeles* species. The present research is very important because of obtain genetical resources for future studies and sapling production.

Keywords: *Chaenomeles japonica*, selection, fruit quality, titratable acidity, pomology

1. GİRİŞ

Japon ayvası (*Chaenomeles japonica* (Thunb.) 1.2 m kadar gelişebilen bodur çalı bitkilerden, kışın yapraklarını döken/kısmen döken bir türdür. Dalları oldukça dikenlidir. Çiçeklenme erken ilkbaharda, yapraklardan önce oluşmaktadır ve yaklaşık 45 gün kadar sürmektedir. Son derece gösterişli, koyu kırmızı, kızıl, pembe, turuncu, nadiren beyaz renkte çiçekleri vardır. Meyveleri elma şeklinde, üzeri beyaz noktalı, oldukça sert, asidik yapıda ve hoş kokuludur. Taze olarak yenmesi neredeyse olanaksızdır, işlenmesi gerekir. Meyvelerinde 80-100 adet tohum vardır, bu da işlenebilecek nitelikte meyve etini azaltmaktadır.

Rosales takımı, *Rosaceae* familyası, *Maloideae* alt familyası *Chaenomeles* Lindley alt cinsi içinde yer almaktadır. Anavatanı Doğu Asya'da Çin, Kore ve Japonya'dır. Pembe-kırmızı renkli çiçekleri ile ilk olarak 1784'te Japon dağlarında bulunmuştur (Mihova ve diğ.,2012). Avrupa'da 19. yüzyılda kültüre alınarak süs bitkisi değeriyle yetiştirilmeye başlanmıştır. Japon ayvası birçok ülkede süs bitkisi olarak yaygın yetiştirilmektedir. Kuzey Avrupa ülkelerinde ise, sağlık açısından önemli bir meyve olup, çok sayıda projeye konu olmuştur. 3000 yıldan beri Doğu Asya'da Çin tıbbının önemli bitkilerinden biri kabul edilmektedir (Bieniasz ve diğ. 2017).

2. JAPON AYVASININ KİMYASAL BİLEŞİMİ

Japon ayvasında 100 g taze meyvede 30-195 mg C vitamini, 0.65-1.69 g pektin, 0.60-3.98 g şeker, 41.64-110.31 g organik asit bulunmaktadır (Turkiewicz ve diğ. 2020). Yapraklarındaki ana polifenol grubu fenolik asitlerdir. En yaygın polifenol bileşiği ise klorojenik asit olarak belirlenmiştir (Urbanaviciute 2019). Bileşiminde şekerlerden glikoz, fruktoz ve sorbitol bulunmaktadır. Organik asitlerden malik asit ve kuinik asitlerce zengindir. Aspartik asit, asparjin ve glutamik asit içeriğindeki önemli aminoasitlerdir. Mineral maddelerden potasyum ve florid oldukça yüksek değerde bulunmaktadır. Meyve suyu bileşimi japon ayvasının değerini ortaya koymaktadır. Yüksek C vitamini içeriği ve fenolik madde bileşimi, antioksidan karakteri japon ayvasını olağanüstü bir meyve yapmaktadır (Hellín et al., 2020, Chojnacka ve diğ. 2020). Meyvelerinin kutiküler mumları yağ asitleri, alkoller, aldehitler, esterler, eterler ve alkanlar olmak üzere çok sayıda bileşen içermektedir (Lykholat et al. 2021).

3. JAPON AYVASININ TIBBİ ÖZELLİKLERİ

Japon ayvası insan sağlığına olumlu etkileri olan antioksidanlar ve sekonder metabolitler gibi birçok biyokimyasal bileşikler açısından zengin bir bitkidir. Ekstraktları zengin fenol içeriği ve sitotoksik etkisi nedeniyle kansere karşı etken madde olarak değerlidir (Strek ve diğ., 2007;

Gorlach ve diğ., 2011). Kalorisi çok düşüktür; diyeti antioksidanlarca zenginleştirebilecek biyokomponentler bakımından zengindir (Urbanaviciute 2020). Japon ayvasının yaprak ekstraktı sağlıklı hücrelere zarar vermeden kanserli hücrelerin canlılığını azaltabilmektedir. Bu nedenle tıbbi amaçlı kullanımı yüksek değere sahiptir (Zvikas ve diğ. 2021).

Chaenomeles türlerinin ve türler arası melezlerin meyve mumlarında biriken biyoaktif bileşikler antimikrobiyal aktivite göstermektedir. İzopropanolik meyve özleri, disk difüzyon tahlilinde dört gram negatif bakteri, beş gram pozitif bakteri ve bir mantar suşuna karşı doza bağlı antimikrobiyal aktivite sergilemiştir. Bu sonuçlar meyve kütükül mumlarındaki biyoaktif bileşiklerin *Chaenomeles* türlerinin sağlığı geliştirici özelliklerini ortaya koymaktadır (Lykholat et al. 2021).

Japon ayvasının taze ve kurutulmuş meyveleri geleneksel Çin tıbbında yüzyıllar boyunca kansızlık, romatizma, gut ve kalp-damar hastalıklarının tedavisinde kullanılmıştır. Boğaz ve deri enfeksiyonları, ishal, soğuk algınlığı, meme dokusu iltihabı, hepatit gibi birçok rahatsızlığa iyi geldiği düşünülmektedir. Antioksidanlar açısından zengin olmasından dolayı grip, tümörler, karaciğer rahatsızlıkları, Parkinson hastalığı, bakteriyel enfeksiyonlar ve eklem iltihapları için kullanılmaktadır (Shen ve diğ.2020).

Chaenomeles meyveleri iyi bir malik asit kaynağıdır. Meyveleri farmakolojide kullanılma olanağı bulabilecek fonksiyonel bileşenlerin kaynağı olarak ortaya konmuştur. *Chaenomeles* biyoaktif bileşiklerinin biyoyararlanımı ve sindirilebilirliği test edilmiş, faydalı bağırsak bakterilerinin gelişiminin teşvik edilmesinde ve serbest radikallere karşı lipid membran üzerinde koruyucu etkisi belirlenmiştir (Turkiewic 2020). Yapılan araştırmalarda Japon ayvası bileşenlerinin lipid membranlarını etkilediği, serbest radikallerin difüzyonunu engelleyerek oksidatif reaksiyonu azalttığı belirlenmiştir Dolayısıyla kanser tedavisi ve kanserin önlenmesi için umut verici olduğu gösterilmiştir (Strugala ve diğ.2016, Urbanaviciute ve diğ. 2019)

4. JAPON AYVASININ GIDA VE GIDA KATKI MADDESİ OLARAK DEĞERLENDİRİLMESİ

Japon ayvası meyveleri, kimyasal bileşimi ve meyve özelliklerine dayalı olarak meyve suyu, şarap, meyve püresi, doğal meyve aroması, pektin, diyet lifi gibi ürünlerin üretilmesinde kullanılabilir (Thomas ve diğ. 2003; Urbanaviciute 2019). Özellikle Letonya ve Litvanya pazarında Japon ayvasının şurup, likör, gazlı içecekler, marmelat ve çeşit meyve şekerlemelerini görmek mümkündür. Bu bitkiden sağlıklı çaylar, reçeller ve çeşitli yemekler

hazırlanmaktadır. Japon ayvası meyve suyunun yüksek organik asit içeriği, kendine özgü aroması ve diyet lifi içeriğinin yüksek olması, gıda sanayisinde yüksek öneme sahiptir. Meyve suyunun son derece asidik olması ve bulanıklık olmaması, pektin bakımından zengin olması olağanüstü bir gıda bileşeni olmasına olanak sunmaktadır (Hellín ve diğ., 2003). Japon ayva yaprağı tozu, yiyecek veya içecek katkı maddesi olarak kullanılabilir (Urbanaviciute 2019). Kimyasal koruyucu olarak konserve sektöründe yer alabilecektir (Urbanaviciute 2020).

Gıda ve gıda katkı maddesi olarak sadece Japon ayvasının meyvelerini değil aynı zamanda tohum ve yapraklarını da kullanmak mümkündür. Yapraklarının güçlü antioksidan aktivitesi ve yüksek fenol içeriği ile yiyecek ve içeceklerde katkı maddesi olarak kullanılabileceği göstermiştir (Urbanaviciute ve diğ., 2019).

5. JAPON AYVASININ KOZMETİK SEKTÖRÜNDEKİ KULLANIMI

Kimyasal koruyucu olarak kozmetik sektöründe katkı maddesi niteliği taşımaktadır Soğuk preslenmiş *Chaenomeles japonica* tohumu yağı karotenoidler, skualen, polifenoller, fitosteroller, tokoferoller gibi yüksek biyolojik aktiviteye sahip bileşikler içermektedir. Ayva tohumu müsilağı, cildin yenilenme sürecini başlatıcı özellik gösterir (Urbanaviciute 2020). *C. japonica*'nın kallus özütünün, cilt dokusundaki bağları etkilediği, cilt yaşlanmasını geriletmediği belirlenmiştir. Kallus ekstraktındaki triterpenoidler kozmetik cilt ürünlerinin üretiminde kullanılabilir olarak bildirilmiştir (Kikowska ve diğ., 2018).

6. JAPON AYVASINDA YÜRÜTÜLEN ÇALIŞMALARIN GÜNCEL DURUMU

Meyve suyu, aroma ve lif üretimi için yeni bir Avrupa meyvesi (FAIR5-CT97 3894, 1998-2001) başlıklı bir Avrupa Araştırma Projesi olarak 1998 yılında çalışmalar başlatılmıştır. Projede amaç, seleksiyon ıslahı ile bitkinin özelliklerinin iyileştirilmesidir (Rumpunen, 2002). Japon ayvasında bugüne kadar yürütülen çalışmalara baktığımızda meyve ve meyve suyunun özellikleri ve bileşenleri üzerine yoğunlaşmıştır. Şekerler ve organik asitler (Lesinska, 1987), uçucu ve uçucu olmayan aroma bileşenleri (Lesinska ve diğ., 1988), pektik maddeler (Thomas ve diğ., 2003) incelenmiştir. Meyvelerinin işlenme potansiyeli (Hellin ve diğ., 2020), polifenol içerikleri (Kikowska ve diğ., 2019), endüstriyel özellikleri (Lykholat ve diğ., 2019) ile sağlık açısından faydaları (Watychowicz ve diğ., 2017) ele alınmıştır.

Islah çalışmaları ile dikenlilik %4 oranında azaltılabılmış, erken olgunlaşma sağlanmış ve verim artırılmıştır. *C. japonica*'nın üretim materyalinin kalitesinin artırabilmek için Letonya-Litvanya-İsveç 1992 yılında ortak ıslah programı başlatmıştır. Günümüzde seçilen genotiplerin

klonal çoğaltımı ile oluşturulan bahçelerde çalışmalar Finlandiya, İtalya, Letonya, Litvanya ve İsveç’de sürdürülmektedir. Çalışmalarda Japon ayvasının morfolojik, biyolojik ve biyokimyasal özellikleri üzerinde durulmaktadır (Ruisa, 1995; Rumpunen ve diğ., 1998; Rumpunen ve diğ., 2000). Japon Ayvası, meyve suyu ve aroma üretimi için ‘‘New European Fruit Crop’’ projesi kapsamında ’’1998-2001 yılları arasında, ‘Darius’, ‘Rondo’ ve ‘Rasa’ adlı dikensiz çeşitler piyasaya sürülmüş ve yetiştirilmeye başlanmıştır (Kaufmane ve Ruisa, 2020). 2020 verilerine göre Letonya’da 558 ha dikili alan bulunmaktadır.

7. SONUÇ VE ÖNERİLER

Besin içeriği, tıbbi değeri ve endüstride geniş kullanım olanakları ile Japon ayvası önemi artan bir bitkidir. Mevcut genotiplerde seleksiyon çalışmalarının artırılması, bitki özelliklerinin iyileştirilmesine, çoğaltılmasına yönelik çalışmaların geliştirilmesi önemlidir. Ayrıca yetiştiricilik isteklerinin belirlenmesi de verim ve kaliteyi artırabilecektir.

Isabella grape (*Vitis labrusca* L.) is one of the special grape species of the Black Sea region, and the leaves of this species, which are called fragrant grapes, are used for cooking, and wrapping. In this study, the antioxidant properties and phenolic composition of Isabella grape leaves, collected from Akçaabat of Trabzon, Turkey were investigated. The Total Phenolic Content (TPC), Total Flavonoid Content (TFC), total antioxidant capacity and phenolic profile of the 70% ethanolic extracts of dried fresh grape leaves were examined. As a result of the RP-HPLC-PDA analysis with 25 phenolic components including resveratrol, the resveratrol was not detected in the extract, but ellagic acid and rutin were determined as the major phenolic components. In addition, chromogenic acid, luteolin, quercetin, chrysin, pinocembrin, apigenin, and p-OH benzoic acid were determined in a lower concentration. The average TPC and TFC values of grape leaf extracts were measured as 23.327 ± 0.049 mg GAE/g and 2.598 ± 0.105 mg QUE/g respectively. The total antioxidant capacity of grape leaf extracts was measured in terms of Ferric Reducing Antioxidant Power (FRAP) and 2,2-Diphenyl-1-picrylhydrazyl (DPPH) radical scavenging activity (IC_{50}) and was found to be 215.501 ± 1.326 μ mol $Fe_2SO_4 \cdot 7H_2O$ /g and $0,299 \pm 0,011$ mg/mL, respectively. As a result, Isabella grape leaf was determined as a food with high antioxidant capacity and high antioxidant properties.

Keywords: Isabella grape, leaf, *Vitis labrusca* L., antioxidant, ellagic acid, rutin

Introduction

Grape-vine leaves (*Vitis vinifera* L.) are traditionally used in cooking especially stuffed grape leaf (dolma/sarma) is a very famous dish in Turkish, Balkan and Middle East Nations cuisine (Banjanin et al., 2021). Grape-vine leaves are used in the food and pharmaceutical industry as a safe phenolic resource, and dietary supplement (Babalık & Baydar, 2019, Cantwell et al., 2022). Grape-vine leaves (*Vitis vinifera* L.) have been used in folk medicine because of their antibacterial, antifungal, antiviral, hepatoprotective, anti-inflammatory, antioxidant, hypoglycemic, spasmolytic, vasorelaxant properties and used treatment of disorder such as diarrhea, hemorrhage, eye infections and hypertension (Fernandes et al., 2013, Lima et al., 2016, Pintac et al., 2019). Additionally, *Vitis labrusca* var Bordo has antioxidant, neuroprotective, hepatoprotective, renal-protective, cardioprotective, anticarcinogenic and antithrombotic activity (Se-Uk et al., 2016, Oliboni et al., 2011). However, there is limited information in the literature on the biological activity of the Isabella grape (*Vitis labrusca* L.) which is one of the naturally grown grape species on trees or walls in the Black Sea Region without any pesticide or fertilizer (Kavgacı et al., 2023). Pacifico et al., (2011) showed antioxidant and antiproliferative activity of methanol extract of Isabella grape leaves in HepG2 human hepatoma cell lines and A549 human adenocarcinoma epithelial cell lines. Isabella grape and leaves are shown in Figure 1(Isabella grape and leaves).

Figure 1: Isabella grape and leaves

The chemical compositions of grape leaves vary depending on grape species, soil type, and agro-climatic factors such as solar radiation, temperatures, rainfall, humidity, cold, wind, and insect activity (Pintac et al., 2019). For this purpose, antioxidant and phenolic compounds

analysis of Isabella grape leaves (*Vitis labrusca* L.) which were collected from Akçaabat-Trabzon, Turkey were investigated.

Material and Methods

Chemicals and Grape Leaf Samples

All chemicals are analytic grade from Sigma Aldrich (Chemie, Germany) and Merck (Chemie, Germany). Isabella grape leaves were collected from Akcaabat, Trabzon in August 2022, randomly. Akçaabat-Trabzon province was shown Figure 2 (Akçaabat-Trabzon and Turkey Map). All Isabella grape leaves were washed with water and dried at 40 °C. Dried Isabella grape leaves were grained and weighed 3 g and incubated in a shaker (Heidolph Promax 2020, Schwabach, Germany) with 30 mL 70 % ethanol for the 24 h at 200 rpm and filtered (Kara et al., 2022a). Leaf extracts were divided into two groups for antioxidant and phenolic composition analysis. Leaf extracts that saved phenolic analysis were evaporated by a rotary evaporator (IKA Werke Staufen, Germany) at 40 °C and prepared for RP-HPLC-PDA analysis by liquid-liquid extraction (Kara et al., 2022b). All extracts were saved at + 4 °C until they were used.

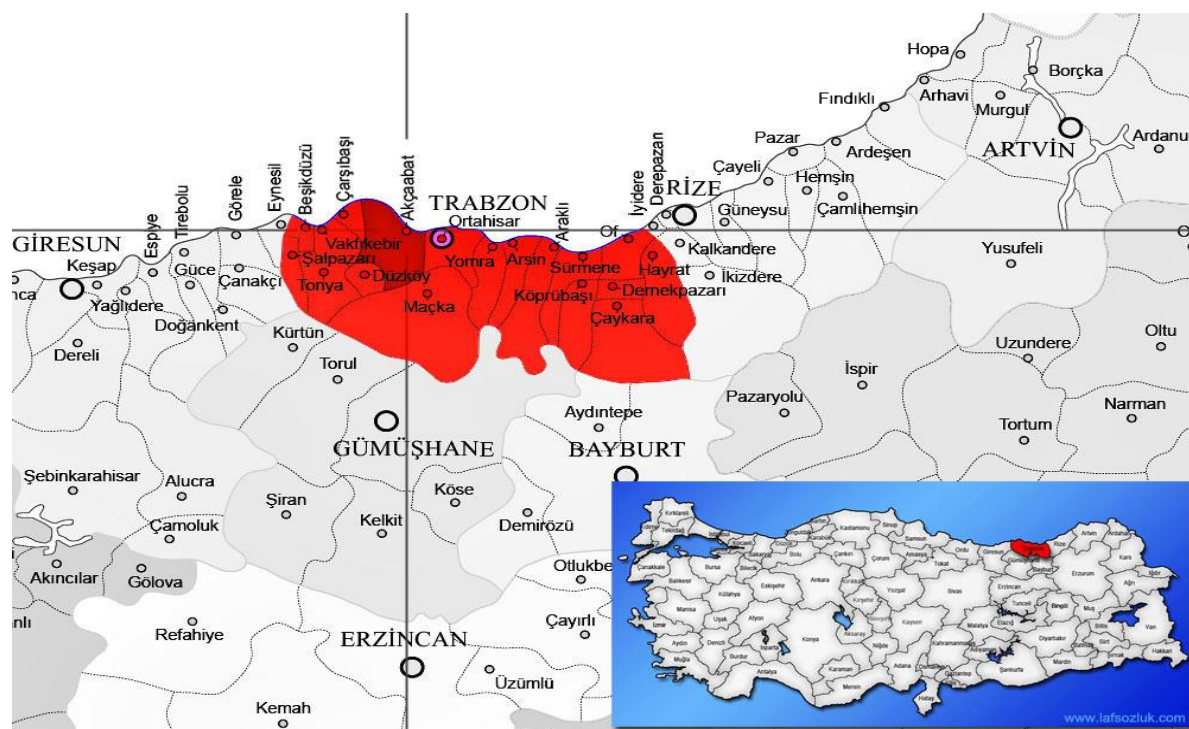

Figure 2: Akçaabat-Trabzon and Turkey Map.

Total Phenolic Content

The Total Phenolic Content values of Isabella leaf extracts were determined by Folin Ciocalteu's method (Singleton, Orthofer & Lamuela-Raventos, 1999) and Gallic acid was used as a standard. The absorbance of samples was measured at 760 nm by spectrophotometer. TPC values of Isabella leaf extracts were expressed as mg gallic acid equivalent (GAE)/g fresh leaf sample. All experiments were performed three times.

Total Flavonoid Content

The Total Flavonoid Content values of Isabella leaf extracts were determined by the spectrophotometric method of Fukumoto and Mazza (2000) and Quercetin was used as a standard. The absorbance of samples was measured at 415 nm by spectrophotometer. TFC values of Isabella leaf extracts were expressed as mg quercetin equivalent (QE)/g fresh leaf sample. All experiments were performed three times.

Ferric Reducing Antioxidant Power

The total antioxidant capacity values of Isabella leaf extracts were determined by the Ferric Reducing Antioxidant Power method of Benzie and Strain (1996) and Trolox was used as a standard. The absorbance of samples was measured at 595 nm by spectrophotometer. FRAP values of Isabella leaf extracts were expressed as $\mu\text{mol Fe}_2\text{SO}_4 \cdot 7\text{H}_2\text{O}/\text{g}$ fresh leaf sample. All experiments were performed three times.

DPPH Radical Scavenging Activity

DPPH Radical Scavenging Activity values of Isabella leaf extracts were determined by the method of Molyneux (2004) and Trolox was used as a standard. Scavenging activity against DPPH radical expressed as IC_{50} (mg sample/mL). The absorbance of samples was measured at 517 nm by spectrophotometer. All experiments were performed three times.

Phenolic Composition

Phenolic composition analysis of Isabella leaf extracts was performed by RP-HPLC-PDA (Shimadzu Liquid Corporation LC 20AT HPLC equipped with a PDA detector) according to the method of Kara et al. (2022). For phenolic composition analysis of leaf extracts, C18 column (250 mm x 4.6 mm x 5 μm ; GL Sciences) was used as a reversed phase, 70-30 % for

acetonitrile-ultra pure water and 2 % acetic acid-ultra pure water were used as a mobile phase, and sample injection volume, flow rate and column oven temperature were set 20 μ L, 1 mL/min and 30 $^{\circ}$ C. Additionally, 25 phenolic standards such as apigenin, p-OH benzoic acid, m-OH benzoic acid, caffeic acid, caffeic acid phenethyl ester (CAPE), chlorogenic acid, chrysin, t-cinnamic acid, p-coumaric acid, curcumin, daidzein, ellagic acid, epicatechin, ferulic acid, gallic acid, hesperetin, luteolin, myricetin, pinocembrin, protocatechuic acid, quercetin, resveratrol, rhamnetin, rutin, syringic acid were used for analysis. Phenolic analysis results were expressed as μ g phenolic standard substance/g sample. All experiments were performed one time.

Statistic Analysis

Results of TPC, TFC, FRAP, and DPPH Radical Scavenging Activity of Isabella leaf extract are shown mean \pm standard derivation (n=3). Phenolic composition analysis of Isabella leaf extract was studied one time (n=1).

Results

TPC, TFC, FRAP, DPPH Scavenging Activity and phenolic composition analysis results of Isabella grape leaf extracts were shown in Table 1 and Table 2.

Table 1: Antioxidant properties of Isabella grape leaf extracts. (Mean \pm Standard Derivation, n=3)

Antioxidant Parameters	Isabella Grape Leaf
Total phenolic compounds (mg GAE/ g)	23.327 \pm 0.049
Total flavonoid compounds (mg QUE/ g)	2.598 \pm 0.105
Total antioxidant capacity (μmol Fe₂SO₄.7H₂O/g)	215.501 \pm 1.326
DPPH radical IC₅₀ (mg/mL)	0.299 \pm 0.011

Table 2: Phenolic composition of Isabella grape leaf extracts. (n=1)

Phenolic composition in RT-HPLC-DOT ($\mu\text{g/g}$)	Isabella Grape Leaf
Apigenin	21.675
p-OH benzoic acid	8.450
m-OH benzoic acid	-
Caffeic acid	-
CAPE	-
Chlorogenic acid	218.190
Chrysin	13.659
t-Cinnamic acid	-

Pinocembrin	10.562
Protocatechuic acid	-
Quercetin	87.682
Resveratrol	-
Rhamnetin	-
Rutin	436.906
Syringic acid	-

Discussion

Generally both of *Vitis vinifera* and *Vitis labrusca* L. (Isabella) grapes are used production of wine and fruit juice in the food industry. Additionally, the hybrid form of *Vitis vinifera* and *Vitis labrusca* L. also known as Strawberry grape, is used in red wine production in Italy. Pacifico et al., (2011) investigated methanolic extracts of the hybrid form of *Vitis vinifera* and *Vitis labrusca* L. grape leaves for antioxidant properties and antiproliferative activity in HepG2 and A549 cell lines. Caffeic acid and quercetin were determined at 5.2 mg/g extract and 11.4 mg/g extract by NMR analysis in methanolic extract of grape leaves and TPC values were measured higher than peel, seed, pulp and stalk extracts approximately 800 GAE/100 g fresh leaves. Trindade et al. (2016) investigated antigenotoxic, antimutagenic and antioxidant properties of the aqueous extract of organic and conventional *Vitis labrusca* L. Isabella grape leaves in V79 lung fibroblast cells. Quercetin 3-O-glucoside concentrations of water extracts of organic and conventional Isabella grape leaves were determined 54.66 ± 0.01 mg/g and 34.11 ± 0.05 mg/g and rutin concentrations were determined 5.41 ± 0.05 mg/g and 3.27 ± 0.04 mg/g, respectively by HPLC-DAD assays. Additionally, TPC values of water extracts of organic and conventional Isabella leaves were measured 56.05 ± 1.09 mg/g and 28.93 ± 0.88 mg/g and DPPH IC₅₀ values were measured 32.85 ± 0.01 mg/g and 83.8 ± 0.01 mg/g, respectively. Dani et al., (2010) investigated phenolic content and the neuroprotective effects of organic and conventional *Vitis labrusca* var. Bordo grape leaf extracts against hydrogen peroxide in rat brain tissues. TPC values of 70 % ethanolic extracts of organic and conventional grape leaves were determined 20.2 ± 1.80 mg gallic acid/mL and 19.0 ± 0.05 mg gallic acid/mL, respectively and quercetin concentrations were measured 5.86 ± 0.15 mg/g raw extract and 6.74 ± 0.08 mg/g raw extract, respectively by HPLC-UV. Additionally, rutin concentrations were measured 44.90 ± 0.22 mg/g raw extract and 55.75 ± 0.10 mg/g raw extract, catechin concentrations were determined 3.64 ± 0.01 mg/g raw extract and 4.30 ± 0.03 mg/g raw extract, resveratrol concentrations were determined 0.714 ± 0.01 mg/g raw extract and 0.062 ± 0.003 mg/g raw extract, kaempferol concentrations were determined 1.37 ± 0.10 mg/g raw extract and 1.43 ± 0.15 mg/g raw extract in organic and conventional leaves extracts, respectively and naringenin concentration was determined only conventional leaves extracts 0.77 ± 0.012 mg/g raw extract.

As stated above, since insufficient literature on Isabella grape leaves, the result comparison is difficult. Most researchers used different grape leaves or hybrid species, different extraction techniques and methods for antioxidant parameters and phenolic compound analysis. However, this study demonstrated the antioxidant properties and phenolic compounds of the Isabella grape leaves and contributed to the literature.

Conclusion

In conclusion, this investigation showed that *Vitis labrusca* L. grape leaves are good antioxidant resources and have phenolic compounds in different concentrations such as apigenin, chlorogenic acid, chrysin, ellagic acid, luteolin, pinocembrin, quercetin and rutin. With future studies, the components and biological activities of the grape species *Vitis labrusca* can be better clarified and Isabella leaves can be used an alternative antioxidant resource for the food and pharmaceutical industry.

Abstract

Fast and reliable delivery in the e-commerce sector is becoming increasingly important with the growth of digital sales channels. Customers value delivery reliability and whether or not orders arrive on the stipulated day. Accurate prediction of delivery times in the e-commerce sector plays an important role in optimizing supply chain operations and customer experience. The aim of this study is to develop delivery time prediction models based on supervised machine learning algorithms. Prediction models have been developed using Extreme Gradient Boosting (XGBoost), Random Forest (RF) and Multi-Layer Perceptron (MLP). The dataset, which has been obtained from Kaggle, has 5113 rows and includes historical shipment data over the 16-month period between February 14th 2019 and June 13th 2020. The performance of the developed models has been evaluated using Mean Absolute Error (MAE) by utilizing 10-fold cross-validation on the dataset. Results show that the average MAE's of RF-based, XGBoost-based and MLP-based models are 3.50, 3.68 and 3.83, respectively.

Keywords: Delivery Time Prediction, Supervised Learning, E-commerce

1. INTRODUCTION

For e-commerce companies, the most important factor influencing customers' purchase decisions is price perception, but staying competitive on price is not a sustainable strategy. In this context, e-commerce brands have started to focus on delivery times, which are one of the critical pillars in the supply chain, as Generation Z in particular expects fast delivery. Cargo companies determine the basic factors such as shortening delivery times, reducing costs and undamaged delivery of goods. This information is obtained from the cargo companies and agreements are made that include regional deadlines and the number of packages expressed in regional and non-regional terms. However, due to each brand's products and customer structure, there may be differences in delivery times. These differences lead to problems, such as the delivery time on the company's website, which is either quite long (e.g. between 4-7 days) and therefore not competitive, or does not convey any information at all. Since delivery time is an important purchase criterion for the end customer, the long delivery time causes them to abandon the purchase or develop an expectation based on an average time. While the company with which the brand has an agreement may be able to deliver within these deadlines in some regions (especially major cities), it may take quite a long time in others.

PwC's research shows that 39% of customers want delivery within 2 days and 50% find 3-5 days acceptable, but predictability of delivery time is more important than speed. Given the vagaries of the delivery process, accurately predicting the delivery date at the time of order is one of the biggest challenges in e-commerce, because a shipment delivered after the promised date impacts both the customer experience and the optimization of supply chain operations. For this reason, cargo delivery time prediction is of great importance for the e-commerce sector.

This study aims to develop delivery time prediction models based on supervised machine learning algorithms. For this purpose XGBoost, RF and MLP have been used. The performance of the developed models has been evaluated using MAE.

This paper is organized as follows: Section 2 presents related literature. Section 3 provides details on dataset generation. The methodology and details of the prediction models are given in Section 4. Result and discussions are presented in Section 5. Section 6 concludes the paper.

2. LITERATURE REVIEW

In the last few years, numerous methods have been used for delivery time prediction. (Antamis, et al., 2021) proposed predicting critical time frame states from warehouses to delivery points.

For this purpose RF, Gradient Boosting, WaveNet and Bagging were used. Monte Carlo simulations were performed for each technique to determine the method or methods with the best predictive performance. The simulation results showed that the Gradient Boosting and Bagging techniques predicted the best time intervals for most of the time periods studied. (Borst, 2019) used XGBoost to analyze and estimate service times for the delivery of customer goods. The performance of XGBoost was described in comparison to the current rule-based model for predicting service times and to a Simple Linear Regression model. (El Mekkaoui, et al., 2020) proposed a method for building prediction systems for ship arrival time prediction. Existing approaches for predicting expected time of arrival (ETA) were presented and the results showed that Neural Networks models predict the arrival time of a ship at its destination. (Mahajan, et al., 2022) described a machine learning based approach to deal with uncertainty in ETA of shipments. Multiple regression techniques were used to predict the ETA of a shipment at the destination port. The proposed approach predicted the ETA of the shipment with 89% accuracy. (Panchenko, et al., 2020) proposed a method for predicting the expected departure time for a cargo dispatch at the marshaling yard based on RF, and tested the prediction accuracy. (Prokhorchenko, et al., 2019) proposed method based on an MLP structure and a cross-validation method for predicting the ETA of a freight shipment. (Serova and Garlickii, 2022) introduced a delivery time prediction method based on determining the time that the stream occupied the facilities along the transportation routes based on their loads. The method was tested and proved its suitability in fulfilling the set tasks, as well as its effectiveness in calculating the prediction time of export coal cargo flows occupying the transportation routes. (Zhu, et al., 2020) used a Deep Neural Network based model to predict the fulfillment time, which refers to the amount of time that elapses between a customer placing an order and receiving the meal. Extensive offline and online experiments demonstrate the effectiveness of the approach. (Wahyudi and Arroufu, 2022) presented a method for predicting delivery time based on Linear Regression. The performance of the developed models was evaluated using Root Mean Square Error (RMSE). The result showed that LR achieved an RMSE value of 0.37%.

3. DATASET GENERATION

The dataset, which has been obtained from Kaggle (URL 1), has 5113 rows and includes historical shipment data over the 16-month period between February 14th 2019 and June 13th

2020. Categorical variables in the dataset were converted to numerical values using One-Hot Encoding. The attributes in the dataset and their explanations are given in Table 1.

4. METHODOLOGY

In this study, models were developed using XGBoost, RF and MLP to predict delivery times. 10 different models were created (i.e., for the creation of the 1st model, the first 500 rows of the dataset were used as the test set and the remaining data were used as the training set. For the 2nd model, rows 500 to 999 were used as the test set and the remaining data as the training set. This process was repeated 10 times and models were created). The summary of the methods used for developing the prediction models are given below.

Table 1. Attributes in the dataset

<i>Attribute Name</i>	<i>Definition</i>
Year	Year
Month	Month of the year
Day	Day of the month
Hour	Hour of the day
Minute	Minute of the hour
Second	Second of the minute
PuP	Pick up point
DoP	Drop off point
Source_country	Country from where the product needs to be delivered
Destination_country	Country to where the product needs to be delivered
Freight_cost	Cost of transportation / kg
Gross_weight	Gross weight in kg which needs to be delivered
Delivery_charges	Fixed cost per delivery
Delivery_mode	Method of delivery
Delivering_company	Candidate delivering company
Shipping_time	The time that it takes for a product to reach their destination

4.1. Random Forest

RF is a learning method used in random decision forest, classification, and regression, among others. In this method, a cluster of decision trees is first created. Then the data is classified based on the randomly generated decision trees. In this method, there is a directly proportional relationship between the number of trees in the forest and the accuracy rate (Noshad, et al., 2019).

4.2. Extreme Gradient Boosting

XGBoost is a machine-learning classification method. It features high information processing speed and improved performance characteristics. The method is created by increasing the size of tree models. In this process, existing models are developed by repeatedly adding new models. In this method, gradient descent algorithm is used for reduction when a new model is added (Prabha, et al., 2021).

4.3. Multi-Layer Perceptron

MLP is a feedforward artificial neural network model that is made up of multiple layers of nodes in a directed graph, with each layer fully connected to the next one. The elements of the hidden and output layers are called neurons. Each neuron is a processing unit (Sakar, et al., 2019).

5. RESULTS AND DISCUSSION

The performance of the models was evaluated using MAE. Table 2 shows the MAE's of the models using XGBoost, RF and MLP.

Table 2. MAE's of the models

Model No	XGBoost	RF	MLP
1	2.58	2.59	2.78
2	2.74	2.71	2.91
3	2.64	2.55	2.81
4	2.6	2.61	2.84
5	2.7	2.65	2.79
6	2.92	2.73	2.75
7	3.08	3.01	3.36
8	2.89	2.87	3.3
9	4.37	2.9	4.41
10	10.28	10.33	10.37

- The lowest MAE (2.55) has been observed in the 3rd model based on RF and the highest MAE (10.37) has been observed in the 10th model based on MLP.
- The average MAE's of RF-based, XGBoost-based and MLP-based models are 3.50, 3.68 and 3.83, respectively.
- In general, delivery time prediction models show consistent performance.

6. CONCLUSION

With cargo delivery time prediction, e-commerce companies can manage their delivery processes more effectively and explore different cargo company alternatives in regions where

they are no longer competitive in terms of delivery times. With effective delivery management, they can increase customer satisfaction, manage customer expectations with the information they can communicate on a regional basis, and gain a competitive advantage in delivery time, which is one of the critical purchasing decisions compared to their competitors. With highly accurate delivery time information, outcomes such as building customer trust in their brands, creating brand loyalty over time along with other critical factors, and increasing customer-based profitability in the medium term will be possible. This study proposes a delivery time prediction method using machine learning algorithms. Three different machine learning algorithms; RF, XGBoost and MLP have been used. It is found that the delivery time prediction models have consistent performance and can be used to predict delivery times with reasonable error rates.

Abstract

On e-commerce marketplace websites and mobile applications, multiple sellers can sell the same product. When a seller wants to add a new product to the store, the system first checks if the product is available on the marketplace. If the product is available, it is added as a new seller under the existing product code without creating a new product code. This screen, where the same product is displayed with different seller options, is called "Buybox". The order in which sellers are listed on the "Buybox" screen is very important. This is because most product sales are made by the seller who is in the first place. At the same time, the higher a seller is in the ranking, the more likely he/she is to make a sale. In this study, a sorting algorithm based on Extreme Gradient Boosting (XGBoost) has been developed to rank sellers on the Buybox screen. A dataset of 57690 rows consisting of 7 attributes of products sold on Trendyol.com has been created. The sorting algorithm has been tested on 4 different product categories including electronics, fast-moving consumer goods (FMCG), textiles and default. The default category includes all electronics, FMCG and textile products. The performance of the developed algorithm has been evaluated using Mean Absolute Error (MAE). The MAE's obtained for the electronics, FMCG, textile and default categories are 2.49, 0.91, 0.31 and 1.54, respectively. In general, the performance of the ranking algorithm has been found to be high for all categories.

Keywords: Ranking Algorithm, Machine Learning, E-commerce Marketplace

INTRODUCTION

E-commerce marketplace is the term for online platforms set up by third parties on the Internet to bring sellers and buyers together, where sellers open stores and upload their products, and consumers evaluate and purchase corresponding products. In recent years, the number of e-commerce marketplaces has increased due to evolving technology and changing consumer shopping habits. It is well known that sellers who sell products and services through e-commerce marketplace platforms make their sales in a highly competitive environment. When a product is offered by too many sellers, it can increase e-commerce competition and negatively impact shop profitability. That's why the BuyBox system for e-commerce marketplace platforms was developed to help sellers sell more easily and quickly.

On e-commerce marketplace platforms, the BuyBox is the screen where sellers are ranked when more than one seller offers the same product. When customers click buttons like "Buy" or "Add to Cart" to purchase a product or service, they buy the product of the seller whose product is at the top of the BuyBox screen. Buybox brings many benefits to both buyers and sellers. On e-commerce marketplaces, Buybox increases the sales of related products and services, making them more advantageous than their competitors. This can increase the seller's visibility and help them reach more customers.

The importance of Buybox for customers is satisfaction oriented. Users who buy from the first seller on the Buybox screen have a more professional shopping experience and customers get both good products and good service because the seller in question meets some criteria to be higher on the Buybox screen.

This study aims to develop sorting algorithm based on XGBoost to rank sellers on the Buybox screen.

This paper is organized as follows: Section 2 presents related literature. Section 3 provides details on dataset generation. Methodology and details of the classification models are given in Section 4. Results and discussion are presented in Section 5. Section 6 concludes the paper.

LITERATURE REVIEW

(Hunold et al., 2022) analyzed seller and product recommendations of the hybrid e-commerce platform Amazon. They found that using web-scraped data made the visibility of offers of third-party suppliers in the "Buybox" dependent on prices on competing marketplaces like Walmart and eBay. (Cranenburgh et al., 2022) aimed to facilitate (further) the integration of machine

learning in the choice modelling field. To achieve this they made the case that (further) integration of machine learning in the choice modelling field was beneficial for the choice modelling field, and, shed light on where the benefits of further integration can be found. First, the similarities and differences between the two modelling paradigms were clarified. Second, a literature overview on the use of machine learning for choice modelling was provided and then the strengths of the current theory-driven modelling paradigm and compared with the machine learning modelling paradigm were reinforced. (Gomez et al., 2022) tried to estimate empirically the relevant seller characteristics that Amazon could consider featuring in the Buybox. To that end, 22 product categories from Italy's Amazon web page were studied over a ten-month period, and the sellers were analyzed through their products featured in the Buybox. Two different experiments were proposed and the results were analyzed using four classification algorithms (Neural Network, Random Forest, Support Vector Machine, and C5.0 Decision Trees) and rule-based classification. The first experiment aimed to characterize sellers unspecifically by predicting their change at the Buybox. The second one aimed to predict which seller would be featured in it. Both experiments revealed that the customer experience and the dynamics of the seller's prices were important features of Buybox. Additionally, they proposed a set of default features that Amazon could consider when no information about sellers was available. (Dash et al., 2021) was performed an end-to-end systematic audit of related item recommendations on Amazon and proposed a network-centric framework to quantify and compare the biases across organic and sponsored related item recommendations. (Lan et al., 2021) analyzed data collected from the Amazon website (specifically in the Handmade Category) to understand and analyze Vietnamese artisans' business context. Data analysis was also applied to determine the factors that bring success to Handmade products and compare products of the same industry among competitors to find out potential products. They also proposed solutions to help Vietnamese products become more appealing to international customers on the Amazon website. (Fletcher et al., 2021) outlined eleven key features of online markets that might necessitate standards additional to or different from those that were applicable offline, and provided a menu of possible policies in relation to each. Many of these were general to all online markets, but some were specific to the largest digital platforms. (Wieting and Sapi, 2021) analyzed algorithmic pricing on Bol.com, the largest online marketplace in the Netherlands and Belgium. Based on more than two months of pricing data

for around 2,800 popular products, they found that algorithmic sellers could both increase and reduce the price of the Buybox. (Abaluck and Compiani, 2020) stated a sufficient condition under which choice data alone sufficed to identify consumer preferences when choices are not fully informed. Firstly, the data-generating process was a search model in which the attribute hidden to consumers is observed by the econometrician; secondly, if a consumer searched good j , she/he also searched goods that were better than j in terms of the non-hidden component of utility; and thirdly consumers chose the good that maximized overall utility among searched goods were supposed. The approach intertwined several standard models, including full information. (Gómez-Losada and Duch-Brown, 2019) modeled the dynamics among sellers occupying the buy-box using a classification approach. Italy's Amazon webpage was crawled for ten months and features from products were analyzed to estimate the more relevant ones Amazon could consider for a seller occupying the Buybox. Predictive models showed that the more relevant features were the ratio between consecutive prices in products and the number of assessments received by customers. (Chen and Wilson, 2017) briefly summarized two recent works from a group that use observational data to study the mechanisms used by two large markets. First, Uber's surge price algorithm was examined and observed that its incentive model may not be effective at changing driver behavior. Second, the adoption of dynamic pricing strategies by sellers on Amazon Marketplace was studied and investigated how these strategies interact with Amazon's "Buybox" matching algorithm.

DATASET GENERATION

A dataset of 57690 rows consisting of 7 attributes of products sold on Trendyol.com has been created. The attributes in the dataset and their explanations are listed in Table 1.

Table 1. Attributes in the dataset

Attribute Name	Definition
product_price	Price of the product
product_price_difference_ratio	The ratio of the difference between the product price with the minimum price in the Buybox
seller_score_difference_ratio	The ratio of the difference between the product score with the maximum score in the Buybox
seller_score	Seller's score
has_seller_score	Whether or not seller has score
is_rush_delivery	Whether or not there is rush delivery
is_cargo_free	Whether or not cargo is free

METHODOLOGY

A sorting algorithm based on XGBoost has been developed to rank sellers on the Buybox screen. XGBoost is a machine-learning classification and regression method. It features high information processing speed and improved performance characteristics. The method is created by increasing the size of tree models and existing models are developed by repeatedly adding new models. (Prabha et al., 2021).

RESULTS AND DISCUSSION

The sorting algorithm has been tested on 4 different product categories including electronics, FMCG, textiles and default. The default category includes all electronics, FMCG and textile products. The performance of the developed algorithm has been evaluated using MAE. The MAE's obtained for the electronics, FMCG, textile and default categories are 2.49, 0.91, 0.31 and 1.54, respectively.

As a result of this study,

- In general, the performance of the ranking algorithm has been found to be high for all categories.
- The way in which the factors to be used for ranking are calculated has been better adapted to the operational processes of the providers.
- The factors that are important to customers' buying preferences have been identified.
- Activities such as promotions, campaigns, and coupon identification involving vendors have been incorporated into the ranking algorithm to have an impact in favor of the customer.
- Sudden changes in ranking scores caused by existing variable definitions have been prevented.
- Competition between vendors has been developed positively and in line with customer expectations.

CONCLUSION

In this study, a sorting algorithm based on XGBoost has been developed to rank sellers on the Buybox screen. The MAE's obtained for the electronics, FMCG, textile and default categories are 2.49, 0.91, 0.31 and 1.54, respectively. As a result of this study, the performance of the ranking algorithm has been found to be high for all categories and activities such as promotions, campaigns, and coupon identification involving vendors have been incorporated into the ranking algorithm to have an impact in favor of the customer.

**MIGRATION AND UNIMPLEMENTED HUMAN RIGHTS: CASE OF
EASTERN OF THE DEMOCRATIC REPUBLIC OF CONGO**

Bosse Omar Ndahetwa

Kocaeli University / Department of International Relations

E-mail: bossomari2@gmail.com

Orcid: 0000-0002-7647-0952

ABSTRACT

Migration and human rights are usually connected each other due to the contexts of war conflicts in the Democratic Republic of Congo. Different analyses reveal a big number of Congolese who flee their homes because of gradual conflicts that exist from more than two decades. The reality is that Democratic Republic of the Congo is one of the most underlined country holding rebels and insurgents in East Africa. This situation gives result on violation of human right and uncontrollable trafficking due to human migration. This study analyzes the fundamental causes of migration in the Democratic Republic of Congo's eastern region, as well as the application of human right violation. In addition, it emphasizes the importance of regional and international actors in assisting in finding concrete solutions to problems. This research is conducted through qualitative research method which examines some documents related with migration and human rights as focus of data collection. The research results confirm that Congolese decide to leave from homeland due on the scarcity of peace and prevention of human right. From that perspective, war conflicts are increased under various reasons which have been analyzed. As there is lack of official judiciary instruments about human rights, migration is gradually increasing in Eastern of the Democratic Republic of Congo. Therefore, the existence of many rebels and army groups in the region contributes the violation of human right whose impacts are based on inciting migration to neighboring countries and other countries.

Keywords: Eastern Africa, Migration, Human Right, RDC, Impunity

INTRODUCTION

One of the key causes leading to the current deadlock in the violence in eastern DRC is poor mining governance. Hundreds of thousands of Congolese artisanal miners rely on minerals found in South Kivu and Ituri, but their trade and exploitation are plagued by largescale corruption and human rights atrocities done by armed groups, including undisciplined parts of the national army (Brier, 2021). Even if the level of the ferocity of the armed conflict that has plagued the Democratic Republic of Congo (DRC) for the past two decades has gradually decreased.

The situation of violence and instability in the east of the country, which began with Laurent Desiré Kabila's 1996 coup d'état against Mobutu Sese Seko and culminated in his surrender of power in 1997, persists. Following that, in 1998, the so-called 1st African World War began, in which Burundi, Rwanda, and Uganda, along with various armed groups, attempted to depose Kabila, who had received support from Angola, Chad, Namibia, Sudan, and Zimbabwe. This war was a result of deaths of nearly five million people, including at least 200.000 women, forced displacement of hundreds of thousands, and a long-term humanitarian disaster. The signing of a ceasefire in 1999, as well as various peace agreements between 2002 and 2003, resulted in the withdrawal of foreign troops and the formation of a transitional government led by Joseph Kabila, followed by an elected government in 2006, which was approved by referendum in 2011 elections amid allegations of fraud (Rufanges & Royo Aspa, 2016).

Nonetheless, due to Rwanda's role and the presence of non-demobilized militias like Les Forces Démocratiques pour la Libération du Rwanda (FDLR), which was responsible for the Rwandan genocide in 1994, this approach, did not end bloodshed in eastern DRC. Non-compliance with the peace agreements in 2009 prompted militants from the former CNDP to abandon the Congolese Army, which they had joined in 2012. According to Beswick, those who deserted formed the Mouvement du 23-Mars, which was sponsored by Rwanda (BESWICK, 2012). The insurrection was put down in 2013. At the same time, armed actors operating in the DRC, ranging from armed groups to the Armed Forces and other governmental agencies, have committed and continue to commit rapes and other acts of sexual violence as a war weapon. As a result, they contribute to the pervasive climate of insecurity and impunity that exists in the area. In the east of the country, there is ongoing instability and bloodshed, and the control and

exploitation of natural resources has led to the continuation of the DRC war and the deployment of foreign armed forces. As reported by the United Nations for the first time in April 2001, the Congolese Armed Forces (FARDC), local and international armed groups, local enterprises, several bordering countries, and Western and Asian multinationals have all been involved in this business. Even while considerable progress has been made in terms of the application of due diligence requirements to ensure that supply chains do not promote the mining of minerals from conflict-affected and high-risk areas, the mineral sector continues to ignore them, demonstrating the relevance of smuggling (Rufanges & Royo Aspa, 2016). According to the UN Group of Experts, Rwanda is where the majority of unlawfully exported resources are laundered and labeled (OCHA Services, 2001). However, there are a number of measures in place at the federal level.

In the end, the fact that the country experienced increased political instability, as Kabila's second presidential term draws to a close had to be emphasized. Political violence, suppression of the opposition, and the use of disproportionate force in mobilizations had all increased. Non-compliance with the electoral calendar had become a reality, which might lead to the postponement of elections and the extension of Joseph Kabila's presidential mandate, which was set to expire at the end of 2016, an issue that could spark a new cycle of instability (Rufanges & Royo Aspa, 2016). Finally, it is crucial to mention that the DRC has embarked on a new path of democratization following the arrival of new President Felix Tshisekedi. Soft-Power strategy has been seen as advocating for the construction of a new Eastern DRC devoid of war and turmoil. Felix Tshisekedi followed the same strategy with of the Burundian President Evariste Ndayishimiye as he presented his foreign policy to the international audience, inviting various leaders from other countries to discuss bilateral relations with the once-dubbed "enemy of the state" (Bigirimana, 2022). He made the decision to change DRC's fate in a different way than his fore fathers. He outlines the Congolese focus while dealing with other countries and ensures that Africa as a whole is liberalized in his foreign policy.

The main question of this study is how does Congolese government deal with regional actors and human right defenders in case of promoting security of people and decreasing the number of regional migration?. The design of this study of giving a brief presentation of region challenges on migration followed by the case of Eastern Congolese migration and rule of law in protecting people. After the brief introduction, the study will display the conceptual

framework and go around with analyzing the unimplemented human right in DRC and finally, searching and devotement of the solution to mixed migration challenges.

Brief Overview of Congolese refugees

Congolese Refugees: A Portrait

Congolese refugees in Burundi are mostly from Katanga and South Kivu Provinces, but Congolese refugees in Rwanda are virtually entirely from North Kivu. The majority of people in Tanzania come from South Kivu, while the majority of people in Uganda come from North Kivu. The majority of the refugees in Rwanda and Tanzania today left in 1996, with a second peak in 1999 in Tanzania (UNHCR, 2022). Between 2002 and 2005, there was a steady but significant increase in immigration in all four countries, with Uganda seeing the most growth. Banyarwanda people make up the majority of Congolese refugees. The remaining Congolese refugee populations come from a wide range of ethnic groups. The bulk of the refugees in the DRC are under the age of 18. For the prolonged population, the average household size is expected to be five people. A large majority of Congolese refugees do not have access to formal schooling. They speak a variety of languages, the most common of which are Kinyarwanda and Kiswahili (UNHCR, 2022). Although French is more widely spoken than English, French skills are vanishing in English-speaking host nations. Moreover, agriculture is where the bulk of Congolese refugees labor.

The majority of Congolese refugees from eastern DRC live in camps or settlements in the Great Lakes and Southern Africa region, most of who have been there for many years. The 45,124 Congolese refugees registered in Burundi as of January 1, 2014 reside in the city of Bujumbura. The 72,988 Congolese refugees registered in Rwanda dwell in different camps of the country (Ibid). In addition, the 64,569 Congolese refugees in Tanzania are housed in Nyarugusu camp; eighty-eight percent of Uganda's 155,742 Congolese refugees live in settlements, while twelve percent live in Kampala. The goal of this research is to better understand the fundamental causes of migration in the Democratic Republic of Congo's eastern region, as well as the application and violation of human rights against Congolese residing there. This research will also reveal how these infractions affect the country's sociopolitical and economic circumstances, as well as what may be done to improve things. To do this, the focus of this research will be on other researchers and articles on the subject. The following are the research objectives, which have been designed to achieve the above-mentioned goal: Understanding the causes and

consequences of migration and human rights violations in the Eastern region of the DRC, to address the underlying cause of relocation in this socially polarized region of the DRC. Demonstrating how education and democratic values may be utilized to combat all forms of evil in the global environment and finally, to emphasize the importance of regional and international actors in assisting in the development of concrete solutions to problems.

CONCEPTUAL FRAMEWORK

The humanitarian, human rights, and security situation in the DRC have been deteriorating, its effects have been disastrous for the Congolese people, with 4.5 million people uprooted from their homes, the highest number in Africa, and 2 million children facing famine. In recent months, tens of thousands of refugees have fled to Uganda, Angola, Tanzania, and Zambia (Sewenet, 2019). The 2006 general elections, which saw incumbent president Joseph Kabila win re-election, signaled the end of the transition phase and solidified the control of the national institutions by a democratically elected president and his patronage network (ibid). As the affirmation of Kabila's power hampered the chances of significant changes in the national power balance, numerous factions that had already expressed dissatisfaction with the transitional process refused to integrate their men into the national army (Verweijen & Vlassensroot, 2017). Since 2015, security forces have killed nearly 300 individuals amid mostly peaceful rallies. As a result, since August 2016, an outbreak of violence between Congolese security forces, government-backed militias, and local armed groups has killed up to 5,000 people in the country's central Kasi area.

Furthermore, government officials and security forces perpetrated widespread repression and grave human rights crimes against political opposition leaders and sympathizers, pro-democracy and human rights activists, journalists, and peaceful protestors throughout 2018. Widespread irregularities, voter suppression, and violence marred the December 30 elections. When voting in three pro-opposition districts was postponed until March 2019, more than a million Congolese were unable to vote (World Report, 2019). Several armed groups, as well as government security personnel, attacked residents in central and eastern Congo, murdering and injuring many innocent people. With 4.5 million people uprooted from their homes and over 130,000 refugees fleeing to neighboring nations, the humanitarian situation remained dire (World Report).

Driver of Displacement in Eastern DRC

Large numbers of people have been displaced from their homes in the DRC for nearly two decades, frequently repeatedly, because of ongoing war. Over the years, the waves of violence have become so common that they have developed a culture of displacement that has affected practically every resident of the eastern provinces. In September 2014, the DRC had an estimated 2.7 million internally displaced persons (OCHA Services, 2014). The number of internally displaced persons (IDPs) has generally remained around two million for over a decade, despite fluctuations. The highest number of internally displaced persons (IDPs) ever reported in Congo was 3.4 million at the end of 2003 (IDMC, 2022), the number of internally displaced persons (IDPs) increased again at the end of 2013 (to 2.9 million), but has since decreased to 2.6 million. To put the enormity of the crisis in context, the DRC has the world's fifth biggest IDP population, behind Syria (7.6 million), Colombia (5.7 million), Sudan (3.4 million), and Nigeria (3.4 million) (Médecins Sans Frontières, 2014).

Inter-ethnic tensions, power battles over natural resources and territory, the development of armed organizations, many of which are foreign, and the meddling of DRC's neighbors in the situation in the east have all contributed to the ongoing war in eastern Congo. Multiple armed groups and militias operating in the eastern provinces, including FARDC, have never made a clear difference between civilians and combatants during the DRC conflict. Furthermore, they have preyed on civilian communities on a regular basis, carrying out arbitrary killings, rapping and kidnapping women, pillaging villages, and forcibly recruiting youngsters into their army. Abuse and harassment of civilians is a common occurrence. People are forced to carry supplies for armed groups and are billed for protection and transportation (Médecins Sans Frontières, 2014).

UNIMPLEMENTED HUMAN RIGHTS

Human Rights Violation Patterns

In eastern DRC, human rights violations can be classified into three categories:

A. Abuse of human rights by state and non-state actors in the pursuit of physical control over resource-rich areas, as well as trade routes, border checkpoints, and economic hubs. These atrocities were most serious in places touched by the armed conflict in eastern DRC, although they also happened elsewhere;

B. These groups perpetrated human rights violations after conquering these areas in order to maintain control. Most of these were done by fighting sides in the midst of an armed conflict;

C. Systematic violations of economic rights resulting from large-scale looting, theft, and corruption, both in conflict and non-conflict areas, were a motivation for these parties to keep fighting; a major source of finance that sustained their activities and enabled them to continue perpetrating acts of violence against civilians; and a factor that prolonged the conflict (Global Witness, 2009).

Perpetrators and Protection from Discrimination

The Congolese government and security forces, as well as a variety of Congolese non-state armed groups, including the Rassemblement congolais pour la démocratie (RCD) and its three factions RCD-Goma, RCD-Mouvement de libération (RCD-ML), and RCD National, and the Mouvement de la libération du Congo (MLC), have all been perpetrators of all three categories of abuses (MLC) according to many sources. The Union des patriotes congolais (UPC), the Front des nationalistes et intégrationnistes (FNI), the Forces armées du peuple congolais (FAPC), the Forces de résistance patriotique d'Ituri (FRPI), and a host of mai-mai and other groups have all brought chaos to this part of DR Congo (Global Witness, 2009). In addition, companies and individual traders who were willing to trade in natural resources produced under these conditions, or with communities with a history of poor human rights, can be deemed to have contributed to these unfortunate circumstances.

The DRC continues to be plagued by conflict-related sexual and gender-based violence (UN Team of Experts, 2017). Ongoing insecurity, internal displacement, and political tensions pose a threat to progress in combating sexual violence as a weapon of conflict (UN Security Council, 2018). Sexual assault is on the rise in conflict-affected provinces, perpetrated by both armed groups and security officials (UN Security Council, 2018). Moreover, violence against women and girls is on the rise in both social and domestic settings (United States Department of State, 2017). Women and girls have experienced an increase in sexual and gender-based violence in conflict-affected areas as a result of this climate.

The United Nations Population Fund (UNFPA) reported 5,783 occurrences of sexual violence in conflict-affected provinces in 2017, more than double the number in 2016 (UN Team of

Experts, 2017). In 2017, conflict-related sexual violence spread to the three Kasai provinces in the center of the DRC, but the eastern provinces of Tanganyika and Ituri accounted for 72 percent of the instances (Stearns & Vogel, 2015). Armed groups have also been responsible for conflict-related sexual violence in North and South Kivu, with the number of armed organizations increasing from around 70 in 2015 to 118 in 2017 (Stearns & Vogel, 2017). This surge in Sexual and Gender based violence (SGBV) incidents in conflict-affected areas is not just due to armed groups, but also to Congolese security forces. In 2017, the number of sexual violence occurrences ascribed to the Congolese army (FARDC) and the Congolese National Police (PNC) increased by 28% and 109%, respectively, when compared to 2016 (UN Peace Keeping, 2018). The victim was in police custody for more than a third of the events (Ibid).

According to the Demographic Health Survey conducted in 2013-2014, 27 percent of women in the DRC had experienced sexual violence at some time in their life, up from 22 percent in 2007 (United States Department of State, 2017); (Promundo, 2014). According to a survey done in North Kivu region in 2013, roughly 65 percent of male participants thought, "Women should accept partner violence to keep the family together." Around 27% of men agreed with the statement "a male can force a woman to have sex, and she may love it" in the same study, indicating a significant level of discriminating views among men (Ibid).

Legal Framework

According to the article 8, 12 and 13 of the 2015 Democratic Republic of the Congo Constitution: *The human person is sacred and has the right to life.* The State has the obligation to respect it and to protect it. Each citizen has the right to the full development of his person within respect for the rights of others, of the public order, of ethics and of morals.

The penalty of death is abolished (Article 8)

War crimes, crimes against humanity, the crime of genocide, are punished within the conditions determined by the law, as they are imprescriptible (Article 12). Any propaganda or any incitement to ethnic hatred, to insurrection, to violence or to civil war constitutes a crime punished by the law (Article 13).

Regional and International Actors

Eastern Neighbors of the DRC

Uganda, Rwanda, and Burundi's rivalries, as well as their internal difficulties, pose a threat to the DRC. These countries have used militias in the DRC to fight proxy wars between themselves. The FDLR, for example, is tied to Uganda and Burundi in their fight against Rwanda. 64 In exchange, Rwanda is linked to assisting rebel organizations fighting Burundi in South Kivu and rebels like the ADF fighting Ugandan President Yoweri Museveni (French, 2009). President Tshisekedi intends to settle this dynamic diplomatically, hence the quadrature framework for rapprochement between Rwanda, Uganda, and Burundi.

The UN Mission in the Democratic Republic of the Congo (MONUSCO)

Since the creation of MONUC in 1999, the United Nations (UN) has been the dominant Inter Governmental Institution (IGI) in the DRC war. The United Nations Security Council (UNSC) established MONUSCO in 2010 as an upgrade to MONUC, with two strategic priorities: civilian protection and support for the stabilization and strengthening of state institutions in the DRC, as well as key governance and security reforms. The United Nations contributes 57 personnel from various member states (UN). Because of MONUSCO's poor response to reported attacks against civilians, the inhabitants of Beni demanded its departure in February 2020. The lack of success was attributed to a lack of financial, people, and logistical capabilities, as well as engagement rules that do not allow for quick involvement when needed (Minani, 2020). Despite these setbacks, MONUSCO's collaboration with the FARDC and the Congolese National Police (PNC) allowed for the safe return of displaced people. The situation of late October 2020 in Pinga, Walikale territory of North Kivu, is a recent example (MAGURU & BA, 2022).

Civil Society

The Catholic Church in the DRC is the most powerful civil society organization with a membership that exceeds 50% of the population. It participates in the DRC's peace process as a neutral party (mediator), facilitating political involvement (mobiliser) (Berkley Center for Religion, 2020). The postponed election and repression sparked actions that went beyond mediation (The Africa Center for Strategic Studies, 2027). Under Kabila's administration,

human rights breaches and democratic inadequacies shaped his mobilizer's role, while Tshisekedi's administration takes a different approach. Furthermore, Actions et Initiatives de Développement Pour la Protection de la Femme et de l'Enfant (AIDPROFEN), which focuses on women and children and receives support from INGOs and the US Embassy, among others, focuses on women and children. In Goma, North Kivu, an equal education initiative for abandoned girls and boys has managed to prevent many from joining armed organizations (AIDPROFEN, 2022).

SOLUTION TO MIXED MIGRATION CHALLENGES

The Government of the DRC has difficulties in central, and the national government that pushed on the lacks of dynamism to fill the void. As a result, the government should lead a structural shift away from overburdening the central government and toward empowering provinces to manage their own affairs. In terms of the economy and security, this entails decentralization. As a result, legitimate authorities at the local level will lead to conflict prevention and resolution. This will inspire grassroots ownership of governance, peace, and security infrastructures. The load on the central government will be decreased as a result of this decentralization process. This will help to strengthen institutions, which is one of the African Charter on Democracy, Elections, and Governance's top priorities (ACDEG) (African Union, 2007). In this vein, more initiatives with political will to work, such as the Inter-provincial Commission to Support the Awareness, Disarmament, Demobilization, and Community Reintegration Process (CIAP-DDRC), which was launched in South Kivu in 2019, are needed in eastern DRC, and the context specificity of the CIAP-DDRC should be emphasized.

This would facilitate the following: the transition of armed groups with ties to local communities into provincial security forces capable of receiving adequate professional training; political participation by focusing citizens' and civil society's attention on appointing suitable leaders to manage the affairs of the provinces. Furthermore, the formulation, implementation, monitoring, and evaluation of policies tailored to the realities of each province rather than the national average. It would also create a climate in which inter-provincial competitiveness might be shifted away from violent confrontation and toward development.

To Interstate Organization

The timely restructuring of FIB requires the support and facilitation of UN member states (ISS, 2020). Following its triumph over the M-23 movement, it has shown to be the only effective

force against armed groups, necessitating SADC's call for FIB reorganization. However, the focus should be on improving its ability to defend civilians. There is also a need to concentrate on local grievances and ties with local communities, which are exploited by armed organizations. These criticisms might readily be construed to MONUSCO's harm, jeopardizing the much-needed public trust and support in local communities. As a result, managing and avoiding further attacks would include UN MONUSCO finding a mechanism to avert retaliation and increasing public diplomacy operations. To the ICGLR, the AU, and the RECs to begin, technical and capacity-building assistance for institutions at the grassroots level is needed to help them develop a sense of ownership of governance, peace, and security infrastructures. This is important for peacebuilding because broken institutions are one of the reasons why the conflict in eastern DRC has lasted so long. In addition, the African Union needs to strengthen its presence in the DRC in order to comply with UNSCR 2250, the African Youth Charter, the African Union Continental Framework on Youth Peace and Security, and other similar normative frameworks (s). This is important for conflict prevention and peacebuilding because it will help to occupy and distract the attention of the young population, allowing them to see beyond the use of violence as a means of survival.

The AU PSC may also be required to intervene in international terrorism and violent extremism, establish measures to prevent genocide and other crimes, and become more involved in human rights concerns, particularly to rein in the FARDC's excesses (African Union, 1993). On the youth agenda in the DRC, RECs and the International Conference of the Great Lakes Region (ICGLR) should collaborate with the AU. RECs and member states must also expand their support for President Tshisekedi and his diplomatic strategy in order to boost regional security cooperation. Finally, the AU and RECs should prioritize maintaining peace and facilitating constructive conversation between Pro-Kabila and Pro-Tshisekedi. This would result in a healthy opposition, as is required in a democracy that does not fuel conflict or undermine governmental institutions.

CONCLUSION

Despite significant progress in the DRC's, fight against impunity for human rights violators must be reviewed and making in action new policies to deal with it. Such as the President of the Republic's promulgation of legislation on the implementation of the Rome Statute of the International Criminal Court on December 31, 2015, or the law n°15/013 of August 1, 2015 on

rules for implementing women's rights and gender parity, several malfunctions negatively impact the Congolese justice system and impede progress in the effect. During the time under review, the President and Congolese authorities, with the backing of the international community, spearheaded initiatives and public campaigning that resulted in the conviction of at least 231 State agents for conflict-related sexual violence.

Furthermore, according to UNJHRO data, at least 447 FARDC soldiers and PNC operatives were convicted of human rights breaches during the same time. In comparison to the large number of reported human rights breaches, this remains a low figure. The low number of security agents successfully convicted, particularly high-ranking officers, and the difficulty in prosecuting armed group combatants as they physically evade justice. In other word or are rather targeted by military operations, are concerning considerations, especially given that United Nations bodies frequently emphasize the importance of bringing perpetrators of serious human rights and international humanitarian law to justice in order to effectively combat impunity. The percentage of human rights breaches committed by government agents (54, 5%) is alarming. It exposes major institutional flaws as well as a lack of criminal prosecution of human rights violations, particularly by high-ranking officers. This situation must be rectified immediately, especially given the country's current electoral setting, in which security forces are viewed as a tool of the state used to achieve political ends, namely to suppress political opponents, civil society, and the media. Prosecution of armed group combatants for crimes including human rights violations is extremely rare, with only 28 convictions recorded over the time period under consideration.

Amnesty or absorption into the FARDC ranks are frequently offered to armed group combatants. Indirectly, this de facto impunity encourages the commission of violations, which has a negative impact on the victims. The National State of Justice held in Kinshasa from April 27 to May 2, 2015, and coordinated by the Ministry of Justice and Human Rights and the *Conseil supérieur de la magistrature* conveyed a strong message about the government's intention to strengthen the Congolese legal system. The Ministry of Justice and Human Rights' efforts to institutionalize judicial changes are admirable; nevertheless, aggressive prosecutions of human rights violators, legislative reforms, and enough resources supplied by the government and its foreign partners must back them. The East African migration is underlined with a big number of Congolese who abandoned their mother in search of freedom and care of

human rights values. The region of eastern RDC is the main in the case of national migration index influenced by several repletion of war and human right violation. Non-respect of principal human right value in the rule of power and well-being of people sourced from government staffs and non-government groups has negative impacts on forming national peace and stability aimed to develop the country.

ABSTRACT

The political and economic interdependency pushes several states to come under cooperation and establishes strong partnership in many aspects of life. The development and foundation of European Union promoted economic and welfare of European countries and decreases political instability in the region. This study focus on the Romanian EU relation from full membership to the present, analyses the regional relation under economic and political dimension. This study displayed the Romanian interest on EU, the process and political dimension applied by Romania and it advantages of full integration. The research demonstrated that Romania gained much more advantages than consequences in his membership in the EU member states. In its conclusion, this paper confirmed that the integration of Romania in European Union contributed in setting policies of ameliorating social, economic, and political structures. The relationship between Romania and the EU from its full membership to the present is examined in this article using the content analysis method of qualitative research.

Keywords: Romania, EU, Full Membership, Social Mobility, Integration, Diplomatic Relation.

1. Introduction

The foundation of European Union as an intergovernmental organization in 1993 promoted much more European countries to be collective and work under a policy of partnerships in several issues. Since its foundation, many countries of Europe gate chance to move from a bad style of life to a precious one. Due on this policy of welfare of European countries, many states established several policy toward the EU integration and worked with dignity in order to gain membership.

The foundation based on promoting economy in the region, did not limit his affection on trade cooperation but it outmoded the main point and development many other branches to push over stability and economy in the region. EU seems to be one of the most successful intergovernmental organization in the globe, it power of application still pushing other states to take example from it. The economy interdependency pushes some states to follow the line of integration in the EU, staring from forming strong partnership to a membership status, are timeline exerted by countries in dealing with the incorporation in EU. Romania is one of country who tried and succeed in taking party in EU since 20007. As it was before and after it, Romania is taking place of one of the most important country doing business with EU member states from long.

This study took a while on displaying the demographic structure of Romania followed by its socio-politic structure, give a brief understand of the time line of Romanian policy toward European Union and its diplomatic aspect of progression. Moreover, the study will present advantages and consequence of the integration of Romania in the EU. After the official integration of Romania in the EU many aspect seem to change in the country and the new policy have been established toward the standard of EU member countries. From 2007 to the ongoing time, Romania developed his intern politic and economic. The influence of being member of EU help on state reconstruction and resized the political situation that was facing the country from long. National industry and trade capacity upsized and pushed the stability of development in several aspect of life in the region.

1.1. PRESENTATION OF ROMANIA

1.1.1. Demographic Presentation of Romania

Romania is a state situated in the Southeastern Europe with a total of 238 391 km², it has border with Bulgaria in South, Ukraine in North, the West part there is Hungary and Serbia in the Southwest followed by Moldova in the East and the Black Sea in the Southeast (Britannica, 2021). The county is very popular and know depend on its forest region of Transylvanian. The country's official language is Romanian and its currency is Romanian Leu, the population of the state is 19.29 million (Macrotrends LLC, 12), (The World Bank, 2021). The report of World Bank demonstrated that in Romania population range is decreasing instead of increasing.

1.1.2. Socio Politic and Economic Structure of Romania

The socio politic situation of Romania changed several times due on politic played in the region and the change rule in the country. In this party starting from social reform to political changes, brief analyze will be done in order to compare the polity of Romania before the membership and how it changes after his integration in the European Union in 2007. According to the historical background of the country, the change of socio political views took place while it started to pursue the participation in NATO. Romania started the movement of taking way to democracy in 20003 with the target of entering NATO and European Union (Constitutional Court of Romania, 2003). The policy toward EU integration pushed the proclamation of Social republic where people derived sovereignty. From the full membership in the European Union, Romania established several policies and developed many factors of promoting social life style followed by economy and political structures.

1.1.2.1. Social

In the past of Romania, the republic was well known as a Social Republic of Romania; during the era of 1947 until 1989 Marxist-Leninist and one party communist dominated the country. The long of 1989 to 1965 the country was recognized as the Romanian People's Republic (Bachman, 1991).

After the reform of social class in the country, social mobility took place in the region and pushed several changes to be in application. The social mobility was founded by maintaining the evolution of family law, changes of family structure and family life. In other side Break out of women organization, education system was promoted. People of Romania

even the political influence of religion in the region is punched principally on Orthodox and Catholics; other religions are not taking important place as the two on top. Finally, the social mobility seems to increase amelioration of social condition, case of Housing, public health and state welfare assistance (Bachman, 1989). The transformation of social class in Romania built a schema of social class under 10 classified groups (Pop, 2013). Starting from *Employers, Managers, Professionals, Supervisors, Self-employed, Technicians and officer workers, skilled manual workers, service and trade workers, unskilled manual works and farmers (peasants)*. This classification was designed by the report done by Pop while analyzing the new class schema in the Republic of Romania.

After a brief passage dating from the past of Romania in social mobility, Romania established policies to act in accordance with the EU integration and helped on developing several sectors of social life. The Romanian policy toward EU integration was characterized by changing its social status and put in place some amelioration of citizen's life. Creating occupation, establishing a policy to face social income and welfare of householders seem to be in priority of change in social structure in the last decades (China-cee.eu, 2021). The social life of Romanian changed its views after its full integration in the European Union, benefiting from EU social policy and social development toward welfare of people gives change to Romanian to develop its skills and promote much more social security.

1.1.2.2. Economic

As it was in the social structure of Romania before its integration in the EU, the economic average was at the same time under a shot. The country was full of people living in rural economic power, people of the region was much influenced by law economy depended on agriculture. It was underlined by several study that the economic situation of Romania took reform after 2007; its integration to EU promoted the reconstruction of economy and helped on developing his industrial sectors. The world economical rank demonstrated that, in 2020 Romania occupied 45th place of Gross Domestic product globally (World Bank, 2021), the index of economic freedom in 2021 demonstrated that Romania is occupying 43th place with a score of 69.5 in the globe. At the sometime Romania, appear at the 26th class of 45 European countries (Heritage.Org, 2021).

Out of economic change of Romania, one of the most important factor of production that promote education in the region is rentable land. Romania is rich of naturel resources, local

industry utilize the prosperity of and contribute in national economic and development (123Helpme, 2021). I should argue that Romania is one of the European states that has adequate suppliers of nature gas and petroleum; it has iron, ore, timbre, coal and salt. By analyzing the result of commercial evolution of Romania, it has high income that is mixing economy and high Human development index and organized labor force. It concluded the 12th place of Europe in total nominal DDP and occupied the seventh largest by sup up power equivalence (International Trade Administration, 2021).

1.1.3. Political Structure

Romania is a democratic republic with has a semi presidential rule, in the state the Prime Minister is at top of government and the president is taking representation of the country at international level. The president has authority of signing some decree and ratify laws announced by the parliament (Europa.eu, 2021). The republic of Romania is an independent sovereign and unitary, the president of Romania is coming to power from a direct election with a term of five years and renewable only two times. The body is government is compose by 329 deputies the government under control of Parliament and 136 senator directly elected (Europa.eu, 2021). Executive, judicial and legislative, forms the Romanian main power (Global Edge, 2021)

2. HISTORICAL BACKGROUND OF THE EU

European Union is an intergovernmental organization established on 1993, it took existence from the European Coal and Steel Community (ECSC) founded in July 23 1952 in Paris (Europa, 2022) followed by the European Economic Community founded under the treaty of Paris in 1951 and the Treaty of Rome in 1957. The movement was influenced by the cooperation of six countries that come together to establish an economic organization with aims to facilitate trade and market between then, the up listed members of the organization at the beginning were: *Belgium, France, West Germany, Italy, the Netherlands, and finally Luxembourg* (EUR-LEX, 2022). By analyzing, the main reasons of creating the European Union seem to stop war among neighbors, establishment of supranational organization to deal with enforcement of democracy and making war unthinkable (European Union, 2022).

2.1. Development of EU Over Decades and Important Events

The periodical analyses of European Union starts with the era of 1945 just after the end of the second WW. Taking point from this time to 1993 is period-characterized changes and

development of EU from beginning of cooperation between European countries to the foundation of the intergovernmental and supranational organization.

- Period between 1945 and 1959

This period defined as the post war era, is characterized by the break out of cooperation in Europe, which gives result of foundation of several organization and treaties. The break out of the period are as bellow: 1945, end of WW II in Europe followed by the establishment of the ECSC in 1951. The first treaty in Europe after the WW II took place in 1957 well known as Treaty of Rome that played an important role in bringing together European states (Netaffair.org, 2022). Many European bodies were established just after the WW II as determined in the EU country history: On 4 April 1949 the establishment of NATO, 5 May 1949 the Council of Europe, 9 May 1950 New political Cooperation in Europe and on 18 April 1951 the European Coal and Steel Community (EU, 2022).

- Period between 1960 and 1969

An important remark point named “Period of Economic growth” characterized the era between 1960 and 1969. Some of major activities and events realized in this period was 1960 creation of European Free Trade Association, 1961 construction of Berlin Wall, 1962 Common Agriculture policy, 1963 first international Agreement signed by EEC, 1965 Merger Treaty, 1968 Student riot in Paris, 1968 Break out of Customs Union and finally in 1968 the crush of Prague spring (EU, 2022).

- Period between 1970 and 1979

The fill out of European Community characterized this period, some of predominant events of the era are: the Environmental protection in 1970, up size the member of EU from six to nine in 1973, oil crisis in Europe 1973. During 1974, there was a reduction of disparities among region, new democracy in three country in 1975 and the direct election in the European Parliament in 1979 (EU, 2022).

- Period between 1980 and 1989

During this period in Europe, there has been a change of the views of Europe and the give way from communist. Some events of this term are, rights of worker established in 1980, set up of the initial European research program in 1981, maintaining the policy on the

road of single market in 1986, in 1987 the starts of Erasmus program and finally in 1989 the drop down of Berlin wall (EU, 2022).

- Period between 1990 and 1999

This era is the promoted first decade just after the foundation of European Union, during this period in Europe various changes have been remarked, the main aspect of the period is that Europe passed to "*no border system*". All countries member of the organization gained a privilege of free travel. The remarked changes and events of this decade are the first event took place in 1991 that was the break-up of Yugoslavia, 1992 the Maastricht Treaty. the put in place of single market in 1993, creation of European Economic area in 1994, establishment of free border in 7 countries, the treaty of Amsterdam in 1997, and finally the nascent of the Euro in 1998 (EU, 2022).

- Period between 2000 and 2009

This period recognized as the period of "*Further expansion*", during this period extend of Europe influenced by new members occupied the reality of Europe. Some of event and important activities of the decade are the Treaty of Nice in 2001, break out of Euro notes and coins in twelve states in 2002, the first peacekeeping operation of Balkans in 2003. In 2005 the establishment of EU constitution followed by Lisbon treaty in 2007 and finally the global crisis based on economy in 2008 (European Union, 2022).

- Period between 2010 and 2019

This decade was announced as the *challenging* era of EU, in this term the European Union played mayor role in setting policies toward welfare of people and the respect of human right. Underlined that this decade gives conclusion on the decrease of member stated resulted from the referendum of 2016. Displayed events and activities of the decades were listed as bellow; in 2010 the Europe windless the financial crisis, in 2012 Nobel peace prize, 2015 terrorism in Europe followed by the Paris agreement of climate change. After 2015 Europe faced a problem of asylum seeker, in 2016 the United Kingdom elected to be away from the EU and in 2019 the establishment of process to face climate change (EU, 2022).

- The ongoing period from 2020 until present

The most important issues influencing the ongoing era of Europe is the global crises pushed by the Pandemic Covid-19. In the history of EU, this era is called the period of "*Covid-19 and the road to recovery*". The main event of the ongoing situation is the Covid-19 pandemic and the fight of human health (European Union, 2022).

2.2. Timeline of European Union Member States

The EU founded in 1993, was promoted by the starting of ECSC under membership of six countries. From this promotion in 1952, the line of change seem to take progression over time and gives the result of founding the EU in 1993. Since its creation to 2020, the organization has 28 member states. At the end of January 2020, the UK abdicated the organization and given the result of member states of EU to become 27 (European Union, 2022). The timeline of member states of EU is; at the first time, the organization commenced with six countries that established the ECSC in 1951, in 1957 the EEC and the EAEC. The six countries are Belgium, Germany, France, Italy, Luxembourg and the Netherlands (European Commission, 2022).

Timeline of countries that joined the union after the six (Schengen Visa Info, 2022):

1973: Denmark and Ireland

1981: Greece

1986: Portugal and Spain

1995: Austria, Finland, Sweden

2004: Cyprus, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Malta, Poland, Slovakia and Slovenia.

2007: Bulgaria and Romania.

2013: Croatia

The study displayed that many European states joined the Union after the demolition of Yugoslavia. Romania is one of the recent states to join the European Union comparing with other countries in the timeline of the EU member states (De Munter, 2021).

2.3. Romania's Journey towards Integration into the European Union

2.3.1. Process

The process of Romania to join the EU started long time even before the official idea of founding the European Union, after the Romanian revolution in 1989; the countries started by participate in the EC. After this era, the government of Romania and all political parties

manifested the important of it integration in the European Union. In other sources, the regional interest pushed the government of Romania to follow the line of integration, as the Republic of Bulgaria seem to follow the line in the same time (European Commission D G C, 2022). The first process of Romania to integrate in the European Union started with its first application of membership in 1995, this application take place of decision of the Council of Ministers on 17 July 1995 and provided its consultation under the commission (European Commission, 2022). During his process to join the EU, the government of Romania demonstrated with high competence his capability of dealing with all realizations and norms, obligations of EU member states, at his stage the government promised to upgrade and realizes the obligation under cited.

Some of principal criteria expressed by the Romanian government toward EU are:

- Development of the implementation law and Consolidation,
- Access of pluralism in politic
- To separate power
- Freedom in election
- Priority and respect of human rights
 - Establish the market and capability of economy in accord with EU. All this criteria, are taking reference from the EU enlargement criteria well defined as "*the Copenhagen Criteria*" (European Commission, 2022).

The change of government of Romania in 1966 promoted much more the way to reach the integration in the EU, the president of the term starting by saying that the policy of the country must work hard to make reform in the economic structure of the country (Popescu, 1997).

By analyzing the timeline and process of Romania integration to EU, even there was no any problem remarked during it wait for accordance there have been a hold up of years before it official recognition. The research released that scarcity of reform in administration and slow-moving economy seem to be the main reason of the delay in passing on full agreement (CVCE, 2022). It was remarked that Romania applied its EU membership with too many other countries that have been accepted as countries member of EU in 2004, but the accord of Romania and Bulgaria joined in 2007. According to the register of EU the two states integration is recognized as the *fifth enlargement of the European Union* (Rem & Gasper, 2008). On the road to EU, the government of Romania updated it intern policy in order to arrive at the accomplishment of

Copenhagen criteria, several changes were realized by the government include the change of government. Romania participated in many cooperation with other European states. In 1990s, Romania and EU countries signed an agreement on trade cooperation (Phinnemore, 2008).

2.3.2. Diplomatic Relationship

After the deterioration of Romania and Russia in 2000, Romania started to push it foreign policy in the west power (IMEMO, 2022). The accession of the country in NATO promoted its relation with the United State. After 2007 Romania played a major role of increasing it relation with European states due on it full membership in the European Union (Pridham, 2007). The summary of diplomatic relation of Romania and European Union was not founded by the full membership in the organization but since the regional cooperation between European counties, the government of Romania was influenced by western cooperation more than the other side of Soviet priority. The vies of Romanian foreign policy changed just after it got the occasion of joining NATO in 2004 and the EU in 2007 (OLTEANU, 2020).

3. ADVANTAGES AND CHALLENGES OF ROMANIA IN THE EUROPEAN UNION

3.1. ADVANTAGES

3.1.1. Social-economic

In this passage we will try to take away to analyze the socio economic changes in Romania before its membership to EU and compare with its situation after the integration in the European Union. Comment on the reality of change and the influence of EU on the socio economic changes of Romania.

3.1.1.1. Social

During the process of Romania to access the EU, several development took place and influenced extraordinary changes in all aspect of life and social evolution. As the government played important role in promoting and achieving the request of membership of EU, at the sometime welfare of people and upsizing social criteria were at the first place.

The timeline of social change of Romanian started with the end of communist regime in 1989 (Friedlmeier & Gavreliuc, 2013), that promoted his way regarding democracy and capitalist system. The long of communist era, Romanian people's life was set with successful policy from the communist rule; all right and need of people were fulfilled. The situation of Romania seem to change and passed in mediocre situation just after its social structure changes

from Communist to road of democracy (Friedlmeier & Gavreliuc, 2013). It was argued with Friedlmier and his colleagues that, after the social change in 1989 in social life the role of women changed its views and women were taking role in the care of family and jobs. Young and adolescent were the most challenged by the changes due on the non-adaptation on work (Friedlmeier & Gavreliuc, 2013).

With the success of Romania to integrate in the European Union, countless social changes break out, with the power of democracy the social class of Romania changed and women participation in much aspect of life took place. Democratic liberation pushes political parties to act with guaranty of existence and freedom. With the contribution of the EU, established policies to maintain welfare of Romanian and durability of social structure are mentioned as bellow (VASILESCU, 2019):

- *Employment*: it is policy established in order to decrease the economic situation in the region and promote the increase of social income in the society. In additional this policy promoted active labour and market policies, facing the take forward of working mass and skill inadequacy.

- *Poverty and income inequity*: this policy was established in 2015 with the aim of resizing the average of poverty in the country and make stability on income issues. This policy pushed the integration of social income, education, labour market, health, housing and social participation policies for people of countryside.

- *Social inclusion of downsides category*: this policy faces women places in society and the principle right of children.

- *Migration policy*: this policy was established to deal with "*Diaspora start-up*" influenced by people who emigrant back to Romania.

Out of those policies putted in place by the EU, many other programs have been organized by the organization in order to promote the development of social structures of Romania. From it full membership in the EU Romania benefited from the EU more package of setting is socio economic progress (European Commission, 2022). The republic of Romania has 15 representative in the European Economic and social committee (EESC) working in the advisory of the countries and deal with changes and social situation (EU, 2022).

3.1.1.2. Economic

Statistical result of several research's done in 2007 demonstrated that Romania upsized its socio-economic style just after its integration in EU. Economically, the country developed much more all sectors of production. Starting from industry, foreign trade, tourism, trade and services, Earning, labour force and marketing, unemployment (Voineagu , 2022). According to the many found of realized studies, the full membership of Romania promoted the sectoral development followed by increasing welfare of people and guaranty of work.

The sectorial index of development realized after the full membership of Romania in the EU are briefly demonstrated as bellow (Voineagu , 2022): This average are given by comparing February 2006 and February 2007, economy of Romania changes followed this line.

Source *Sectoral evolution of Romania*.

- Industry 5.6%
- Resource of primary energy 80.3%
- Construction 27.9%
- Trade and services 71.3% (wholesaler)
- Foreign trade 73.3% Export and 71% Import
- Tourism 16.6%
- Earning 2.5 %
- Unemployment (decreased women 1.3% and men 4.5%)

Out of the brief statistical result of Romania just after a sort moment of its integration in the EU, depends on the economic development of European Union and the implementation of its policy over member states, Romania get chance to upsize its economy and occupied a good rank among European counties even globally.

Global ranking of Romania during time changes;

In 2006, Romania was 48th ranking in GDP of 195 countries published globally; it figured \$122.024 million in 2006 (Country Economy, 2022). In 2020, the World Bank denounced the GDP of Romania with a number of 248.75 billion \$. The World Bank argue that in 2020 Romanian GDP was 0.22 % of global economy (Trading Economic, 2022).

3.1.2. Politics and Security

The political structure of Romania seem to move to from another aspect just after its route to democracy, its separation from the communist movement promoted much more political

change in Romania. The political construction of Romania before 1989 was founded under one political party that was the *Communist party of Romania*, it was the only one party officially recognized and acting as the main force in Romanian society (Britannica, 2022). Political change in Romania stated in 1991 under push of constitution of that year, the adopted constitution of 1991 delated the single party in politics and adopted the rule of democracy and plurality in political parties. It was underlined by the Britannica that, after the adoption of new law in the 1991 constitution political parties revived from WW II come back in activity after this new adoption of law (Britannica, 2022). Security and peace process was not that easy in Romania before it joined NATO in 2004, even before its acceptance as member of NATO Romania seem to be the first Eastern Europe state to join the North Atlantic Treaty Organization (Britannica, 2022). It was argue that the *military force of Romania played an important role in Afghanistan in 2002 where they was representing international security assistance*, confirmed by the Britannica. The body of Romania security is under control of the Ministry of Administration and Interior (MAI). Three divided groups NPF, NG, and BPF form police force.²⁰

3.1.2.1. Record of event in Romania outline

The time line of Romania profile from its path to EU until now was collected from the BBC news channels in comparison with the Romanian official web and EU reports (BBC, 2022), (Romania-Insider, 2022).

Right way to EU membership

On his way to EU membership in 2004 Romania joined NATO, the presidency of Trian Basescu voted in 2004, Ally Calin Tariceanu took power of prime ministry with plan of stimulating EU oriented changes. In 2005, Romania adopted EU joining treaty (European Union law, 2021).

Full member ship

Romania joined the EU in 2007; this period was characterized by several changes in Romania politic along with the EC notification over Romania prominent corruption in 2008 (CSIS, 2021). The financial crisis in Romania pushed the IMF to fund a package of 20 billion euros to redeem Romania's situation (The New York Times, 2022).

²⁰ **NPF:** National Police Force

NG: National Gendarmerie (Military branch of the National police)

BPF: Border Police Force

Other political events over time

Here are some political events that took place between 2012 and 2020. In 2012, the government started confrontation over self-denial and corruption and the push of Victor Ponta on the rule of prime ministry (Leaders Mag, 2022). The out pointed event of 2015 was the resign of Victor Ponta in his previous position after the misconduct that resulted in died of citizens in fire (Chandler, 2015). In 2016, NATO installed a system of defense in the views of Russian opposition (NATO, 2022). The first political event of 2017 was the formation of government by social democrats after the win of December 2016 election and the posttest over government due on corruption process. It was remarked that since the change of political structure in Romania from the communist regime in 1989 the huge demonstration was manifested in 2017 (DW, 2022). 2019 was remarked by the misplace of social democracy that given priority to Centrist Ludovic Orban on the place of prime minister, one year later the defense minister become prime minister in action at the place of Orban (Balkan Insight, 2022).

3.2. CHALLENGES

3.2.1. Copenhagen Criteria

As required to all country that apply membership to the EU, Romania faced the challenge of completing the Copenhagen criteria while starting it road to the EU. At this act, Romania played important role of dealing with the EU requirement. Romania was challenged by establishing an institution of dealing with democracy, implementation of law, promoting human rights and protecting minorities (OECD, 2022). With the work toward integration to EU Romania's incapability on facing integration, criteria seem to result on the delay of Roman to being accepted in the European Union member states.

3.2.2. Socio-economic

After the full membership of Romania there, have been a break out of migration in Romania changes the social status of the country and promoted the fair of EU member states to do not react directly on the issues of Romania. These issues contributed in border instability between EU countries (MPI, 2022). It was underlined that a big number of immigrant who moved from a region to region were under search of labour, in social case one of the most remarked challenge of Romania was of dealing with the decreasing of number of unemployment. Rebuilt economy of Romania was observed as main challenge of the country

in completing the criteria of integration, even the government tried why high stage in pushing national economy the reality of corruption seem to increase and pushed the late of country's opportunity to integrate (Statista, 2022). Challenges faced by Romania toward EU membership were characterized by the scarcity of economy and social structure, from its way to EU integration the country worked hard in promoting the power of stability and complete all needs from the EU. Away from challenges faced by Romania toward EU, the ongoing situation of Romania demonstrate that as all country in globe are suffering from global crisis resulted from the Pandemic Covid-19, at the same level Romania is surviving that challenges (ITA, 2021).

3.2.3. Current important issues that Romania is facing

Source: Statista 2022. <https://www.statista.com/statistics/1109873/challenges-romania/>

CONCLUSION

Starting from the full membership of Romania in EU, the relation of the two actors seem fruitful due on the policies of EU toward member states and the contribution of Romania in the EU. A back analyses of the collected data demonstrated that the EU did not give that much priority on Romania integration due on several challenges faced the country as determined in the timeline. Even Roman applied to join the organization since long time, being out of those states that joined the organization in 2004 displayed how Romania was not that much attractive in the join of the organization at same case of Bulgaria. The join of Romania was not easy

depend on that the country was not eligible to complete all the required criteria case of Copenhagen.

The relation of EU and Romania was founded under the EU member states policies toward development and welfare of EU people. Out relation based in organization, Romania has a strong relation with other EU member states due on its power of energy supply. The development of industry in Romanian promoted the increase of bilateral relation between the EU and Romania. With its strong cooperation and integration to EU Romania upsized it economy globally and pushed the change of social structure of the region. The relation between EU and Romania seem to resize the case in racism in the countries and promoted much social development in the region, at the sometime Romania faced several problem before even after its full membership in the region. Even the relation of Romania and EU appeared in several aspect of development still Romania is facing much many challenges. The most important challenges that is facing Romania are at the top al all there are Heath problems, economic instability followed by the rise of price influenced by inflation. At other side education, system, housing, and environment are underlined in the list of the post important issues of that are facing the country.

In conclusion, the two actor's relation is built under the EU's membership relation followed by the regional influence that are resulted from geopolitical aspect of Romania and the European Union. Even Romania faced more challenges toward EU integration his participation in the intergovernmental organotin displayed this good will in the road of development and cooperation.

**FRANSIZCA ÖĞRETİM YÖNTEMLERİNDE DERS KİTABI ETKİNLİKLERİNİN
EVRİMİ**

Dr. Öğretim Üyesi Can Denizci (Orcid ID: 0000-0003-3759-3359)

Dokuz Eylül Üniversitesi, Buca Eğitim Fakültesi, Fransız Dili Eğitimi Anabilim Dalı, İzmir
can.denizci@deu.edu.tr

ÖZET

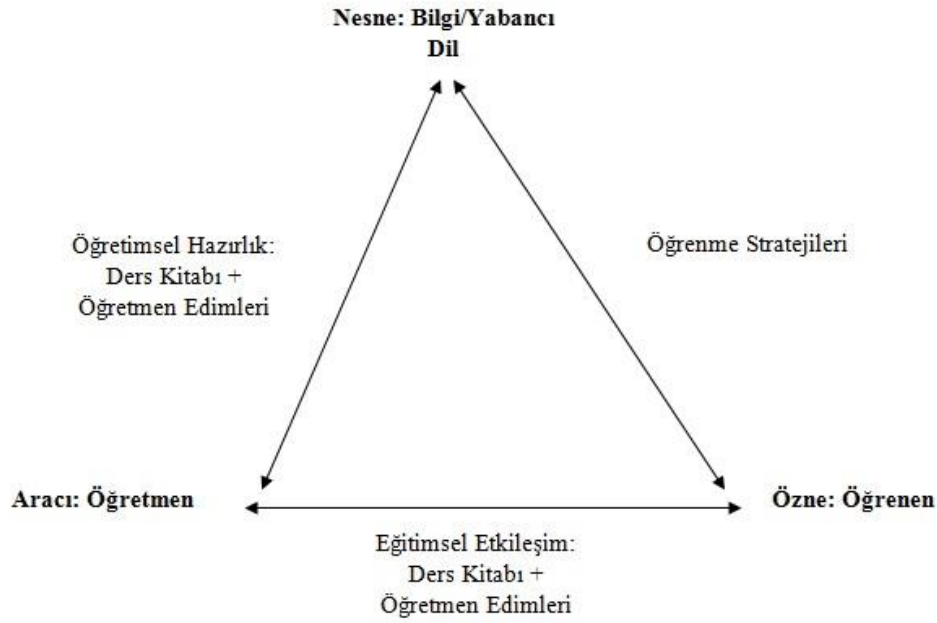

Bu çalışmanın amacı, çok ögeli bir dizge arz eden Fransızca öğretiminde ders kitabı etkinliklerinin, yani kuramsal içerik ile alıştırmaların geçirdiği evrimi irdelemektir. Bahsi geçen evrimi irdelerken ilk olarak yabancı dil öğretiminin, özellikle dilbilim ve ruhbilim gibi rehber teşkil eden alanlardan etkilenerek geçirdiği tarihsel dönüşüm dikkate alınmıştır; bu bağlamda dil odaklı, bildirişim yetisi odaklı ve güncel olarak da daha seçmeci bir özellik gösteren eylem odaklı aşamalar gözlemlenmektedir. Daha sonrasında ise Fransızca öğretimi bağlamında önemli yer tuttuğu düşünülen ders kitapları, belge çözümleme yöntemiyle nitel olarak irdelenmiştir. Fransızca öğretiminin değerler dizisinde kuram ile uygulama arasında köprü görevi gören ders kitaplarındaki etkinliklerin evrimine bakıldığında şu bulgulara rastlanmıştır: Dil yetisinin giderek yerini bildirişim yetisine bıraktığı süreçte, çeviri tamamen bir kenara bırakılmış; dilbilgisinin önemi önce azalmış, sonra artmıştır. İkinci olarak ise sözlü dil kullanımı daha çok vurgulanmaya başlanmıştır. Daha güncel yöntemlerde bildirişime ve dil kullanımı yoluyla gerçekleştirilen gerçek eylemlere yönelik etkinlikler artmıştır. Kültür aktarımında güncel öğeler ön plana çıkartılmıştır. Kitaplardaki görsellik zenginleşmiş ve eğitsel içeriğin özgün belgelerle aktarımı yaygınlaşmıştır. Sonuçta, günümüzde Fransızca ders kitabı etkinliklerinin yöntemli ve ilkeli bir seçmecilikle oluşturulduğu bulgulanmıştır.

Anahtar Sözcükler: Fransız dili, yöntem, ders kitabı, bildirişimsel yaklaşım, eylem-etkinlik yaklaşımı

GİRİŞ

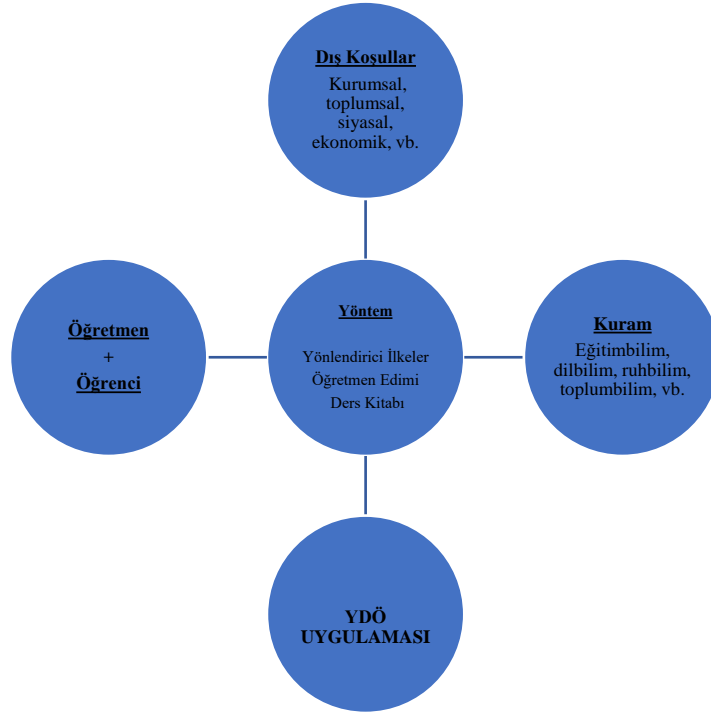

Bu çalışmada, Fransızca öğretimi ders kitaplarında bulunan dilsel ve/ya da bildirişimsel alıştırmalar/etkinliklerin değişimi, yabancı dil öğretimi (YDÖ) yöntemlerinin evrimi ışığında ele alınacaktır. YDÖ'nün disiplinlerarası bir alan olduğu; özellikle, eğitimbilim (ki kendi de karma bir alan arz etmektedir), dilbilim, toplumbilim ve de ruhbilim gibi rehber teşkil eden alanların kesişim noktasında konuşulduğu öne sürülebilir. Ancak, nesnesi olan yabancı dilleri belli bir yöntemle aktarması ve kendine has terimler ortaya koyması hesaba katıldığında, YDÖ'nün bilgi kuramı açısından (bknz. Piaget, 1970) bir bilim olduğu da belirtilebilir. YDÖ'nün değerler dizisi düşünüldüğünde ise alanın siyasal/ekonomik/toplumsal dış etmenlerle yukarıda bahsi geçen rehber alanlardan etkilendiği, sonrasında ise kendi kuramını ve uygulamasını oluşturduğu anlaşılmalıdır. Bunun en belirgin örneklerinden biri şudur: 2. Dünya Savaşı'nın ortamında müttefik güçlerinin askerlerinin hızlıca Almanca öğrenme gereksinimi doğduğundan, ABD'de davranışçılığın savunucularından Burrhus Frederic Skinner'ın ruhbilimsel uygulamaları ve Leonard Bloomfield'in dağılımcı yapısalcılığı bir potada eritilerek *Ordu Yöntemi* adı da verilen *İşitsel-Sözel Yöntem (méthode audio-orale)* ortaya çıkmıştır; yani, dilbilim ve ruhbilim harmanlanarak YDÖ bağlamında tutarlı bir yöntem ortaya konulmuştur (Germain, 1993).

YDÖ'yü ister disiplinlerarası ortak bir alan, ister salt bir bilim olarak düşünelim, öncelikle Hameline'in (1985) *eğitimbilimsel üçgenini* ele almalıyız; burada üç temel bileşen olan *nesne*, *özne* ve *aracı*, YDÖ'de sırasıyla *yabancı dil*, *öğrenen/öğrenci/dil kullanıcısı* ve *öğretmen/eğitmen* tarafından temsil edilmektedir (aktaran Pastiaux & Pastiaux, 2011, s. 7). Üçgende (bknz. Şekil 1) her bir bileşenin arasındaki bağıntılar irdelendiğinde, ilkin öğretmenin ders öncesi hazırlığı, yani öğretimsel hazırlık (*élaboration didactique*) söz konusudur; öğretmen ders öncesinde anlatım, tekrar, açıklama, tanımlama, beden dili, ders kitabı, diğer ders materyalleri vb. (bknz. Cicurel, 2011) sözlü/sözlü dil dışı stratejilerini ve/ya da edimlerini planlamakta, belirlemekte ve çalışmaktadır. Öğretmen, öğrenciyle arasındaki eğitimsel etkileşim (*relation pédagogique*) bağlamında bu stratejileri ve edimleri sınıfta uygulamaktadır; öğrenci ise bilişsel, duyuşsal ve toplumsal-etkileşimsel-kültürel öğrenme stratejilerini (bknz. Oxford, 2011) kullanarak yabancı dili öğrenmeye çalışmaktadır.

Şekil 1. Eğitimsel Üçgenin YDÖ'deki Belirginliği

Dolayısıyla, YDÖ'nün değerler dizisi, temelde, rehber alanlardaki kuramların şekillendirdiği yöntem ve yöntemin sınıfta uygulanması etrafında oluşmaktadır; bu dizideki değişkenler ise *öğrenci*, *öğretmen*, *kuram*, *yöntem* ve *dış koşullar* olarak görülebilir (bkz. Şekil 2). Bu çalışmanın temel amacı da, kuramsal alanın tetiklediği yöntem ve uygulama değişkenlerinin bir parçası olan Fransızca ders kitaplarındaki etkinliklerin evriminin incelenmesidir. Burada, *yöntem* kavramının kapsamına, rehber teşkil eden kuramsal alanlardaki ilkesel yönelimler (yani, dil anlayışı ve öğrenme anlayışı bağlamında örneğin, dilbilimde işlevselcilik ya da ruhbilimde bilişsellik), öğretmenin sınıfta Fransızca öğretmek için seçtiği ve/ya da izlediği yol-yordam (yani, öğretim anlayışı bağlamında gerçekleştirilen edimler ve dersin aşamaları) ve de bir ürün olarak ders kitapları girmektedir (bkz. Germain, 1993). Kaldı ki, Fransızca ders kitapları bir dönem (özellikle 1970'li ve 1980'li yıllarda) *Fransızca Öğretim Yöntemi* alt başlığıyla basılmışlardır. Yani, Fransız alanyazınında yöntem kavramı çok anlamlıdır. Bu çalışmada ise yöntem ve ders kitabı Anglosakson alanyazından esinlenilerek ayrı terimler olarak kabul edilecektir.

Şekil 2. YDÖ'deki Değerler Dizisi

YDÖ'nün evrimi göz önünde bulundurulduğunda, üç temel aşama saptanmaktadır: *dil yetisi odaklı dönem*, *bildirişim yetisi odaklı dönem* ve *eylem odaklı dönem*; kullanım sıklığı ve belirginlik/önem etmenlerini hesaba katarak (bu çalışmada ders kitapları etkinlikleri ekseninde) *Dilbilgisi-Çeviri Yöntemi*, *Doğal Yöntem*, *İşitsel-Sözel Yöntem*, *İşitsel-Görsel Yöntem*, *Bildirişimsel Yaklaşım* ve *Eylem-Etkinlik Yaklaşımı* gibi YDÖ yöntemlerini/yaklaşımlarını alanyazından derleyerek kısaca irdelleyelim (Puren, 1988/2012; Germain, 1993; Martinez, 1996; Seara Rodriguez, 2001; Cuq, 2003; Tagliante, 2006; Bertocchini & Costanzo, 2008; Cuq & Gruca, 2017):

- *Dilbilgisi-Çeviri Yöntemi* (*méthode grammaire-traduction*, DÇ ya da *méthode traditionnelle/classique*, *Geleneksel/Klasik Yöntem*) salt dil yetisine odaklı bir yöntemdir. Rönesans sırasında din adamlarına Latincenin ve Yunancanın yabancı dil olarak öğretilmesini örnekçe olarak alan ve 20. yüzyıla kadar geçerli olan bu yöntemin temel belirginlikleri arasında okuma-yazma becerileri, dilbilgisi ve çeviri bulunmaktadır. Yabancı dil öğrenme, DÇ'de entelektüellik ve kültür göstergesi olarak (zihinsel bir etkinlik olarak) görülmektedir; sınıf etkinliklerinde dilbilgisi konularına bağlı olarak bildirişimsel bir durum arz etmeyen, bağlamdan soyutlanmış tümceler (ya da ilerleyen aşamalarda yazınsal/dinsel/felsefî metinler) anadilden yabancı dile, sonra da yabancı dilden anadile çevrilmektedir. Dilbilgisi kuralları tümdengelimle ve açık olarak kurdan örneğe doğru ilerlenerek aktarılmaktadır. Sözlü bildirişime önem verilmemekte ve anadil sınıf etkinliklerinde kullanılabilir. Sözlü bildirişime önem verilmemekte ve anadil sınıf etkinliklerinde kullanılabilir.

- Bildirişim yetisi odaklı aşamanın, sözlü dilin kullanımına önem veren *Doğal Yöntem* (*méthode directe*, DY) ile başladığı ileri sürülebilir. Kökleri 16. yüzyıla dayanan (Örneğin, ünlü Fransız felsefeci Montaigne, Almancayı ve Latinceyi bu yöntemle öğrenmiştir.) ve 19. yüzyılın sonları ile 20. yüzyılın ilk yarısında özellikle Almanya ve Fransa’da geçerli olan DY’de, anadilin çocuk tarafından doğal bir biçimde öğrenilmesi örnekçe olarak alınmış ve bu örnekçe, YDÖ’ye uyarlanmıştır; öğrenci, doğrudan yabancı dilde düşünmesi için teşvik edilmektedir. DY’deki dil anlayışına göre amaç yabancı dilde sözlü bildirişimdir. Sınıf etkinliklerinde anadil kullanımı yasaktır ve dilbilgisi, tümevarımla örtük bir biçimde (yani örnekten kuralı sezdirecek biçimde) aktarılmaktadır. Öğrenim-öğretim anlayışı bakımından ise dildışı içerik ile dilsel biçim, çağrışımçılık (*associationnisme*) ilkelerine göre eşleştirilmektedir. Öğretimde izlenen yol ise ilkin ders içeriklerinin çeşitli bildirişimsel temalar etrafında oluşturulmasıdır; ikinci olarak ise dildışı içerik resimler, nesnelere, el-kol devinimleri ve yüz ifadeleri aracılığıyla sözcüklerle eşleştirilmekte ve öğrencinin, sözcükleri tümce içinde kullanması sağlanmaktadır. Sınıf alıştırmaları arasında soru-yanıt, serbest söyleşi, boşluk doldurma, yazdırma (*dictée*) ve yazılı çalışmalar (*composition/rédaction*) bulunmaktadır.
- 1940’lı yıllarda ABD’de ortaya çıkan *İşitsel-Sözel Yöntem*’de (*méthode audio-orale*, İSY) amaç, yabancı dili o dilin konuşucusu kadar iyi bir söyleyişle (*accent*) konuşabilecek kişiler yetiştirmektir; dolayısıyla sözlü bildirişim ve özellikle de konuşma birincil öncelik arz etmektedir. Öğrenme anlayışı davranışçı ruhbilimden, dil anlayışı ise dağılımcı yapısalcılıktan esinlenmektedir. YDÖ’de belirlenen yol, sınıf etkinlikleri bağlamında şudur: Davranışçılığa özgü uyaran-tepki ikili karşıtlığından yola çıkarak dildeki biçimsel-sözdizimsel kalıplar (*cadres morphosyntaxiques*) ya da dilbilgisel kurallar, dağılımcılık (*distributionnalisme*) ilkesine göre öğretilmektedir. Ferdinand de Saussure yapısalcılığının Amerikan sürümü olan dağılımcılıkta, sözcük türleri, sözcük dizilimleri (yani, sözcüklerin tümcede hangi konumda bulunduğu) ve sözcüklerin tümcede uğradığı biçimsel değişimler (ekler vb.) önem kazanmaktadır; *dağılım* kavramı bir sözcüğün tümcede yer alabileceği dilsel konumlara (hangi sözcük türüyle yan yana gelebileceği, hangi ekleri alabileceği, hangi anlamsal işlevlere sahip olduğu, hangi sözcüklerle karşıtlık içinde olduğu vb.) göndermede bulunur (bknz. Schott-Bourget, 1994). İSY, dil laboratuvarlarında dilsel kalıpların uyaran (soru)-tepki (yanıt)-pekiştirme (tekrar) yöntemiyle, yani aşırı tekrar yoluyla öğrenilmesini ve otomatikleştirilmesini salık vermektedir. Laboratuvarda yapılan alıştırmaya ya da etkinliklere *yapısal alıştırma* (*exercice structural*) adı verilmiştir. Yapıya/biçime aşırı önem vererek anlamı geri plana atan ve karşı anlıkçı (*anti-mentaliste*) bir yaklaşım sergileyen İSY daha sonraları Noam Chomsky gibi, dildeki anlam boyutuna ve dil

kullanımındaki bilişsel özelliğe dikkat çeken dilbilimciler tarafından eleştirilmiştir. Yapısal alıştırma türlerine ise *Araştırma ve Bulgular* bölümünde değinilecektir.

- İSY'nin bir türevi olarak görülebilecek *İşitsel-Görsel Yöntem*'in (*méthode audiovisuelle*, İGY) kuramsal temelleri 1950'li yıllarda Petar Guberina (Zagreb) ve Paul Rivenc (Fransa) tarafından ortaya atılmıştır. Gündelik konuşmalardan yola çıkılarak Fransızca öğreniminin başlangıç seviyesine yönelik 1475 sözcükten oluşan ve *Temel Fransızca (français fondamental)* adı verilen bir bütüncü oluşturularak eğitsel içerik hazırlanmıştır. İGY, öğrenme ve dil kuramları bağlamında yapıscılık, çağrışımıcılık ve *gestalt* gibi (herhangi bir biçimin bütünsel olarak algılanıp bileşenlerinin beyin tarafından daha sonra süzgeçten geçirildiğini savunan anlayış) akımlardan etkilenmiştir. *Gestalt* (biçim) bağlamında, dilsel yapılar bir bütün olarak öğretilmelidir; örneğin, bir metinde sözcüklerin tek tek önemi yoktur, önemli olan, metnin bütünündeki genel anlamdır. Diğer bir deyişle, dilsel öğeler kapsamlı olarak aktarılmalıdır; yani dilbilgisi, söz varlığı ve söyleyiş bilgisinin yanında titreleme (*intonation*) ya da vurgulama gibi bürünsel (*prosodique*) olgular ile el-kol devinimi ya da yüz ifadesi gibi sözlü dil dışı öğeler de öğrenim-öğretim sürecine katılmalıdır. Öte yandan, öğrenci yalnızca dilsel öğrenme stratejilerini değil, aynı zamanda duyuşsal (*affectif*), etkileşimsel ve ruhsal temeldeki becerilerini de devreye sokmalıdır. Bu nedenle, İSY'nin YDÖ'deki yaklaşımı yapısal-bütünsel (*structuro-global*) olarak nitelendirilmektedir. Son olarak ise eğitsel içerikle ilgili etkinlikler (ders konusunun diyaloglar aracılığıyla tanıtımı ve soru-yanıttan oluşan alıştırma) ses ile görselliğin harmanlandığı bir süreç arz eder; öğrenci yabancı dili anlayabilmek için ses ile imge arasında eşleştirme yapmalıdır. Ancak, bu yöntemde sözlü dile çok fazla önem verilmesi (özellikle, diyaloglardaki kalıpların ezberletilmesi ve söyleyiş üzerinde fazlaca durulması), örneğin dilbilgisi gibi örtük olarak aktarılan alanlara ilişkin becerilerin gelişimini geciktirmektedir; aslında, İSY'ye getirilen eleştirilerden biri de budur.
- 1980'li yıllarda YDÖ'nün değerler dizisinde daha köklü bir değişim yaşanarak ortaya *Bildirişimsel Yaklaşım (approche communicative, BY)* çıkmıştır. 1990'lı yıllara da damgasını vuran bu yöntem yaklaşım adının verilmesi boşuna değildir; öncelikle, teknolojik gelişmelerin ışığında ders kitabı setlerine kasetlerin ve daha sonra CD'lerin eklendiğini; sınıf ortamına kişisel bilgisayarların yavaş yavaş girmeye başladığını görmekteyiz. Öte yandan, öğrenme-dil anlayışı bağlamında ruhbilim, toplumdilbilim, edimbilim ile dil felsefesinin kavşağında bulunan ve seçmeci bir özellik arz eden BY'nin en büyük belirginliği, YDÖ ortamında tamamen bildirişim odaklı ders kitaplarının ve öğretmen edimlerinin tasarlanması ve uygulanmasıdır. Yöntemin çıkış noktasında Amerikalı toplumdilbilimci Dell Hymes'in 1972 yılında *dilsel kalıpları toplumsal bağlama göre kullanabilme* olarak tanımladığı *bildirişimsel yeti* kavramı bulunmaktadır. Bu bağlamda, Hymes, Noam Chomsky tarafından düşüncenin anlatımı

olarak kavramsallaştırılan dil olgusuna karşı çıkar; çünkü dil öncelikle bir sözlü bildirişim aracıdır. Öte yandan, dil felsefesinde İngiliz dilbilimci John Langshaw Austin'in (1962/1970) ortaya attığı *dil/söz edimi* kavramının, yani dil yoluyla gerçekleştirilen örtük/açık edimler/eylemlerin de BY üzerinde etkisi olmuştur; öyle ki ders kitaplarındaki ünite ve dersler dil edimlerinin, yani kolaydan zora doğru dilsel işlevlerin (örneğin, kendini tanıtmak, biriyle tanışma, rica etme, bilgi verme/alma, yakın çevresini betimleme, gerekçelendirme yapma, tavsiye verme, uyarıda bulunma, emir verme vb.) etrafında oluşturulmaya başlanmıştır. Günümüzde de ders kazanımları/işlevleri, ders kitaplarındaki ünitelerin ya da konuların başında tanımlanmaktadır. Sonuçta, BY'nin anlayışına göre, dil konuşucusu herhangi bir dili belli bir bildirişimsel niyetle (ki bunu dil edimi ya da işlevi olarak okuyabiliriz) ve belli bir bildirişimsel bağlamda kullanmaktadır; dolayısıyla, dil kullanımında dilsel biçimler ile içeriği toplumsal bağlama ya da bildirişimsel duruma uyarlamalıdır. Buradaki öğrenme anlayışı Rus ruhbilimci Lev Vigostki'nin toplumbilişsellğine (*socio-cognitivism*) dayanmaktadır; yani, dil öğrenen birey bilişsel işlemler yapmakta; öte yandan da, hem fiziksel hem de toplumsal çevreyle etkileşmektedir. BY Fransızca öğretimi bağlamında günümüzde yaygın kullanılan bir yöntemdir. BY'nin diğer belirginlikleri şunlardır:

- i. Öğrenene odaklılık ve öğrenenin gereksinimleri temeldir; bu nedenle, farklı gruplara farklı ders içerikleri sunulmalıdır (örneğin, genel Fransızca, turizm Fransızcası, özel Fransızca vb.).
- ii. Bildirişimsel yeti kapsamlıdır; bu yeti, dil yetisinin dışında dilin kullanımına ve genel kültüre yönelik bilgi-becerileri de kapsamaktadır.
- iii. Dilbilgisi öğretimi temelde örtük (kimi zaman açık) ve işlevseldir; belli bir metinden ya da ses diyalogdan yola çıkılarak dil kuralları toplumsal bağlam içerisinde öğrenciye sezdirilir. Bununla birlikte, BY sergileyen Fransızca ders kitaplarının özellikle ünite sonlarında dilbilgisi kurallarının tündengelimli ve açık olarak aktarıldığı özetleyici kısımlar da (*bilan*) mevcuttur. Diğer bir seçenek olarak da Fransızca öğretmeni, yardımcı ders notlarıyla ya da ders anlatımlarıyla dilbilgisel noktaları öğrencide sağlamlaştırabilir.
- iv. Ders kitaplarında yazınsal metinler, kurgusal diyaloglar, elle yapılan çizimler ya da bağlamdan kopuk fotoğraflar yerine, gerçek bir bildirişim durumu arz eden ve daha çok gündelik yaşama ilişkin *özgün belgeler* (gerçek gazete haberleri, kaza tutanakları, mektuplar, dilekçeler vb.) kullanılmaya başlanmıştır. Daha önceki yöntemlerde de özgün belgelere kimi zaman yer verilmiştir; oysa BY özgün belgeleri daha düzenli ve hedefli olarak kullanmıştır. Özgün belgeler sonuçta gerçek bildirişimsel durumları yansıtmaktadır ve aslen eğitsel

nedenlerle üretilmemiştir. Ancak, kimi BY ders kitaplarında gerçek fotoğraflarla aktarılan kurgusal diyaloglar da (fotoroman benzeri) bulunmaktadır.

- v. Sınıfta konuşma-yazma becerileri bağlamında gerçekleştirilen bildirişimsel etkinlikler ise kurgusal karakterlidir; BY’de öğrencilerin bildirişim yetilerini geliştirmek için *benzetime (simulation)* ve kurgusal rollere dayalı *canlandırmalara (jeu de rôle)* başvurulmuştur. Örneğin, alışverişe dayalı bir ders içeriğinin açıklanması ve çalışılmasından sonra iki öğrencinin tahtaya çıkartılarak birine satıcı diğerine alıcı rolleri atanıp öğrencilerin birbiriyle diyalog kurmaları BY’nin tipik canlandırma etkinliklerinden biridir.
- 2000’li yıllara doğru Avrupa Konseyi *Avrupa Dilleri İçin Ortak Başvuru Metni*’ni (Conseil de l’Europe, 1998/2001/2005) yayımlayarak YDÖ’nün siyasasına ve eğitsel içeriğine yönelik bir rehber yapıtı oluşturmuştur. Bahsi geçen yapıtta önerilen YDÖ yöntemi *Eylem-Etkinlik Yaklaşımı*’dır (*Perspective Actionnelle*, EEY). Puren’in (2019) de belirttiği üzere, BY’nin bir devamı ya da türevi olarak görülebilecek olan EEY’nin YDÖ’deki en büyük belirginliği, gerçek bildirişim durumları arz eden dilsel-bildirişimsel-kültürel çalışmaların, yani eylem-etkinliklerin (*tâche*) sınıf ortamında ve ders kitaplarında yer almasıdır. Adından da anlaşılacağı üzere, eylem-etkinlik dâhilinde yabancı dil öğrenenler, birer toplumsal aktör olarak birtakım gerçek eylemlere girişirler (BY’deki kurgusal etkinliklerin tersine); bu eylemlerde dilsel, bildirişimsel ve/ya da kültürel bilgi-beceriler harekete geçirilir (Conseil de l’Europe, 1998/2001/2005). Fransızca olarak gerçekleştirilecek eylem-etkinliklere örnek olarak okul gazetesi çıkartma, okul radyosunda yayın yapma, yabancı turistleri gezdirme, sınıfta öğrencinin doğum gününü kutlama, şiir yarışmasına katılma, güncel bir konu hakkında araştırma yapıp sınıfta sunum yapma, internet sitesi kurma, video çekip bir kanaldan yayımlama vb. gösterilebilir. Bu türden, kurgusal olmayıp gerçek olan etkinlikler birçok beceriyi aynı anda harekete geçirerek öğrencinin dili ve diğer becerilerini gerçek toplumsal bağlamda kullanmasını sağlamaktadır. EEY’de ayrıca çok dillilik, çok kültürlülük, öğrenme özerkliği ve özdeğerlendirme gibi kavramlar da ön plana çıkartılmaktadır.

Temel YDÖ yöntem ve yaklaşımlarını tartıştıktan sonra özellikle Anglosakson alanyazında büyük tartışma yaratan *yöntem sonrası dönem* kavramına değinmek gerekmektedir. Dick Alwright 1991 yılında *Death of the Method (Yöntem Kavramının Ölümü)* başlıklı bir seminer vermiş; öğrenci gereksinimi, öğrenci bilişselliği (örneğin farklı öğrenme biçimleri, stratejileri vb.) ve bağlam gibi değişkenleri dikkate almayarak yabancı dil sınıfının her bir bireyine aynı yöntemle yabancı dil öğretmeye çabalayan yöntem odaklı dönemi eleştirmiştir (aktaran Thornbury, 2020). Buna bağlı olarak alternatif bir yöntemden ziyade, yöntem kavramının kendine bir alternatif aranmakta olsa da, yöntemsizlik değil, daha çok ilkeli ve tutarlı bir seçmecilik ya da uygulama ortaya konulması amaçlanmıştır; öğrenci gereksinimi ve özerkliği

gözetilerek uygulamadan hareketle yöntemin oluşturulması, yöntemin baştan dayatılmaması gerektiği görüşü ağır basmıştır (Kumaravadivelu, 2003, 2006).

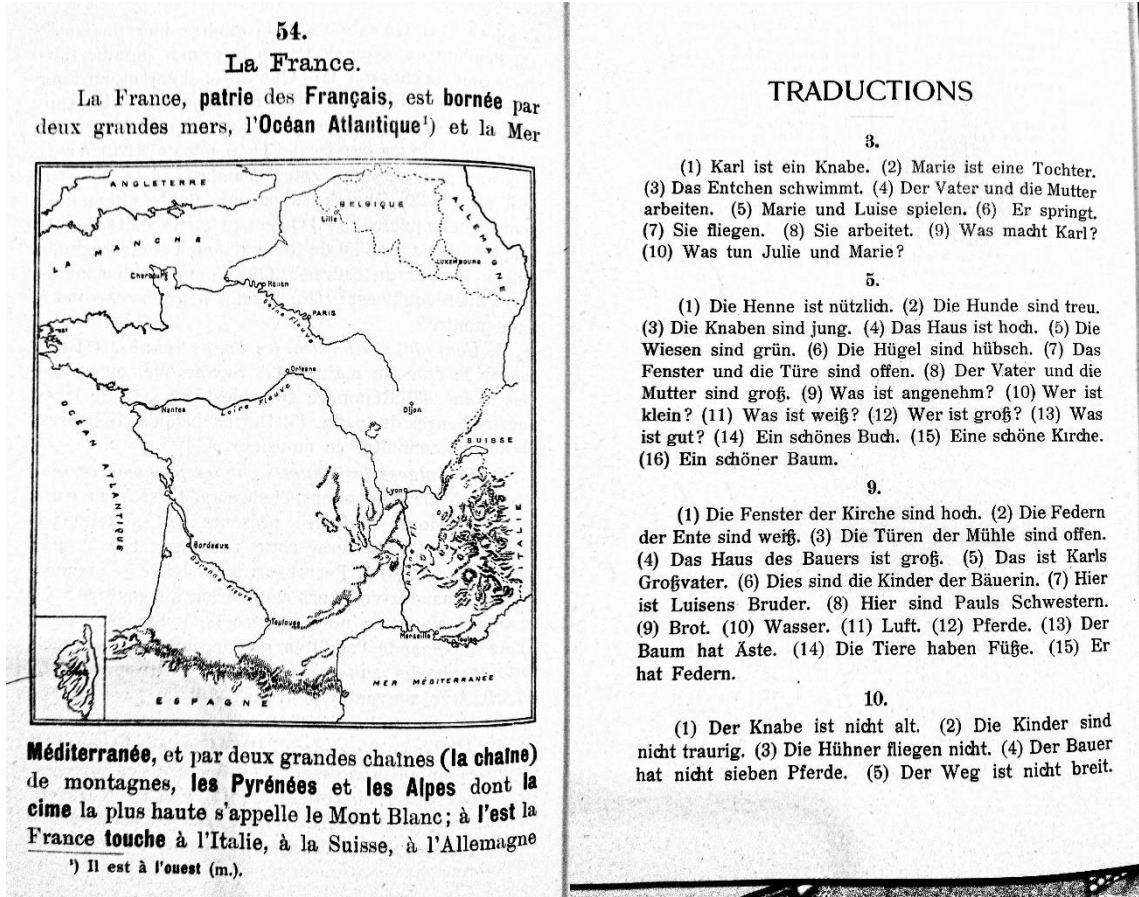

Hiç kuşkusuz, aynı yöntemle yabancı dil öğrenen bireyler, birçok değişken hesaba katıldığında, farklı sonuçlar alacaklardır; öte yandan, öğrenci odaklılık ve gereksinimleri YDÖ’de asıl amaç olmalıdır. YDÖ’de tutarlı ve ilkeli bir biçimde farklı yöntemlerin en etkili öğeleri seçmeci bir yaklaşımla harmanlanabilir; öğrenci çeşitliliği de gözetilerek öğretmenler farklı kaynaklardan, yöntemlerden ve alanlardan yararlanarak kendi yöntemlerini, öğrenci gereksinimlerini de hesaba katarak oluşturabilirler. Ancak, unutulmamalıdır ki YDÖ yöntemlerinin evrimine bakıldığında, toplumsal/teknolojik gereksinimler/değişimler ışığında her bir yöntem, bir önceki yöntemin getirilerinin üzerine fazladan katkı sunmayı amaçlamıştır. Bu bağlamda belli bir tutarlılık ve süreklilikten bahsedilebilir. Aynı şekilde, hiçbir yöntem mükemmel olmadığından, kuram-yöntem-uygulama üçlüsünün her bir bileşeni birbiriyle sürekli etkileşimde olmalı ve birbirini beslemelidir. Kuramsal temelin ya da belli bir yöntemin olmadığı, keyfi ya da rastlantısal uygulamalar başarısız olacaktır; öte yandan, uygulamanın elde ettiği sonuçları önemsemeyen kuram ya da yöntemler de güdük, soyut ve gereksiz olacaktır.

ARAŞTIRMA VE BULGULAR

Çalışmanın sorunsalı olan Fransızca ders kitaplarında etkinliklerin evrimini irdelemek için kullanılan yöntem, nitel belge çözümlemesidir (Merriam, 2009). Burada etkinlikten kastedilen, hem kuramsal içerik hem de içerik etrafında oluşturulmuş dilsel-bildirişimsel alıştırmalardır. Öte yandan, Fransızca ders kitaplarını seçerken erişilebilirlik temel alınmış, herhangi bir yöntemi en çok temsil ettiği düşünülen kitaplar seçilmeye çalışılmış ve belli bir dil düzeyi gözetilmemiştir.

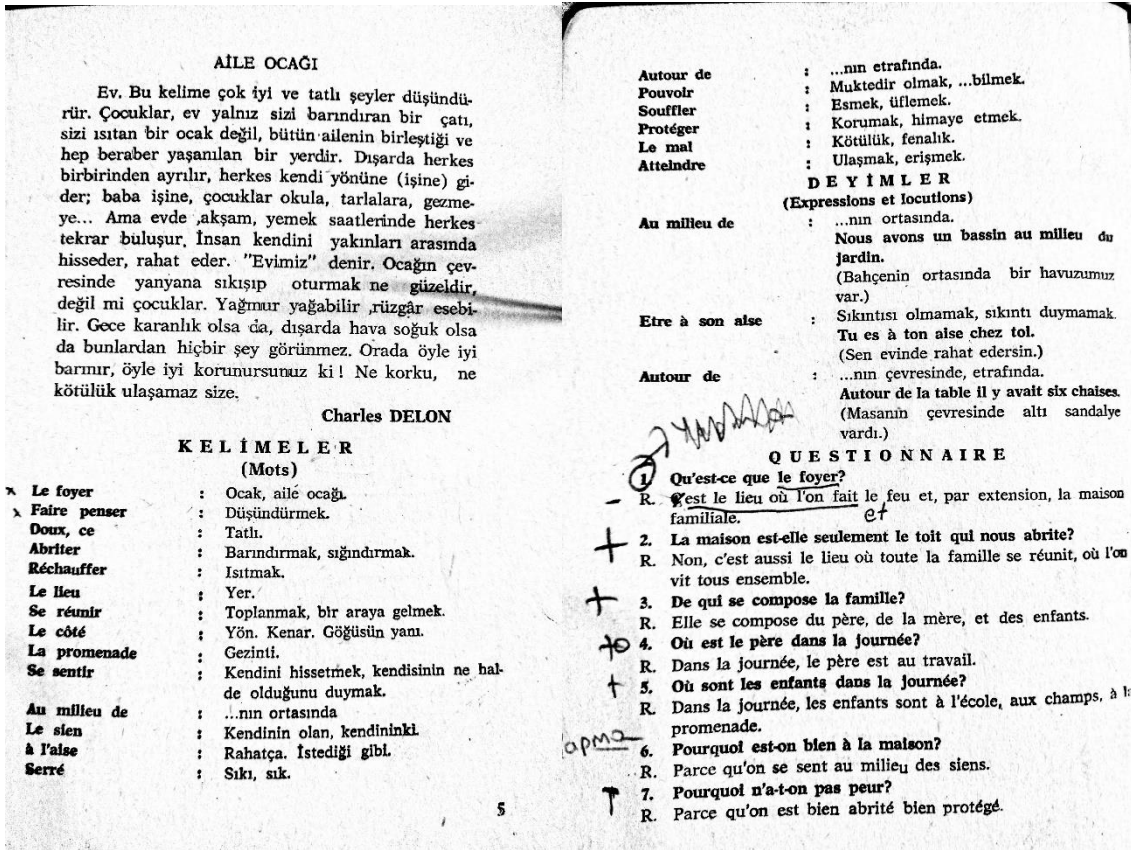

DÇ yöntemi özellikle 20. yüzyılın ilk yarısında Fransızca öğretiminde yer bulmuştur. DÇ çerçevesinde en önemli kitaplardan biri *Méthode Alge: Nouvelles Leçons de Français*’dir (Alge & Ripman, 1927). İsviçre’de Almanca bilen topluluğun Fransızca öğrenmesine yönelik olarak hazırlanmış kitapta (ilk 2 yıllık Fransızca öğretimi bağlamında), Şekil 3’te de görüldüğü üzere, dilbilgisi tümdengelimle ve açık bir biçimde verilmektedir; söz varlığı (*vocabulaire*) aktarımı, kitap sonunda Fransızcadan Almancaya çeviri yöntemiyle desteklenmektedir. Alıştırma türleri tamamen dil odaklı olup dilbilgisi ve söyleyiş bilgisini ön plana çıkartmaktadır; amaç sözcüklerin dilbilgisi dâhilinde öğretilmesidir. Alıştırmalarda basit soru-yanıtlar, değiştirim (örneğin, adın yerine adıl koyma) çalışmaları ve okuma-sesletme çalışmaları yer almaktadır. Başlangıçta daha kısa, ilerleyen aşamalarda daha uzun metinlerle ders içerikleri öğretilmektedir. Görsellik bağlamında ise kitapta yalnızca Fransa haritası bulunmaktadır; bu bağlamda, Galisson’un (2000) *gündelik kültür/yüksek kültür* (uygarlık) ayrımına göndermede bulunursak, kültür aktarımı denilince, DÇ’ye has bir biçimde, yalnızca tarihte yer etmiş kültür öğeleri; yani uygarlık öğeleri anlaşılmalıdır. Bu seçkinci kültür aktarımı anlayışı ilerleyen yöntemlerle birlikte yerini daha çok, gündelik kültürün aktarımına bırakmıştır.

<p style="text-align: center;">2</p> <p style="text-align: center;">2. Numéro deux.</p> <p>Travailler: Le père travaille, il travaille. Şekil 3. *Méthode Alge* (Alge & Ripman, 1927, ss. 2-3, s. 154. & s. 294)

DÇ yöntemine bağlı olarak ülkemizde de Fransızca ders kitapları kullanılmıştır. En tipik örneklerden biri *Fransızca Yardımcı Ders Kitabı 1* (Öztaş, 1968) ve ilgili seridir. Şekil 4'te de görüldüğü üzere, Türkçe olan bir metinden yola çıkarak etkinlikler tasarlanmıştır. Bahsi geçen metindeki kimi önemli sözcüklerin ve kalıpların Fransızca karşılıkları verilmiştir. Büyük olasılıkla, sınıf etkinliklerinde ilk önce Türkçe metin öğretmen gözetiminde Fransızcaya çevrilmiştir. Soru-yanıt alıştırmalarından sonra ise eylem çekimleri üzerinde durulmuştur. (Burada gösterilmemiştir.) Yardımcı ders kitabı olsa da, izlenen yol bağlamında bu yapıt DÇ'nin eğitimsel anlayışıyla uyumludur.

Şekil 4. Fransızca Yardımcı Ders Kitabı: Lise 1 (Öztaş, 1968, ss. 5-6)

Blanchet'nin de (2000) bahsettiği üzere, dilbilgisinin açık ve tümdengelimli anlatımı ile kültür aktarımı bağlamında DÇ yöntemine bağlı kalan bir diğer önemli Fransızca kitabı *Cours de Langue et de Civilisation Françaises I* dir (Mauger, 1953/1967). Ancak, sayfa düzeni ve eğitsel içerik açısından bakıldığında, bahsi geçen kitap DY'nin ilkelerini de yansıtmaktadır. Öncelikle, kitabın herhangi bir yerinde Fransızca dışında başka bir dile başvurulmasını öneren ya da ima eden bir kısım bulunmamaktadır. Dolayısıyla, kitabın kullanıcısı etkinliklerde kendi anadiline başvurmayacaktır. Şekil 5'te de görüldüğü üzere, dikdörtgen kutular içinde ders içeriği verilirken temel çıkış noktası açık ve tümdengelimli dilbilgisidir; ancak çeviriye başvurulmamaktadır. Öte yandan, söz varlığı aktarılırken resimlere başvurulmaktadır. Söyleyiş bilgisi için köşeli ayraç içerisinde sözcüklerin sesletimleri verilmektedir; böylece, bu ders kitabı, o dönem popülerleşen *Uluslararası Sesbilgisi Abecesi*'ni öğrenciye tanıtmış olmaktadır. Öte yandan, çoğu çizime dayalı resimlerin oluşturduğu görsel imgeler dışında, kültür aktarımı bağlamında gerçek bir sınıfın fotoğrafı da yer almaktadır (ve kitabın ilerleyen bölümlerinde başka bildirim durumlarını yansıtan fotoğraflar). Etkinlikler ve alıştırmalar açısından bakıldığında ise ucu açık sorular, boşluk doldurma soruları, yazdırım çalışmaları ve diyaloglar yoluyla çeşitlilik sağlanmıştır. Sonuç olarak bu Fransızca ders kitabı ilkeleri ve uygulanması kapsamında, DÇ yöntemi ile DY arasında konuşlanmıştır.

UNE CLASSE dans une école de français pour étrangers.

DICTÉES (à préparer)

1) Voici une classe (ou une salle de classe). Qu'est-ce que c'est? — C'est la porte. — Est-ce que ce sont les fenêtres? — Non, ce ne sont pas les fenêtres, ce sont les murs. — Le professeur est devant le tableau noir. Les étudiants sont devant le professeur, derrière les tables, sur les bancs.

2) Le livre vert, le cahier rose, la gomme grise, la règle noire, les crayons bleus sont dans la serviette jaune. La serviette est sous le banc, devant le tableau noir. Le mouchoir est dans le sac. Le sac est rouge. Et le mouchoir? — Le mouchoir est blanc.

DIALOGUE

La classe

— Toc! Toc! — Entrez! — Bonjour, Monsieur. — Bonjour, Hélène. Fermez la porte, s'il vous plaît. Savez-vous votre leçon? — Oui, Monsieur. — Répondez : qu'est-ce que c'est? — C'est un livre. — De quelle couleur est le livre? — Le livre est vert. — Qu'est-ce que c'est? — Ce sont des crayons. — De quelle couleur sont les crayons? — Les crayons sont bleus. — Où sont les crayons? — Les crayons sont dans la serviette. — De quelle couleur est la craie? — La craie est blanche. — Est-ce que le tableau est blanc? — Non, le tableau n'est pas blanc; il est noir. — Est-ce que la robe de Marie est verte? — Oui, la robe de Marie est verte. — Où sont les lampes? — Les lampes sont sous le plafond. — Où sont les tables? — Elles sont sur le plancher. — Merci, Hélène; c'est bien.

Şekil 5. Cours de Langue et de Civilisation Françaises I (Mauger, 1953/1967, ss. 8-11)

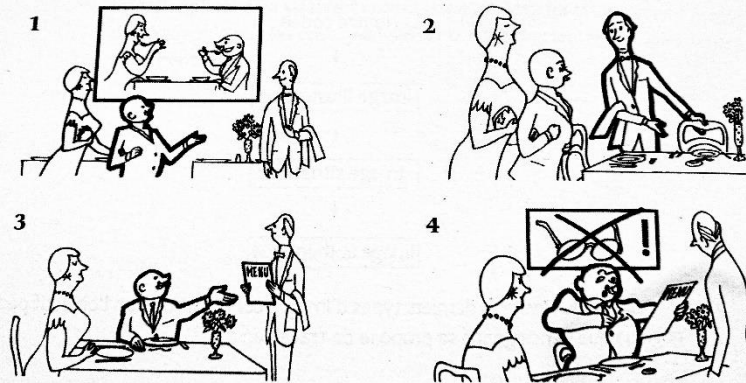

Sınıf etkinlikleri bağlamında, İSY'de ve İGY'de 1950'li yıllardan başlayarak 1980'li yıllara kadar kullanılan yapısal alıştırmalar belirginlik kazanmaktadır; hatta, yapısal alıştırmalar

kısmen 1990'lı yıllarda BY kapsamında kimi ders kitaplarında yer almıştır. Amaç, öğrencinin Fransızcanın biçim-sözdizimini, yani dilbilgisi kurallarını aşırı tekrarla pekiştirerek otomatikleştirmesidir; buna bağlı olarak örnekçe teşkil eden bir soru-yanıt sonrasında ilgili kural, *değiştirim* (*substitution*) ve *dönüştürüm* (*transformation*) alıştırmaları üzerinden çalıştırılır (Girard, 1972; Tagliante, 2006). Değiştirim alıştırmalarında bir sözcük, sözcük grubu ya da tümce bir başkasıyla değiştirilir; örneğin ad dilbilgisel ulamı yerine adıl kullanılabilir. Dönüştürümde ise bir tümce herhangi bir kurala göre yeniden yazılır; örneğin, etken çatılı bir tümcenin çatısı edilgene dönüştürülerek gerekli biçimsel-sözdizimsel değişiklikler yapılır. Girard (1972) dönüştürüme örnek olarak eylemleri şimdiki zamanda yazılmış bir paragrafın başına *dün* sözcüğünün eklenerek zamanların değiştirilmesi ve paragrafın yeniden yazılmasını vermektedir (s. 125). Germain'in (1993) ise değiştirim için verdiği örnek şudur (s. 146):

- *Vous partez le treize ? (Aydın on üçünde mi yola çıkıyorsunuz?)*
- *Nous... → Değiştirim → Nous partons le treize. (Aydın on üçünde yola çıkıyoruz.)*

Yapısal alıştırmalar sonuçta 1990'lı yıllarda yazılmış kimi BY Fransızca ders kitaplarında bile farklı adlandırmalarla devam ettirilmiştir; örneğin, *Le Nouveau Sans Frontières 2*'de (Dominique ve diğerleri, 1989) bu türden alıştırmalara *düzenek* (*mécanisme*) denilmiştir.

İGY bağlamında bir diğer belirginlik de şudur: *Voix et Images de France* (1958) adlı ders kitabıyla beraber, yabancı dil öğrenenler aynı anda işitsel ve görsel uyarana tabi tutulmuşlardır; yani amaç, duvara ya da tahtaya yansıtılan yansılar (karikatürümsü çizimler/görüntüler) ve teypteki kasetten dinletilen diyalogların eşzamanlı olarak öğrenciye aktarılmasıdır; projektör ve teyp aracılığıyla görüntü ve ses aynı anda öğrenciye ulaştırılarak öğrencinin birçok beceriyi harekete geçirmesi (dili dinleme ve el-kol devinimlerini/yüz ifadelerini izleme) amaçlanmıştır; örneğin, *Le Français et La Vie* (1971) adlı ders kitabında, ders içeriği olarak restoranda sipariş verme teması, çizim ve teypten dinletilen kaset yoluyla şu şekilde verilmiştir (Mauger, 1971, s. 210, aktaran Tagliante, 2006, ss. 184-185):

- 1 - *Garçon, nous voulons déjeuner. (Garson! Öğle yemeği yemek istiyoruz.)*
- 2 - *Bien monsieur. Asseyez-vous à cette table. (Hay hay bayım. Bu masaya oturunuz.)*
- 3 - *Donnez-moi le menu, s'il vous plaît. (Bana mönüyü veriniz lütfen.)*
- 4 - *Oh! Je n'ai pas mes lunettes! (Ah! Gözlüklerim yok!)*

Şekil 6. İGY'de Çizim-Diyalog İlişkisi

Burada ses ile eşzamanlı olarak verilen yansılar sayesinde öğrenci adeta bir çeşit çizgi film izlemektedir. Öte yandan, görsellikle seslerin göndermede bulunduğu sözcükleri eşleştirmek, öğrenci açısından kimi zaman zor olabilmektedir. Unutulmamalıdır ki İGY’de anadile başvurmak sınıfta yasaktır.

Ders içeriği dışındaki etkinliklere bakıldığında İGY’de *aktarım (transposition)* adı verilen (bkz. Germain, 1993) ve ana diyalogla benzer bildirişim durumları içeren başka diyaloglar da öğrenciye çalıştırılmaktadır; ayrıca diyaloglar üzerine sözlü soru-yanıt alıştırmaları ile dinleme-yazma becerilerini geliştirmeye yönelik yazdırım alıştırmaları da mevcuttur; İGY’nin en önemli ders kitaplarından biri olan *De Vive Voix*’da (Moget & Neveu, 1975) görüntülü olarak dinletilen diyaloglar (asıl diyalog ve aktarımın yapıldığı diyalog) sonrasındaki tüm alıştırmalar temelde sözlü dili geliştirmeye yöneliktir (bkz. Şekil 7).

Şekil 7. *De Vive Voix*’da Ana Diyalog ve Aktarım Diyaloğu (Moget & Neveu, 1975, s. 3 & s. 7)

İGY’nin dilbilgisi anlayışı örtük ve tümevarımsal olduğundan, genelde dil yetisi ve özelden ise yazma yetisi YDÖ sürecinin özellikle başlangıcında öğrencilerde pek gelişmemektedir. Dolayısıyla, İGY’nin dilbilgisi dersleriyle desteklenmesi gerekli görülmüştür.

Çizimlerden oluşan ve kurgusal olan diyaloglar, BY ile beraber yerini temelde özgün; yani, asıl olarak eğitsel amaçlarla oluşturulmamış metinlere (gazete haberleri, makaleler, raporlar, görüşmeler vb.) bırakmıştır. BY’nin diyaloga dayanan ders içeriklerinde ise fotoromana benzeyen, altyazılı fotoğraflara rastlanmaktadır. Bu diyaloglar ise temelde kurgusaldır. Şekil 8’de de görüldüğü üzere, örneğin *Le Nouveau Sans Frontières 2*’de (Dominique ve diğerleri, 1989) hem kurgusal diyaloglar (gerçeğe yakın bildirişim durumları arz eden) hem de özgün belgeler kullanılmıştır.

UNITÉ 1 - LA GUERRE DES STARS - PAGES 8-9

LEÇON 1 UNE VEDETTE DE LA TÉLÉVISION

1. Dans la salle à manger d'une famille française. Il est vingt heures.

A table! C'est bientôt l'heure du journal télévisé! Laure, tu peux mettre la Quatre, s'il te plaît?

Moi, je trouve cette Claire Martin plutôt ennuyeuse. J'aime mieux le présentateur de TV5. Il a de l'humour, lui!

On ne peut pas regarder les informations sur une autre chaîne?

Il fait des plaisanteries stupides.

Et elle est agréable à regarder!

Et il n'est pas très objectif.

Claire Martin, elle, est sympathique, pas bête.

Bon, d'accord, j'ai aussi seule contre tous, j'abandonne. Regardons votre star!

TÉLÉ- SEMAINE

CLAIRE MARTIN, PRÉSENTATRICE DE L'ANNÉE

Soixante pour cent des téléspectateurs choisissent de regarder le journal télévisé sur Antenne 4 et Claire Martin s'impose comme la présentatrice tendre de l'année. Mais notre star du petit écran n'a pas une vie familiale. Tout simplement, je suis très organisée. Le matin, je me lève à 7 h et je m'occupe des enfants... petit déjeuner... école... Puis je passe une heure dans la salle de bains. C'est bon pour moi.

8. VOICI DES ACTEURS FRANÇAIS. Quel type de rôles leur donneriez-vous? Expliquez pourquoi

Michel CONSTANTIN

Emmanuelle BÉART

ANÉMONE

7. QU'EST-CE QUI FAIT l'originalité de ce chauffeur de taxi?

DES GENS, DES FAITS, D

Robert le taxi, le Zorro du voyageur

Tout va mal, certains jours: migraine, boutons, discussions... Il a posé en urgence et manque de timbre... Pour couronner le tout, vous allez être en retard à votre rendez-vous à l'autre bout de Paris? Le bonheur c'est ce jour-là de rencontrer le taxi de Robert Izord.

clients. Puis s'habituant à la surprise, le regard saute du Pariscapote de la semaine à des jeux de patience destinés au prochain embouteillage. En cas de besoin, Robert Izord dévoile sa boîte secrète: sa « malloite des petits services rendus ». Parmi les tricornes, l'agrafeuse, l'aiguille, l'essen-

Ancien photographe, organisateur de sa vie, Robert vous conduira à destination. Jusqu'à, rien d'extraordinaire pour un taxi. La première chose qui étonne dans sa voiture, c'est le dos des sièges-avant placardés de coupures de presse. Des photocopies des articles sont même à la disposition des

ce de térébenthine ou l'aspirine submergée. Tous les petits objets dont l'absence est cause de mille tracés quotidiens, sont disponibles sur simple sourire. On irait jusqu'à soupçonner Robert de détenir aussi du papier cadeau dans son coffre. Pour le savoir, rendez-vous dans son taxi... aux prochaines fêtes. ■

Quel que soit votre souci du moment, du bouton décousu à la lettre à timbrer, sans oublier les migraines; Robert a vraiment réponse à tout!

Imaginez ce que pourrait être ...

- un train original,
- chez le médecin ou chez le dentiste, une salle d'attente originale,
- un café ou un restaurant original.

FEMME ACTUELLE, n° 195.

Şekil 8. Le Nouveau Sans Frontières 2' de Kurgusal Diyaloglar ve Özgün Metinlere Dayalı Alıştırılmalar (Dominique ve diğerleri, 1989, s. 8, s. 13 & s. 46)

Sonuçta, burada amaç, gerçek ya da gerçeğe yakın bildirişim durumlarıyla öğrenciyi yüzleştirmektir. Bu nedenle, belli bir role bürünmeye (canlandırma) ve benzetime dayalı alıştırmalar BY'nin ön plana koyduğu sınıf etkinliklerindedir (bkz. Şekil 9).

4. RÉPONDEZ-LEUR en imaginant de fausses excuses

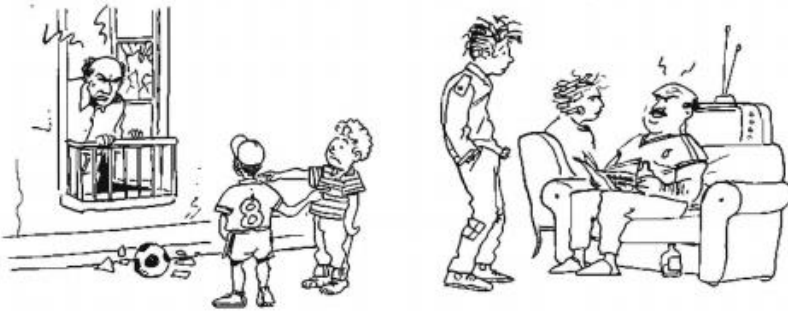

a. Vous n'avez pas envie d'aller à ce dîner. Vous pensez que vous allez vous y ennuyer. b. Vous n'avez pas envie de le/la revoir.

M. et Mme Jean Baudin
vous prient de leur faire l'honneur
de venir dîner
le 25 novembre à 20 h.
R.S.V.P.

Je voudrais bien qu'on se revvoie.
Voudrais-tu dîner avec moi
un de ces jours ou aller voir
un film ?

10. JOUEZ LES SCÈNES. A. accuse – B. s'explique et s'excuse

a/ Ils ont cassé un carreau. b/ On l'a renvoyé.

8. ÉCOUTEZ! Faites le compte rendu de cette séance du Conseil municipal

Précisez quel est l'objet de la réunion.
Résumez en une phrase les interventions de chaque participant au débat.

Şekil 9. *Le Nouveau Sans Frontières* 2'de Rol Oynama ve Benzetim Etkinlikleri (Dominique ve diğerleri, 1989, s. 45, s. 47 & s. 71)

Şekil 9'daki 4 numaralı alıştırmada, gerekçe göstererek bir davete katılmaması konusunda öğrenciye mektup yazdırılmaktadır. 10 numaralı alıştırmada ise ilkin öğrencilerden rol yapmaları istenmektedir; soldaki bildirişim durumunda cam kıran iki çocuk ve onlara kızan ev sahibi, sağdaki ise okuldan ya da işinden kovulan bir genç ile babası arasındaki diyalogun gerçekleştirilmesi istenmektedir. 8 numaralı etkinlik ise asıl olarak bir benzetimdir. Öğrenciler belediye meclisi toplantısını dinleyip bir tutanak yazarak toplantının konusunu ve katılımcıların sözlerini aktaracaklardır. Ancak, daha sonrasında, öğretmen öğrencilerden başka bir konuyla ilgili olarak sınıfta grupça gerçekleştirilecek bir toplantı yapmalarını ve toplantıdaki kişileri canlandırmalarını isteyebilir. Benzetimler, skeç benzeri olan rol oynama etkinliklerine göre daha planlı ve daha kapsamlıdır; ön hazırlık gerektirebilecektir (bkz. Bertocchini & Costanzo, 2008).

Son olarak sınıf etkinlikleri bağlamında EEY'nin belirginliğinden bahsetmek gerekmektedir. Rol yapmaya ve benzetime dayalı sınıf etkinlikleri, yerini gerçek bildirişim durumları arz eden ve dilsel, bildirişimsel ve/ya da kültürel bilgi-becerilerin eşzamanlı olarak harekete geçirildiği

etkinliklere bırakmıştır. Bahsi geçen eylem-etkinlikler aşamalara bölünerek genelde grupça (maksimum 4 öğrenci örneğin) ve sınıfta ya da sınıf dışında gerçekleştirilir. Amaç, grup etkileşimini, öğrenme özerkliğini ve özdeğerlendirmeyi teşvik etmektir (bkz. Conseil de l'Europe, 1998/2001/2005). Şekil 10'daki eylem-etkinlik, B2 dil düzeyi için tasarlanmış ve EEY'yi düzenli olarak uygulayan ilk Fransızca ders kitaplarından *Rond-Point 3*'te (Capucho ve diğerleri, 2003) yer almıştır.

8. LE NAMING, C'EST IN

A. Écoutez cette interview du directeur d'une agence de *naming*. Prenez des notes à l'aide de cette fiche.

B. Feriez-vous appel à ce type d'entreprise si vous aviez un produit à commercialiser ? Discutez-en avec deux camarades, puis exposez le point de vue de votre groupe au reste de la classe.

9. INÉDIT !

A. Par groupes de trois, créez un nom de marque et un slogan pour un objet quelconque, soit un objet du quotidien (un balai, un tabouret, un tournevis...) soit un produit très exclusif (un parfum, une marque de vêtements, une voiture...) soit un objet original de votre création. Dans la mesure du possible, suivez les procédures et les critères indiqués par le directeur de l'agence de *naming*.

B. Créez ensuite une page de pub pour un magazine afin de faire connaître votre produit et sa marque.

Şekil 10. *Rond-Point 3*'te Eylem-Etkinlik Örneği (Capucho ve diğerleri, 2003, s. 17)

8 numaralı eylem-etkinlikte ilkin bir reklam ajansının yöneticisinin konuşması dinletilmektedir. Konuşma sırasında öğrencilerden not tutmaları istenmektedir. Ardından, 3'lü gruplar hâlinde, konuşmadaki pazarlama stratejisinin uygun olup olmadığının sınıfta sunum-tartışma şeklinde görüşülmesi önerilmektedir. 9 numaralı eylem-etkinlikte ise yine 3'lü öğrenci grupları dâhilinde, günlük kullanım değeri olan ya da ender bir ürün (veyahut öğrencilerin kendilerinin tasarlayacağı bir ürün) için öğrencilerden marka adı ve slogan üretmeleri istenmektedir. Sonrasında ise öğrencilerden ürünü ve marka adını tanıtımları için bir dergiye reklam sayfası tasarımları beklenmektedir. Bu türden eylem-etkinlikler özellikle dil düzeyi arttıkça çeşitlendirilebilir; öte yandan, sosyal medyanın gelişmesiyle birlikte eylem-etkinliklerin tam anlamıyla gerçekleştirilebilme olasılığı da artmıştır. Eylem-etkinlikler, daha önce de belirtildiği üzere, aşamalara ayrılmalı ve belli bir zamana yayılmalıdır; bir dönem içerisinde bir ya da daha fazla eylem-etkinlik uygunluğa, zamana, içeriğe ve sınıf başarımına bağlı olarak gerçekleştirilebilir. Sonuçta, her dil düzeyine uygun bir eylem-etkinlik tasarlamak, Fransızca öğretmenin yaratıcılığına ve süreci yönetme becerisine bağlı olacaktır.

SONUÇ

Bu çalışmada, ders içeriklerinin tanıtımı ve alıştırmalar dâhil olmak üzere, Fransızca ders kitaplarındaki etkinliklerin evrimi sorunsalı ele alınmıştır. Sosyal medyada, yani çevrimiçi ağda bulunan içerikler bu çalışmanın kapsamının dışında tutulmuştur. Özellikle 20. yüzyılın ortalarından itibaren, uygulanan yöntemlerin çerçevesi öğrenim anlayışı, dil anlayışı ve öğretim anlayışı bağlamında daha belirginleşmiştir. Bu araştırmada, yabancı dil olarak Fransızca öğretiminde belirginlik arz ettiği ve yaygın olarak kullanıldığı düşünülen yöntemler ve ders kitapları ele alınmaya çalışılmıştır.

Dilbilgisi-Çeviri (Geleneksel/Klasik) *Yöntemi*'nden günümüzün *Bildirişimsel Yaklaşım* ve *Eylem-Etkinlik Yaklaşımı* gibi daha seçmeci ve bütüncül yöntemlerine ya da yaklaşımlarına ilerlendiğinde göze çarpan belirginlikler şunlardır:

- Salt dil yetisi, yerini bildirişim yetisinin daha çok vurgulandığı bir Fransızca öğrenim-öğretim sürecine bırakmıştır; yani dile ilişkin bilginin belirli bir bildirişim niyetiyle ve bildirişim durumunda nasıl kullanılabilceği sorunsalı öne çıkartılmıştır; ders kitaplarındaki ders etkinlikleri de bunu destekler niteliktedir. Özellikle, sözlü dilde bildirişimi (bireysel olarak ya da grup içerisinde) teşvik eden bir anlayışla karşılaşmaktadır. 1950'ler öncesinde yazılı dile önem verilirken, ilerleyen dönemlerin yöntem kitaplarında sözlü dil ve bildirişim olguları vurgulanmıştır. Ancak, farklı öğrenim-öğretim ve değerlendirme bağlamları ele alındığında, öğrenci gereksinimlerine göre içerik hazırlama, uygulama ve değerlendirme yapmanın önemi ortaya çıkacaktır. Örneğin, Türkiye'de yabancı dil olarak Fransızca öğretiminin hedefleri ile değerlendirme biçimleri, Fransa'da ikinci dil olarak öğretilen Fransızcaninkilerden farklı olacaktır; çünkü Fransa'da ikinci dilini öğrenen bir birey için öncelik, gündelik yaşamda sözlü Fransızcanın kullanımı iken, Türkiye'deki Fransızca öğreneni için öncelik, sınavların özellikle yazılı olması da hesaba katıldığında, yazılı dil, dilbilgisi ya da kurallı dil olacaktır. Bu durumun farkına varan yeni Fransızca kitapları (yabancı dil bağlamında) dilbilgisine de gerekli önem vererek bildirişimsel yetiyi destekleyici içeriklere ağırlık vermektedir. Sonuçta, her ne kadar bildirişim amaç olsa da, dilin kurallı kullanımına ilişkin bilgi-beceri olmazsa olmazdır; yani, dilbilgisi gerek şarttır; ancak yeter şart değildir.
- Dilbilgisi açık ve tümdengelimli etkinliklerle verilirken, özellikle *İşitsel-Sözel Yöntem* ve *İşitsel-Görsel Yöntem* dönemlerinde örtük ve tümevarımsal bir yaklaşımla aktarılmıştır. Ancak, güncel yöntemler olan *Bildirişimsel Yaklaşım* ve *Eylem-Etkinlik Yaklaşımı* sırasında açık ve tümdengelimli dilbilgisi öğretimi yine ön plana çıkmıştır. Dil kuralları öğretilirken, özellikle 1990'lı yıllardan itibaren, örneğin metinlerden yola çıkarak belli bir bildirişim durumunu yansıtan dil öğeleri ya da tümceler üzerinde çalışılıp (bağlamdan kopuk, soyutlanmış ve tekil tümceler üzerinde çalışmak yerine) daha işlevsel bir yaklaşım sergilenmeye başlanmıştır.

- Söz varlığı öğretilirken de, herhangi bir sözcüğün sözlük anlamının verilmesinden ziyade belli bir metin ya da diyalogdaki kullanımından yola çıkılmış; bildirişimsel/anlamsal temelde farklı kullanımları ve tümce içindeki kullanımları üzerinde giderek daha fazla durulmuştur.
- Fransızca ders kitaplarında temalar belirlenirken dilsel işlev, kullanım sıklığı ve kolaylık-zorluk (kolaydan zora doğru) ölçütleri temel alınmıştır. Örneğin, Fransızca öğretim sürecinin başında selamlaşma, kendini tanıtmaya, basit bilgi verme, bilgi sorma, çevresini betimleme vb. dil işlevlerin ya da bildirişimsel hedeflerin/kazanımların öğrenciye öğretilmesi hedeflenmiştir. Bu hedefler, ders kitaplarında özellikle *Bildirişimsel Yaklaşım* ve *Eylem-Etkinlik Yaklaşımı* ile beraber öğrenciye açıkça belirtmeye başlanmıştır.
- Çeviriye verilen önem giderek azalmıştır; hatta çeviri, belli bağlamlar dışında Fransızca sınıfının dışında kalmıştır; çünkü öğrencinin otomatik olarak ya da doğrudan yabancı dilde düşünerek konuşması ve yazması beklenir olmuştur. Ancak, özellikle ileri dil düzeylerinde anadil ile yabancı dil arasında biçimsel-sözdizimsel ve anlambilimsel karşılaştırmalar yapabilmek adına çeviri etkinlikleri anlamlı olabilir.
- Kültür aktarımında değerler dizisi değişmiş, tarihte yer etmiş uygarlık öğeleri, yerini daha çok gündelik öğelerin aktarılmasına bırakmıştır. Aynı zamanda, çok kültürlülük ve çok dillilik teşvik edilmiştir.
- Öte yandan, öğrenci özerkliği, grup içinde rol alabilme ve özdeğerlendirme/özdenetim daha çok teşvik edilmeye başlanmıştır.
- Fransızcanın öğretimi sürecindeki ders kitaplarının evrimine bakıldığında, alıştırmalar daha da çeşitlendirilmiştir; açık soru-yanıt, yazdırım, dönüştürüm/değiştirim, boşluk doldurma, bağdaştırma vb. alıştırmaya türleri yerlerini korusa da, gerçek bildirişim durumlarında öğrencinin Fransızca kullandığı kapsamlı etkinlikler yaygınlaşmıştır. *Bildirişimsel Yaklaşım*'daki canlandırma ve benzetim gibi kurgusal alıştırmalar, yerini günümüzde daha çok, öğrencinin gerçek dilsel-bildirişimsel-kültürel edimler ortaya koyduğu, çok aşamalı ve bütüncül bir özellik arz eden eylem-etkinliklere bırakmıştır. Bu eylem-etkinliklerde hem bireysel hem de grup içi başarıya önemli yer tutmaktadır.
- Fransızca ders kitaplarındaki görsel öğeler de çeşitlilik kazanmıştır; elle çizilen resimler, yerini sıklıkla özgün fotoğraflara ve görsel belgelere bırakmıştır. Etkinliklerin özgün görsel belgeler üzerinden yapılması yaygınlaşmıştır.

Sonuçta, özellikle Anglosakson alanyazında ilgi gören *yöntem sonrası dönem* kavramı yanlış anlaşılmalıdır. Yabancı dil ders kitapları basılı ve/ya da elektronik ortamda var olmaya devam edecektir. Önemli olan, sürekli değişen teknolojiye de yararlanarak ve öğrenim-öğretim bağlamı ile öğrenci gereksinimlerini dikkate alarak ilkeli ve yöntemli bir seçmeci uygulama uygulamaktır; yani Puren'in (2019) de bahsettiği üzere sürekli hareket etmek ve ilerlemek temeldir.

"Multidisipliner Bilimsel Çalışmalar ve Küresel Uygulamaları"

4. Uluslararası Kongresi

Kuzey Kıbrıs Türk Cumhuriyeti

28-30 Nisan 2023

04.05.2023

REF: Akademik Teşvik

İlgili makama;

"Multidisipliner Bilimsel Çalışmalar ve Küresel Uygulamaları" 4. Uluslararası Kongresi 28-30 Nisan 2023 tarihlerinde Kuzey Kıbrıs Türk Cumhuriyeti'nde 27 (Türkiye, Pakistan, Hindistan, Romanya, Azerbaycan, Endonezya, Nijerya, Macaristan, KKTC, Cezayir, Gürcistan, Polonya, Vietnam, Mısır, Rusya, Kazakistan, Slovakya, Ukrayna, İtalya, Kosova, İran, Portekiz, Fas, Bulgaristan, Filipinler, Sırbistan, Irak) farklı ülkenin (Türkiye-225, Diğer Ülkelerden-243) akademisyen/araştırmacılarının katılımıyla gerçekleşmiştir. Kongre 16 Ocak 2020 Akademik Teşvik Ödeneği Yönetmeliğine getirilen "Tebliğlerin sunulduğu yurt içinde veya yurt dışındaki etkinliğin uluslararası olarak nitelendirilebilmesi için Türkiye dışında en az beş farklı ülkeden sözlü tebliğ sunan konuşmacının katılım sağlaması ve tebliğlerin yarıdan fazlasının Türkiye dışından katılımcılar tarafından sunulması esastır." değişikliğine uygun düzenlenmiştir.

Bilgilerinize arz edilir,

Saygılarımızla

Dr. Mehmet Fırat BARAN

Kongre Başkanı
