CONFERENCE ID

HONORARY PRESIDENT OF CONFERENCE

Dr. Mehmet Fırat BARAN

ORGANIZING COMMITTEE

Dr. Ahmet ÇELİK (Adıyaman University, Faculty of Agriculture, TÜRKİYE)

Dr. Bahar Burtan DOĞAN (Dicle University, Faculty of Economics and Administrative Sciences, TÜRKİYE)

Dr. H. Deniz ŞİRELİ (Dicle University , Faculty of Agriculture , TÜRKİYE)

Dr. Korkmaz BELLİTÜRK (Tekirdağ Namık Kemal University, Faculty of Agriculture, TÜRKİYE)

Dr. Ristina Siti Sundari (University of Perjuangan Tasikmalaya, Faculty of Agriculture, Wezt Jawa-INDONESIA)

Dr. Seden TURAMBERK ÖZERDEN(Girne American Universty, CYPRUS)

Dr. Sipan SOYSAL (Siirt University, Faculty of Agriculture, TURKEY)

Dr. Şahin AY (Siirt University Kurtalan Vocational High School, TURKEY)

Dr. Zubair ASLAM (University of Agriculture, Department of Agronomy, Faisalabad-PAKİSTAN)

PARTICIPANTS COUNTRIES

Türkiye, Algeria, Azerbaijan, Egypt, Ethiopia, Finland, Hungary, Indonesia, India, Iran, Iraq, Kazakhstan, Macedonia, Moldova, Morocco, Nigeria, Pakistan, Russia, Romania, Serbia, South Africa, Tunisia, Ukraine

TOTAL ACCEPTED ARTICLE

Türkiye: 225

Other Countries: 243

SCIENCE BOARD

Dr. Abdurrahim YILMAZ (Bolu Abant İzzet Baysal University, Faculty of Agriculture, TÜRKİYE)

Dr. Ali Beyhan UÇAK (Siirt University, Faculty of Agriculture TÜRKİYE)

Dr. Ali İhsan KAYA (Adıyaman University, Faculty of Engineering, TÜRKİYE)

Dr. Ali BOLAT (Adıyaman University, Faculty of Agriculture, TÜRKİYE)

Dr. Arzu ALTUNTAŞ (Siirt Üniversitesi University, Faculty of Agriculture, TÜRKİYE)

Dr. Alamettin BAYAV (Isparta University of Applied Sciences, Faculty of Agriculture, TÜRKİYE)

Dr. Arzu ÇIĞ (Siirt University, Faculty of Agriculture, TÜRKİYE)

Dr. Aynur BİLMEZ ÖZÇINAR- (Siirt University, Faculty of Agriculture, TÜRKİYE)

Dr. Bahar SÖZÜBEK (Tekirdağ Namık Kemal University, Muratlı Vocational School, TÜRKİYE)

Dr. Başak AYDIN (Republic of Türkiye Ministry of Agriculture and Forestry)

Dr. Cihan DEMİR (Kırklareli University, TÜRKİYE,)

Dr. Durdane MART (Eastern Mediterranean Agricultural Research Institute, Department of Agronomy, TÜRKİYE)

Dr. Erhan KAHYA (Tekirdağ Namık Kemal University, TÜRKİYE)

Dr. Esra BİLİCİ (Uşak University, TÜRKİYE)

Dr. Fatih ÇIĞ (Siirt University, Faculty of Agriculture, TÜRKİYE)

Dr. Ferhat KIZILGEÇİ (Mardin University, TÜRKİYE)

Dr. Hasan KILIÇ (Bingöl University, Faculty of Agriculture, TÜRKİYE)

Dr. Hatun BARUT (Eastern Mediterranean Agricultural Research Institute, Department of Agronomy, TÜRKİYE)

Dr. Halil İbrahim OĞUZ (Adıyaman University, Faculty of Agriculture, TÜRKİYE)

Dr. Leila IMANPARAST (Agri Ciel Institute Company, TÜRKİYE).

Dr. Mehmet YILMAZ (Siirt University Faculty of Medicine, TÜRKİYE)

Dr. Meltem AVAN (Adıyaman University, Faculty of Engineering, TÜRKİYE)

Dr. Melekber SÜLÜŞOĞLU DURUL (Kocaeli University, Faculty of Agriculture, TÜRKİYE)

Dr. Mesut BUDAK (Siirt University, Faculty of Agriculture, TÜRKİYE)

Dr. Mesut SIRRI (Siirt University, Faculty of Agriculture, TÜRKİYE)

- Dr. Mesut YILMAZ (Akdeniz University, Faculty of Fisheries, TÜRKİYE)
- Dr. Murat DEVECİ (Tekirdag Namık Kemal University, Faculty of Agriculture, TÜRKİYE)
- Dr. Mükerrerem ATALAY ORAL (Akdeniz University, Elmalı Vocational School, TÜRKİYE)
- Dr. Nejat ÜNLÜKAL (Selçuk University Faculty of Medicine, TÜRKİYE)
- Dr. Nizamettin TURAN (Siirt University, Faculty of Agriculture, TÜRKİYE)
- Dr. Nusret ÖZBAY (Bingöl University, Faculty of Agriculture, TÜRKİYE)
- Dr. Osman GÖKDOĞAN (Isparta University of Applied Sciences, Faculty of Agriculture, TÜRKİYE)
- Dr. Okan ORAL (Akdeniz University Faculty of Engineering, TÜRKİYE)
- Dr. Ömer ACER (Siirt University Faculty of Medicine, TÜRKİYE)
- Dr. Sait AYKANAT (Eastern Mediterranean Agricultural Research Institute, Department of Agronomy, TÜRKİYE)
- Dr. Suat BENEK (Tekirdağ Namık Kemal University Faculty of Medicine, TÜRKİYE)
- Dr. Şerif AKSİN (Siirt University Faculty of Medicine, TÜRKİYE)
- Dr. Sevilay GÜL (Tekirdağ Namık Kemal University, TÜRKİYE)
- Dr. Sevim AKÇAĞLAR (Uludağ University, Faculty of Medicine, TÜRKİYE)
- Dr. Sıdıka EKREN (Ege University, Faculty of Agriculture, TÜRKİYE)
- Dr. Yavuz DEMİRCİ (Adıyaman University, Faculty of Engineering, TÜRKİYE)
- Dr. Zeynep DUMANOĞLU (Bingöl University, Faculty of Agriculture, TÜRKİYE)
- Dr. Abdul Khaliq (University of Agriculture, Department of Agronomy, Faisalabad, PAKISTAN)
- Dr. Adnan Abbas (Nanjing university of information science and technology, nanjing CHINA).
- Dr. Ali Mekki (University of Sfax, Biological Engineering-Environmental Bioprocesses and Soil Science, Sfax-TUNISIA)
- Dr. Ajar Nath Yadav (Eternal University, Department of Biotechnology, Himachal Pradesh-INDIA)
- Dr. Ashokkumar Vallabhbhai Rajani (Junagadh Agricultural University, College of Agriculture, Dept. of Agril. Chem. & Soil Science, Gujarat-INDIA)
- Dr. Barbara Wiśniowska-Kielian (University of Agriculture in Krakow, Faculty of Agriculture and Economics, Department of Agricultural and Environmental Chemistry, Krakow-POLAND)
- Dr. Babak SAFAEI (Tsinghua University, CHINA)

Dr. Blend Ibrahim (School of Tourism and Hospitality Management. Department of Tourism
Girne American University, CYPRUS)

Dr. hab. Barbara Sawicka (University of Life Sciences in Lublin, Faculty of
Agrobioengineering, Department of Plant Production Technology and Commodity Sciences,
Lublin-POLAND)

M.Sc. Benjamin Bantchina (Bursa Uludag University, Faculty of Agriculture, Department of
Biosystems Engineering, Bursa-TÜRKİYE)

Dr. Brygida Klemens (Opole University of Technology, Faculty of Economics and
Management, Opole-POLAND)

Dr. Derya Timuçin, (School of Tourism and Hospitality Management. Department of Tourism
Girne American University, CYPRUS)

Dr. Elham Matallebi, Islamic Azad University, Garmsar, IRAN

Dr. Grzegorz Paćzka (Rzeszów University, Department of Natural Theories of Agriculture
and Environmental Education, Rzeszów, POLAND)

Dr. Fahrurrozi Fahrurrozi (University of Bengkulu, Faculty of Agriculture, Dept. of Crop
Production, Bengkulu-INDONESIA)

Dr. Faisal SULTAN (Hazara University, PAKISTAN)

Dr. Francesco Nocera, (University of Catania, ITALY)

Dr. Herák David, (Czech University of Life Sciences Prague, CZECH REPUBLIC)

Dr. Hüseyin Bozdağlar (Girne American University, School of Tourism and Hospitality
Cyprus)

Dr. Irshad Bibi (University of Agriculture, Faculty of Agriculture, Institute of Soil and
Environmental Sciences, Faisalabad-PAKISTAN)

Dr. Iwan Setiawan, S.P., M.Si. (Department of Agricultural Economics, Agricultural Faculty.
Universitas Padjadjaran. Jl. Raya Bandung-Sumedang km 21. Jatinangor. West Java.
INDONESIA)

Dr. İsmet Esenyel (Girne American University, School of Tourism and Hospitality,
CYPRUS)

Dr. Jam Nazeer Ahmad University of Agriculture, Faculty of Agriculture, Department of
Entomology, Faisalabad-PAKISTAN)

Dr. Jasmin Latoviç (Southern Federal Üniversitesi, RUSSIA)

Dr. Khalid Hussain (University of Agriculture, Faculty of Agriculture, Department of
Agronomy, Faisalabad-PAKISTAN)

Ph.D. Kusumiyati KUSUMIYATI, SP, M Agr. Sc.,. (Agronomy Department, Faculty of Agriculture, Universitas Padjadjaran Jl. Raya Bandung-Sumedang km 21. Jatinangor. West Java, INDONESIA)

Dr. Mazhar Rafique (University of Haripur, Faculty of Agriculture Sciences, Department of Soil & Climate Sciences-PAKISTAN)

Dr. Medeuova Galiya (Kazakh National Women's Pedagogical Universty, KAZAKHISTAN)

Dr. Md. Iqbal HOSSAIN (Bangladesh University, BANGLADESH)

Dr. Muhammad Arshad (University of Agriculture, Faculty of Agriculture, Department of Entomology, Faisalabad-PAKISTAN)

Dr. Muhammad Shahbaz Naeem (University of Agriculture, Faculty of Agriculture, Department of Agronomy, Faisalabad-PAKISTAN)

Dr. Mohammad Mehdizadeh (Univesity of Mohaghegh, Department of Agronomy and Plant Breeding, Ardabili-IRAN)

Dr. Muhammad Zahid Ihsan (Islamia Univeristy of Bahawalpur, Cholistan Institute of Desert Studies, Bahawalpur-PAKISTAN)

Dr. Muhammad Adnan (University of Swabi, Department of Agriculture, Swabi-PAKISTAN)

Dr. Muhammad Zubair Siddiqi (Hankyong National University, Department of Biotechnology, SOUTH KOREA)

Dr. Muhammad Nurdin YUSUF (Agribusiness Department. Agricultrural Faculty. University of Galuh. Jl. R.E. Martadinata No. 150. Mekarjaya, Kec. Baregbeg. Kab. Ciamis. West Java 46274. INDONESIA)

Dr. Mushtaque Ahmed Jatoi, (University of Zagreb, Department of Pomology, Zagreb, Croatia, Beijing, CHINA)

Dr. Murat Akkaya (Girne American Universty, Vocational School, CYPRUS)

Dr. Nabeel Khan Niazi (University of Agriculture, Faculty of Agriculture, Institute of Soil and Environmental Sciences, Faisalabad-PAKISTAN)

Dr. Niteesh Kumar Upadhyay (Galgotias University and South Ural State University RUSSIA)

Dr. Rana Nadeem Abbas (University of Agriculture, Faculty of Agriculture, Department of Agronomy, Faisalabad-PAKISTAN)

Dr. Rakesh GUPTA (Delhi University, INDIA)

Dr. Ristina Siti Sundari (University of Perjuangan Tasikmalaya, Faculty of Agriculture, Department of Agribusiness, Wezt Jawa-INDONESIA)

Dr. Safdar Bashir (Ghazi University, Faculty of Agricultural Sciences, Department of Soil and Environmental Sciences, Dera Ghazi Khan-PAKISTAN)

Dr. Sardar Alam Cheema (University of Agriculture, Faculty of Agriculture, Department of Agronomy, Faisalabad-PAKISTAN)

Dr. Shah Fahad (University of Haripur, Department of Agronomy, Haripur-PAKISTAN)

Dr. Saddam Hussain (University of Agriculture, Faculty of Agriculture, Department of Agronomy, Faisalabad-PAKISTAN)

Dr. Somayyeh Razzaghi (Sivas Science and Technology University, Faculty of Agriculture Science and Technology, TÜRKİYE)

Dr. Shitnaan E. Wapmuk (University Of Jos, Plateau State, Nigeria)

M.Sc. Setyo Budi Kurniawan (Universiti Kebangsaan Malaysia, Faculty of Engineering & Built Environment, Department of Chemical and Process Engineering, MALAYSIA)

Dr. Tahir Igbal, (Arid Agriculture University, Rawalpindi, PAKISTAN)

Dr. Wan Taek Im (Hankyong National University, Department of Biotechnology, SOUTH KOREA)

Dr. Viliana Vasileva (Agricultural Academy, Institute of Forage Crops, Forage Production and Livestock Department, Pleven-BULGARIA)

Dr. Yar Zar Chit (Sagaing University MYANMAR)

Dr. Zhongbing Chen (Czech University of Life Sciences Prague, Faculty of Environmental Sciences, Prague-CZECH REPUBLIC)

Dr. Zizis Vryzas (Democritus University, Thrace School of Agricultural & Forestry Sciences, Department of Agricultural Development, Orestiada-GREECE)

Dr. Zulfiqar Ahmad Dasti (University of Agriculture, Faculty of Agriculture, Institute of Soil and Environmental Sciences, Faisalabad-PAKISTAN)

IV. INTERNATIONAL CONFERENCE ON GLOBAL PRACTICE OF MULTIDISCIPLINARY SCIENTIFIC STUDIES

April 28-30, 2023 / Turkish Republic of Northern Cyprus

CONFERENCE PROGRAM

IMPORTANT, PLEASE READ CAREFULLY

- ❖ To be able to attend a meeting online, login via <https://zoom.us/join> site, enter ID "Meeting ID or Personal Link Name" and solidify the session.
 - ❖ The Zoom application is free and no need to create an account.
 - ❖ The Zoom application can be used without registration.
 - ❖ The application works on tablets, phones and PCs.
 - ❖ The participant must be connected to the session 5 minutes before the presentation time.
 - ❖ All congress participants can connect live and listen to all sessions.
 - ❖ Moderator is responsible for the presentation and scientific discussion (question-answer) section of the session.
- Points to Take into Consideration - TECHNICAL INFORMATION**
- ◆ Make sure your computer has a microphone and is working.
 - ◆ You should be able to use screen sharing feature in Zoom.
 - ◆ Attendance certificates will be sent to you as pdf at the end of the congress.
 - ◆ Requests such as change of place and time will not be taken into consideration in the congress program.

ÖNEMLİ, DİKKATLE OKUYUNUZ LÜTFEN

- ❖ Kongremizde Yazım Kurallarına uygun gönderilmiş ve bilim kurulundan geçen bildirimler için online (video konferans sistemi üzerinden) sunum imkanı sağlanmıştır.
 - ❖ Online sunum yapabilmek için <https://zoom.us/join> sitesi üzerinden giriş yaparak "Meeting ID or Personal Link Name" yerine ID numarasını girerek oturuma katılabilirsiniz.
 - ❖ Zoom uygulaması ücretsizdir ve hesap oluşturmaya gerek yoktur.
 - ❖ Zoom uygulaması kaydolmadan kullanılabilir.
 - ❖ Uygulama tablet, telefon ve PC'lerde çalışıyor.
 - ❖ Her oturumdaki sunucular, sunum saatinden 5 dk öncesinde oturuma bağlanmış olmaları gerekmektedir.
 - ❖ Tüm kongre katılımcıları canlı bağlanarak tüm oturumları dinleyebilir.
 - ❖ Moderatör - oturumdaki sunum ve bilimsel tartışma (soru-cevap) kısmından sorumludur.
- Dikkat Edilmesi Gerekenler- TEKNİK BİLGİLER**
- ◆ Bilgisayarınızda mikروفon olduğuna ve çalıştığına emin olun.
 - ◆ Zoom'da ekran paylaşma özelliğine kullanabilmelisiniz.
 - ◆ Kabul edilen bildiri sahiplerinin mail adreslerine Zoom uygulamasında oluşturduğumuz oturuma ait ID numarası gönderilecektir.
 - ◆ Katılım belgeleri kongre sonunda tarafınıza pdf olarak gönderilecektir
 - ◆ Kongre programında yer ve saat değişikliği gibi talepler dikkate alınmayacaktır

**Before you login to Zoom please indicate your name surname and hall number,
exp. H- 1, M. Firat BARAN**

CONGRESS LANGUAGES: **English and All Turkish Dialects**

28.04.2023 | SESSION-1

Kyrenia Time: 09:00–11:00

In Person Participation - The Olive Tree Hotel, Kyrenia

HEAD OF SESSION: Prof. Dr. Derya Yücel

Authors	Affiliation	Presentation title
Betül Kolay	GAP International Agricultural Research and Training Center	Direct Sowing in Wheat After Second Crop Maize Harvesting
Melekber Sülüoğlu Durul Hülya Ünver	Kocaeli University	New Trends in Strawberry Tree Breeding
Derya Yücel İrfan Erdemci Celal Yücel Medeni Yaşar Murat Koç	Şırnak University	Evaluation of Agricultural Characteristics of Chickpea Genotypes in Diyarbakir Ecological Conditions
Derya Yücel İrfan Erdemci Celal Yücel Medeni Yaşar Murat Koç	Şırnak University	Determination Of Some Technological Characteristics of Chickpea Genotypes Under Ecological Conditions of Diyarbakir
Zeynep Dumanoğlu Kağan Kökten Selim Özdemir	Bingol University	Determination of Some Physical Properties of Peas (<i>Pisum sativum</i> L.) Evaluated as Dry Food
Celal Yücel Cemal Deniz Derya Yücel İbrahim Halil Çetiner Celile Aylin Oluk	Şırnak University	Determination of Forage Quality and Its Related Characteristics of Some Pearl Millet Populations Under Gap Conditions
Celal Yücel Cemal Deniz Mustafa Apaydın Derya Yücel Rüştü Hatipoğlu	Şırnak University	Determination of Forage Yield and Its Related Characteristics of Some Pearl Millet Populations Under Gap Conditions
Gökhan Baktemur Ecem Kara Tolga Karaköy Yeter Çilesiz Faheem Shahzad Baloch Zemran Mustafa Betül Yücel Muhammad Tanveer Altaf Hatıra Taşkin Nihal Denli Davut Keleş	Sivas University of Science and Technology	Propagation Of Garlic Genotypes Grown in Turkey by Shoot Tip Culture
Yusuf Uzun Şeyda Çavuşoğlu Nurettin Yılmaz Sedat Kesici İsmail Acar Mustafa Emre Akçay Cemil Sadullahoğlu	Van Yuzuncu Yıl University	Doğal Mantar Türlerinde Antioksidan Kapasitesinin Mars Algoritması İle Tahmini
Meltem Uçar Yakup Kara Sevgi Kolaylı	European University of Lefke	Antioxidant Properties and Phenolic Components in The Leaf of Izabella Grape (<i>Vitis labrusca</i> L.)
Kader Aydın Mehmet Fırat Baran	Siirt University	Aronya yetiştiriciliğinde uygulanan mekanizasyon

(All speakers required to be connected to the session 10 min before the session starts)

Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

28.04.2023 | SESSION-2

Kyrenia Time: 11:30–13:30

In Person Participation - The Olive Tree Hotel, Kyrenia

HEAD OF SESSION: Prof. Dr. Halil Ibrahim Oguz

Authors	Affiliation	Presentation title
Meliha Feryal Sarikaya Muhammed Tatar İlker Yüce Ecem Kara Yeter Çilesiz Muhammad Azhar Nadeem Ömer Sözen Gökhan Baktemur Tolga Karaköy	Sivas University of Science and Technology	Ipbs-Retrotransposons Variations: The Evaluation of Genetic Diversity and Population Structure in International Sugar Beet Germplasm
Erdal Çağan Kağan Kökten	Bingol University	Microelement Contents of Alfalfa (<i>Medicago sativa</i> L.) Populations Cultivated in The Eastern Anatolian Region of Turkey
Erdal Çağan Kağan Kökten	Bingol University	Microelement Contents of Some Alfalfa (<i>Medicago sativa</i> L.) Cultivars
Siddık Keskin Nurhan Keskin Birhan Kunter	Van Yuzuncu Yıl University	Ankara-Kalecik Ekolojisinde Narince Üzüm Çeşidi için Sıcaklık ile Verim Arasındaki İlişkinin Modellenmesi
Suna Akkol Aslı Akilli	Van Yüzüncü Yıl University	Comparative Analysis of Lactation Curve Models in Holstein Friesian Cows
Ali Öztürk Recep Kara A. Fatih Fidan	Afyon Kocatepe University	Investigation of Heavy Metal Contamination and Microbiological Quality of Massage Oils Sold in Turkey
Halil Ibrahim Oguz Fırat Ege Karaat Mehmet İlhan Odabaşoğlu İlbiçe Oğuz	Adıyaman University	Early Season Grown of Mulberry (<i>Morus</i> spp.) Cultivation in The Mediterranean Region
İlbiçe Oğuz Ebru Kafkas	Cukurova University	A Study on The Biochemical Contents and Human Health Benefits of Raspberry (<i>Rubus idaeus</i> L.) Fruits
İlbiçe Oğuz Ebru Kafkas	Cukurova University	A Review on Determination of Physical and Biochemical Contents of Some Aronia (<i>Aronia</i> spp.) Berry Fruit Species
Salih Sezer Gülşah Akgül Esra Bilici	Uşak University	Rapid Etiological Diagnosis of Neonatal Calf Diarrhea with Immunochromatographic Test Kits in Esme District of Usak
Bülent Çakır İlker Inal Celal Yücel Derya Yücel Rüştü Hatipoğlu Hakan Özkan	Eastern Mediterranean Agricultural Research Institute	Determination of The Relations Between Forage Yield and Some Agricultural Characteristics in Pearl Millet Populations by Correlation and Path Analysis
Esra Çakır Hakan Özkan	Çukurova University	Evaluation of Yellow Rust (<i>Puccinia striiformis</i> f. sp. <i>tritici</i>) Disease in Durum Wheat (<i>Triticum durum</i> L.) Genotypes by Biplot Method in Cukurova Conditions

(All speakers required to be connected to the session 10 min before the session starts)

Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

28.04.2023 | SESSION-3

Kyrenia Time: 14:30–16:30

In Person Participation - The Olive Tree Hotel, Kyrenia

HEAD OF SESSION: Prof. Dr. Cetin Karademir

Authors	Affiliation	Presentation title
Gülşah Koyuncu Emine Karademir	Siirt University	The Effect of Different Applications of Calcium on Yield and Fiber Quality Characteristics in Cotton
Mehmet Kiliç Emine Karademir	Siirt University	The Effect of Different Foliar Fertilizer Applications on Cotton Yield and Fiber Quality Properties
Nurullah Tektaş Çetin Karademir	Siirt University	Determination The Effectiveness of Defoliation on Cotton (<i>Gossypium hirsutum</i> L.) At Different Development Periods
Hevin Kutat Çetin Karademir	Siirt University	Determination Effects of Sulfur Application on Yield and Fiber Quality Criteria in Cotton
Cihan Demir Osman Gökdoğan	Kırıkale University	Kırklareli İli Ceviz Atıklarının Biyokütlesi ve Enerji Potansiyeli
Gülcan Üren Mehmet Fırat Baran	Siirt University	Analysis of Some Energy Values of Grain Stem Wastes Grown In Şırnak Province
Mehmet Fırat Baran Ekrem Kadak	Siirt University	Input Usage and Gross Profit Analysis in Pomegranate Production: Siirt Province Example
Melekber Sülüsoğlu Durul Mehmet Polat	Kocaeli University	An Overview of Japanese Quince (<i>Chaenomeles japonica</i>)
Alamettin Bayav Bahri Karli Bektaş Kadakoğlu	Isparta University of Applied Sciences	Development of Foreign Trade in Medicinal and Aromatic Plants in Türkiye
Alamettin Bayav Bahri Karli Orhan Gündüz	Isparta University of Applied Sciences	Apple Production and Foreign Trade in The World and Türkiye
Alamettin Bayav Mevlüt Gül Orhan Gündüz	Isparta University of Applied Sciences	Changes in Red Meat Prices and Marketing Margin in Türkiye
Ali Kipel Cüneyt Yurt Hamit Yılmaz Yıldırım Adigüzel Zehra Sude Sari Mehmet Fatih Akay	Cukurova University	Time Series Based Financial Forecasting Models
İlker İnal Bülent Çakir Celal Yücel Celile Aylin Oluk Abdullah Çil Atalay Ergül	Eastern Mediterranean Agricultural Research Institute	Determining The Relations Between Some Feed Quality Parameters in Pearl Millet Populations by Correlation and Path Analysis

(All speakers required to be connected to the session 10 min before the session starts)

Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

28.04.2023 | SESSION-4

Kyrenia Time: 17:30–19:30

In Person Participation - The Olive Tree Hotel, Kyrenia

HEAD OF SESSION: Assoc. Prof. Dr. Nezahat Hamiden Karaca

Authors	Affiliation	Presentation title
Kürşad Sayın Abdullah Karaman	Selcuk University	Natural Heritage Asthma Cave and Tourism Potential
Alper Ateş Islam Islamzade	Near East University	Refugees and Tourism
Alper Ateş Özlem Dağdelen	Near East University	Tourism Sector in The Process of Adaptation to The European Green Deal
Nursel Aşan Baydemir Şükrü Tüzmen	Kırıkkale University	Distribution and The Conservation Status of Egyptian Fruit Bat in Cyprus
Duygu Toygür Eroğlu Umur Eroğlu	Bursa Uludağ University	Differences in Adaptive Behavior Levels of Salespeople in Automotive Dealers According to Their Demographic Characteristics
Kürşad Sayın Abdullah Karaman	Selcuk University	Evaluation Of Kitchen Chefs' Perspectives to Menu Planning in Restaurants in Mersin
Mehmet Biçici	Gaziantep University	Türk Siyasal Hayatında Hürriyet Partisi
Nebile Dayılar Nezahat Hamiden Karaca	Afyon Kocatepe University	Can Emotion Regulation Skills in Preschool Period Be Supported with Motor Creativity Activities?
Ayşegül Karakaya Nuray Kurtdele Fidan	Afyon Kocatepe University	A Qualitative Study on Raising Sustainable Environmental Awareness in Life Science Course
Nezahat Hamiden Karaca Halil Uzun Mehmet Oğuz Göle Rasim Aydoğuş	Afyon Kocatepe University	Teachers' Perceptions of Risky Play and Children's Motor Creativity Skills
Meryem Öksüzöğlü	Akdeniz Karpaz University	Historical Process of Inspection in Cyprus Turkish Education
Aytaç Demiray H. Arif Tunçez	Selcuk University	A Research on Jevons Paradox in Developing Countries
Eda İlhan	Bursa Uludağ University	Understanding The Effects of Inflation on Consumer Behavior
Gizem Öksüzöğlü	Final International University	Memories of Social Identity: Time and Space
Nedime Karasel Eylem Menteşoğulları Şevket Şafakoğulları	Uluslararası Kıbrıs University	Comparative Analysis of Research Published in The Last Five Years In The Field of Educational Audit In Trnc
Alim Malta Mete Ünal Girgen	Girne Final University	Gastronomide Yeni Trendler: Konsept Restoranlar Üzerine Bir Literatür Çalışması
Ilkcan Cilasın Mete Ünal Girgen	Girne Final University	Gastronomide Yeni Trendler: Kuzey Kıbrıs Slow Food Akımı Örneği

(All speakers required to be connected to the session 10 min before the session starts)

Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

28.04.2023 | SESSION-5

Kyrenia Time: 21:00–23:00

In Person Participation - The Olive Tree Hotel, Kyrenia

HEAD OF SESSION: Prof. Dr. Nuray Kurtdede Fidan

Authors	Affiliation	Presentation title
Mehmet Metin Yeliz Eratlı Şirin	Cukurova University	The Effect of Athlete Leadership on Team Cohesion in Team Sports
Tuğçe Metin Ibrahim Arslan	Cukurova University	An Assessment from A Green Economy Perspective; Kahramanmaraş-Centered Earthquakes
H. Arif Tunçez Aytaç Demiray	Selcuk University	According to Turkish Accounting Standards, The Cash Flow Statement and The Methods Used in The Analysis of The Cash Flow Statement
Nuray Kurtdede Fidan Ayşe Aydın Biol Karabulut	Afyon Kocatepe University	Social Studies Course in Distance Education According to Primary School Students
Dicle Özavci	Siirt University	Cas From Past to Present
H. Arif Tunçez Aytaç Demiray	Selcuk University	Logistics Costs and Accounting Transactions
Aytaç Demiray H. Arif Tunçez	Selcuk University	The Informal Economy and Its Effects on The Turkish Economy
Şemsi Yazıcı Demet Yavuz	Ege Universty	Effect of Cement/aggregate Ratio on Mechanical and Hydraulic Properties of Pervious Concrete
Gökhan Başman Erdoğan Karip Tuğçe Özcan Mehmet Serkan Yılmaz Cengiz Yaşin	Eti Krom	Enrichment of Fine-Grain Chrome Ore with Multi Gravity Separator, Pilot Scale Yield Analysis
Arkın Akalın Hasan Acar	Girne American University	Early Usg and Doppler Findings in Children of Mothers with Hashimoto's Disease
Volkan Çetintaş Mehmet Emin Sönmez	Gaziantep University	Golan Tepelerinin Mevcut Durumu ve Geleceği
Özlem Firtina Filiz Pars Uçağı	Gazi University	A Comparative Analysis of Martin Walser's Narrative "Ein Fliehendes Pferd" and Its Theatrical Adaptation
Şahin Ay	Siirt University	Violation Of Tax Privacy and Consequences
Şahin Ay	Siirt University	An Assessment On The European Union And Turkey's Financial Cooperation
Selim Akyulaf	University of Limerick	Turkish Cypriots' Social Identity Processes and Categorisation
Nihayet Koçyiğit	Batman University	Her Çağın Malzemesi Akıllı Polimerler ve Uygulama Alanları

(All speakers required to be connected to the session 10 min before the session starts)

Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

28.04.2023 | SESSION-1 | HALL-1

Kyrenia Time: 09:00–11:00

Ankara Time: 09:00–11:00

Meeting ID: 869 2364 3653 / Passcode: 282930

HEAD OF SESSION: Assoc. Prof. Dr. Korkmaz Bellitürk

Authors	Affiliation	Presentation title
Sebiha Erol Emine Budakli Çarpici Barış Bülent Aşık	Bursa Uludağ University	The Effects of Sowing Date and Harvest Stages on Silage Quality in Quinoa (<i>Chenopodium quinoa</i> Willd.)
Zohaib Hassan Sain	Superior University	Students Assessment of Online Education during the Covid-19 Epidemic
Meltem Türkeri	Eastern Mediterranean Agricultural Research Institute	Breeding Research on Dried Pea Suitable for Mediterranean Climate
Pushkar Pandey Renu Kundu	Indian Institute of Technology	UX study on Handheld Augmented Reality Games by Applying Spradley's Nine Dimensions Design Principle
Korkmaz Bellitürk	Tekirdag Namık Kemal University	Determination of Plant Nutrition Capacities of Agricultural Areas by Soil Analysis: The Case of Ipsala District of Edirne Province
Pushkar Pandey	Indian Institute of Technology	Applying UX Principles to find Pre-Patterns in Handheld Augmented Reality Games
Korkmaz Bellitürk	Tekirdag Namık Kemal University	Productivity Parameters Decreased Over Time in Agricultural Soils: Soil Organic Matter and The Case of Süleymanpaşa District of Tekirdağ Province
Khanifah Auliana Sultan Mubarak	Halal Center of UIN	Halal Behavior in Media Technology System
Korkmaz Bellitürk	Tekirdag Namık Kemal University	Productivity Parameters Destroyed Over Time in Agricultural Soils: Soil Reaction (Ph) and The Case of Keşan District of Edirne Province
Balasubramani G L Rinky Rajput Manish Gupta Pradeep Dahiya Jitendra K Thakur Rakesh Bhatnagar Abhinav Grover	Jawaharlal Nehru University	Structure-based Drug Repurposing to Inhibit the DNA Gyrase of <i>Mycobacterium tuberculosis</i>
Sabiq Muhammad Zaki Hendri Hermawan Adinugraha	UIN K.H. Abdurrahman Wahid Pekalongan	The Role of Traditional Markets in Community Economic Growth

(All speakers required to be connected to the session 10 min before the session starts)

Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

28.04.2023 | SESSION-1 | HALL-2

Kyrenia Time: 09:00–11:00

Ankara Time: 09:00–11:00

Meeting ID: 869 2364 3653 / Passcode: 282930

HEAD OF SESSION: Prof. Dr. Aydın ADİLOĞLU

Authors	Affiliation	Presentation title
Harun Hurma Korkmaz Bellitürk İsmet Başer Alpay Balkan	Tekirdağ Namık Kemal University	Economic and Environmental Evaluation of Sustainable Durum Wheat Production
Gheorghe Giurgiu Manole Cojocaru	Titu Maiorescu University	Natural Modulation of The Gut Microbiota in Dogs with Spinal Cord Injury
Bağnu Çolakoğlu Harun Hurma	Tekirdağ Namık Kemal University	Evaluation of Producer Awareness on The Potential Uses of Agricultural Wastes
Mahmood Ahmed	University of Education	Investigation of Minerals in Fruit Peels Powder: Ultrasound Assisted Extraction Followed by Flame Atomic Absorption Spectrometry
Aydın Adiloğlu Serdar Kadakal	Tekirdağ Namık Kemal University	Investigation of Suitable Extraction Methods for Determining the Available Sulphur Contents of Trakya Region Soils Which Growing Canola (<i>Brassicca napus oleifera</i> spp)
Sevinç Khasayeva Saida Siracova Fidan Gurbanova	Azerbaycan Devlet Ekonomi University	Health Problems Caused by Urbanization and Solutions
Aydın Adiloğlu Tuncay Sari	Tekirdağ Namık Kemal University	An Investigation of Some Heavy Metal Pollution Along the Tem Motorway Agricultural Areas in Edirne
P. Manoj Kumar J. Sravani	Department of Civil Engineering	Analysis and Design of Residential Building on Wind Load Analysis
Esra Cura Sevin Teoman Duran Meryem Ipek Ahmet Ipek	Bursa Uludağ University	Farklı Ön Uygulamaların Sarımsak (<i>Allium sativum</i> L.) Tohumlarında Dormansinin Kırılması Üzerine Etkileri
Nurhan Keskin	Van Yuzuncu Yıl University	Effective and Economical Biostimulant in Proper with the Vision of Sustainable Viticulture: Seaweed Extract
Dinda Safira Hendri Hermawan Adinugraha	UIN K.H. Abdurrahman Wahid Pekalongan	Self-Awareness of the Khamr Effects

(All speakers required to be connected to the session 10 min before the session starts)

Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

ABSTRACTS

**AVRUPA BİRLİĞİ VE TÜRKİYE’NİN, MALİ İŞBİRLİĞİ ÜZERİNE BİR
DEĞERLENDİRME**

Dr. Öğr. Üyesi Şahin AY Orcid ID: 0000-0002-3036-2155

Siirt Üniversitesi Kurtalan Meslek Yüksekokulu

E-mail: sahinay@siirt.edu.tr

Özet

Yirmi yedi ülkeden oluşan Avrupa Birliği, dünya ekonomisi için son derece önem arz etmektedir. Hem birlik içerisindeki ülkeler arasındaki mali yardımlaşma hem de üyelik başvurusunda bulunan ülkelere yapılan mali yardımlar ekonomi kapsamında tartışılmaktadır. Avrupa Birliği’nin önemli amaçları arasında ortak bir pazarın kurulması ekonomi politikalarının üye ülkeler içerisinde birbirleriyle uyumlaştırılması yer almaktadır. Bu doğrultuda Avrupa Sosyal Fonu kurulmuştur. Türkiye’nin Avrupa Birliği ile olan ekonomik ilişkilerini iki döneme ayırmak mümkündür. Bu dönemlerden ilki adaylık öncesi mali yardımların yapıldığı dönemdir. Bu süreç 1964-1999 arasındaki yılları kapsamaktadır. İkinci dönem ise 2000 yılından günümüze kadar olan adaylık sonrası dönemdir. Mali yardımların önemli bir kısmı Avrupa Birliği tarafından verilen krediler ve hibeler olarak karşımıza çıkmaktadır. Süreç içerisinde özellikle IPA kapsamında uygulanan mali yardımlar oldukça önemlidir. Mali yardımların müktesebat uyumu, uyum için idari kapasite ile ekonomik ve sosyal uyum projeleri temelinde hibeler verilmektedir. Mali yardımlar konusunda bir takım eksikliklerin olduğu da değerlendirilmiştir. Bu hususta Avrupa Birliği’nin ekonomik yapısını iyi bilmek, AB mevzuatına hâkim olmak ve açılan ilanlar kapsamında hareket etmek gerekmektedir. Yine mali protokoller, tamamlayıcı protokol ve özel mali işbirliği çerçevesinde alınan mali yardımların incelenmesi önemlidir. Üzerinde durulması gereken bir diğer durum ise 2021-2027 dönemini kapsayan IPA III. döneminde belirlenen yaklaşık 14 milyar euroluk bütçenin adil paylaşımdan kaynaklı olacak biçimde yararlanılmasının sağlanmasıdır.

Anahtar Kelimeler: Avrupa Birliği, Mali Yardım, IPA

**AN ASSESSMENT ON THE EUROPEAN UNION AND TURKEY FINANCIAL
COOPERATION**

Abstract

The European Union, consisting of twenty-seven countries, is extremely important for the world economy. Both the financial assistance between the countries in the union and the financial aids to the countries applying for membership are discussed within the scope of economy. Among the important objectives of the European Union is the establishment of a common market and the harmonization of economic policies within the member states. Accordingly, the European Social Fund was established. It is possible to divide Turkey's economic relations with the European Union into two periods. The first of these periods is the period in which financial aids are made before the candidacy. This process covers the years between 1964-1999. The second period is the post-candidacy period from 2000 to the present. A significant part of the financial aids appear as loans and grants given by the European Union. In the process, especially the financial aids applied within the scope of IPA are very important. Grants are awarded on the basis of financial aid alignment with the *acquis*, administrative capacity for harmonization, and economic and social cohesion projects. It has also been evaluated that there are some deficiencies in financial aids. In this regard, it is necessary to know the economic structure of the European Union well, to have a good command of the EU legislation and to act within the scope of the announcements. It is also important to examine the financial aids received within the framework of financial protocols, complementary protocols and special financial cooperation. Another situation that needs to be emphasized is the IPA III, which covers the 2021-2027 period. It is to ensure that the budget of approximately 14 billion Euros determined in the period of

Özet

Mevcut çalışmada, Soğanlı yaylasında (Kars/Sarıkamış) toplanan *Lepista nuda* (Bull.) Cooke, *Hypholoma*, *Agaricus* sp., *Paxillus involutus* (Batsch) Fr., *Suillus luteus* (L.) Roussel, *Marasmius oreades* (Bolton) Fr., *Lyophyllum* sp., *Hebeloma* sp. ve *Lactarius spp* toplam dokuz adet yenilebilir mantar türü toplandı. Çalışmanın amacı mantar türlerinde toplam fenolik ve

antioksidan kapasitesi içerik analizleri yapılarak elde edilen sonuçların, çok değişkenli uyarlanabilir regresyon uzanımları (MARS) algoritması aracılığıyla mantarlarda bağımlı ve bağımsız değişkenlerin antioksidan kapasitesi üzerine etkisini ortaya koymaktır. Çalışmadan elde edilen bulgulara göre, en yüksek antioksidan kapasitesi sırasıyla 62.12 (*Marasmius oreades*), 60.45 (*Paxillus involutus*), 42.40 (*Suillus luteus*), 38.68 (*Lyophyllum* sp.), 28.47 (*Agaricus* sp.), 25.77 (*Repsida nuda*), 24.65 (*Hebeloma* sp.), 22.34 (*Lactarius* sp.) ve 13.79 $\mu\text{mol TE g}^{-1}$ ile *Hypholoma* türünde tespit edildi. Ayrıca, MARS algoritmasına göre *Marasmius oreades* ve *Paxillus involutus* mantar türlerinin antioksidan kapasitesi üzerinde artan bir değere sahip olmasının yanı sıra artan değerlerde toplam fenolik içeriğinin de antioksidan kapasitesi üzerinde pozitif bir etkiye sahip olduğu gözlemlendi.

Anahtar Kelimeler: Doğal mantar türleri, toplam fenolik içeriği, antioksidan kapasitesi, MARS

Abstract

Izabella grape (*Vitis labrusca* L.) is one of the endemic grape species of the Black Sea region, and the leaves of this species, which are called fragrant grapes, are used for cooking, and wrapping. In this study, the antioxidant properties and phenolic composition of Isabella grape leaves, collected from Akçaabat of Trabzon, Turkey were investigated. The Total Phenolic Content (TPC), Total Flavonoid Content (TFC), total antioxidant capacity and phenolic profile of the 70% ethanolic extracts of dried fresh grape leaves were examined. As a result of the HPLC-PDA analysis with 25 phenolic components including resveratrol, the resveratrol was not detected in the extract, but ellagic acid and rutin were determined as the major phenolic components. In addition, chromogenic acid, luteolin, quercetin, chrysin, pinocembrin, apigenin, and p-OH benzoic acid were determined in a lower concentration. The average TPC and TFC values of grape leaf extracts were measured as 23.327±0.049 mg GAE/g and 2.598±0.105 mg QUE/g respectively. The total antioxidant capacity of grape leaf extracts was measured in terms of Ferric Reducing Antioxidant Power (FRAP) and 2,2-Diphenyl-1-picrylhydrazyl (DPPH) radical scavenging activity and was found to be 215.501±1.326 µmol Fe₂SO₄.7H₂O/g and 0,299±0,011 mg/mL, respectively. As a result, Izabella grape leaf was determined as a food with high antioxidant capacity and high antioxidant properties.

Keywords: Izabella grape, leaf, *Vitis labrusca* L., antioxidant, ellagic acid, rutin

Özet

Bu araştırmada, rastgele örneklem metoduyla seçilen farklı firmalara ait ve farklı özleri içeren 10 adet, ISO9001 standardına sahip, aromatik masaj yağının ağır metal içeriği ve mikrobiyolojik kontaminasyon düzeylerinin belirlenmesini amaçlanmıştır. Ağır metal düzeylerinin belirlenmesinde ICP-MS tekniği kullanılmıştır. Mikrobiyolojik kontaminasyonun belirlenmesi amacıyla, aerobik mezofil genel bakteri, maya ve küf sayımı, Enterobacteriaceae, koliform bakteri sayımı, *Escherichia coli* sayımı, Staphylococcus-Micrococcus varlığı analizleri gerçekleştirilmiştir. Masaj yağlarında gerçekleştirilen analizlerde hiçbir örnekte Maya/Küf, Koliform Bakteri *E. Coli* olmadığını, bununla birlikte 2 örnekte Enterobactericea ve 5 örnekte Staphylococ üremesi olduğunu ortaya koymuştur. Masaj yağı örneklerinin hiçbirinde Arsenik tespit edilmemiştir. Ancak, bazı örneklerde alüminyum, kurşun, civa, kadmiyum gibi oldukça toksik ağır metallerin varlığı, endişe verici bir durum olarak görülmüştür. Bir numunede yüksek çıkmış olsa da çinko önemli bir toksik metal olarak görülmemektedir. Bu sonuçlar, masaj yağlarında bir halk sağlığı problemi oluşturabileceği için, ürünlerin üretim ve pazarlaması süreçlerinin daha dikkatli izlenmesi ve mevcut standartların yeniden gözden geçirilmesinin önemli olacağını düşündürmektedir.

Anahtar Kelimeler: Aromatik Yağlar, Mikrobiyoloji, Ağır Metal, Masaj

**RAPID ETIOLOGICAL DIAGNOSIS OF NEONATAL CALF DIARRHEA WITH

Abstract

This study was carried out for rapid etiological diagnosis of neonatal calf diarrhea by using immunochromatographic test kits in the Eşme district of Uşak. The animal material of the study consisted of 100 1-28 days old neonatal calves of different breeds and genders in the Eşme district of Uşak. Stool samples were taken from calves with diarrhea as a result of clinical examination. When stool samples were examined by a rapid diagnostic test, none of the disease factors sought in the study were found in 10 (10%) of 100 calves, while one or more disease factors were detected in 90 (90%) of calves. Rotavirus was detected in 27 (27%) calves, Escherichia coli 14 (14%) calves, Coronavirus in 8 (8%) calves, Clostridium perfringens in 19 (19%) calves, Cryptosporidium spp. in 17 (17%) calves, Rotavirus + Coronavirus in 2 (2%) calves, Rotavirus + Clostridium perfringens in 1 (1%) calf, Rotavirus + Cryptosporidium spp. in 1 (1%) calf, and Escherichia coli - Clostridium perfringens in 1 (1%) calf. As a result, data on the presence and distribution of enterogenous pathogens that cause diarrhea in neonatal calves in the Eşme district of Uşak were presented, and it was concluded that it would shed light on future studies on diarrheal calves in the Eşme.

Özet

Bu çalışmada, Türkiye'nin Kırklareli ilindeki ceviz atıklarının biyokütle ve enerji potansiyeli hesaplamaları yapılmıştır. Çalışmada Türkiye İstatistik Kurumu verileri (2022 yılı) ve diğer çalışmalar referans olarak kullanılmıştır. Kırklareli ilinde hububat ve diğer bitkisel ürünlerin toplam alanı 243257.2 ha, nadas alanı 306.7 ha, sebze alanı 1448.1 ha, meyveli içecek ve baharat bitkileri alanı 3216.5 ha ve toplam tarım alanı 248228.5 ha'dır. Kırklareli ilinde 2022 yılında 1762.4 ha alanda ceviz üretimi yapılmış ve 2279 ton ceviz üretimi gerçekleştirilmiştir. Kırklareli ilinin toplam ortalama ceviz taze atık potansiyeli 158616 ton olarak hesaplanmıştır. Bu miktardaki ceviz üretiminin toplam 48466 ton/yıl kuru madde verebileceği hesaplanmıştır. Kırklareli ilinde ceviz atıklarından elde edilebilecek toplam enerji potansiyeli 948479.6 GJ/yıl ve 22658.1 TEP/yıl olarak hesaplanmıştır. Bu atıklar enerji dönüşüm sistemlerinin kullanılmasıyla enerjiye dönüştürülerek tarım işletmelerinin enerji ihtiyaçları için enerji kaynağı olarak kullanılabilir.

Anahtar Kelimeler: Biyokütle, ceviz, Kırklareli.

BIOMAS AND ENERGY POTENTIAL OF WALNUT WASTES IN KIRKLARELI PROVINCE

Abstract

In this study was done the biomass and energy potential computations of the walnut wastes in Kırklareli province of Turkey. Turkish Statistical Institute data (2022 year) and other studies were used as reference in study. The total area cultivated with cereals and other herbal products is 243257.2 ha, fallow area is 306.7 ha, vegetable area is 1448.1 ha, fruits beverage and spice herbs areas are 3216.5 ha and the total agricultural area covers 248228.5 ha in Kırklareli province. Walnut cultivation was taken place in area of 1762.4 ha and yielded 2279 tons of walnut in Kırklareli province in 2022. The total average walnut fresh waste potential of Kırklareli province was computed as 158616 tons. It was computed that this quantity of walnut production can yield a total of 48466 ton/year dry matter. The total energy potential that can be acquired from walnut wastes in Kırklareli province were computed as 948479.6 GJ/year and 22658.1 TEP/year. These wastes can be converted into energy by the use of energy conversion systems and used as an energy source for the energy needs of agricultural farms.

Abstract

The process of financial planning in business is designed to forecast future financial trends and determine how best to use financial resources in pursuit of the organization's short- and long-term objectives. This study aims to develop financial forecasting models using univariate time series methods. For this purpose, deep learning based Convolutional Neural Networks – Long Short Term Memory (CNN- LSTM), Multi-Horizon Quantile Recurrent Forecaster (MQRNN) and statistics based AutoRegressive Integrated Moving Average (ARIMA) have been used. The performance of the developed models has been evaluated using Mean Absolute Percentage Error (MAPE). The dataset includes 291 rows of total revenue and cash revenue data in weekly format from January 1st, 2017 to July 31st, 2022. Forecast models have been developed for two different months randomly selected from the dataset. The MAPE's obtained using CNN-LSTM, MQRNN and ARIMA for total revenue are 4.28%, 5.61% and 6.31% for June and 2.45%, 4.24% and 3.28% for July, respectively. The MAPE's obtained using CNN-LSTM, MQRNN and ARIMA for cash revenue are 5.09%, 4.15% and 3.41% for June and 4.77%, 2.44% and 5.88% for July, respectively. The results show that CNN-LSTM model for total revenue forecasting outperforms other models whereas there is no specific order on the performance of the models for cash revenue forecasting.

Özet

Yem bitkilerinde yem kalitesi ve kalite ile ilişkili özelliklerin bilinmesi, ıslah çalışmalarına yardımcı olmasının yanı sıra hayvan besleme içinde önemlidir. Bu çalışmada, ICRISAT'tan temin edilen 225 adet inci darı (*Pennisetum glaucum* (L.) R. Br.) popülasyonunun yem kalitesi ve kalite ile ilişkili bazı özelliklerin korelasyon ve path analizi ile belirlenmesi amaçlanmıştır. Araştırma, Adana'da 2021 yılı ikinci ürün yetiştirme döneminde, Alfa Latis (15 x 15) deneme deseninde yürütülmüştür. Bitkilerin hasatları, salkımdaki tanelerin süt-hamur olum dönemine denk geldiği zamanda yapılmıştır. Araştırma sonucunda; nispi yem değerinin (NYD) 75.14-124.81, kuru ot verimlerinin 239.31-2425.58 g/bitki, asit deterjan lif (ADF) %33.43-%45.73, nötral deterjan lif (NDF) %46.85-%65.96, ham protein (HP) oranının %5.59-11.94, kuru madde

oranı (KMO) %90.94-%97.08, kuru madde tüketiminin (KMT) %1.82-%2.56, sindirilebilir kuru madde (SKM) oranının %53.28-%62.85 ve net enerji laktasyon değerinin 1.247-1.421 mcal/kg arasında değiştiği saptanmıştır. Yapılan korelasyon analizi sonucunda; nispi yem değeri (NYD) ile HP ($r=0.575^{**}$), KMT ($r=0.982^{**}$), SKM ($r=0.935^{**}$) ve net enerji ($r=0.942^{**}$) arasında olumlu önemli bir ilişki saptanırken, ADF ($r=0.942^{**}$), NDF ($r=-0.980^{**}$) ve KMO ($r=-0.165^{**}$) arasında olumsuz önemli bir ilişki saptanmıştır. NYD ile kuru ot verimi ($r=0,039$) arasında olumlu önemsiz bir ilişki saptanmıştır. Path analizi sonuçlarına göre; KMT ve net enerjinin NYD'ye doğrudan etkilerinin olumlu (sırasıyla 0.6325 ve 0.3044) ve çok yüksek (sırasıyla %60.81 ve %30.64), kuru ot verimi ve ADF'nin ise olumlu (sırasıyla 0.0075 ve 0.0763) ve yüksek (sırasıyla %8.71 ve %7.68) olduğu saptanmıştır.

Anahtar Kelimeler: İnci darı (*Pennisetum glaucum*), Popülasyon, Ot Kalitesi, Korelasyon, Path analizi

Özet

Akdeniz Havzasının sıcak noktasında yer alması Kıbrıs'ın biyolojik bakımdan korumasını daha da önemli hale getirmektedir. Son yıllarda Kıbrıs'ta biri meyveyle, 21'i böceklerle beslenen 22 yarasa türünün yayılışı belirlenmiştir. Türkiye'de yayılış gösteren 39 yarasa türü ile karşılaştırıldığında, izole bir ada için bu oldukça önemli bir sayıdır. Güney Kıbrıs'tan Kıbrıs yarasaları üzerine birçok çalışma yapılmış olmasına karşılık ne yazık ki Kuzey Kıbrıs yarasa türleri için yapılan çalışmalar çok azdır. Palearktik bölgede yayılış gösteren ve Afro-tropikal bir tür olan Mısır meyve yarasası, *Rousettus aegyptiacus*, adadaki tek meyve yarasasıdır. Fırsatçı bir toplayıcı olan bu türün adadaki diyet tercihi, mevsimsel meyvelere ve tüneme ortamına göre farklılık göstermektedir. Bu çalışmada Güzelyurt, Gazimağusa, Beşparmak dağlarından meyve yarasasının yeni yayılış yerleri kayıt edilmiştir. Güzelyurt'taki mağaralar yıl boyunca her iki eşey tarafından kullanılmaktadır. Bu mağaralarda aynı anda uçabilen yavrular ile çiftleşen ergin bireyler de kaydedilmiştir. Bir akar türü olan ve Pteropodidae familyası ile özelleşmiş *Meristaspis* sp., türü adadan ilk defa bu çalışma ile tespit edilmiştir. Günümüzde Kuzey Kıbrıs'taki Mısır meyve yarasası popülasyonları, çeşitli antropojenik tehditler nedeniyle önemli ölçüde azalmaktadır. Giderek artan turizm faaliyetleri, elektrik telleri, yoğun aydınlatma, mağaraların girişlerinde yanlış tasarlanmış kapılar, zehirlenme, yasa dışı öldürme, meyve ağaçlarının kesilmesi ve kalker ocakları gibi antropojenik etkiler türün adada yayılışını geri dönüşü olmayan şekilde etkilemektedir. Bu çalışma ile, türün Kuzey Kıbrıs coğrafyasına ilişkin mevcut yayılış ve koruma durumunu belirlenmiş ve etkili bir koruma için yaşadığı habitatların önceliklendirilmesine yönelik öneriler sunulmuştur.

Anahtar kelimeler: Mısır Meyve Yarasası, Palearktik bölge, Antropojenik tehditler

Özet

Literatürde; satış elemanlarının müşterileriyle etkileşim halindeyken sergiledikleri uyarlamacı davranış düzeylerinin satış performansları üzerinde belirleyici etkileri olduğuna dair anlamlı sonuçlar sunulmaktadır. Akademik verilerin ışığında, uygulamacılar tarafından da uyarlamacı satış davranışı sergilemek için gerekli özelliklere sahip satış elemanlarının istihdam edilmesi ve tutulmasına dair verilen önemin gün geçtikçe artmakta olduğu görülmektedir. Uyarlamacı satış davranışı, “müşteri ile etkileşim sırasında algılanan bilgilere dayalı olarak satış davranışlarının değiştirilmesi” olarak tanımlanmaktadır (Weitz, 1981). Durumsallık teorisiyle öne sürülen uyarlamacı satış davranışına göre; satış elemanları karşılaştıkları her bir müşterinin kendine özgü olduğunu kabul ederek, davranışlarını müşterinin durumuna göre değiştirebilme esnekliğine sahip olduklarında, müşterinin o ürünü ya da hizmeti satın alma kararı üzerinde pozitif etki yaratabilmektedirler. Uyarlamacı davranış düzeyleri yüksek olan satış elemanları; müşterilerinin tepkilerini gözlemleyerek, hızlı strateji ayarlamaları yapabilmektedirler. Dikkatli gözlemleri, müşteri ihtiyaçlarını ve beklentilerini de anlamalarını kolaylaştırmaktadır (Zhou & Charoensukmongkol, 2021). Bu sayede satış elemanı-müşteri arasında uyum sağlanarak, müşterilerle olan ilişkiler de beslenmektedir. Satış elemanları, müşterilerine uygun olarak farklı satış sunumları kullandıklarında ve davranışlarında ayarlamalar yaptıklarında yüksek düzeyde uyarlamacı davranış sergilemekte, buna karşılık tüm satış ortamlarında aynı satış sunumunu kullandıklarında ise uyarlamacı davranış düzeyleri düşük olmaktadır (Spiro & Weitz, 1990). Çalışmada; satış elemanlarının uyarlamacı davranış düzeylerinin ölçümü için Spiro ve Weitz (1990)’in geliştirdikleri ADAPTS ölçeğine dayanarak, Robinson vd. (2002) tarafından kısa versiyonu geliştirilen tek boyutlu beş maddelik ADAPTS-SV ölçeği kullanılmıştır. Değerlendirmeler için ise 5’li Likert Ölçeği kullanılmıştır. Araştırma, otomotiv sektörü

bayilerinde müşterilerle direkt iletişim halinde olan satış elemanları üzerinde gerçekleştirilmiştir. Araştırma neticesinde elde edilen bulgular cinsiyete göre incelendiğinde; kadınların erkeklere oranla daha yüksek düzeyde uyarlamacı davranış sergiledikleri, medeni durumlarına göre incelendiğinde, bekarların evlilere oranla daha yüksek düzeyde uyarlamacı davranış sergiledikleri ve eğitim düzeylerine göre incelendiğinde ise; eğitim düzeyi arttıkça uyarlamacı davranış düzeylerinin de anlamlı bir şekilde arttığı tespit edilmiştir. Bulgular pozisyona göre incelendiğinde, satış müdürlerinin, satış danışmanlarına oranla daha fazla uyarlamacı davranış sergiledikleri dikkat çekmekte ve bu bulgu da eğitim düzeyine göre anlamlı artışı desteklemektedir. Örneklemin satış deneyimine göre incelenmesi yapıldığında ise; deneyime göre anlamlı bir farklılaşma tespit edilmemiştir. Benzer şekilde yaşa göre incelendiğinde de anlamlı bir bulgu ortaya çıkmamıştır.

Özet

Beyaz devrim olarak nitelendirilen 1950 seçimleri Türk siyasal hayatının dönüm noktalarından biridir. Türkiye’de iktidar ilk kez demokratik seçimler sonucu el değiştirmiştir. Demokrat Parti’nin iktidara geldiği bu döneme 487 meclis üyeliğinden 408 üyelik kazanmıştır. almıştır. 1954 seçimlerine hazırlanan Demokrat Parti ülkedeki meclisi 1953’te olağanüstü toplantıya çağırmıştır. Demokrat Parti meclis grubu yeni çıkaracakları kanunların toplumsal ve siyasi düzeni koruyarak hazırlanması bahanesiyle meclise sunulan önerilerin de kabulü gerçekleşmeden meclisi tatile çıkarma kararı almıştır. 1953 yılında iktidar ve muhalefet ilişkileri de gerginleşmeye başlamıştır. Cumhuriyet Halk Partisi’nin Ulus Gazetesi’nde Demokrat Partiye karşı yaptığı propagandasına karşı Adnan Menderes *Moskova Radyosu’nun yayınları kadar iğrenç*” diyerek iki parti arasındaki ilişkiyi tanımlamıştır. 1954 seçimlerinden sonra muhalefet güç kaybederken Demokrat Parti kendi içinde parti muhalefeti belirginleşmeye başlamıştır. Demokrat Parti’nin ülkede uyguladığı ekonomi politikaları toplumsal hoşnutsuzluğu arttırmıştır. Tek parti rejiminin devrilmesi amacı ile bir araya gelen Demokrat Partililer arasında fikir çatışması ve ayrılıklar yaşanmaya başlamıştır. Bu ayrılıklar Demokrat Partinin iktidar sürecinde sürekli artmıştır. İktidar sahiplerinin demokratik rejimin gelişmesini sağlayacak asgari bir zihniyete sahip olmaması sonucu program ve tüzüğündeki ana prensip ve hedeflerden aykırı bir yol tutmuş olması ile sonuçlanmıştır. Bu noktada partide aradığını bulamayan muhalefet düşünce ve ifade özgürlüğü amacıyla kurulan Demokrat Partiden ayrılarak yeni partiler kurmaya başlamışlardır. Bu partilerden biri olan Hürriyet Partisi Çalışma konumuzu oluşturmuştur.

Anahtar Kelimeler: Hürriyet Partisi, Demokrat Parti, Türk Siyasal Hayatı

Özet

Bu araştırmada Hayat Bilgisi dersi okutan sınıf öğretmenlerinin sürdürülebilir çevreye ilişkin görüşlerini ortaya çıkarmak, öğrencilere sürdürülebilir çevre bilinci kazandırmak adına yapmış oldukları etkinlikler ve yürüttükleri projeler hakkında bilgi edinmek, sürdürülebilir çevre bilincinin oluşmasına engel olan etmenler ve bu bilincin oluşturulması için öğretmen önerilerini belirlemek amaçlanmıştır. Araştırma nitel araştırma desenlerinden fenomenolojik yaklaşımla gerçekleştirilmiştir. Araştırmanın çalışma grubunu 2021/2022 eğitim öğretim yılında Afyonkarahisar ilinin merkezinde bulunan devlet okullarında görev yapan ve ölçüt örnekleme ile belirlenen 9 kadın, 7 erkek olmak üzere 16 sınıf öğretmeni oluşturmaktadır. Araştırmanın verileri açık uçlu on sorulardan oluşan yarı yapılandırılmış görüşme formu ile toplanmış, toplanan veriler ise tematik analizi ile incelenmiştir. Araştırma sonucunda katılımcıların çoğunluğunun sürdürülebilir çevre bilincinin küçük yaşlarda kazandırılması gerektiğini belirtmişlerdir. Bu bilincin oluşturulmasında ailenin bilinçli olmasının ve aile desteğinin olması ön koşul olarak bildirmişlerdir. Katılımcıların görüşlerinden elde edilen bulgular doğrultusunda öğretmenler, rol model olunması, eğitim yöneticilerinin desteğinin artırılması, öğretim programlarında sürdürülebilir çevre ile ilgili kazanımların artırılması ve kazanımların içeriğinin uygulamaya ve yaparak-yaşayarak öğrenmeye dayalı bir şekilde düzenlenmesi, velilerin bilinçlendirilmesi önerisinde bulunmuşlardır.

Özet

Çalışmada Öğretmenlerin riskli oyun algıları ile çocukların motor yaratıcılık becerileri arasındaki ilişkinin incelenmesi amaçlanmıştır. Bu amaç doğrultusunda 2022-2023 Afyonkarahisar İl Millî Eğitim Müdürlüğü'ne bağlı okullarda görev yapmakta olan okul öncesi öğretmeni ve aynı öğretmenlerin sınıfında yer alan çocuklar çalışma grubunu oluşturacaktır. Çalışmada öğretmenlere Torrance (1981) tarafından geliştirilen Karaca ve Aral (2017) tarafından Türkçe'ye uyarlanan Eylem ve Harekette Yaratıcı Düşünme Testi" ölçme aracı ile Karaca ve Uzun (2020) tarafından geliştirilen "Erken Çocukluk Riskli Oyun Değerlendirme Aracı-Öğretmen Formu (EÇRODA-ÖF)" kullanılacaktır. Çalışmada veri analizi için veriler toplandıktan sonra normallik testi yapılacak ve test sonucuna göre analizler belirlenecektir. Araştırmadan elde edilen sonuçlar doğrultusunda öneriler bulunulacaktır.

Anahtar Kelimeler: risk, riskli oyun, yaşam becerileri, erken çocukluk dönemi

KIBRIS TÜRK EĞİTİMİNDE DENETİMİN TARİHSEL SÜRECİ

Doç. Dr. Meryem ÖKSÜZOĞLU (Orcid ID: 0009-0006-3226-8898)

Akdeniz Karpaz Üniversitesi

E-mail: meryem.oksuzoglu@akun.edu.tr

Özet

Bu çalışma, tarihsel süreç içinde Kıbrıs Türk eğitim sisteminde denetimin günümüze gelene kadar geçirdiği süreçlerin incelenmesi amacıyla yapılmıştır. Yönetim süreçlerinin önemli bir basamağı olan denetim, diğer tüm yönetim alanlarında olduğu gibi eğitim yönetiminin de önemli bir aşamasıdır. Bir kurumun gelişimi ve değişimi için denetim kaçınılmaz olmaktadır. Eğitim sisteminin en önemli unsurlarından olan öğretmenin de eğitim ve öğretimde verimli ve etkili olabilmesi çağdaş denetim uygulaması ile başarıya ulaşmaktadır. Ulaşılan kaynaklarda Kıbrıs Türk eğitimini denetimi ile ilgili Osmanlı yönetimi (1571-1878) dönemine ait kesin bir bilgiye ulaşılamamıştır. Ancak Osmanlı yönetim anlayışında eğitim kurumları şahıslar ve vakıflara aitti ve okulların doğrudan bağlı olduğu bir mercinin olmadığı görülmektedir. 1826'da Osmanlı devleti'nde "Evkaf-ı Hümayun" nezaretinin kurulması ile eğitim kurumlarının kontrol altına alınması amaçlanmıştır. Ulaşılan kaynaklarda eğitim denetimi ile ilgili bilgiler Kıbrıs'ta Osmanlı yönetiminin sonları, İngiliz yönetimi başlarında karşımıza çıkmaktadır. Osmanlı yönetimi döneminin ardından adanın İngilizlere devredilmesiyle başlayan dönemde de Osmanlı yönetiminin Kıbrıs Türk eğitimi üzerinde etkisinin devam ettiği görülmektedir. Çalışmada Kıbrıs Cumhuriyeti dönemi ve sonrası ile Kuzey Kıbrıs Türk Cumhuriyeti (KKTC) döneminde eğitim denetimi ve uygulamaları tarihsel süreç içinde ele alınarak incelenmiştir. Çalışmada nitel araştırma yöntemlerinden kaynak taraması yapılarak geçmişten bugüne eğitim denetimi ile ilgili bulgular ortaya çıkarılarak denetimin nasıl ve hangi amaç ve ilkelere dayandırılarak yapıldığı ve hangi yöntemlerin kullanılmış olduğu ve geçirdiği süreçler ortaya konmuştur. Denetim uygulamalarıyla ilgili kaynaklardan elde edilen veriler seçilerek anlamlandırılmış ve değerlendirilmiştir. Çalışmada Kıbrıs'ta egemen olan her yönetimin eğitimi etkisi altına alma çabası güttüğü görülmüştür. Bu bağlamda eğitimin daha etkili ve sistemli olması çabası ortaya konarken, bazı dönemlerde de Kıbrıs Türk eğitimini kendi denetimini yapabilmesi için politik olarak da bazı dönemlerde mücadele vermesi gerektiği görülmüştür. Kıbrıs Türk eğitimini başlangıcından bugüne eğitim geldiği nokta ve geçirdiği süreçler kronolojik olarak ortaya konmuştur.

Anahtar Kelimeler: Kıbrıs Türk Eğitimi, Denetim, Müfettiş, Denetmen, Denetim Tarihi

Özet

Dünya genelinde ekoloji ve iklim uzmanları insanlık-doğa ilişkisinin artık sürdürülemez durumda olduğu ve çevreye verilen zararlar konusunda gelişmiş kapitalist ülkelerin başı çektiği konularında tam bir fikir birliği içerisindeyler. Artık bilim çevreleri arasındaki tartışmalar bir iklim krizini gerçekleştirip gerçekleştirilmeyeceği değil, gerçekleşecek iklim krizinin boyutunun ne olacağı üzerinde yoğunlaşmış durumdadır. Beklenen iklim krizinin en büyük sorumluları olarak gösterilen egemen kapitalist sınıf ise sorunları genellikle görmezden gelmektedirler. Beklenen iklim krizi ile ilgili kapitalist ülkeler tarafından alınan önlemler genellikle teknolojik değişim yoluyla üretim sistemleri üzerine “devrimcileştirmeyi” kapsadığı görülmektedir. Mevcut toplumsal ve ticari ilişkilerin oluşturduğu küresel ekonomik sistemin ise bu devrimlerin dışında kaldığı, ekonomik sistemle ilgili herhangi bir iyileştirme yapılmadığı görülmektedir. “Üretimin devrimcileştirilmesi” terimi ilk kez kapitalist toplumun ayırt edici özelliği olarak Karl Marx tarafından “Komünist Manifesto” isimli eserde kullanılmıştır. Günümüz kapitalist ülkeleri de artık art arda gelen teknolojik buluşların ve klasik iktisadın efsanevi görünmez elinin ihtiyaç duyulduğunda çevre ile ilgili bütün sorunları kendiliğinden çözeceğine inanmayı tercih etmektedirler. Bu görüşün aksine çevre bilimcilerin bir çoğu teknolojik ilerlemenin tek başına iklim krizi felaketine çözüm olmakta yeterli olamayacağını, çağımız üretim yöntemlerinin temelden dönüşümünü hedef alan uzun vadeli sosyal bir devrime ihtiyaç duyulduğunu yüksek sesle dile getirmektedir. Günümüzde enerji üretimindeki etkinlik artışının sonucu olarak enerji tüketiminde fark edilir şekilde bir artış yaşanması (geri tepme etkisi) durumu ekonomi literatüründe Rebound etkisi olarak kendine yer bulmuştur. Rebound etkisi kavramı ilk kez Jevons’un (1866) çalışmasında kullanılmış bir ifade olduğundan Jevons Paradoksu olarak da bilinmektedir. Bu çalışmada başta Türkiye olmak üzere gelişmekte olan ülkelerde enerji üretiminde kullanılan daha verimli teknolojilerin sebep olduğu rebound etkisinin boyutlarının enerji üretim ve tüketim istatistiklerinin yansıtıldığı tablo ve grafikler üzerinden belirlenmesi ve analiz edilmesi amaçlanmıştır.

Anahtar Kelimeler: Jevons Paradoksu, Rebound Etkisi, Enerji Verimliliği

Özet

Ekonomide meydana gelen değişimler tüketicinin yaşamının birçok alanını etkilemektedir. Aynı zamanda tüketicilerin ürün tüketimi ve satın alma ile ilgili tüketici davranışlarını da belirlemektedir. Tüketiciler, özellikle ekonomik durumun dünya çapında dikkate değer değişikliklere uğradığı, enflasyonun arttığı son birkaç yılda, alışveriş davranışlarıyla ilgili farklı davranış değişiklikleri göstermişlerdir (Yurievna, 2022). Enflasyon, tüketici davranışlarını etkileyen ve bir şirketin kâr veya zararını belirleyen temel unsurlardan biridir (Dhar, 2022). Enflasyonun arttığı dönemde tüketiciler, finansal sorunlar nedeniyle satın alma davranışlarını değiştirmekte ve satın almalarını azaltmakta veya sınırlandırmaktadırlar (Sharma & Sonwalkar, 2013). Bir işletme, tüketicilerin davranışlarını tahmin ederek tüketicilerin ihtiyaçlarını anlayabilir ve beklentilerini karşılamaya çalışabilir. Bu, nihayetinde işletmelerin refahlarını korumalarına ve uzun vadeli hedeflerine ulaşmalarına yardımcı olacaktır (Nistorescu ve Puiu, 2009). Bu araştırma; enflasyon bağlamında gençlerin ithal ürünlere olan ilgisini, nitel bir araştırma yaparak teoriğe ve pratiğe katkı sağlamayı amaçlamaktadır. Modern ekonomide, gençlerin kendilerine ait düzenli bir gelirleri olmamasına rağmen çok aktif bir tüketici yaş grubu olduğuna şüphe yoktur (Zollo, 1995). Bu gençlerin gelir kaynağının çoğu ebeveynlerinin parasıdır ve hatta bazılarının aktif bankacılık faaliyetleri ile kendi banka hesapları vardır (Furnham, 1999). Günümüzün genç tüketicileri, kişisel tatmine büyük önem vererek daha bireysel odaklıdır (Newall & Steele, 2002). Ayrıca, gençlerin davranışlarının, kendileriyle sık temas halinde olan yetişkinlerin inançlarından büyük ölçüde etkilendiği kaydedilmiştir (özellikle ebeveynleri ile olan ilişkisi). Buna göre, gençlerin harcama alışkanlıklarının, ebeveynlerinin çok harcama yapmasından veya çok tasarruf etmesinden büyük ölçüde etkilendiği görülmektedir (Furnham & Thomas, 1984a; Furnham, 1999). Bu çalışmada örneklem olarak 17-18 yaş aralığında özel okulda okuyan gençler seçilmiştir. Tüketici davranışlarını ölçebilmek için nitel araştırma yöntemi kullanılmıştır. Odak grup çalışması yapılarak, yarı yapılandırılmış sorular sorulmuştur. Çıkan sonuç OECD'nin verileriyle uyumlu olup mevcut literatürden farklılık göstermektedir. Türkiye'de yaşayan orta-üst grup gelir düzeyine sahip gençler enflasyona rağmen daha fazla ithal mal ve lüks tüketim ürünü satın almakta, fiyatların her geçen gün artacağı konusundaki endişeleri nedeniyle de satın alma davranışlarını ertelemeyip, bir yerine daha fazla alıp, stoklamanın daha iyi olacağı konusunda hemfikirler. Daha fazla almak istemelerinin nedeni aldıkları ürünleri kullansalar bile ileride daha fazla bir fiyata kullanılmış olarak satabilecekleri inancıdır. Bir diğer unsur ise; ileride hiç alamazsam diye şu anki fiyatına bakmadan almaktadırlar. Araştırma sonuçları literatürde beklenen rasyonel tepkilerden farklılık göstermektedir. Geleceğe yönelik araştırmalarda bu farklılıkların altındaki diğer nedenler araştırılabilir, örneklem genişletilebilir ve nitel ile birlikte nicel çalışma da yapılarak literatüre katkı sağlanabilir.

Anahtar Kelimeler: Tüketici davranışları, Enflasyon, İthal ürünler

MEMORIES OF SOCIAL IDENTITY: TIME AND SPACE

Assoc. Prof. Dr. Gizem ÖKSÜZOĞLU (Orchid ID: 0000-0002-3964-8977)

E-mail: gizem.oksuzoglu@final.edu.tr

Abstract

This research aims to explore islanders' memory of social identity in relation to time and space with a theoretical approach that positioned in the nexus between reflexive anthropology and social psychology. Islands are perceived as carrying memories of disturbances (LeGoff, 1992). Islands are living entities. They are characterised by sand, iodine smell, mist, rocks, stones, places dominated by nature's forces and usually their liminality is defined by the sea. (Joseph, 2020). This usually makes them physically detached from influences from larger continents, in Cyprus's case the influence of larger continental forces has been significant throughout the history. Islands preserve the feelings of a society as a space of memory. The colonial, and post-colonial influences are memorialised through spaces by formerly traumatised islands. Societies which are condemned by the pressured position between contemporary times and past memories use the space as a constant, reminding, monolithic symbol or representation of memory; or a symbol of transformation. Those physical places enable mourning through symbolic representations or memory becomes more vague as the time passes as a result of socio-physical and cultural transformations. This research explores memories of social identity in North Cyprus, through visual data with an aim to explore the Turkish Cypriots' memory of social identity in time and space.

Keywords: Social Identity, Memories of Social Identity, Islands, Cyprus, Physical Spaces

Özet

Eğitim denetimi alanında yapılan çalışmalar, bu alana ilişkin güncel eğilimlerin ortaya konulması ve eksikliklerin tespit edilmesi açısından önemlidir. Mevcut durumun tespiti, ilerleyen dönemlerde hedef koyma ve yapılacak araştırmalara yön verme açısından önemli bir başlangıçtır. Bu doğrultuda hazırlanan araştırma; 2017-2022 yılları arasında Kuzey Kıbrıs Türk Cumhuriyeti'nde yapılan eğitim denetimi alanına ait araştırmaların karşılaştırmalı olarak incelenmesi amacı ile hazırlanmıştır. Araştırmanın literatür kısmını; denetim kavramı, denetim ilke ve modelleri, KKTC denetim sistemi, KKTC denetmen seçim kriterleri oluşturmaktadır. Araştırma kapsamında 2017-2022 yılları arasında yayınlanan 12 makale doküman analizi yolu ile incelenmiş, tablolaştırılmış ve bu makaleler farklı boyutları ele alınarak karşılaştırılmıştır. Araştırmalar incelendiği zaman; araştırmacıların, yoğunluklu olarak eğitim yönetimi üzerine yoğunlaştığı ve eğitimin denetim bacağına ihmal edildiği saptanmıştır. Ülkemizde son beş yılda yapılan bilimsel çalışmaların incelenmesi ile denetimle ilgili 2019 ve 2020 yıllarında araştırmalarda bir artış meydana geldiği fakat bu artışın, 2021 yılında devamının gelmediği söylenebilir. Yapılan araştırmalarda görüşme yöntemine ağırlık verilmiş, daha çok denetmenlere yönelik görüşler araştırılıp denetim sistemlerinin karşılaştırılmasına ve yaşanan sorunların tespitine ağırlık verilmiştir. Yapılan bu çalışma, sadece yayınlanan araştırmalarla sınırlı bir çalışma olması ile birlikte, çalışma sırasında yapılan taramada, Kuzey Kıbrıs'ta yapılan araştırmaların yayınlanması veya bu araştırmalara ulaşılması konusunda zorluk çekildiği görülmüştür. Ülkemizde "Eğitim Yönetimi ve Denetimi" alanında, bir çok üniversite ve kurumda yüksek lisans programı yer almasına rağmen, denetim boyutunda az çalışma yapılmış olması, konu kapsamının bir bacağına eksik kaldığını göstermektedir. Araştırmacıların, sadece eğitim yönetimi değil, eğitim denetimi alanında da çalışmalar yapması gerekliliği ve yapılan çalışmaların yayınlanması aşamasında daha iyi bir veri tabanının oluşturulmasının gerekliliği; bu çalışmayı yapan yazarlar tarafından önerimizdir.

Özet

Vergi, bir devletin birincil ve en önemli gelir kaynağıdır. Ekonominin tüm aktörleri, gerçekleştirdikleri ekonomik faaliyetler sonucu ortaya çıkan değer üzerinden güçleri oranında devlete vergi ödemekle yükümlüdürler. Mükellefler tarafından karşılık beklenmeksizin ödenen vergiler, hükümet tarafından ekonomik sistemin sorunsuz işlemesi amacıyla belli bir maliye politikası çerçevesinde kamu harcamaları olarak tekrar ekonomiye dahil edilir. Ülke ekonomisi içerisinde faaliyet gösteren ve bu kamu harcamalarından direkt veya dolaylı şekilde faydalanan bazı mükellefler vergi ödemeyerek veya eksik vergi ödeyerek kayıt dışı gelir sağlama eğiliminde olabilmektedir. Resmi kayıtlarda görülemeyen, kanunlarca belirlenmiş geçerli belgelere dayanmayan, ülkenin reel üretimine dahil olmakla birlikte mevcut ölçüm yöntemleriyle tespiti mümkün olmayan yani ülkenin GSYH hesaplarına dahil edilemeyen tüm ekonomik faaliyetler; kayıt dışı ekonomi şeklinde adlandırılmaktadır. Kayıt dışı ekonomi özellikle gelişmekte olan ülkelerde vergi gelirlerini ve dolayısıyla kamu harcamalarını düşürücü etkisinden dolayı çözüm bekleyen sorunların başında gelmektedir. Keynes'in özellikle gelişmekte olan ülkelere sürdürülebilir bir ekonomik büyüme için sunduğu temel politika olan genişletici maliye politikasının temelinde kamu harcamalarının artırılması yatmaktadır. Kayıt dışı ekonomi kamu harcamalarının en önemli kaynağı olarak görülen vergilerin azalmasına sebep olmakta, kamu harcamalarının yetersiz kalmasına sebep olarak ekonominin tam istihdam seviyesine ulaşma amacının önünde büyük bir engel teşkil etmektedir. Bu bilgiler ışığında kayıt dışı ekonomiyle mücadele için ülkelerin yeni politikalar geliştirmesi ve kararlılık göstermesi ekonomi açısından büyük bir gerekliliktir. Son derece karmaşık bir yapıya sahip olan kayıt dışı ekonomi ile mücadelede hükümetlerce uygulanan mali politikalar büyük önem arz etmektedir. Gelişmiş ülkelerde uygulanan etkin maliye politikaları sayesinde kayıt dışı ekonomi ile mücadelede önemli seviyede başarı sağlanmış fakat gelişmekte olan ülkeler için bu tehdit halen yüksek seviyededir. Kayıt dışı ekonomi, Türkiye ekonomisi için de önemli bir tehdit oluşturmaktadır. Kayıt dışı ekonomi üzerine yapılan çalışmalar incelendiğinde Türkiye'de kayıt dışı ekonominin yüksek seviyelerde olmasının ana sebepleri olarak yüksek vergi oranları, eğitim (halkta vergi bilinci eksikliği), denetimlerin yetersizliği, cezaların caydırıcılıktan uzak olması ve sık uygulanan vergi afları şeklinde sayılmaktadır. Bu çalışmada kayıt dışı ekonominin başta Türkiye ekonomisi olmak üzere dünya ekonomisinde sebep olduğu tahribatlar, mevcut mücadele politikaları ve dünyada kayıt dışı ekonomi ile mücadele konusunda başarıya ulaşmış politikaların Türkiyede uygulanabilirliği tablo ve grafiklerin analiz edilmesi yoluyla okuyucuya sunulmaya çalışılmıştır.

GOLAN TEPELERİNİN MEVCUT DURUMU VE GELECEĞİ

Volkan ÇETİNTAŞ

Güvenlik Stratejileri ve Yönetimi Uzmanı

Prof. Dr. Mehmet Emin SÖNMEZ

Gaziantep Üniversitesi, Fen Edebiyat Fakültesi, Coğrafya Bölümü

Özet

Ortadoğu'daki kırılğan yapı tarihsel olaylar kadar dinsel fanatizmin, ekonomi ve stratejilerin de etkili olduğu birçok olaydan etkilenmiştir. Osmanlı Devletinin bölgeden çekilmesi ile her ne kadar meydana gelen hadiselerin hemen hemen hepsi farklı nedenlerden kaynaklanmış olsa da sonuç olarak batılı devletlerin arabuluculuk etmesi ya da dolaylı yollardan olaylara müdahil olmaları ile son bulmuştur. Şii-Sünni, Arap-İsrail ve kısmen de farklı nedenlerden kaynaklı çatışmaların sonucunda şekillenen bu coğrafya, her zaman sahip olduğu yer altı zenginlikleri, konumu ve kültürel mirası münasebetiyle de batılı devletlerin gözünde önemini hep korumuştur. Bu alanlardan bir tanesi de su kaynakları, tarım alanları stratejik konumu ve nüfus barındırma potansiyeli ile ön plana çıkan Golan Tepeleridir. Golan Tepeleri, Suriye, Lübnan, Ürdün, Filistin ve İsrail'in sınırlarının kesiştiği alanda yer almaktadır. Ortadoğu'nun en önemli kentlerinden, Suriye'nin de başkenti olan Şam'a yalnızca 35 km, İsrail'in en önemli kentlerinden ve limanlarından biri olan Hayfa'ya ise yüz kilometreden daha az mesafededir. 1200 km² si İsrail'in, 270 km² si BM'in ve 390 km² si ise Suriye'nin kontrolünde olmak üzere toplamda 1860 km² lik alan kaplamaktadır. Çalışmada öncelikle Arap-İsrail uyuşmazlığının getirmiş olduğu sonuçlar neticesinde Suriye'nin toprağının bir parçası olan Golan Tepelerinin işgalinde rol oynayan etkenler ile alanın mevcut durumu ve statüsü üzerinde durulmuştur. Özellikle İsrail'in Golan Tepelerini işgalinin bölgesel ve ulusal etkileri değerlendirilmiş ve Golan Tepelerinin gelecekteki statüsü ve olası senaryolar tartışılmıştır.

Anahtar Kelimeler: Golan Tepeleri, İsrail, Suriye, Arap-İsrail Savaşları

TURKISH CYPRIOTS SOCIAL IDENTITY PROCESSES AND CATEGORISATION

Selim AKYULAF (Orcid ID: 0009-0002-9575-0092)
University of Limerick, Department of Psychology
E-mail: SelimG.Akyulaf@ul.ie

Abstract

When people emigrate from one country to another they do not only physically relocate, they also take their own culture with them to a new and unfamiliar environment. When two or more different groups of people come into contact with each other, they may not only adopt each other's beliefs, behaviours but also values and languages (Sam and Berry, 2010). According to Berry (2008), this process begins when individuals with a certain cultural background starts to interact with another group of individuals that come from a different cultural background and such interaction eventually results in cultural and psychological changes in both groups. The transition to the united group identity requires a profound understanding of each group's rationale of what constitutes their sense of belongingness, what constituted their united identity in the first place and shared identity elements before the transition process take place. Adopting Cognitive Developmental Model of Social Identity Integration, a four-stage model which explains the specific processes by which multiple social identities develop intra-individually and become integrated within the self over time (Amiot et al., 2007); this research aims to explore Turkish Cypriot's understanding and opinions on what constitutes their identity and their rationalisation of changes on their identity. It proposes an interdisciplinary lens and aims to capture concept of identity within socio-cultural discourses across time periods and is informed from individual and social psychology, history, sociology and politics. It unfolds at two levels; at micro level, it investigates individual aspects and at macro-level it looks into the social aspects and aim to create an overarching framework combining these.

**STUDENTS ASSESSMENT OF ONLINE EDUCATION DURING THE COVID-19
EPIDEMIC**

Zohaib Hassan Sain

Faculty of Business & Management Sciences, Superior University, Pakistan

E-mail: zohaib3746@gmail.com

Abstract

The purpose of this study was to assess the online instruction given to students during the COVID-19 epidemic. At the four universities of Lahore city that were the center of the study, 650 students pursuing undergraduate, graduate, and doctoral degrees participated. A mixed method was used to design the research using both qualitative and quantitative components. An online survey was employed during the quantitative phase. Online in-depth interviews using a semi-structured interview form were carried out during the qualitative phase. Local Lahore, Pakistan, inhabitants were among the responses. The content analysis led to the identification of 21 categories and three major themes. The following themes were accomplished: "It could have been better!" for their suggestions, "Face-to-face education is better!" for the bad parts of the student's experiences, and "Better than nothing!" for the positive aspects of their experiences. It has been decided that a technology approach should be employed to further expand the distance education curriculum in the four universities that have been selected.

Keywords: Covid-19, Distance Education, Online Education, University Students.

AKDENİZ İKLİMİNE UYGUN KURU BEZELYE ISLAH ARAŞTIRMALARI

Dr. Meltem Türkeri (Orcid ID: 0000-0001-5225-967X)
Eastern Mediterranean Agricultural Research Institute-ADANA
E-mail: irmakturk@hotmail.com

Özet

Bezelye hem taze hem de kuru tane olarak üretilip, tüketilmektedir. Ülkemizde kuru bezelye yetiştiriciliği ve üretimi diğer ülkelere oranla oldukça azdır. Bu çalışma ile amacımız, Akdeniz Bölgesine adapte olabilen, yüksek verimli kuru bezelye çeşitlerini üreticiye kazandırmaktır. Bu amaçlar doğrultusunda araştırma, Doğu Akdeniz Tarımsal Araştırma Enstitüsü Müdürlüğü deneme alanlarında 2019 yılı yetiştirme sezonunda yürütülmüştür. Çalışmada 15 adet bezelye genotipi ve 5 adet bezelye çeşidi kullanılmıştır. Araştırma tesadüf blokları deneme desenine göre, 3 tekrarlamalı olarak kurulmuştur. Islah amaçlarına uygun olarak; çiçeklenme gün sayısı (gün), bakla bağlama gün sayısı (gün), bitki boyu (cm), ilk bakla yüksekliği (cm), 100 tane ağırlığı (g) ve verim(kg/da) gibi özellikler incelenmiştir. Araştırmadan elde edilen analiz sonuçlarına göre en yüksek çiçeklenme gün sayısı değeri 60 gün ile TR-61290 Tekirdağ genotipinden elde edilirken, en düşük değer 45 gün sayısı ile Rondo ve Utrillo çeşitlerinden elde edilmiştir. Bitki boyları bakımından incelediğimizde; TR-61290-Tekirdağ genotipi 161 cm ile en yüksek bitki boyu değerine ulaşırken; Carina çeşidi 70.5 cm ile en düşük bitki boyu değerine sahip olmuştur. Verim değeri sonuçlarına göre ise; en yüksek değerler sırasıyla 338.7 kg/da ve 326.3 kg/da ile Carina çeşidi ve Bursa-20 genotipinden elde edilmiştir.

Anahtar Kelimeler: Islah, kuru bezelye, çeşit,

**UX STUDY ON HANDHELD AUGMENTED REALITY GAMES BY APPLYING
SPRADLEY'S NINE DIMENSIONS DESIGN PRINCIPLE**

Indian Institute of Technology, Department of Design, Kanpur 208016, India

Abstract

The first step in researching augmented reality was making a head-mounted three-dimensional display at the beginning of 1968. The idea behind a three-dimensional display is to show the user a perspective image from a different point of view that changes as the user moves. Since that time, the majority of growth in augmented reality has been driven by technology. The researcher's emphasis on AR's technological aspects, such as its hardware and software, has resulted in very few initiatives directed toward user experience and exploration studies. To address the transition of the notion of augmented reality from research/laboratories to the general user, it is necessary to approach the technology in a more user-friendly, user-centric manner. In this study, we focus on handheld augmented reality (HAR) gaming applications and propose to employ Spradley's nine dimensions to investigate components of handheld augmented reality experience so that designers may comprehend the human-centric design approach. we posted a questionnaire to a diverse sample of 215 individuals. After the questionnaire, we select 35 individuals and provide them with our iPhone11 to play AR Games for direct observation. In the result, we found out 61.9% of users know about HAR games, and 8.1% of users played the AR game without understanding that it is known to handle augmented reality implying that even after utilising augmented reality, many are unaware of it. 28.2% (strongly agree) and 32.5% (agree) on the issue that it is easier to get skilled at AR games. We conclude our research by finding out there are 4 insights related to the HAR games. The detail of these insights is discussed in context with the human-centric design in HAR games.

Keywords: handheld augmented reality (HAR), user-centric, Spradley's nine dimensions, human-centric design

**APPLYING UX PRINCIPLES TO FIND PRE-PATTERNS IN HANDHELD
AUGMENTED REALITY GAMES**

Pushkar PANDEY (Orcid ID: 0000-0002-5894-1036)

Department of Design, Indian Institute Of Technology Kanpur, India

E-mail: Pushkarp@iitk.Ac.In, +91_9021818161

Abstract

Reality-based interfaces that produce "embodied" game play experiences have recently attracted a lot of attention from the gaming industry and allied research areas. Handheld augmented reality (HAR) is a reality-based interface that superimposes computer-generated imagery (CGI) over a user's view of the actual world. In a HAR environment, players can use their existing physical and social skills to engage with the game system. The application of user experience (UX) design principles to augmented reality (AR) systems has received only a limited amount of research attention. In this study, we look into the potential relevance of such principles to the field of handheld augmented reality game development. The UX design tools such as shadowing, ethnographic research, people and context research, empathy mapping and experience map are used to define the pre-patterns in HAR games. **Participants** - We select a sample of 23 gamers of the gaming society Indian Institute of Technology Kanpur. After the sample of 23 gamers we select diverse sample of 27 individuals to dive deep into the UX research.

Keywords - embodied game, handheld augmented reality (HAR), computer generated imagery (CGI), shadowing, experience map, pre-patterns.

HALAL BEHAVIOR IN MEDIA TECHNOLOGY SYSTEM

Khanifah AULIANA

Halal Center of UIN KH ABDURRAHMAN WAHID Pekalongan

Sultan MUBAROK

Halal Center of UIN KH ABDURRAHMAN WAHID Pekalongan

Abstract

The development of this modern era, which has entered society 5.0, makes it easier for humans to use technology easily. The growth of this technology can be profitable for various purposes that can be done quickly. However, there are negative impacts that will occur if humans use technology to be misused. One example of the negative impact that exists is the opening of someone's privacy that can be tracked only by using today's modern technology systems. Therefore, efforts must be made to prevent the technology system from being used for useful things only. With the development of technology, of course, human intelligence also increases, for this reason, digital literacy or ethics is needed in using anything related to public technology. Behavior and traits that are formed can be from environmental factors or oneself. Prioritize teaching from an early age about the correct and wise use of technology through formal education or learning moral ethics from the people around you.

Short Introduction

Drug repurposing is an alternative avenue for identifying new drugs to treat tuberculosis (TB). Although TB can be cured with anti-tubercular drugs, the emergence of multidrug-resistant and extensively drug-resistant strains of *Mycobacterium tuberculosis* H37Rv (Mtb), as well as the significant death toll globally, necessitate the development of effective drugs to treat TB.

Experiments and Key result findings:

In this study, drug repurposing approach was employed to address this drug resistance problem by screening drugbank database to identify novel inhibitors of the Mtb target enzyme, DNA gyrase. The compounds were screened against the ATPase domain of gyrase B subunit (MtbGyrB47), and the docking results showed Echinacoside, Doxorubicin, Epirubicin, and Idarubicin possess high binding affinities against MtbGyrB47. Comprehensive assessment using fluorescence spectroscopy, SPR, and CD titration studies revealed that Echinacoside as a potent binder against MtbGyrB47. Further, ATPase, and DNA supercoiling assays exhibited IC₅₀ values of 2.1-4.7 μ M for Echinacoside, Doxorubicin, Epirubicin, and Idarubicin. Among these compounds, the least MIC₉₀ of 6.3 μ M and 12 μ M were observed for Epirubicin and Echinacoside, respectively. Hence, our findings indicate that Echinacoside and Epirubicin target mycobacterial DNA gyrase, inhibit its catalytic cycle, and retard mycobacterium growth. Further these compounds exhibits potential scaffolds for optimizing novel anti-mycobacterial agents that can act on drug-resistant strains.

THE ROLE OF TRADITIONAL MARKETS IN COMMUNITY ECONOMIC GROWTH

Abstract

This study aims to determine the extent to which the role of traditional as an economic sector in growing the economy of the surrounding community, whether the community is sufficiently assisted by the presence of traditional markets or not. This study uses qualitative methods, with data collection methods through interviews, field surveys, as well as additional scientific literature from books and scientific journals. The results of this study conclude that the market is a sector that is quite taken into account in administering government. Traditional markets are one of the important sectors that support the community's economy. It contains the interests of the small to medium-sized community in meeting their needs. Traditional markets provide good accommodation for the community, especially traders and buyers because traditional markets can make it easy for people to carry out buying and selling transactions. The existence of traditional markets also provides considerable accommodation in improving the community's economy, because they are able to increase the income of traders while the buyers themselves can meet their daily needs easily and can save expenses so it can be concluded that the community can be said to be prosperous and also helped by the existence of traditional markets. Apart from that, the community's economic conditions have been greatly helped by the presence of traditional markets, but there are still some traders who feel that the daily caretaker fees are still too high and the increased income from the regional budget shows this. it is important for the government to develop traditional markets.

Abstract

Background The metabolites produced by microbiota metabolism can modulate gut bacterial composition and brain biochemistry acting as neurotransmitters in the central nervous system. Polyphenols are usually hydrolysed by intestinal enzymes or by gut microbiota. In this form they reach blood, tissues and brain where exert biological activities. The dysbiosis is thought to impair recovery by decreasing the production of short-chain fatty acids which play a role in suppressing inflammation within the central nervous system. The gut microbiota can synthesise neurotransmitters or regulate their levels acting on their precursors. Alteration in the homeostasis of gut-brain axis has been associated also to spinal cord injury. Objective To order to show that polyphenols could increase the levels of neurotransmitters in situations of spinal injury where there is an urgent need to generate new neurons. To arrive at these observations, the authors examined how Polenoplasmin and diet solve paralysis in dogs. Materials and methods Dysbiosis could have significant therapeutic value in the management of spinal cord injury. Results In fact, some polyphenol metabolites can modulate directly neuronal receptors. Metabolites from dietary polyphenols exert neuroprotective effects after reaching the brain by crossing blood-brain barrier. Polyphenols indirect actions involve mechanisms that improve the peripheral cerebrovascular health. Conclusion Dietary polyphenols improve vasodilatory response and increase levels of circulating nitric oxide species that are essential in the control of vascular tone; vasodilation and blood flow in the body and in cerebral circulation. Gut microbiota are able to synthesize neurotransmitters thus microbiota homeostasis can impact on spinal cord injury.

Abstract

Osteoporosis is a worldwide disease depicted by the reduced bone mass, an adequate supply of minerals are needed to support bone remodeling and their deficiency causes bone-related diseases, osteoporosis in particular, and have osteo-protective effects. The aim of recent research was to quantify the micro (Mn, Fe, Cu, and Zn) and macro elements (Mg, K, and Ca) in the peels powder of some common fruits (pomegranate, orange, lemon, mango, and grapefruit) by flame atomic absorption spectrometer (FAAS). The extraction of micro and macro elements in peels powder was done by using dilute acids in ultrasonic bath. Apple leaves were used as standard reference material (SRM, NIST 1515) to optimize the ultrasound assisted extraction (UAE) method at varied operating parameters. Maximum response was obtained for extracting of minerals in 500 mg SRM at 60 °C temperature, setting a vortexing time of 5 min. while using 5.0 mL extracting agent HNO₃ (0.5 M)-H₂O₂ (10 %) at 90 % sonication amplitude of ultrasound bath for 6 min. While analyzing the SRM, the percentage recovery was obtained in ranged between 96.8-102.7 % to assure the accuracy whereas repeatability (n = 10) study in terms of % RSD yielding ≤ 2.29 well support the precision of proposed method and limits of quantitation (µg/g) were 0.034, 0.061, 0.065, 0.057, 0.017, 0.175 and 0.053 for Mn, Fe, Cu, Zn, Mg, K and Ca respectively. The proposed UAE method was reliable, efficient, and advantageous over the conventionally employed acid digestion method with regards to less consumption of reagents and short analysis time for the determination of micro and macro elements in fruit peels powder.

Özet

Sarımsak, Amarydaliaceae familyasında soğandan (*Allium cepa* L.) sonra en çok kültürü yapılan önemli bir bitki türüdür. Sarımsak, tohumlarında meydana gelen dormansi nedeni ile tohumla çoğaltım yöntemi kullanılarak üretilmemektedir. Sarımsak üretimi ve çoğaltımı dişler ile yapılmaktadır. Ancak, dişler ile çoğaltım yöntemi pahalı olmasının yanı sıra, işçilik de gerektirmektedir. Sarımsak bitkisinin çoğaltımında sarımsak tohumlarının kullanılabilmesi için sarımsak tohumlarında görülen dormansinin kırılması ve çimlenmenin teşvik edilmesi gerekmektedir. Bu çalışmanın amacı, farklı ön uygulamaların (katlama, giberellik asit, ve giberellik asit + katlama uygulamaları) sarımsak tohumlarında dormansinin kırılması üzerine etkilerinin incelenmesidir. Bu çalışmada, iki farklı genotipteki sarımsak populasyonundan elde edilen tohumlar kullanılmıştır ve tohumlar hasat edildikten hemen sonra uygulamalara başlanmıştır. Katlama uygulamalarında; tohumlar 4°C sıcaklıkta, nemli kum içerisinde farklı süreler ile (0, 2, 4, 6 ve 8 hafta) bekletilmişlerdir. Giberellik asit uygulamalarında, tohumlar 16°C sıcaklıkta 72 saat süre ile farklı konsantrasyonlardaki (250, 500, 1000 ve 1500 ppm) giberellik asit çözeltilerinde bekletilmişlerdir. Katlama+GA₃ uygulamalarında ise, tohumlara katlama uygulamalarını takiben giberellik asit çözeltilerinde bekletilmişlerdir. Uygulamalar sonrasında, tohumlar doğrudan çimlendirme testlerine alınmışlardır. Çimlendirme testleri sonucunda normal çimlenme oranı (%), ortalama çimlenme süresi (gün) ve çimlenme indeksi değerleri hesaplanmıştır. Buna göre her iki genotip için de en iyi sonuçlar, 2 hafta süre ile yapılan katlama +1000 ppm giberellik asit uygulamalarından elde edilmiştir.

Anahtar Kelimeler: *Allium sativum* L., GA₃, normal çimlenme oranı, ortalama çimlenme süresi, tohum dormansisi

SELF-AWARENESS OF THE KHAMR EFFECTS

Dinda SAFIRA (Orcid ID: 0009-0003-9146-2859)
UIN K.H. Abdurrahman Wahid Pekalongan, Indonesia

Hendri Hermawan ADINUGRAHA (Orcid ID: 0000-0002-8394-5776)
UIN K.H. Abdurrahman Wahid Pekalongan, Indonesia

Abstract

The purpose of this research is to describe self-awareness of the khamr effects. This research method uses a literature review approach that originates from books, journals and other literary sources related to self-awareness of the khamr effects. The results of this study's literature review concluded that there was a significant relationship between self-awareness and khamr consumption behavior. The higher the level of self-awareness, the lower a person's desire to consume khamr, because they already know the negative effects of consuming khamr. Vice versa, the lower the level of self-awareness, the easier it is for someone to be affected by negative things, including consuming khamr. However, a person's attitude of self-awareness is influenced by factors from the individual himself as well as factors from the surrounding environment. The negative impact of khamr can cause mental disorders and even dangerous health problems. In addition, consuming khamr also causes addiction which can cause death due to the long-term effects of consuming khamr. But many khamr consumers ignore the negative effects of khamr. Everything that happens to a person begins with his own mindset and awareness. Therefore a person must have a strong foundation of life principles that must be adhered to.

Abstract

The purpose of this study is to explain the influence of the management of the regional financial accounting system on the quality of the financial statements of Pekalongan Regency. This study uses a systematic literature review method. The data sources for this research come from books, journals and other literature related to the potential and opportunities for exporting halal cosmetic products in Indonesia. Analysis of research data using VOSviewer - Visualization of scientific landscapes. Specifically, the objective of government financial reports is to provide information useful for decision making and to demonstrate the accountability of the reporting entity for the resources entrusted to it to fulfill these objectives. Government Accounting Standards Government financial reports such as balance sheets, budget realization reports, cash flow reports and notes to financial statements, as discussed above, are prepared in accordance with Government Accounting Standards. This standard regulates, among other things, when assets, liabilities, revenues, expenditures, financing receipts, sales expenditures are recorded in accounting and subsequently reported in the financial statements; how to determine the value of each element of the financial statements; how to disclose it so that the reporting of the elements of the financial statements can be adequately explained. If a centralized system is used, the person responsible for accounting for all financial transactions is assigned to one SKPD (usually the Regional Financial and Asset Management Service) and treats transactions that occur as transactions at the regional government level.

Abstract

The purpose of this research is to educate students about what financial accounting standards/SAK are. This study uses qualitative methods, with data collection methods through interviews, field surveys, as well as additional scientific literature from scientific journals. The findings in this study conclude that Financial Accounting Standards (SAK) are Statements of Financial Accounting Standards (PSAK) and Interpretations of Financial Accounting Standards (ISAK) issued by the Standards Board of the Indonesian Institute of Accountants (DSAK IAI) and the Sharia Standards Board of the Indonesian Institute of Accountants (DSAS IAI).) as well as capital market regulatory regulations for entities under its supervision. Objectives of Financial Accounting Standards (SAK): For uniformity, relevant and reliable financial statements, Facilitate the preparation of financial reports due to standard guidelines so as to minimize the bias of preparation, Facilitate auditors in auditing, Facilitate financial statement readers to interpret and compare financial statements of different entities , There are many users of financial statements so that the preparer cannot explain it to each user. There are 4 types of SAK, namely SAK, SAK-ETAP, SAK Syariah, and SAK EMKM. The process for preparing Financial Accounting Standards: The Due Process Procedure for preparing and repealing financial accounting standards/sharia financial accounting standards and the Due Process Procedures for preparing technical bulletins and annual improvements are not required to follow all due process stages regulated as referred to in paragraph.

Abstract

This study aims to explain the use of e-wallets for students of the Islamic Faculty of Economics and Business UIN K.H. Abdurrahman Wahid Pekalongan. This study uses a descriptive qualitative approach. Researchers obtained data by conducting interviews as primary data and secondary data obtained data from books, journals, other written information that has relevance to the research topic. This research involved fifteen students of the Faculty of Islamic Economics and Business at UIN K.H. Abdurrahman Wahid Pekalongan who uses e-wallets in transactions. This research resulted in the following conclusions: current technological developments affect all activities that were originally done manually, now they can be done instantly. As a result, the needs of consumers in terms of making payments have also changed, where initially the payment system was made with cash, now a non-cash payment system has appeared in the form of an e-wallet. E-wallet is a form of Fintech (Financial Technology) that utilizes internet media and is used as an alternative payment method. In Indonesia there are various e-wallet products, the most popular of which include Dana, ShopeePay, GoPay and Ovo. Advertisements and social environmental factors are the main sources of e-wallet information for students. Students use e-wallets for various needs, such as transportation needs, buying credit, buying food, and shopping for clothes. The three basic reasons are the attractive promos offered, convenience, and ease of payment because they can be made anywhere to make students interested in using them.

Keywords: e-wallet, use value and benefits, cashless and digital payment

Abstract

This study aims to explain the Characteristics of Islamic Economics. This study uses a literature review approach that originates from books and journals related to the characteristics of Islamic Economics. This research literature review resulted in the following conclusions: Islamic economics is a decision-making process of production, distribution and consumption activities based on sources of Islamic law, namely the Koran and hadith. The characteristics of Islamic Economics include three main principles. The three of them fundamentally and jointly regulate economic theory in Islam, namely the principles of faith, morality and the principle of law (muamalah). There are several characteristics of Islamic Economics as mentioned in Al Mawsuah Al-ilmiyah wa al-amaliyah al Islamiyah which are summarized as follows: Property Belongs to Allah and Humans Be the Khalifah of wealth; Economy is Bound by Aqidah, Sharia (Law), and Moral; Balance between Spiritual and Material; Islamic Economics creates a balance between individual interests and public interests; Individual Freedom Guaranteed in Islam; The State Is Authorized to Intervene in the Economy; Consumption Guidance; Investment Instructions; Riba Prohibition; Zakat. The relationship between Islamic economics and Islamic faith is evident in many ways, such as the Islamic view of the universe which is subdued (provided) for the benefit of humans. The relationship between Islamic economics and faith and sharia allows economic activity in Islam to become worship. Islam emphasizes the importance of functioning money in its normal field, namely as a transaction facility and a means of valuing goods. Among the factors that divert money from its normal field is interest (usury).

Özet

Bu araştırma, son yıllarda Doğu Akdeniz Tarımsal Araştırma Enstitüsü tarafından tescil ettirilmiş ekmeçlik buğday çeşitlerinin azotlu gübre ihtiyaçlarının Kahramanmaraş bölgesi için belirlenmesi amacıyla yürütülmüştür. Deneme, Doğu Akdeniz Geçit Kuşağı Tarımsal Araştırma Enstitüsü (Kahramanmaraş) arazilerinde, tesadüf bloklarında bölünmüş parseller deneme deseninde üç tekerrürlü olarak kurulmuş, ana parsellerde çeşitler, alt parsellerde ise azot dozları yer almıştır. Araştırmada 4 adet ekmeçlik buğday çeşidi (Gökkan, Yakamoz, Altınöz ve Candaş) tohumluk materyali olarak kullanılmıştır. Ekmeçlik buğday çeşitleri için 5 farklı azot düzeyi (0, 7, 14, 21 ve 28 kg N/da) uygulanmıştır. Ekimle tüm parsellere dekara 8

kg P₂O₅ düşecek şekilde gübreleme yapılacaktır. Araştırma sonucunda, buğday çeşitleri için gerekli optimum saf azot (N) dozları belirlenmiştir. Yapılan araştırmada; tüm çeşitlerde verim ile azot dozu arasında kuadratik ilişki ($Y=a+bx+cx^2$) olduğu tespit edilmiştir. Buna göre azot dozları ile buğday verimleri arasındaki ilişki; Gökkan çeşidi için $Y=237.02+37.92X-0.91X^2$ ve buna göre uygulanabilecek optimum azot miktarı 20.83 kg/da'dır. Yakamoz çeşidi için; $Y=166.58+23.43X-0.55X^2$ ve optimum azot miktarı 21.30 kg/da'dır. Altınöz çeşidi için; $Y=236.56+39.76X-1.07X^2$ ve optimum azot miktarı 18.57 kg/da ve Candaş çeşidi için ise $Y=222.78+36.74X-0.96X^2$ ve optimum azot miktarı 19.13 kg/da olarak belirlenmiştir. Yapılan araştırmada azot dozlarının bazı verim (bitki boyu, metrekarede başak sayısı, 1000 dane ağırlığı, hektolitre ağırlığı) ve kalite (protein, gluten, sedimantasyon) parametreleri üzerine etkileri de araştırılmıştır.

Anahtar kelimeler: Ekmeklik buğday, azot dozu, verim, kalite

TAX FUNCTION FOR THE STATE

Siska YULIANA (Orcid ID: 0009-0004-8485-8166)
UIN K.H. Abdurrahman Wahid Pekalongan, Indonesia

Hendri Hermawan ADINUGRAHA (Orcid ID: 0000-0002-8394-5776)
UIN K.H. Abdurrahman Wahid Pekalongan, Indonesia

Abstract

This study aims to explain the importance of the tax function for the state. This study uses a descriptive qualitative method based on a literature review approach and analysis sourced from books and journals related to the importance of the tax function for the state. This research literature review resulted in the following conclusions: The largest source of state revenue in Indonesia is taxes. So Tax is an obligation of every citizen which is collected by the government of a country every year through a special agency or agency that handles tax collection matters. The amount of tax that must be paid depends on the amount of income or the object of the tax. Tax is not something foreign to the ears of the general public, almost all groups of people know about taxes. Where taxes are coercive, so do not be surprised if a terrible picture in the minds of the people appears when the word "Tax" is mentioned. So that people who have registered as taxpayers are directly overshadowed by dependents because they have to share the proceeds earned to pay taxes, especially since the benefits cannot be felt immediately. Taxes have two functions, namely taxes as a source of state finance (budgetair) meaning that taxes are a source of government revenue to finance expenditures, and taxes as regulators (regularend) meaning taxes are a tool for regulating or implementing government policies in the social and economic fields, as well as achieving certain non-financial purposes.

Keywords: tax, tax function for the state, tax function

**EFFICIENT VALORIZATION OF POULTRY BY-PRODUCTS VIA METHANE
PRODUCTION OPTIMIZATION**

Ayoub CHAOUI

Ibn Zohr University, Faculty of Sciences, Agadir, Morocco

E-mail: ayoub.chaoui.88@gmail.com

Abstract

This investigation concerns the employment of poultry by-products as a substrate for anaerobic digestion and the enhancement of methane production. Experimental trials employing chicken waste as substrate were conducted at a temperature of 38°C in order to explore the influence of various factors, such as ratios of inoculum to the substrate, pH, feather effect, and inoculum type, on anaerobic digestion. The results show that the yield coefficient exhibited a range of variation across the tested values, with the maximum methane production of 275 ml CH₄ obtained under optimal factors including an inoculum-to-substrate ratio of 50%, a pH of 8, chicken waste without feathers, and an inoculum with a basic solution. Moreover, in order to elevate the digestibility of chicken waste, diverse pretreatments were examined, such as dilution pretreatment using different dilution factors of 2, 4, 6, and 8, and the impact of extra alkalinity was evaluated using different volumes of 10, 30, and 50 ml. The combination of these two pretreatments resulted in an increase in methane yield to 550 ml, corresponding to a 107% improvement relative to the yield from untreated poultry by-products.

Keywords: Anaerobic digestion. waste recovery, poultry by-products, Pretreatment. Methane production. Bioenergy.

PILLARS AND TERMS OF SALE AND PURCHASE

Michelle Prajna PRAMESWARI (Orcid ID: 0009-0004-8304-2894)

UIN K.H. Abdurrahman Wahid Pekalongan, Indonesia

Faculty of Islamic economics and business, UIN K.H. Abdurrahman Wahid Pekalongan,
Indonesia

Abstract

This study aims to explain the pillars and conditions of buying and selling. Judging from the type of data, the method used in this study is a qualitative approach. This study resulted in the following conclusions: According to the term pillar, it is defined as something that is formed into the existence of something other than its existence, considering that something exists with the pillars or the elements themselves, not because of their uprightness. As for conditions, according to the terminology of the jurists as formulated by Muhammad Khudlari Bek, is something whose absence obliges and results in the absence of the law itself. Buying and selling is considered valid if the pillars and conditions have been fulfilled. The pillars in question are: First, there is a seller and a buyer, both of them must meet the requirements, namely wise, mature, not extravagant, and no coercion from any party. Second, there are goods to be traded, with the condition that the goods must be present at the time of the transaction, in the form of useful assets, belonging to themselves and can be controlled, and not disgusting items such as carrion and excrement. Finally, there is a sighat or consent sentence, consent granted can be done with the words submission or acceptance, or it can also be in written form, such as invoices, receipts, or notes, and et cetera. The terms of the consent granted are clear and understandable statements, and shows the will of both parties.

Keywords: Pillars, Terms, and Buying and Selling.

Abstract

This study aims to determine the development of MSME businesses in recording financial reports, so that later they can be used as material for evaluating researchers to socialize recording and reporting of financial reports for MSME business actors. In this study using the literature review method obtained from previous research books and journals related to the Perceptions of MSME Actors on Financial Statements and using a technique in the form of the documentation method. Based on this study, information was obtained that MSME actors often underestimate the recording of financial reports, even considering that financial reports are something complicated. Padahal by recording financial reports in accordance with SAK EMKM standards can increase the credibility of the company and can be used as material for evaluating the company's performance in one period. So far, MSME entrepreneurs only make very simple financial reports, so they are not in accordance with SAK EMKM rules.

Keywords: MSME, financial reports, EMKM

EFFECTIVE TIME MANAGEMENT STRATEGIES FOR COLLEGE STUDENTS

Abstract

The purpose of this research is to describe an effective time management strategy for university students. This research method uses a literature review approach that originates from books and journals related to effective time management strategies for students. The results of this research literature review concluded that students must have an effective management strategy so that the time they have is not wasted. Effective time management will improve student learning outcomes. By optimizing a good management strategy it will have a major effect on learning outcomes. However, managing time management strategies is not easy for students. Most of the results of student research cannot be consistent with effective time rules. The process of setting a strategy is very important. If it is related to time, the process of forming a strategy in making time management becomes a matter of principle. Time requires a strategy in using it, if students can manage time strategies efficiently it means that students are also able to manage their lives effectively. The management strategy process is characterized by efforts to achieve goals through certain strategies and policies. Thus the first step is goal setting. The second step is determining the strategy to achieve these goals. With a strategy in managing time, it means that students can make the best use of their time so that the time they have is not wasted. With a strategy, students are able to manage time well. Students will not be confused in managing time, because they already have a strategy that has been made.

Keywords: Strategy, time management, effective

**THE EFFECT OF TRINEXAPAC-ETHYL ON PLANT HEIGHT, YIELD AND SOME
AGRICULTURAL TRAITS OF WINTER BREAD WHEAT (*Triticum aestivum* L.)**

Assist. Prof. Dr. Mehmet Zahit YEKEN (Orcid ID: 0000-0003-0490-371X)
Bolu Abant İzzet Baysal University, Faculty of Agriculture, Department of Field Crops, Bolu
E-mail: yekenmehmetzahit@gmail.com

Abstract

This study was carried out at Sakarya Maize Research Institute in the Pamukova district of Sakarya province to investigate the effects of different doses of trinexapac-ethyl on plant height, yield and some agricultural characters in winter wheat in 2021-2022. The experiment was established with four replicates according to the randomized blocks experimental design, and the Alada variety (plant height: 90-105 cm) was used as a plant material. Plant height, grain yield, 1000 grain weight, hectoliter weight, seed size (over 2.5 mm sieve) and number of grains per spike traits were examined in both the trinexapac-ethyl applied plots and the control plots in the experiment. The data of investigated traits were subjected to variance analysis and the mean values were compared using the DUNCAN multiple comparison method. As a result, it was determined that a 10 g/da dose of trinexapac-ethyl significantly shortened the plant height (13-14%) and increased the grain yield of wheat.

Indonesia

Abstract

The purpose of this study is to examine the decision to marry without having children or childfree from the perspective of human rights (women's reproductive rights). The research method used is library research which originates from books and journals related to childfreeness in the perspective of Human Rights (HAM). The data analysis technique in this research uses a qualitative descriptive analysis technique. Childfree is a term for people who make the decision not to have children - childfree. The decision to be childfree raises a negative stigma from society. Childfree can be defined as a view of a husband and wife who decide not to have children. Childfree is not a new term, many married couples in big countries have chosen this decision. The decision to choose childfree in household life cannot be separated from the role of husband and wife. This is because it concerns their reproductive rights. Human rights are a form of guaranteed protection in law, especially women's rights, the decision to Childfree is something that does not affect the marriage relationship. It depends on the female body. Therefore, Childfree's decision is a woman's right and a person's personal right that must be supported. Even though there has been a change in the purpose of marriage which is no longer focused on the presence of a child. However, it turns out that the presence of children will always be considered important in marriage. Therefore, the changes that have occurred have enabled society to begin to accept marriage conditions that have so far been considered less than ideal, for example childless marriages.

Abstract

This study aims to explain the latest Sharia Economic Development in Indonesia. This study uses a literature review approach sourced from books and journals related to the latest Islamic economic developments in Indonesia. This research study resulted in the conclusion that the development of sharia economy in Indonesia has developed, the proof is the existence of various Islamic financial institutions, the existence of sharia economics study programs, a lot of sharia economic literature, the existence of sharia economic and business consulting companies, the presence of Muslim economists and the emergence of sharia economic movement organizations. The government also participates in the development of the sharia economy in Indonesia, namely by creating regulations to support the development of sharia business.

Indonesia

Abstract

In society there are various problems that occur between ethics and morals, such as examples of drug abuse and illegal drugs, drugs are now one of the problems of morality in society, corruption and neoptism are social diseases that hit the world community. Especially in newly developing countries, say Indonesia, this disease is a serious problem and very difficult to eradicate. as for also crossing the street randomly one of the violations that generally occurs on the street is pedestrians, therefore the solution that needs to be needed is awareness from the community because it can endanger the lives of hell, littering even though a place has been provided for the garbage but there are still people who throw it away haphazardly, as we know that in religion there are values of morality and ethics, therefore religious education in the community is very necessary, and also environmental and social factors are one of the factors that cause people to fall into morality problems, as expressed "bad associations destroy good habits" means wherever we are and with whom we associate it will have an impact on our way of life. Therefore, we must be careful. From this problem, it can be concluded that the problem of morality is a problem that continuously becomes our problem. Because like it or not, we as humans live in a diverse socio-cultural environment. Therefore, let's take care of each other and our families so that we don't get into issues of morality and ethics.

Abstract

The economic favourable growth, large profitability, social progress and performance of any organisation is directly depended on the high labour productivity output. Furthermore, in every labour intensive industry, such as the construction industry, project performance is tied to the effectiveness and efficient of its labour productivity. The poor performance of the Nigerian construction industry in terms of project delay, low productivity output, and quality deficiency are caused by inadequate utilisation of welfare facilities and lack of basic amenities for the workers. Based on this, various theories relating to welfare packages and employees productivity were synthesised to bring to the fore through review the welfare packages influence on worker's productivity. The Functional labour welfare theory holds that, employees are more effective, efficient, committed, and productive when their welfare is being taken care of which in turns leads to their mental and physical satisfaction. However, Equity theory to employees welfare assumes that employees should be fairly and sufficiently rewarded according to the amount of effort they put in to perform a particular job. The review revealed that a set of mutually reinforcing, integrated welfare packages have a more substantial influence on workers productivity. Thus, best welfare packages, and policies to improve the construction workers productivity are suggested.

Abstract

The purpose of this study is to explain the basic concepts of the basic principles of Islamic economics namely belief in Allah SWT as the Rabb of the universe, so that this is very closely related to the factors of production. This research method uses a library approach sourced from books and journals that are in accordance with the topic and focus of the research. The findings are that in Islam producing something is not just for self-consumption or selling to the market. These two motivations are not enough, because they are still limited to economic functions. Islam specifically emphasizes that every production activity must also realize a social function. In view of economics can be divided into two parts between economic philosophy and economics. The difference between Islamic economics and conventional economics lies in the economic philosophy, not in economics. Economic philosophy provides a spirit of thought based on Islamic values and sharia limitations, while economics contains tools of economic analysis that can be used. With this framework in mind, the factors of production in the Islamic economy are the same as the factors of production in the conventional economy, which in general can be expressed in terms of the production factor of labor, the factor of production of raw and auxiliary materials, and the factor of capital production. Among the three factors of production, it is the capital production factor that requires special attention because in conventional economics the interest system is applied. The effect of interest on capital turns out to have a widening impact on the level of production efficiency.

Abstract

The purpose of this study is to explain the importance of vocational competency certification for students for future life needs. This study used a qualitative method, with data collection methods through interviews, field surveys, and using a systematic literature review. The findings in this study conclude that the purpose of qualification certificates for SMK students is basically to prepare experts who are ready to work and produce quality and competent graduates. by the employer. Job seekers consider hiring SMK graduates who have the skills and specialties that suit them. Based on these aspects, qualified SMK graduates have a greater chance of being accepted at a company, of course, in a field of work that is in accordance with the required scope of majors. Large companies are of course also very considerate when looking for workers to work in their companies, especially in the field of internal accounting, because this is related to the smooth preparation of the company's financial reports which have an impact on the survival of the company. Vocational High School qualification certificates do not guarantee 100 percent acceptance to work at companies, but they can increase opportunities to be considered in employee selection. In addition, it is a matter of pride for SMK graduates who have a qualification certificate, because it is proof that knowledge, skills and attitudes have been verified by an independent third party to meet qualification standards.

Abstract

Acute lung injury and its advanced form, Acute Respiratory Distress Syndrome (ARDS), are important respiratory complications that are difficult to treat and have a high mortality rate. Although ARDS is frequently encountered in intensive care units, no substance or drug has been developed to treat pathological findings such as a neutrophilic alveolitis, hyaline membrane deposition and microthrombus formation. In this project, regeneration results of bone marrow-derived mesenchymal stem cells, which have been known to provide cell and tissue regeneration for years, and stem cells-derived exosomes, which are investigated as a new therapeutic treatment method, in acute lung injury were demonstrated. Oleic acid administered to rats at a dose of 60 mg/kg administered via the tail vein produced significant lung damage as shown in figure 3. When histopathological analysis was performed, oleic acid caused significant bleeding, infiltration, edema and hyperplasia in the lung parenchyma tissue. According to the

scoring of the histopathological image, damage parameters were 3 times more intense in the oleic acid group than in the control. Bone marrow stem cells in 1×10^6 numbers given from the tail vein 2 hours after acute lung injury resulted in a dramatic improvement in the parameters of bleeding, infiltration, edema and hyperplasia caused by oleic acid application. Serum total antioxidant capacity levels were evaluated by administering 1×10^6 number of exosomes released from bone marrow mesenchymal stem cells in acute lung injury induced by oleic acid (60 mg/kg) in rats. While oleic acid suppressed total antioxidant capacity as expected, exosome administration did not reverse this suppression. ANOVA was used for statistical analysis and Dunn-Sidak multiple comparison test was used for post-hoc test. The marrow stem cell group was found to be significant compared to the MSC-exosome group.

Indonesia

Abstract

The purpose of this research is to describe the role of financial literacy in financial management. This research method uses a literature review approach that originates from books and journals related to the role of financial literacy in financial management. The results of this research literature review concluded that financial literacy greatly influences the way financial management in adolescents and has a negative effect on student consumptive behavior. Students who have low ability in financial literacy will make wrong decisions in consuming, because in consuming they do not take into account priority needs. Students who have good financial literacy will be selective in consumption, they will prioritize buying what they need, and set aside what they want. Student financial literacy is measured using 5 (five) indicators, namely an understanding of needs, an understanding of scarcity, an understanding of economic principles, an understanding of economic motives, and an understanding of economic activity. Knowledge of the economy has an important role in shaping a person's consumption behavior. Individuals with a better level of financial literacy are expected to be able and more selective in determining which product to consume and prioritizing their needs first and adapting it to the abilities of each individual. The importance of financial literacy will minimize students' consumptive behavior in consuming if students apply economic theories in everyday life. However, students who have good financial literacy are not necessarily able to minimize consumptive behavior. This is influenced by various factors, for example student personality, lifestyle, and self-control.

Abstract

This study aims to explain the importance of personal financial management. This study uses a literature study approach sourced from books and journals associated with the relevance of personal finance management. The study literature results in the following conclusion: financial management is a person's responsibility for his or her finances. So finance management is important to regulate the daily balance because every need is never separate from finance. College needs are getting longer and longer and more and therefore need to be managed well, that is, by regulating spending- spending that is tailored to his/her income. Personal financial management in it there is a lifestyle that has priority. It can also be called the power of priority and influence the level of discipline of a person when managing the money he or she makes every day. Money management is done because it is an individual responsibility in daily life. "Money is not everything"

Abstract

The purpose of this research is to describe the importance of good and correct Indonesian from a subjective perspective. This research method uses a literature review approach that originates from books and journals related to the importance of the Indonesian language. The results of this research literature review concluded that the importance of the Indonesian language has several advantages, namely facilitating communication. Good and correct Indonesian can facilitate communication between individuals or groups with different backgrounds and cultures. Clear and structured language will help messages to be conveyed more easily understood and interpreted. Increasing the credibility of using Indonesian properly and correctly will increase one's credibility in speaking or writing. People who use proper Indonesian will be seen as more intelligent, educated, and trustworthy. Improving the ability to think Indonesian is good and right to help improve the ability to think logically. Strengthening national identity Indonesian is the national language that strengthens Indonesian national identity. Good and correct language helps maintain the purity of the Indonesian language, thereby strengthening national unity and pride. Increasing career opportunities in good and correct Indonesian is an important requirement in the world of work. The use of appropriate and regular language will increase one's chances of getting a job or achieving a successful career. Improving foreign language skills in good and correct Indonesian can help improve foreign language skills. When a person masters Indonesian well, it will be easier for him to learn a foreign language because he has a strong foundation in using the language. Preserving the Indonesian language is good and correct, helping to preserve the Indonesian language.

Abstract

Breast cancer is a malignant disease with high morbidity and mortality rates. Chemotherapeutic agents used in breast cancer have serious side effects. For this reason, Photodynamic Therapy (PDT), which has photoactive agents, offers an alternative treatment in this regard as a method that can treat cancer by combining a photosensitizer and light of a certain wavelength in the presence of oxygen. The purpose of the present study was to uncover possible antitumor activity and mechanism of action of the newly designed Palladium (Pd)-conjugated Schiff-base Ligand (SBL)-mediated PDT on MCF-7 cells by comparing it with Cisplatin. LED light source was used in the study. Newly synthesized Pd-conjugated SBL (complex-1, complex-2) agents with

cisplatin were applied to MCF-7 cells. MCF-7 cells were incubated with agents for 4, 8, and 12 hours for cellular uptake analysis. In MTT analysis, the toxic effects of the agents on MCF-7 cells were determined after 48 and 72 hours of incubation. After the optimization experiments, light (Control, Cisplatin, Complex-1, Complex-2) and non-light (Control, Cisplatin, Complex-1, Complex-2) cells groups were formed. Cell death was examined by flow cytometry. The level of ROS was evaluated with the DCFDA Kit. In our results, the cellular uptake rate of MCF-7 cells to which the agents were applied was found to be at the highest level at the 12th hour. It was determined that the light-exposed cisplatin, complex-1 and complex-2 groups increased cytotoxicity after 72 hours of incubation. In addition, it was observed that ROS levels increased in cisplatin, complex-1 and complex-2 groups with and without light. Also, apoptotic and necrotic cell death was observed in these groups. However, cell death weren't detected in the light and non-illuminated complex-2 groups. In conclusion, complex-1 agent had potential as a candidate anticancer agent in FDT on MCF-7 cells, but complex-2-mediated PDT hadn't anticancer activity.

Abstract

The purpose of this study is to analyze the role of parents in overcoming the impact of adolescent fanaticism on online games. This research method uses a literature review approach that originates from books and journals related to adolescent fanaticism towards online games. The results of this research literature review concluded that fanaticism can be interpreted as belief in a fanatical object which is often associated with something or excessive enjoyment of an object, where this fanatical attitude is usually shown through enthusiasm for extreme objects, emotions, excessive interest in a long time, and often assume what they believe is the most correct thing. Teen fanaticism towards online games can be a serious problem because it can interfere with their daily life and make them lose interest in other things. In reducing fanaticism, it is necessary to have the role of parents in minimizing the addictive level of playing online games in their children, so that in the future they can live their lives in harmony without causing negative effects from unexpected problems. Some of the roles of parents in overcoming adolescent fanaticism for online games include limiting the time to play games, namely parents can help control teenage fanaticism by managing the time to play online games. They can set a daily time limit for playing games and ensure that teens do not exceed the allotted time. In addition, parents can also encourage other activities, establish communication, limit children's pocket money and snacks and get professional help.

Abstract

The purpose of this study was to analyze the factors that trigger adolescent fanaticism towards online games. This research method uses a literature review approach that originates from books and journals related to adolescent fanaticism for online games. The results of this research literature review concluded that fanaticism can be interpreted as a belief in fanatical objects that are often associated with something or excessive pleasure in an object, where this fanatical attitude is usually shown through enthusiasm for extreme objects, emotions, excessive interest in time for a long time, and often assume what they believe is the most correct thing. Fanaticism in online games in adolescents can be triggered by an attitude of dependence on games. Teenagers who play online games too often and for too long can become addicted to these games and consider them an important part of their lives. Playing games with great frequency and intensity can have side effects of addiction and dependency. As for the consequences that arise, the individual will continue to pursue it. This can cause them to become fanatical and obsessed with the game. Then other triggering factors are fanatical gaming communities, influence of friends or groups, opportunities to escape from problems, lack of understanding of healthy boundaries in playing games, influence of social media, and inadequate education. All of these factors can predispose adolescents to become fanatical and obsessed with certain online games, which can be detrimental to their mental and social health.

THE INFLUENCE OF SOCIAL MEDIA ON BUSINESS ACTIVITIES

Dwi MUTIARA (Orcid ID: 0009-0006-3940-045X)
UIN K.H. Abdurrahman Wahid Pekalongan, Indonesia

Hendri Hermawan ADINUGRAHA (Orcid ID: 0000-0002-8394-5776)
Faculty of Islamic economics and business, UIN K.H. Abdurrahman Wahid Pekalongan,
Indonesia

Abstract

The purpose of this study was to determine the effect of social media on business activities. This research method uses a literature study approach that originates from previously existing journals and is relevant to the purpose of this study. The results of this literature study conclude that social media is very influential on today's business activities. Social media is now used as a medium for buying and selling online. Compared to traditional buying and selling activities or having to meet directly between sellers and buyers, online buying and selling activities have many advantages. The existence of social media is the easiest marketing and promotion media and through social media is also more efficient. Promotion using social media has also increased business activities, especially due to easy marketing, production activities have also increased. For example, if previously handmade handicraft sellers in Indonesia themselves lacked interest, by using social media handmade handicraft sellers could market their products abroad where they have an interest in handmade handicraft products. This shows that social media is very influential on business activities.

Özet

Suç olaylarının aydınlatılmasında adli kimliklendirme amacıyla kullanılan STR lokuslarının kullanımı standart bir yöntem haline gelmiştir. Yirmi yılı aşkın bir süredir, 300-400 baz çifti uzunluğundaki STR bölgeleri adli genetikte kimliklendirmeye katkı sağlamaktadır. Olay yerinden toplanan biyolojik örneklerin, sıcaklık, nem, vb çevresel etkenlere maruz kalması nedeniyle DNA yapısında degradasyon meydana gelebilmektedir. Bu durumda STR lokusları ile 100 bp den küçük, analiz edilemeyen degrade DNA örneklerinin, SNP (Tek Nükleotid Polimorfizmi) analiz yöntemi ile incelenmesi mümkün hale gelmektedir. Bireylere fenotipik ve genotipik özellikler kazandıran DNA'nın polimorfik gen bölgelerinin özelliklerinden dolayı SNP'ler, günümüzde adli kimliklendirmede soy tahmini, fenotip tahmini, biyocoğrafik kimliklendirme gibi çalışmalarda kullanılmaktadır. Şüpheli bir durumda, STR profili ile bir eşleşme olmadığında, olay yerinden toplanan biyolojik örneğin kime ait olduğunun belirlenmesine yardımcı olabilecek herhangi bir bilgi çok değerli olacaktır. Bu nedenle adli genetikte, analizi güç olan biyolojik örneklerin ait olduğu kimliğin teşhis edilmesinde, adli DNA fenotipleme ile mağdur/maktül/şüpheli'nin yaşı, saç ve göz rengi gibi fiziksel görünümü hakkında ek bilgilerin çıkarılmasında, SNP'lerin kullanımı tercih edilmektedir. Şüpheli bir şahıs ile olay yerinden gelen DNA örneklerinin aynı kaynaktan gelip gelmediğini tespit etmek için, miras, annelik-babalık davalarında akrabalık ilişkilerinin belirlenmesinde, antropolojik çalışmalarda, felaket kurbanlarının kimliklendirilmesinde ve kayıp kişilerin belirlenmesinde SNP'ler kullanılmaktadır. Ancak bu uygulamalarda bazı çözümlenebilir engeller bulunmaktadır. Bunlar, adli alanda uygulamanın gerçekleşmesi sırasında meydana gelen etik hususlardır. Bir diğer husus ise; SNP'lerin Türkiye'de adli alanda uygulanmasıyla ilgili veri tabanının mevcut olmamasıdır. Ancak SNP'lerin kimliklendirmede kullanımının hız kazanmasıyla adli veritabanı oluşabilecek, dolayısıyla SNP'ler adli olayların çözümlenmesinde rutin olarak kullanılabilir nitelik kazanabilecektir. 1990'lı yıllardan bu yana STR çalışan laboratuvarlar tarafından özellikle CODIS verileri ile ilgili büyük bir veritabanı oluşmuştur. SNP'lerin kullanımıyla bu verilerin göz ardı edilmesi mümkün değildir. Mali yönden de değerlendirilecek olunursa; STR ile analizi mümkün olmayan ve degrade olan DNA örneklerinde SNP kullanımı mümkün görünmektedir. Bu düşünceden yola çıkarak, Jandarma ve Sahil Güvenlik Akademisi, Adli Bilimler Bölüm Başkanlığı, Adli Doğa Bilimleri Bölüm Başkanlığı'nda "SNP'leri kullanarak göz rengi ve saç rengi tahmininin adli kimliklendirmede optimizasyonu" başlıklı bir proje gerçekleştirerek, çalışmalarımızla veritabanına ve de suç olaylarının çözümlenmesine katkı sağlamayı planlamaktayız.

Abstract

The use of STR loci for forensic identification in the investigation of criminal cases has become a standard method. For over two decades, STR regions of 300-400 base pairs in length have contributed to identification in forensic genetics. The DNA structure of biological samples collected from crime scenes may be degraded due to exposure to environmental factors such as temperature and humidity. In this case, it becomes possible to examine degraded DNA samples smaller than 100 bp, which cannot be analyzed with STR loci, by the SNP (Single Nucleotide Polymorphism) analysis method. Therefore, SNPs are preferred in forensic genetics to identify the identity of difficult-to-analyze biological samples and to extract additional information about the physical appearance of the victim/suspect, such as age, hair and eye color, through forensic DNA phenotyping. SNPs are used in cases involving inheritance, maternity, and paternity, as well as in studies such as ancestry estimation, phenotype estimation, and biogeographic identification in forensic identification. SNPs have also been used to determine whether DNA samples from a suspicious person and DNA samples from the crime scene come from the same source, and to identify disaster victims. However, there are ethical issues that arise during the realization of the application in the forensic field, and a database on the application of SNPs in the forensic field is currently lacking in Turkey. With the increasing use of SNPs in identification, it is possible that a forensic database will be established, allowing for routine use of SNPs in solving forensic cases. From a financial point of view, it seems possible to use SNPs in degraded DNA samples that cannot be analyzed by STR. Since the 1990s, STR laboratories have built up a large database, particularly of CODIS data. It is not possible to ignore this data with the use of SNPs. We have been planning to carry out a project titled "Optimization of Eye Color and Hair Color Estimation Using SNPs in Forensic Identification" at the Gendarmerie and Coast Guard Academy, Department of Forensic Sciences, Department of Forensic Natural Sciences, and contribute to the database and the analysis of criminal cases with our studies.

Abstract

TiCN (titanium carbonitride) coatings deposited using chemical vapor deposition (CVD) have become increasingly popular for cutting tool applications due to their excellent mechanical and tribological properties. The development of TiCN coatings has been driven by the need for improved tool life, increased cutting speeds, and better surface finishes in various metal machining applications. This paper summarizes the recent advancements in TiCN CVD coatings for cutting tool applications. Also, the present paper focuss on the CVD process and the various parameters that can affect the deposition of TiCN coatings, including precursor selection, deposition temperature, gas flow rate, and pressure. Next, the mechanical and tribological properties of TiCN coatings are examined, including hardness, wear resistance, and coefficient of friction. The effect of coating thickness and substrate material on the properties of TiCN coatings is also discussed. The paper then discusses the recent advancements in TiCN CVD coatings, including the incorporation of elements such as aluminum and silicon to improve the properties of the coatings. Additionally, the use of new precursors and the development of novel deposition techniques, such as pulsed-CVD and plasma-enhanced CVD, are explored. The review also covers the surface modification of TiCN coatings using various techniques, such as laser treatment to improve their performance. Finally, the paper summarizes the current state of TiCN CVD coatings for cutting tool applications and highlights the future research directions. The paper concludes that TiCN CVD coatings have shown great potential for cutting tool applications, with the recent advancements in the deposition process and surface modification techniques improving the performance of these coatings. The review also suggests that further research is needed to optimize the deposition process and to develop new techniques to further improve the properties of TiCN CVD coatings for cutting tool applications.

Abstract

Eating disorders are defined as the deterioration of eating behaviors and the negative effects of body weight due to this deterioration. Depression, on the other hand, is known as an emotional state that manifests itself with loss of interest and pleasure in ordinary activities, great sadness, feelings of guilt and worthlessness, loss of appetite, sleep loss and loss of sexual desire. The aim of this study is to evaluate the relationship between depression and eating attitudes and behaviors in adults. The research was carried out on a total of 288 individuals, 103 (35.8%) male and 185 (64.2%) female, aged between 18-70 years. The data were collected with a questionnaire and the questionnaire included questions about the descriptive information of individuals, Eating Attitude Test-26 (EAT-26) and Beck Depression Inventory. It was determined that 28.6% of women and 9.7% of men had the risk of depression ($p<0.05$). Dieting, bulimic behavior scores, and total EAT-26 scores of individuals at risk of depression were found to be higher than those without ($p<0.05$). Statistically significant correlations were obtained between body mass index and oral control score and between BDI score and dieting, bulimic behavior, oral control subscale and total EAT-26 score ($p<0,05$). As a result, eating behaviors may differ according to depression status. However, studies should be conducted with different sample groups and larger samples in which depression and eating behaviors are evaluated together.

Keywords: depression, eating behavior, dieting, oral control behavior, bulimic behavior

Abstract

This research was carried out to find out the causes of low performance in students with the view to using activity-based methods in helping students to improve upon their academic performances. The study took place at New Abirem Senior High School in the Birim North District of the Eastern Region in Ghana. Some students were used as a sample and the accessible population. Class exercises and observation were the technique used to collect data on the low performance of the students under study in the academic year 2021-2022. This study is based on qualitative research method. As a result, it was obvious that teachers are not aided in the provision of teaching-learning materials and that was hindering their effectiveness in teaching.

Abstract

This study aims to analyze the information of Bank Muamalat Indonesia. This study uses a literature review approach. This literature research concludes that the Company is the first bank in Indonesia to use the concept of Sharia banking. The company was founded based on the Deed of Establishment No. 1 November 1 1991 AD or 24 Rabiul Akhir 1412 Hijriah, made before Yudo Paripurno, SH, Notary, in Jakarta. The establishment deed was approved by the Minister of Justice of the Republic of Indonesia in Decree No. C2-2413.HT.01.01 of 1992 dated March 21, 1992 and was registered at the Central Jakarta District Court office on March 30, 1992 under No. 970/1992 and announced in the State Gazette of the Republic of Indonesia No. 34 dated 28 April 1992 Supplement No. 1919A.

Abstract

This research aims to describe the Implementation of Happy Tolerance. This research uses the library research method. The main data sources in this study come from books, journals and other manuscripts that are relevant and related to the Implementation of Tolerance with Joy. This research literature review concluded that radicalism in educational institutions is a religious phenomenon in society. Various data and findings show that campuses and schools are exposed to radicalism. The problem of radicalism and intolerance in educational institutions also shows a hidden character of intolerance. Many students are reluctant or do not need to give Christmas greetings to Christians. This case both shows the narrative that tolerance is important. Both of them tend to see tolerance as limited to respecting and appreciating different religions but forget to carry out tolerance internally (to their own religion). The potential to be different is huge. This difference results in the birth of different legal results, because it is influenced by the social conditions in which this proposition lives. Religion is a matter of interpretation, and fiqh is a matter of definition. We want to hold a single definition or truth about who is tolerant and who is intolerant, between who is radical and who is not. Efforts to tolerance are rarely seen and built from within, fellow religions. Like, how do we understand, realize, tolerate various thoughts, understandings, regarding differences in Islamic law (fiqh) or differences in the interpretation of religious texts, and so on.

Abstract

The milk yield and growth of ruminant animals are largely dependent on the quality of the feed. Especially seen as low voluntary intake and digestibility. Determining the in vivo intake and digestibility of feedstuffs is time consuming, laborious and expensive. It is also not suitable for large scale feed evaluations as it requires large quantities of feed. Therefore, many attempts have been made to estimate intake and digestibility using in vitro techniques. For these purpose a lot of methods have been developed, evaluated and modified. In vitro methods can give more accurate and reliable results. Because in vivo microorganisms and enzymes are more sensitive to undetectable factors affecting the rate and level of digestion. To be effective, in vitro methods must be reproducible and have a good correlation with in vivo parameters. In vitro methods are cheaper and less time consuming, while maintaining experimental conditions more precisely than in vivo experiments. Developed by Menke et al., (1979) gas test method is very simple to apply and does not require advanced equipment. In this review, the advantages and disadvantages of in vitro techniques used for feed evaluation were described.

**THE URGENCY OF EDUCATION AND RESEARCH TECHNOLOGY IN LAUNCHING AN
INDEPENDENT CURRICULUM**

Khairun NISA (Orcid ID: 0009-0007-5957-8885)
UIN K.H. Abdurrahman Wahid Pekalongan, Indonesia

Abstract

The purpose of this research is to describe the urgency of MENDIKBUDRISTEK in launching the independent curriculum. This study uses the method of literature review. The main sources of data in this study come from books, journals and other manuscripts that are relevant and related to the Urgency of the Ministry of Education and Culture in launching the independent curriculum. This research literature review concluded that the Minister of Education, Culture, Research and Technology (Mendikbudristek), launched the Independent Curriculum on 11 February 2022 online. The Merdeka curriculum is much more concise, simpler and more flexible to be able to support learning loss recovery due to the Covid-19 pandemic. Apart from that, through the Independent Curriculum it is also to catch up with Indonesian Education from other countries. At the start of the pandemic, the Ministry of Education and Culture launched the Emergency Curriculum, as the first step of the Independent Curriculum. In the Emergency Curriculum, the government drastically reduced the amount of material. So that students and teachers can focus on exploring the most essential topics. There is no compulsion in this choice because the government offers it to schools. They can then see if the Emergency Curriculum is much simpler, so teachers can focus. In addition, the Merdeka Curriculum can also be adapted to the online system. So teachers and students are not burdened with a lot of material. The Minister of Education and Culture also emphasized the Independent Curriculum as an option without coercion for educational units. Because schools that are not comfortable implementing the Independent Curriculum are still allowed to choose the first option, namely the 2013 Curriculum. The Independent Curriculum is part of the teachers at school. According to him, teachers must be able to adjust to changes. Because the implementation of the Independent Curriculum cannot be separated from the role of the teacher.

Keywords : MENDIKBUDRISTEK, Independent curriculum

Abstract

Drug discovery and design are inextricably linked to various branches of chemistry, particularly organic chemistry. Many aspects of chemistry must be involved in order to translate knowledge of the molecular, genetic, and cellular bases of cancer into effective therapies. Thus, the goal of this research is to identify promising active compounds for coumarin as CK2 protein kinase inhibitors using a QSAR model and drug similarity analysis. CK2 is a ubiquitous Ser/Thr-specific protein kinase that is required for cell cycle viability and progression. CK2 levels are particularly high in proliferating, normal, or transformed tissues, and transgenic mice expressing its catalytic subunit are responsible for lymphomas. The work began with the optimization of the equilibrium structures of the basic coumarin in order to select the most reliable forecasting approach compared to experimentation and at the lowest computational cost. Following our research, we conduct a multiple linear regression (MLR) analysis to generate QSAR models. An external validation research was done because the results show that the QSAR model of CK2 inhibitory activity is robust and has extremely strong prediction capacity, as indicated by R² values of 0.951 and 0.927, respectively, following linear regression analysis. The investigation using QSAR models is successful in screening 34 candidate chemicals. Following that, the compounds under consideration were evaluated for drug-likeness and reactivity (ADME, golden triangle, lipophilicity indices). The results reveal that when supplied orally, the majority of the substances have no bioavailability issues. The data also aid in determining which chemicals do not have clearance issues, as well as which are the most stable and reactive among those examined. The anticipated findings of this study may aid in the development of novel coumarins with significant CK2 inhibitor activity.

Keywords: coumarine, CK2, QSAR, MLR.

Abstract

On e-commerce marketplace websites and mobile applications, multiple sellers can sell the same product. When a seller wants to add a new product to the store, the system first checks if the product is available on the marketplace. If the product is available, it is added as a new seller under the existing product code without creating a new product code. This screen, where the same product is displayed with different seller options, is called "Buybox". The order in which sellers are listed on the "Buybox" screen is very important. This is because most product sales are made by the seller who is in the first place. At the same time, the higher a seller is in the ranking, the more likely he/she is to make a sale. In this study, a sorting algorithm based on Extreme Gradient Boosting (XGBoost) has been developed to rank sellers on the Buybox screen. A dataset of 57690 rows consisting of 8 attributes of products sold on Trendyol.com has been created. The sorting algorithm has been tested on 4 different product categories including electronics, fast-moving consumer goods (FMCG), textiles and default. The default category includes all electronics, FMCG and textile products. The performance of the developed algorithm has been evaluated using Mean Absolute Error (MAE). The MAE's obtained for the electronics, FMCG, textile and default categories are 2.49, 0.91, 0.31 and 1.54, respectively. In general, the performance of the ranking algorithm has been found to be high for all categories.

Abstract

The purpose of this study is to explain the influence of the management of the regional financial accounting system on the quality of the financial statements of Pekalongan Regency. This study uses a systematic literature review method. The data sources for this research come from books, journals and other literature related to the potential and opportunities for exporting halal cosmetic products in Indonesia. Analysis of research data using VOSviewer-Visualization of scientific landscapes. Specifically, the objective of government financial reports is to provide information useful for decision making and to demonstrate the accountability of the reporting entity for the resources entrusted to it to fulfill these objectives. Government Accounting Standards Government financial reports such as balance sheets, budget realization reports, cash flow reports and notes to financial statements, as discussed above, are prepared in accordance with Government Accounting Standards. This standard regulates, among other things, when assets, liabilities, revenues, expenditures, financing receipts, sales expenditures are recorded in accounting and subsequently reported in the financial statements; how to determine the value of each element of the financial statements; how to disclose it so that the reporting of the elements of the financial statements can be adequately explained. If a centralized system is used, the person responsible for accounting for all financial transactions is assigned to one SKPD (usually the Regional Financial and Asset Management Service) and treats transactions that occur as transactions at the regional government level.

Abstract

This study's goal was to synthesize and construct biomaterials of the cationic and anionic types. These substances were utilized as adsorbents in waters that had been contaminated by various adsorbates that were probably prevalent in the environment. In order to describe the various materials, various approaches (IRTF, DRX, MEB, BET, and ATG/DTA) will be used. Studies on the adsorption by these substances will be conducted while changing a number of variables, including pH, mass, concentration, and temperature. Removal of effluents in aqueous media, particularly the adsorption technique, which appears to be well suited to remove pollutants due to its shown efficacy as well as for financial reasons, using inexpensive adsorbents such agricultural and industrial wastes.

Abstract

This study aims to analyze the Islamic economic review of e-money. This research uses research literature study data obtained indirectly. Sources of data needed in this research are books, journals and documents relevant to this research. The results of the study concluded that E-money in the perspective of Islamic Economics has now become part of technological advances in society, so it is lawful and has fulfilled the principles of Islamic law as a means of transaction and muamalah. This halalness is based on the rules and the existence of demands for human needs for electronic money, and consideration of the many benefits that exist in it, both for the benefits to the users of the electronic money themselves and the parties concerned. In addition, with electronic money, people can get security and comfort in carrying money. If it is associated with gharar and maysir, it is clear that this electronic money does not contain gharar or maysir aspects. This is because the nominal value that can be used is exactly the same as that deposited. As for administration fees, in this context, it is a service that is permissible because of the services that are obtained by the holder of the electronic money. Regarding the cost of making a card and administrative costs, this is actually an optional value. Not the value stated on the card. In addition, organizers must be based on retail payment needs which demand faster and more efficient transactions to avoid maysir.

GEBE BİR KÖPEKTE KRONİK DİYAFRAM FITIĞININ TEDAVİSİ

Yüksek Lisans Öğrencisi Veteriner Hekim Ayberk SUBAŞ

Ondokuz Mayıs Üniversitesi, Veteriner Fakültesi, Cerrahi Anabilim Dalı, Samsun

E-mail: ayberksubasi@gmail.com

Özet

Diyafram, plevral ve peritoneal boşluklar arasında fiziksel bir bariyer görevi görür. Ventilasyona ve lenfatik sıvının hareketine yardımcı olma işlevi gören tendon-kas yapısına sahip bir septumdur. Abdominal içeriğin diyaframdan herniasyonu doğuştan veya travmatik bir olayın sonucu olabilir. Konjenital veya plöroperitoneal herniler köpeklerde ve kedilerde nadir olarak görülür. Diyafram, glottis açıkken karın üzerine kuvvetli bir darbe ile yırtılır ve akciğerler, diyaframın kraniyal olarak hareket etmesine izin vererek kollabe olabilir. Diyafram fitiğinin varlığını belirlemek ve rüptür yerini lokalize etmek için radyografi yapılır. Radyografiler, diyafragmatik silüetin bir kısmının veya tamamının kaybını, kalbin normal kaudal silüetinin bir kısmının veya tamamının yokluğunu ve ayrıca yer değiştirmiş iç organların ve sekonder plevral sıvının varlığına bağlı olarak toraksta artan doku yoğunluğunu gösterebilir. Karaciğer, dalak, hava veya sindirimle dolu mide, hava veya sindirimle dolu duodenum, hava veya sindirimle dolu jejunum veya hava veya dışkıyla dolu kolon olduğundan, abdominal organların pozisyonundaki bir değişiklik tanıya yardımcı olur. Bu organların tamamı veya bir kısmı kraniyal yönde göğüs boşluğuna doğru yer değiştirebilir. Abdominal organların pozisyonundaki bu kraniyal kayma sadece karın içinde olabilir veya göğüs boşluğuna kadar uzanabilir. Her iki durumda da, hem göğüs boşluğunun hem de karın boşluğunun radyografik görünümü normalden belirgin şekilde farklıdır. Midenin göğüs boşluğu içinde kalması ve pilorus geçişinin engellenmesi durumunda midede genişleme meydana gelebilir. Göğüs boşluğu içinde gizlenmiş gastrointestinal segmentlerin varlığını göstermek veya karın içinde pilor antrumunun ve duodenumun fıtıklaştığını belirlemek için bir indirekt radyografi yöntemi olan baryum sülfat takip çalışması yapılabilir. Böylece göğüs boşluğu içerisine fıtıklaşmış mide, ince bağırsaklar ve kolon radyografide opasitesi artmış olarak görüntülenebilir ve seyri takip edilebilir.

Anahtar kelimeler: Cerrahi, diyafram, göğüs, köpek

Abstract

The electricity consumption and generation can be regarded as a stringent problem that needs urgent solving. It is paramount to preserve the balance in the electricity grids for ensuring an adequate supply to the home or industrial consumers. The developments in the area of devices working on alternative energy resources imposed the stabilisation of the unsteadiness among the demand and supply by storing the excess of electricity. In this context, the scientists were determined to find suitable materials that allow the storage of electric energy. For instance, the main component of a capacitor is the dielectric medium, which must exhibit an improved permittivity and a high dielectric breakdown field. Relying on the depicted background, this work is aiming to estimate the dielectric characteristics of some polymers loaded with distinct amounts of barium titanate. Several polymer structures were chosen as matrix, namely poly(methyl methacrylate), polyimide, cellulose acetate butyrate, polystyrene, polybenzoxazine and poly-4-vinylpyridine. The electrical properties of the matrix materials were determined by group contribution theory. Since the excellent dielectric features of barium titanate are widely recognized, their involvement in improving the effective permittivity of the studied polymers is analyzed. This was done by employing specific mixing rules. It was found that in all multiphase systems the addition of the ceramic particles conducted to the augmentation of the dielectric constant. Also, the molecular polarizability of each polymer was shown to influence the electrical performance of the composite. The differences given by the mixing relations are also discussed here. Another addressed aspect was the

impact of the dielectric characteristics of the ceramic filler in the tetragonal, orthorhombic, or cubic phase on the overall properties of the samples. All the aforementioned aspects are crucial for producing polymer composites with suitable electrical parameters that are matching the demands for manufacturing the dielectric parts, which can be implemented in capacitors or other related devices.

Keywords: flexible polymer, ceramic filler, dielectric properties.

Abstract

In the context of the fast evolution in the area of the polymer-based materials, many technologies have registered a tremendous progress. The synergism of the concepts derived from nanotechnology and polymer processing have led to a new category of materials, namely polymer nanocomposites. Considering the above premises, this work presents studies on the preparation and characterization of some composites containing a hydrosoluble matrix which was loaded with two sorts of carbon –based fillers. Thus, in polyvinyl alcohol matrix were incorporated variable quantities of pristine or modified carbon nanotubes. The mentioned filler was selected owing to its widely known excellent electrical and mechanical properties. Furthermore, for generating a better interaction with the polymer matrix having lots of hydroxyl functional groups, the carbon nanotubes were chemically modified by hydroxylation reaction. This procedure renders functional moieties on the filler walls that lead to better wettability with polyvinyl alcohol. The level of the filler dispersion in the matrix was studied by means of optical microscopy, showing good homogeneity of the samples. In order to understand how the filler affects the electronic structure of the polyvinyl alcohol, UV-VIS spectra were obtained. From these data, it was possible to further determine the dependence of the absorption coefficient and from its variation with the photon energy, the Urbach energy – depicting the structural disorder in the samples – was evaluated. Next, the Tauc theory was applied to the spectral data and the optical band gap energy was estimated as

a function of the filler amount in the composite. The results were also discussed by considering the sorts of the filler introduced in the polyvinyl alcohol matrix. The influence of the functionalization on the calculated optical parameters was analyzed. The presented data in this work is very important for applications which are involving polymer-based materials, characterized by flexibility, enhanced electrical properties and mechanical resistance. Such films are of great interest for introducing them in electronic devices.

Keywords: polymer composite, carbon-based filler, morphology, absorption edges.

**SOL ANTEBRACHIUMDA OSTEOSARCOMA MEYDANA GELEN BİR KÖPEKTE
TÜMÖRLÜ DOKUNUN OSTEOTOMİ YÖNTEMİ İLE UZAKLAŞTIRILMASI**

Yüksek Lisans Öğrencisi Veteriner Hekim Ayberk SUBAŞ

E-mail: ayberksubasi@gmail.com

Özet

Osteosarkom (OSA), köpeklerde en sık görülen kemik tümörüdür (malign kemik tümörlerinin %80'inden fazlası). OSA'lı köpeklerin %80'i akciğer metastazı nedeniyle ölmektedir. OSA'nın etiyopatogenezi bilinmemektedir, ancak çeşitli predispozan faktörler (cinsiyet, vücut ağırlığı) gelişimine yol açabilir. Vücut ağırlığı 40 kg'ın üzerinde olan köpekler, daha küçük köpeklere göre daha yatkındır. Çalışmaların çoğu, bu neoplazmanın erkekleri dişilerden daha sık etkileme eğiliminde olduğunu göstermektedir. Bir neoplazmanın yeri, metastaz ve ölüm riskini artırır. Distal radiusta lokalize olan tümörler daha düşük metastaz riski ile ilişkilendirilirken, proksimal humerus ve distal femur veya proksimal tibia lokalize tümörler yüksek metastaz kabiliyetine sahiptir ve bu da mortalitede önemli bir artışa neden olur. Klinik belirtiler primer tümörlerin konumuna bağlıdır. Apendiküler OSA'da tipik klinik belirtiler şunlardır: topallık (belirgin bir ağrı olsun ya da olmasın) ve tümör bölgesinde genellikle tümörün çevredeki yumuşak dokulara yayılmasının bir sonucu olan lokal şişlik. Esas olarak Rottweiler, Alman Çoban Köpeği, Boxer, Doberman Pinscher, Setter). En sık orta yaş köpeklerde (6 ila 10 yaşları arasında) görülür. Topografik konum apandiküler iskelet (vakaların %64'ü), eksenel iskelet (%28, 5) (kaburgalar ve kafatası) ve ekstraskeletal kaslar (%7, 5). Apendiküler OSA ön ayaklarda arka ayaklara göre daha sık görülürken, ekstraskeletal OSA öncelikle viseral organlarda (adrenal bez, göz, mide bağı, ileum, böbrek, karaciğer, dalak, testis ve vajina) gelişir.

Gereç ve Yöntem

Melez ırkı 10 yaşlı köpekte sağ antebrachiumun distalin de gelişen osteosarkomun tedavisi için planlama yapıldı muayene aşamaları tamamlandıktan sonra çekilen X-ray görüntüleme işlemi sonrası bilgisayarlı tomografi (GE HiSpeed 2 kesit) çekildi. Tomografi işlemiyle belirlenen sağlıklı kemik doku sınırları belirlendi. Operasyon yapılan plan çerçevesinde gerçekleştirildi.

Anahtar kelimeler: Cerrahi, köpek, kemik, kanser, operasyon

Abstract

The dielectric characteristics of the polymer-based layers have been presenting huge interest for the fabrication of flexible components implemented in energy storage devices, especially in capacitors. The performance of the materials can be modulated by combining the benefits of the polymers and filling particles. It is widely acquainted that inorganic reinforcement agents, such as metal oxides, are exhibiting tremendous applicative potential since they are able to improve the electrical properties of polymers. In this work, a theoretical evaluation of certain parameters of some polymer composites designed for energy storage purposes, are investigated. For this goal, hydroxypropyl methylcellulose (HPMC) was chosen as matrix due to its remarkable biodegradability, water solubility, easy of processing, mechanical stability and flexibility features. This polymer was further loaded with fillers, like manganese-doped zinc oxide (ZnMnO), titanium dioxide (TiO₂), hafnium oxide (HfO₂) and tantalum pentoxide (Ta₂O₅). The dielectric constant of this cellulosic matrix was ascertained by employing a method that accounts on its structural characteristics, which are quantified through connectivity indices. Then, the effects created by the different quantities of the metallic particles introduced in the matrix on the dielectric properties of the composites were predicted by using certain mixing rules. Furthermore, the critical analysis of the data acquired with these models was done. The next step involved the evaluation of the dielectric breakdown and electric energy density for all the proposed composite systems. These electrical parameters together with the dielectric constant are essential factors in describing the multicomponent material suitability of storing electrical energy. This reported approach is providing a facile and quick tool for designing polymer composites with optimal targeted electrical properties without expensive consuming of the raw substances used in synthesis stage. In this way, it is possible to appraise the best composition and association of polymer and filler to acquire the desired performance of dielectric layers utilizable for energy-related applications.

Keywords: cellulose ester, composite, bio-filler, dielectric constant.

Özet

Önceki çalışmalarda 2-nitrobenzaldehit bazında sentezlenen diklorodiazadienlerin NaN_3 ile reaksiyonundan 4-azido-2H-1,2,3-triazoller sentezlenmişti. Reaksiyon sırasında azit anyonunun çift bağındaki heminal klor atomlarının yer değiştirmesi sonucu devamsız bis-azidlerin oluştuğu belirlendi. Daha sonra azot molekulunun ayrılması ve molekül içi siklizasyon reaksiyonu sonucunda karşılık gelen 1,2,3-triazoller elde edildi. Azit grubunun organik sentezdeki yer değiştirme reaksiyonlarına kolayca dahil olması onların geniş bir uygulama alanına sahip olmalarının önünü açmaktadır. Özellikle birçok tıbbi maddelerin sentezinde kullanmak mümkündür. Bu yöntem, biyolojik olarak aktif 4-azido-2H-1,2,3-triazollerin elde edilmesi için çok etkili bir sentez yöntemi olarak kabul edilebilir. Bu doğrultuda 3-nitrobenzaldenitten sentezlenen diklorodiazadienler üzerinde araştırmalara devam edilmiş ve 1,2,3-triazoller sentezlenmiştir.

Sentezlenen bileşiklerin yapısı, NMR ile birlikte RQA araştırma yöntemi ile doğrulanmıştır.

Anahtar kelime: triazol, diklorodiazadien, fizyolojik olarak aktif madde

Abstract

Most epidemiological studies show that a diet rich in vegetables and fruits in particular has cancer-preventive properties. The beneficial effects of this diet can be attributed to polyphenols, bioactive compounds with anticancer properties. One of the foods containing these polyphenols is artichoke. Artichoke (*Cynara scolymus* L.) is a perennial plant that has been used as food from the past to the present, especially in the Mediterranean diet. This plant is rich in phenolic acids and flavonoids. It is also an important medicinal plant for therapeutic purposes or as a supportive treatment. Polyphenols from the edible part of artichoke have been shown to be a potential chemopreventive on various cancer cells. Cynarin has been identified as the most important polyphenol in artichoke. Cynarin (1,3-O-dicaffeoylquinic acid), found in plants of the *Astraceae* family, is a derivative of dicaffeoylquinic acid. Cynarin is found mostly in the head and leaf parts of this plant. However, the plant contains Cynarin in very low amounts. This component, which enhances the effects of artichoke, has many health benefits. The potential health effects of Cynarin can be summarized as anti-carcinogenic, hepatoprotective, choleric, cholesterol-lowering, diuretic, anti-atherosclerotic, antioxidative, antibacterial, anti-diabetic and immunomodulatory activity. Polyphenol compounds show antiproliferative and apoptosis-inducing effects in cancer cells. They also have the ability to regulate cell differentiation and cell cycle. These compounds can stimulate apoptosis in cancer cells as prooxidants as well as repairing and healing cells as antioxidants. Polyphenols in artichoke have been shown to activate the apoptotic mechanism of cancer cells via mitochondrial pathway or death-receptor pathway at high doses. There are studies showing that low doses induce aging in cancer cells through epigenetic and ROS-mediated mechanisms. In support of the studies, high doses of Cynarin applied to some cancer cells are reported to have tumor suppressor effects by stimulating apoptosis. However, it was found that low doses did not have any effect on apoptosis. In conclusion, Cynarin may be a promising compound in cancer chemoprevention or treatment. For this reason, it is thought that more *in vitro* and *in vivo* studies should be conducted to further clarify the apoptotic effects of Cynarin.

Keywords: Cynarin, Polyphenol, Cancer cells, Apoptosis

**EVALUATION OF SOYBEAN BREEDING LINES FOR CULTIVAR DEVELOPMENT
IN MEDITERRANEAN REGION AS A MAIN CROP CONDITIONS**

Abstract

The objective of this study was to evaluation the agronomic and quality traits of soybean breeding lines in the main crop growing season for Mediterranean region. This study was conducted in the Eastern Mediterranean Agricultural Research Institute experimental area in 2019. The experimental design was randomized complete block design with three replications. Seventeen soybean breeding lines and three varieties, Mona, Lider, Sa88, were used as plant material. In the study, days to maturity, plant height, number of pods, 1000 seed weight, seed yield, protein ratio, fat ratio and fatty acid compositions were investigated. According to the research findings, seed yield values varied between 223.7-558.4 kg/da. In the experiment, the average of control varieties was determined as 451.7 kg/da and seven soybean breeding lines performed above trial standard averages. The highest fat content was obtained from Mona (24.5 %) and the highest protein content was obtained from the DA-12-14-(1-3) breeding line (40.9%).

**HISTOCHEMICAL ANALYSIS OF THE SYMPATHETIC NERVOUS STRUCTURES
IN THE WALL OF THE INTERNAL ILIAC ARTERIES**

Misir BAYRAMOV

Department of Human Anatomy and Medical Terminology of Azerbaijan Medical
University, Baku, Azerbaijan

Anar ABDULLAYEV

Department of Human Anatomy and Medical Terminology of Azerbaijan Medical
University, Baku, Azerbaijan

Introduction

The study of the nervous apparatus in the walls of blood vessels in various areas in some vertebrates adds to the information about the features of the sympathetic innervation of the blood vessels. The study of the nervous apparatus of the vessels provides information on their various functional activities. Functional changes in the nervous structures in the walls of blood vessels have recently been encountered frequently.

Purpose of the study

The aim of the study was to investigate sympathetic nerve structures in the wall of the internal iliac arteries of white rats.

Material and methods

The material for the study was pieces of the wall of the internal iliac arteries taken from 15 female white rats weighing 250–400 grams. Sympathetic nerve fibers and structure were identified using the technique of V.N. Shvaley and N.I. Zhuchkova.

Results

The study showed the presence of a clearly visible sympathetic innervation in the walls of the internal iliac arteries of white rats, which is represented by a plexus of sympathetic fibers. In addition, individual bundles of sympathetic fibers, which are located in parallel, were also detected on the obtained histochemical preparations. Identified sympathetic nerve fibers are represented by different diameters. In the composition of the walls of the internal iliac arteries, nerve fibers of large and medium caliber are mainly detected. As part of the wall of the internal iliac arteries, the density of the sympathetic nerve fibers increases in the proximo-distal direction. In the walls of the internal iliac arteries, thickenings were also found, such as in the adventitia and the subendothelial layer.

Conclusion

The sympathetic nerve fibers' density increases in the proximal to distal direction in the wall of the internal iliac arteries.

**THE INFLUENCE OF THERMAL RADIATION AND CHEMICAL REACTION ON
MHD MICROPOLAR FLUID IN THE PRESENCE OF HEAT GENERATION/
ABSORPTION**

Abstract

Numerical and theoretical analysis of mixed convection flow of MHD micropolar fluid with stretching capillary in the presence of thermal radiation, chemical reaction, viscous dissipation and heat generation/ absorption have been studied. The governing non linear partial differential equations of momentum, angular velocity, energy and concentration are converted into ordinary differential equations using similarity transformations which can be solved numerically. The dimensionless governing equations are solved by using Runge Kutta fourth fifth order along with shooting method. The effect of physical parameters viz., micropolar parameter, unsteadiness parameter, thermal buoyancy parameter, concentration buoyancy parameter, Hartmann number, spin gradient viscosity parameter, microinertial density parameter, thermal radiation parameter, Prandtl number, Eckert number, heat generation or absorption parameter, Schmidt number and chemical reaction parameter on flow variables viz., velocity of micropolar fluid, microrotation, temperature and concentration has been analyzed and discussed graphically. MATLAB code is used to analyze numerical and theoretical facts. From the simulation study it can be concluded that an increment of micropolar parameter, Hartmann number, unsteadiness parameter, thermal and concentration buoyancy parameter results in decrement of velocity flow of micropolar fluid; microrotation of micropolar fluid decreases with an increment of micropolar parameter, unsteadiness parameter, microinertial density parameter and spin gradient viscosity parameter; temperature profile of micropolar fluid decreases with an increment of thermal radiation parameter, Prandtl number, micropolar parameter, unsteadiness parameter, heat absorption and viscous dissipation parameter; concentration of micropolar fluid decreases as unsteadiness parameter, Schmidt number and chemical reaction parameter increases. Furthermore, computational values of local skin friction coefficient, local wall coupled coefficient, local Nusselt number and local Sherwood number for different values of parameters have been investigated.

Keywords: Thermal radiation, chemical reaction, viscous dissipation, heat absorption/ generation, similarity transformation.

Abstract

Dornogov aimag - the total area is 109472 km². Aimak is subdivided into 14 soums. Our route was through 8 somon. Features of the territory The aimak is subdivided from north to south into 4 physical-geographical regions: the Middle Khalkha holly steppe, the Northern Gobi, the East Gobi depression and the East Gobi (Dzamyin-Uda) peneplain. In the Dornogov aimag, 79 species of birds belonging to 13 orders, 27 families and 57 genera are recorded. According to the nature of their stay, 25 resident species and 54 migrant species are noted. The ecological group in the avifauna of Dornogov aimag is dominated by open habitats (steppes, semi-deserts), 35 species of campophiles (44.3%) are noted. In trees and shrubs, the share of which is 27 species (34.2%). There are 17 limnophiles (21.5%) in the wetlands. The taxonomical classification of avifauna of the Dornogovi aimak is the following: Galliformes - 1, Anseriformes - 4, Falconiformes - 8, Gruiformes - 1, Charadriiformes - 9, Columbiformes - 4, Cuculiformes - 1, Strigiformes - 2, Apodiformes - 1, Upupiformes - 1, Piciformes - 1, passeriformes - 46 species. According to B.K. Shtegman (1938) in the study area, representatives of 9 types of fauna were noted by widespread species of middle latitudes: Mongolian – 22, Transpalearctic - 17, European - 12, Siberian - 11, Chinese - 6, Arctic and Mediterranean - 4, Tibetan - 1 and it is not clear origin - 2 species.

Abstract

The progress in the research regarding polymer systems was principally focused on the improvement of their balance of properties. This led to the multiplication of the categories of this sort of materials as a function of their main group of functionalities. A peculiar interest was directed towards introduction of photosensitive features to polymers by chemical modification or by mixing them with molecules that are responding to light action. Among these, azochromophores are very interesting because the azo-moiety can suffer numerous conversions from one isomeric state to another when exposed to radiations of precise energy. This work is aiming to prepare some photosensitive layers by using several polyimide precursor structures in association with an azo dye having cyano as terminal group. In order to make flexible layers, the polymers were synthesized by using a carefully selected pair of aromatic dianhydride and diamine containing ether bridges among the phenyl units. The dianhydride also presents the isopropylidene groups, while the diamine has a cyano group substituted on the benzene ring in meta or ortho position. To accomplish the targeted supramolecular systems, in the solution of the polyimide precursor was inserted the azo-component, namely 4-[(4-cyanophenyl)diazanyl]phenol (AzoCN). The photosensitive counterpart was incorporated in the polymer in several mixing ratios and subsequently the resulted samples were deposited onto clean glass slides. To finalize the film drying and cyclization of the polyimide precursor, a thermal treatment was applied. This approach led to supramolecular polyimide systems and their properties can be controlled via the inserted amount of AzoCN. Its influence on the optical properties was first tested by means of colorimetry. The data indicated important differences in the film's aspect as a function of both polyimide structure and azochromophore quantity. Another analysis involved the evaluation of the refractive index by applying the group theory method. It was found that the light velocity through the samples is modified as a result of photo-responsive component presence in the polymer. The data are

relevant for further selecting the best conditions of surface texturing via laser to make flexible components for electronics.

Keywords: flexible polyimide, azo dye, optical properties.

Abstract

The present study aimed to identify the nutrients (UPLC-PDA-ESI-MS/MS method) and biological activity (the activity of antioxidants as the power of metal-chelating, antiradical ability ABTS•+, activity of removing hydroxyl radicals, capability to inhibit the activity of catalase, anti-inflammatory to inhibit the activity of lipoxygenase) of polyphenolic powder of white grape ('Solaris' cultivar). The study was also to determine the potential bioaccessibility and bioavailability in the *in vitro* model of simulated gastrointestinal digestion. Phytochemical profiling of polyphenolic powder revealed 18 compounds, including 3 phenolic acids, 7 flavonols, and 8 flavan-3-ols. Highly bioaccessible during *in vitro* conditions were dimer procyanidin and caffeoyl-tartaric acid. The polyphenolic extract showed high bioaccessibility of metal-chelating power, the activity of removing hydroxyl radicals and inhibiting the activity of catalase. While extract of polyphenolic white grape powder was highly bioavailability. Thus, the white grape polyphenolic powder can be used in designing functional foods tailored to individual needs and diet-related disorders and/or in designing symbiotics. This research was funded as a whole by National Science Centre, Poland [grant no. 2020/39/D/NZ9/01810].

Keywords: bioactive compounds, simulated gastrointestinal digestion, antioxidant activity, anti-inflammatory activity.

SOME TRANSFORMATIONS OF ETHYL CYANOACETATE

Abstract

It has been found that ethyl cyanoacetate (1) in the presence of triethyl phosphite and zinc acetate participates in self-condensation reaction with the formation of diimine derivative (2), the formation of which should be considered as a product of the addition of the CH₂ fragment of compound (1) to the nitrile groups of two molecules of compound (1) according to the scheme:

Alkylation of compound (1) with 1,2-dichloroethane in DMSO in the presence of potash at 80°C for 3 hours gives three products: C,C-intramolecular dialkylation with the formation of cyclopropane derivative (3), an intermolecular product of C,C,C ,C-tetraalkylation with the participation of two moles of the reagent and two moles of the substrate - bis 1,4-(cyanoethoxycarbonyl)cyclohexane (4) and a polymeric product

Alkylation of compound (1) with 1,2,3-trichloropropane is more complicated and 2 mol of a substrate (1) and 3 mol of trichloropropane are involved in the condensation reaction. Along with alkylation, dehydrochlorination also occurs. Under the reaction conditions, the primary alkylation product undergoes partial hydrolysis and decarboxylation, as well as complete hydrolysis and decarboxylation to form products 5 and 6, respectively.

Keywords: alkylation, cyanoacetate, 1,2-dichloroethane, 1,2,3-trichloropropane, condensation

DESTRUCTIVE FUNGAL DISEASES OF TURFGRASS

E-mail: acoskuntuna@nku.edu.tr

Abstract

Turfgrass absorbs atmospheric pollutants such as carbon monoxide, sulfur dioxide, ozone, nitrogen dioxide, ammonia and volatile organic compounds. Turfgrass quality is very important in green areas and keeping it healthy is more important than growing it. There are many factors that limit the development of turfgrass and spoil its color. Since turfgrass does not have a strong stem, it is more sensitive to abiotic factors such as environmental stress factors and biotic factors than other plants. The risk of disease transmission increases, especially since the leaves in the golf and football fields that are open to continuous use are more worn out. Anthracnose (*Colletotrichum graminicola*), Bipolaris Leaf Spot (*Bipolaris sorokoiniana*), Brown Patch (*Rhizoctonia solani* and *R. zae*), Copper Spot (*Gloeocercospora sorghi*), Dollar Spotting (*Sclerotinia homoeocarpa*), Fusarium Leaf Spot and Root Rot (*Fusarium culmorum*, *F. tricinctum*), Gray Leaf Spot (*Pyricularia grisea*), Helminthosporium Leaf Spot (*Drechslera poae*), Powdery Mildew (*Blumeria graminis*), Rust (*Puccinia* spp), Fairy Rings, Pythium Leaf Blight and Root Rot (*Pythium ultimum*, *P. aphanidermatum*) and Summer Patch (*Magnaporthe poae*) are the most common fungal diseases. These diseases cause plant death in very large turfgrass areas. This review was aimed to provide an overview of the turfgrass diagnosis and highlight prospects for disease detection.

Keywords: Turfgrass, pathogen, fungi, disease, symptom

**PROMOTING A STUDY ON THE IMPORTANCE OF MAINTAINING ADEQUATE
NUTRITION AND HEALTH DIET FOR CHILDREN WITH CEREBRAL PALSY IN
MODERN SOCIETY**

Fr. Baiju THOMAS

Ramakrishna Mission Vivekananda Educational and Research Institute, Faculty of Disability
Management and Special Education, Vidyalaya Campus, SRKV Post, Coimbatore – 20,
E-mail: rtobaiju@gmail.com

Abstract

The contemporary study on the importance of maintaining adequate nutrition and a healthy diet for children with cerebral palsy (CwCP) in modern society. Undernutrition is more likely in children with severe CP, especially those with oropharynx dysfunction. Several factors and approaches go into figuring out if someone need nutritional assistance. Children who do best on an oral diet often get immediate benefits from supplementation. Enteral tube feeding might be explored for malnourished children if poor weight gain persists despite oral nutritional supplements and the child develops oropharynx dysphagia and an unsafe swallow. Making educated guesses about calorie and protein needs isn't enough to prevent overfeeding or underfeeding. Children with CP should be fed in a way that promotes good growth and development for their health, quality of life, comfort, and happiness. The risk of malnutrition can be mitigated by providing parents and caregivers of children with CP, who often have a significant disability, with nutrition education. Caretakers and children with mild to moderate CP should be taught classes on preparing and eating a balanced diet, focusing on receiving appropriate vitamins to fight obesity. The cognitive, neurological, muscular, and skeletal involvement in children with cerebral palsy can be as varied as in adults. The greater a child's need for medical care, the higher the risk of being malnourished. Medical complications later in life can be mitigated if feeding and nutritional issues are identified and treated early on by a multidisciplinary team of care professionals. Caregivers and family members play an essential part in the team regarding the day-to-day logistics of feeding and nutrition. This paper provides an impression of CP, its consequences on a child's health diet and development, and the various treatment and rehabilitation options available to families with a child with the disorder. Many health diet issues pursuing children with CP have to do with their development and nutrition. Stunted development and malnutrition pose major threats to the health, quality of life, social relationships, motor skills, and even mortality of children with cerebral palsy. Many methods for treating developmental delays have been developed since they were first identified. The contemporary era's greater focus on malnutrition as a cause of stunting has resulted in better rehabilitation treatments and higher survival rates. Advances in treatment for children with CP have resulted from a better understanding of the neurological, metabolic, and environmental factors contributing to its development in modern society.

AKDENİZ BÖLGESİNDE NOHUT (*Cicer aritinum* L.) HAT VE ÇEŞİTLERİNİN
ARAŞTIRILMASI

Dürdane MART (Orcid ID: 0000-0002-2944-1227)
Doğu Akdeniz Tarımsal Araştırma Enstitüsü-ADANA
E-mail: durdanemart@yahoo.com

Özet

Akdeniz ekolojik koşullarında bazı nohut (*Cicer aritinum* L.) genotiplerinin verim ve tarımsal özelliklerinin belirlenmesi ve çeşit ıslahı amacıyla bu araştırma yürütülmüştür. Tarla denemesi 2017 yılında Doğu Akdeniz Tarımsal Araştırma Enstitüsü Doğankent lokasyonu deneme arazisinde, 20 genotip ile kışlık olarak ekilerek yürütülmüştür. Bu çalışmada ülkesel ve ICARDA orjinli genotipler kullanılmış ve tesadüf blokları deneme deseninde ekimler yapılmıştır. Ekimlerde, sıra arası 45 cm, sıra üzeri 8 cm olacak şekilde, 5 m uzunluğundaki 4 sraya 9 m²'lik parsellere ekimler yapılmıştır. Ekim öncesi dekara 2-3 kg N, 5-6 kg P₂O₅ gelecek şekilde gübreleme uygulanmıştır. Araştırmada, Çukurova koşullarında nohut verim ve verimle ilgili bazı özellikler arasındaki ilişkilerin tespiti ve çeşit geliştirmeye yönelik, nohut genotiplerinden kışlık ekime yönelik seleksiyon ve değerlendirmeleri yapılmıştır. Araştırmanın yürütüldüğü yılda kışlık ekimlerden elde edilen en yüksek ve en düşük tane verim değeri 212,50 kg/da olarak FLIP 09-186C ve 97,83kg/da ile ENA 144-10 nohut genotiplerinden elde edilmiştir. 100 tane ağırlığı bakımından 47,33 -34,27gr arasında değerler elde edilirken; çeşit ve hatlarda, erkencilik özelliği için de çiçeklenmede 88,00-73,67 gün değerleri arasında ve bakla bağlamada 99,00-94,00gün değerleri arasında olarak tespit edilmiştir. Makinalı hasata uygunluk bakımından bitki boyları 74,40-59,40cm ve ilk bakla yükseklikleri 35,53-27,10cm değerleri elde edilmiş ve öncelikli olarak incelenmiştir. Bu sonuçlar yapılan ıslah çalışmalarında belirleyici olmaktadır. Çeşit ve hatlar bölge koşulları içinde değerlendirilerek çeşit tesciline yönelik çalışmalar sürdürülmektedir.

Anahtar kelimeler: nohut, verim, tarımsal özellikler ve çeşit ıslahı

Özet

Yapay zeka ve otomasyonun hızlı gelişimi, birçok işin yerini yapay zeka uygulamalarının alacağı anlamına geliyor. Yapay zekanın hakim olacak birçok alanda uygulanması sonucunda mevcut meslekler işlevini yitirdiği için iş kayıpları ortaya çıkıyor. İnovasyonun bir sonucu olarak üretim maliyetlerindeki düşüş, robotların üretim, paketleme, inşaat, bakım ve tarım gibi yeni alanlarda giderek artan sayıda manuel görevleri üstlenmesini sağlıyor. Bu nedenle teknolojik gelişmenin her dalgasında işçiler işsizlikle karşı karşıya kalmaktadır.

Anahtar kelimeler: yapay zeka, yasal düzenleme, ücretli emek, işçi, işveren, meslek, robot, iş gücü, data mining (veri madenciliği).

EFFECTS OF PASTURE AND CONCENTRATE-BASED FEEDING ON MILK AND DAIRY PRODUCTS

Dr. Celile Aylin OLUK (Orcid ID: 0000-0001-8939-3610)

Republic of Türkiye Ministry of Agriculture and Forestry Eastern Mediterranean Agricultural
Research Institute, Yüregir, Adana, Türkiye
E-mail: celileaylin.oluk@tarimorman.gov.tr

Abstract

Pasture-fed dairy products has recently increased the interest of consumers. Although there are many studies describing the effect of different feeding strategies on the composition of milk in our country and in the world, there are few studies that compared pasture-based and concentrate-based nutrition. Milk obtained from different feeding strategies have effects on products, such as yield amount, color, effect of spreadability, melting temperature, change in gel firmness. Changes in milk composition have also been effects on milk and dairy product workability, functionality and sensory properties. Methods have been found to determine traceability of dairy products or to verify marketing claims such as "pasture fed". Availability of forage and forage quality are quite variable depending on climatic and seasonal factors. Consumption of grasses which mature later in the growing season has been shown to significantly increase milk protein yield and milk protein concentration. The practice of seasonal, pasture-based feeding systems is largely determined by economic and environmental factors, but evidence for potential nutritional benefits associated with dairy commodities produced therefrom could also provide valuable considerations in this regard. This study will investigate the effects of feed types on milk composition and quality and the ultimate impact of dietary changes on milk and dairy product functionality, with special emphasis on pasture and concentrate-based feeding systems in Turkey and around the world.

THE EFFECT OF COMBINATION OF CHICKEN MANURE EXTRACT WITH AB-MIX NUTRITION ON THE GROWTH AND YIELD OF MUSTARD GREENS IN HYDROPONIC SYSTEM

Ahmad Zaky ABYAN

Faculty of Agriculture, University of Lampung, Bandar Lampung, Indonesia

Darwin H. PANGARIBUAN

Faculty of Agriculture, University of Lampung, Bandar Lampung, Indonesia

E-mail: darwin.pangaribuan@fp.unila.ac.id

Abstract

The demand for mustard greens continues to increase in line with the growing population, so efforts need to be made to increase mustard green production. Hydroponic cultivation is one of the efforts to increase mustard green production on limited land. This study aims to determine the effect of substituting chicken manure extract and to determine the appropriate concentration combination on AB-mix nutrition on the growth and yield of mustard greens (*Brassica juncea* L.) using NFT hydroponic system. This study was conducted in Bandar Lampung, in November-December 2022. The treatments were arranged in a Completely Randomized Design (CRD) with 4 single treatments and 6 replications. Each treatment consisted of four levels, namely 100% AB-mix, 100% chicken manure extract, AB mix 50% + chicken manure extract 50%, and AB mix 75% + chicken manure extract 25%. The results showed that the growth and yield of mustard greens in the AB-mix 75% + chicken manure extract 25% treatment were significantly higher than in the 100% AB-mix treatment, as evidenced by the variables of plant height, stem length, leaf dry weight, leaf count, stomatal count, and the amount of weight of three plant heads but equivalent or not significantly different for the leaf greenness, root length, and harvest index variables. The best composition of chicken manure extract substituted with AB-mix nutrition was AB-mix 75% + chicken manure extract 25%.

Abstract

This research study investigates the relationship between management practices and young employee retention in the hospitality and tourism industry in Lebanon. Besides, it examines the moderating role of the workplace context in the relationship between management practices and employment retention in the industry. Non-probability purposive sampling method was used to collect 421 questionnaires through a survey of young employees. Exploratory factor analysis (EFA) and Cronbach's alpha test are conducted to test the construct validity, reliability, and internal consistency of collected data. Descriptive statistics are used to interpret the data. Zero-order correlations, multiple regression analysis and Fisher's Z-test are applied to assess the interrelations of the various groups of variables and the determinants of young employee retention. The findings show that management practices tested in this study have significant relationships with young employee retention in the hospitality and tourism industry in Lebanon. Further, the findings reveal that the workplace context moderates the relationship between three management practices (participation in decision-making, training, and performance recognition) and young employee retention. Further, the findings suggest that managers in hospitality and tourism businesses must improve their management practices and promote a positive workplace context to retain young employees. Finally, this study is the only one that tests the moderating role of the workplace context in the relationship between five selected management practices (participation in decision-making, training, performance recognition, remuneration and job continuity) and young employee retention. Previous studies used fewer variables.

Keywords: Workplace context, management practices, young employee retention, hospitality, tourism, lebanon

**MEDIATING ROLE OF PUBLIC SERVICE MOTIVATION BETWEEN
MANAGEMENT PRACTICES AND TAKING CHARGE BEHAVIOR: A MULTI-
MEDIATION MODEL**

Dr. Muhammad Waseem Bari

Lyallpur Business School, Government College University Faisalabad, Pakistan

E-mail: Muhammadwaseembari786@hotmail.com

Asad-Ur- Rahman

Department of Public Administration Government College University Faisalabad, Pakistan

Abstract

This study concentrates on extra-role behaviors that contribute to continuous improvement of the individuals who work on the frontline *i.e.*, take-charge behavior (TCB). This study investigates the impact of management practices on TCB and the mediating role of four dimensions of public service motivation (attraction to policymaking, commitment to the public interest, compassion, and self-sacrifice) between management practices and TCB. This multi-mediation study is conducted on street-level bureaucrats (police). The data (N = 451) were collected from the employees working in the police department, in Punjab, Pakistan. The data were examined through SPSS-23 for descriptive statistics and partial least square structural equation modeling (PLS-SEM) for inferential statistical analysis. Smart PLS-3 was used for data analyses. The results confirm that management practices have a direct effect on TCB. However, public service motivation partially mediates the relationship between management practices and TCB. The study implications, limitations, and future research directions are presented in the last section of the study.

Keywords: Extra Role Behavior; Street-Level Bureaucrats; Public Service Motivation; Public Sector; Management Practices

**ŞEHİRLERİN PAZARLANMASI VE MARKA ŞEHİR BAĞLAMINDA EDİRNE: BİR
SWOT ANALİZİ**

Dr. Öğr. Üyesi Sumru KALELİ (Orcid ID: 0000-0003-2057-170)
Trakya Üniversitesi, Keşan Yusuf Çapraz Uygulamalı Bilimler Yüksekokulu
E-mail: sumrubayraktar@gmail.com

Özet

Şehirler, gerek coğrafi konumları, gerek kültürel zenginlikleri ve sosyal dokularıyla içinde yaşayanların yaşam kültürlerini belirleyen önemli unsurlardandır. Şehirlerin markalaşması, özünde tüm diğer ticari ya da ticari olmayan ürün ve hizmetlerin markalaşmalarından farklı değildir. Hepsinde de, hedef kitlesinin gözünde benzerlerinden farklılaşma, bu farklılık sayesinde konumlanabilme, kendine özgü nitelikleriyle öne çıkma, bilinirlik ve çekiciliklerini yükseltme hedefleri vardır. Ancak bu hedefler gerçekleştirildiğinde başarılı bir markalamadan söz edilebilir. Bu çalışmada marka şehir olma yolunda Edirne şehri incelenmiş, onu marka şehir yapan/yapabilecek özellikleri Swot analiziyle değerlendirilmiştir. Durum Analizi ismiyle de anılan Swot Analizi, bilindiği üzere araştırmaya tabi tutulan konu, unsur ya da fenomenin üstün ve zayıf yönlerinin incelendiği, bununla birlikte fırsat ve tehditlerin değerlendirildiği bir analizdir. Üstün ve zayıf yönler iç çevresel özelliklerin bir getirisi olmakla birlikte, fırsat ve tehditler daha ziyade dış çevresel faktörlerden doğan “potansiyel” özellikleri olarak değerlendirilmektedir. Bu bağlamda Edirne iline ait analizin temel çıktıları şöyledir,

Üstün yönler:

- 1) Sahip olunan tarihi ve kültürel miras,
- 2) Türkiye'nin en büyük metropolüne fiziki yakınlık ve şehrin Avrupa'ya sınır komşusu olması
- 3) Kırkpınar Güreşleri ve Kakava Şenlikleri'nin marka kent olma yolunda önemli bir unsur olan Unesco Kültür Mirası listelerindeki yeri
- 4) Tarıma elverişli arazi ve iklim yapısı

Zayıf yönler:

- 1) Otel, motel, misafirhane gibi konaklama tesislerinin yetersizliği
- 2) Eğlence ve gece hayatı kültürünün zayıf olması
- 3) Şehrin turistik öğelerinin pazarlanmasındaki eksiklikler
- 4) Başta imalat sanayi olmak üzere sanayisinin gelişmemiş olması

Fırsatlar:

- 1) İstanbul-Edirne arası yapımı tamamlanmakta olan hızlı tren projesiyle iki il arası geliş-gidişlerin kolaylaşması
- 2) Başta Bulgar ve Yunan turistlerin şehrin ekonomisine katkısı
- 3) Çeşitli kültürel etkinliklerin yıllar içinde profesyonelleşmesi ve çevre illerden ve ülkelerden bu etkinliklere olan katılımın artması
- 4) İstanbul'un Edirne'ye doğru büyümesi ve zaman içinde kentin, İstanbullular için bir uğrak yeri haline gelmesi

Tehditler:

- 1) Doğal su kaynakları ve topraktaki kirlenme, kuraklık, yanlış tarım politikaları gibi sebeplerle tarımsal faaliyetlerin azalması,
- 2) Kurumlararası çatışmalardan doğan koordinasyon ve iletişim eksikliği, verimli ortak çalışmaların yürütülememesi,
- 3) Nitelikli iş gücünün yakınındaki büyük şehir olan İstanbul'a göçü ve şehirdeki girişimci eksikliği.
- 4) Son yıllarda artan plansız şehirleşme faaliyetleri, dere yatağına yapılan evler, kurulan mahalleler.

Anahtar Kelimeler: Marka, şehir, Edirne, swot analizi.

**FRAMEWORK FOR HEALTHCARE ORGANIZATION GOVERNANCE- A SYSTEM
THINKING APPROACH AUTHOR**

Vinaytosh MISHRA

Associate Professor, College of Healthcare Management and Economics
Gulf Medical University, Ajman, UAE

Abstract

The healthcare industry across the globe is facing a value crisis, which is a situation where the cost of healthcare services is not commensurate with the outcome. Traditionally, the primary goal of healthcare organizations has been to maximize shareholder profits. However, in recent years, there has been a growing recognition that this approach may not be the best way to ensure the long-term success and sustainability of the healthcare industry. This paper stresses the need of thinking beyond this narrow approach of shareholder profit maximization and focus on stakeholder value maximization. This study uses system thinking approaches such as a causal loop diagram and iceberg model to understand the pitfall of the narrow approach of shareholder profit maximization in healthcare organizations. The study further performs stakeholder analysis to identify the interests, needs, and expectations of each stakeholder, as well as their level of influence and power over the health systems and policy. The study further uses graph theory and matrix approach (GTMA) to analyze and represent complex healthcare systems and propose an approach for value maximization in such systems. Thinking beyond shareholder profit maximization, healthcare organizations can prioritize patient-centered care, social responsibility, and innovation, ultimately leading to better outcomes for patients and society. This paper provides a descriptive and prescriptive framework in this direction. The findings of this study are useful for healthcare organization owners and health policymakers.

Keywords: Healthcare Organization, Shareholder Profit Maximization, Shareholder Value Maximization, Shareholder Analysis, Graph Theory, and Matrix Approach (GTMA)

16369, Türkiye

E-mail: aygun.tokay@bursaligrubu.com

Özet

Günümüzde tekstil ürünlerinde en çok tercih edilen doğal liflerin başında selülozik esaslı pamuk lifi gelmektedir. Rahat kullanım hissi, ısı yalıtımı sağlaması ve yüksek nem tutma kapasitesine sahip olması nedeniyle diğer liflere göre daha çok tercih edilmektedir. Pamuk yapısal olarak sarımtırak renge sahip olup içerisinde birçok safsızlık (pektin, mumsu yapılar vb.) barındırmaktadır. Pamuğun bu safsızlıklardan arındırılması ve boyamaya hazır hale gelebilmesi için ön işlem prosesi uygulanmaktadır. Pamuğun ön işlem proseleri genellikle haşıl sökme, yıkama ve ağartma işlemlerinden oluşmaktadır. Ağartma prosesi sonrası pamuk lifinin renklendirmesi için boyama işlemi uygulanır. Selülozik esaslı tekstil mamullerinin boyanmasında genellikle reaktif boyarmaddeler tercih edilmektedir. Reaktif boyarmaddeler, selülozik mamulleri bazik ortamda tuz ve boya yardımcı kimyasalları ile boyayabilmektedir. Ön terbiye ve boyama proseslerinde fazla miktarda tüketilen su ve kimyasallar, çevre ve insan sağlığını tehdit etmektedir. Selülozik mamullerin ön terbiye prosesinde tüketilen su, enerji ve kimyasal miktarının azaltılması, yeni proses ve kimyasalların geliştirilmesi ile mümkün olacaktır. Bu kapsamda pamuklu mamullerin ön işlem proseslerinde yaygın olarak enzimler kullanılmaktadır. Bu prosesler incelendiğinde ise genellikle bir ön işlem yapıldıktan sonra banyonun döküldüğü ve boyama işlemine geçildiği gözlenmiştir. Yapılan bu projede ise ön işlem sonrası banyo çözeltisi dökülmemektedir. Boya ve yardımcı kimyasallar aynı banyo çözeltisi içerisine ilave edilmektedir. Yapılan çalışmada ise geliştirilen ticari kimyasal ile ön işlem prosesi ortadan kaldırılarak, ham iplik ve kumaşların tek banyoda boyanması üzerine çalışılmıştır. Tek banyoda boyama prosesinde belirlenen renkler geleneksel boyama prosesinde elde edilen renkler ile karşılaştırılmıştır. Karşılaştırmalar için spektrofotometre cihazı kullanılmıştır. Her iki boyama prosesi sonrası elde

edilen numunelerin renk farklılıkları (ΔE), hidrofilite deęerleri, yıkama ve srtme haslıkları deęerlendirilmiřtir. Sonular incelendięinde birbirine benzer renk farklılıkları (ΔE) elde edilmiř fakat hidrofilite deęerlerinin geleneksel boyama yntemine gre daha dřk olduęu tespit edilmiřtir. zellikle sellozik havlı kumařların boyanmasında kullanılan tek banyoda boyama prosesi iin hidrofilite alıřmaları yapılmaktadır. Farklı ıslatıcı ile havlı kumařların hidrofilite deęerlerinin iyileřmesi iin alıřmalar devam etmektedir. Bu alıřma sayesinde bir n iřlem ve boyama prosesi iin %79,87 kimyasal, %83,06 doęalgaz, %69,83 elektrik, %59,38 su ve %68,07 zamandan tasarruf saęlanmıřtır. Geliřtirilen proses ile reaktif boyamada daha az enerji, su ve kimyasal kullanılarak, tekstil sektrne evreci bir boyama prosesi kazandırılmıřtır.

Anahtar Kelimeler: Pamuk boyama, n iřlem, tek banyo

Özet

Özellikle ev tekstili sektöründe önemli bir yere sahip olan havlu kumaşlar, genellikle iki çözü ve bir atkı ipliği sistemi kullanılarak dokunmaktadır. Havlu dokuma makineleri, hav çözü salma sistemi ve hav oluşturma mekanizmaları açısından diğer dokuma makinelerinden farklılık gösterir ve sadece havlu yapı dokuyacak şekilde tasarlanarak üretilmektedir. Üretilmek istenen ürün ebadına göre tezgâh üzerinde dokuma ayarları yapılmaktadır. Bu ayarlamalardan bir tanesi de lamel ayarıdır. Lamel, her bir çözü ipliğine takılan ve çözü iplik yoklayıcısı olarak da bilinen, çözü ipliği koptuğunda ya da gevşediğinde aşağı düşerek elektrik devresini kapatan ve makinenin durmasını sağlayan sistem elemanıdır. Lamel ayar işlemi, her bir ipliğin geçeceği tel sayısı ve ihtiyaç duyulan lamel adedinin belirlenmesiyle gerçekleştirilmektedir. Mevcut durumda ihtiyaç duyulan lamel adedi tezgâh üzerinde bulunan lamel adedinden fazla ise tezgâha lamel eklenmesi gerekmektedir. İhtiyaç duyulan lamel adedi tezgâh üzerinde bulunan lamel adedinden eksik ise tezgâh üzerinde bulunan lameller tezgâh dışarısına alınmaktadır. Yapılan lamel ekleme ve çıkarma işlemi manuel olarak gerçekleşmektedir. Bu durum zaman ve iş gücü kayıplarının oluşmasına sebep olmaktadır. Çalışma kapsamında geliştirilen sistem ile lamel ekleme ve çıkarma işleminin otomatik gerçekleşmesi hedeflenmektedir. Çalışmada lamellerin kayar bir kızak üzerinde hareket eden araba ve arabaya montaj edilen ayarlanabilir lamel ayırıcı aparat geliştirilmiştir. Bu ayırıcı aparat sayesinde lamellerin, tezgâh üzerinde sabit kalması sağlanmıştır. Bu sayede lamellere ekleme veya çıkarma işlemine gerek duyulmadan iş gücü ve zaman kayıplarının önüne geçilmiştir. Tasarlanan lamel ayırıcı aparat ile yarı otomatik olarak gerçekleştirilen işlemin, devam eden tasarımlar ile otomatik olarak gerçekleştirilmesi planlanmaktadır.

Anahtar Kelimeler: Dokuma tezgâhı, lamel, çözü ipliği

Abstract

A common chemotherapy drug used to treat several cancers is cisplatin. The primary drawback of cisplatin therapy is that it induces organ toxicity, which compromises its clinical efficacy. Although significant progress has been made in understanding the mechanisms underlying cisplatin-induced toxicity, protective strategy development has not kept pace. The animals were divided into four groups, each group contained 5 rats. Animals in the control group received intraperitoneal injections of saline (NaCl). Cisplatin group: For three months, the animals received 134 mg/kg of cisplatin intraperitoneally, which is the same dose that was used in the human treatment protocol. Animals in the chlorella group received 150 mg/kg of chlorella orally every day for three months. Cisplatin/Chlorella group: Over the course of three months, the animals received 134 mg/kg of cisplatin intraperitoneally once per week and 150 mg/kg of chlorella orally daily. The obtained results showed that cisplatin increased levels of lipid peroxidation, tumor necrosis factor alpha (TNF-alpha), nitric oxide (NO), interleukin 12 (IL-12), and interleukin 6. (IL-6). Cisplatin, however, reduced antioxidant capacity. The chlorella treatment, on the other hand, reverted this change to values that were closest to the control values. After cisplatin treatment, it was observed that the liver and kidney function markers were elevated. Chlorella supplementation has the potential to significantly reduce these functional marker levels. Additionally, light and transmission ultrastructure microscopy analysis revealed that chlorella supplementation prevented abnormalities from occurring after cisplatin treatment caused liver, kidney, and spleen injury. Nuclear factor erythroid 2-like 2 (Nrf2) expression was significantly increased in the liver and kidney after treatment with cisplatin, whereas it was significantly decreased in the chlorella/cisplatin group. Additionally, it has been demonstrated that taking supplements of chlorella vulgaris can guard against the toxic effects of cisplatin on various body organs. The use of *Chlorella vulgaris* supplementation makes cisplatin therapy safer.

Keywords: cisplatin; *Chlorella vulgaris*; liver; kidney; spleen

Özet

Bu araştırmada, Siirt ili Merkez ilçesinde bulunan tüketicilerin balın yanı sıra diğer arı ürünlerine olan satın alma tercihlerini ve bu tercihlerin arkasındaki nedenleri incelenmesi amaçlanmıştır. Araştırmada kullanılan veriler 2022 yılına ilişkin olup, toplam 107 tüketiciden anket yoluyla elde edilmiştir. Araştırmada, tüketicilerin ne sıklıkla arı ürünlerini satın aldıklarını, hangi arı ürünlerinin daha fazla talep gördüğünü, hangi özelliklerin tüketiciler için önemli olduğunu ve bu ürünleri neden tercih ettikleri araştırılmıştır. Verilerin analizinde ortalama, yüzde, standart sapma gibi tanımlayıcı istatistikler kullanılmıştır. Sonuçlara göre, tüketicilerin %31,78'i aylık bal ve diğer arı ürünlerini satın almak için 81TL'den daha fazla para harcadıkları ortaya çıkmıştır. Arı ürünleri içerisinde baldan sonra sırasıyla polen, arı sütü ve propolis tüketiciler tarafından daha fazla bilinen ürünler olarak tespit edilmiştir. Ayrıca, tüketicilerin bu ürünleri satın alırken fiyat faktörüne birinci sırada önem verdikleri ortaya çıkmıştır.

Anahtar Kelimeler: Arı ürünleri, Arıcılık, Tüketici tercihi

Abstract

Çeviri teknolojileri çok ileri bir noktaya ulaşmış ve makine çevirisi yöntemleri de günümüzde çok gelişmiş hale gelmiştir. Buna rağmen, iyi eğitilmiş çevirmenlerin çeviri alanındaki rolü yadsınmaz. Dilbilgisi ile ilgili yazılı kaynaklar ve sözlükler genellikle çeviri sürecinde referans kaynağı olarak kullanılır, ancak referans kaynağı olarak ayrıca verimli olduğu düşünülen bir kaynak bir bütüncelerdir. Bugün, bütüncelerin çevrimiçi ve ücretsiz kaynaklar olması, onları kolayca erişilebilir hale getirmiştir ve birçok araştırmacı dil araştırması için bütüncelere başvurmaktadır. Bütünce kullanımı, çeviri alanındaki araştırma ve uygulamalarda da yaygınlaşmıştır. Bu nedenle bu çalışmada bir bütüncenin çeviri düzeltmesinde ne kadar etkili olabileceği üzerinde çalışılacaktır. Bu araştırmanın amacı, çeviride meydana gelen farklı kategorilerdeki hataların bir referans bütüncesi kullanılarak ne ölçüde azaltılabileceğini ve ne tür farklılıklar doğuracağını araştırmaktır. Araştırmada hem nicel hem de nitel yöntemler kullanıldı. Kontrol ve deney grupları olarak iki gönüllü öğrenci grubu oluşturuldu. Her iki gruptan da "Küçük Prens" kitabından bir bölümü çevirmeleri istendi ve öğrenci çevirileriyle küçük bir çeviri bütüncesi oluşturuldu. Daha sonra çeviriler farklı sözcüksel ve dilbilgisi kategorilerindeki hatalar için kodlandı. Hatalar tespit edildikten sonra deney grubuna bütünce kullanımı konusunda eğitim verilmiştir. Eğitimden sonra öğrenci çeviri bütüncesinden örnek cümleler seçilerek cümle tamamlama testi ve çoktan seçmeli alıştırmalar hazırlandı. Kontrol grubu, görev sırasında referans olarak sözlüklere ve dilbilgisi kitaplarına başvurdu; deney grubu ise bir referans bütüncesine başvurdu. Çalışmanın sonuçları, bir referans bütüncesinin çeviriye destek amaçlı olarak verimli kullanımına ışık tutmaktadır.

Anahtar Kelimeler: Çeviride düzeltme, çeviri araçları, bütünce, bütünce eğitimi

THE SITUATION OF MIGRATION IN INTERNATIONAL POLITICAL ECONOMY

MA. Semih Özen (Orcid ID: 0009-0000-3306-4623)

Ministry of National Education, Ankara Provincial Directorate of National Education

E-mail: sozen2002@hotmail.com

Dr. Mahir Terzi (Orcid ID: 0000-0003-1308-2060)

Ministry of Culture and Tourism, Department of Foreign Affairs

E-mail: mahirterzi@yahoo.com

Abstract

Migration concerns the agenda of international political economy in some main categories such as human rights, security and economy. In the context of human rights-security at the global level, the United Nations High Commissioner for Refugees (UNHCR) deals with migration and has special concepts for them such as refugees and asylum seekers. According to UNHCR records, 89.3 million people worldwide have been displaced by violence disrupting public order. Of these, 27.1 million are refugees, 53.2 million are displaced within the borders of the country, and 4.6 million are asylum seekers. In terms of economical references like sustainable development, especially the United Nations International Organization for Migration (IOM) stands out. IOM defines the phenomenon of migration in a broader framework and as an umbrella concept. It refers to persons who have moved away from their habitual residence, either temporarily or permanently, or for various reasons, within a country or internationally. In this sense, illegal migrants and international students are also in this status. In this presentation, the focus is on the importance of remittances for financing development at the national level. According to IOM data, as of 2020, there are 281 million migrants in the world and they constitute 3.6 percent of the global population. Again, 164 million of them are active workforce. As of 2020, the amount of remittances sent by migrants and diaspora is 702 billion USD. As of 2020, the top 10 countries with the most remittances are India, China, Mexico, Philippines, Egypt, Pakistan, France, Bangladesh, Germany and Nigeria. In this presentation, the limit is international political economy and workers' remittances. In terms of the results, the following can be stated: The amount of remittances for migrants/workers is an important amount at the global level and in the light of current data, it is seen that these moneys are directed especially from high-income countries to low and middle-income countries. In this sense, remittances continue to be important in financing the development of low and middle-income countries.

Abstract

Background: Cardio vascular disease remains the leading cause of death and disability. It has been linked to the role demonstrated in certain structural proteins such as the Apolipoprotein A-1 and Apolipoprotein B and the relationship with physical activities. **Objectives:** The serum levels of Apo A-1, Apo B and glucose were evaluated in the elderly, actively exercising and non-actively exercising individuals in Nnewi. **Materials and methods:** Ninety subjects recruited for the study were grouped into; Group A- Non-actively exercising , Group B Actively Exercising aged , and Group C- Elderly Individuals aged between 55 years and above. Blood sample was collected from all the participants after 10-12hours overnight fast. Apolipoprotein A-1, Apolipoprotein B and Glucose levels were determined spectrophotometrically. Their systemic (SBP), and diastolic blood pressures (DBP) including the Heights, and weights were also measured. Questionnaire was used to obtain their socio-demographic information. Data was analyzed using ANOVA, Bonferroni Post Hoc Test, and Pearson r correlation. **Result:** There was no significant difference in the mean serum value of Apolipoprotein A-1 and Apolipoprotein B in elderly and actively exercising compared with the Non-exercising ($p>0.05$). A significant higher difference existed in the mean serum value of glucose in the Elderly (6.60 ± 1.50) and actively exercising (5.89 ± 0.82) compared with the Non-exercising (5.40 ± 0.48) ($p<0.05$). A significant higher difference was seen in the mean

systolic, diastolic, and BMI levels of the Elderly compared with the non-exercising ($p \leq 0.05$). However there was significantly lower mean systolic and diastolic blood pressure value, and BMI value in the actively exercising compared with the Non-exercising group ($p \leq 0.05$). A strong positive correlation was observed between Apo B vs Apo A-1 in the actively exercising, and Non-exercising groups, while a weak negative correlation existed between BMI and Apo A-1 in the actively exercising. **Conclusion:** The significant differences observed in the parameters measured were not clinically significant.

Keywords: Apolipoprotein A-1, Apolipoprotein B, Glucose.

FORECASTING THE RELIABILITY OF MOBILE ROPEWAYS BASED ON SELF-PROPELLED WHEELED CHASSIS

Prof. Dr. Alexander V. LAGEREV (Orcid ID: 0000-0003-0380-5456)

Prof. Dr. Igor A. LAGEREV (Orcid ID: 0000-0002-0921-6831)

Kuban State Technological University, Rectorat, Krasnodar, Russia
E-mail: lagerev-bgu@yandex.ru

Abstract

Mobile ropeways based on two self-propelled wheeled chassis with high load capacity and cross-country capability coupled with a single rope system are a promising type of transport and transshipment equipment for use in remote areas and areas of natural or man-made disasters. Therefore, increased requirements are imposed on the reliability of this transport equipment, since it is operated far from the locations of repair and restoration enterprises. Within the framework of grant No. 22-29-00798 of the Russian Science Foundation, a set of studies was carried out on the creation of mathematical models and computer methods for modeling the reliability indicators kinetics of mobile ropeways at the design stage. Mathematical models are based on an approach using systems of ordinary differential equations of the first order of Kolmogorov-Chapman. This approach allows us to take into account all possible (from the point of view of reliability theory) states in which the equipment of a mobile ropeways can be located, as well as possible transitions between them. The positive effect of carrying out scheduled maintenance and repairs of equipment in the interval between the intervals of ropeways operation was taken into account by adjusting the probability of failure-free operation of those key structural elements that were undergoing schedule repair. The developed methodology for predicting changes in the time of operation of quantitative indicators of reliability of mobile ropeway equipment was implemented in the form of a computer program. The use of the developed models and methods in the practice of designing mobile ropeways has shown that it is advisable to use them for planning repairs of complex technological equipment: to determine the timing of repair operations of key structural elements, the volume and cost of repairs, the number of spare parts.

**EXPLORING FAITH-BASED INTERVENTIONS IN FOOD INSECURITY IN
NIGERIA: A PHENOMENOLOGICAL APPROACH**

Favour C. Uroko (Ph.D)

Department of Religion and Cultural Studies, Faculty of the Social Sciences, University of
Nigeria Nsukka

E-mail: Favour.uroko@unn.edu.ng

Abstract

This study explores food insecurity in Nigeria, especially from 2015 to 2023. Although, the issue of food insecurity has received attention from the scholarly community, literature has yet to isolate the reason for persisting food insecurity in Nigeria and what faith groups could do to stem the tide. Staple foods such as garri, corn, rice, yam, beans, millet, potatoes, and others have all jerked up with prices above the common man's pocket. With the rising food inflation, it is not uncommon that some households could have been forced to eat at a ratio of 0.0.1 or 0.1.0 for their daily meals. Nearly 25 million Nigerians are at risk of facing hunger between June and August 2023, if urgent action is not taken. Data was gotten from personal observations and relevant literature. Content analysis was used to analyse the data. Findings indicate that food insecurity is caused by climate change, faith-based insecurity, and rural-urban migration, among others. Unfortunately, the impact of faith-based organisations on food insecurity in Nigeria has been negligible. There is a need for faith based groups to begin climate preservation campaigns in rural and urban centres in Nigeria. This can also be done in churches and mosques. Faith-based interventions can also focus on sensitising their members to be tolerant when it comes to religious issues, this will reduce insecurity drastically. Recommendations are discussed.

Abstract

We have tried to develop plastic waste-based Carbon as electrodes and environmentally safe ionic liquid doped polymer electrolyte. High conducting electrolyte developed are based on ionic liquid (IL) doped solid Polyethers. Porous Carbon materials has been developed using plastic bottle throne within campus of Sharda University while veriety of low viscosity ionic liquids doped polyether's have been prepared using solution cast technique and characterized by impedance spectroscopy, optical microscopy (OM), differential scanning calorimetry, x-ray diffraction (XRD), and fourier transform infrared spectroscopy (FTIR). Finally we have tested these Carbon based electrodes and IL doped high conducting solid polymer electrolyte films in energy devices namely supercapacitors/dye sensitized solar cell.

**ROLE OF CREATIVE HUBS AND PRODUCING NEW MEDIA PRODUCTS
TOWARDS THE SDGS, AS A TOOL FOR ACHIEVING THE GOAL OF
SUSTAINABLE CITIES SDG 11.**

A. K. Ayapbergenova (Orcid ID: 0009-0007-9874-3302)
al-Farabi Kazakh National University, Kazakhstan, Almaty

Abstract

The article discusses the structure of modern creative industries and the interrelation of the concept with media and innovative mass media technologies. The role of creative hubs in creating new media products is examined, as well as how they are one of the main tools in achieving the goals of the Concept for the Development of Creative Industries in the Republic of Kazakhstan for 2021-2025, and as one of the methods for achieving the goal of developing cities, as set out in the UN Sustainable Development Goals until 2030. The aim of the research is to identify methods for developing this topic using content analysis and desk research. The literature, the Resolution of the Government of the Republic of Kazakhstan on the implementation of the strategy for the development of the creative sector and the achievement of growth indicators and expected results, and the Voluntary National Review on the implementation of the Agenda for Sustainable Development until 2030 are considered. It is noted that media resources play a significant role in popularizing the strategically important tasks of this industry. They are designed to transmit truly scientific knowledge and the importance of the development of creative industries to society as the main booster of the country's economic development and one of the solutions to ensure sustainable development of Kazakhstani society. However, to date, scientific research in the field of social sciences and the topic of the connection between the media as an important component of creative industries and the hypothesis of its development from the involvement of the media are poorly studied. As successful and confident development of the creative sector is important to support not only materially but also to create a favorable and efficient information environment. The author describes the possibilities of digital journalism, which should be used to promote scientific knowledge in society and attract the attention of government agencies to the activities of Kazakhstani scientists in the field of communications. The scientific significance of the article is an attempt to outline a completely new view on popularizing scientific knowledge in society; to offer new methods of developing creative industries, to determine the relationship between creators of creative content, business representatives, and the state as one of the methods contributing to the growth of the country's economy and the share of creative industries. In addition, the author, using examples of existing programs and projects in the field of innovative technologies, reveals the work already done in this direction in the country, gives an independent research assessment based on the existing project "Digital and Creative Laboratory" of the Nazarbayev University Innovation Cluster as an example of providing state support to entrepreneurship entities to stimulate the creative industries of the Republic of Kazakhstan, and actively promotes the implementation of the main UN Agenda for Sustainable Development.

Keywords: Creative industries, new media, digital journalism, innovation, sustainable development, media business, incubation, cultural economy, media production, information environment.

Abstract

Harmonic and anharmonic oscillators are fundamental concepts in materials science as they play a crucial role in understanding the electronic and vibrational properties of materials, including semiconductors and insulators. These oscillators provide a theoretical framework for the analysis of the behavior of atoms and molecules in material and their interaction with electromagnetic fields, making them a vital tool for the development of new materials and technologies. This paper explores the significance of harmonic and anharmonic oscillators in InGaN/GaN heterostructure by analyzing their electronic and optical properties under the impact of a nonresonant intense laser field, including higher-order anharmonic terms. The research employs effective-mass and parabolic band approximations, along with the finite element method to determine the eigenvalues and eigenvectors of the electron confined within the harmonic and anharmonic oscillator potentials. By utilizing the density matrix expansion approach, the paper derives analytical expressions of the linear and third-order nonlinear optical absorption coefficients for a two-level system. The findings suggest that the electronic and optical properties of nanostructured semiconductors can be adjusted to fit specific responses for particular applications or goals by manipulating the structural parameters such as the width, depth of either HO or AHO potential, and applied laser intensity. Furthermore, the integration of ILF results in a decrease in the amplitude of the resonance peaks of the OACs and a shift of these peaks towards higher energy ranges. The study also concludes that the impact of the incident electromagnetic intensity is more prominent in the absence of the ILF than when it is present, for both HO and AHO potentials.

Keywords: Absorption spectrum; ILF; Harmonic; Anharmonic-oscillator.

**EXPLORING THE PERSISTENCE OF HYPERTENSION DESPITE MEDICATION:
IMPLICATIONS FOR ADVANCING TREATMENT AND POLICY PERSPECTIVES IN
INDIA**

Mr. Prateek SINGH

Research Analyst, Institute of Economic Growth, Delhi University, India

E-mail: Prateeksingh22120810@gmail.com

Dr T.R.DILIP

Assistant Professor International Institute for Population Sciences, India

Abstract

Background & objectives: Hypertension, a silent yet pernicious ailment, afflicts a significant proportion of the Indian populace. Tragically, only one-third of those suffering from hypertension are cognizant of their condition, and an even tinier percentage are able to effectively regulate it through medication. It is imperative that we comprehend the underlying characteristics and behaviours of patients treated for hypertension, in order to generate evidence for improved management strategies. This study endeavours to investigate the key factors associated with uncontrolled blood pressure levels among patients receiving medication for hypertension. **Methods:** Data from the LASI survey (2017-18) is analysed to study hypertension control among 12,353 individuals aged 45+ who were diagnosed and on medication. Blood pressure levels were used to classify respondents into 4 categories of hypertension control. Logistic regression analysis is used to examine the association between hypertension control and demographic, socio-economic and behavioural characteristics. **Results:** A critical proportion of respondents is having uncontrolled hypertension of grade 1 (31 per cent), grade 2 (15 per cent) and grade 3 (2 per cent), despite taking medication for the same. As compared to their remaining counterparts the risk of uncontrolled hypertension is high in rural areas (OR=1.37, 95% CI, P<0.01), old adults living alone (OR=1.63, 95% CI, P < 0.05), patients having no schooling (OR=1.18, 95% CI, P < 0.05), patients with obesity (OR=1.2, 95% CI, P<0.05), Moderate alcohol drinkers (OR=2.1, 95% CI, P<0.01), Abusive alcohol drinkers (OR=1.6, 95% CI, P<0.01). **Interpretation & Conclusions:** Poor control over blood pressure levels among patients from rural areas, the poorest and most vulnerable sections support the governmental efforts initiated since 2018 to expand community-level screening and provisioning of NCDs, including hypertension. In addition, concrete efforts for health promotion within patients under medication for hypertension to are essential for better management of this condition.

Abstract

Diabetic Foot Ulcer (DFU) are lesions associated with autonomic, sensory and motor neuropathy due to Diabetes Mellitus (DM). In addition to the well-known complications of DM such as retinopathy, nephropathy, neuropathy and cardiovascular disease, oral complications such as burning mouth syndrome, dry mouth sensation, gingival recession and tooth loss associated with neuropathy can also be expected. Our aim in the study was to examine the oral complications and oropharyngeal dysphagia symptoms that can be seen in patients with DFU in detail using the Eating Assessment Tool (EAT-10). 35 individuals with a diagnosis of Type 2 Diabetes Mellitus and having foot ulcers were included in the study. Burning mouth syndrome, presence of intraoral lesion, gingival recession and tooth loss were recorded as oral complications of the participants. The EAT-10 scale was used to evaluate the symptoms and severity of oropharyngeal dysphagia. 16 (45.7%) of the individuals included in the study were female, mean age was 61.40 ± 8.83 , and mean diabetes duration was 17.71 ± 7.25 years. Burning mouth syndrome was recorded in 45.7% of the participants, intraoral lesion in 57.1%, gingival recession in 71.4% and tooth loss in 91.4% of the participants. A total score of 3 or above in the EAT-10 scale, which evaluates the symptom and severity of oropharyngeal dysphagia, indicates that there is a swallowing problem. In our study, the total mean scale score of individuals with DFU was 13.71 ± 8.99 . Participants were mostly respectively; they stated that they experienced intense complaints of difficulty in swallowing solid foods, food stuck in the throat while swallowing, difficulty swallowing pills, coughing while eating, and pain during swallowing (Table 1). In our findings, we found that individuals with DFU had swallowing problems according to the EAT-10 scale. As a result, oropharyngeal swallowing problems may be seen in individuals with DFU due to oral complications related to diabetes. Paying attention to eating and swallowing problems in the evaluation and treatment stages of individuals with DFU can increase the effectiveness of rehabilitation.

Abstract

The treatment of milk processing industry wastewater (MPIW) with an abundance concentration of hazardous organic contaminants is desirable for the sustainability of food processing industries, but it is challenging. This study aimed to develop a novel green synthesized iron-oxide nano-adsorbent (GSIO-NA) using an eco-friendly, ultrasonic-assisted extract of the *Catharanthus roseus* flower to achieve desirable sulfate and nitrate adsorption in real and synthetic MPIW. Quality characteristics of MPIW determined and found huge effluent loads, including sulfate and nitrates. The GSIO-NA characterization revealed stable, non-spherical particles with a grooved surface and a face-centered cubic phase with a typical hematite spinal structure. Strong H-bonding interactions and phytochemicals were found to be responsible for reducing ferric chloride hexahydrate into iron-oxide nanoparticles. These were used as an adsorbent for MPIW treatment. The percent reduction efficiency (%RE) of nitrate and sulfate with GSIO-NA was determined with a focus on the initial concentration of pollutants, pH, adsorbent dosage, and contact time. Predictions of process responses were made by artificial neural networks coupled with response surface methodology-based soft-computing technique. In a batch study, 88.08 and 86.36 %RE of sulfate and nitrate were absorbed on GSIO-NA at optimized adsorption process parameters. Pseudo-second-order, Freundlich, and intra-particle-diffusion models were the best fit to predict the adsorption capacity of a developed adsorbent. Most MPIW characteristics fell below the permissible limits of effluent standards, especially sulfate, and nitrate, resulting in 98.21 and 92.30 %RE upon using GSIO-NA. Hence, this novel green technology could be used in the milk processing industry for cleaner production and recycling wastewater.

Abstract

This research was conducted by conducting a survey of SME business owners in Banyumas Regency. This study has a goal including to provide views and empirical evidence on how the level of emotional intelligence can affect creativity by considering a person's personality as moderation and coping strategies as mediation when facing the aftermath of the pandemic, namely the COVID-19 endemic which can affect the owner's decision making on life. his company. The population used in this study were SME business owners who were then taken through a purposive sampling method with several criteria so that 76 respondents were collected. Using PLS (Partial Least Square) as an analytical tool shows that: (1) Emotional intelligence has a positive effect on coping strategies (2) Emotional intelligence has a positive effect on creativity (3) The personality trait of neuroticism has a negative influence on the relationship between emotional intelligence and coping strategies while conscientiousness and openness to experience have no significant relationship to the two variables (4) Coping strategies can mediate the relationship between emotional intelligence and creativity. The implications and suggestions concluded from this research are that it is important to remember the importance of the government, institutions, and communities engaged in the economy to realize that business owners have the desire to continue to survive despite the perceived impact of the pandemic so that more attention is needed by providing direction, training, and guidance so that business owners can continue to develop their businesses creatively. This study provides a further empirical view of how the relationship between emotional intelligence, coping strategies, and creativity that is still limited. Future research could investigate further how the relationship between the three variables can help the economic sector, especially small business owners.

**THE IMPORTANCE OF MANAGEMENT FUNCTIONS IN NATURAL DISASTERS:
EVALUATION OF KAHRAMANMARAŞ-CENTERED EARTHQUAKES**

Prof. Dr. Adnan Celik (Orcid ID: 0000-0002-8538-9937)

Selcuk University, FEAS, Department of Business, Konya/Turkiye

E-mail: adnancelik@selcuk.edu.tr

Abstract

Management; It is the whole of efforts to direct a group of people towards determined goals and to ensure coordination with cooperation between them. The concept of management evokes; “To make decisions that will enable to use human resources, financial resources, fixtures, tools-equipment, raw materials and auxiliary materials, and finally the time factor in a harmonious and effective manner in order to achieve the goals, and to enforce them”. To operate through others and to achieve predetermined goals; Some processes are required. That is, management requires a series of activities. These activities, which are constantly repeated in mutual interaction, are called "management functions". This process consists of “planning, organising, executing, coordinating and controlling” functions. Management functions interact with each level (strategic, coordinative, operational) in the management pyramid. Businesses, public institutions, non-governmental organizations and every non-profit organization management must know these functions. This fact is also valid for any institution or person struggling with natural disasters. Natural disasters are events that negatively affect human life. In some cases, they may develop gradually. Sometimes, they can affect our lives suddenly. Among these, the following can be listed: “Earthquakes, storms, tornadoes, floods, floods, volcanoes, forest fires, severe cold, landslides, rock falls, avalanches, droughts and famines”. Some disasters may be man-made. These are generally: “Nuclear-biological-chemical accidents, transport accidents, industrial accidents, accidents caused by overcrowding, immigrants and displaced, etc.”. The deterioration of the ecological structure increases the destructive effect of natural disasters day by day. This study has been prepared on the importance of management functions in natural disasters. The study focuses on natural disasters in general and destructive earthquakes in particular. In this study, firstly, literature information is explained. First of all, management, management functions, natural disasters and the importance of management functions in natural disasters are explained. Then, the results of Kahramanmaraş-centered earthquakes are given. Methodology department; It is about the problem, purpose and importance of the research, as well as the research method and scope. In the title of findings and discussion, the importance of management functions in particular for Kahramanmaraş-centered earthquakes has been discussed. The study is concluded with conclusions and recommendations.

LIE AND NOETHER SYMMETRIES OF SECOND-ORDER PARTIAL DIFFERENTIAL EQUATIONS

Dr. Farhad ALI

Supervisor, Faculty Mathematics, Kohat University of Science and Technology

E-mail: <mailto:farhadmardan@gmail.com>

Abstract

Second-order partial differential equations (PDEs) mostly appear in physics, mechanics, chemical engineering, and other fields of science. Any second-order PDE is equivalent to the Euler-Lagrange equation. Each Euler Lagrange equation has Lagrangian or in fact, an infinite number of Lagrangians. The Lagrangian of dynamical system is the difference between the kinetic and potential energies. The main goal of this study is to find the Lagrangians of the considered PDEs (Euler Lagrange equations). Then use the Noether symmetry equation to find all the Noether symmetries of the obtained Lagrangians. Compare the Lie and Noether symmetries for each PDE and then use the Noether theorem to find all the conservation laws hold in the given dynamical system.

Keywords: Lagrangians, Noether symmetries, conservation laws

**INCREASING THE QUALITY OF SERVICES PROVIDED IN THE HOTEL
INDUSTRY THROUGH A QUALITY MANAGEMENT SYSTEM**

Abstract

For the survival of tourism industry, the quality of the provided services is perceived as a survival strategy, especially in the post-pandemic period. Quality became an important tool for competitiveness at the market. Modern trends confirm the constantly growing demands for quality. At the same time, more emphasis is placed on strong and meaningful experiences. In effective planning and quality management, it is important to realize not only the influence of enormous market competition, but also to know the characteristics of decision-making processes, as well as the psychological aspects of tourism participants. Quality is currently an integral part of international competitiveness at the national level and at the corporate level. It is certainly an indisputable attribute of economic success and prosperity. Information about a high-quality service provided will reach five other potential customers, while the rumor about a bad, low-quality service will reach at least 15 people. According to the conducted research, it has been shown that the cost of acquiring new customers is much higher than the cost of keeping old customers. For this reason, keeping satisfied and loyal customers remains a fundamental business principle in this industry. Some researchers have noted that in the service industry, competitive advantage is focused on exceptional quality services that bring customer satisfaction and loyalty. The paper specifies the perception of quality management in tourism enterprises. The aim of the research was to find out the differences in the rate of registration of complaints from customers in the context of the application of the quality management system in accommodation facilities. The research sample was hotels in the countries of the Vyšehrad Four. By means of the questionnaire method, the state of improvement of visitors' satisfaction during the introduction of the system of quality was determined. Managers of accommodation facilities were questioned. Obtained data were verified through Pearson's chi-square and other tests. The results show that the introduction of a quality management system in accommodation facilities has a positive effect on reducing the level of complaints and increasing the satisfaction of the accommodated guests. In conclusion, it follows that the quality management system is a useful tool for strengthening quality due to the immediate possible response to potential deficiencies. Its application is beneficial for the management of individual businesses as well as a tool contributing to increasing competitiveness at the tourism market in the post-pandemic period.

Keywords: Quality. Hospitality. System of quality management. Tourism business competitiveness.

SWITCH MODE POWER SUPPLY-BASED MULTIFUNCTIONAL EMULATOR

Dr. Öğr. Üyesi Cagfer YANARATES (Orcid ID: 0000-0003-0661-0654)

Gumushane University, Department of Electric and Energy Electrical Power Generation,
Transmission and Distribution Programme, Gumushane Kelkit Aydın Doğan Vocational School,
Turkiye.

E-mail: cagferyanarates@gumushane.edu.tr

Abstract

In this paper, a DC-to-DC buck converter-based multifunctional emulator is presented. The proposed system aims to build a novel module-based flexible power electronics circuit architecture capable of simulating multiple renewable energy sources and batteries with a single device. Due to the fixed circuit topology and control system used in the current market's various energy source emulators, each emulator device can only emulate a single energy source. The proposed approach enables the use, integration, and flexible transformation of power electronics circuit successfully for a variety of converter topologies. Several single-phase DC/DC buck converters, a multiple-phase interleaved DC/DC buck converter, and a three-phase converter can be cited as easily applicable examples of the proposed system. Thus, multiple renewable energy sources and batteries or a single high current energy source can be emulated easily and spontaneously with the developed power electronics circuits in the module. Additionally, providing a cost-effective (less implementation cost) approach for developing advanced power conditioning devices (PCUs), higher efficiency and reduction in the level of complexity, being easily adaptable and feasible to function under variable environmental conditions and frequent load changes can be considered as the significant advantages of the proposed system. The performance of the proposed topology will be validated experimentally with the implementation of MATLAB/Simulink/Stateflow on dSPACE Real-time-interface (RTI) 1007 processor, DS2004 High-Speed A/D and CP4002 Timing and Digital I/O boards in the near future.

Keywords: Switch Mode Power Supply-based Emulator, DC-DC Buck Converter, Multiphase-Converter Topology, Power Electronics Circuit Architecture, Renewable Energy Sources and Battery Emulators

DESCARTES'TAN HABERMAS'A MODERN ÖZNEİN SERÜVENİ

Özet

Descartes, yöntemsel kuşku anlayışıyla özneyi doğrunun tek ölçütü olarak tanımlamış ve bu bağlamda geçmişe ait bilgisel birikimi de şüpheli olarak betimlemiştir. Descartes için bütün kuşkulardan kurtulabilmenin yegâne sarsılmaz dayanağı insânî öznenin bizatihi kendisidir. Kant ise modern sübjektivite metafiziği bağlamında, Kartezyen bireysel özne ya da Hume tarzı ampirik özne anlayışları yerine, transandantal özne, sonrasında ise ahlâkî özne anlayışlarını ikâme etmiştir. Hegel'le birlikte başlayan özne-nesne ikiliğini aşma arayışları Nietzsche'de modern öznenin parçalanıp bölünmesi yoluyla doruğuna ulaşmış, Heidegger ortaya koyduğu Dasein anlayışıyla öznenin varlıktan ayrı düşünülemeyeceğini ortaya koymuştur. Foucault gibi kimi çağdaş düşünürler ise, bilhassa Nietzsche'nin açtığı yoldan giderek modern özneye alternatif öznellik imkânlarına yönelmişlerdir. Frankfurt Okulu'nun yaşayan son temsilcisi olan Habermas, aklı ön plana alan iletişimsel özneyi inşa ederek modernitenin içine düştüğü akıl ve özne krizini aşma derindedir. Modern öznenin gelişimi ve eleştirisi yönündeki tartışmalar günümüze kadar devam etmiştir. Bildiride modern öznenin serüveni genel hatlarıyla ortaya konulduktan sonra modern sübjektivite metafiziğinin en son geldiği noktaya dair özgün değerlendirmeler ortaya konulacaktır.

Anahtar Sözcükler: Descartes, modernizm, öznellik, özne, Hume, Kant, Hegel, Nietzsche, Habermas

COMBINATORIAL PROPERTIES OF POWER GRAPHS OVER GYROGROUPS

Miss. Tanzeela RUBAB

Mathematics department, Kohat University of Science and Technology.

E-mail: Tanzeelarubab28@gmail.com

Abstract

Algebraic graph theory connects algebra (both abstract and linear) and graph theory. Many algebra concepts have been facilitated through the construction of graphs as tools used in computer science. Conversely, graph theory has also helped to characterize certain algebraic properties of any algebraic structures. The power graph $P(G_1)$, a group G_1 is a simple graph with the vertex set G_1 such that two distinct vertices $w, u \in G_1$ are adjacent in $P(G_1)$ if and only if one is an integral power of the other. In this work, we determine the degree of all the nodes and the lambda number of power graphs over gyrogroups. Moreover, we find certain polynomials and the Hosoya index for the same algebraic graphs and also find a link between gyroautomorphisms and the group of auto morphisms of the power graph of gyro group. The gyro group G_l is basically the union of $W(l)$ and $H(l)$, where $W(l) = \{0, 1, 2, \dots, 2^{l-1} - 1\}$ and $H(l) = \{2^{l-1}, 2^{l-1} + 1, \dots, 2^l - 1\}$ is used to explain the structure of $P(G_l)$ of G_l . Since W is a cyclic subgroup of order 2^{l-1} , so it is $P(G_l)$ is isomorphic to K_l graph $K_{2^{l-1}}$, and each element of $H(l)$ is connected only towards identity e . Therefore, the structure of the power graph of $G(l)$ is given below:

$$P(G_l) = K_1 \vee (K_{2^{l-1}} \cup K_l)$$

Keywords: Power Graph, Gyro group, Gyroautomorphisms.

CERTAIN TOPOLOGICAL PROPERTIES OF COMMUTING GRAPHS OVER SEMI-DIHEDRAL GROUPS

Mr. Kumail Raza

Mathematics department, Kohat University of Science and Technology

E-mail: Kumailraza050@gmail.com

Abstract

A topological descriptor is a numeric value derived from a molecular structure that reflects significant structural characteristics of the suggested molecule. Various physical properties, chemical reactivity, and biological activity are correlated with the chemical composition based on its algebraic value. This work examines algebraic graphs. Algebraic graph theory basically explores the link between abstract and linear algebra and graph theory. Let G be a group and X be a nonempty subset of G . The commuting graph $C(G, X)$ of G has X as the vertex set, where two elements in X are adjacent if $xy = yx$. This work discusses several degree-based and distance-based topological descriptors of commuting graphs of semi-dihedral groups. Furthermore, the atom-bond connectivity index and its fourth version, the Wiener index and its reciprocal, the geometric-arithmetic index and its fifth version, Schultz molecular topological index, harmonic index, Harary index, Sankruti Index, Hosoya polynomial, Reciprocal status Hosoya polynomial, Randić index and the general Randić index will be calculated using the two proposition of Semi-dihedral group.

Proposition 1. $\Gamma(SD_{8n}) = K_4 \vee (nK_4 \cup K_{4n-4})$ for odd n .

Proposition 2. $\Gamma(SD_{8n}) = K_2 \vee (2nK_2 \cup K_{4n-2})$ for even n .

Keywords: Topological Indices, Semi-dihedral group, Commuting graphs.

Abstract

Contemporary management finds place everywhere in contemporary literature. The most important management functions are: planning, organizing, leading and controlling. The application of contemporary management is very important in the tourism industry, which is also used in tourist agencies. Management is one of the most important activities since the beginning of mankind when people needed to fulfill their goals and objectives. Now management has become essential even in the field of business where decision-making in complex organizations becomes simpler by relying on human groups who constantly manage or direct the work that must be done successfully and properly from the planning stage to at the control, which is the final stage where it shows the result of the work, is it going well or does it need improvements. Given the competition, quality services and modern management techniques, help you to be one step ahead and be as close and open as possible to customers.

The purpose of this paper is to understand the contemporary management functions used in the tourist agency and the quality of the service. To define and describe what are the contemporary management techniques that this company uses. The qualitative method was used for the methodology of this study. The instrument used for data collection is the interview with the person in charge of the tourist agency Sann Fly in Ferizaj. This study aims to present the functions of contemporary business management and how Sann Fly tourist agency applies contemporary techniques. SANN FLY offers all services to its passengers with the most modern online methods and at affordable prices. This business also provides its own services online, where the booking of tickets and other services is done electronically.

Abstract

Different physical environments cause the human brain to respond to it and affect the body in different ways. Some environments are perceived as risky and activate the sympathetic nervous system, while others lead to relaxation by affecting the parasympathetic nervous system. The fundamental component of the environment is the landscape. In a natural environment people experience fewer negative emotions; and by visiting city parks and green areas city dwellers can reduce anxiety, tension and stress. A visual connection with nature, even through a window, has a positive effect on restoring attention and general well-being. The view out of the window on a poorly maintained facade, an offset composition can lead to a reaction of anxiety, disgust and depressive feelings. The answer is the transformation of the landscape into a hybrid version, where natural elements (for example, planted trees) are present along with the artificial buildings. Some of the modern cities are full of chaotic construction with high-rise buildings. Residents of apartments on high floors testify to the fear of being trapped by a fire or an earthquake, terrorist attacks, falling from windows or balconies, acquiring infectious diseases by sharing buttons, etc. Humans are biologically inclined to want to be in places where there is some complexity and variety. Long monotonous fences, identical entrances, houses and entire yards force the nervous system to overextend, causing psychological discomfort. Different textures, colors and materials, awnings, arches or other architectural details, see-through doors and windows lead to an improvement in the mood of the city people. The general aesthetics of the city is also essential. The harmonious appearance of the street has a good effect on the mood, promotes good health. On the other hand, anti-aesthetics, which includes damaged houses, garbage and graffiti, has a negative effect on the human psyche.

Keywords: urban environment, landscape, psychological stress, façade, aesthetics, psycho-emotional state

Abstract

During the embryological development period, there are anastomoses between the internal carotid artery, which will feed the brain, and the basilar artery formed by the vertebral arteries. These anastomoses are the trigeminal, otic, hypoglossal and proatlantal arteries, named according to the structures they are adjacent to. These 4 pairs of primitive arteries are called presegmental arteries. Presegmental arteries disappear at about the 5th week of the embryo after the communicating arteries have developed. However, although rare, some of them can survive into adulthood. Persistent trigeminal artery (PTA) is the most common vertebrobasilar variation. Although it is seen with a frequency between 0.1% and 0.6% in the population, it constitutes 85-87% of carotid-basilar artery anastomoses. PTA is an asymptomatic variation that is usually seen incidentally during radiological imaging. However, there are studies reporting that it may be associated with various vascular anomalies and disorders, including aneurysm, arteriovenous malformation, and symptoms such as trigeminal neuralgia, vertigo, ataxia, paralysis, migraine, and headache. A 72-year-old female patient was admitted to the neurology clinic with complaints of dizziness and blurred vision. Digital subtraction angiography (DSA) was planned for endovascular treatment when a stenosis was detected in the origin of the right vertebral artery in the Doppler ultrasonography. In DSA, the presence of PTA originating from the cavernous segment of the left internal carotid artery was detected. PTA, which did not differ in terms of sex, was first described by Richard Quinn in 1844 at autopsy and by Sutton in 1950 for angiography. There are different classifications according to the regions fed by the PTA, the vessels or the place of attachment to the basilar artery. Saltzman divided the PTA into 2 groups, Weon divided it into 5 groups and Komiyama into 3 groups. Tasdemir et al., on the other hand, added a new one to all these classifications by presenting a case of PTA that alone forms basilar artery, where vertebral artery is not connected. It has been reported that PTA may cause some symptoms and clinical problems. It should be considered that the posterior circulation is provided by the carotid interna, and the risk of posterior ischemic stroke in the presence of atherosclerotic plaques in this vessel will increase. At the same time, there may be a risk of developing cerebellar ischemia due to the presence of hypoplastic vertebral artery and insufficient filling of the PICA originating from this artery. Tyagi et al. reported in their retrospective study that PTA may cause vascular malformations and aneurysms with altered hemodynamics. In terms of its anatomical course, the association of aneurysms, trigeminal neuralgia and transsellar PTA during transsphenoidal surgery is of particular importance for neurosurgeons. Preoperative recognition and correct interpretation of these variations are important to avoid complications during intracranial operations.

Keywords: PTA, Variation, DSA

**FRANSIZCA ÖĞRETİM YÖNTEMLERİNDE DERS KİTABI ETKİNLİKLERİNİN
EVRİMİ**

Dr. Öğretim Üyesi Can Denizci (Orcid ID: 0000-0003-3759-3359)

Dokuz Eylül Üniversitesi, Buca Eğitim Fakültesi, Fransız Dili Eğitimi Anabilim Dalı, İzmir
E-mail: can.denizci@deu.edu.tr

Özet

Bu çalışmanın amacı, çok ögeli bir dizge arz eden Fransızca öğretiminde ders kitabı etkinliklerinin geçirdiği evrimi irdelemektir. Bahsi geçen evrimi irdelerken ilk olarak yabancı dil öğretiminin, özellikle dilbilim ve ruhbilim gibi rehber teşkil eden alanlardan etkilenerek geçirdiği tarihsel dönüşüm dikkate alınmalıdır; bu bağlamda dil odaklı, bildirişim yetisi odaklı ve güncel olarak da daha seçmeci bir özellik gösteren yöntem sonrası aşamalar gözlemlenmektedir (Puren, 1988/2012; Germain, 1993; Kumaravadivelu, 2003, 2006; Cuq & Gruca, 2017). Öte yandan, yabancı dil öğretiminin değerler dizisinde kuram ile uygulama arasında köprü görevi gören yöntem olgusunun iki önemli alt bileşeni vardır: öğretmenin sınıf içi edimleri (Cicurel, 2011) ve ders kitapları. Dolayısıyla, bu çalışmada ders kitaplarında önerilen etkinliklerin geçirdiği dönüşüm, yukarıda anlatılan aşamalarla ilintilendirilecektir; başka bir deyişle, Fransızca öğretiminde kırılma noktaları oluşturan Dilbilgisi-Çeviri, Doğal, Sözel-İşitsel, Görsel-İşitsel, Bildirişim ve Eylem-Etkinlik gibi yöntemlere ya da yaklaşımlara bağlı oluşturulmuş Fransızca öğretimi kitaplarındaki dilsel-bildirişimsel etkinliklerin, dinleme-okuma-konuşma-yazma yetileri kapsamında (Conseil de l'Europe, 2005; Bertocchi & Costanzo, 2008) nasıl tasarlandığı; yani, etkinliklerin içeriği, oluşturulacak çözümlene çerçevesi aracılığıyla nitel olarak (Merriam, 2009) araştırılacaktır. Burada dikkat edilecek öncül öğeler dilsel odaklılık, bildirişimsel odaklılık, dil yetisi türü, etkinliklerin gerçek ya da kurgusal özelliği, etkinlikte kullanılan belgelerin özgünlüğü vb. olacaktır; ancak araştırma sürecinde bu öğeler değişiklik gösterebilecektir. Sonuç olarak, bu araştırmanın bulgularının Fransızca ders kitaplarındaki etkinliklerin geçirdiği evrime ve gelecekteki olası seyrine ışık tutması hedeflenmektedir.

Anahtar Sözcükler: Fransız dili, yöntem, ders kitabı, bildirişimsel yaklaşım, eylem-etkinlik yaklaşımı

**TO WHAT EXTENT IS ACADEMIC BURNOUT INFLUENCED BY POSITIVE

Abstract

Academic burnout is defined as a sense of fatigue due to the demands and requirements of education, a pessimistic sense of the subject and poor personal progress in education (self-efficacy). Positive thinking as a new approach in psychology involves training skills to change negative attitudes and pessimism and skills to create a positive and effective lifestyle that can help students to prevent and cope with academic burnout. This study aimed to analyze the effect of positivity training on reducing academic burnout among students of Sepidan Higher Education Center. The present research is a semi-experimental study on 154 students majoring in public health and nutrition, using the pre/post-test design. Maslach questionnaire was used to evaluate the effect of positive thinking on the reduction of burnout and compare it before and after the intervention. The data were analyzed using the SPSS software. In this study, 31.2% of the participants were male and 68.8% were female. 12.3% of them had a bachelore degree, 72.1% were undergraduate, and 15.6% had postgraduate and higher degrees. Their minimum age was 18 and the maximum age was 52 years old; their mean age was 28.25 years. Their mean burnout score before the intervention was 50.85 and reached 49.25 after the intervention. The mean scores at the post-test stage shows 1.6 units compared to the pre-test. The results showed that there was a significant difference between the pre- and post- tests. The results also showed that positive thinking training effectively reduced the rate of academic burnout and its components (academic burnout, doubt, pessimism, and academic self-efficacy).

Keywords: Positive thinking, academic fatigue, educational burnout, educational apathy, educational self-efficacy.

Abstract

The aim of this study was to evaluate the cognitive, psychomotor, and attitudinal readiness of faculty members and students of Shiraz University of Medical Sciences for using e-learning in 2019 in order to move toward the desired future of e-learning in medical education, promote the benefits of e-learning in the country, and provide training to each of the research groups, if needed. This is a cross-sectional study conducted in Shiraz University of Medical Sciences, Iran, in 2019. The study population consisted of 379 students and 281 professors selected through the systematic random sampling in Shiraz University of Medical Sciences. The e-learning readiness questionnaire developed by Zarif Sanaei et al. was used to evaluate the students' and teachers' viewpoints. The results showed that the average level of skill, knowledge, and attitude among students and teachers was positive and higher than the mean ($P < 0.05$). It had only a significant relationship in the level of education of the teachers and the marital status of the participants. There was also a significant interaction between skill, knowledge, and attitude. There is a need for successful implementation of e-learning by creating appropriate infrastructure, applying the required standards, as well as taking measures to reduce the existing resistance in this regard, which can be achieved through training workshops. The experience of successful universities in the country and abroad can also be used to implement e-learning.

Abstract

This study examined sexism and gender stereotyping in two popular online comic skits using multimodal discourse analysis as theoretical framework. aspect which accounts for the grammar used in the skits. The study appraised the verbal and the visual choices of the characters and attempted to establish patterns of sexism in both. It was discovered that while focusing on the goal of entertainment, the skits portrayed evidence of sexist use of English in the linguistic choices of the characters. The study also found that through the instrumentality of both verbal and visual choices, the skits portrayed gender-based prejudices. Based on these findings, the study concluded that these Nigerian online comedy skits primarily present characters as stereotypes and uses sexist language. However, both the stereotypes and the sexism target females more than the target males and this reflects the sociocultural context of patriarchy. It recommended that content creators should adopt a more inclusive language and avoid sexism in online comedy skits.

Keywords: Sexism in entertainment, multimodality, gender stereotyping in skits, media and language, semiotics, Nigerian comedy, linguistic sexism, and visual grammar.

**PYRIMIDINE-BASED COMPOUNDS AS INNOVATIVE PROTEIN-PROTEIN
INTERACTION INHIBITORS IN CANCER TREATMENT**

Abstract

In neuroblastoma, Aurora Kinase A (AURKA), independently of its kinase activity, binds to the oncoprotein N-Myc, preventing its degradation and contributing to the progression of neuroblastoma since it interferes with the cell-cycle exit of neuroblasts. While intense efforts have been made to develop AURKA inhibitors, the very low druggability of N-Myc has prevented any successful strategy for chemotherapeutic intervention. However, recent studies demonstrating the interaction between AURKA and N-Myc have provided an innovative therapeutic approach. These findings have prompted the identification of new compounds able to disrupt the AURKA/N-Myc complex, in order to promote N-Myc degradation. New studies indicated that **RPM1722**, a promising orthosteric bis-anilinopyrimidine AURKA inhibitor, was capable of blocking this protein-protein interaction [1]. **RPM1722** bromine atom is thought to be responsible for induced-dipole forces that freezes the enzyme in an unusual “DFG-out/loop-in” conformation. However, although in vitro assays RPM1722 was able to also inhibit the N-Myc/AURKA interaction, it seemed quite ineffective in cell-based assays. In this scenario, we described the design and synthesis of a new library of 2,4-disubstituted pyrimidine structurally related to RPM1722. The pyrimidine core and the 4-carboxyphenylamino substituent in position 2 have been kept. Conversely, the nitrogen atom was replaced with an oxygen or sulfur and the phenyl ring in position 4 of the pyrimidine was modified by introducing halogens in 2, 3 and 4 positions. On the other hand, it has been also shown a covalent Coenzyme A inhibition of AURKA as a result of the formation of a sulfur bridge between the thiol group of the pantetheine tail and the side chain of Cys290 residue located in the activation loop of AURKA [2-3]. This mechanism is specific and provides the proof of concept for a potential irreversible inhibitory mechanism of AURKA which would possibly keep the AURKA in a conformation unsuitable for N-Myc binding. Hence, we retained the 2-(4-carboxyphenylamino) pyrimidine core of RPM1722 as anchor site and decided to design a long branch with a terminal electrophilic warhead to mimic the pantetheine tail of acetyl-CoA to reach for the Cys290 residue. All the newly synthesized compounds were evaluated in enzymatic inhibition assays and X-ray crystallographic experiments were performed to corroborate our biological results. Further investigations are needed to better understand the mechanism of action of our compounds.

Keywords: pyrimidines; AURKA; N-Myc; conformation disruptors; kinase inhibitors.

INFLUENCE OF GINGER EXTRACT ON STABILITY AND SENSORIAL QUALITY
OF SMOKED MACKEREL (*Scomber scombrus*) FISH

Marcquin Chibuzo Iheagwara (Orcid ID: 0000-0001-8449-5335

Department of Food Science and Technology Federal University of Technology, Owerri

P.M.B. 1526 Owerri, Imo State, Nigeria

Email: marcquin.iheagwara@futo.edu.ng

Abstract

The effect of ginger extract on the stability and sensorial quality of smoked mackerel fish stored at $28 \pm 2^\circ\text{C}$ was determined over 20 days. Chemical, microbiological and sensory analyses were performed to investigate quality changes, and to determine the shelf stability of the products. The proximate, thiobarbituric acid (TBA) value, peroxide value (PV), mould count, and trimethylamine (TMA) were found statistically significant ($p < 0.05$) in the smoked mackerel fish throughout storage. Protein, fat and ash contents of the ginger extract treated samples had marked % increase compared to the control. The lowest TBA (0.08 mg MDA/kg), peroxide (4.50 mEq/kg) and TMA (3.46 mg N/100 g) values were recorded in 5% ginger extract treated samples, while the highest TBA (1.45 mg MDA/ kg), PV(30.07 mEq/kg) and TMA (15.52 mg N/100 g) occurred in the control. The result also revealed that samples treated with ginger extract had lower mould count than the control. The organoleptic results showed that samples treated with 5% ginger extract had the best acceptance, and were significantly different ($p < 0.05$) when compared to the control after 10 days of storage.

Keywords: Smoked mackerel fish, ginger, stability, quality, thiobarbituric acid.

**PERFORMANCE OF MECHANICAL & DURABILITY PROPERTIES OF TERNARY
BLENDED CEMENT CONCRETE**

Subhashish DEY

Pradesh, India

E-mail: subhasdey633@gmail.com

Abstract

Cementitious composites are the most frequently used man-made material, with a 25 billion tonne manufacturing volume and 5% greenhouse gas emissions. Concrete composites release a lot of CO₂ into the environment. Thus, replacing concrete composite raw material is a priority. To reduce this industry's carbon footprint, large-scale reuse of industrial byproducts including Fly Ash (FA), Silica Fume (SF), and Ground Granulated Blast-Furnace Slag (GGBS) in cementitious composites is growing. This method addresses waste management for industry byproducts in two ways. The mechanical strength and durability of cementitious composite products with many ingredients must be documented. The study's major goal is to evaluate high-strength cementitious composites' mechanical strength and durability. FA (20%, 30% & 40%), SF (5%, 7.5% and 10%), and GGBS (10%, 15% and 20%) binder were used to make high-strength cementitious composites. Waste management has developed into a problem for the environment. The illegal and unethical practices involved in mining natural river sand (NRS) have gotten worse. Therefore, by substituting Granite Quarry Dust (GQD) for fine aggregate, the lack of NRS for building is prevented. GQD was employed to replace natural river sand at different levels of replacement as the fine aggregate phase in 10%, 20% and 30%. The fresh cementitious composites used to describe the cementitious composites. Additionally evaluated were its flow-ability and the cured cementitious composites' properties, particularly their compressive strength, flexural strength, and split tensile strength. Additionally, the strength characteristics such water sorptivity and the Rapid Chloride Permeability Test (RCPT). We shall evaluate it with normal concrete based on the results.

Keywords: Cement, fine aggregate, coarse aggregate, fly ash, Silica fume, GGBS and Water

ON THE SPECTRA OF A NEW CORONA TYPE GRAPH AND APPLICATIONS

Renny P VARGHESE (Orcid ID: 0000-0003-0243-979X)

Professor & Head Department of Mathematics Catholicate College, Pathanamthitta
Kerala, India – 689 645

E-mail: rennypv1@gmail.com

Abstract Let $S(G)$ be the subdivision graph of G . Given two graphs G_1 and G_2 , the S_G corona, $G_1 \cup G_2$ is the graph obtained from $S(G_1) \cup G_1$ and n_1 copies of G_2 , all vertices distinct, by joining i^{th} vertex of G_1 to every vertex in the i^{th} copy of G_2 . In this paper, we determined the adjacency spectrum (respectively Laplacian and signless Laplacian spectrum) of $G_1 \cup G_2$ for a regular graph G_1 and an arbitrary graph G_2 in terms of the corresponding spectra of G_1 and G_2 . Finally, as an application of these results, we constructed infinitely many pairs of cospectral graphs. In addition, the Kirchhoff index and the number of spanning trees of $G_1 \cup G_2$ are also calculated.

Keywords: spectrum, corona, cospectral graphs, Kirchhoff index, spanning trees.

Abstract

This research highlights the importance of nutritional biochemistry. Daily nutrition is a matter of biochemistry. A good state of health with an optimal level of nutrition must take into account the chemical needs of the body. The main purpose of this study is to look at the effect of nutrition on the human body and focuses on the importance of nutrients that the human body needs. The methodology of this study used descriptive methods to describe the separation of nutrients and to analyze them depending on their role in the organism. A literature database by searching the electronic MEDLINE via PubMed was performed. Eating healthy means regularly eating foods that are rich in vitamins and minerals, such as fruits, vegetables, whole grains, and low-fat dairy products. There are six major classes of nutrients essential to human health: carbohydrates, lipids, proteins, vitamins, minerals, and water. Carbohydrates, lipids and proteins are considered macronutrients and serve as a source of energy. Water is required in large quantities, but it does not provide energy. Vitamins and minerals are considered micronutrients and play an essential role in metabolism. Vitamins represent organic chemical compounds (or a group of related compounds) that the body cannot synthesize at all or in sufficient quantities and must obtain through nutrition. They have different biochemical functions in human health. This article contributes to the body of knowledge by highlighting how the biochemistry of nutrition affects human health and the organism. Nutrition is the only way through which the nutrients that are necessary for the construction of tissues, and organs and for the maintenance of their vital functions, are consumed and introduced into the organism, and thus it represents an integral and inseparable part of life.

Keywords: nutrition, human body, nutrients, food

**REVIEW OF ENVIRONMENTAL DNA METABARCODING FOR FRESHWATER
BENTHIC MONITORING**

Dr.Nupur Luharia

Shri Mathuradas Mohota College Of Science, Nagpur

Ku.Kuldeep Kaur

Sakkardara Square, Umrer Road Nagpur- 440024

Abstract

Aquatic biomonitoring is being transformed by environmental DNA (eDNA) metabarcoding, which uses parallel DNA/RNA sequencing to identify entire groups within a targeted group. Water eDNA and macroinvertebrate bulk samples have been the subject of the majority of metabarcoding research to date that try to evaluate the ecological state of aquatic ecosystems. To evaluate microbial or meiofaunal biota, eDNA metabarcoding has also been used on soft soil samples. eDNA metabarcoding offers potentially significant advantages for evaluating the environmental quality of sediments when compared to traditional approaches based on manual sorting and morphological identification of benthic organisms. To increase their robustness, comparability, and usability within regulatory frameworks, sediment eDNA metabarcoding methodologies and processes must be standardized because they can vary greatly between research. With an emphasis on the stages of sampling, preservation, and DNA extraction, we examine the information that is currently available on eDNA metabarcoding used on sediment samples. The variety of eDNA sources, states, and permanence in the sediment are only a few of the difficulties we explore when it comes to sediment eDNA analysis. With the widespread use of sediment eDNA in future benthic monitoring, this research seeks to identify best practices and allow method harmonization.

Keywords: eDNA, Metabarcoding, Benthic Macroinvertebrates

**MODEL PREDICTION OF POTENTIAL DISEASE EFFECTS FROM PM_{2.5} EMISSION
AMONG SCHOOL CHILDREN IN COMING 30 YEARS IN SOUTH TANGERANG**

Abstract

Background: The largest global environmental health risk factor is the ambient of air pollution, that largely attributed to transportation emissions. One of the main causes of PM_{2.5} emissions is thought to be on-road transportation. PM_{2.5} has an impact on health, especially on children that relate to the respiratory system such as asthma, lung cancer, and decreased intelligence. **Objective:** The research objective was to predict the risk potential disease due to PM_{2.5} in children from vehicle emissions in South Tangerang City. **Method:** This research is an observational analytic study with a cross-sectional study design using a dynamic model approach using STELLA software. The environmental and human samples are used to calculate the exposure level to PM_{2.5}, taken from 32 points in 7 sub-districts of South Tangerang City (North Serpong, Serpong, Pondok Aren, Ciputat, East Ciputat, Pamulang, and Setu). then, meteorological data was also collected. Results: The number of vehicles in the city of South Tangerang is quite high, especially between 11:00 and 15:00 with the majority of vehicles passing by are cars and motorbikes. PM_{2.5} pollution levels will fluctuate until 2053. The effects of temperature, weather, and humidity might cause an increase in

PM_{2.5} pollutants at specific times. According to the modeling calculation results, even though there are occasions when PM_{2.5} pollution levels fall, acute respiratory infection (ARI) incidence in children will continue to rise over time. Although PM_{2.5} emissions fluctuate, exposure to PM_{2.5} in low concentrations poses a risk to human health.

Keywords: Children, transportation, particulate matter, acute respiratory infection

Özet

Estetik diş hekimliği, bilimsel prensipler ve sanatsal yeteneğin birleşimi objektif ve sübjektif verilerin uygun kombinasyonu ile sağlanmaktadır. Diş hekimi, doğal ve estetik bir gülüş tasarlarlarken hastanın yüz analizleri, ten rengi, göz rengi ve bu değerlerin alt başlıklarındaki tüm basamakları dikkate alarak yol almanın yanında hastanın sübjektif yargılarını, hastaların beklentilerini, kişisel özelliklerini dikkate alarak ekip çalışması ile hastaya optimum güncel estetiği sağlayabilir. Optimum estetik için Maryland adeziv köprüler, dişlerin tamamen prepare edilmesi ile yapılan full kron restorasyonlar, minimal invaziv, non-prep ve prepless porselen lamina veneer restorasyonlar yapılabilmektedir. Materyal metod: porselen laminate veneerler ile tedaviye başlanmadan önce intraoral olarak; orta hattın belirlenmesi, insizal uzunluk tespiti , zenith noktalarının belirlenmesi, dişlerin aksı, şekli ,konumlarının değerlendirilmesi altın oranın sağlanması gerekirken, extraoral olarak ise konjunktiva rengi, parlaklığı, dudak desteği, yüz simetri ve dengesinin sağlanması, cinsiyet ve yaş özelliklerinin göz önüne alınması, üst, orta ve alt yüz yüksekliklerinin değerlendirilmesi, interpupiller mesafe, camper düzlemi gibi kriterlerin mutlak değerlendirilmesi ve yapılan restorasyonlara aktarılabilmesi gerekmektedir.

Sonuç: Laminate veneerler ile optimum estetiğin sağlanması yüksek oranlarda mümkündür. Bu nedenle laminate veneerlerin yapımından önce bahsedilen estetik analizlerin yapılmış olması %100 hasta memnuniyeti sağlayarak güncel bilimsel verilerle elde edilmiş tedaviler ortaya koyar.

Keywords: laminate veneer, estetik analiz, dental estetik, minimal invaziv, prepless

**YEREL YÖNETİM BİRİMİ OLAN BELEDİYELERİN SOSYAL MEDYADA
VARLIĞININ ANALİTİK YÖNTEMLERLE İNCELENMESİ**

Dr. Aslı ÖZCAN (Orcid ID: 0000-0003-2783-012X)

Süleyman Demirel Üniversitesi, İktisadi ve İdari Bilimler Fakültesi, Isparta

E-mail: aslozcn09@gmail.com

Özet

Devletlerin kurulmasıyla ortaya çıkan yerel yönetimler belirli hizmetlerin sağlanması, yürütülmesi ve denetlenmesi gibi konularda merkezi yönetimlerin önemli bir parçası konumundadır. Günümüzde yeni medya olarak da adlandırılan sosyal medya, geleneksel medya araçlarının aksine çift yönlü iletişim ortamı sunarak anında geri bildirim alınmasına olanak tanımaktadır. Özellikle sosyal medya platformlarından biri olan Twitter sayesinde belediyeler; faaliyetleri ile ilgili kamuoyuna bilgi sağlama imkanına sahip olmuştur. Bunun yanında yüz yüze görüşmeye gerek kalmaksızın çeşitli istek, şikâyet, öneri ve beklentilerini iletilebilme gibi durumlarda belediye yetkilileri tarafından hızlı bir şekilde geri dönüş alma kolaylığına da sahip olmaktadır. Bu çalışmada belediyelerin sosyal medyayı nasıl kullandıklarını tespit etme ve daha iyi kullanım yolları önerme amacıyla yapılmıştır. Araştırmaya Ege bölgesinde kurumsal Twitter hesabı bulunan Aydın, Denizli ve İzmir olmak üzere 3 büyükşehir belediyesi dahil edilmiştir. İlgili belediyelerin 1 Şubat 2023 ve 1 Nisan 2023 tarihleri arasında resmi hesaplarındaki tweetleri veri madenciliği programları yardımıyla elde edilerek Çok Kriterli Karar Verme Yöntemleri yardımıyla elde edilen veriler üzerinden performans analizi gerçekleştirilmiştir. Araştırma sonucunda, sayısal yöntemler yardımıyla belediyelerin sosyal medya kullanımlarının performans değerlendirilmesi yapılmış sonuçlar karşılaştırılarak konuya ilişkin çözümler geliştirilip ilgili kurumlar başta olmak üzere tüm belediyelere sosyal medya kullanımı ile ilgili öneriler sunulmuştur.

Anahtar Kelimeler: Yerel yönetimler, Sosyal Medya, Çok kriterli karar verme

3PL (ÜÇÜNCÜ PARTİ LOJİSTİK) FİRMA SEÇİMİNDE KULLANILAN KRİTER AĞIRLIKLARININ ÇKKV YÖNTEMLERİ İLE BELİRLENMESİ

Dr. Aslı ÖZCAN (Orcid ID: 0000-0003-2783-012X)

Süleyman Demirel Üniversitesi, İktisadi ve İdari Bilimler Fakültesi, Isparta

E-mail: aslozcn09@gmail.com

Özet

Günümüzde işletmelerin çoğu lojistik faaliyetlerini gerçekleştirmek için 3. Parti Lojistik (3PL) firmalarından hizmet almaktadır. 3PL, firmanın lojistik faaliyetlerinin bir kısmının ya da tümünün işletme dışarısından yabancı firmalar tarafından yerine getirilmesi durumunu kapsamaktadır. İşletmeler 3PL firma seçiminde birçok kriteri göz önünde bulundurmakta ve karar verme aşamasında güçlük çekmektedirler. Bu çalışmada lojistik firma seçim aşamasında kullanılacak olan kriter ağırlıklarının ÇKKV (Çok kriterli karar verme) metoduyla tespit edilmesi ve sıralanması amaçlanmıştır. ÇKKV, karmaşık durumları ele almak ve Karar Vericilere yardımcı olma amacıyla yaygın olarak kullanılan güçlü bir araçtır. Çalışmada uygulanmak üzere ÇKKV ağırlıklandırma metodlarından olan SWARA (Step-Wise Weight Assessment Ratio Analysis- Adım Adım Ağırlık Değerlendirme Oran Analizi) metodu seçilmiştir. Kriterlerin belirlenmesinde ve kriter ağırlıklarının hesaplanması aşamasında literatür incelenerek alanında uzman kişilerin görüşlerinden faydalanılmıştır. Çalışmanın sonucunda lojistik firma seçiminde kullanılacak en etkili kriterin tercih edilecek olan firmanın lojistik sektöründeki tecrübesi olduğu tespit edilmiştir. Analizler sonucunda bu kriteri takiben sırasıyla güvenilirlik, hizmet kalitesi, fiyat, hız ve lojistik ekipman yeterliliği olduğu analizler sonucunda bulgulanmıştır. Elde edilen sonuçlar bu alanda yapılan araştırma sonuçlarıyla uyumludur. Buna ilaveten ÇKKV metodu olan SWARA'nın lojistik alanında kullanılan kriter ağırlıklarının belirlenmesinde gerçeğe yakın sonuçlar elde edebileceği tespit edilmiştir. Aynı zamanda uygulama sonucunda kriter ağırlıklarının belirlenmesi 3PL firması seçerken işletmelere yardımcı olacağı düşünülmektedir.

Anahtar Kelimeler: 3PL (üçüncü parti lojistik), Çkkv (Çok kriterli karar verme), Swara

**MODELING OF COOLING STRATEGY BY ARTIFICIAL INTELLIGENCE
TECHNIQUES IN THE ANALYSIS OF RESIDUAL STRESS OCCURRED IN THE
MACHINING OF SUPER ALLOY**

Dr. Mustafa ÇAKIR (Orcid ID: 0000-0002-1794-9242)

Iskenderun Technical University, Iskenderun Vocational School of Higher Education,
Department of Electronics and Automation, Iskenderun, HATAY, TURKIYE
E-mail: mustafa.cakir@iste.edu.tr

Abstract

Superalloys offer high strength, high-temperature resistance, and corrosion resistance, making them popular materials in industries such as aerospace and defense. However, residual stress can occur during machining, which may result in cracks or fractures in the part. Therefore, optimizing residual stress is crucial. Cooling conditions during machining have a significant impact on the occurrence of residual stress, making it an optimization problem. An experimental design of the turning process was made with the Taguchi technique. Experimental studies were carried out using a constant feed rate, depth of cut, three different coolant systems (conventional cooling, minimum quantity lubrication, and dry), and cutting speeds. This study used data obtained from experiments during the machining process of superalloys to obtain models via artificial intelligence (AI) techniques. These models were compared using evaluation metrics, and their success was determined. The study investigated and modeled the residual stress effects on the material surface during machining while considering different cutting speeds, feed rates, depths of cut, and cooling conditions using experimental data. However, the study focused on revealing and quantifying trapped stresses, which are of vital importance in terms of post-processing operational conditions. Meaningful estimation and evaluation optimization of these obtained values has been revealed with AI algorithms.

Keywords: Artificial Intelligence, Machine Learning, Residual stress, Superalloy, Cooling conditions

Abstract

Prefabricated functional appliances (PFAs), are made of soft elastomeric material, were first introduced in the 1980s. They are available in different shapes and designs related to their indications. During the last years clinical trials are performed aiming to summarize clinical effects of PFA. The aim of this presentation is to show our experience using them in young orthodontic patients. Material and methods. Clinical cases will be discussed during the presentation. All patients at the beginning of therapy were 8-10 years old, with Class II, division 1 malocclusion, large overjet and deep bite. They were treated with PFA, keeping the appliance during night. During the first year they controls were performed every 2 month and after one year, follow up every 6 months. Results. After one year of treatment with PFA, cephalometric tracing confirmed reduction of ANB angle, large overjet and overbite was in all cases. Molar sagittal relationship was improved toward a Class I. Changes were observed in patient's profile as well. Improvements were found regarding lip incompetence, respiratory problems and self esteem. In follow up controls after the first year, the situation was generally stable. Conclusion. PMA are effective in correcting increased overjet, over bite, lip incompetence and Class II malocclusion in early mixed dentition, leading to an improved or normal occlusion. Many times no further orthodontic treatment is needed after their use. By correcting some dental risk factors for dental trauma such as large overjet and lip incompetence, they may be considered as an effective preventive treatment regarding this issue.

Abstract

COVID-19 has put the health care in a new prospective. The dental studio environment is considered one of the most spreading environments due to concentration of aerosol. The ongoing crisis, during 2020 put patients in difficulties as they couldn't access the dental visits even though their needs. The purpose of the study was to analyze common prosthetic emergencies and provide recommendations to manage these issues during pandemic situations. Objectives: 1. To evaluate strategies on the control of COVID-19 infection in a dental clinic during prosthetic manipulations 2. To access the possible transmission routes of COVID-19 in dental clinics 3. To examine dentists personal experiences and the impact of the pandemic for the prosthodontist. Medical scientific articles and books were used for the literature review and two categorized questionnaires for patients and dentists were used for the exploratory-descriptive study. Study results report of an increase in the cost of prosthetic services, alternation of prosthetic sessions both in duration and frequency, an increase in preventive protective measures reported in the same values with 71% among dentists and 73 % in patients. During the COVID-19 pandemic, services and materials costs were increased the applicability of prosthetic have been and difficult, especially for young dentists. This has had an impact in the in the cost of prosthetic services.

Abstract

The issue of the expansion of urban heat islands and the resulting problems, including climate change at the global level, is one of the topics that must be seriously pursued. The morphology of urban street canyons is one of the cases that aggravate urban heat islands and their side risks on a large scale with the change in urban micro-climate conditions and the increase in temperature. For this reason, this article focuses on the significance of optimizing the conditions of street canyons and the results obtained in this field. Achieving optimal values about the configuration of street canyons, in addition to creating a balance between land use ratios (in terms of the importance of land in dense urban areas) and the thermal comfort conditions of citizens, since it can guidance for Architects and urban planners will be important in reducing the climatic problems of the cities and improving the living conditions of the residents.

Keywords: Configuration of street canyons, Optimization, Reduction of urban heat island, Thermal comfort of citizens, Urban microclimates.

**SOCIAL COMPARISON, SELF-COMPASSION, SELF-IMPROVEMENT, AND
MENTAL HEALTH PROBLEMS IN YOUNG ADULTS**

Ribaha Sultan

University of management and technology

E-mail: ribahasultan95@gamil.com,

Dr. Ayesha Jabeen

University of management and technology

E-mail: ayesha.jabeen@umt.edu.pk

Abstract

The current study explored the relationship of social comparison with self-compassion, self-improvement, and mental health problems in young adults. The sample size of this study consisted of 300 men and women young adults with the age range of 18 to 25 years ($M = 21.8$, $SD = 1.77$), in equal proportion from the Bs four years program. The sample was selected through a stratified random sampling technique from the different private universities of Lahore. Indigenous scales were used to make the study more culturally relevant. The scale of social comparison, self-compassion, self-improvement, and DASS was provided to students to find out the relationship between variables. The present study investigated that, downward social comparison, self-compassion, and self-improvement were inversely associated with mental health problems in young adults though downward social comparison and self-compassion have a significant positive association. Moreover, self-compassion and self-improvement also have a significant positive relationship. Regression analysis revealed that downward social comparison and self-improvement were significant predictors of mental health problems in young adults. The results were discussed indigenously in terms of gender difference, demographic variables, and implications for counseling services.

Keyword: social comparison, self-compassion, self-improvement, mental health problems, young adults

VICTOR BRAUNER: FROM DADA TO SURREALISM

Dr. Monica GAROIU
University of Tennessee-Chattanooga

Abstract

This paper examines the work of Victor Brauner (1903-1966), a surrealist artist of Romanian origin, from his avant-garde beginnings to his diverse major works expressing a true surrealist spirit. First, I will seek to explore the concept of "picto-poetry" that he created in 1924 with the poet, Ilarie Voronca, in the avant-garde magazine *75 HP*, where words and images are joint as in a Dada collage. Next, I will attempt a comparative analysis between his visual work and his only work of fiction, "Promenade" -- a text written in 1941 and published for the first time in 2005 -- in order to establish how Brauner succeeds in merging the real and the surreal, as well as multiple fields such as myth, occultism, and Kabbalah.

Abstract

The presentation aims at eliciting insight into the results of ongoing research regarding evolving trends and attitudes towards online assessment of English and other languages in higher education. The focus pinpoints *online* as one of the most trending forms available during the global pandemic. The study was first initiated in 2019 in which its main target was to reveal the intriguing question of students' and assessors' attitudes towards online assessment. The research questions the attitudes towards the latest trends, possible online task types, their advantages and disadvantages through an in-depth experimental process currently undergoing implementation. Material and methods include surveys, needs and wants analysis and thorough investigations regarding candidates' and assessors' attitudes towards online tests in the field of languages. The survey was carried out at the University of Pécs Medical School. Over 400 respondents from more than 28 countries participated in the survey, which gives us an international and intercultural insight into how students with different cultural and educational background deal with the evolving online world. The results show the pandemic's impact which brought the slumbering online world of assessing roaring alive, fully operational and now bears phenomenal relevance in today's global education. Undeniably, the results can be used as a perspective in a vast array of contents. The survey hypothesized the generation of the 21st century expect everything readily available online, however, questions whether they are ready for this challenge are lurking in the background.

Keywords: assessment; English; international; languages; online; testing;

Abstract

The present article theoretically discusses the relationship between anti-consumption and consumerism. The article starts with a general review of the most critical aspects of both concepts and concludes with a conceptual discussion of the link and interrelationships between the two. This includes a review on anti-consumption manifestations and the related concepts of brand avoidance, politically motivated brand rejection, resistance to consumption, the link between anti-consumption and self-identity and a discussion of involuntary anti-consumption. The article then moves to analyze consumerism, including its relationships with the marketing concept, political consumerism, ethical consumerism and how the concept of consumerism has been framed within the mainstream theories of consumers' role in free market systems. It is concluded that anti-consumption is a complex concept that encompasses less emphatic manifestations such as the preference to consume one product, service, brand or organization over other, to stronger types of anti-consumption manifestations, involving resistance or even rejection of consumption in general. Consumerism, which may be regarded as a soft and collective form of anti-consumption was developed in response to the power imbalance between corporations and consumers and although

it represents a movement of empowerment of the consumer it is not incompatible with the marketing concept. On the contrary, it can be considered an opportunity for marketing. The article conceptually frames the relationship between anti-consumption and consumerism, by arguing that both concepts: i) are centered on the consumer, reflecting a certain disposition towards consumption; ii) are multifaceted concepts, encompassing a large variety of manifestations, positive and negative, constructive and destructive behaviors, with differentiated levels of severity; iii) constitute a response to modern capitalism and power imbalances between companies and consumers and; iv) inspire a considerable interest in recent consumer behavior research. The article then analyses the dichotomy of altruistic/egoistic motivations and how consumerism and anti-consumption may reflect a disposition towards social ethos in the current post-modern society. It is concluded that consumerism, as an expression of consumer activism, seems to entail an altruistic dimension that is not present in some anti-consumption practices. However, it is argued that in some cases consumerism, at the individual level, is not necessarily the result of purposeful acts of altruism, ideological protest or the outward expression of countercultural sentiments. Some consumers may engage in consumer activism for personal well-being, while having few qualms about indulging in others.

Keywords: Anti-consumption, Consumerism, Consumer behavior, Market system, Post-modern.

Abstract

The western economic development, which allowed the consumer to have access to goods and services in an easy and accessible way, brought the attention of the academia and practitioners for the current mass consumption society and consumption's role in generating happiness among consumers. However, contradictory to the contemporary way of life, some consumers have established a different current, in which anti-consumption is seen as a way to also achieve well-being, while contributing to the sustainability of the planet. The discontented consumer and the consequent upraising of the activist consumer means that negative consumers' attitudes towards consumption and the corporate world need to be addressed. The concept of consumerism comprises the activities of governments, businesses, and independent organizations to protect and promote consumers' rights. This rather different approaches from the consumers to the market offer requires better understanding, due to the impacts on marketing practitioner's policies and actions. The purpose of this study is threefold. First, to assess the relationship between consumers' consumption

and consumers' anti-consumption, and its influence on well-being and happiness. This relationship is subjective by nature, because each individual behaviour is the sum of a set of social-cultural, personal and psychographic traits, in which not only the perception depends on each consumer's interpretation of the reality and self-concept of well-being, but also of its state of mind, sensations, emotions and memories. Composite by force, because marketing and other macro and micro environmental forces, stimulate and influence customers' perception. Second, the study provides a conceptual model encompassing five constructs (consumption, anti-consumption, materialism, well-being and happiness); third, to construct and develop an operational scale to measure attitudes towards consumption. In this regard, we conducted a literature review on anti-consumption and consumerism. A conceptual model based on the literature reviewed was developed and an operational scale constructed. Implications for the academia and practitioners are then discussed.

Keywords: Anti-consumption, Consumerism, Materialism, Attitudes, Conceptual model, Scale

**PUBLIC ADMINISTRATION CONCEPTUAL TRANSFORMATIONS UNDER THE
MARTIAL LAW IN UKRAINE**

Kalashnyk NADIYA (Orcid ID: 0000-0003-0814-0246)

Doctor of science in public administration, professor, National Forestry University of Ukraine
Lviv, Ukraine

E-mail: nadiia.kalashnyk@ntu.edu.ua

Abstract

Under the martial law in Ukraine, special attention of public administration is focused on the social, environmental, economic and managerial vectors of development. It was determined that the destructive consequences of military actions turned out to be critical for almost all internal economic indicators, which caused, according to the domino principle, an imbalance of all macroeconomic indicators not only in the European region, but also on a global scale. It is substantiated that: global energy security, progress in the gradual transition to clean energy; global food security has had the greatest destructive impact at the world level; global ecosystem related to the conservation of water resources, land resources; the state of multilateralism of international relations and cooperation in achieving the goals of sustainable development. At the regional and national levels, problems are observed in achieving all the sustainable development goals, the most vulnerable were: zero hunger, no poverty, quality education, good health and well-being, affordable and clean energy, etc. The years of independence, Ukraine overcame the path of post-socialist transformation – democratic society stable institutions were formed, market economic relations were developed, and civil society institutions were actively being formed. These positive transformations took place against the background of serious crises and public opposition. Key trends analysis show uneven development, which was accompanied by a significant number of crises. While state building and introducing new tools for socio-economic processes market regulation, Ukraine needed clearly defined and socially acceptable strategic development frameworks. Ukraine consistently implemented the concept of building a democratic society with a market economy and European integration. This situation required joining at the level of strategic understanding to the processes of the global level, the best and most effective practices of state building.

**THE PERINATAL ASSISTANCE SYSTEM STATE REGULATION: APPROACHES
AND CHANGES**

Malachynska MARIYA (Orcid ID: 0000-0003-2895-3666)

candidate of medical sciences, associate professor Doctoral student of the Department of Public Administration and Regional Studies Odesa Regional Institute of State Administration Odesa, Ukraine

E-mail: malachynska.m.y.@op.edu.ua

Abstract

The issue of the perinatal services system development is always extremely relevant for any country. Unfortunately, in situation that has developed in Ukraine is paid attention to the system of perinatal care not according to a comprehensive, but according to a branch approach. As a result, the efficiency of all components at the already mentioned levels decreases. We see this as a problem, first of all, of a managerial nature, which is laid down by the methodology of the attitude to perinatal services from the post-Soviet period, with a division into separate areas of responsibility: medical, social, informational and educational, etc. The war in Ukraine demonstrated that perinatal services should be provided comprehensively and preferably in one place. This is a guarantee of their effectiveness and efficiency. The specificity of the information base for studying the problems of perinatal care research methodology lies in the variety of sources of data collection, namely: medical documentation, information of social services, scientific developments on exclusively medical issues of providing medical services to pregnant women, newborns and women in labor, newmothers and children up to 3 years old, their social security, issues of management of medical and social spheres, regulatory settlement, etc. As a result, the processing of such information, which is diverse in content and sources, as well as huge in volume, requires the specifics of research methods. As for research on changes in the state regulation of the perinatal care system in Ukraine during the war, today we only have the practice of solving current issues in extreme conditions and in an emergency manner. Research and awareness of the consequences of this practice can enrich theoretical and scientific approaches to the mentioned problems in the future. Currently, in Ukraine, and in fact throughout the world, a research methodology is being developed in conditions of great risks. This need to manage various areas of health care and social welfare of the population was caused by the global pandemic of COVID-19, and then also by the war in Ukraine. It cannot be said that the war in our country concerns only the scientific community and studies of perinatal care problems exclusively in Ukraine. A large number of countries, primarily European ones, provided an opportunity and assisted in the movement of patients and entire medical institutions within the country and abroad, and in the further deployment of these institutions or the integration of Ukrainians into the perinatal care systems of a certain country. And this requires coordination of the methodology of the processes: medical, diagnostic, pharmaceutical, management, support, logistics, financing and subfinancing, etc. Formation of new approaches to the study of these processes is necessary.

**CULTURAL PRACTICES HINDERING GIRL CHILD'S ACCESS TO EARLY YEARS
EDUCATION. A CASE OF NOMADIC PASTORALISTS OF MARSABIT COUNTY,
KENYA**

Yattani BUNA (PhD)

Department of Early Childhood Studies, Kenyatta University

Nyakwara BEGI (PhD)

Department of Early Childhood Studies Kenyatta University

Abstract

Early years' education provides children with learning skills which helps them to have a strong start and critical life skills. This means that children denied access to early education will lack the benefits of early years education. Literature reviewed has shown that girls are more affected in access to education than boys due to geographic locations and community beliefs. Consequently, there was need to establish the cultural practices hindering girl child's access to early years education among the nomadic pastoralists of Marsabit County, Kenya. The study was guided by Urie Bronfenbrenner's Ecological Systems Theory. Mixed methods research design was employed in the study. The target population was parents, teachers, chiefs and area Education Officers. Purposive and simple random sampling techniques were used to select sample for the study. Interview schedule and focus group discussions were used to collect data which was analyzed using qualitative and quantitative techniques and results presented using tables, figures and text. The results had shown that many girls of school going age did not have access to early years education due to several cultural practices. The practices include: Cultural roles; early betrothal for marriage; and Female Genital Mutilation. The study recommends that varied strategies should be used to improve children's access to early years education like community education and stakeholder involvement.

Keywords: Harmful Cultural Practices; factors hindering; girls' access; early years education; Nomadic Pastoralists; Marsabit County; Kenya

**DEVELOPMENT PROBLEMS OF ASSISTED REPRODUCTIVE TECHNOLOGIES
MANAGEMENT**

Volodymyr YUKALO

PhD student of Public Administration and Public Service Department, the Institute of Public Lviv
Polytechnic National University, Ukraine

E-mail: yukalo0888@gmail.com

Abstract

Under the war, the priorities and institutional vision of the development of the health care system, approaches and views on reforming various areas of ensuring the functioning of the entire health care system, including the reproductive one, changed. In order to determine the priorities of health care policy in the conditions of war, it is necessary to clearly understand the existing problems. The WHO European Regional Office has drawn up recommendations for Ukraine on the development of the health care sector. Among the measures of the short-term perspective, the following were noted: the need to integrate the provision of humanitarian aid with the provision of primary services by health care institutions; provide modular training of medical workers according to programs for wartime needs (mental health, sexual violence and physical rehabilitation); carry out critical short-term repairs in hospitals with an increase in energy efficiency. Among medical problems, the following are identified: issues of temporarily displaced persons - medical workers; mass departure of medical personnel outside the country due to non-pecuniary, economic or other reasons; the question of the motivation of medical workers in conditions of increased workload on them; training of medical personnel of various qualifications taking into account the needs of war and post-war times; establishment of competitive remuneration for medical workers, etc. Another problem is that the use of assisted reproductive technologies is not perceived in the worldview of society as primary or emergency medical care, so support for the provision of such medical services has, as expected, fallen into the background. On the one hand, there is logic in this, but on the other hand, in the conditions of recording a huge number of sexual crimes in the occupied territories, non-compliance with annual medical examinations, problems with access to medical services and their quality in the occupied territories and territories of active hostilities, etc., problems with reproductive health, unfortunately, cannot be avoided. In the medium and long term, there is the risk of personnel and technology crisis in this area. As for the development of assisted reproductive technology programs, we believe that the proposed directions will have a slight positive effect. The demand for assisted reproductive technology programs will recover after some time, and in the future of 5-10 years it will even increase, but even in the near future, the cost of such programs will be covered mainly by the couples themselves or by the person who decided to have a child.

**MULTIMODAL DISCOURSE ANALYSIS OF SEXISM AND GENDER
STEREOTYPING POPULAR NIGERIAN ONLINE COMIC SKITS**

E-mail: Joseph.ahaotu@uniport.edu.ng

Abstract

This study examined sexism and gender stereotyping in two popular online comic skits using multimodal discourse analysis as theoretical framework. aspect which accounts for the grammar used in the skits. The study appraised the verbal and the visual choices of the characters and attempted to establish patterns of sexism in both. It was discovered that while focusing on the goal of entertainment, the skits portrayed evidence of sexist use of English in the linguistic choices of the characters. The study also found that through the instrumentality of both verbal and visual choices, the skits portrayed gender-based prejudices. Based on these findings, the study concluded that these Nigerian online comedy skits primarily present characters as stereotypes and uses sexist language. However, both the stereotypes and the sexism target females more than the target males and this reflects the sociocultural context of patriarchy. It recommended that content creators should adopt a more inclusive language and avoid sexism in online comedy skits.

Keywords: Sexism in entertainment, multimodality, gender stereotyping in skits, media and language, semiotics, Nigerian comedy, linguistic sexism, and visual grammar.

Abstract

This work deals with the numerical simulation of the flow of a gas in a micro cavity, using the lattice Boltzmann method (LBM) as a numerical alternative to purely kinetic methods to describe the behavior of rarefied gases. We studied the flow of a rarefied gas in a micro cavity in the presence of two obstacles, one is adiabatic in the lower wall and the other is heated in the upper one. The cold fluid enters with a constant speed from the left wall and exits out in the right side of the cavity. the effects of rarefaction given by the Knudsen number on the velocity and temperature profile have been studied.

Keywords: lattice Boltzmann method - rarified gas - Knudsen number - obstacles.

**NUMERICAL ANALYSIS OF NATURAL CONVECTION IN A SQUARE CAVITY

Abstract

The numerical analysis of natural convection in square cavities filled with nanofluid is a rapidly growing research topic in the field of fluid thermodynamics. This subject poses challenges for engineers who seek to understand and optimize the behavior of nanofluids in various applications. In this work, a numerical study of natural convection was conducted in a square cavity filled with Al_2O_3 -water nanofluid, with one heated wall and two cold horizontal walls. The lattice Boltzmann method was used for the analysis. The influence of the Rayleigh number and nanoparticle fraction on the structure of natural convection is discussed through temperature and velocity profiles, streamlines and isotherms. The study results show that the presence of nanoparticles leads to an increase in the average Nusselt number and fluid velocity in the cavity. These results are important for optimizing the design of cooling and heating systems using nanofluids.

Keywords: Natural convection – Square cavity – Nanofluids – Lattice Boltzmann Method.

**STUDY ON FLIGHT OF THE SUMMER AND WINTER FORM OF PINE
PROCESSIONARY MOTH**

Gergana ZAEMDZHIKOVA

Forest research institute - Bulgarian academy of sciences, Sofia, Bulgari, senior assistant

E-mail: zaem.bg@abv.bg

Abstract

In present work, the flight dynamic of the summer and winter form of *Thaumetopoea pityocampa* was studied. The experiment was conducted under laboratory conditions (room temperature and natural lighting). A bimodal and even a trimodal distribution of flight over time with multiple peaks has been found. Our preliminary results show a lack of dependence of multimodal flight distribution with temperature fluctuations in the study area. The statement, that the flight of the winter form begins around the date of the summer solstice (21.06.2021) is confirmed, and their flight period coincides with the hottest time of the year (June and July). Conversely, the flight of the summer form begins a month earlier (May-June) and precedes the hottest time of the year. No relationship was found between the time of peak flight and the length of the flight period. On the other hand, a relationship between the time of their occurrence and the culmination of local temperatures has been established.

**SURVIVAL OF SUMMER AND WINTER FORM OF THAUMETOPOEA
PITYOCAMPA IN THE HIBERNATION PERIOD**

Gergana ZAEMDZHIKOVA

Forest research institute - Bulgarian academy of sciences, Sofia, Bulgaria, senior assistant

E-mail: zaem.bg@abv.bg

Abstract

In the present work the survival of summer and winter form of pine processionary moth (*Thaumetopoea pityocampa*) during the hibernation period and the influence of its factors are studied. The investigation was carried out under laboratory conditions at room temperature and natural light. The development of 1224 individuals was followed, of which 708 individuals of the summer form found in the ground (224 hibernating larvae and 484 cocoons) and 516 larvae of the winter form (taken from processions). Prepupae were found in all summer form cocoons excavated at the end of the winter season. In the winter form, an average higher parasitism rate by Tachinidae was observed-10.5% against 0.6% in the summer one. At the same time, in the summer form the mortality caused by entomopathogenic fungi was much higher-av. 35% against 1% in the winter form. In both phenological forms, the mortality caused by unknown factors (av. 10.7%) was low, as well as the number of unemerged pupae (av. 5.3%). Within the summer form, the mortality caused by entomopathogenic fungi was high-av. 27.7% (larvae) and 37.4% (prepupae), respectively. A significant difference was found in the mortality caused by unknown factors-av. 31.7% (larvae) vs. 2.5% (prepupae). In both hibernating stages of the summer form, the rates of parasitism and unemerged pupae were negligible.

Abstract

This research identifies the influencing factors for entrepreneurs' decision in order to embrace a social career by establishing and maintaining a social entrepreneurial structure on the market. The research is based on the conceptual model of analysis the antecedents of social entrepreneurship proposed by Jiao in 2011, which was used to predict the intentions leading to the emergence of social enterprises. Previous research has focused on traditional entrepreneurship, being much less focused on social entrepreneurship, a newer concept with various interpretations. The present research specifically explores the measure of relationships between Jiao Theory predictors and social entrepreneurial career intentions. The research conducted in Romania is based on a general sample of 142 social entrepreneurs and their assessments of social entrepreneurial career intentions and compares the factors underlying the decision to start a social enterprise. The results of this research, obtained only from social entrepreneurs who could shed light on the phenomena prior to the formation of social enterprises, support the universal effects of antecedents, but the influence of external factors on social entrepreneurial career intentions should not be neglected either. Researchers in the field of social entrepreneurship can expand their study of the factors that influence the creation of social companies using the framework described in this paper. The framework also aids in the theoretical development of the definition of social entrepreneurship by emphasising the link between social enterprise activities and the production of social impact as a group that together make up social entrepreneurship. Since a poor conceptualization can lead to deviations during data collecting or data analysis, permitting the development of potentially incorrect results, this conceptual clarification helps to minimise errors that may exist in both

theoretical and practical studies. The research explains specific societal challenges faced by social entrepreneurs, assisting those looking to start a social enterprise in understanding how this organisation type is initially formed. The development of educational programmes for the training of social entrepreneurs in social incubators and accelerators may also be aided by a knowledge of the factors that led to the founding of social companies.

Abstract

We present techno-legal and techno-socio-economical aspects of research to human rights on the clean and safe water, sanitation, pollution free industry infrastructure context in Smart World for 17 sustainable development goals (SDG) item no. 6 & 9 and present views regarding the possible use of the Green Internet of Things (G-IoT) in India and so are intended to be achieved globally by 2030. This research has as main goal to evaluate the feasibility of a Next Generation Nano-structured Wireless Sensor Network System (n-WSN) as G-IoT application for fresh air and pollution free industry detection and ecological disaster protection. Although there has been immense development of more sensitive and selective nano-structured sensor arrays and Artificial Intelligent (AI) enabling advanced data mining technology, there have been very few reports on the applications of electronic nose (e-Nose), electronic tongue (e-Tongue) and electronic vision (e-vision) for the detection of pollution free industry, ecological disaster and forest fire protection and management. The current Techno-legal and Socio-economical and techno-legal research sheds light on the practical applicability of e-Tongue for heavy metal detection from drinking water and waste-water and e-Nose for the pollution free industry and detection of hazards gaseous like as volatile organic compound (VOC) emissions detection, those are ingredient of air pollution, ecological disaster and forest fire.

Keywords: Clean water, Sanitation, GIoT, nWSN, e-Tongue, e-Nose, Zero emission industry.

**PARENTAL ROLES IN RELATION TO ADOLESCENT RISK BEHAVIOR: BASIS
FOR INTERVENTION PROGRAM**

Abstract

The parent is the first home teacher as it is where the adolescents learn not only the basic aspects of life but also the skills necessary to develop into responsible members of the community. Parents have roles in terms of how they carry out their responsibilities that associate to adolescents' risk behavior. This study aimed to find out the relationship between parental roles and adolescents' risk behavior and further determine the extent of risk behavior committed among adolescents. An intervention program will be conducted based on the results of the study. Descriptive – correlational research was employed and a non-parametric test was used for data analysis. There was no significant difference in the parental roles when data were analyzed by gender, parents' marital status, parent's educational attainment, family monthly income, religious affiliation, type of family and living arrangements. However, there was a significant difference in the parental roles when data were analyzed by age. Adolescents 18 to 19 years old scored their parental roles just satisfactory. Moreover, variables such as parent's marital status, religious affiliation, and type of family did not influence the adolescents' risk behavior. On the contrary, variables such as age, gender, parent's educational attainment, parent's occupation, family monthly income, and living arrangements affect the adolescents' risk behavior. Adolescents aged 18-19, males, parents obtaining elementary level as highest education, fathers whose occupation were laborers/unskilled workers, mothers who stayed in the household, families having a family monthly income of below Php 5,000, and those who don't have mothers/fathers have higher risk behavior. Apparently, there was no significant relationship between parental roles and adolescent's risk behavior. The study recommended for the development of an intervention program on Skills Training Development to augment the income of the families and to address risk behavior, a seminar – workshop on Moral Values Regeneration is suggested.

Key words: parental roles, adolescent, risk behaviors, intervention program

Özet

Endonezya Hükümeti Bürokratik Reformunun Büyük Tasarımı Bürokratik reform 2010 yılından bu yana devam etmektedir ve 2024 yılında tamamlanması beklenmektedir. Bu çalışma, Google Scholar ve resmi hükümet web sitesi aracılığıyla raporlar, araştırmalar, kitaplar, dergiler ve hükümet ve özel taraflardan diğer veriler gibi çeşitli kaynaklardan elde edilen veri ve belgeleri kullanan ikincil bir veri araştırmasıdır. Bu çalışmada üç ana gösterge kullanılmıştır: Endonezya'da yolsuzluğun gelişimi, bürokratik reform çabaları ve bürokratik reformun önündeki zorluklar/engeller. Çalışmanın bulguları, Endonezya hükümetinin idari reformunun iyileştiğini, ancak yerel yönetim düzeyinde yüksek yolsuzluk seviyelerinin yanı sıra belediyelerdeki bürokratik dönüşümün genel seviyesinin oldukça zayıf kalması nedeniyle büyük bir endişe kaynağı olmaya devam ettiğini göstermektedir.

Anahtar Kelimeler: Yolsuzluk; reform, bürokrasi, Endonezya.

Abstract

The use of nutrients in a hydroponic system is very important to obtain optimal plant growth and development. One of the popular hydroponic nutrients used as hydroponic nutrition is AB mix nutrition, but there are many obstacles in its use, namely it is expensive, difficult to obtain, and sometimes not suitable for plant needs. So we need alternative organic nutrients in the form of lamtoro leaf extract which is cheap, easy to obtain, and rich in nutrients for mustard green. This study used a completely randomized design (CRD) with 4 single factors of various nutrient solutions in the form of P1 = 100% AB mix (Control), P2 = 75% AB mix + 25% lamtoro leaf extract, P3 = 50% AB mix + 50% lamtoro leaf extract, and P4 = 100% lamtoro leaf extract. Results showed that the treatment with 75% AB mix + 25% lamtoro leaf extract had an effect on increasing number of leaves, green level of leaves, and harvest index of mustard green. The best concentration of lamtoro leaf extract is 25% lamtoro leaf extract substituted with AB mix nutrients because it can balance, complement, or act as a nutritional substitute for AB mix.

Abstract

This study has an aim to check the impact of gender of respondents on the willingness to pay additional price for organic food consumption's in the future. This type of products are illustrated on natural milk and natural oil generated from olive. The method explored in this research is an online survey between January-November 2022 among 81 respondents from Turkiye and Algeria. Then, the results were analysed through SPSS software V26 in order to use the Chi-square test. The results indicate that the independency between the willingness to pay in the future in order to consume organic food and the gender of respondents is ensured. It means that both men and women are agreeing to pay extra price in this case.

Abstract

This project intends to develop a specifically modified trolley to fulfil various functions, namely extracting car components particularly gearbox and transferring these components to a specific workspace. It also aims to examine its efficiency when utilized to perform these two tasks. It was found that many car mechanics and students of automotive courses found these tasks to be physical demanding and exhausting and sometimes put them at risk of undesirable incidents. Thus, this trolley was designed to minimize physical workload, reduce time taken to perform tasks related to removing gearbox and transferring car components as well as mitigate health and safety risks. There will be 20 respondents involved in this study and they are required to test the project before completing observation checklists and questionnaires developed to elicit their feedback on the trolley. The findings from this research might be useful to study how this project can be improved to be safer and more efficient.

Abstract

The purpose of this project was to examine the effectiveness of a specially designed teaching aid known as “Galaxy Mat” on children’s ability to recognize and remember basic numbers through galaxy-themed print visuals. It was found that the preschool children had difficulties recognizing numbers and remembering them properly. Thus, this teaching aid was created in order to help children identify numbers and apply its concept accordingly by using a set of galaxy-themed print cards. Due to the pandemic regulation, only 10 children were involved as subjects in this research. Their behavioral responses and ability to perform the task were observed using a checklist. The findings revealed that the children displayed greater interest in mastering the numerical concept and they were able to demonstrate their understanding of the subject matter correctly during the task. It signified the potential of the teaching aid to be used as an educational activity for children at preschools.

Abstract

The rammed earth, one of the ancestral techniques of construction in raw earth, knows a new rise today in the world thanks to its energy performance in all the life cycle of a building. This strong point makes it possible to consider the rammed earth as a promising material of the building sector in the context of the sustainable development. However, this material which constitutes a large part of the built heritage in raw earth in Algeria in the Ksour of the Sahara and in the habitas of the Highlands and Kabylie. In the north of the Sahara, the Ksour of Laghouat present not only a favorable environment rich in cultural, cultural, historical and architectural potentialities, but also a know-how so particular in the region, is that of the rammed earth. Indeed, the rammed earth, and earthen constructions in general, constitute a quality response to very contemporary issues. The questions of ecological footprint, renewable materials and lower consumption during the construction as well as during the use of the building are at the heart of the current reflection. The old ksar of Ain Madhi located north of Laghouat is one of the ksour so well known in the region by its architecture, its gardens and especially by an ancestral know-how so particular where the shy presence of the rammed earth material is marked like a treasure in danger. From there, came the idea of the revalorization of the technique of the rammed earth in the ksar by the creation of a training center in earth architecture built in rammed earth at the level of the region and precisely above the tourist extension zone of Ain Madhi, in the vision of a development of the local heritage considered as a socio-economic promoter. The present study is part of a master's thesis that focuses on the revaluation of the rammed earth technique in the Ksar of Ain Madhi, in order to better understand this technique, discover the architectural heritage of the region, analyze the site and design a training center in raw earth. The research is based on the contextual approach and the conceptual approach.

Keywords: revalorization, rammed earth, contextual approach, conceptual approach, earth center, Ksar Ain Madhi (Algeria)

Abstract

Objective: *Calopogonium mucunoides* is a medicinal plant used widely in the south eastern Nigeria for the management of a number of ailments including aches and pains. The clinical symptoms of many diseases like headache, fever, other aches and pains related to various diseases are indirectly or directly because of inflammatory process. However, most conventional anti-inflammatory drugs are associated with adverse side effects; hence need for the search for cheaper and safer anti-inflammatory drugs. This study was designed to assess the nutritional composition and anti-inflammatory activity of ethanol extract of *Calopogonium mucunoides* leaves (EECML) applying *in-vitro* and *in-vivo* models.

Method: In this study, *In-vitro* anti-inflammatory studies of EECML were performed using inhibition of platelet aggregation method, phospholipase-A₂ enzyme activity, egg albumin denaturation inhibition assay as well as hypotonicity-induced membrane stabilization method. *In-*

vitro antioxidant potential and nutrient composition of the plant extract were evaluated using standard biochemical procedures. In the *in-vivo* anti-inflammatory assay, a total of twenty five (25) adult male albino rats (120-160g) were divided into five (5) groups of five (5) rats in each group. Group 1 received normal saline; Group 2 received 10 mg/kg body weight of Indomethacin, while Groups 3, 4 and 5 received 100, 200 and 400 mg/kg body weight of EECML respectively.

Results: The plant's qualitative and quantitative analysis of the secondary metabolites revealed the existence of flavonoids, saponins, glycosides, alkaloids, tannins, phenols, steroids and terpenoids in varying amounts. The acute toxicity test of the extract was safe up to 5000 mg/kg b.w. The results revealed significant amounts of antioxidant vitamins and minerals. Proximate analysis of EECML showed the presence of appreciable amounts of protein, carbohydrate, fat, crude fibre, ash and moisture contents. In the systemic rat paw oedema model, scalar doses of the extract significantly ($P < 0.05$) suppressed the development of paw oedema induced by egg albumin. This compares well with the standard anti-inflammatory drug indomethacin (10 mg/kg b.w) which at 5 hours inhibited egg albumin-induced rat paw oedema (84.25%). The extract at different concentrations (10-640 μ g/ml), significantly ($P < 0.05$) exhibited DPPH (1-1diphenyl-2-picrylhydrazyl) radical scavenging activity, in a concentration-dependent manner, similar to the standard antioxidant, ascorbic acid. Also, varying doses of the extract significantly ($P < 0.05$) inhibited platelet aggregation, phospholipase-A₂ activity, albumin denaturation as well as hypotonicity-induced hemolysis of red blood cells in a concentration-related manner, provoking inhibition comparable with the standard anti-inflammatory drug used.

Conclusions: These results indicate that the extract possesses significant anti-inflammatory and antioxidant activities as well as nutritional potential. Furthermore, the results indicate that the plant extract can be a potential source of anti-inflammatory agents as well as a possible source of cheap food nutrients.

Keywords: Anti-inflammatory, *Calopogonium mucunoides*, nutritional composition, anti-oxidant.

OPTIMIZATION OF A NEW ANTIOXIDANT FORMULATION USING A SIMPLEX
LATTICE MIXTURE DESIGN OF *Apium graveolens* L., *Coriandrum sativum* L., AND
Petroselinum crispum M. GROWN IN NORTHERN MOROCCO

Abstract

A statistical Simplex Lattice Mixture design was applied to develop a new formulation based on a combination of three plants grown in northern Morocco: *Apium graveolens* L., *Coriandrum sativum* L., and *Petroselinum crispum* M. We examined the extraction yield, total polyphenol content (TPC), 2,2-diphenyl-1-picrylhydrazyl (DPPH) radical scavenging activity, and total antioxidant capacity (TAC). The results of this screening study showed that *C. sativum* L. had the highest content of DPPH (53.22%) and TAC (37.46 ± 0.29 mg Eq AA/g DW) compared to the other two plants, while *P. crispum* M. showed the highest TPC (18.52 ± 0.32 mg Eq GA/g DW). Furthermore, the ANOVA analysis of the mixture design showed that all three responses (DPPH, TAC, and TPC) were statistically significant, with determination coefficients of 97%, 93%, and 91%, respectively, and fit the cubic model. Moreover, the diagnostic plots showed good correlation between the experimental and predicted values. Therefore, the best combination obtained under optimal conditions ($P_1 = 0.611$, $P_2 = 0.289$, $P_3 = 0.100$) was characterized by DPPH, TAC, and TPC of 56.21%, 72.74 mg Eq AA/g DW, and 21.98 mg Eq GA/g DW, respectively. The results of this study reinforce the view of stimulating the effect of plant combinations to achieve better antioxidant activities, thus providing a better formulation using designs of mixtures for the food industry and in cosmetic and pharmaceutical applications. Moreover, our findings support the traditional use of the Apiaceae plant species in managing many disorders cited in the Moroccan pharmacopeia.

Keywords: *P. crispum* M.; *C. sativum* L.; *A. graveolens* L.; mixture design; antioxidant activity.

Abstract

Root canal treatment (RCT) is one of the most common dentistry practices. Indeed, this kind of treatment allow not only to take away the pain from irreversible pulpitis but also to solve periapical inflammation such as granulomas and cysts. The RCT consist in different “surgical” phases: opening of the root chamber, scouting of the canals, Coronal flaring, Glide path establishment, Shaping of the canal, cleaning and filling. The introduction of Nickel-Titanium (NiTi) in the routine daily practice has completely changed the root canal treatment. Despite this world changing introduction, it is still controversial the use of NiTi in root canal shaping. Indeed, while the number of rotary instruments available on the market, with different mechanical characteristics thought to challenge every clinical situation. Despite the current literature highlighted the uncountable advantages of NiTi files over the traditional stainless steel (SS) files, a lot of Endodontist and General Practitioner still use them. Indeed, SS files are still mainly used at least in the first phases of the root canal treatment, such as scouting and coronal flaring. This procedure is often motivated by a higher safety of the SS files, which less frequently are broken inside the root canal. Despite this safety idea could be true especially in the past, the SS files could lead to several problems such

as ledge, zipping and perforation. These problems often lead to the failure of the root canal treatment. Moreover, the introduction of thermal treatments of the NiTi drastically increased the safety of the rotary files, reducing the separation percentage inside the root canal. For these reasons, the authors created a different approach to the shaping procedures of the root canal treatment. This new protocol, so called Only Rotary Endo (O.R.E.) Protocol, is based on the current literature, leading to an Evidence Based Dentistry. This allows to split the shaping procedures into different phases, based on the anatomy difficulties of the canal. This approach allows to use the most proper instrument for the different phases of the treatment, matching the inevitable anatomical difficulties with the properties of the instrument used to challenge it.

Abstract

Corrosion is a major challenge in various industrial sectors, and numerous methods have been developed to control it. The use of corrosion inhibitors is one of the most efficient methods for corrosion control. However, the high cost and environmental concerns associated with the use of conventional corrosion inhibitors have led to the search for alternative materials. Polymeric wastes, which are abundant and cost-effective, have been explored as potential corrosion inhibitors. This review paper provides an overview of the application of polymeric wastes as corrosion inhibitors. The paper discusses the different types of polymeric wastes that have been investigated for their corrosion inhibiting properties. The synthesis and characterization techniques of these polymeric wastes are also highlighted. The mechanisms of corrosion inhibition by polymeric wastes, including adsorption and film formation, are discussed. The effectiveness of polymeric wastes as corrosion inhibitors for various metals and alloys, including carbon steel, aluminum, and copper, are also reviewed. Furthermore, the paper discusses the limitations and challenges associated with the application of polymeric wastes as corrosion inhibitors, including their stability, solubility, and compatibility with other additives. The review concludes with suggestions for future research directions in the area of polymeric waste-based corrosion inhibitors. Overall, the review highlights the potential of polymeric wastes as an alternative source of corrosion inhibitors, which can contribute to reducing the environmental impact of industrial processes.

COMPARATIVE STUDY ON THE EFFECT OF DIFFERENT KINDS OF URBAN CONTEXTS BLOCKS (TRADITIONAL AND MODERN) ON USING NATURAL WIND FLOW FOR CREATING THERMAL COMFORT IN URBAN CROSSINGS (CASE STUDY: KASHAN, IRAN)

Mostafa AZAD

Department of Architecture, Bu-Ali Sina University, Hamedan, Iran

E-mail: m.azad@art.basu.ac.ir

Mehrdad KARIMIMOSHAVER

Department of Architecture, Bu-Ali Sina University, Hamedan, Iran

E-mail: mkmoshaver@basu.ac.ir

Abstract

Urban crossings are important component of the cities. Creating thermal comfort especially in the marginal cities of the deserts could improve the life quality. How we can solve this problem effectively? By natural wind flow. The block formation of buildings in urban crossings are different in traditional and modern contexts. In Kashan, a city in Iran, as our case study, the building blocks formation are divided into 4 general categories:

- 1) Completely traditional context: often central yard, 7-meter height
- 2) Semi- traditional context: some of newly build building, one side built, at last 7.5-meter height (according to the existing rules.)
- 3) Urban new context with non-ordered routes: different heights, at last 5 floors.
- 4) Urban new context with ordered axis: the same heights for the buildings, from 3 to 6 floor, more than 6 floors in some cases.

The current research question is that what is the difference between the block formation of buildings in Kashan, Iran for modern and traditional context in confronting natural wind flow and air flow in urban crossings and which one has more thermal comfort?

Research tools are based on the newest maps of Kashan, Iran to investigate different plaques of different parts (traditional and modern) and the differences of wind flow formation and have an effect on creating thermal comfort of the urban outdoors.

Research tools are CFD like Ansys Fluent and Autodesk CFD and making maquettes and doing test in wind tunnel in order to simulate natural air flow. Finally, a comparative study showed the effect of different forms of urban contexts on thermal comfort and help to propose the utilized block form. Finally, a comparative study showed the effect of different forms of urban contexts on thermal comfort.

Keywords: Block forms in urban contexts, Traditional context of the city, Modern context of the city, Natural wind flow, Thermal comfort, Urban outdoors

**THE EFFECT OF THE URBAN CONTEXT FORMS ON USING NATURAL WIND
FLOW FOR CREATING THERMAL COMFORT IN URBAN CROSSINGS (THE
MARGINAL CITIES OF THE DESERTS IN IRAN)**

Mostafa AZAD

Mehrdad KARIMIMOSHAVER

Department of Architecture, Bu-Ali Sina University, Hamedan, Iran

E-mail: mkmoshaver@basu.ac.ir

Abstract

Urban crossings are important component of the cities. They may cause one of the most important health problems for humans. The buildings which are conforming urban crossings, are decreasing fresh wind heavily. Urban crossings are the main source of pollution in the city caused by traffic and other human activities. Creating thermal comfort especially in the marginal cities of the deserts could improve the life quality. How we can solve this problem effectively? By natural wind flow. To understand the relevant procedures, it is necessary to understand the main currents at first. The forms of buildings should be used as a passive strategy in order to improve air conditions, in addition to morphology of the city. The wind behavior could be investigated confronting different kinds of buildings in different scales (from city scales to residential units and interior design.) some of the elements are considered in the urban scale and have an effect on block building. Then, the investigation should be according to urban and the neighborhood scale. The current research question is that utilizing the block forms in marginal cities of the Deserts in Iran how affect using natural wind for creating thermal comfort? In this research plaques of newly build parts of the city are based on the confirmed descriptive plan for the city to investigate the effects of the relevant parameters changes in wind flow formation and have an effect on creating thermal comfort of the urban outdoors. Research tools are CFD like Ansys Fluent and Autodesk CFD and making maquettes and doing test in wind tunnel in order to simulate natural air flow. Finally, a comparative study showed the effect of different forms of urban contexts on thermal comfort and help to propose the utilized block form.

ASSOCIATION BETWEEN WORK-LIFE BALANCE AND JOB SATISFACTION OF EMPLOYEES

Dr. Vikram Singh CHOUHAN (Orcid ID: 0000-0002-8643-2618)

Assistant Professor, Jaypee University of Engineering & Technology, Guna(MP) India.

E-mail: vikram443322@rediffmail.com

Abstract

The research aims to study the relationship between work-life balance and the job satisfaction in the Indian service sector. A survey was conducted for data collection from 184 workers in Indian service sector. Data analysis was performed using SPSS. The findings reveal that work-life balance had a significant influence on job satisfaction. The workforce in Indian service sector reported a middling level of work-life balance in this study. The results suggest that work-life balance approach, work-load, and organizational support exerted a positive and significant impact on the job satisfaction of the service sector workforce. It is recommended that service enterprises should examine their working environment in order that the workforce gets fascinated toward joining the service sector and make a contribution to India's financial development. Organizations should frame and execute well-designed work-life balance policies, programs and practices for supporting and stimulating work-life balance skills. The institutions must provide work-family programs such as flexi-timings for reducing the stress of the workforce and enabling them to balance their personal life and job successfully. This study makes a contribution to literature since Indian organizations have recently executed numerous work-life balance policies. The research findings would aid HR practitioners in understanding the employees' work-life balance requirements and its influence on their job satisfaction.

Abstract

A chitin complex derived from shrimp carapace (CV) was tested for its ability to biosorb Acid Red 337 (AR) and the chromic 1:2 complex of Acid Blue 349 (AB). Sorbent characteristics, dye concentration, contact time and working pH were the factors considered. SEM images of the CV show different morphologies and pore structures. The FTIR spectra of the CVs show the presence of chitin. AR dye showed higher absorption compared to AB dye for all sorbents. Excellent adsorption capacity for red and blue acids with maximum adsorption capacities above 150.42 mg/g. Adsorption kinetics obey the pseudo-second order model. The Freundlich model best fits the experimental sorption isotherms. Through these processes, we have been able to clean up industrial wastewater, as well as prove the value of chitin as an effective biopolymer in several fields of application. The methods of preparation and chemical functionalization as well as the characterization techniques allowed us to successfully solve this problematic. The present study suggests that the sorbent derived from the studied wastes is effective for the removal of low molecular weight acid dyes from water.

Abstract

Modeling the MWA as a multiphysics problem involves the simultaneous modeling of multiple physical phenomena that occur during the procedure, including electromagnetic wave propagation, heat transfer, and tissue damage. These phenomena are interrelated, and modeling them together can provide a more accurate and comprehensive understanding of the behavior of tissue during the procedure. The first stage encompasses the accurate modeling of the microwave radiation of the antenna. The second stage involves modeling the interaction between the tissue and antenna radiation, heat transfer, blood flow effects, etc. The third stage requires estimating cell death due to heating. While the material parameters of the antenna components can generally be observed as constant during ablation, the material properties of the healthy tissue and tumor are temperature (time) dependent. Tumor shape is patient-specific, so a general approach with a spherical or static tumor model is not accurate. The water concentration in the tissue changes with increasing temperature, which effectively changes the physical properties of the tissue.

Keywords: Multiphysics, microwave balation, tissue.

Abstract

Microwave ablation is a medical procedure that uses high-frequency electromagnetic waves to create heat and destroy abnormal or cancerous tissue in the body. It is a minimally invasive alternative to surgery that is often used to treat liver, lung, kidney, and bone cancer, as well as other conditions such as benign tumors, nodules, and cysts. Microwave ablation is generally considered a safe and effective treatment option for certain types and stages of cancer. It is often performed on an outpatient basis, which means that patients can go home the same day as the procedure. However, like any medical procedure, there are some potential risks and side effects associated with microwave ablation, such as pain, bleeding, infection, and damage to nearby organs or tissues. Patients should discuss the benefits and risks of this treatment with their healthcare provider before deciding whether it is right for them. For this study, the finite elements method (FEM) is used to solve coupled electromagnetic-field and heat-transfer equations, including all details of multislot antenna design and properties of healthy and tumoral tissue. The obtained simulation results reveal that precisely localized heating distributions and heating effectiveness can be achieved by using a multi slot antenna probe than a single slot antenna.

Keywords: finite element, multislot antenna, microwave ablation

PROGRESS IN THE DEVELOPMENT OF CASSAVA-BASED INSTANT NOODLE FOOD

Onyeka Stanislaus OKWUNDU

Science and Engineering Unit, Nigerian Young Researchers Academy (NYRA), Awka Road,
430231, Anambra State, Nigeria.

E-mail: onyeka.okwundu@eng.uniben.edu

Abstract

Across the globe, instant noodle is one of the most patronized quickie foods. Ideally, noodles are made from wheat, a gluten-rich grain that is linked to type 2 diabetes, obesity, and some other wheat-related disorders. Unfortunately, the same wheat protein (gluten) behind wheat-related disorders is responsible for the unique sensory qualities of wheat-based baked foods and noodles. In pursuit of wheat/gluten-free foods, cassava, a relatively cheap root tuber, has garnered much interest. This study presents recent progress in cassava-based instant noodle food development. A mixture of cassava flour and water does not yield a malleable matrix; hence, a method of preparing whole-cassava dough was discussed. While most reports are focused on improving the nutritional composition of the carbohydrate-rich cassava-based noodle via fortification, the major bottleneck remains the relatively poor sensory qualities of cassava noodles. Although more appealing cassava-based noodles could be made by compositing cassava and wheat, such foods compromise the “wheat/gluten-free” content. For the unappealing cassava-based features, I concluded the study with some future perspectives. I hope this could pave the way for the development of other cassava-based food products.

**DEVELOPMENT OF PHONOLOGICAL ABILITIES AT THE PRESCHOOL AGE
EDUCATION IN THE NEW WORLD**

Abstract

Numerous studies indicate that phonological abilities are one of the most important factors in children's reading adoption, so it is important to encourage them. The paper presents action research in Preschool institution "Plavi Chuperak" in Serbia, an initial research aimed at determining the development of phonological abilities in preparatory preschool groups. The sample was 100 children tested individually with a test of phonological abilities - FONT 2.1. (51% boys) average age of 6.5 years. The results indicate that almost all children have a developed ability to segment syllables, over 70% and to rhyme and identify the initial phoneme, while 45% of children successfully identifying the final phoneme. In half of the children, the ability of voice analysis was developed, the ability of phonemic substitution developed less than 40% of children, and the elimination of the initial phoneme less than 20% of children. The results confirm that non-phonemic abilities develop earlier, and that phonemic analysis, which are directly related to the adoption of reading in the largest number of children, develop in the year before starting school. It is important to work in a partnership with parents and the school on encouraging phonemic segmentation, initial phoneme elimination, and phoneme substitution so that children are ready to acquire initial reading.

Keywords: phonological abilities, reading adoption, prompting, partnership, transition

**SERBIAN ORTHODOXES AND GREEK PHANARIOTS UNDER OTTOMAN
TURKISH RULE AN THE BALKANS IN THE 16-18 CENTURIES**

Research Fellow. Dr. Sándor FÖLDVÁRI (Orcid ID: 0000-0002-7825-0531)

Debrecen University, Faculty of Humanities, Hungary

E-mail: alexfoldvari@gmail.com

Abstract

There is a common misconception that the Serbs fled the Balkans because the Ottoman Muslim occupiers did not allow them to practice their Christian culture, but it is not true. The Church Slavonic liturgy, understood by Serbian believers, was not destroyed by the Turkish invaders but became impossible with the advent of the elite of the Greek Phanariots. As highlighted in the classic monograph on Serbian history by English scholar Temperley, following the author of Balkan history by Jireček, the rule of Greek Phanariots in monastic schools made it impossible to write the Cyrillic alphabet in Slavic, and they denied the usage of the Church Slavonic Liturgy. (Temperley, 1917: 123, 163-166. Jireček, 1876. 466-467.) In the Ottoman Empire, Greek priests held ecclesiastical power in their hands, because the patriarch of Constantinople was the head of all Christians. The Turkish Sultan appointed him the head of the Christian “millet”. The millet system is well-known to those who have studied the history of the Ottoman Empire. (Karpát, 1982, 1997) Islamic practice did not prohibit the “peoples of the book” from practicing their religion if they paid proper taxes. The Orthodox (Byzantine) church had a well-established administration when the Turks conquered the Balkan peoples. Therefore, it was advantageous that the secular head of the Christian millet became the parochial leader. But in the seventeenth century, the wealthy and educated Greek bourgeoisie, named after the Phanar (Lighthouse) part of Istanbul, seized both economic and administrative power over all Christians under Ottoman rule and even corrupted the patriarch together with the entire church. Ecclesiastical positions were the object of sale in the Greek-dominated Balkan clergy, and the largest amount of corruption money had to be paid for the highest rank, that of the patriarch. The rich Greek Phanariotes hated the Slavic peoples, thus the Serbs and Bulgars. As a Balkan historian, Constantin Jireček wrote in his monograph, The Greek Phanariots did not allow Serbs to use the Church Slavonic language, only Greek, and Slavic liturgical books and manuscripts were even lit. The Turkish Sultan's goodwill was shown by the fact that the soldier of Serbian origin, Sokolović, could rise to the highest rank, and by the name of Mehmed Sokollu, converting to Islam, he became the Grand Vizier of Suleiman the Magnificent and helped his Serbian brother, who remained Christian. It was he, the Grand Vizier Sokollu Mehmed, who re-established the Serbian Orthodox Christian Patriarchate in Peć in 1557 and appointed his brother as patriarch. Serbian Grand Vizier, who was the second person after the Sultan, had good opportunities to provide his Christian Serbs. Sulejman the Magnificent is known in Roman Catholic historiography as a Cruel Conqueror, albeit he was a great statesman thus under his reign the great Empire worked by a good administration. Thus nothing repression and ruination went by the Turks but by the Greeks. Islam never burned books anywhere, because it honored the

Peoples of the Book. But, on the other hand, the Greek Orthodox Christian priests burned the Serbian temple books, because they persecuted the Slavs. This was one of the reasons why Serbs fled to the Kingdom of Hungary and were free to practice their religion there. Therefore, the Serbs bought Slavic liturgical books in the territory of the Kingdom of Hungary, and by this time they had already acquired them from the Ukrainian territories. The author of the paper is a researcher of the migration of books between the Polish-Lithuanian Commonwealth and the Serbs, thus he studied the situation of the Serbian culture in the Balkan and In the Hungarian Kingdom and has already published several papers about the Serbs purchasing their Slavic books from the Eastern Slavic lands while on the Balkans their situation became sad. (Földvári, 2014, 2022).

Keywords: Serbs, Balkan, Phanariots, Book-culture, Orthodoxes, Ottoman_Empire.

Abstract

This paper aims to determine a relationship between the attitudes and willingness of young consumers to promote sustainable consumption (accordingly to the expectations of the Sustainable Development Goal 12 of the United Nations Agenda 2030 and its targets) and their behaviour in practice. In this sense, research studies suggest an increasing tendency towards sustainable consumption as well as producers are conscious on it. Thus, the use of sustainability claims and logos to publicize their initiatives has become a common practice up to the extent that quite a percentage of the population indicates that there is an overinformation making hard to differentiate a label that certifies the positive impact of a product of a mere (or totally empty) claim. This circumstance, which is also mentioned in the Proposal for a Directive on Green Claims in the European Union, generates a feeling of confusion and reduces the effectiveness of 'true' seals, then questioning the role of consumers and brands to be part of the active solution to face the current environmental challenges. On this basis, an experimental study was conducted to test the perception of sustainability labels and certificates by young consumers. Specifically, a sample of 24

individuals were involved in a neuromarketing experiment with eye-tracking. While the members of the experimental group received a previous training on sustainability labelling (concrete pieces of information on the purpose and types of labels, together to some 'tips' to differentiate between 'real' labels and commercial 'empty' claims), the members of the control group did not. Then, members of both groups faced three options of a same product (chocolate), including either a formal eco-label, a commercial claim or nothing in their package, and they were asked to choose the sustainable option. The eye-tracking software collected information on the time that subjects used in their decisions as well as the times they stared at each one of the alternatives. The results obtained suggest the influence of training in consumers when taking their decisions on the sustainability of products, as those individuals who had received a previous training on labelling required less time to locate the elements which could effectively help them to make their purchase decisions, as well as they devoted more time and stared more times at formal eco-labels when compared to informal claims. As a consequence, the need to complement the information of sustainability issues with a prior training that allows consumers to distinguish those elements that really provide useful information is concluded, as well as the convenience of simplifying the information provided, accordingly to the intentions of the aforementioned Proposal for a EU Directive.

Keywords: sustainable development; responsible consumption; environmental labelling; sustainable purchasing; neuromarketing; eye-tracking.

**THE BENEFITS OF MINDFULNESS IN TEACHING ENGAGEMENT FOR
TEACHING EFFECTIVENESS: A LITERATURE REVIEW**

Lien Thi Kim PHAN, MSc.
Nha Trang University, Vietnam
E-mail: phankimlien@ntu.edu.vn

Abstract

Teaching effectiveness is directly related to the level of engagement teachers put on the teaching process, but building and maintaining the engagement is a challenge for educators. One suggested effective tool to support teaching engagement in the classroom is to train teachers mindfulness skills. This review outlines some of the major benefits of mindfulness on teaching engagement to improve teaching effectiveness. We used the Consensus search engine to find the most relevant scientific papers on the topic, by asking the questions "Does mindfulness improve teaching engagement?" and "Does teaching engagement improve teaching effectiveness". The responses highlighted were assessed to select the most relevant papers. We then used Google and Google Scholar search engines to access the full text version of the studies. Overall, mindful teachers are better at keeping students engaged in the learning purposes and learning process; engaging with students; and providing a supportive teaching environment, all factors leading to a better teaching effectiveness. In conclusion, mindfulness is very helpful in keeping the teachers focused on those factors contributing to the effectiveness, but also in recognizing their distracted moments and guide themselves back to these factors. We suggest that to improve teaching effectiveness through mindfulness, educators should be trained in mindfulness to experience the benefits on a personal level and apply it in the classroom and attend to conferences on the potential of mindfulness on education effectiveness.

Keywords: mindfulness, teaching engagement, teaching effectiveness.

**SEMI-NUMERICAL ANALYSIS OF MHD BOUNDARY LAYER FLOW OF A CASSON
FLUID OVER AN EXPONENTIALLY SHRINKING SHEET VIA COLLOCATION
TECHNIQUE USING SHIFTED CHEBYSHEV POLYNOMIALS**

Akash GORAVAR

Department of Mathematics, Rani Channamma University, Belagavi, Karnataka-591156, INDIA

Abstract

The analysis of magnetohydrodynamic (MHD) boundary layer flow of non-Newtonian Casson fluid over an exponentially shrinking surface has been carried out. The appropriate similarity transformations of exponential kind, transforms the governing equations into a nonlinear ordinary differential equation and it is numerically solved through semi-numerical technique viz. Shifted Chebyshev Collocation Method (SCCM). The influence of various parameters such as magnetic parameter, suction/injection parameter, and Casson fluid parameter describing the flow characteristics on velocity profiles are studied. The obtained results are presented through graphs and table, which are in well agreement with previous findings.

Keywords: Casson fluid, MHD, Shifted Chebyshev polynomial, Collocation method.

**MULTIGRID METHOD FOR THE SOLUTION OF THERMAL
ELASTOHYDRODYNAMIC LUBRICATION POINT CONTACT PROBLEM WITH
SURFACE ASPERITIES**

Abstract

In the present paper, the numerical solution of thermal elastohydrodynamic lubrication (EHL) point contact problem with surface asperities is analysed. The effect of the temperature and surface roughness on the fluid film thickness is studied in detail. The governing equations comprises Reynolds, film thickness, load balance and energy equations with appropriate boundary conditions. The second order finite difference approximation is used to discretize the governing equations. Multi level multi integration technique is employed to solve the film thickness equation. Multigrid V-cycles is employed to solve the resultant non-linear algebraic equations with FAS technique. The obtained results are illustrated in the form of graphs and tables which are comparable with earlier findings. The film thickness profiles shows dimple near to out let region due to temperature-viscosity wedge mechanism. Isothermal minimum film thickness is higher than the thermal minimum film thickness. Minimum film thickness is much smaller when slide to roll ratio is positive than compared to negative, whereas the central film thickness behaviour is contrast to that of minimum film thickness.

Keywords: EHL, Multigrid method, FAS, Thermal, Slide to roll ratio, MLMI.

**POST-PANDEMIC TIMES OF COVID-19 AND ROLE OF LIBRARIES: A STUDY OF
GOETHALS INDIAN LIBRARY AND RESEARCH SOCIETY; KOLKATA**

Abstract

In the post-pandemic situation both the factors; library services and the user behavior are being changed. In the adverse situation of the Covid -19 pandemic, people picked up much more competitive ways of survival, where libraries are no different. As a result, online library services demanded a different panorama, like digitized documents, e-books, e-journals, and different other resources at the remote end of every user at their perusal. All the academic libraries attached to higher education and research institutes, IITs, IIMs, Medical Institutes, Engineering Institutes and Law Institutes made themselves more suitable to serve the users with the latest online technologies. Besides this library professionals managed to be trained to fulfill the contemporary needs related to information provision at the desk of library services. In this paper, the discussions are made on Goethals Indian Library and Research Society, Kolkata. The library has preserved rare documents and archived documents for the research need of scholars. The study will reveal the services of this library and how far it is acquainted with to deal current situation, especially the combating capacity in a pandemic situation.

Keywords: Pandemic, library and post-pandemic situation, research need and archive, digital preservation of rare document in digital mode, library services, librarian and their role

**CHALLENGES OF CURRICULUM REFORM IN THE CANTON OF SARAJEVO,
BOSNIA AND HERZEGOVINA FROM PARENTS' PERSPECTIVES**

Prof. Dr. Mersiha KOLČAKOVIĆ
Herzegovina University, BiH
E-mail: k.mersiha@gmail.com

Mr. Sc. Mirela VASIĆ-HADŽIHALILOVIĆ
Herzegovina University, BiH
E-mail: daliahadzi911@gmail.com

Abstract

Education sector in Bosnia and Herzegovina is much decentralized and it is organized autonomously on a state, entities and cantons' levels. Nevertheless, one of the biggest and financially strongest cantons, the Canton of Sarajevo, has engaged in curriculum reform as a way to equip students with the knowledge, skills and competences needed for today's fast-changing world. However, how to initiate such change both, in this canton and wider within BiH in the most suitable and effective way remains somewhat challenging not only for teachers, but also for parents. Each parent that thinks a great deal about the future of their children should seriously reconsider all the aspects of a new curriculum and ask themselves if they would wish their child to grow up and live in a modern, educated and technologically advanced society. Therefore, the aim of this article is to do a research on parents' perspectives what their roles would be in curriculum reform. The research is conducted on the sample of 150 parents whose children attend pre-school institutions (50), primary schools (50), and high schools (50). The results of the research show that parents do not have a clear picture of what the curricular reform means and that they should be more involved into educational process of their children. Due to that, it is necessary to achieve better connection between school and family, the one that will contribute to better implementation of the curriculum.

Keywords: curriculum reform, the role of parents

APPLICATION OF INTELLIGENT SYSTEMS IN THE DESIGN OF PRODUCTION SYSTEMS

Alexandrov V.S.

Postgraduate student, Kazan National Research Technical University named after A.N. Tupolev,
REIMT department
E-mail: bridgelin2@yandex.ru

Abstract

The main difficulty in training intelligent systems is an insufficient data set. Let's focus on a specific example. Let there be a task of ensuring fire safety at the enterprise through the introduction of intelligent systems. The main difference between such systems and conventional sensors is the ability to make decisions independently depending on the situation and the current situation. To do this, the system must be properly trained. It must clearly understand what a fire is, what its main signs are, so as not to confuse it with ordinary smoke. The mistake of such a decision-making will cost a lot of material costs. It is necessary to talk about the rationality of the use of intelligent systems in the enterprise. The advantages include high measurement accuracy, the possibility of retraining the system when the location changes, the analysis of many factors affecting the safety of technological production. In addition, the intelligent system can be integrated into a network of intelligent systems that will simultaneously control many parameters and cover a large area. For example, it is possible to install intelligent fire safety sensors, temperature, pressure and humidity control of the room; monitor the concentration of harmful substances in the production process. Based on a comprehensive assessment of all factors of production, the intelligent system will conclude that the working environment at the enterprise meets the required standards. In case of violation of these conditions, the data will be transferred to the appropriate services, and special measures will be taken against enterprises that violate the established legislation. This will protect the life and health of employees.

**ANALYSIS OF GENERALIZED BESSEL-MAITLAND FUNCTION AND ITS
PROPERTIES**

Talha USMAN

Department of General Requirements, University of Technology and Applied Sciences, Sur-411,
Sultanate of Oman

E-mail: talha.sur@cas.edu.om

Abstract

In this paper, we present the generalized Bessel-Maitland function (EGBMF) by using extended beta function and obtain some interesting properties of it. Then, we show interesting relationships of this function with Laguerre polynomials and Whittaker functions. Further, the Mellin transform of this function is evaluated in terms of generalized Wright hypergeometric function and Euler transform is also evaluated. Finally, we used the Gaussian quadrature and Laguerre-Gauss quadrature method to derive several graphical representations and it was shown that the numerical and theoretical simulations are consistent. Besides, the derived results are applied to find potentially useful in several fields notably physics, applied mathematics and engineering.

Key words: generalized Bessel-Maitland function, extended beta function, fractional derivative, Mellin transform, Laguerre polynomials, Whittaker functions, Wright generalized hypergeometric functions

Abstract

The study examines Entrepreneurship Education and Human Capital Development with particular reference to the state universities students in South-East, Nigeria. Specifically, the study examines the relationship between Curriculum content, Content knowledge, Content Delivery, Skill Acquisition, Infrastructural development as the independent variable and human capital development as the dependent variable. The study anchored on Social Cognitive theory by Bandura (1978) and Human Capital Development theory by Robert (1991). the study adopted descriptive survey research. The area of the study covered the South-East, Nigeria. The population of the study comprises 1325 final year students of Accountancy and Business Administration Department of the state universities in the South-East, Nigeria. Mathematical formular devised by Taro Yamane was used to ascertain the sample size at 307. Data were sourced through both primary and secondary sources. Primary data were generated through the use of structured questionnaire on a five-point likert scale. Data generated were analyzed using descriptive statistics such as simple percentages and mean for presentation of data while inferential statistics involving Pearson Product Moment Correlation Coefficient was used to test hypotheses. From the analysis, the study revealed that; curriculum content, content knowledge, content delivery and skill acquisition have positive and significant relationship with human capital development while infrastructural development has no significant relationship with human capital development. The study concluded that entrepreneurship education has a positive significant relationship with human capital development.

Based on the findings, the study recommended that; Entrepreneurial curriculum should be designed in such a way that it will contain the vital topics that translate to achieving entrepreneurial success. The lecturers of entrepreneurship education should possess adequate and full knowledge of the course contents embedded in the curriculum that will enable them to impart into the students the right entrepreneurial spirit. Universities authorities should ensure a “fit” in the recruitment of entrepreneurial education lecturers. Tutors and lecturers of entrepreneurship education should possess the right teaching methods that will encourage and promote innovative behaviours in budding entrepreneurs. Students should be equipped with entrepreneurial skills that will enable them to become job creators instead of job seekers after graduation. Basic infrastructural facilities should be provided by the institution to enhance entrepreneurial education and training

**DESIGN A HORIZONTAL AXIS WIND TURBINE BLADES BASED ON INSPIRATION
OF BIOMIMICRY FOR WHALE TUBERCLES**

Dr. Ziad Shakeeb Al SARRAF (Orcid ID: 0000-0001-9957-4386)

Department of Mechanical Engineering, Faculty of Engineering, University of Mosul, Mosul,
Iraq

E-mail: ziadalsarraf@uomosul.edu.iq

Abstract

Wind speed is the major factor in generating power in a wind turbine. However, due to the non-optimum and redundant design of wind turbine blades, not nearly enough wind is captured for utilization. In the present study, modifications were done on the leading edge of the HAWT blade using tubercles showing their effects on aerodynamic performances. From this research, the following results found with respect to the performances of HAWT with leading-edge tubercles were that; blades with tubercles on the leading edge will have superior performance in the post-stall regime by 35 %, tubercles with a smaller amplitude and lower wavelength will produce higher lift and lower drag in the low wind speed condition, and tubercle blade will have a stable and smooth performance in varying wind speed conditions, producing higher torque and power at low wind speed. Using a small wind turbine model, Solid Works Motion Analysis Simulation was used for dynamic modeling to evaluate and determine the force and torque of the mechanical structure. These results were compared and examined using standard wind turbine blades which showed an improvement of 48% in efficiency.

Keywords: wind turbine BLADE, tubercle blade, horizontal-axis wind turbines, biomimicry, analysis simulation

SEPARATION AXIOM IN TOPOLOGICAL SPACES

Abstract

In this paper, six exciting new spaces like space, $g_s T_{\alpha J^{**}}$ -space, $g T_{\alpha J^{**}}$ -space, $\alpha J^{**} T_{\delta}$ -space, $g_{\delta} T_{\alpha J^{**}}$ -space, $\pi_{gp} T_{\alpha J^{**}}$ -space are introduced and the independence of these new spaces with other existing separation axioms are analysed.

**USING MACHINE LEARNING TO PREDICT MENTAL HEALTH TRENDS POST
COVID-19 PANDEMIC IN CONFLICT SETTINGS**

Tawseef Ahmad (Orcid ID: 0000-0002-3551-1594)

Bharat Institute of Engineering and Technology, Mangalpally(v), Ibrahimpatanam, Hyderabad,
501510

E-mail: mtechnb@gmail.com

Dr. Mahesh Lokhande

Bharat Institute of Engineering and Technology, Mangalpally(v), Ibrahimpatanam, Hyderabad,
501510

Abstract

The COVID-19 pandemic has had a substantial influence on mental health worldwide, disproportionately affecting some of the most vulnerable people, like those who live in conflict zones. In this situation, utilising machine learning to forecast mental health trends can give policymakers and medical experts a useful tool to better comprehend and care for the mental health requirements of persons living in conflict zones. In order to forecast changes in mental health following the COVID-19 pandemic in conflict areas, this study will employ machine learning algorithms. The study will train the machine learning algorithms using data from prior conflicts as well as data gathered during the COVID-19 pandemic. A wide range of variables will be included in the data, including demographic details, social and economic characteristics, and access to healthcare services. In order to forecast post-pandemic mental health patterns in conflict zones, machine learning algorithms can be used. Large and complex datasets can be handled via machine learning, which can also be used to make accurate predictions and spot patterns and trends that conventional statistical analysis would miss. The study's findings will shed important light on the mental health requirements of people residing in conflict areas, which can help in the creation of efficient treatments and regulations to aid these populations. However, this strategy has its drawbacks as well. Algorithms for machine learning rely on the quality and quantity of data that is readily available, which may be scarce in areas of armed conflict. The application of machine learning to forecast mental health outcomes also poses ethical questions, such as the necessity to safeguard patient privacy and the possibility of prejudice. In order to gain a deeper knowledge of the complex aspects influencing mental health in conflict zones, machine learning algorithms can also be used to spot patterns and trends that may not be immediately obvious through traditional statistical research. With a more sophisticated and data-driven approach to assessing and addressing the mental health needs of persons residing in conflict zones following the COVID-19 pandemic, this study has the potential to significantly advance the field of global mental health.

Abstract

India has imposed a nationwide lockdown in March 2020 in order to stop the spread of the coronavirus. From March 23 through June 30, 2020, a nationwide lockdown was implemented in stages, with services restarting on June 8, 2020, in a staged manner known as Unlock. Prior to lockdown, during lockdown, and after lockdown, this study was undertaken in Nashik, India, to monitor and measure air quality and the Air Quality Index (AQI). Data was acquired from the Central Pollution Control Board (CPCB), Ministry of Environment, Forest and Climate Change, Government of India's Online Air Quality Index dissemination website for the Nashik-MPCB Air Monitoring Station. The concentration and status of PM 2.5, PM 10, NO₂, NH₃, SO₂, CO, Ozone, and the Air Quality Index (AQI) were measured from January 1st to December 31st, 2020. During the nationwide lockdown, air pollution and AQI in Nashik city decreased considerably, but concentrations of air pollutants and AQI began to climb during the post-lockdown period, according to this comparative analysis. According to the data, India's nationwide lockdown had a positive influence on air pollution and the AQI in Nashik

**ACHIEVEMENT OF A FAVOURABLE BALANCE OF PAYMENT: THE ROLE OF
MONETARY POLICY IN NIGERIA**

Habeeb Olaniyi OLAYIWOLA

Department of Banking and Finance The Federal Polytechnic, Ilaro

E-mail: habeeb.olayiwola@federalpolyilaro.edu.ng

Abstract

This study investigated the nexus between monetary policy and balance of payment in Nigeria for the period of 32years (1990-2021). The data such as monetary policy rate, exchange rate, inflation rate and net balance of payment figures were culled from the Central Bank of Nigeria (CBN) statistical bulletin. The data were analyzed using descriptive statistics, correlation analysis, Autoregressive Distributed Lag (ARDL) and error correction model via Eviews 9. The study found the existence of short run relationship between monetary policy variables and balance of payment in Nigeria. Similarly, the evidence of long run connection between monetary policy and balance of payment was proven in the study as reported by ARDL bound test. Among all the regressors, only inflation rate has no significant influence on balance of payment over the short and long runs. Hence, the result of Error Correction Model (ECM) is negative and significant at -1.196. This confirmed the correction of short run disequilibrium in the long run at 119%. The study concluded that moderate monetary policy rate and stable exchange rate are the main ingredients of achieving favourable balance of payment in Nigeria. It was therefore suggested among others, that government should embark on efficient and effective expenditure switching policy or devaluation of currency (Naira), as devaluation of the country's currency could make exports cheaper and imports more expensive, thus, leading to a favourable balance of payments position in the country.

Abstract

The present study has carried out to understand the scenario and status of Bioremediation of spills. Bioremediation is one of the most promising technology to the problem of hazardous waste, which relies on microorganisms such as bacteria and fungi like *Vibrio*, *Aspeergillus*, etc. to transform hazardous chemicals into less toxic or non toxic substances. In the recent years, we are frequently heard about the oil spills which has attracted the environmentalist to control its impacts on the most of the marine organisms, seabirds, filterfeeders. This review paper is designated to overview and compares the role of microbes in bioremediation for oil spills. An oil spill can be caused by breakdown of equipments such as pipelines, mistakes done by people or by their carelessness, natural disaster such as hurricanes and also deliberate actions by terrorists, countries at war, vandals or illegal dumpres. Use of microorganisms is preferd because they directly degrade contaminants rather than transferring them from one medium to another, employ metabolic degradation pathways and can be used In situ to minimize disturbance of the cleanup site. Bioremediation of oil spills can be approached by two ways depending on the case, this includes bioaugmentation which involves introducing oil degradation microorganisms to the affected site, and also biostimulation which involves adding supplemental nutrients to the affected site to aid the existing oil degradation microorganisms. Secondary data has been collected and extracted from the quality research articles published in reputed research journals. The result of the present study shows the adverse impact of oil spills and their management with the help of using technology Bioremediation.

Keywords: Bioremediation, Oil spills, Bioaugmentation, Biostimulation, Oil degradation microorganisms

Abstract

As we are currently going through various global environmental issues which are making adverse impact on living health and economy at large. Environmental education helps students understand how their decisions and actions affect the environment, builds knowledge and skills necessary to address complex environmental issues, as well as ways we can take action to keep our environment healthy and sustainable for the future. India is in the phase of implementing New Education Policy 2020 (NEP 2020) with many drastic changes in the entire education system in the country. Present study has carried out with the aim of understanding and making systematic review of how India is considering environment education and its implementation through New Education Policy 2020. The systematic study of NEP 2020 has been made in present study with focused on environment education right from primary level to higher education system. The data has been extracted from government published NEP 2020 draft, documents, notifications and research articles. It has been found that India is considering environment education seriously in entire education system by NEP 2020. This study also highlighted some importance aspects of environment education in NEP 2020 and its proper implementation to achieve environmental sustainability goals.

Abstract

Indanedione structural motifs are widely distributed in natural products, pharmaceuticals, and functional materials. In particular, They present diverse biological applications by acting as pharmacophores and by providing useful scaffolds for the rational designing of pharmaceuticals deliberated at diverse biological targets. The goal of the current research is to create drug-loaded silver nanoparticles with an anticoagulant 2-phenyl-1,3-indandione, as well as to investigate their biological activities. Among different metallic nanoparticles developed so far, nanoparticles of silver have been the most anticipated, due to their diverse applications in the fields of electronics, environmental remediation, electrochemistry, and biomedicine. Antimicrobial and antifungal activities are the most investigated biological properties of silver nanoparticles. A simple procedure for green synthesis of galactose-assisted silver nanoparticles as an anticoagulant-loaded system was reported. Research in the field of green synthesis of nanoparticles continues to expand because of the abundance of biomaterials in nature, which are a potent source of organic reductants for the

eco-being production of nanoparticles. Analytical techniques like ultraviolet-visible spectroscopy (UV-Vis), X-ray diffraction (XRD), spICP-MS, and transmission electron microscopy (TEM) were used to analyze the production, crystallinity, and morphology of bio-reduced silver nanoparticles. The drug-release properties of the synthesized nanoparticles were investigated, as well. The antibacterial study was performed by following the standard disc diffusion method. These green synthesized silver nanoparticles were found to have potent antibacterial, and anticoagulant properties which make them an attractive choice for future medical applications.

Keywords: silver nanoparticles, green method, galactose, indandiones, anticoagulant, antimicrobial

MODERN PREVENTION OF RELAPSES OF GASTRODUODENAL HEMORRHAGE

P.H. NAJAFGULIYEVA

II Department of Surgical Diseases, Scientific Surgical Center named after Topchibashev
E-mail: parvindr@hotmail.com

I.N. GASIMOVA

II Department of Surgical Diseases, Scientific Surgical Center named after Topchibashev

Abstract

Introduction The solution of the problem of effective treatment of gastroduodenal hemorrhage of ulcer origin remains a topical issue in modern surgery. At present, the incidence of gastroduodenal hemorrhage continues to be high, 7.4-16%, lethality 13-15%. Such a high percentage requires new research in the treatment and prevention of gastroduodenal hemorrhage. **The aim of the study** is to improve the results of complex treatment and prevention of gastroduodenal hemorrhage of ulcer origin. **Materials and methods** During 2013-2021, 410 patients diagnosed with gastroduodenal hemorrhage of ulcer origin were under our supervision at the City Clinical Hospital No. 5. Of the patients, 110 were women and 300 were men. The age range of patients was 20-80. hemorrhage from gastric ulcer in 102 patients, bleeding from 12-finger intestinal ulcer in 308 patients. In these patients, the diagnosis was made by emergency fibroesophageal gastroduodenoscopy, hemostatic in the complex treatment of patients (aminocaproic acid 100ml x 3 times intravenously, dision 2ml x 4 times intramuscularly, transamine 5ml x 2 times intravenously, kleston 5ml x2 times histamine, H-histamine H) blockers - ranitidine 50 mg x 3 times, kvamatel 20 mg x 2 times or proton pump inhibitor (pantoprozole - 30 mg intravenously x 1 time), infusion-transfusion (erythrocyte mass, plasma, protein preparations, etc.), antihelicobacterial (clarithromycin 0,5 x 2 times, amoxicillin 1.0 x 2 times) were used in the treatment. In the majority of patients receiving this treatment regimen, the acute period was eliminated, and the bleeding was stopped quickly. In 55 patients, endoscopic hemostasis (coagulation + sclerotherapy) was performed because the bleeding continued and conservative treatment was ineffective, thus stopping the bleeding. In 12 patients, due to the continuation of profuse bleeding, even if endoscopic hemostasis is performed, there is a high probability of recurrence of bleeding, emergency surgery was performed, and the bleeding vessel was closed. **Conclusion** In the majority of patients receiving the above treatment regimen, the acute period was eliminated, the bleeding was stopped quickly. Due to the continuing bleeding and the high probability of recurrence of bleeding, even if endoscopic hemostasis is performed, emergency surgery was performed. According to our observations, the complex treatment of gastroduodenal hemorrhage with modern drugs is a convenient method, which allows to quickly eliminate the bleeding, to quickly stop the acute period, to discharge patients from the hospital as soon as possible. In addition to diagnosing gastroduodenal hemorrhage, endoscopy examination also stops the bleeding by endoscopic hemostasis for therapeutic purposes, thus significantly reducing the risk of surgery.

**COUNTERFEIT BRAND SHOES AND PURCHASE INTENTION IN VIETNAM – IS
MORALITY FACTOR SIGNIFICANT ENOUGH TO MITIGATE THE PROBLEM?**

Hoai T. BUI

Nha Trang University, Vietnam

E-mail: hoaitb@ntu.edu.vn

Abstract

Counterfeit fashion products are common in Vietnam, both on online and traditional retailing platforms. Despite several strict actions from the government, this phenomenon still carries on and leads to detrimental effects on genuine fashion brands. While top-down regulations and rules may not fully respond to the problem, inducing actions from customers might be considered. Examining the issue from the perspective of consumption, the research aims at identifying and analyzing factors influencing purchase intention of Vietnamese consumers, focusing specifically on counterfeit brand shoes. A model was established on the basis of theory of planned behavior (TPB) with an emphasis on factors relating to attitude towards purchase intention and how morality was relevant to the issue. The study adopted the exploratory factor analysis method prior to two regression models for six independent variables including price, perceived value, attitude, morality, subjective norm and perceived behavioral control. Descriptive statistics, reliability statistics and one-way ANOVA were also used. The first regression was carried out to examine how perceived value and price affected attitude, which is a vital variable in the second regression model, and indirectly influenced the dependent variable of purchase intention. In the second regression model, three major variables in the TPB model and morality were captured to identify their magnitudes in the purchase intention. A sample of 163 valid respondents was collected. All technical data analysis was performed via SPSS. The results show that perceived value and price have a positive significant relationship with consumers' attitude towards counterfeit brand shoes, and, indirectly leading to an intention to purchase them. As expected, morality is negatively significant in the second model but its magnitude is the least among independent variables. In general, consumers' overall feeling towards counterfeit products is the most important factor in inducing purchase behaviors. Comparing to authentic shoes, Vietnamese consumers opt for counterfeits due to favorable price and perceived value that a pair of fake shoes can bring to them. The study contributes to the literature of purchase intention to counterfeits and points out possible implications on solving the problem.

Keywords: purchase intention; counterfeits; counterfeit shoes; perceived value; morality

NEW CLASSIFICATION USING NLP TECHNIQUE

Abstract

eNews is the most readable content in current world and reading the news is common in everyday life. In the current paper we will observe the implementation of a news system that will be making a classification of the news based on the content present in the news article. The approach used is a Novel approach in the field of Artificial Intelligence. We will be making a usage of the area called Natural Language Processing to Deal with the Problem addressed. The Language used for implementation is indeed Python. Python is the tool on which the entire development of the application is made. The accuracy value obtained in the current work is very electrifying and we are making the best out of it. The Algorithm used is a Novel and a versatile one.

Keywords: Algorithm, NLP, AI, ML, Python.

GENETIC DIVERSITY OF MEDICINAL PLANT (*Euphorbia resinifera* O. berg) USING MORPHOLOGICAL TRAITS AND ISSR MARKERS

Sultan Moulay Slimane University, B.P. 523, Beni Mellal, Morocco

Abstract

To evaluate the genetic diversity of *Euphorbia resinifera* O.Berg using ISSR markers. 12 natural populations were chosen from its geographical area of and analyzed. Using 14 ISSRs primers generated 101 polymorphic bands corresponding to a percentage of polymorphism nearly 80%. This high percentage of polymorphism suggests that there is an important genetic diversity in this melliferous and medicinal species in Morocco. While the mean of I and Ht indicates that there is a high genetic diversity in this species. Thus, the high values of PIC and Rp parameters show that the ISSR primers are very informative and effective to analyze the genetic diversity of *E.resinifera*. The results of the AMOVA showed that the high degree of variability is present within population. The high value of FST suggest that the studied populations are highly differentiated in agreement with very limited gene flow between each population. Additionally, the genetic structuring of populations into two groups obtained from UPGMA and Structure analysis revealed a dependence on the geographical origin of the populations. The data obtained will be useful to define conservation strategies and improvement programs of this melliferous and medicinal species.

Keywords: *Euphorbia resinifera*; genetic diversity; medicinal; ISSR; polymorphism; Morocco

Abstract

Air Quality Index (AQI) forecasts the future pollution levels and how harmful the current air is. The health risks that may be a result of the air quality are also explained by the AQI. Specifically, it examines the short-term health risks associated with breathing polluted air. This study carried out to monitor and assess the current scenario of Air Quality Index (AQI) in selected cities of India to understand how much air quality is polluted across the country. Data has been executed from Online Air Monitoring Stations located in selected cities in India. The concentration and status of PM 2.5, PM 10, NO₂, NH₃, SO₂, CO, Ozone and Air Quality Index (AQI) has been assessed for the month of 1st January 2023 to 31st March 2023. The AQI in the cities that were compared in this study increased within the time frame that was examined. According to the findings, the air quality in India is deteriorating as a result of the release of several air pollutants into the environment.

**BLACK WOMEN REVOLT IN THE STRUGGLE FOR FREEDOM: AN
EXPLORATION OF TONI MORRISON'S FICTION**

Léa Blandine MBOUILOU NDOULOU

Doctor in American Literature (Denis Sassou N'guesso University - Republic of Congo)

E-mail: leablandinembouiloundoulou@gmail.com

Abstract

This research work about black women's contribution in the struggle for black freedom in America as dramatized in Toni Morrison's works. Drawing from the New Historicism and the sociological approach which allow enlighten a literary text within its socio-historical dimension, it purports to highlight strategies of revolt settled by black female characters against social injustices and discrimination in order to integrate the American society. The exploration of the selected narrative evidences the manifestations of black women's struggle for black freedom; a revolt related to the history of America with abolitionists like Harriet Tubman called by 'black Moses,' Harriet Jacobs, Rosa Park to quote only some. Being the most vulnerable for ages in the practice of slavery, black women revolted and involved themselves into concrete actions to claim not only their identity as black people but also the right to be considered human beings as white people in the American soil. To get rid of the white system of slavery, black women inner motivation of revolt has been expressed by the psychological awake allowing them to act for their identity and freedom. This study finally shows not only the involvement of black women in the struggle for black freedom, but also the black women power in conflict regulation testimonies of which are substantial in the history of America.

Key Words: Black women, revolt, freedom, discrimination, strategies, consciousness-raising

Abstract

Environmental pollution results when hazardous items, including chemicals, sewage, and waste materials, oil spills are dumped into the surroundings. The need to reduce pollution is very important since they have a direct impact on both humans and other living organisms. The only way how pollution may be addressed is by implementing better waste management procedures, enforcing restrictions on industrial and agricultural operations, raising public knowledge and awareness of the problem. Through this study, the determination of Cu (water; 0.029 mg/l and soil; 4.98 mg/kg) Fe (water; 0.712 mg/l and soil; 2.78 mg/kg), Mn (water; 0.033 mg/l and soil; 2.56 mg/kg), Ni (water; 0.039 mg/l and soil; 2.65 mg/kg), Pb (water; 0.241mg/l and soil; 4.98 mg/kg), Zn (water; 3.564 mg/l and soil; 5.62 mg/kg), As (water; 0.028 mg/l and soil; 0.028 mg/kg), Sb (water; 0.049 mg/l and soil; 0.041 mg/kg) and Cd (water; 0.089 mg/l and soil; 0.098 mg/kg) was made in soil and groundwater samples in the urban district of Pristina. From the results obtained, we are dealing with a higher concentration of water samples than the soil samples. Therefore, some water samples have exceeded the maximum amount allowed value, so they must go through the purification process before using them. The sampling was done during august of 2022. The experimental procedure was done by using Atomic Absorption Spectroscopy, (AA Spectrophotometer- S2 SERIES- AA System- Thermo Electron Corporation).

VIDEO FORGERY DETECTION USING K-MEANS CLUSTERING ALGORITHM

Vaibhav Kant SINGH (Orcid ID: 0000-0002-6776-9573)

Assistant Professor, Department of Computer Science & Engineering, School of Studies of Engineering and Technology, Guru Ghasidas Vishwavidyalaya, Central University, Bilaspur, Chhattisgarh, India

E-mail: vibhu200427@gmail.com

Abstract

There is significant role of digital images and videos in our daily life. Video is nothing but the collection of images or frames. Manipulating a video has become an easy task with the increased number of sophisticated forgery tools. However, image tampering has become very easy by using editing software's. Now a day image authenticity is a big concern. Image forgeries may have many types- such as copy-move forgery, splicing, and many more. Most widely used method to make forged image is copy-move forgery. It refers to copy one part from another image, and paste it inside same image. In the current work we will observe the Detection of forgery done by means of K-Means Clustering Algorithm.

PREDICTING HEART RISK LEVEL -MULTIVARIABLE LINEAR REGRESSION

Vaibhav Kant SINGH (Orcid ID: 0000-0002-6776-9573)

Assistant Professor, Department of Computer Science & Engineering, School of Studies of Engineering and Technology, Guru Ghasidas Vishwavidyalaya, Central University, Bilaspur, Chhattisgarh, India

E-mail: vibhu200427@gmail.com

Abstract

Heart Disease (CVD) is, for the most part, alluding to conditions that include limited or blocked veins that can prompt a heart attack, chest torment (angina) or stroke. The input dataset is collected from dataset repository. After that, we have to implement the pre-processing step. Then, we have to implement the machine learning algorithm such as linear Regression. The experimental results shows that the accuracy as r2-score. Heart Disease (CVD) residues the number one cause of death throughout the world. The application of machine learning brings a new proposing to Heart Disease prediction. There are differing types of heart conditions like coronary heart disease, angina, congestive coronary failure, cardiomyopathy, congenital heart condition, arrhythmias, and myocarditis. The reason for Heart Disease failures and strokes is generally the nearness of a blend of hazard factors, for example, tobacco use, unfortunate eating regimen, and heftiness.

Abstract

Cognitive Psychology, which forms the basis of Cognitive Behavioural Therapy, can be defined as one of the unique branches of psychology which deals with the study of our internal mental processes and mental activities. The processes and activities include our thinking ability, remembering things, creatively expressing ourselves. Making decisions, learning new things and drawing conclusions. Cognitive psychology focuses on how sensation and stimulation impact our behaviour and our changing behaviour. It is also useful for treating mental illness such as anxiety, eating disorders and depression. Cognitive psychology has also been found to be making a very beneficial impact on educational, social, abnormal and developmental psychology and in linguistics and economics as well. It is different from other branches of psychology as the other branches focus on our behaviour and activities that are external and observable whereas the cognitive psychology focuses on the thought processes which influence our behaviour and actions. This paper aims to discuss the importance of cognitive psychology in our daily lives and how it can be effectively put to use to help people lead better lives.

COMPUTATIONAL MUSICOLOGY IN SOCIETY 5.0

Abstract

Music is an indispensable outlook of human civilizations and it has the potential to intensely, ethically, and culturally influence societal behaviours. When the human beings from one cultural society reciprocate music with others from other culture, they achieve significant insight into the other dimension of societal life. The Big Data analytics, Internet of Things, sensor networks, intelligent automation, and virtual-augmented realities are just numerous of the technological advancements which influence the Industry 4.0. These progresses enhances functioning states and improve the creativeness and the quality of industrial manufacturing. Although, they can also enhance the human life and societal issues principally. An innovative viewpoint is alligned towards the social well-beings and named as, Society 5.0. Industry 4.0 bears the transformation to the newly-designed society, however additional drivers are also required. For guiding the transformation, it is much needed to recognise the enabling factors which confluence the Industry 4.0. Society 5.0 illustrates as a human-centric society that stabilizes the economic progression with the resolution of social challenges by a systematic endeavours that principally integrates the cyber-space and physical space, such as Music. The music learning and computational Musicology were fundamentally based on offline teaching-learning mechanisms. These transformation happended because of the communal contributions to be habituated to new requirements, potential conditions, and phenomena related to the growth of the society. Not accomplished with the aspects of the Industry 4.0, nowadays people are facing issues of the Society 5.0, objects and every persisting social orders associated with virtual reality. Here from the concept of Internet of Music Things highlighted. Primary objective is to resolve durability of qualitative music education in the trend of Society 5.0. The outcomes of this conceptual and human-centric research dimension are anticipated to arrange wisdom values because the music is one of the significant ingredients for society to face a social transformative era.

Keywords: Society 5.0; Internet of Music Things, Sustainability, Computational Musicology, Human Centered Computing.

Abstract

Artificial woody plantation stands provide people with a softened microclimate in their residential areas and other positive changes in urbanized areas. Local communities are slowing down the pace of global warming and generally reducing their negative impact on the microclimate by using artificial forest stands in mining districts. Modern economic relations and the level of development of the introduction of plants open up new prospects for the introduction of both new types of well-known crops and non-traditional rare crops for various countries, including Ukraine. The aim of the work was to reveal the phytoremediation role and recreational potential of introduced vegetation species using the example of the genus *Chaenomeles* (ch.) and the genus *Berberis* (b.), as well as *Prinsepia Uniflora* Batalin, *Jošta* plants for their further possible use in the steppe zone on the territory of Ukraine with insufficient diversity types of fruit plants that have health-improving properties. The first plot is located on the territory of the Botanical Garden of the Dnipro National University (48 ° 26'7 "N, 35 ° 2'34" E, Dnipro city, Ukraine; plot 1). The second plot is located in a private subsidiary farm (48 ° 24'45 " N, 33 ° 42'12 " E, Dnipropetrovsk province; plot 2). In plot 2, unfavourable regional climatic conditions (low air temperatures in winter and high in summer, insufficient moisture in the soil, frequent hot dry winds) have a significant impact on the growth and development of plants. The study of the component composition of biologically active substances of fruit crops reveals prospects in the use of antibacterial and antifungal effects of plant extracts.

Shehu, I.

Department of Microbiology, Faculty of Life Sciences, Federal University Dutsin-Ma, Katsina State, Nigeria

Abstract

Cosmetics are substances intended to enhance the visual appeal of the human body. The cosmetics industry takes bacterial spoilage extremely seriously because it can result in both product and financial losses. The purpose of this research was to assess the bacteriological quality of regularly used cosmetics in the Kaduna Metropolitan Area. Twenty five (25) samples of Body lotion, Cream, Foundation, Powder and Mascara were randomly purchased. Five (5) samples of each cosmetic brands were acquired from five separate markets. Using standard protocol, the samples were inoculated onto nutrient agar and macConkey agar for the isolation and identification of bacteria. *Staphylococcus aureus*, *Bacillus* sp. *Pseudomonas aeruginosa*, *Salmonella* sp. *Micrococcus* sp. and *Escherichia coli*. were found in the samples. The percentage of bacteria present in the samples varies by species and market. P 0.05 indicates a statistically significant difference between the different brands of cosmetics analysed in terms of the prevalence of bacterial isolates in the marketplaces. The percentage of germs detected in the study clearly demonstrates the extent to which the cosmetics brand was contaminated during production, packaging, or storage. Numerous bacteria, including *Escherichia coli*, *Staphylococcus aureus*, *Bacillus* sp., *Micrococcus* sp., *Pseudomonas aeruginosa*, and *Salmonella* sp., were discovered to be contaminating the various cosmetic products that were analysed. Microbes may contaminate personal care goods during production due to the handling of raw materials, or a finished product may get contaminated during sale or storage. The necessity to prevent bacterial contamination of products has sparked significant anxiety among cosmetic makers. Frequently, quality assurance should be considered alongside raw material controls, process controls, and product inspections.

Keywords: bacterial spoilage, cosmetics, *Pseudomonas aeruginosa*, *Salmonella* sp., process controls

IN-VITRO ANTIOXIDANT ACTIVITIES OF THE SELECTIVE EXTRACTS OF
PLANTAGO LANCEOLATA L. OBTAINED BY SUPERCRITICAL FLUID
EXTRACTION

Dr. Cornelia NICHITA (Orcid ID: 0000-0002-4928-4564)

University of Bucharest, ICUB, Faculty of Physics, CTT-3Nano-SAE Research Center,
Bucharest, ROMANIA

E-mail: cornelia.nichita@unibuc.ro

Abstract

Plantago lanceolata L. belonging to the Plantaginaceae family is a common perennial weed of arable fields and grassland abundant throughout Europe, North and Central Asia. In traditional medicine *Plantago lanceolata* L. it has multiple uses due to antiviral, anti-inflammatory, astringent, anti-helminthic, analgesic, antihistaminic, anti-rheumatic, antitumor, anti-ulcer, diuretic, expectorant and hypotensive properties. The pharmacological properties are due to the complex chemical composition consisting of iridoid glycosides, polysaccharides (plantaglucide, glucomannan), flavonoids and flavone glycosides, phenolic carboxylic acids, alkaloids (indicain, plantagonin), terpenoids (loliolide, ursolic acid, oleanolic acid and other constituents, like allantoin. Considering these biological properties, the present work aims to obtain selective extracts with a high content of polyphenolic compounds by applying supercritical fluid extraction (SFE) and at the same time, *in vitro* evaluate their antioxidant activity by applying three distinct methods. The selective extracts were obtained by employing the supercritical fluid extraction (SFE), procedure followed by filtration at normal pressure and concentration by roto-evaporation under vacuum. Antioxidant activity were evaluated by *in vitro non cellular* assays using the chemiluminescence technique in luminol hydrogen peroxide system, DPPH(2,2-diphenyl-1-picrylhydrazyl) free radical scavenging assay and ABTS (2,2'azinobis-(3-ethylbenzthiazoline-6-sulfonic acid) methods. In addition, the biochemical analysis carried out by UV-VIS spectrometric method determined the total phenolic contents (TPC) expressed as gallic acid equivalent/g (mg/GAE g⁻¹) using the Folin-Ciocalteu reagent, total flavonoid contents (TFC) expressed as rutin equivalent/g (mg/RE g⁻¹), by aluminium chloride colorimetric assay and the caffeic acid derivatives content (CADc) expressed as mg caffeic acid equivalent/g dry extract (mg/CAG⁻¹) by using Arnows' reagent. From the obtained results, we can conclude that the application of the SFE method leads to obtaining selective extracts with a high content of active polyphenolic principles and improved antioxidant biological potential, compared to the extracts obtained by classical methods.

Keywords: Supercritical fluid extraction, antioxidant activity, *Plantago lanceolata* L.

HARVESTING PEDAL ENERGY FOR AUTOMOTIVES (HPE)

Mohammed Alaa Alwafaie (Orcid ID: 0000-0002-8083-4018)

Abstract

Renewable energy sources have become increasingly popular recently, with wind turbines and solar panels widely used for energy harvesting. However, Electromechanical energy harvesting has emerged as a highly promising source of electric energy due to its ability to generate significant amounts of electricity that can be utilized in various ways. Electromechanical energy harvesting is a method of generating electrical energy from mechanical motion. This technology works by converting the kinetic energy produced by mechanical motion into electrical energy, which can then be used to power various devices and systems. It is a promising source of electric energy due to several advantages it offers. The automotive industry is one of the areas where electromechanical energy harvesting is being explored as a supplement. The energy-harvesting pedal, for example, generates electricity from the driver's motion, which can be used to power the vehicle's electrical systems or charge its battery. This technology could potentially reduce the reliance on external power sources and improve the overall energy efficiency of the vehicle. The energy-harvesting pedal receives motion from the driver's throttle or brake pedal through a mechanical connection rod, generating electricity that can power the vehicle's electrical systems or charge its battery. Overall, electromechanical energy harvesting has the potential to revolutionize the way we generate and use energy, providing a sustainable and renewable source of power for a wide range of applications.

VITALITY OF TREES IN THE CONDITIONS OF URBOGENIC ENVIRONMENT

Dmytro HANABA (Orcid ID: 0000-0002-7042)

graduate student at the Department of Ecology Khmelnytskyi National University,
Khmelnytskyi, Ukraine.

E-mail: sveta_ganaba@ukr.net

Abstract

The city is a complex and multi-component organism, where a special microenvironment is created. The operation of transport and industrial enterprises, high density of buildings and heating of buildings, continuous asphalt or other hard covering of streets and squares increase the general temperature of the air, making it overheated and too dry. Green spaces protect urban agglomerations from high temperatures, the consequences of the greenhouse effect, from direct solar radiation, severe overheating, from atmospheric air pollution, motor vehicle emissions, and the effects of industrial gases and heavy metals. They are unique indicators of ecological conditions and the state of the environment, as they perform the role of a universal natural filter against man-made pollution. Greening of the urban environment is one of the prerequisites for its sustainable development. The problem of finding optimal conditions for the growth and development of plants in the urban area in conditions of elevated temperatures is complex and multifaceted, as it depends on many factors. One of the important factors in the functioning of physiological processes and optimization of plant productivity is their water supply. Violation of the water regime causes a decrease in the water content in plant tissues, causes them to lose mineral substances, inhibits and stops their growth, causes browning, drying and falling of leaves, etc. The process of transpiration is an important factor in the vitality of trees in the urbogenic environment. It is necessary and useful for the development and functioning of plants. Thanks to this process, water and mineral substances rise up the stem from the roots to the leaves, the plant is cooled, it is not allowed to overheat, etc. The plant has a number of physiological features that allow you to significantly regulate the return of water. The process of transpiration depends on the effectiveness of the absorption action of the root surface, the structure and size of the plant itself, its age, the location and structure of the leaves, their area, size, and shape. The intensity of the process of water evaporation by the plant also depends on external factors, namely: the speed of movement of air masses, an increase in the temperature regime and the level of humidity and dustiness of the air, the lack of water vapor pressure in it, etc.

THE DEPICTION OF MESOPOTAMIAN QUEENS IN CHILDREN'S LITERATURE

Prof. Ansam Yaroub KHYOON (ORCID 0000 0002 7344 7976)

University of Baghdad, Department of Theoretical Studies, Baghdad, Iraq

E-mail: maiada.najm@cope.uobaghdad.ed.iq

Abstract

The aim of the research is to shed the light on two Mesopotamian queens as depicted in children's literature. The researchers selected two children stories each for one of the two queens and analyzed the portrayal of these queens in literature in comparison to facts known about them. Unlike queen Puabi, many children books are written about Queen Semiramis yet the facts in those literary works are not accurate and manipulated for religious and political reasons. Thus the researchers selected George Capaccio's *Queen Pu-abi's Royal Tomb* (2009) as a literary example for the Mesopotamian queen Puabi; the queen of Ur is skillfully portrayed. Queen Puabi was buried in one of the wealthiest tombs at Ur of the Chaldees, which Sir Leonard Woodley discovered at the Ur III Period Royal Cemetery. The second queen is Semiramis, a great Assyrian queen and a legendary warrior that is portrayed in *Queen Semiramis: The Legend* by Ingrid de Haas (2020). The researchers, after detailed literary analysis concluded that these children books accurately portray the facts about these queens and thus they are recommended not only for literary reading but for educational purposes as well.

Keywords: golden harp, Queen Pubai's seal, royal cemetery, royal game, Shammuramat warrior queen.

ANALYSIS OF THE APPLICATION OF THE PRINCIPLES OF ISLAMIC BUSINESS ETHICS AT DADDY BRO COFFESHOP TULIS BATANG DISTRICT

Ghina JAZILA (Orcid ID: 0000-0002-0044-7713)

Faculty of Economics and Islamic Business, State Islamic University K.H Abdurrahman Wahid
Pekalongan, Indonesia

Abstract

Islamic business ethics are morals in doing business in accordance with Islamic principles, so that in doing business there is no need to worry, because you already believe that something is right and good. The application of Islamic business ethics is also required in all areas of the economy, including the implementation of production, consumption and distribution. This is done by several economic actors by applying Islamic business ethics in their operations. In this study using qualitative research with descriptive methods. Primary data sources by conducting interviews and observations. Research object at Daddy Bro Coffeeshop located on Jl. Raya Write, Gondangan Village, Write District, Batang Regency, Central Java. The research aims to determine the implementation of the application of the principles of Islamic business ethics in Daddy Bro Coffeeshop. The results of the study show that the application of the principles of Islamic business ethics which include monotheism (unity), balance (equilibrium), free will (free will), and responsibility (responsibility) has been implemented by Daddy Bro Coffeshop and is considered quite good in its business implementation.

Abstract

Composite materials are the essential element in the design of wind turbine blades, these materials degrade as they are exposed to high environmental conditions such as humidity and temperature, and it is for this reason that their impact on wind turbine blades must be studied from the design stage.

Environmental effects will affect the resin matrix as well as the interface and fibers. The objective of this study is to identify the most resistant resins to humidity/temperature in terms of fatigue life. A variety of resins are compared, using the resins most commonly used for manufacturing wind turbine blades, and tested under temperatures of 20°C and 50°C in "dry" and "damp" conditions. Due to predict fatigue life under different environmental conditions. The performances of three algorithms (Backpropagation BP, Particle Swarm Optimization PSO and Cuckoo Search CS) are compared to adjust the synaptic weights and to evaluate their effectiveness in predicting the fatigue life of the materials studied, under given conditions. In order to evaluate the accuracy, the Mean Square Error MSE is used as an objective function to be optimized by the three algorithms.

Keywords: Wind turbine blades; fatigue life; artificial neural network; optimization algorithms; composite materials; hygrothermal effect.

EDUCATION AS A SPACE FOR PERSONAL DEVELOPMENT

Abstract

The current stage of the development of society testifies to the situation of a civilizational transition from the values and priorities of the industrial era to the post-industrial one. The new context of social reality significantly affects the existence of a person. Those familiar symbolic landmarks that determined his life are disappearing. Modernity necessitates the formation of a person of a new formation, capable of creating and perceiving something new. Such a person shows the ability to quickly and flexibly adapt to changing realities, the ability to predict, and possibly prevent negative and destructive processes. The field of education is called upon to help a person quickly adapt to changes in society, learn to learn, navigate among a large amount of information, without losing touch with traditions, spiritual augmentations of previous generations. It is in this area that human capital is formed, the quality of which determines the possibilities and prospects for the development of society in the future. The emphasis on the future is changing the purpose of education in public life. From a translator and repository of the cultural experience of generations, the educational sphere is turning into a workshop in which a person with an innovative type of thinking is becoming. It focuses more and more on developing the ability to learn. The situation of civilizational transition provides for a change in the fundamental positions of the educational process. The strategic guideline of modern education is the awakening of a person's creative potential, his ability to perceive and create something new.

**FIRST OCCURENCE OF CAT LICE *FELICOLA SUBROSTRATA* IN CATS IN THE
BELGRADE AREA**

Dr. Ivan PAVLOVIC (Orcid ID: 0000-0003-4751-6760)

Academ. Principal Res.Fell. Scientific Institute of Veterinary Medicine of Serbia, Belgrade,
Serbia

E-mail: dripavlovic58@gmail.com

Abstract

Cats are increasingly the favorite pets of people in urban areas, including Belgrade. Despite this, their parasitic fauna has not been sufficiently examined, especially the fauna of ectoparasites. From that reason in the period 2018-2021, we performed a parasitological examination of the 250 pet cats. All cats brought for examination from Veterinary clinics in the Belgrade. During our examination ectoparasites infection we established at 31.2% animals. To closely identify a lice, a piece of clear tape can be used to collect it and then it can be examined under a microscope. Parasites were collected from cats and determination was made on the basis of their morphological characteristics. During our examination lice infection we established at only 3 cats that often went outside and stayed for several days outside the house and lived in an unfavorable environment. At all cases they are presented *Felicola subrostrata*. Infestations with lice is common to be seen more in cats and kittens that are strays, feral, neglected, malnourished, weakened, sick, dirty and those kept in unclean overcrowded environments. Nits are also small but visible to the naked eye and can be seen as tiny white dots at the base of the hair when the hair is parted. Lice are a rather uncommon finding in cats that are receiving flea control; however, lice do infest cats on occasion, especially young, old, debilitated, or neglected cats. Chewing lice attach at the base of the hair and are typically located around the head, neck, tail, and body openings. Infestation can cause irritation and pruritus, which can lead to rubbing, scratching, and alopecia of the infested areas, which we occurred at all infected cats. This was the firs occurence of cat lice *Felicola subrostrata* in pet cats in the Belgrade area.

Abstract

The internet is rapidly expanding and gaining a lot of attention, with a focus on making life easier for people. It has progressed from static pages to smart industries and factories where machines are directly connected to the web. These systems can make autonomous decisions and visualize the entire production process. Blockchain technology, based on hashing, is at the foundation of platforms for trading cryptocurrencies and executing smart contracts. Industry 4.0, also known as the fourth industrial revolution, includes IoT, CC, Big Data, and AI, and is fostering IIoT. Blockchain version 4.0 is ensuring supply chain transparency, record immutability, and end-to-end trading organization trust. Blockchain has several characteristics, including decentralization, stability, security, and non-modifiability, which have the potential to change network architecture. The consensus algorithm plays a crucial role in maintaining the safety and efficiency of the blockchain, and selecting the right algorithm can significantly increase performance. This work provides an overview of the consensus algorithms, their characteristics, and performance and application scenarios. It also gives technical guidance on selecting an appropriate consensus algorithm and summarizes the limitations and future development of blockchain technology.

Keywords: Blockchain, algorithms, smart contracts

**ANALYTICAL STUDY OF SAVINGS AND INVESTMENT PATTERNS OF
COOPERATIVE INDUSTRY WORKERS**

Dr. Vidya Sunil KADAM

Associate Professor, Rajarambapu Institute of Technology Affiliated to Shivaji University
Maharashtra (India)

Email: vidya.kadam@ritindia.edu

Abstract

Cooperative industries have emerged as a significant economic model, with worker participation and ownership being key features. One crucial aspect of financial well-being for workers in these industries is their savings and investment patterns. This study aims to analyze the savings and investment patterns of cooperative industry workers in Islampur Sangli District, with a focus on understanding their financial behaviors and decision-making processes. The study utilizes a mixed-methods approach, combining qualitative and quantitative research methods. Primary data is collected through structured questionnaires and interviews with cooperative industry workers. The study sample of 285 workers from various cooperative industries, such as agriculture, manufacturing, the findings reveal that cooperative industry workers exhibit diverse savings and investment patterns, influenced by various factors such as income level, age, education, family size, and financial literacy. The study identifies several common saving and investment practices, including savings in cooperative banks or credit unions, investment in cooperative shares or bonds, and participation in collective investment schemes offered by their respective cooperatives. The study also identifies challenges faced by cooperative industry workers in their savings and investment practices, such as lack of financial literacy, limited access to formal financial services, and fluctuations in income due to market conditions. Additionally, the study highlights the importance of social and cultural factors in shaping the savings and investment behaviors of cooperative industry workers. The findings of this study have implications for policymakers, cooperative leaders, and practitioners in developing strategies to enhance the financial well-being of cooperative industry workers. This study contributes to the existing literature by providing empirical insights into the savings and investment patterns of cooperative industry workers and highlighting the need for tailored financial education and support services to address their unique financial challenges.

Keywords: Cooperative industry, savings, investment, financial behaviors, financial literacy.

DESIGN AND FABRICATION OF WHEAT STRAW PRESSING MACHINE

Rehman KHAN

Mechanical Engineering Department, Swedish College of Engineering and Technology Wah,
Punjab Pakistan

Hasnain SALEEM

Mechanical Engineering Department, Swedish College of Engineering and Technology Wah,
Punjab Pakistan

Abstract

This project is based on wheat straw pressing machine. In this project chopped wheat straw is collected and added manually into trolley which is then filled into pressing chamber of machine which is operated on this machine. Then, through trolley straw is inserted into main frame of the machine. Afterwards, machine is switched on and straw is pressed by hydraulic press of the machine. In this way, the straw is converted into a sack of straw. The handling of sack of saw is very easy which saves lots of time and money having low cost and maintenance, easy to operate. Wheat Straw Pressing Machine is mainly used in agricultural industry and is very helpful for conversion of chopped wheat straw into useful, handy and manageable wheat straw sacks. The study about this machine is that in wheat season, farmers face lots of problems related to high volume of wheat straw storage methods, they hire lots of workers for the storage of high-volume of wheat straw. This makes expensive and time-consuming storage method for farmers. The solution that we came up with after theoretical study is that, by using wheat straw pressing machine, we can overcome above said problems. This machine is composed of three sections, hydraulic system, electrical system and main frame. This is really useful to bind huge hay or straws in minimum size, so the transportation and storage can be easy. With this machine, we can reduce the labour cost, transportation cost, stock cost and space for handling huge amount of wheat straw.

Keywords: Wheat straw, Hydraulic press, Electrical system.

**NIGERIA'S ELECTORAL ACT 2022: THE NOVEL INNOVATIONS AND RECENT
JUDICIAL INTERPRETATIONS**

Samuel Akpadiagha ETUK

Department of Paralegal Studies Akwa Ibom State Polytechnic, Ikot Osurua

E-mail: harrieslawpartners@gmail.com

Abstract

Recently, the Independent National Election Commission (INEC) conducted the country's general election, using the newly enacted Electoral Act, 2022. This paper highlights the novel innovations introduced into the country's electoral politics, the constitutional issues arising from them and the recent judicial interventions as they affect the mischiefs, the new legislation intended to cure. It argues that these innovations are in tandem with the provisions of the grund norm of Nigeria, which is the Constitution of the Federal Republic of Nigeria, 1999 (as amended). However, for the Act to be effective and cure the mischiefs intended, the judiciary must avoid technical justice and arrive at substantial justice, in the overall interest of the country's democracy. It proposes effective judicial actions to avoid the Act going the part of its predecessor and causing more havoc to the country's democracy than good.

Abstract

The advent of inexorable human, and industrial activities as well as the input of nature has impacted the environment by releasing Heavy Metals into the aquatic system. Hence, the physical removal of hazardous HM remains a demand of the day. This review envisages the use of agro-waste with the incorporation of nanotechnology for the removal of HM from aquatic systems and aid in water purification. The focus is on plant parts, plant metabolites, and plant-cellulose-derived Carbon Nanofibers (CNF) as materials used for the removal of pollutants in aquatic systems. Owing to their high surface area, high mechanical strength, greater chemical reactivity due to the presence of dangling bonds, non-toxicity, high porosity, channel-like morphology, and lower cost as the precursor, energy-efficient production; makes CNF an effective adsorbent. CNF synthesized from agro-waste and plant-metabolite to adsorb Heavy Metals; as well as acts as a filtration base has been touched upon with the hope of bridging the gap between ever-increasing demand and available clean water. A brief introduction to the CNF, its structure, properties as well as common methods of synthesis of CNF is given. Moreover, Physico-Chemical and Biological methods that are being used is also touched upon. The article suggests the need for innovative, low-cost, and environmentally friendly surface modification techniques and the use of agro-waste-derived CNF for water purification.

Abstract

There is a definite correlation between cardiovascular diseases and depressive disorders. Most antidepressants have a negative effect on the cardiovascular system. They can affect blood pressure, the inotropic state of the heart and cardiac conduction. Side effects may occur due to the direct action of these agents or through drug interactions. The purpose of this work is to identify the causes and reasons of cardiotoxicity in patients who use short-term or long-term antidepressant therapy. Serotonin reuptake inhibitors (sertraline, paroxetine, etc.) are the most commonly used agents because of their profile. Hypertensive crisis, tachycardia, bradycardia, weight gain, drowsiness, gastrointestinal problems, etc., are the most serious problems associated with the administration of antidepressants. Antidepressants are not considered socially safe. Indeed, similar effects have been reported with the administration of antidepressants, among which the effects of cardiovascular use are of great importance due to their life-threatening nature. Since these agents can be lethal both in therapeutic dose and after overdose, recognition of this abnormality is for safe prescribing and also some of the salient issues in antidepressant therapy versus cardiovascular considerations should be considered when prescribing medications like that. We cannot conclude about cardiotoxicity, for this we need the follow-up of biochemical and echocardiographic parameters as well as other more advanced studies, but we can suggest patients to be more careful during therapy, monitoring the presented symptoms and have a more serious approach during taking monotherapy and combined therapy. Especially patients who wish to discontinue therapy after long-term treatment will need information and support to cope with the potentially severe effects of discontinuation.

Keywords: antidepressants, cardiotoxicity, side effects.

UNDERSTANDING GREEN BRAND EQUITY

Prof. Dr. Manita MATHARU (Orcid ID: 0000-0001-7240-9866)

Amity School of Business, Amity University, Noida, UP, India

E-mail: manita.mktg@gmail.com, 09811642001

Abstract

Consumers who care about the environment are always looking for green goods. This has led companies to create new product lines that meet or exceed customer environmental concerns. Still, not all companies were able to make a big profit from their investments in environmentally friendly goods. But when there is a lot of competition, businesses must shift their attention to building a trustworthy brand that is good for the environment and can green all parts of the marketing mix. If a company is able to provide goods or services that meet the environmental needs of its customer base, then those customers will be more likely to purchase those goods or services from that company. With the advent of the environmental era, businesses are obligated to identify opportunities to enhance the environmental performance of their products in order to build brand equity. In this way, businesses must not only come up with eco-friendly goods that don't sacrifice traditional qualities, but they must also find a way to get people to think positively about their green marketing efforts. In response to increased customer demand for environmentally friendly products, companies are shifting their management focus from brand equity to green brand equity. As a result, green brand equity is going to emerge as a new marketing phenomena. This study is conceptual in nature, attempts to understand the concept of green brand equity and the factors that influence green brand equity. Additionally, the owners and managers of the companies could benefit from this study by learning more about the significance of green brands alongside strengthening the green brand equity.

Keywords: Brand, green brand equity, green satisfaction, green trust, green image

21ST LUDDITES AND ETIDDULS IN THE 4TH INDUSTRIAL REVOLUTION

David WORTLEY (Orcid ID: 0000-0001-5598-6987)

Mr David John Wortley FRSA, 360in360 Immersive Experiences, Alderton, United Kingdom,

Abstract

The 4th Industrial Revolution (IR4.0) is likely to present unprecedented challenges to all knowledge professionals with social and economic consequences more serious than those experienced in the 1st Industrial Revolution (IR1.0) of the 18th and 19th centuries. At the dawn of IR4.0, we see serious global challenges in healthcare, environment, education, business and society, manifestations of how digital technologies have disrupted traditional practices and relationships, leading to their breakdown or collapse as they are threatened by new processes, perceptions, tasks, devices and environmental situations. These problems are inextricably linked to human factors and a failure to recognise, respond to and/or harness the impact of technologies associated with IR4.0. This presentation looks at the impact of the Digital Age on a range of professions and skilled trades between 1955 and 2021 in the context of salaries, training needs, cognitive challenges and responsibilities. Based on a series of case study examples where human intelligence, judgement, skills and/or knowledge has already become embedded within technology, it speculates on the future implications for knowledge workers, their skills, experience, career prospects, salaries and status in IR4.0. It draws the conclusion that, at the dawn of the IR4.0, the future of knowledge workers is highly uncertain, whilst skilled trades based on apprentice-ships are likely to prosper.

Abstract

Theories related to human development suggest that childhood experiences are relevant throughout an individual's lifespan, and that the parent-child relationship is crucial for a child's physical and psychological health. The objective of this study was to examine whether parental abandonment has an impact on self-conscious emotions like shame and guilt. This quasi-experimental study included 230 adolescents and teenagers (mean age = 17.1, SD = 1.82), and data was collected via an online self-reported questionnaire. The Guilt Inventory, The Experience of Shame Scale, Childhood Trauma Questionnaire, and Parental Acceptance/Rejection Questionnaire were used for data analysis. The results indicated that a child's environment was significantly associated with feelings of shame. High levels of abuse had an impact on both shame and guilt, while paternal rejection was associated with guilt only. The study highlights the importance of considering the conditions in which children and teenagers develop and the crucial role of social work assistance for those who have experienced abandonment.

Keywords: abandonment; shame; guilt; parental rejection; adolescents and teenagers; institutional care; family environment.

**SUPPRESSION OF RUST RED FLOUR BEETLE, *Tribolium castaneum* HERBST
[COLEOPTERA: TENEBRONIDAE] WITH TWO *OCIMUM* SPECIES POWDERS ON
WHEAT GRAINS**

Abstract

Stored product insect pests are problems throughout the world, as they diminish both the quantity and quality of grains. The resultant effect of this is an eminent threat to global food security which might negatively impact peoples' well-being. Efforts by humans to curb the menace of these insect pests have brought about negative effects because of the use of synthetic chemical insecticides. Recent development has been seen in the use of botanicals and agricultural wastes in the control of these pests. This research investigated effects of *Ocimum gratissimum*, and *O. basilicum* powders against *T. castaneum* infesting wheat grains in storage. Powders were tested singly and mix at dose 0.2, 0.4, 0.6, 0.8 and 1.0 g, while extracts were tested at concentration 0.1, 0.2, 0.3, 0.4 and 0.5 ml /20 g of wheat grains. Parameters that were tested include adult mortality, numbers of adult emergence, % seed damage, % weight loss and weevil perforation index. The results revealed that powders and the extracts of the *Ocimum* species were effective as the dosage and concentration ascended with different degrees of effectiveness based on exposure time. The two tested *Ocimum* species powders and extracts significantly ($P < 0.05$) reduced the population of adult *T. castaneum* on treated wheat grains. *O. basilicum* powder at dosage 1.0 g caused 50% mortality of adult *T. castaneum* after 24 hours of treatment. This followed by combination of *O. basilicum* and *O. gratissimum* powders that evoked 40% beetles mortality. The least toxic was *O. gratissimum* powder that caused 30% mortality of adult *T. castaneum*. The lethal dosage of *O. basilicum*, *O. gratissimum* and combination of *O. basilicum* and *O. gratissimum* powders at which 50% population of *T. castaneum* response after the first day of exposure were 1.09g, 1.44g and 1.45g while the lethal dosage needed to achieve 90% (LD_{90}) mortality after the first day of exposure were 4.24, 8.44 and 5.38 respectively. This research showed that *O. basilicum* and *O. gratissimum* powders had toxicity effects on the survival of *T. castaneum* on wheat grains. *O. gratissimum* had the lowest lethal dosage. The use of *Ocimum* species as bio-control in the management of red-rust flour beetle in stored wheat grains among poor resource farmers and foods merchants should be advocated.

Keywords: *Ocimum gratissimum*; *Ocimum basilicum*; *Tribolium castaneum*; Wheat; Biocontrol

Abstract

The alarming rise of bacterial *resistance* is occurring worldwide and endangering the efficacy of *antibiotics*. Therefore, development of new and efficient antibacterial agents remains paramount. In the present work we designed and synthesized a series of N'-(1,3-benzothiazol-2-yl)-substituted aryl/alkyl hydrazides **C1-C27**. In the extra-precision docking compounds **C1-C27** exhibited interactions mainly with the N-terminal and central domains of *S. aureus* GyrB catalytic pocket. Binding free energy (ΔG_{bind}) of compounds **C1-C27/3U2K** complexes were computed by MM-GBSA approach. Free energy components indicated Coulomb energy term as favourable for binding, while van der Waals and electrostatic solvation energy terms strongly disfavoured the binding. ADMET properties of synthesized compounds **C1-C27** are also computed.

**GREENING OF THE KERALA UNIVERSITY CAMPUS- AGRICULTURE AND
HORTICULTURE TO THE FORE**

Thiruvananthapuram, Kerala, India.
E-mail: kscnair@gmail.com

Abstract

The University of Kerala, earlier known as the University of Travancore, is a state-run public university in Thiruvananthapuram, Kerala. It is the state capital of Kerala, India. The University of Kerala was established in 1937 by a proclamation of the Maharaja of Travancore Sri Chitira Thirunal Balarama Varma, the 1st Vice Chancellor of the University of Kerala. Now the University of Kerala is accredited by NAAC A++, the highest grade, and scored 3.67 points out of 4. The University of Kerala has over 150 affiliated colleges and has 16 Teaching faculties, and 43 Departments of Teaching and research. The extensive green campus with 359 acres is close to the Kazhakuttom on National Highway 66. Kariavattom campus is situated Northeast of Thiruvananthapuram city and 3km nearest to the Arabian Sea. Geographically the Kariavattom campus lays 834'6 N latitude and 7652'51 E longitude at 60 m above sea level. The average tropical climate was predominant, with a mean rainfall of 1850 mm. The textural soil of the site has been categorized into lateritic soil. In 2019, the University authorities did away with acacia and eucalyptus trees that contributed much of the kariavattom campus's greenery and replaced them with crops. In 2014, Kerala University approved the proposal for a Green Charter for environmental conservation. The Green charter states that no plastic-wrapped bouquets, plastic wrapping of moments, plastic confetti, or "kodithoranam" decorations were not used in the functions conducted by the University. The monoculture of acacia in the kariavattom campus was replaced with various trees focused on preserving and enhancing the kariavattom campus's Biodiversity. Kerala University's Harithalayam project was an exemplary model of Biodiversity. The Government of Kerala would consider expanding this project and converting the campus into a significant seed production center. The high-yielding "Manuratna," the variety of rice harvested on the campus, was procured by Kerala Agriculture University. Then it was distributed among the farmers across the state for more production. Here the study is focused on explaining the greening of the Kerala university along with the agriculture and horticulture activities.

Keywords: Greening, Agriculture, Horticulture, Harithalayam Project, Kerala University, Kerala.

**CONTRIBUTIONS OF GENETIC ENGINEERING IN RAISING THE EFFICIENCY OF
GENETIC SELECTION IN LIVESTOCK**

Cluj county, Romania

E-mail: hussamaryan@yahoo.com

Abstract

Genetic engineering has become a powerful tool for improving the efficiency of genetic selection in livestock. Conventional breeding methods have their limitations when it comes to achieving rapid genetic progress in complex traits controlled by multiple genes. An important contribution of genetic engineering is the development of genetically modified (GM) animals with specific genetic changes to improve desired traits. For example, GM goats with reduced myostatin levels have more muscle mass and better meat quality, and GM dairy cows have higher milk production and better protein quality. Another important contribution is the development of gene editing tools such as CRISPR-Cas9, which allow targeted modification of genes associated with specific traits. Gene editing has created pigs resistant to African swine fever, reducing the threat to the global swine industry, and can introduce desirable mutations for disease resistance or improved production traits, accelerating genetic progress. Genetic engineering can be used to solve environmental and animal welfare problems in animal agriculture. For example, genetic engineering is being studied to reduce methane emissions from cattle, which contribute to climate change. By modifying genes that regulate methane production, researchers hope to create more sustainable and environmentally friendly livestock systems. Although genetic engineering offers potential benefits, there are concerns about its safety and ethical implications. There is a need to ensure that any genetic modifications introduced into animal populations do not negatively impact animal health, welfare, or the environment. In addition, potential social and ethical implications should be considered, such as concerns about animal welfare, genetic discrimination, and impacts on traditional agricultural practices. In summary, genetic engineering has greatly increased the efficiency of genetic selection, improved animal health and welfare, and solved environmental problems in animal agriculture. With continued research and development, genetic engineering can lead to more sustainable and efficient animal production systems. However, responsible and ethical use is critical, taking into account the potential risks and benefits.

Keywords: livestock, gene editing, genetic engineering, genetic selection

**DIPLOMATIC RELATIONS BETWEEN VIETNAM AND CAMPODIA FROM 1997 TO
2022**

Dr. Pham Duc THUAN (Orcid ID: 0000-0003-2338-7773)

Abstract

Vietnam and Cambodia are two neighboring countries in Southeast Asia. The two countries have had diplomatic relations since early, going through many stages in history. After helping Cambodia escape the genocide caused by Polpot, Vietnam gradually supported Cambodia in many fields. In 1997, both countries joined the ASEAN organization and increasingly have closer relations, making important contributions to the development of Southeast Asia. Today, with the development of the region and the interweaving of interests among many countries in the ASEAN region and in the world, the Vietnam - Cambodia relationship has new advantages and challenges. This article aims to analyze the diplomatic relations between the two countries, thereby drawing out historical issues and international relations, serving the study of diplomatic.

Keywords: Vietnam, Cambodia, diplomatic, ASEAN

**DR. FAISAL DIRECTOR (HRIMS/ISMOHR) CARRIED OUT THAT AI MODULES IN
PAKISTAN LIKE MODERATE NATIONS IT IS SIGNIFICANT PREREQUISITE FOR
THE DEVELOPMENT OF PAKISTAN**

Dr. Muhammad FAISAL (Orcid ID: 0000-0002-5797-766X)

Director (HRIMS/ ISMoHR) Ministry of Human Rights Government of Pakistan

Abstract

Executing computer based intelligence models requires cautious thought of different elements, like information accessibility, foundation, assets, and neighborhood setting, which might change significantly relying upon the particular use case and area. In any case, Dr. Faisal Director (HRIMS/ ISMoHR) from Ministry of Human Rights Government of Pakistan give a few general suggestions to man-made intelligence models that could be important for horticulture and IT areas in Pakistan: Irritation and Illness The board: man-made intelligence models can break down information on weather conditions, bother populaces, and infection episodes to give early advance notice frameworks and suggestions for vermin and sickness the executives procedures. This can assist with shielding basic IT foundation and information from digital assaults. It's essential to take note of that the turn of events and sending of simulated intelligence models require intensive assessment, approval, and moral contemplations to guarantee their viability, decency, and wellbeing. Legitimate information administration, protection, and safety efforts ought to likewise be set up to safeguard delicate information and guarantee consistence with applicable guidelines. Executing artificial intelligence models in Pakistan, or some other nation, would require joint effort among different partners, including government, industry, the scholarly world, and neighborhood networks. Modified arrangements that are customized to the particular requirements and difficulties of the horticulture and IT areas in Pakistan would be great for boosting the advantages of computer based intelligence reception in Pakistan. The Pakistani government can foster approaches and guidelines that support the utilization of man-made intelligence in horticulture and IT areas. This can incorporate giving duty impetuses, awards, and subsidizing for computer based intelligence innovative work, as well as making administrative systems that address issues connected with information protection, security, and moral contemplations. Pakistan can cultivate joint effort among the scholarly world and industry to work with the exchange of computer based intelligence examination to down to earth applications. This can include joint exploration projects, innovation move projects, and organizations among colleges and industry players to advance man-made intelligence development and business venture. Pakistan can team up with worldwide accomplices, including different nations, research establishments, and associations, to use worldwide mastery and assets in computer based intelligence. This can include joint examination projects, information sharing, and support in global computer based intelligence rivalries and difficulties.

Keywords: Irritation, Illness, boosting, impetuses, subsidizing, exploration.

**TECHNICAL EFFICIENCY DIFFERENTIALS OF MAIZE FARMER'S
PRODUCTIVITY IN OYO STATE, NIGERIA**

Oyewo ISAAC. O

Department of Agribusiness Management Federal College of Forestry (FRIN) P.M.B 5087

Jericho Ibadan, Oyo State Nigeria

E-Mail: ojerry2@gmail.com

Abstract

Farmer's inefficiency and low productivity in agriculture has been observed to be one of the problem affecting increased productivity and sustainable farm income among average farmers in Nigeria. The study examined the technical efficiency differentials of maize farmer's productivity in Oyo state using cross sectional data. The study uses five local government areas (LGAs) which are: Ogbomoso South, Oriire, Surulere and Ogooluwa LGAs respectively. A multistage sampling technique was employed in selecting 30 maize farmers from each of the four local government making 120 farmers. Data was collected through a well structured questionnaire and analyzed by the use of descriptive, inferential statistic (OLS) and The (Tran-slog) stochastic frontier production model. The estimated parameter using Trans-logarithm regression model revealed that land as a variable is statistically significant at different levels for all the LGAs considered while labour ($\beta=0.119$, $p<0.01$) and ($\beta=0.023$, $p<0.01$) are significant ($p<0.01$) percent level for Oriire and Ogooluwa LGAs, credits are only statistically significant ($\beta=0.046$, $p<0.10$) for Oriire LGA. The coefficient of the square term for all the variables shows a less than proportionate increase in maize output except for seeds in Ogooluwa LGA while the estimated coefficient for interactive terms shows a remarkable significant for land size, credits and between land and seeds. The estimated gamma parameter ($\Upsilon=0.50$) in Ogbomoso South, ($\Upsilon=0.99$) in Ogo Oluwa, ($\Upsilon=0.99$) in Surulere, ($\Upsilon=0.99$) in Oriire and ($\Upsilon=0.89$) for the pooled data indicated that 50%, 99%, 99%, 99% and 89% of the total variation in maize output is due to the technical inefficiencies in the local government area respectively. The mean technical efficiency was 0.810 in the pooled data, 0.810 in Ogooluwa and Surulere LGAs. Therefore, there is scope for increasing maize production in the local government areas by 0.19 percent, 0.19 percent, 0.22%, 0.20% and 0.09% with the present technology, it could be seen that maize farmers in Ogooluwa LGA are more technically efficient than farmers in other local government areas. It was therefore concluded that access to credit have positive impact on output and increase in size of production, though the production system is in stage three with respected to labour. It was recommended that more land should be cultivated at the current labour size, agricultural banks should be established in the rural areas in other to cater for the agricultural credit needs of small scale farmers and results of better researches of improved agronomic practices should be extended to the farmers.

**ANAEROBIC DIGESTION OF OLIVE OIL MILL WASTE: INOCULUM/SUBSTRATE
RATIO FOR BIOGAS PRODUCTION**

Inass HAMDI (Orcid ID: 0000-0003-3429-592X)

Ibn Tofail University, Faculty of Sciences

E-mail: inass.hamdi@uit.ac.ma,

Abstract

The disposal of olive oil-crushing residues represents a major challenge, as huge quantities are generated every year that need to be treated. Anaerobic digestion is a feasible alternative for the management and valorization of this waste through the production of biogas, which offers an option to generate renewable energy. The use of inoculum can significantly improve the stability of the process as well as the generation of biomethane by increasing the load of methanogenic bacteria. Several experimental investigations have been carried out using anaerobic biodegradation of solid and liquid waste from olive oil mills mixed with sewage sludge or cow manure to find the optimal I/S ratio to produce methane. The aim of this work is to present anaerobic digestion as a solution for the management of these residues, and the recent advances in the use of inoculum for their treatment.

Keywords: Anaerobic digestion, inoculum/substrate ratio, Olive oil-crushing residues, Valorization.

**UNPACKING THE IMPACTS OF EDUCATIONAL TECHNOLOGY ON BEGINNER
LEARNERS' DISPOSITIONS TOWARD EFL PEDAGOGY AT TANGUIÉTÁ
SECONDARY SCHOOL IN BENIN**

Zounhin TOBOULA

English Department, University of Abomey Calavi (UAC), Benin Laboratoire du Groupe de
Recherche sur l'Afrique et la Diaspora (GRAD)

E-mail: zounhin@gmail.com

Abstract

This study aims to determine the influence of Information and Communication Technologies (ICT) on beginner learners of Tanguiétá Secondary School and their attitudes towards English as a Foreign Language (EFL) pedagogy. Specifically, the research examines the impact of ICT on students' performance, attitudes, and study habits in EFL instruction. Data was collected from third- and fourth-form students at Tanguiétá Secondary School, and a mixed-methods approach was used to analyze the data. The quantitative data were analyzed using descriptive and inferential statistics, while the qualitative data was analyzed through content analysis. The results demonstrate that using ICT significantly influences students' attitudes and study habits, although its effect on their performance requires further investigation. The findings underscore the importance of teachers and parents in guiding students' use of ICT. This study provides valuable insights into the integration of ICT in education and its impact on EFL learners, serving as a comprehensive guide for future research and educational policy.

Keywords: Information and Communication Technologies (ICT), Beginner learners, Tanguiétá Secondary School, EFL teaching, Students' attitudes and performance

**EXPLORING EFFECTIVE STRATEGIES FOR MANAGING CLASSROOM
CONFLICTS: A STUDY ON THE IMPORTANCE OF CONFLICT MANAGEMENT
FOR ENHANCING CLASSROOM INTERACTION**

Dèkandé Sylvestre TCHAGNONHOU

Linguistique et Didactique des Langues Djibo Hamani University of Tahoua, Niger

Coffi Martinien ZOUNHIN TOBOULA

University of Abomey-Calavi (UAC), Benin

E-mail: zounhin@gmail.com

Abstract

This study explores effective strategies for managing classroom conflicts and the role of conflict management in enhancing classroom interaction in the context of English as a Foreign Language (EFL) instruction. The study investigates the significance of addressing and resolving conflicts among 438 EFL learners and 13 EFL teachers in a classroom setting. It examines the impact of conflict management on students' learning outcomes and overall classroom environment. The study utilized a mixed-methods approach, with a questionnaire administered to all participants and semi-structured interviews conducted with a subsample of teachers. The survey data was analyzed through thematic analysis, specifically a deductive thematic approach following the guidelines by Braun and Clarke (2006), while the interviews were analyzed through inductive content analysis, specifically an Interpretative Phenomenological Analysis (IPA) approach following the guidelines by Smith et al. (2009). The results indicate that effective conflict management strategies, such as communication, collaboration, and problem-solving, positively impact students' academic performance and foster a supportive and productive classroom environment. Additionally, the study reveals that teachers play a crucial role in managing conflicts in the classroom and that their beliefs, attitudes, and skills in conflict management greatly influence classroom dynamics. The findings of this study suggest that conflict management should be an essential component of EFL instruction and that teacher training programs should emphasize the development of conflict management skills to enhance classroom interactions and improve student learning outcomes.

Keywords: Classroom conflict management, Classroom interaction, EFL instruction, Thematic analysis, Interpretative Phenomenological Analysis

Abstract

The study focuses on identifying the consequences of the CoVid-19 pandemic in business trends with a focus on Kosovo. In all countries, business is one of the main carriers of economic development. The pandemic has negatively affected the business of each type of companies, Kosovo is known for an economy in transition where the business field is under development, based on elaborated statistics it is observed that no type of business has been left untouched by the pandemic, ranging from small individual businesses to large businesses or joint stock companies in Kosovo. The pandemic has a negative impact on all economic sectors, starting from the gastronomy, tourism, food industry, agricultural sector, trade and so on. The objective of the research is to identify the state of businesses in the post-pandemic period, the focus of the paper is to identify the chain impact on economic development trends in countries through economic indicators. The study offers factual data processed from a critical point of view from the research carried out during the month of February - March '23 in 80 businesses in the country, the methodology of analytical processing of empirical data from the official reports of local and international institutions was used, with the aim of finding on the way to a faster recovery of the economic situation in Kosovo, not overlooking other countries that can take the findings as a model.

Keywords: Businesses, Economic sectors, Pandemic, Economy in transition, etc.

**STUDY ON BIOSORBENTS FOR THE REMOVAL OF CHLORIDE
ION FROM WATER**

Subhashish DEY

Department of Civil Engineering, Gudlavalleru Engineering College, Gudlavalleru, Andhra Pradesh,
India

E-mail: subhasdey633@gmail.com

Abstract

The presence of pollutants in aqueous solution particularly from hazardous heavy metals and metalloids is an important environmental and social problem. The chlorides are one of the serious groundwater contaminants in rural areas. The chlorides are regulated in drinking water quality primarily because excess amounts can cause disease. Chloride in both its gaseous and liquid form can be irritating to the eyes, respiratory tract and skin due to its alkaline nature. Biosorption is one of the biological treatments that has emerged as a new technology for the removal and recovery of metal ions from aqueous solutions which is more environmentally friendly. In this study biosorption were used with the intention to remove heavy metals such as copper, zinc, chlorides and mercury ions from synthetic(distill) water. In the preliminary water analysis, the results indicated that several factors including Total Dissolved solids (1,07,000mg/l), Total solids (67,500mg/l), Suspended solids (1,81,000mg/l) shows higher value. After the treatment with biosorbent (fish scale powder) the value was found to be very less, the concentration of Total dissolved solids (9184mg/l), Total solids (13120mg/l), Suspended solids (4000mg/l).The optimum adsorption capacities of fish scale was investigated under several condition namely, pH, biosorbents dosage, initial heavy metals concentration, and contact time while final concentration was obtained by using the maximum percentage removals were observed at pH 6.5 and dosage 4.3g at biosorbent concentration at 90 rpm agitation speed with maximum removal achieved at 1/2 hours. Chloride analysis shows that presence of the heavy metal absorption by Solids and flowers. Every biosorbent had different physical, chemical and biological properties for heavy metals removal by biosorption from the water. The biosorption process can be made economical by regenerating and reusing of biosorbent after removing the heavy metals. Various bioreactors can be used in biosorption for the removal of metal ions from large volume of water.

**A GLUCOSE BIOSENSOR USING MEDIATED ELECTROCHEMISTRY OF *P*-
BENZOQUINONE AND GLUCOSE OXIDASE AND MACHINE LEARNING**

Dr. Keyvan ASEFPOUR VAKILIAN (Orcid ID: 0000 -0001-5035-7727)

Department of Biosystems Engineering, Gorgan University of Agricultural Sciences and Natural
Resources, Gorgan, Iran

E-mail: keyvan.asefpour@gau.ac.ir

Abstract

During the last three decades, a wide range of commercial portable blood glucose meters has been developed for patients with diabetes mellitus. However, according to the operating characteristics of these devices, their accuracy in determining the approximate concentration of glucose in the blood can be significantly influenced by environmental parameters. These conditions affect the activity of the glucose-oxidase enzyme significantly. The objective of this study was to develop an adaptive neuro-fuzzy inference system (ANFIS) to improve the performance of an amperometric glucometer in rough storage and operating conditions. ANFIS includes adaptive artificial neural networks (ANN) and a fuzzy inference system and uses a hybrid-learning rule merging gradient descent, backpropagation, and a least-squares algorithm to determine a set of parameters. An amperometric glucose oxidase biosensor was constructed using *p*-benzoquinone as the electron-transfer mediator. The adaptive neuro-fuzzy inference system as a robust machine learning method was utilized to learn the sensor's input features, including the current response of the sensor, operating temperature, and storage time period (in other words, the age of the enzyme; which can affect the enzyme's activity) to predict the glucose concentration of the human blood. The application of the proposed device in improper storage and operating temperature situations (e.g., temperatures higher than 40°C) resulted in lower than 0.015 mean squared error (MSE) compared with laboratory tests. Commercial glucometers usually need to be stored in relatively low temperatures to avoid decrement in enzyme activity. However, results showed that in comparison to laboratory tests and commercial devices, the system could predict blood glucose with acceptable performance even in improper thermal conditions. Machine learning is a promising technique when regression methods cannot model the system's behavior in nonlinear form.

Keywords: ANFIS, biosensor, glucose oxidase, portable device, *p*-benzoquinone

**THE IMPACT OF CLIMATE CHANGE ON MARINE KELP FORESTS AND THEIR
ECOSYSTEM SERVICES**

Vidya PADMAKUMAR (Orcid ID: 0000-0002-3830-4232)
Department of Zoology, Bangalore University, Bangalore, India
E-mail: vidyapkumar3@gmail.com

Murugan SHANTHAKUMAR (Orcid ID: 0000-0002-6132-6288)
Department of Zoology, Bangalore University, Bangalore, India

Abstract

Marine kelp forests are productive and diverse ecosystems that provide habitat, food and shelter for many marine organisms, as well as fisheries, nutrient cycling and carbon sequestration. However, climate change can affect their distribution, structure and functioning by altering ocean temperature, acidity and oxygen levels. These changes can reduce the growth, survival and reproduction of kelp and associated organisms, as well as the economic value and social benefits of kelp ecosystem services. To understand and manage these vital ecosystems in a changing climate, we propose a research agenda that includes: monitoring kelp dynamics using remote sensing and citizen science; assessing climate change impacts on kelp physiology, ecology and biogeochemistry; evaluating kelp ecosystem services under different climate scenarios; and developing adaptive management strategies and policy options to conserve and restore kelp forests.

Keywords: Marine kelp forests; Climate change; Ecosystem services; Ocean warming; Biodiversity

VARIOUS WAYS OF WASTE MANAGEMENT

Abstract

In this paper we have discussed about an important problem of our environment which is Waste and various ways of waste management. Waste management was among the biggest problems we are facing today. First, what is waste? So waste is any unwanted thing in our environment which are generated by human activities. According to The World Counts, more than 2 billion tons of wastes are dumped every year. Also, if all the waste was put on trucks, they can go around the world 24 times. And this great amount of waste is because 99 percent of the stuffs used by us are discarded within 6 months. For reducing this, we need to maintain or manage wastes so that they would not cause any harm to our environment. For waste management we must follow the 3R's that is Reduce, Reuse and Recycle. And for following 3R's we need to first segregate waste. Waste should be segregated because without segregation we cannot recycle the waste produced and it may result in severe environmental issues. For waste segregation, government are providing us with two types of dustbins which are coloured in two different colours that is blue and green. We should use it accordingly in blue one we have to have to dump dry, metal and anything that can be recycled waste materials and in green one we must dump wet wastes or organic wastes. Sadly, we fail to segregate or only few or very small amount of waste can be recycled because as we see that even having dustbin many people throw their waste all around the dustbin and do not even notice them and we also observed that the garbage collectors often mix them in same truck and the mixed waste is dumped in the open and fills near outskirts of cities. Recycling is not possible without segregation, government was helpless and unable to segregate this waste in its own, rag pickers do some good job in landfills, they segregate waste found in the landfills, in roads and in market places and sell them in private companies for recycling and help to save environment. Government is setting up many plants for waste segregation near landfills but that are also only helpful in planting only 10 -20 percent of waste. Remaining 80 percent of waste is left non recycled everywhere all-around and causing harmful risks to our environment. So, we should and everyone should segregate their waste at their home so that we can recycle almost all the waste formed. Like for example in Turkey they use zero waste management system.

ANTIDIARRHEAL ACTIVITY OF ETHANOL LEAF EXTRACT OF *Polyalthia longifolia* ON RAT MODELS

Abstract

Diarrhea illnesses are one of the main reasons for morbidity and mortality in developing nations and are accountable for the death of hundreds of thousands of people every year. Traditionally, people used *Polyalthia longifolia* for the treatment of various ailments, including diarrhea. Therefore, this study was aimed to investigate the antidiarrheal activity of ethanolic leaf extract of *Polyalthia longifolia* against castor oil-induced diarrhea and gastrointestinal motility in Rat models. The results of phytochemical screening showed that alkaloids and tannins occurred in high concentration, flavonoids and steroids occurred in moderate concentration, whereas terpenoids, glycosides and phenolic acid occurred in lowest concentration. The acute toxicity study revealed that the plant extract were not toxic even at the dose of 500 mg/kg. Different doses of ethanolic leaf extract of *Polyalthia longifolia* (200,400 and 600 mg/kg b.w) were evaluated for their antidiarrheal activities using castor oil-induced diarrhea, gastrointestinal transit models in Swiss albino Rats. Groups treated with 200,400, and 600 mg/kg b.w of extract showed significant ($P < 0.05$) inhibition in the frequency of defecation of wet feces and total fecal output compared with positive control. Similarly, Groups treated with 200, 400, and 600 mg/kg body weight of extract demonstrated significant ($P < 0.05$) antimotility activity when compared with the positive control. In conclusion, these findings illustrated that the ethanolic leaf extract of *Polyalthia longifolia* supported the traditional claim of antidiarrheal activity of the plant though further investigations are warranted.

Abstract

IoT technology has greatly benefited the general field of automation solutions. There are a few issues with existing automated processes due to the sector's significant number of data collection devices, most of which were developed and deployed long before the concept of the Internet of Things was introduced. The Internet of Things is a recent development in information and communication technology that provides worldwide connectivity and information management for users, devices, and sensors. As a result, over time, IoT and embedded technologies have collaborated to solve a variety of real-world problems. Because it employs gateways, the technology for integrating legacy equipment with IoT solutions is not novel. IoT gateways connect hardware to the Internet so that it can be used in real-world applications. A common real-world application is sending data from a microcontroller to a website, webpage, or web dashboard. Almost all of these applications favour wireless technology. Because of their smaller form factor when combined with a Wi-Fi shield, the ESPxxxx series of Wi-Fi modules is the most commonly used in these situations. An IoT gateway prototype is presented in this project to connect traditional Modbus RTU sensors to MQTT/HTTP cloud servers. The solution involves employing an ESP 8266 Node MCU as a bridge between the Modbus network and the cloud server. To make the data visible to the users, the data is transmitted from the sensors to the cloud server. This gateway will be able to take any type of value and it can be visible from anywhere in the world.

**BİYOKİMYASAL BAKIŞLA TRANSFÜZYON MERKEZİ DONANIM EKİPMAN
KRİTİK STOK SEVİYESİ DEĞERLENDİRMELERİ**

Uz Dr Naile Mısırhoğlu

Gaziosmanpaşa Eğitim ve Araştırma Hastanesi Biyokimya Uzmanı

Giriş ve amaç

Transfüzyon Merkezi; Acil durumlar dışında kan bağışıcısından kan alma yetkisi olmayan, kan ve bileşenlerini bağılı bulunduğu BKM'den temin eden, transfüzyon için çapraz karşılaştırma ve gerek duyulan diğer testleri yaparak hastalarda kullanımı için hazırlayan birimdir. Tüm yataklı tedavi kurumları sağıık kuruluşları TM açar. TM bu uygulama ile ilgili bilgileri BKM'ne iletmekle yükümlüdür. Transfüzyon Merkezi tanım olarak acil durumlar dışında kan alma yetkisi olmayan, kan ve bileşenlerini bulunduğu ildeki Kızılay BKM'den temin ederek, transfüzyon için çapraz karşılaştırma ve gerek duyulan diğer testleri yaparak hastalar için kullanıma hazırlayan birimdir (1).

Yöntem

Sonuçların onaylanması işleminde yerine getirilmesi gerekenler başlıca, gelen numunedeki kişiye özel tanımlama numarası, istem formundaki veya bilgisayardaki numara ile karşılaştırılmalı, etiketlemede ve kayıt safhasında hata yapılmadığından emin olunmalıdır. ABO ve RhD gruplarının, mümkünse elektronik ortamda, daha önce bakılan grupta sonuçlarıyla karşılaştırılarak doğrulaması yapılmalıdır. Transfüzyondan önce tüm uyumsuzluklar giderilmelidir. Laboratuvarda test sonuçlarının kontrolüne ve bağımsız iki kişi tarafından onaylanmasına olanak veren bir prosedür bulunmalıdır (2).

Sonuç

Kalibrasyonu geçmiş cihaz oranı, zamanında tamamlanmayan ekipman kalifikasyon oranı kan bağış sürecinin gerçekleştirilmesinde önemlidir. Güvenli kan için önemli kriterlerden biri de sürecin doğru ölçümlerle işletilmesidir. Bu nedenle her alanda kullanılan cihazların kalibrasyon zamanlarının planlanması ve bu plana uygunluğun takip edilmesi, kalifikasyon çalışmalarının etkinliğinin izlenip değerlendirilmesi kapsamında iyileşmeye açık alanların tespit edilerek ortadan kaldırılması önemlidir (3).

Abstract

In this study, it is discussed that gender, unlike biological sex, expresses learned patterns about femininity and masculinity and what kind of attitude differences this perception causes in business life. The socio-cultural & economic relations created by accumulating in the historical process during social life are also related to the gender role and social identity of the individual, and bring about the shaping of their behaviors accordingly. It causes problems in business life and can drag individuals exposed to it to a disadvantageous position. Restrictive identity labels created depending on gender roles are out of the hands of the patriarchal majority that rules the society and are used by the hegemonic patriarchal order to keep other minority crowds in a certain line with the pressure of "naturalization" towards gender. The aim of the study is to question gender attitudes, which rebuild the interpersonal social organization and determine the lives that people should live only depending on the biological sex they have, and turn them into a fixed necessity. The antidote to this polarization ultimately stands behind an alternative egalitarian theory as a more positive value. It has been tried to clarify feminism, which is thought to glorify women or to be hostile to men. Quantitative research model survey, one of the scientific research methods, was applied and the findings were reached with the SPSS. Questions in the research: The fairness of women working for lower wages than men, Whether marriage prevents women from working, the suitability of women to work after becoming a mother, the obligation of a working woman to give her husband her income, and contains content about men doing household chores such as laundry and dishes. As a result, the existing codes suppressed into thought structures needs to be changed. Recognizing two biological sexes, not masculinity and femininity, but one that is inextricably linked to the other, without the continuation of the lineage, and which can realize nature together, on the contrary, the destruction caused by artificial gender roles is clear. Having equal rights in theory does not mean that it can be applied in this way in practice. As it can be built with education and legal order, an enlightenment at the level of consciousness is also required.

Keywords: Gender roles, equality, feminism, work life balance, patriarchal system

R-CIRCULANT MATRICES WITH FIBONACCI-LIKE NUMBER ENTRIES

Abstract

The Fibonacci sequence $\{F_n\}$ is one of the most famous and important sequences studied in mathematics throughout the history. Its terms are called the Fibonacci numbers and they are defined recursively by the relation

$$F_n = F_{n-1} + F_{n-2}$$

for $n \geq 2$ where $F_0 = 0$ and $F_1 = 1$ are the initial values. The same recurrence relation also defines the Lucas sequence when the initial values are $L_0 = 0$ and $L_1 = 1$. One of the generalizations of the Fibonacci sequence is the generalized bi-periodic Horadam sequence $\{w_n\} = \{w_n(w_0, w_1; a, b, c)\}$ defined by the recurrence relation

$$w_n = a^{\xi(n+1)} b^{\xi(n)} w_{n-1} + c w_{n-2}$$

for $n \geq 2$ where w_0 and w_1 arbitrary initial values, and a , b and c are nonzero real numbers. Indeed, the the generalized bi-periodic Horadam sequence reduces to the Fibonacci sequence when $w_0 = 0$, $w_1 = 1$ and $a = b = c = 1$. In other words, $\{F_n\} = \{w_n(0, 1; 1, 1, 1)\}$. Similarly, $\{L_n\} = \{w_n(2, 1; 1, 1, 1)\}$, $\{q_n\} = \{w_n(0, 1; a, b, 1)\}$, $\{p_n\} = \{w_n(2, a; b, a, 1)\}$, and $\{H_n\} = \{w_n(w_0, w_1; a, a, c)\}$ are the Lucas sequence, the bi-periodic Fibonacci sequence, the bi-periodic Lucas sequence, and the Horadam sequence, respectively.

Matrices can be formed from the terms of a sequence. A special case of interest is the r -circulant matrices $C = [c_{ij}]$ of size $n \times n$ with entries

$$c_{ij} = \begin{cases} c_{j-i}, & j \geq i \\ r c_{n+j-i}, & j < i \end{cases}$$

where r is a nonzero complex number. Our goal in this talk is to construct r -circulant matrices whose entries are Fibonacci-like numbers with a particular emphasis on the generalized bi-periodic Horadam numbers. We provide lower and upper bounds for the norms of these matrices. We then compute the eigenvalues and determinants.

Keywords: R-Circulant Matrix, Spectral Norm, Bi-Periodic Horadam Numbers

Abstract

Despite many studies on the relationship between defense expenditures and economic growth, there is no consensus on the effects of defense expenditures on growth. This study econometrically examines the relationship between defense expenditures and economic growth in Turkey using annual data for the period 1988-2021. The stationarity of the variables used in the study was tested by ADF and PP tests and ARDL bounds test was utilized to reveal the short and long run relationships between the variables. The findings reveal that defense expenditures have a negative impact on growth in the short run. In the long-run, although defense expenditures have a negative impact on economic growth, its effect on growth is found to be statistically insignificant.

Keywords: Growth, Defense expenditures, ARDL bounds test

Özet

Rastgele değişkenler arasındaki bağımlılığın doğası, istatistiksel araştırmaların bir asırdan fazla bir süredir odak noktası olmuştur. Ancak günümüzdeki araştırmalar, öncelikle doğrusallık analizine odaklanmaktadır. Shannon karşılıklı bilgi ölçüsü, toplam bağımlılığı değerlendirmek için en kapsamlı yaklaşım olarak kabul edilmiş ve iki değişken arasındaki doğrusal ve doğrusal olmayan bağımlılık bileşenlerini ayırt etmek için birkaç teknik önerilmiştir. Bu çalışmada, parametrik özellikleri nedeniyle, toplam bağımlılığı ölçmek için Rényi ve Tsallis karşılıklı bilgi ölçülerinin kullanılması önerilmektedir. İlk olarak, değişkenler arasındaki doğrusal bağımlılığı ortadan kaldırmak için artık analizi kullanılmaktadır. Daha sonra, orijinal verilerin Rényi ve Tsallis karşılıklı bilgi ölçüleri, doğrusal bileşenin kaldırılmasından sonra elde edilen ölçülerle karşılaştırılarak doğrusallık derecesi belirlenir. Ayrıca, sonuçlar Shannon karşılıklı bilgi ölçüsü kullanılarak elde edilen sonuçlarla karşılaştırılmaktadır. Literatür, Shannon karşılıklı bilgi ölçüsünün kullanımını tercih etmektedir, ancak çalışmamız, parametrik esneklikleri sayesinde Rényi ve Tsallis karşılıklı bilgi ölçülerinin değişkenler arasındaki ilişkinin doğasını daha iyi yansıttığını göstermektedir.

Abstract

In architectural design education, students construct their ways of learning and reflect their ideas verbally in front of their tutors and visually through sketches, diagrams, plans, sections, digital models, and simulations. Although drawing, sketching, and model-making is crucial in architectural education, visualising textual and numeric data gathered through the design process could also help architecture students. To think with textual data could turn into an image to think with. Nowadays, the visualisation of textual data is more visible, doable and popular due to AI text-to-image-generated tools such as Midjourney and DALL-E. In that respect, this paper focuses on three types of visualisation based on textual and numeric data: calligrams, infographics and concept maps. This research compares examples of calligrams, infographics and concept maps to the current text-to-image-generated tools under five headings of data type, data collection, source of data, the aim of the visualisation, and types of visual narrative. As a result, comparing the five mentioned headings with numerous case studies could be a visual guide for architecture students. The visual guide is utilised to decrease their cognitive overload, communicate with their peers and tutors, find the necessary data for their project, analyse the textual and numeric data efficiently and enhance their design process.

Keywords: Architectural representation, calligram, concept map, infographics, text-to-image.

Abstract

Cities must deal with increasing disasters due to global climate change. University campuses are socio-ecological systems that can act like urban prototypes in which we can test self-sufficiency and resilience in their physical context. Current studies commonly look for smart city indicators and how to demonstrate them on university campuses, but most of them do not offer resilient planning and design strategies. This paper focuses on proposing a resilient smart campus design index. The proposed research methodology involves the determination of the index by integrating resilience and smart city indicators, followed by a case study assessment with BIM and climate analysis simulation. Simulation and modeling tools, including computer simulations, 3D modeling, and digital twins as part of "Smart," is used to evaluate the effectiveness of existing campus masterplan design guidelines and strategies for disaster resilience. As a result, climate change adaptive design strategies were proposed of different typologies, capable of functioning for different types of hazards. The potential use of digital twin and smart city technologies in disaster-resilient university buildings and campus design is explored, and potential challenges and limitations are identified. Integrating smart city principles and resilient thinking is a major demand for the city's future sustainability. This research methodology contributes to the literature on adaptive and smart disaster-resilient urban design index. The proposed study can assist in climate change adaptation and help decision-makers support further comprehensive planning and design approaches.

Abstract

This paper aims to explain the relationship between endoplasmic reticulum (ER) stress and Alzheimer's-like pathology. For this purpose, the studies on ER stress and Alzheimer's-like pathology have been reviewed. The ER is an important organelle that regulates processes such as the protein folding and trafficking (Braakman and Bulleid, 2011). Conditions such as increased protein synthesis, energy imbalance, and inflammation cause an increase and accumulation of unfolded proteins, leading to unfolded protein response (UPR) and ER stress in the cell (Chaudhari et al., 2014). It is known that ER stress plays a role in the pathogenesis of not only neurodegenerative diseases but also diabetes and cancer (Hoozemans et al., 2005; Ozcan et al., 2004). Alzheimer's Disease is a type of dementia that significantly affects the daily life of a person with learning, memory and behavioral impairments. It also creates social, psychological and economic problems for individual and society. For these reasons, new diagnosis and treatment options continue to be investigated in order to make an early diagnosis, increase the quality of life, slow down the clinical course, and reduce the economic burden for the individual and society, apart from symptomatic treatment (Kelly, 2008). Important markers of Alzheimer's disease are senile plaques formed by A β accumulation and neurofibrillary tangles formed by hyperphosphorylation of tau protein (Long and Holtzman, 2019, Kadavath et al., 2015). ER stress has been shown to be important in the course and progression of Alzheimer's disease (Scheper & Hoozemans, 2015). It was observed that p-eIF2 α , one of the ER stress markers, increased in Alzheimer's patients and neurodegeneration has been found to be prominent in p-eIF2 α positive neurons (Hoozemans et al., 2005). In another study, it was found that increased levels of eIF2 α lead to increased formation of amyloid- β responsible for plaque formation (Devi and Ohno, 2014). ER stress also reduces the degradation of tau proteins and causes their accumulation (Sakagami et al., 2013). UPR can cause Alzheimer's-like pathology, and proteins that increase in Alzheimer's disease can also cause UPR. It has been shown that tau hyperphosphorylation and A β accumulation decrease by inhibiting the GSK-3 β signaling pathway in Alzheimer's patients (Bian et al., 2016; Leroy et al., 2017). ER stress plays a role in the pathogenesis of Alzheimer's disease. New approaches to reduce ER stress could provide alternative treatment options.

Keywords: Endoplasmic reticulum stress, Alzheimer's Disease

Özet

Adli Tıp Kurumuna ait ölü muayene istatistikleri ve ölüm şekline bağlı hızlar incelenerek adli tıp hizmeti ve toplum sağlığını geliştirme planlanmalarına yardımcı olmak, yıllar içerisindeki negatif otopsi oranlarını değerlendirmek amaçlandı. Her yıla özgü adli tıp kurumu şube müdürlüklerine başvuran ölümlerin hızları ilgili yıldaki nüfus büyüklüğü üzerinden değerlendirilerek 1.000.000 kişideki ölüm sayısı yani ölüm hızı [(ölüm şekline göre sayı/nüfus)*1.000.000] hesaplandı. Adli Tıp Kurumu tarafından yapılan ölü muayeneleri arasında trafik kazasına bağlı, ateşli silah yaralanmasına bağlı, doğal (kendisinde mevcut hastalık), künt travmatik (darp, yüksekten düşme vb.) ölümlerin ilk sıraları oluşturduğu, ölüm nedeni bilinmeyenlerin oranının yıllar içerisinde arttığı gözlemlendi (Tablo 1, Tablo 2). Adli Tıp Kurumu Şube Müdürlüklerinin yaptığı adli olaylara bağlı ölü muayene sayısının toplam kaba hızının yıllar içerisinde arttığı gözlemlendi. 2013-2021 yılları arasında ölüm nedeni tespit edilemeyen vakaların oranları ülkemizdeki negatif otopsi oranlarını göstermesi açısından anlamlıdır. Bu oranların, 2013 yılı ve sonraki birkaç yılda literatürde bildirilen negatif otopsi oranlarının çok altında olmasının; “ölüm nedeni tespit edilemedi” ifadesinden kaynaklanabilecek doğal bir çekince olduğunu; bu ölümlerin adli boyutunun olmadığını, doğal bir sebepten olduğunu belirtmek adına daha çok “Doğal ölüm, kendisinde mevcut hastalık” ya da “Diğer” şeklinde kayıt edilmiş olabileceğinden kaynaklandığını düşünmekteyiz. Yıllar içerisinde bu konudaki farkındalığın arttığı ve negatif otopsi tanısının daha çok ve yerinde kullanılmaya başlandığı artan oranlardan anlaşılmaktadır. Ateşli silah yaralanmasına bağlı ölümlerde hızın dalgalı ve yatay seyir izlemesi, kesici, delici, ezici aletlerle olan ölümlerin ise ılımlı artışlar göstermesi, bu iki durumun da halen toplum güvenliği ve sağlığı için önemli bir sorun olduğunu göstermektedir. Bu nedenle bireysel silahsızlanma yönündeki politikaların

güçlenerek sürdürülmesi ve kamu güvenliği sağlanmasında rol oynayan kurumların gerekli tedbir ve denetimleri artırması faydalı olacaktır. Uygulamada trafik kazası sonucu meydana gelen ölümlü olayların bir kısmı nöbetçi adli hekimler tarafından değerlendirildiğinden ülkedeki durumu tam yansıtmamaktadır. Ancak diğer adli nitelikli ölümlü olaylar Adli Tıp Kurumu yapılanması üzerinden değerlendirildiğinden ülke genelini yansıtmaktadır.

Özet

Klasik otopsi bulguları ve olay yeri inceleme bulguları ile boyunda iki bıçak yaralanmasına bağlı ölüm vakası sunularak ölüm şeklinin (orijin) tartışılması amaçlandı. Olay yeri incelemesinde; 30 yaşında, psikiyatrik hastalık öyküsü tariflenen kadın olgunun mutfakta boynundan yaralanmış olarak yerde yattığı, yanında bıçak olduğu, ateşi yanan ocak üzerindeki tencerede yanmış yemek olduğu, olay yerinde boğuşma, dağınıklık bulguları olmadığı, cesedin boyun etrafında kan göllenmesi olduğu, bu göllenme dışında olay yerinde kan izi bulunmadığı, ellerinin kanlı olduğu, yalnızca kazağın boyna yakın yerlerinde kan bulaşlarının olduğu gözlemlendi. Boyunda iki adet kesici delici alet yaralanması olduğu, ilk yaralanmanın boyun orta hattın sol yanından başlayıp sağa ve hafif aşağı oblik uzandığı, boyun sol yanında daha derin seyrettiği, trakea kesisi ve solda vena jugularis interna kesisi oluşturduğu gözlemlendi (Resim). Diğer yaralanmanın ise boyun sağ tarafta yukarı doğru oblik uzandığı, alt ucunun ilk tarif edilen yara ile kesiştiği, yalnızca cilt ve kas seyirli olduğu gözlemlendi (Resim). Her iki akciğerde kan aspirasyonuna bağlı kaplan postu görünümü mevcuttu. İç organlar genel olarak soluk izlendi. Ölüm nedeni aşırı kan kaybı ve kan aspirasyonuna bağlı asfiksiydi. Boğazda tereddüt kesisi olmaması, iki tane kesici-delici alet yaralanması olması, ocakta yanmış yemek bulunması, genelde beklenen planlı intiharların olay örüntüsünden uzaklaştırarak, orijini cinayete doğru yaklaştırmaktadır. Bununla birlikte ilk yaralanmanın oblik seyri ve yara kuyruğu özelliği; yaralanmanın özelliği göz önünde bulundurulduğunda hareket kabiliyetinin bir süre devam edebileceği ön görülmesine rağmen olay yerinde boğuşmaya dair bulguya, cesedin bulunduğu yer dışında kan izine rastlanmaması; psikiyatrik hastalık öyküsü olması intiharı

düşündürmektedir. Tüm adli olaylarda olduğu gibi, ölümlü sonuçlanan adli olgularda da, tıbbi özgeçmiş, olay yeri incelemesi, yapılan adli ölü muayenesi ve otopsi işlemlerinin münferit değil, müşterek bir analizle değerlendirilmesi adli soruşturma süreçlerine katkı sunacaktır.

Resim: Boyunda iki keskin kuvvet yaralanması.

**HASTANELERDE BİLGİ GÜVENLİĞİ VE KALİTE SİSTEMİNİN HASTA
GÜVENLİĞİ ÜZERİNE ETKİSİ**

Birimi

E-mail: cihanyildiz365@gmail.com

Özet

Bir hastane bilgi sistemi, klinik bilgilere erişilebilirliği ve sağlık hizmetlerinin kalitesini iyileştirme potansiyeline sahiptir. Ancak, bu sistemin kullanımı, sağlık bilgilerinin güvenliği konusundaki endişeler gibi yeni zorluklarla sonuçlanmıştır. Araştırmamız Nisan 2022-Nisan 2023 12 aylık bir dönemini kapsamaktadır. Hastane bilgi güvenliğine ilişkin çalışanların ve hastaların görüş, öneri ve değerlendirmelerini tespit etmek amacıyla anket ve görüşmelerin kullanıldığı bu çalışmada ulaşılmıştır. Görüşmelerden elde edilen veriler analiz edilerek yorumlanmıştır. Bu doğrultuda uygulamada ortaya çıkan sorunlar ve çözüm önerileri bu görüşler doğrultusunda oluşturulmuştur. Araştırma sonucunda, katılımcıların yaygın olarak bilgi güvenliğinin önemini vurguladıkları ve bilgi güvenliği olgusunun öncelikle “hasta mahremiyeti” olgusuyla birlikte algılandığı tespit edilmiştir. Bilgi güvenliği yönetim sisteminin etkili işlemesi amacıyla, yöneticiler ve çalışanların işbirliği içinde olması araştırma sonuçlarına ilişkin geliştirilen önerilerden biridir. Başlarda zor ve anlamsız gözükten çalışmalar, sonrasında zamandan ve iş gücü bakımından tasarruf edildiği gözlemlenmiştir. Bir hastane bilgi sistemi, klinik bilgilere erişilebilirliği ve sağlık hizmetlerinin kalitesini iyileştirme potansiyeline sahiptir. Bu çalışmamız, üniversite hastanelerinde bilgi güvenliğinin durumunu idari, teknik ve fiziksel önlemler açısından değerlendirmeyi amaçlamaktadır.

Anahtar Kelimeler: bilgi güvenliği, bilgi güvenliği yönetimi, hastane bilgi sistemi

**ANESTEZİ VE REANİMASYON YOĞUN BAKIM ÜNİTESİNDE TRAVMA
HASTALARIN TAKİP VE TEDAVİ YAKLAŞIMI**

Uzm. Dr. Veysel DİNÇ (Orcid ID:0000-0003-2718-5212)

E-mail: veysel.dinc@saglik.gov.tr

Özet

Çalışmamızda 2020-2022 yılları arasında Yoğun bakım üniteleri (YBÜ), potansiyel olarak yaşamı tehdit eden hastalıklarla uğraşan multidisipliner yapılardır. YBÜ’de tedavi edilen hastaların bir kısmını travma hastaları oluşturmaktadır. Çalışmada YBÜ’de tedavi ve takip ettiğimiz travma hastalarındaki mortalite nedenlerini inceledik. Bu çalışmada primer çıktı olarak travma nedeni ile kabul oranlarında ulusal ve uluslararası ölçekte farklılıklar ortaya çıkmış olup mortalite oranları düşük bulundu, travmatik yaralanmaların genç ve erkek cinsiyette daha fazla görüldüğü saptandı. Çalışmamızda; laktat düzeyi yüksekliği ile 27-95 günlük mortalitenin olumsuz olarak etkilendiği ve laktat düzeyi düşüklüğü ile hemodiyaliz ihtiyacının belirgin olarak azaldığı gösterildi. Erken enteral beslenmenin 27 ve 95 günlük mortalite üzerine olumlu etkisi ortaya konuldu. Travma hastalarının yoğun bakıma kabulü sırasında yüksek laktat, APACHE-2 ve düşük RTS düzeyi mortalite ile doğrudan ilişkilidir. Mortalitenin düşürülmesi açısından mekanik ventilasyonda kalış süresinin mümkün olduğunca kısaltılması hedeflenmelidir. Özellikle travma öyküsü olan ve periferik sinir bloğu yapılması planlanan hastalarda ameliyat öncesi nörolojik muayene hemen işlem öncesi hemen yapılmalı, ameliyat sonrası karşılaşılabilecek sinir hasarının ayırıcı tanısında bu çok önemlidir. Travmaya bağlı sinir hasarı görülen hastalarda erken dönemde nörolojik muayene normal iken, hastanın motor ve duyu muayenesinde değişiklikler olabilir ve bu durum gözden kaçabilir.

Anahtar Kelimeler: Travma, yoğun bakım, YBÜ mortalite

TRAVMATİK DAMAR YARALANMALARI VE TEDAVİ YAKLAŞIMI

Uzm. Dr. Burcu BIÇAKHAN (Orcid ID: 0000-0002-5798-6750)
S.B.Ü. Gaziosmanpaşa Eğitim ve Araştırma Hastanesi - Kalp ve Damar Cerrahisi
E-mail: isiksungur@gmail.com

Özet

Travmatik damar yaralanmaları sadece harplerde değil, artık bugün sivil hayatta da sıklıkla karşılaştığımız, tedavisi özellikler isteyen bir konudur. Kliniğimizde tedavi edilen damar yaralanması olguların nedenleri, teşhis metodları, tedavisi ve sonuçlarına ait verileri tartışmaktır. 2014-2018 yılları arasında kliniğimize 31 damar yaralanması incelendi. 31 damar yaralanması incelendi. Bunlardan 30'u erkek, 1'i kadındı. 20 hasta kurşunlanma, 2 hasta camla kesi, 4 hasta bıçaklanma, 2 hasta saçma ile, 1 hasta silah namlusu parçası ile, 2 hasta taş ile yaralanmıştır. 23 vakada yaralanma alt extremitede, 8 vakada üst extremite- tede idi. 1 vakaya yaralanmadan 3 saat sonra, 1 vakaya 24 saat, 1 vakaya 5 gün sonra, ilk müdahale yapılmıştır. 8 tanesine yaralan- Badan hemen sonra ilk müdahale yapılmıştır. 12 tanesine ilk müdahale yapılmış fakat yaralanmadan ne kadar sonra olduğu belirsizdir. 8 vakanında ilk müdahale görüp görmediği tesbit edilememiştir. Periferik damar yaralanmalarında yaralanma şekli ve yeri, ek lezyon olup olmaması ve erken cerrahi girişim morbidite ve mortaliteyi belirleyen en önemli faktörlerdir.

Anahtar Kelimeler: arter, yaralanma, cerrahi

Abstract

Androgen insensitivity syndrome (AIS) is an X-linked recessive disorder associated with incompatible genotypes and phenotypes caused by mutations in the androgen receptor (AR) gene is located at Xq11-q12. We have detected a rare mutation in the AR gene that has not been reported in the literature. Clinical findings are female external genitalia at birth, abnormal secondary sexual development in puberty, infertility in individuals with a 46, XY karyotype as typically characterized AIS. In our case, a 17-year-old female phenotype presented with primary amenorrhoea and predominantly female external genitalia. The patient had 46, XY with female phenotype. We detected a missense rare mutation in the first exon as NM000044 c.5A>G variant was not found in ExAc or 1000 genome population database. Substituting at position 2 to glutamic acid exchange to glycine. Glutamic acid is a polar amino acid with a negative charge while glycine has stayed in a nonpolar hydrophobic group. So, we thought that the mutation may cause a physical defect in protein and the native three-dimensional structure of the AR gene

Keywords: Androgen receptor, primary amenorrhoea, sequence analysis

Abstract

Vulvar nodular melanoma is a rare type of vulvar cancer. In this research, a patient with vulvar nodular melanoma who had previously been operated on breast cancer was . The case was prepared to share pathological and medical genetic examinations and treatment of this case with professionals dealing with oncology. We studied somatic mutation panel on biopsy material by next gene DNA sequence technology. According to molecular genetics data, a pathogenic variant of the *c-KIT* gene was detected which had a therapeutic target in metastatic melanoma.

Keywords: Breast cancer, *c-KIT* gene, vulvar melanoma

Abstract

Introduction: Although the appearance of the smile has many factors, for a beautiful smile, the teeth, gums, lips and facial structure must be in harmony. The positive effect that the dentist will make on the appearance, outlook and general psychology of the prosthetic visits cannot be ignored. Diastema are spaces between two teeth due to various etiological factors. Polydiastema is the spaces between more than two teeth. Many methods are used in the aesthetic revision of polydiastema, from direct and indirect composite laminates and porcelain laminates to porcelain veneer crowns. Case description: The first of two patients who were admitted to our clinic had maxillary anterior polydiastema at the age of 19, the other had a large diastema between the maxillary central teeth at the age of 52, and both cases had aesthetic parts due to the female gingival level. Necessary treatment options were explained to our patients with good oral hygiene. Direct or indirect composite resins, which are aesthetic and easy to apply, guide their use in limited effects with enamel due to discoloration, microleakage, low elongation resistance and plaque uptake. Ceramic laminate coating; They are aesthetic, biocompatible, stable, predictable treatment results and minimal risk of gingival irritation. Both agreed on the porcelain laminate option. Conclusion: Gingival meeting was performed with Nd-YAG laser in both collections. Treatment of the maxillary anterior teeth with minimally invasive porcelain laminates was performed and 3-month follow-up photographs were taken.

Keywords; Lamina, Laser, Diastema

**BİR DEVLET HASTANESİNDE KAN TRANSFÜZYON MERKEZİNİN
İŞLEVSELLİĞİNİN DEĞERLENDİRİLMESİ**

Uzm. Dr. Mustafa Karagülle (Orcid ID: 0000-0003-4184-902X)

Eskişehir Yunus Emre Devlet Hastanesi / Hematoloji Kliniği / Eskişehir /Türkiye

E-mail:mustafakaragulle@yahoo.com

Özet

Giriş Transfüzyon Merkezi, kan veya kan bileşenine ihtiyacı olan hastaların kan tedariklerinin sağlandığı, kullanıma sunulmadan önce gerekli testlerinin yapıldığı hizmet birimidir. Transfüzyon, sağlık sorunu sebebiyle ihtiyacı olan hastaya tam kan ya da kan bileşeni nakli olarak tanımlanır. Kan ve kan bileşenlerinin tek kaynağı sağlıklı kan bağışçılardır. Transfüzyon, tam kan veya tam kanı oluşturan komponentlerin ayrı ayrı hazırlanmış ürünleri ile yapılır. Bu ürünlerden en çok kullanılanı eritrosit süspansiyonudur. Tam kanın trombosit zengin plazma kısmının ayrıştırılması (200-250 ml) ile elde edilir. Bu çalışmada Ocak 2018-Mart 2023 yılları arasında kan transfüzyon merkezinde yapılan işlemler incelenerek işlevselliğin değerlendirilmesi amaçlandı.

Yöntem Eskişehir Emre Devlet Hastanesi Kan Transfüzyon merkezinde Ocak 2018-Mart 2023 tarihleri arasında yapılan işlemler incelendi. Hastaların bu işlem öncesi serum hemoglobin düzeyleri kayıt altına alındı.

Bulgular Bu süreçte 35430 hastaya cross-match işlemi yapıp eritrosit süspansiyonu hazırlığı yapıldı. Bu işlem yapılmış olan hastalardan 21994' ne (%62,07) ise kan transfüzyonu yapıldı. Transfüzyon öncesi hastaların % 57 'de serum hemoglobin düzeyi <7 gr/dl, % 38'de serum hemoglobin düzeyi 7-10 gr/dl ve % 5'de serum hemoglobin düzeyi >10 gr/dl olarak saptandı. Hastalarda transfüzyon ilişkili hayatı tehdit edici reaksiyon gözlenmedi.

Sonuç: Her hastanın transfüzyon gereksinimi daha önceden belirlenmiş hemoglobin ve hematokrit değerine göre değil, hastanın klinik durumuna göre belirlenmelidir. Kan ürünü talep ederken hastanın kliniği ve işlemin riski gözönüne alınarak daha dikkatli talepte bulunulmalı. Bu durum hem iş gücü kaynağının daha etkin kullanılmasına hem de transfüzyon merkezinin işlevselliğinin artmasına katkı sağlayacaktır.

Anahtar Kelimeler: Transfüzyon, eritrosit süspansiyonu, transfüzyon merkezi, etkinlik

Abstract

Fast and reliable delivery in the e-commerce sector is becoming increasingly important with the growth of digital sales channels. Customers value delivery reliability and whether or not orders arrive on the stipulated day. Accurate prediction of delivery times in the e-commerce sector plays an important role in optimizing supply chain operations and customer experience. The aim of this study is to develop delivery time prediction models based on supervised machine learning algorithms. Prediction models have been developed using Extreme Gradient Boosting (XGBoost), Random Forest (RF) and Multi-Layer Perceptron (MLP). The dataset, which has been obtained from Kaggle, has 5113 rows and includes historical shipment data over the 16-month period between February 14th 2019 and June 13th 2020. The performance of the developed models has been evaluated using Mean Absolute Error (MAE) by utilizing 10-fold cross-validation on the dataset. Results show that the average MAE's of RF-based, XGBoost-based and MLP-based models are 3.50, 3.68 and 3.83, respectively.

Özet

Su, insan hayatının ve canlılığın devam edebilmesi için temel unsurların başında gelmektedir. Günümüzde sanayileşmenin ve nüfusun fazla olmasıyla mevcut su kaynakları hızla tükenmekte ve kirlenmektedir. Küresel olarak çevre kirlenmesi devam ettikçe su sorunu artmaktadır. 2,3 milyar insan (küresel nüfusun %29'u) güvenli ve sağlık bir şekilde yönetilen suya erişimden yoksun olup 721 milyon insan ise yüksek ve kritik düzeyde su kıtlığı yaşayan ülkelerde yaşamaktadır. Diğer taraftan; sürekli olarak gelişen ve değişen sosyoekonomik faktörlerin, su kalitesinin bozulmasına ve su kıtlığı gibi zorluklarla dünyadaki su kaynakları üzerindeki baskıyı arttırmaktadır. Günümüzde küresel olarak su kaynaklarına yönelik talep önemli ölçüde artmaktadır. İnsanların çevre ile olan ilgilerinin artması sonucu küresel ekolojik çevre tüm dünya ülkelerinde daha fazla ilgi görmeye başlamış olup, bu durum toplumların atıksu geri kazanımına daha fazla önem vermesini sağlamaktadır. Atıksuların geri kazanımının artırılması, geri kazanılmış atıksuyu farklı alanlarda kullanım imkanlarının oluşturulması ve geri kazanımının teşvik edilmesi ile sağlanabilir. Geri kazanılmış suyun kullanımı, su kaynaklarının korunmasının önemli bir biçimi olup artan su talebinin karşılanması açısından büyük önem arz etmektedir. Her geçen gün toplumların ihtiyaçları sebebiyle endüstriyel üretim artmakta ancak atıksu arıtımı için kullanılan teknolojilerin pahalı olması sebebiyle işletmeler atıksularını kriterlere uygun şekilde arıtmamakta olup çevre doğrudan kirletilmektedir. Organize Sanayi Bölgeleri ise fabrikaların faaliyetlerinden kaynaklanan çevresel problemlerin en aza indirilmesi veya ortadan kaldırılması ve ekonomik açıdan geri kalmış bölgeler arası dengenin sağlanmasını amaçlayan bir sistemdir. Bu bağlamda çalışmada; organize sanayi bölgesi atıksu arıtma tesislerinin çıkış sularının yine organize sanayi bölgesi içindeki işletmelerde kullanım alternatifleri değerlendirilmiştir. Alternatiflerin değerlendirilmesi sürecinde çıkış sularının arıtılmış atıksuları kullanabilecek sektörlerin taleplerine göre ilave arıtma kademelerinden geçirilmesi düşünülmüştür. Böylece ilave arıtma kademelerinin maliyetleri ortaya konarak birim atıksu geri kazanım maliyeti belirlenmiştir.

Anahtar kelimeler: Atıksu, endüstriyel atıksu, su kıtlığı, geri kazanım, organize sanayi bölgesi

GÜL DEVRİMİ: EGZOTERİK KIRMIZI MI, ESOTERİK SİYAH MI, MAVİ MI?

Özet

Tarih boyunca, fikirleri ve nitelikleri temsil etmek için semboller kullanılmıştır. Bazı şeylerin başka şeyleri temsil ettiği fikri oluşmuştur. Bir şeye, örneğin kırmızı gibi belirli bir renge bakılabilir ve bunun kırmızı rengin kendisini değil, onu aşan bir şeyi temsil ettiği sonucuna varılabilir. Örneğin kırmızı güller açısından tutkuyu, gerçek aşkı, romantizmi ve arzuyu sembolize eder. Kırmızı, ateş renginden dolayı sıcaklık anlamına gelir. Aynı şekilde, kanla kızardığında yüzün kızarıklığının artması nedeniyle öfke anlamına da gelebilir. Siyasi olarak, radikal bir değişimi veya devrimi ifade eder. Beyaz güller tipik olarak masumiyeti, sakinliği ve saflığı temsil eder ve ayrıca yeni bir başlangıcı da temsil edebilir. Beyaz gül, bir hatırlama sembolü olarak güven, sadakat ve saygı ile özdeşleştirilmiştir. Siyah güller neşeli anlamlarla ilişkilendirilmez ve bir dönemin bitişini, kapanmayı ve vedalaşmayı simgeler. Mavi aynı zamanda isyanın da rengidir. Gerçekte mavi güller doğal olarak yoktur; beyaz, gül renginde mavi, gerçekleştirilemez bir rüyayı, coşkuyu ve fanteziyi temsil eder. 2003 yılında Gürcistan muhalefeti Cumhurbaşkanı Şevardnadze'yi devirmiş ve bu iktidar değişikliği, siyasi muhalefet liderlerinin elinde kırmızı güller ile parlamentoda protesto gösterileri yapması nedeniyle 'Gül Devrimi' olarak tanımlanmıştır. Bu makale Gül Devrimi'nin gerçekten kırmızı mı, beyaz mı, siyah mı yoksa mavi mi olduğuna ışık tutacaktır.

Abstract

Petroleum-based synthetic products are frequently used in both textile and other (plastic, packaging, construction, etc.) fields. The biodegradation time of these products takes centuries and the raw material is not renewable, which makes it necessary to recycle such products. Polypropylene fiber is a raw material that is preferred almost as much as polyester fiber in face-to-face carpet production due to its advantages such as lightness, cheapness and color fastness. Since polypropylene fiber has low resilience and static loading resistance, these carpets can be easily felted due to the traffic. Therefore beside these advantages the using life of polypropylene carpet is not very long. The amount of waste generated by petroleum-based polypropylene fiber, both after use and during production, is increasing day by day. Recycling the wastes released during the production process and during use will reduce the amount of petroleum to be used, thus reducing carbon emissions simultaneously. Polypropylene can be recycled in two ways as mechanical and chemical. The mechanical process can be done by converting the product back into fiber with a suitable opening machine, or by converting the products back into granules by extrusion. However, the products obtained in this way are not used as value-added products, but are generally used in the packaging industry or as textile filling material. The quality and market value of these products are equally low. With the recycling methods that can be provided by chemical means, polypropylene fiber is reused by converting it into raw material by pyrolysis process. Re-usability of these recycled fibers in the carpet industry by improving their mechanical properties with the necessary chemical treatments can make a significant contribution to the industry. In this study, the recycling methods of polypropylene fiber used in the carpet industry will be examined.

Özet

Geleneksel mimaride, bölgenin yerel dokusunu oluşturan inşa malzemesi, malzemenin bulunabilirliğine bağlı, yakın çevrede mevcut halde olan doğal kaynaklardan temin edilmektedir. Dolayısı ile iklim koşullarına da bağlı olarak her bölgede farklılık göstermektedir. Ancak hala, diğer çağdaş yapı malzemeleriyle aynı düzeyde kullanılan en eski yapı malzemesi ve tekniklerinden biri kâgir duvardır. Yığma yapım tekniği, geleneksel olarak, yapıları kaplamak ve taşıyıcı sistem oluşturmak için popüler ve etkili bir yöntem olmuştur. Bugün, dünyadaki tarihsel ve kültürel açıdan önemli olan yapıların büyük bir bölümü bu teknik ile inşa edilmiştir. Taş, tuğla, kerpiç vb. yerel malzemeler ve yığma yapım tekniği ile inşa edilen kâgir duvarların örümünde bağlayıcı ya da dış duvarlarda sıva malzemesi olarak yine yerel malzemeye bağlı geliştirilen kâgir harçlar kullanılmaktadır. Dolayısı ile kâgir harçlar, evrensel kullanımı olan, özellikle de geleneksel yapılarda yapı elemanlarının inşasında ve farklı alanlarda uygulanan yerel bir inşa malzemesidir. Alçı-kireç ya da kil esaslı kâgir, hidrolik harçlar üretmek için doğal puzolanik agregaların yapılarda kullanımına, Roma döneminde keşfedildiğinden günümüze kadar sık rastlanılmaktadır. Bu harçların, tuğla inşa malzemesi ile örülen taşıyıcı duvarlarda bağlayıcı olarak kullanıldığı örnekler, dünyada çapında en çok kolonyal dönem yapılarında görülmektedir. Benzer şekilde moloz ve kesme taş ile inşa edilmiş geleneksel yapılarda da bu tür kâgir harç kullanımları yoğundur. Taş duvar-kâgir harç birlikteliği özellikle, 14.-19. y.y arasında inşa edilen yapılarda, farklı teknik ve uygulamalar ile karşımıza çıkmaktadır. Cas Evleri, Türkiye'nin Güneydoğu Anadolu Bölgesi'nde konumlu Siirt kentinde yer alan, çevrenin tüm zor etkilerine karşı direnmeyi başarıp günümüze kadar gelebilen, kentin tarihi dokusunu oluşturan yapılar arasında önemli bir değere sahip olan, yerli halk ve ustalar tarafından konut fonksiyonlu olarak inşa edilen, *cas*, *moloz taş* ve *yığma yapım tekniği* üçlü uyumunun birer örneğidir. Cas evleri, Siirt iline özgü, kendine has yapılarıdır. İki veya üç katlı olan bu evler, iklimsel konforu yüksek, çevreye zarar vermeyen, doğal, sürdürülebilir malzemelerden inşa edilen çevre dostu yapılarıdır. Günümüzde halen ayakta kalıp konut olarak kullanılan ya da hasar almaya başladığı için terk edilen evlerin örnekleri, hem kent merkezi hem de Siirt'e bağlı Aydınlar ilçe merkezinde bulunmaktadır. Bu evlerin inşa malzemesi olan cas harcı, alçı ve kireç taşlarının, moloz taşlardan arta kalan ufak taşlar ile birlikte önce fırınlarda (tandırda) pişirilmesi, daha sonra öğütülerek toz haline getirilmesi ile elde edilir.

Anahtar Kelimeler: Cas evler, geleneksel mimari, evrensel, kâgir, yığma, kireç-alçı taşı, kil

REGULARITY PROPERTIES FOR FRACTIONAL BOUSSINESQ EQUATIONS
AND APPLICATIONS

Veli B. Shakhmurov

Antalya Bilim University Department of Industrial Engineering, Dosemealti,
07190 Antalya, Turkey, **E-mail:** veli.sahmurov@antalya.edu.tr

Abstract

In this talk, we consider the Cauchy problem for the following fractional Boussinesq equation

$$u_t + \beta \Delta u + Au = f(u); x \in \mathbb{R}^n; t \in (0; T); \quad (1.1)$$

$u(x; 0) = \varphi(x), u_t(x; 0) = \psi(x); \quad (1.2)$

where β is a real number, A is a linear operator in a Banach space E , $u(x, t)$ is the E -valued unknown function, $f(u)$ is the given nonlinear function, $\varphi(x)$,

$\psi(x)$ are the given initial functions, and Δ denotes the Laplace operator in \mathbb{R}^n . Since the Banach space E is arbitrary and A is a possible linear operator,

by choosing E and A we can obtain numerous classes of generalized Boussinesq type equations which occur in a wide variety of physical systems,

The existence, uniqueness and regularity properties of solution of the Cauchy problem for the fractional abstract Boussinesq equation is obtained. First, we consider the linear Boussinesq equation and prove the existence, uniqueness and the regularity properties of solutions. It can be used to obtain the existence and uniqueness of the regular solution of corresponding nonlinear Boussinesq equation. By applying this result, the Cauchy problem for finite or infinite systems of Boussinesq equations are studied.

E-mail: hzacar@gmail.com

AIM: Early diagnosis, treatment and follow-up are important in Hashimoto's thyroiditis. To detect early ultrasonography (USG) and Color Doppler (CDUSG) findings in children of mothers with Hashimoto's disease is to provide early diagnosis, treatment and follow-up.

METHODS: USG and CDUSG analyzes were performed using GE Logiq 730 pro, GE Logiq 9, GE Logiq S7 expert devices and 4-15MHz, 5-13MHz linear transducers. Both thyroid lobes and isthmus were examined in different planes. Vascularization characteristics were evaluated. In the presence of nodules, TI-RADS scoring was performed. In our study, USG and CDUSG examinations were performed on 34 mothers diagnosed with Hashimoto's disease and their 42 children in total, and the findings were investigated retrospectively.

RESULTS: The age range of the children is 4-13, the average is 7.5. 22 of them are girls and 20 of them are boys. Normal USG findings were observed in 11 (22.2%) of 42 children. In 16 (38.1%) children, TI-RADS 1 nodules not exceeding the millimeter size were found to be few in number. The gland in these children showed normal size and echopattern. Early-stage Hashimoto's findings were detected in 9 (21.4%) children. These findings can be summarized as diffuse heterogeneous pattern in the gland, patchy hypoechoic areas, pseudonodular infiltration areas, and hyperechogenic fibrous septal structures. No expansion or hypervascularization of the gland was detected in any of these cases. In 6 (14.3%) children, TI-RADS 1 micronodules were detected in addition to early Hashimoto findings.

DISCUSSION: Hashimoto's thyroiditis, also known as chronic autoimmune thyroiditis or chronic lymphocytic thyroiditis. Although it is most common in middle-aged women, it is the most common thyroiditis in childhood and is the main cause of acquired hypothyroidism. Hashimoto's disease affects about 1% of children. It is characterized by the destruction of thyroid follicles due to various cell and antibody-mediated immune processes and lymphocytic infiltration. It is thought to occur with the effect of environmental factors in individuals with

etiologically genetic predisposition. In undiagnosed hypothyroid children, slow growth rate can be seen. Additional symptoms include weakness, pallor, dry and itchy scalp, increased sensitivity to cold, and constipation. If left untreated, it can have devastating consequences such as physical growth retardation and mental retardation. Hypothyroidism can occur in children of any age, even infants, with thyroid problems. In addition, the most common endocrine disorder among school-age children is thyroid-related. It is known that Hashimoto's disease can progress asymptotically for years. This further increases the importance of early diagnosis.

CONCLUSION: Early stage findings can be detected by using USG + RDUSG, which is a noninvasive method, for screening purposes in children of mothers diagnosed with Hashimoto's. Thus, the cases have a chance to be treated and followed up in the early period.

FULL TEXT

EXPRESSING GENES of CANOLA (*Brassica napus* L.): A REVIEW

Asst. Prof. Dr. Aynur BİLMEZ ÖZÇINAR (Orcid ID: 0000-0002-3173-6147)
Siirt University, Faculty of Agriculture, Department of Field Crops, Siirt, Turkey
Corresponding author: aynurbilmez@siirt.edu.tr

Abstract

Canola is one of the most important oilseed crops worldwide. Over the last few decades, research focusing on canola seed oil content and composition has expanded. Identifying genetic variation that increases crop yields is a primary objective in plant breeding. Genetic engineering, to some extent, can overcome the limitations of genetic exchange in conventional breeding. Here reader may find a review of molecular mechanisms underlying the canola plant's response to biotic and abiotic stress factors and yield and oil quality in brief.

Keywords: Genes, expression, canola, rapeseed, *Brassica napus* L., biotechnology

Introduction

Brassicaceae includes numerous vital oils, vegetables, feed crops, and attractive horticultural plants, making it a very significant genus (Wang et al., 2020). *Brassica napus* ($2n=38$, AACC) is a significant oilseed crop in the globe. Breeding programs for *B. napus* (canola, rapeseed) have a primary goal of increasing oil yield. Oil yield in canola is measured by seed yield and oil content at the same time. A great deal of effort has gone into finding a germplasm and hybrid cross with a higher seed oil content (Qu et al., 2013). Rapeseed is a major oil crop in many parts of the world. It is critical to develop new varieties with higher seed output and increased stress tolerance for better response to abiotic challenges caused by global climate change for present production. To some extent, genetic engineering can overcome the restrictions of genetic exchange in traditional breeding. As a result, it is regarded as a viable strategy for improving modern canola crop breeding. Because crop stress resistance is a polygenic complex trait, the only way to acquire comprehensive stress resistance in crops is through multi-gene synergistic effects (Wang et al., 2018).

MicroRNAs (miRNAs) and small interfering RNAs are important regulators of plant development and seed formation. Increasing numbers of small RNAs have been identified as regulatory RNAs that modulate gene expression at both the transcriptional and posttranscriptional levels (Zhao et al., 2012). Small RNAs include two main types of small non-coding RNAs, microRNAs (miRNAs) and small interfering RNAs (siRNAs). The recently published genome of *Brassica napus* offers for the first time the opportunity to gain insights into the genomic organization and the evolution of miRNAs in oilseed rape. 12 small RNA libraries from two *B. napus* cultivars and their four double-haploid lines were sequenced, employing the newly sequenced *B. napus* genome, together with genomes of its progenitors *Brassica rapa* and *Brassica oleracea* by Shen et al., (2015). A total of 645 miRNAs including 280 conserved and 365 novel miRNAs were identified. Comparative analysis revealed a high level of genomic conservation of MIRNAs (75.9%) between the subgenomes of *B. napus* and its two progenitors' genomes, and MIRNA lost/gain events (133) occurred in *B. napus* after its speciation.

Yield and oil quality

Identifying genetic variation that increases crop yields is a primary objective in plant breeding. Miller et al., (2019) used association analyses of oilseed rape accessions to identify genetic variation that influences seed size, lipid content, and final crop yield. Variation in the promoter region of the HECT E3 ligase gene BnaUPL3.C03 made a major contribution to variation in

seed weight per pod, with accessions exhibiting high seed weight per pod having lower levels of BnaUPL3.C03 expression. Researchers defined a mechanism in which UPL3 mediated the proteasomal degradation of LEC2, a master transcriptional regulator of seed maturation. Accessions with reduced UPL3 expression had increased LEC2 protein levels, larger seeds, and prolonged expression of lipid biosynthetic genes during seed maturation. Natural variation in BnaUPL3.C03 expression appears not to have been exploited in current *B. napus* breeding lines and could therefore be used as a new approach to maximize future yields in this important oil crop.

Well-developed seedlings lead to a higher yield stability even under suboptimal growing conditions like reduced nutrient input or drought stress. An optimal seedling development of *Brassica napus* plants leads to a higher yield stability even under suboptimal growing conditions and has therefore a high importance for plant breeders. Körber et al., (2015) examined the expression levels of candidate genes in seedling leaves of *B. napus*, correlated these with seedling development and detected genome regions associated with gene expression levels and seedling development traits in *B. napus* by genome-wide association mapping. The candidate genes GER1, AILP1, PECT, and FBP were strongly correlated with the seedling development traits. They detected a total of 63 associations between single nucleotide polymorphisms (SNPs) and the seedling development traits and 31 SNP-gene associations for the candidate genes. The results suggested that the studied genes ribulose 1,5-bisphosphate carboxylase/oxygenase small subunit (RBC) on the chromosomes A4 and C4 and fructose-1,6-bisphosphatase precursor (FBP) on the chromosomes A9 and C8 are cis-regulated.

Over the last few decades, research focusing on canola (*Brassica napus* L.) seed oil content and composition has expanded. Oil production and accumulation are influenced by genes participating in embryo and seed development (Elahi et al., 2016).

Developing yellow-seeded rapeseed with improved qualities is a major breeding goal. The intermediate and final metabolites of the phenylpropanoid and flavonoid pathways affect not only oil quality but also seed coat colour of *B. napus*. The accumulation of phenolic compounds was analysed in the seed coats of black-seeded (ZY821) and yellow-seeded (GH06) *B. napus* by Qu et al., (2013). Two and 13 unique flavonol derivatives were detected in ZY821 and GH06, respectively. Quantitative real-time PCR analysis revealed significant differences between ZY821 and GH06 in the expression of common phenylpropanoid biosynthetic genes (BnPAL and BnC4H), common flavonoid biosynthetic genes (BnTT4 and BnTT6), anthocyanin- and proanthocyanidin-specific genes (BnTT3 and BnTT18), proanthocyanidin-

specific genes (BnTT12, BnTT10, and BnUGT2) and three transcription factor genes (BnTTG1, BnTTG2, and BnTT8) that function in the flavonoid biosynthetic pathway.

Fatty acid desaturase 2 (FAD2), which resides in the endoplasmic reticulum (ER), plays a crucial role in producing linoleic acid (18:2) through catalyzing the desaturation of oleic acid (18:1) by double bond formation at the delta 12 position. FAD2 catalyzes the first step needed for the production of polyunsaturated fatty acids found in the glycerolipids of cell membranes and the triacylglycerols in seeds. Four FAD2 genes from amphidiploid *Brassica napus* genome were isolated by PCR amplification, with their enzymatic functions predicted by sequence analysis of the cDNAs by Lee et al., (2013). Fatty acid analysis of the FAD2 genes showed that whereas BnFAD2-1, BnFAD2-2, and BnFAD2-4 are functional enzymes, and BnFAD2-3 is nonfunctional. The BnFAD2-3 gene of *B. napus*, a nonfunctional pseudogene mutated by multiple nucleotide deletions and insertions, was inherited from *B. rapa*. All BnFAD2 isozymes except BnFAD2-3 localized to the ER. Nonfunctional BnFAD2-3 localized to the nucleus and chloroplasts.

Biotic factors

Canola is susceptible to infection by the biotrophic protist *Plasmodiophora brassicae*, the causal agent of clubroot. To understand the roles of microRNAs (miRNAs) during the post-transcriptional regulation of disease initiation and progression, Verma et al., (2014) have characterized the changes in miRNA expression profiles in canola roots during clubroot disease development and have compared these to uninfected roots. *P. brassicae* responsive miRNAs were identified and validated. Putative target genes identified in this study were transcription factors (TFs), hormone-related genes, as well as genes associated with plant stress response regulation such as cytokinin, auxin/ethylene response elements.

Brassica napus is one of the most important oil crops in the world, and stem rot caused by the fungus *Sclerotinia sclerotiorum* results in major losses in yield and quality. To elucidate resistance genes and pathogenesis-related genes, genome-wide association analysis of 347 accessions was performed by Wei et al., (2016). Researchers identified 17 significant associations for stem resistance on chromosomes A8 and C6, five of which were on A8 and 12 on C6. Transcriptome analysis suggested that *S. sclerotiorum* infection activates the immune system, sulphur metabolism, especially glutathione (GSH) and glucosinolates in both R and S genotypes. Genes found to be specific to the R genotype related to the jasmonic acid pathway, lignin biosynthesis, defence response, signal transduction and encoding transcription factors.

Twenty-four genes were identified in both the SNP-trait association and transcriptome sequencing analyses, including a tau class glutathione S-transferase (GSTU) gene cluster.

Verticillium longisporum is host specific to members of the family *Brassicaceae*, including oilseed rape. The fungus infects through the roots and causes stunting and early senescence of susceptible host plants and a marked decrease in crop yield. Singh et al., (2012) showed that *V. longisporum* reacts to the presence of *B. napus* xylem sap with the production of six distinct upregulated and eight downregulated proteins visualized by two-dimensional gel electrophoresis. Identification of 10 proteins by mass spectrometry revealed that all upregulated proteins are involved in oxidative stress response. The *V. longisporum* catalase peroxidase (VICPEA) was the most upregulated protein. Catalase peroxidase was found to play a role in protecting the fungus from the oxidative stress generated by the host plant at an advanced phase of the disease.

Abiotic factors

To investigate genes that are involved in response to abiotic stresses in *Brassica napus*, a comprehensive survey of genes induced by high-salinity and drought stresses was done by Chen et al., (2010). In total, 536 clones were identified to be putative high-salinity- or drought-responsive genes. Among them, 172 and 288 clones are detected to be putative high-salinity- and drought-inducible genes, whereas 141 and 189 are candidates for high-salinity- and drought-suppressed genes, respectively. The functional classification of these genes are indicated that belonged to gene families encoding metabolic enzymes, regulatory factors, components of signal transduction, hormone responses, some abiotic stresses-related proteins, and other processes related to growth and development of *B. napus*.

The WRKY gene family is one of the most extensively studied transcription-factor gene families in plants. WRKY transcription factors play important roles in responses to environmental stress stimuli. Using a genome-wide domain analysis, He et al., (2016) identified 287 WRKY genes with 343 WRKY domains in the sequenced genome of *Brassica napus*, 139 in the A sub-genome and 148 in the C sub-genome. These genes were classified into eight groups based on phylogenetic analysis. In the 343 WRKY domains, a total of 26 members showed divergence in the WRKY domain, and 21 belonged to group I. This finding suggested that WRKY genes in group I are more active and variable compared with genes in other groups. Most of the genes were induced by low temperature, salinity and drought stress, indicating that the WRKYs play important roles in *B. napus* stress responses. Further, three *BnaWRKY* genes were strongly responsive to the three multiple stresses simultaneously, which suggests that

these 3 WRKY may have multi-functional roles in stress tolerance and can potentially be used in breeding new rapeseed cultivars.

Flavonoids with antioxidant effects confer many additional benefits to plants. Evidence indicates that flavonoids, including anthocyanins, protect tissues against oxidative stress from various abiotic stressors. Kim et al., (2017) determined whether increases in anthocyanins increased abiotic stress tolerance in *Brassica napus*. Increased dihydroflavonol-4-reductase (DFR) transcript levels for AtDFR-OX *B. napus* shoots correlated with higher anthocyanin accumulation. The AtDFR gene can be effectively manipulated to modulate salinity and drought stress tolerance by directing to high accumulation of anthocyanins in oilseed plants.

MADS-box transcription factors are important for plant growth and development, and hundreds of MADS-box genes have been functionally characterized in plants. Wu et al., (2018) identified 307 potential MADS-box genes (BnMADSs) in the *B. napus* genome and categorized them. Promoter cis-element analyses indicated that BnMADSs may respond to various stressors (drought, heat, hormones) and light. Expression analyses showed that homologous genes in a given subfamily or sister pair are highly conserved, indicating widespread functional conservation and redundancy.

GRAS proteins are an important family of transcription factors (TF) in plants. Genome-wide identification, classification, expression analyses, and functional characterization of GRAS genes in oil crop, *Brassica napus*, indicate their importance in root development and stress response. GRAS proteins are a plant-specific transcription factor gene family involved in tissues development and stress response. Guo et al., (2019) classified 87 putative GRAS genes in the *Brassica napus* genome (BnGRASs) into 13 subfamilies by phylogenetic analysis. A total of 868 pairs of interaction proteins were predicted, the primary of which were transcription factors involved in transcriptional regulation and signal transduction. Most BnGRASs were widely expressed in different tissues/organs at different stages in *B. napus*, and 24 BnGRASs were highly/specifically expressed in roots. Results from a qRT-PCR analysis suggested that two BnGRASs belonging to SCR and LISCL subfamilies potentially have important roles in the stress response of roots.

L-Cysteine desulphydrase (DES; EC 4.4.1.1) is the most important enzyme that catalyzes the decomposition of L-cysteine to pyruvate, ammonia, and hydrogen sulfide (H₂S), the latter of which has recently been recognized as the third gasotransmitter for multiple signaling events in plants. A rapeseed DES gene was isolated and sequenced by Xie et al., (2013). This protein predominantly catalyzes the breakdown of L-cysteine with the side reaction of L-cysteine

synthesis [O-acetyl-L-serine(thiol)lyase activity], and was designated as BnDES1. Molecular evidence showed that BnDES1 mRNA was widely expressed, but with the higher expression level in flowers. Further results showed that the BnDES1 transcripts were differentially up-regulated by several plant growth regulators and chemicals. Overall, the above findings provide evidence showing that BnDES1 is a potentially important enzyme responsible for the H₂S production, and may play an important role in plant growth regulators and chemical stimuli responses.

Transcription factors (TFs) regulate gene expression by recognizing and combining cis-acting elements on the promoter regions of target genes. Transcription factors GATAs are involved in plant developmental processes and respond to environmental stresses through binding DNA regulatory regions to regulate their downstream genes. The release of the reference genome of *B. napus* provides a good opportunity to perform a genome-wide characterization of GATA family genes in rapeseed. 96 GATA genes randomly distributing on 19 chromosomes were identified in *B. napus*, which were classified into four subfamilies based on phylogenetic analysis and their domain structures by Zhu et al., (2020). BnGATAs showed different expression patterns in various tissues and under diverse abiotic stresses. Single nucleotide polymorphisms (SNPs) distributions of BnGATAs in a core collection germplasm are probably associated with functional disparity under environmental stress condition in different genotypes of *B. napus*.

Catalase (CAT) is an antioxidant enzyme expressed by the CAT gene family and exists in almost all aerobic organisms. Environmental stresses induce the generation of reactive oxygen species (ROS) that eventually hinder plant growth and development. The CAT enzyme translates the hydrogen peroxide (H₂O₂) to water (H₂O) and reduce the ROS levels to shelter the cells' death. A genome-wide comprehensive analysis was conducted to classify the CAT genes in the rapeseed genome by Raza et al., (2021). They identified 14 BnCAT genes in the rapeseed genome. They identified five hormone-correlated responsive elements and four stress-related responsive elements. Further, six putative bna-miRNAs were also identified, targeting three genes (BnCAT4, BnCAT6, and BnCAT8). BnCAT genes were largely related to cellular organelles, ROS response, stimulus response, stress response, and antioxidant enzymes. Almost 10 BnCAT genes showed higher expression levels in different tissues, i.e., root, leaf, stem, and silique. The expression analysis showed that BnCAT1–BnCAT3 and BnCAT11–BnCAT13 were significantly upregulated by cold, salinity, abscisic acid (ABA), and gibberellic acid (GA)

treatment, but not by drought and methyl jasmonate (MeJA). Notably, most of the genes were upregulated by waterlogging stress, except BnCAT6, BnCAT9, and BnCAT10.

Phosphate (Pi) transporters play critical roles in Pi acquisition and homeostasis. In total, 49 PHT1 family members were identified in *B. napus*, including 27 genes in the A subgenome and 22 in the C subgenome by Li et al., (2019). Most of the PHT1 proteins were predicted to localize to the plasma membrane. Broad range of expression patterns of individual BnaPHT1 genes occurred in response to phosphorus (P) deficiency. The expression levels of BnaPHT1 genes can be regulated by different nutrient stresses, including nitrogen (N), potassium (K), sulfur (S) and iron (Fe) stresses. Moreover, salt and drought stresses can regulate the transcript abundances of BnaPHT1s, as well as phytohormones including auxin and cytokinin. The results indicate that BnaPHT1s might be involved in cross-talk for sensing the external status of P, N, K, S and Fe, as well as salt and drought stresses. Moreover, these processes might be mediated by phytohormones.

Calmodulin (CaM) and calmodulin-like (CML) proteins are primary calcium (Ca²⁺) sensors and are involved in the regulation of plant development and stress responses by converting calcium signals into transcriptional responses, protein phosphorylation, or metabolic changes. 25 BnaCaM and 168 BnaCML genes were identified in *B. napus* by He et al., (2020). BnaCaMs genes are highly and ubiquitously expressed in all of the organs and tissues examined, while distinct BnaCMLs are expressed specifically in particular organs and tissues. In total, 129 BnaCaM/CML were induced by abiotic stress and phytohormones. BnaCMLs from group IV, VI, VIII, and X were strongly induced by freezing treatment, but were not or just slightly induced by chilling treatment.

Abstract

The evaluation of silage quality is frequently dependent on identifying the characteristics of fermentation and changes in microbial compositions. Silage dry matter content, water soluble carbohydrate concentration, and bacterial counts are typical indicators. However, this evaluation procedure is time-consuming and occasionally unreliable. To increase the nutrient content of these feeds, it is important to describe the microbial populations that are present in silage and comprehend how they change throughout ensiling. Mycotoxins in feed are subject to rules and regulations in almost 100 different nations. The bacterial microbiota of silages can be measured using real-time polymerase chain reaction analysis.

Keywords: Silage, ensilage, fermentation, mycotoxin, sequencing

1. Introduction

Ensilage is a fermentative technique that uses a number of different types of microorganisms to preserve animal feed (forage, cereal grains, and byproducts) (Carvalho et al., 2021). Forage crops can be preserved as silage using a fermentation process that lowers the pH and maintains the fresh crop nutritional content. The primary mechanism is the lactic acid bacteria's synthesis of lactic acid as a byproduct of the fresh crop's water-soluble carbohydrate digestion. However, a variety of fermentations may take place in the silo environment, and this depends on the substrate availability, the microbial populations, the moisture level, and the crop's ability to act as a buffer during ensiling. As it influences both the animal performance and the nutritional quality of the silage, fermentation is a significant step in the ensiling process. If the fermentation does not take place as instructed and undesired fermentations develop, the feed will be completely spoiled and could provide a health concern to both humans and animals. Ruminant animals can consume well-fermented silage in their feeds without any risk to their health or reduction in performance (da Silva et al., 2017).

Knowledge of the variety of prokaryotes and eukaryotes in silage has increased as a result of improvements in microorganism identification techniques. Such information has improved our understanding of how fermentation works in forage crops with various properties and how to optimise the procedure to improve silage quality. Insufficient fermentation might allow undesirable microorganisms to flourish in silage. There is still a lack of information regarding the effects of these metabolites on the health of animals who ingest silage, despite the possibility that these microorganisms are pathogenic and/or produce hazardous metabolic chemicals. Main goal with ensilages is to provide high-quality feed that is hygienic, nutritious, stable, and has a high dry matter recovery rate while requiring no intervention during fermentation and having a wide range of substrate properties. Every substrate has unique characteristics, and we can only improve fermentation if we thoroughly understand microbial variety (Avila & Carvalho, 2020).

Since mycotoxins in feed might result in the presence of their metabolic products in dairy products, which will eventually have an impact on human health, primarily infants, the problem of fungus and mycotoxins in silage goes beyond animal diseases or production losses. Another issue is that, while many of the fungi found in silos are opportunist infections, some of them, like *A. fumigatus*, are epidemiologically significant and provide a significant danger of contamination to agricultural workers who handle them poorly. More information will reveal

the impacts of these microbiota on the production and/or degradation of the mycotoxins found in silage (Alonso et al., 2013).

2. Silage fermentation

When compared to a fresh crop, silage is intended to offer a steady diet with a high recovery of dry matter, energy, and highly digestible nutrients. Numerous end products are produced by microbial fermentation in the silo, which also alters several fodder nutritional characteristics. Silage of high quality should be free of unfavourable substances that can harm the environment, farm income, or animal performance. Forages' soluble carbohydrates ferment in the absence of oxygen, producing a range of byproducts that ultimately lead to the silage preservation of a forage crop. Evaluations of silage fermentations are mostly based on measuring pH and estimating the synthesis of organic acids and alcohols. Other elements that are frequently measured in silages include mycotoxins and various nitrogenous compounds, if required. Although it was widely believed that the chemical reactions taking place in a silo quickly reach a steady state after a few weeks of fermentation, it is now evident that some components continue to undergo relatively minor but significant changes for months, and these changes can have an impact on the quality of the silage. In general, information from analyses of silage fermentation can be utilised to identify whether an excellent, average, or bad fermentation has taken place. Based on these analyses, good assumptions can be made that can be used to explain various outcomes. For example, parameters like moisture level, buffering capacity, sugar content, and the types of organisms that predominated the process can often be used to describe the fermentation that a crop experiences. Silage fermentation and subsequent quality can also be impacted by management parameters as additive type, packing speed, covering management, pack density, chop length, and silo management during feed-out. In rare instances, fermentation analyses can provide a qualitative explanation for low intakes or inadequate nutritive value. The easiest technique to assess the quality of silage is to take a suitable sample and contact an approved analytical laboratory to perform both fermentative and nutritional evaluations. The amounts of organic acids, alcohols, and $\text{NH}_3\text{-N}$, as well as the size of different microbial populations, are the most typical metrics used to assess silage fermentation. An ensiled sample's pH is an indicator of how acidic it is. After being chopped, whole-plant maize and alfalfa have pH values that vary from about 5.5 to 6. Since it is about 10 to 12 times stronger than any of the other major acids present in silages, such as acetic acid (pKa of 4.75) and propionic acid (pKa of 4.87), during ensiling, lactic acid (pKa of 3.86),

produced by lactic acid bacteria (LAB), is typically the acid found in the highest concentration in silages (Kung Jr et al., 2018).

Epiphytic lactic acid bacteria (LAB) utilize water-soluble carbohydrates present in ensiled plants and metabolize them into lactic acid, with a lesser extent of acetic acid which can lower the pH of the silage and prevent undesirable microbial growth, allowing them to be stored for a long time (Soundharajan et al., 2021). Lactic acid concentrations typically range from 2 to 4% of the DM in frequently fed silages, although they can be significantly higher in silages with low DM concentrations (30%). Lactic acid from silage is transformed to propionic acid in the rumen under typical feeding circumstances. The amount of lactic acid present and the crop's ability to act as a buffer are the two parameters most closely related to the final pH of silage. Maize silages have a lower final pH (3.7–4.0) than legume silages (4.3–5.0). Because clostridial organisms can flourish under moist environments (30-35% DM) and convert lactic to butyric acid, the concentration of lactic acid in legumes may drop as silage DM falls below 35 to 40%. As opposed to legumes, which have a higher pH, maize silages have a lower pH, which inhibits the formation of clostridia. Not all wet legume silages, as previously mentioned, succumb to clostridial fermentations, though the likelihood of this occurrence increases when the moisture level is above 70%. Thus, the recommended values for lactic acid for crops below 30 to 35% DM. Silages with higher-than-average pH levels can be triggered by a wide range of sources. A higher than expected pH may be caused by, for instance, an exceptionally high buffering capacity (found, for instance, in bean silages with extremely high protein and ash contents) or a restricted fermentation (found, for instance, under cold climatic circumstances). The second-highest concentration of acids in silage, typically between 1% and 3% of DM, is acetic acid. Similar to lactic acid, the relationship between acetic acid concentration and DM level is often inverse. When a ruminant consumes silage, the acetic acid can either be absorbed from the rumen and used as energy or it can be converted to milk or body fat. Because yeasts are inhibited by moderate levels of acetic acid in silage, the stability of the product when exposed to air is improved. In fact, when exposed to air, silages with extremely low acetic acid contents may become unstable. Because of the previously mentioned conversion of lactic to acetic acid, silages treated with *L. buchneri* frequently have acetic acid concentrations that are moderately higher than normal (about 3-4%). Because acetic acid has potent antifungal properties, an increase in acetic acid results in an improvement in aerobic stability. Due to protracted fermentations, legume silages with high ash contents (>15%) can occasionally have extremely high acetic acid levels. In healthy silages, propionic acid is typically undetectable or present in

extremely low amounts (0.1%). Although propionibacteria have been discovered in silages that convert glucose and lactic acid to propionic and acetic acid, it is unlikely that natural populations can thrive in most silages. Propionic acid is more frequently discovered in high amounts (>0.3–0.5%) in clostridial fermentations, most likely as a result of *Clostridium propionicum*. When given at a rate of 1 to 2 kg/t of wet (35% DM) fodder, propionic acid-containing additives can enhance the concentration of silages during ensiling by 0.15 to 0.30% (DM basis), however this depends on the amount of the acid in the additive. In properly fermented silages, butyric acid shouldn't be found. Some species of clostridia are extremely proteolytic, while others have the ability to ferment carbohydrates into butyric acid (saccharolytic) or change lactic acid into butyric acid. Clostridial silages are frequently characterised by a higher than normal pH, higher than normal quantities of acetic acid, NH₃-N, and soluble protein, as well as the presence of butyric acid and lower than normal concentrations of lactic acid. Ironically, because butyric acid has potent antifungal properties, silages containing this acid tend to be stable when exposed to air. The type of alcohol most frequently detected in silages is ethanol. It can be produced by a number of microbes, including yeasts, enterobacteria, and heterolactic acid bacteria, but it is typically low in whole-plant silages made from maize and legumes (0.5-1.5%). Numerous microbes are capable of generating 1,2-PD. However, in typical silages, 1,2-PD is probably the end product of *L. buchneri*'s lactic acid metabolism. Low quantities of 1,2-PD (0.1–0.3%) in silages can occasionally be produced by naturally existing populations of *L. buchneri*, especially if they are stored for an extended period of time (>6–8 mo). Due to incomplete activation of the lactic acid degradation process prior to 30 to 60 days of fermentation, 1,2-PD is typically not detectable in silages infected with this organism. Although concentrations as high as 3% have been seen, silages infected with *L. buchneri* to increase aerobic stability may contain between 0.25 and 1.5% 1,2PD (Kung Jr et al., 2018).

The ratio of lactic acid to acetic acid is a good indicator of the type of fermentation undergone by the silage. A ratio of at least 2:1 indicates strong homolactic fermentation (Zhang et al., 2010). It is usual practise to utilise the ratio of lactic acid to acetic acid as a qualitative indicator of fermentation. The ratio of these acids in healthy silage fermentations is typically between 2.5 and 3.0. Because low concentrations of acetic acid may not be enough to suppress lactate-assimilating yeasts, silages with very high lactic acid:acetic acid ratios may occasionally be more aerobically unstable than those with normal ratios. Low lactate-to-acetic acid ratios are typically a sign of inappropriate fermentations. Proteolytic reactions between plants and

microbes alter the nitrogenous molecules in silages. Wet legume silages typically contain higher than average concentrations of soluble N and NH₃-N due to proteolytic activity by clostridia. Since high numbers of yeasts in silages are frequently inversely correlated with the aerobic stability of silages and are typically associated with high ethanol concentrations, counting the yeasts and moulds in silages may be helpful. This is especially true for crops based on maize. Although anecdotal evidence from the field suggests that high numbers of yeasts in silage are associated with poor animal performance, an exact link of cause and effect has not been made. Silages that have undergone extensive spoilage may have very low numbers of yeasts and moulds because these organisms have died due to the lack of substrate. Finally, especially in warm weather, the number of yeasts and moulds might significantly rise between the time of sampling and arrival at the laboratory. It might be expensive to perform a thorough examination of a silage sample's chemical and nutritional characteristics. The silage's appearance and aroma provide some hints as to what transpired throughout the fermenting process. Well-fermented silages should not have a strong, particular odour because lactic acid—the main organic acid from the fermentation—is nearly odourless. Since acetic acid is produced in the second highest proportion after lactic acid and is quite volatile, the majority of silages do, however, have a moderate vinegar smell. Smelling silages with very high concentrations of acetic acid will often leave a burning sensation in one's eyes and nose. Wet silage with high acetic acid also smells like vinegar and has a yellow color, particularly towards the bottom of a silo where compaction will further increase the moisture content. It's a common misconception that silages with a fruity, sweet aroma are a stable, well-fermented feed. These odours are actually typically caused by high alcohol (ethanol) concentrations, which are mostly produced by yeasts but also by several microorganisms. Additionally, the alcohols may produce esters when they interact with the acids in the silage, enhancing the fruity scent. Some stable, well-fermented maize silages have been reported to have an acetone-like aroma and smell like nail polish remover or nail polish, with no symptoms of fungus infestation. According to the scant research that is currently available, these odours are correlated with the concentrations of ethyl and propyl esters of lactate and acetate, as well as perhaps phenyl acetic acid. Bacilli are found in soil rather than in the fresh plant material, and their number of spores can increase if manure is used as fertiliser. One of the first types of microorganisms that appear in silages after yeasts start the aerobic spoiling process is bacilli. This kind of material experiences an alternative form of aerobic spoiling that involves intense heating caused by the development of thermogenic bacilli. A silage that smells earthy is likely to have bacillus growth and a high pH level. In addition to

having a musty or mouldy smell, silages that are aerobically unstable may also exhibit visible mould development. Silage that has mould on it should not be consumed since it may contain mycotoxins. Typically found in silage, saccharolytic clostridia (*Clostridium tyrobutyricum* and *Clostridium butyricum*) use soluble sugars or organic (lactic) acids to generate acetic acid and butyric acid, which has a distinct, unpleasant rancid-butter odour. Other clostridia species, including *Clostridium sporogenes*, can ferment both proteins and carbohydrates, with the latter resulting in the production of ammonia and biogenic amines. Excessive proteolysis may produce an unpleasant, fishy, or ammonia-like smell (Kung Jr et al., 2018).

Extremely high temperatures have started to have a significant impact on the quality of silage as a result of global warming because they speed up the fermentation process and aerobic deterioration in tropical and subtropical areas. However, the ideal temperature for lactic acid bacteria to develop and reproduce is usually not higher than 45°C (Bernardes et al., 2018; Guan et al., 2020). The production of heat is a normal occurrence during silage fermentation. The average temperature of the forage mass shouldn't rise more than 5 to 8°C above ambient at filling if silage is tightly packed and sealed immediately. Although, if a forage mass is left overnight in warm weather for several days due to equipment failures or packing delays brought on by inclement weather, temperatures in the topmost layers (top 5–10 cm) may reach as high as 45–60°C. These high temperatures are the result of aerobic bacteria oxidising the extra air trapped in the forage mass. The key is that these temperatures should decrease quickly as further packing removes air from the mass and fermentation takes place. As previously mentioned, extended exposure to high temperatures above 45 to 50°C can result in heat-damaged proteins and a rise in ADIN (acid detergent insoluble nitrogen). Many lactic acid bacteria, which are essential for a successful fermentation, may suffer from temperatures in this range. To remove and keep air from the forage mass, forage should be properly cut, packed fast, and sealed tightly as soon as possible. Temperatures in the silo's core typically progressively drop to 25 to 30°C once the fermentation's active phase is over. Large bales and bag silos are examples of small silos that should cool more quickly than larger silos. Rarely, especially after several months of storage, should retained heat reach above 35°C. Due to the massive fodder mass acting as insulation and producing a very slow heat dissipation, core silage temperatures in large silos frequently remain high for extended periods of time. Silages can occasionally still be quite warm (>30–35°C) even after 4–6 weeks in the silo. This discovery might be more typical in silages that were poorly packed and harvested dry (>40–45% DM). In certain situations, a gradual fermentation or aerobic oxidation may be the cause of the prolonged heat. Dry silages

have a tendency to be more porous when packed, and because delayed fermentation prolongs overall microbial activity and the pH is quite high, it is unable to block the metabolism of yeasts and moulds. If the silo is being used for feeding, this could make the issue worse because the silo face is continually being jostled, allowing air to enter the mass. Silages may occasionally include potentially harmful substances such nitrates, prussic acid, and mycotoxins. Silage's chemical, microbiological, and organoleptic components can be utilised to determine the sort of fermentation that took place. When these components vary significantly from the norm, poor animal performance when fed to ruminants may also be explained or predicted. Farms' environmental concerns may include measuring VOC from silages as well as odour, ammonia, and particle matter. Chemical data must be used more predictably, and new quantifiable indicators that could be used to better understand animal performance must be found (Kung Jr et al., 2018).

3. Mycotoxins in silage

Across the world, dairy cow diets contain a significant amount of ensiled fodder, mainly maize silage. Several mycotoxins can infect forages before harvest, during storage, or after ensiling during feed-out. Mycotoxins in feed have a negative impact on livestock's performance and health, and they also pose a risk to human health. Numerous research and surveys suggest that ruminants are frequently exposed to mycotoxins through the silage they eat, including aflatoxins, fumonisins, trichothecenes, ochratoxin A, zearalenone, and many other fungal secondary metabolites. Preventing fungal growth before and after ensiling can help reduce issues related to mycotoxins in silage. Mycotoxin contamination of dairy cow feeds must be reduced by proper silage management, but it can also be decreased through the use of mold-inhibiting chemical additives called microbial inoculants. To lower mycotoxin levels, a number of sequestering substances can also be added to diets, however their effectiveness varies depending on the type and degree of mycotoxin contamination. Aflatoxin exposure causes dairy cows to produce less milk; decreased milk quality and safety due to carry-over of toxin from contaminated feed; decreased growth rate and feed efficiency in cattle cows; immunological and ruminal system dysfunction; a malfunctioning liver; T-2 immunosuppressive in cattle due to decreased synthesis of antibodies, neutrophil activity, and lymphocyte blastogenesis; late-gestation abortion and bovine infertility. The amount of translocation into ruminant milk is very little. "Deoxynivalenol" causes gastrointestinal issues and decreased performance, perhaps as a result of feed refusal. There is no proof that ruminant carryover is present in milk. "Zearalenone" causes hyperestrogenism, decreased milk output, and infertility in cattle. The

amount of translocation of it into ruminant milk is very little. "Fumonisin" decrease performance, perhaps as a result of feed rejection; make a little hepatic illness. But there is very little toxic carryover of it in ruminant milk. When fed alone at naturally occurring amounts, ochratoxin has no discernible harm to cattle. There is very little toxic carryover of it into milk. "Roquefortine" causes paralytic effects, feeding reluctance, and reproductive problems. But there is no proof that ruminants transmit it with their milk. There is a lack of study on the effects of mycophenolic acid in cattle. There is no proof that ruminants transmit it with their milk. Preventing fungal growth before and after ensiling can help reduce issues related to mycotoxins in silage. Therefore, to reduce mycotoxin contamination of livestock feeds, effective silage management and the use of mold-inhibiting chemical additives or microbial inoculants are crucial (Ogunade et al., 2018).

4. Sequencing tools for microbial ecology of silages

Ensiling of forages was recognised as a microbial-driven process as early as the late 1800s, when it was associated with the production of "sweet" or "sour" silage. Traditional microbiological plating methods identified the epiphytic microbial communities linked to fresh forage, the crucial function played by lactic acid-producing bacteria throughout the ensiling process, and the part played by clostridia, bacilli, yeast, and moulds in the deterioration of silage. Numerous of these traditional investigations concentrated on identifying and characterising a small number of microbial species that were easily isolated on particular conditions. Evidence revealed that many of these microbial populations' members were alive but unable to be cultured, which enabled traditional research to underestimate the true microbial diversity related to ensiling. The initial molecular techniques to analyse silage microbial populations use polymerase chain reaction-based approaches, such as length heterogeneity PCR, terminal RFLP, denaturing gradient gel electrophoresis, and automated ribosomal intergenic spacer analysis. These techniques have been replaced by recent developments in complete comparative genomic, metagenomic, and metatranscriptomic sequencing, allowing for the detailed definition of microbial communities during ensiling that is not achievable using conventional microbiology. These techniques have helped to define changes in microbial communities associated with forage type and composition, ensiling technique, and responses to aerobic exposure in addition to identifying new microbial species in silage. In order to monitor the persistence and contribution of silage inoculants to the ensiling process as well as the function of particular species of yeast and fungi in silage spoiling, strain-specific and species-specific primers have been developed. Results can be significantly influenced by sampling and

the techniques employed to separate genetic material for additional molecular analysis. Biases in the interpretation of sequence data can also result from the choice of PCR primers and the presence of inhibitors. Low taxonomic resolution and the integrity of sequence data inside existing databases are two factors that can affect bioinformatic analyses. Despite these drawbacks, molecular biology developments have the potential to completely transform how we currently understand the microbial ecology of silage. By describing the function of epiphytic populations in silage quality and how silage additives might produce microbiomes more suited to the production of high-quality silage, these methodologies have provided new insight into the intricacy of the microbial ecology of ensiling. During ensiling and feed out, quantitative PCR (qPCR) can be used to specifically measure and document the persistence of particular phylogenies, species, or even strains of bacteria and fungus. Since implanted bacteria can now be distinguished from their epiphytic counterparts in terms of growth and survival, it is clearer how these particular strains affect the ensiling process. These methods could offer original ideas for keeping undesired microorganisms out of silage by identifying mycotoxin-producing fungal communities or possible pathogens like *Listeria* spp. in silage. Currently, the majority of research has been limited to studying the phylogeny of microorganisms utilising internal transcribed spacer (ITS) or 16S rRNA sections for the classification of bacterial and fungal populations, respectively. Although these studies offer a plethora of knowledge regarding the microbial ecology of silage, they only offer scant details regarding the role played by the various microbial species during the ensiling process. The expression of genes encoding for enzymes involved in silage acid generation and metabolism, proteolysis, or the development of mycotoxins during silage rotting could be better understood in the future by using metatranscriptomics to define the ensiling process. The sample and purity of the nucleic acids that are extracted from the forage determine the scientific integrity of the information generated, even if molecular techniques are poised to transform our understanding of the role of microbes in ensiling. The type of data produced can be influenced by the type of primers chosen for amplifying genetic regions of interest, the presence of PCR inhibitors, and the chosen sequencing platform. Predicted results can be impacted by the breadth and depth of the bioinformatic pipelines and the constraints of the gene databases utilised in the interpretation of data after sequence information has been gathered. The emergence of extraction and purification kits by a number of for-profit businesses has streamlined the processes of DNA/RNA extraction. It can be difficult to choose the best commercial kits for nucleic acid extraction from silage because there are so many available from so many different

manufacturers (including Qiagen, MoBio, MP Biomedicals, and Zymo Research). A variety of PCR inhibitors are present in both silage and fresh fodder, which obstruct amplicon and shotgun sequencing. Consequently, kits that have specific steps aimed at removing PCR inhibitors such as those used in the extraction of nucleic acids from soil or stools tend to be most suitable for fresh forages and silages. By producing forward and reverse primers that border the region of interest, amplicon-based PCR amplifies a specific DNA segment. PCR-based molecular amplification techniques have a wide range of applications because they can be used to quantify a specific species or overall bacterial populations as well as to identify a specific species and distinguish between multiple microbial species (conventional PCR in combination with Sanger sequencing of PCR products) (real-time or qPCR). Real-time or qPCR enables the elimination of laborious post-amplification steps such as the use of gel electrophoresis to visualise amplified products following conventional PCR. Overall, sensitivity, repeatability, speed, and quantitative ability are advantages of qPCR over conventional PCR. These applications, however, call for specially crafted primers that are suitable for the desired target. The effectiveness of PCR can be influenced by elements like primer specificity and the size of the fragment that needs to be amplified. Based on the physical separation of distinctive nucleic acid sequences, the advent of molecular fingerprinting techniques offered a pattern or profile of the genetic diversity in a microbial community. All of these methods still rely on amplifying the target genes using PCR, then using different techniques to separate the amplicons that arise. The study of microbial ecology has been completely transformed by developments in NGS. NGS-based metagenomics investigations typically fall into one of two categories: 1) "Metaprofiling" or amplicon-based profiling, more accurately known as single/marker-gene amplification metagenomics (e.g., 16S rRNA gene in prokaryotes), and 2) whole shotgun metagenomics. These techniques enable profiling of the entire microbial population, including uncultivable species, and at a reasonable cost can produce an extensive description of microbial diversity in different habitats. In comparison to whole shotgun metagenomics, marker gene-based metaprofiling produces taxonomic and phylogenetic classification of microorganisms in complex environments with a smaller time and computational capital investment (50,000 reads/sample). The lower cost of sequencing and the absence of (eukaryotic) contamination with host DNA due to target-specific amplification of conserved areas are further benefits of metaprofiling over total metagenomics (e.g., 16S rRNA gene, CPN60 gene). The resolution is frequently insufficient to identify bacteria to the strain or even species level, and primer selection might result in biases towards specific members of microbial communities. No flag

genes are available to amplify and distinguish individuals within the virome, and various primers are needed for multi-domain communities that contain bacteria, archaea, and eukaryotes. Our knowledge of the microbial ecology of ensiling and aerobic degradation is about to undergo a revolution as a result of next-generation sequencing tools. Techniques for sampling, storing, nucleic acid extraction, sequencing, and bioinformatics can all have an impact on how the content and purpose of microbial communities participating in ensiling are interpreted. Therefore, it is important to use caution when extrapolating results from silage experiments using diverse techniques. The consistency and sophistication of the technologies used to research microbiomes in various contexts are constantly improving. Consequently, the databases that are so important for annotation will undoubtedly continue to become more robust. Metagenomics research on silage has the ability to enhance the ensiling process by improving the quality, safety, and uniformity of additives as well as silage (McAllister et al., 2018).

POSTHARVEST HANDLING of CUT FLOWERS

Assist. Prof. Dr. Rukiye GEZER (Orcid ID: 0000-0002-7781-9327)

Siirt University, Faculty of Agriculture, Department of Horticulture, Ornamental Plants
Growing and Breeding Program, Siirt, Türkiye.

E-mail: rukiyekeles@siirt.edu.tr

Abstract

A wide variety of plant materials are grown and harvested worldwide for their ornamental value including Tulips, Chrysanthemums, Gerbera, Freesia, Lilies, Carnations, Alstroemeria, Eustoma russellianum, Hypericum, Gypsophila, Paeonia, Limonium, Zantedeschia, Anthurium, Hippeastrum, Hydrangea, Gladioli, Iris, Snapdragons, Delphinium, Orchids, Lisianthus and Cymbidium. Post-harvest handling and operations are very important to maintain quality during marketing and export. Both pre-harvest and post-harvest conditions and practices are effective in the vase life of cut flowers. This include genetics, growth conditions, flower maturity, stage of harvest, time of harvest, harvesting method, precooling, grading, cleaning, bunching, conditioning, floral preservatives, packing, aging, wilting, shattering, growth tropism, mechanical damage, water quality, light, temperature, humidity, carbon dioxide, water content, refrigerated storage and transport. Some of the selected aspects is the subject of this article.

Keywords: Cut flower, post-harvest handling, pre-harvest conditions

1. Introduction

Such as ferns, lycopodium, gymnosperms (pines, firs, podocarps, etc.), and angiosperms (the flowering plants) a variety of plants get produced and harvested because of their ornamental value. Flowers and cut foliage produced all over the world are offered for sale in the form of arrangements and bouquets. Dormant ornamental nursery plants and propagules, such as rooted and unrooted cuttings, bulbs, corms, tubers, and rhizomes, are also fragile and need to be handled very carefully. Ornamentals have complicated plant organs that can be rejected from the market if the quality of their stems, leaves, or flower sections deteriorate, whether they are cut or left intact (Reid, 2009).

Post-harvest applications are very important for flowers to maintain their quality during sales and export. The end-user vase life of cut ornamentals can be significantly impacted by handling techniques starting from harvest on (Idirisinghe et al., 2013). Flowers continue their metabolic processes long after they get separated from the parent plant, which depletes their supply of carbohydrates and raises their temperature and respiration. Any mechanical injury to a flower will reduce its visual appeal, increase the risk of bacterial infections, and cause the flower to turn black and decompose. Each plant species needs to be harvested at the proper stage in order to guarantee acceptable quality and proper postharvest behavior of cut flowers. Precooling is crucial to remove the field heat after harvesting flowers, which should be harvested in the morning or evening. Cutting equipment and storage containers should also be cleaned and disinfected (Muraleedhran et al., 2022). For cut flowers, important factors include grading, packing, and transportation. Pre-harvest factors include genetics, growth conditions, light, temperature, humidity, and carbon dioxide. Post-harvest factors include temperature, humidity, water content, conditioning, pre-cooling, floral preservatives, and cold storage (Verma & Singh, 2021).

The floriculture industry has enormous potential to increase farmer incomes, generate jobs, and bring in foreign currency through increased exports in many under developed countries. However, the increase is still far below a desirable level due to several technological and infrastructure limitations. Production and productivity are impacted by a poor cultural package, a lack of planting seed and other materials of improved types, and numerous diseases. Large post-harvest losses occur as a result of improper handling, grading, packaging, and storage. These post-harvest losses can be decreased by using proper harvesting and post-harvest handling practices, managing storage temperature, and implementing tight hygienic standards in the grading and packaging rooms. Furthermore, with careful usage of flower preservative,

vase life can be increased. Cut flower quality and longevity are influenced by both pre and post harvest management practices (Abbasi et al., 2005).

2. Postharvest problems

The industry must provide postharvest handling and disease management the attention they deserve in order to meet the growing demand for high quality ornamental crops worldwide. Flowers and foliage plants are subject to significant postharvest losses due to their high rate of perishability. Flowers are more susceptible to numerous biotic and abiotic conditions during and after harvest because of their hardness and softness. Postharvest diseases result in the loss of between 10 and 30 percent of the world's total crop production of cut flowers. Several preharvest and postharvest conditions have an impact on the postharvest life of cut flowers. Using fungicide or bactericide applications, preharvest and postharvest disease management for floricultural crops is generally done. In contrast, using standard chemical treatments for diseases increases the risk of pathogen resistance. Concern among the general public regarding fungicide use in relation to environmental and human risk is also rising. These factors led to develop unique preharvest and postharvest disease management solutions for cut flowers and ornamental plants. The commonly used safe host defense inducers may provide an alternative to conventional chemical substances, which are less desirable from a social and environmental standpoint. Additionally, there are several biological substances and microbes that influence disease development through antagonistic interactions and frequently support integrated disease management strategies (Dhiman et al., 2021).

To identify the production and postharvest issues in the cut flower sector in South and Central America, with a focus on Colombia and Ecuador, Loyola et al. (2019) conducted a survey. Total 51 answers were submitted and 62% of establishments had 100 or more workers. Rose (*Rosa* hybrids), carnation (*Dianthus caryophyllus*), chrysanthemum (*Chrysanthemum grandiflorum*), alstroemeria (*Alstroemeria* cultivars), gerbera (*Gerbera jamesonii*), and hydrangea (*Hydrangea* species) were the most frequently grown or handled crops, in that order. Insect management, disease management, and crop timing were the three most production problems, respectively. The pathogen, leaf miner (Lepidoptera, Symphyta, or Diptera), thrips, and phytosanitary concerns were the most significant species-specific production issues (Thysanoptera). Temperature control was the primary postharvest issue, followed by hydration, floral food management, and botrytis (*Botrytis cinerea*). The most frequently stated problem with on-farm postharvest processing related to flower damage. Temperature control, air

transport, damage, and botrytis were the main issues for the post-harvest storage and shipping period. Damage, botrytis, and phytosanitary issues were consumer complaints.

Fig. 1. A) Cut ‘Sparkling Burgundy’ pineapple lily inflorescences; (B) cut ‘Coral’ pineapple lily inflorescences (Carlson & Dole, 2014).

Stems, leaves, flowers, and occasionally bracts and fruit are all components of commercial cut flowers, which frequently have intricate, complicated structures. Following harvest, each of these components could develop and age differently. There is no single flow chart that works for all flowers due to their enormous variability. It's critical for those working in post-harvest activities to understand the nature of the managed items. Personnel training is desired in this situation. Sound production procedures lead to quality, which includes longevity. Healthy and vigorous growth can be obtained by using the right amounts of water, fertilizer, pesticides, and management. During production, it is especially crucial to minimize pest and disease infestation. Cut flowers are mostly harvested at various bud development stages. Flowers at the bud stage must be mature enough horticulturally so that they have the innate potential to open in the vase. The best time to harvest flowers is cold period of the day when their metabolic rate is low and easier to eliminate field heat (Joyce & Faragher, 2012).

3. Genetics

The flower is a unique feature of flowering plants. According to recent molecular biology research, the expression and interaction of numerous genes acting in a sequence results in the development of a flower. At least four factors, including gibberellin, light quality, photoperiod, and temperature (including vernalization and ambient routes), cause floral evocation. Several genes regulate the development of various floral organs as well as the determination of their boundaries (Krishnamurthy & Bahadur, 2015). Several flower characteristics that determine floral quality, including as repeated flowering, double flowers, petal colors, and scent, were chosen during the domestication stages. Understanding the genetic and molecular mechanisms that regulate these traits is not just a fascinating question of basic biology, but will also help understand how these traits have important implications for the rational manipulation of flower quality (Bendahmane et al., 2013).

New genetic combinations yielded an assortment of new shapes and colors. According to Kamenetsky & Dole, (2012), peonies' ability to sprout and bloom is dependent on temperature and the length of the chilling period, but their ability to bloom early or late appears to be a genetic feature unaffected by temperature.

According to reports, cell death which is genetically programmed can regulate the senescence of flower petals. Ichimura et al. (2009) divided petal senescence for six plants into three types based on nuclear morphology and DNA degradation, which are indicators of programmed cell death. During petal senescence, significant DNA degradation was seen in all plants with the exception of *Prunus yedoensis*. Nuclear fragmentation occurred during programmed cell death in *Argyranthemum frutescens*, morning glory, and petunia. On the other hand, carnation and snapdragon blooms showed evidence of chromatin fragmentation in the nuclei. However, *P. yedoensis* did not exhibit nuclear or chromatin fragmentation. It was demonstrated that ethylene has a strong regulatory effect on the programmed cell death linked to petal senescence in carnation flowers. Cut flowers retain their freshness better when transported wet than when transported dry, although wet transport does not significantly extend the vase life of cut flowers. The vase life of rose flowers was enhanced by treatment with sucrose and antibacterial substances before to shipping and during wet transport.

4. Growth conditions

Numerous physiological investigations into the flowering transition have been conducted since the discovery of photoperiodic floral induction. The physiological analysis and dissection of floral induction were made by introducing an experimental system based on the

understanding that an external controllable stimulus can cause flowering when applied to a specific plant. As an example, grafting induced leaves (donor) onto recipient non-induced plants causes the recipient to blossom earlier in *Perilla frutescens* and *Chrysanthemum*. Plants have particular receptors that can detect the duration of light exposure and distinguish between different light wavelengths, and both the quantity (length of light exposure) and the quality of light are necessary signals for blooming. Temperature has an impact on flowering as well. Increases in day duration must be followed by exposure to cold temperatures for vernalization. A plant must pass through a number of developmental thresholds before it can blossom. The induction of flowers is influenced by the intrinsic signals that communicate growth status, such as nutrient flow, hormones, and plant size. Different studies proved an endogenous floral inductive pathway's existence wherein a plant variety flowers only after producing leaves of a predictable number. Short day plants begin to flower as the day length decreases; long day plants begin to flower as the day length increases; and day-neutral plants begin to flower regardless of changes in day length. Within the day length responses, the plants are further divided into facultative and obligatory groups. For obligatory plants, absolute inductive photoperiods are necessary; otherwise, these plants stay in a vegetative phase. In contrast, facultative plants show accelerated flowering under inductive conditions and undergo normal flowering even in noninductive photoperiod (Peer et al., 2021). In a protected environment, Chauhan et al. (2014) investigated the effects of several media on gerbera (*Gerbera jamesonii* Bolus) cv. Alcochete growth, flowering, and cut flower production. The results showed that the medium amended with regular soil with rice husk, coco peat, castor cake, and vermicompost (1:1:1:1) performed better for maximum plant height and spread at first flower appearance and pick blooming stage, as well as highest number of leaves and suckers per plant. The same pattern was seen for other flowering characteristics, including the shortest time between the emergence of the first flower bud and its opening, the longest flowering period, the width and thickness of the flower as well as the number of ray florets that each flower contains. In case of yield parameters, the same treatment was also found better for fresh and dry weight of cut flower, number of flowers per plant, per square meter and yield of flowers. While, the normal soil as control found for poorest response in all parameters.

Biofertilizers are ready-to-use live formulations of beneficial microorganisms that, when applied to seeds, seedlings, or soil, mobilize the availability of nutrients, particularly through their biological activity, and aid in the development of the microflora, which in turn improves the health of the soil. They contribute significantly to agricultural productivity and

are environmentally beneficial. It was once mostly used for field crops, but today it is also utilized for floral crops. Numerous biofertilizers, including *Azotobacter*, *Azospirillum*, phosphorus-solubilizing bacteria, and AM fungus, demonstrate their potential for use in a variety of flower crops, including rose, tuberose, carnation, marigold, aster, jasmine, and others. Biofertilizers can fix 20–200 kg N/ha/year, solubilize 30–50 kg P/ha/year, and to variable degrees mobilize P, Zn, Fe, and Mo. These products not only help in improving the nutrient uptake by the plants, releasing of growth hormones and antibiotics but also improve the quality of produce along with reduced cost of production (Anop et al., 2013).

5. Harvest Stage

For field-grown cut flowers, it can be especially crucial to know when to cut the stems and how to handle the flowers throughout processing. In addition to having less handling and shipping damage, stems harvested at an early stage of development may also have a longer vase life. The quality of the stems and their capacity to withstand dry handling are also determined by how the stems are handled just after harvest, whether in water or dry (Ahmad & Dole, 2014). Every species has a different harvesting process. Chrysanthemums, gerberas, zinnias, and other Asteraceae species, for example, should be fully mature, whilst inflorescences with many buds are harvested at 25–50% open blooms (Dole & Wilkins, 2005). The harvest stage had no effect on the vase life of *Leucocoryne coquimbensis* (Elgar et al., 2003) or *Viburnum tinus* (Darras et al., 2010) inflorescences, demonstrating that various genotypes have varied reactions (Darras, 2021). Different cut flower species' vase life were greatly impacted by stem length, leaf number, and harvest time (Fanourakis et al., 2013).

7. Hydration

One of the most crucial elements in extending the vase life of cut flowers is water uptake. Water is drained from the flowers through the xylem as the leaves transpire. Transpiration will exceed uptake if there is a vascular obstruction, and stomatal opening will rise if this process is accelerated. This will result in water deficiency (Moody et al., 2014). The most common initial action following flower harvesting is to submerge the cut stems in water or a postharvest liquid. But as an example, dry handling rose flowers is associated with reduced transportation-related damage and maintenance of optimal water relations during vase life highlight the potential of this alternative postharvest strategy for maximizing flower quality and longevity. The use of dry handling in conjunction with maintaining the cool-chain represents an excellent opportunity to improve the postharvest performance of selected cut flowers due to the higher volume and weight of flowers transported after hydration, which translates into higher costs of

transportation and handling (Macnish et al., 2009). Cut flowers often experience short or long periods without hydration (Xue et al., 2019). The cut flower supply chain typically uses the dry management technique to decrease transportation and handling expenses (Ahamd et al., 2012). Since climatic conditions are rarely controlled, excessive transpiration is the main source of cut flower weight depression (In et al., 2016). When the separate contribution of leaves, stem, and flowers on the whole-cut flower transpiration becomes available, a more comprehensive knowledge of the determination of this trait is obtained, aiding breeding and selection efforts (Fanourakis et al., 2021).

8. Cooling

A major problem with postharvest losses in vulnerable horticultural commodities is physiological problems during long-term cold storage (Antunes et al., 2022). Cut flowers benefit from quick cooling to their ideal keeping temperature due to their comparatively high metabolic rates (Kader, 2002). Due to the risk of freezing and damage, sub-zero temperatures are frequently avoided during the cultivation and post-harvest handling of perishable cut flowers. Previous studies, however, indicated that employing sub-zero temperatures during storage might have a favorable impact on the quality and subsequent vase life of cut flowers. Because storage enables species with limited production to extend their growing season, it provides greater supply flexibility, and it may even reduce production costs, storage is an essential part of the supply chain for cut flowers. Due to their high value, seasonal but global production, resistance to subzero temperatures, and capacity to keep cut stems without water, cut *Paeonia lactiflora* (peony) hybrids were primarily utilized to investigate the utilization of sub-zero temperatures for long-term storage (dry storage) in the study of Jahnke, (2020). The best flower quality preservation range for cut *Paeonia lactiflora* (peony) hybrids was between 0 and 1°C. However, characteristics of cut flowers, such as vase life and blossom size, frequently deteriorate after four or more weeks of storage. Although the use of sub-zero temperatures is discouraged in the cut flower industry due to concerns about freeze damage, sub-zero temperatures may enable cut flowers to be stored for longer periods of time. Due to their inherent cold tolerance, susceptibility to spring freezes prior to harvest, and limited seasonal availability, peonies are a candidate for sub-zero storage. It was found that peony and other cold-tolerant cut flower species may benefit from longer periods of dry storage at storage temperatures between 0 and -2 °C.

9. Grading

Grading flowers is a big task because it makes the managing of flowers in greenhouses and markets much easier. Flower grading is the process of classifying flowers into different grades depending on their quality and aesthetic appeal. Grading flowers has emerged as an interdisciplinary topic in botany and computer vision due to the development of computer vision. Grading flowers is seen as a difficult process because there aren't any clear disparities between the grades. In particular, medium grade flowers resemble high or low grade flowers in terms of shape and color (Sun et al., 2017). Identification of flower quality grade is a crucial and difficult duty during the flower sales process. Fresh cut flower grading and classification have always relied on manual labor, which is inefficient and inaccurate. Manual categorization and grading cannot keep up with the market demand, the expanding transportation industry, and the insurance period for fresh flowers. Additionally, manual classification is subjective, laborious, and requires employees who have undergone professional training (Sun et al., 2021).

Fig. 2. Dendrobium flower packaging (Maitra et al., 2020)

The initial packinghouse process is frequently the culling, which involves removing damaged flowers (such as stems that are bent). Although other quality factors must also be taken into account, length is typically the grading standard. Maturity, bud and flower morphology, leaf condition, and pest and disease damage are some of these characteristics. Mechanical and electrical tools like photocell-based stem length graders can help in grading. Bunching of one or more species may consist of either mixed or single types. Typically, length-graded flowers are grouped according to the number of stems (e.g. five- or tenstem bunches). It can also be utilized by weight, either by itself or in combination with stem numbers. The uniformity of bunches is a crucial factor. Numerous mixed-flower bunches can be prepared by

using conveyors on a regular basis. The bunch is gradually augmented with flowers as it travels along the packing line. To check bunch weights, balances may be mechanical or computerized. Rubber bands are frequently used to secure bundles. Elastic string tying machines are also employed. Bundles are cut to the proper length with a saw or guillotine. Bunches are frequently sleeved, especially for expensive flowers and mixed bouquets. Sleeves are typically made of printed plastic and occasionally have perforations. Usually, they are utilized with a chute feed-type dispenser (Joyce & Faragher, 2012).

10. Light

It has been suggested that light plays a beneficial function in maintaining the quality of flowers with photosynthetic leaves, such as rose, chrysanthemum, and protea, during postharvest storage (Rajapakse and Kelly, 1994; Ranwala and Miller, 2000). Nowadays, horticulture makes extensive use of light emitting diodes (LED) lighting technologies. It is feasible to apply particular wavelengths to plant material using LEDs. Cut flowers continue to respond to environmental cues like light spectrum even after being harvested. The 380 to 750 nm region of the light spectrum has an impact on a number of plant functions (Aliniaiefard et al., 2020). Spectrum is one of the aspects of light that has a big impact on how plants react. Along with photosynthesis, light quality also affects a plant's cellular health, water relations, color, carbohydrate content, and antioxidant status (Bayat et al., 2018; Hosseini et al., 2018).

11. Conclusions

Both pre-harvest and post-harvest conditions and applications are important for cut flowers' vase life. Important aspects related to this include genetics, growth conditions, flower maturity, stage of harvest, time of harvest, harvesting method, precooling, grading, cleaning, bunching, conditioning, floral preservatives, packing, aging, wilting, shattering, growth tropism, mechanical damage, water quality, light, temperature, humidity, carbon dioxide, water content, refrigerated storage and transport. Each plant species needs to be harvested at the proper stage in order to guarantee acceptable quality and proper postharvest behavior of cut flowers. Precooling is crucial to remove the field heat after harvesting flowers, which should be harvested in the morning or evening. Cutting equipment and storage containers should also be cleaned and disinfected. Production and productivity are impacted by a poor cultural package, a lack of planting seed and other materials of improved types, and numerous diseases. Large post-harvest losses occur as a result of improper handling, grading, packaging, and storage. Implementing tight hygienic standards in the grading and packaging rooms and careful usage of flower preservative can increase vase life.

Özet

Ülkemiz hayvancılığın kaliteli kaba yem açığının kapatılması için birim alanda yüksek biyokütle verimi ve yem kalitesine sahip yeni yem bitkisi tür ve çeşitlerine gereksinim duyulmaktadır. Kurağa ve yüksek sıcaklığa diğer türlere göre daha toleranslı olan inci darısı, Dünya’da olduğu gibi ülkemizde de yem bitkisi olarak değerlendirilebilmek için de üzerinde durulması gereken önemli bir türdür. Çalışmada, yurt dışından temin edilen 225 adet inci darısı (*Pennisetum glaucum* (L.) R. Br.) popülasyonunun, GAP bölgesi ikinci ürün koşullarında bazı tarımsal özellikleri saptanmıştır. Araştırma, Akçakale/Şanlıurfa’da 2021 yılında, ikinci ürün koşullarında, Alfa Latis deneme deseninde (15 x 15) 2 tekrarlamalı olarak yürütülmüştür. Biçimler, başaktaki tanelerin süt-hamur olum döneminde yapılmıştır. İncelenen özellikler bakımından popülasyonlar arasında önemli derecede istatistiksel farklılıklar saptanmıştır. Ot

kalitesi ile ilişkili özellikler popülasyonlara göre değişmekle birlikte; ham protein (HP) oranının %6.45-14.75, nötr deterjan lif (NDF) %47.19-66.85, asit deterjan lif (ADF) %34.33-46.89, sindirilebilir kuru madde (SKM) oranı %52.37-62.16, kuru madde tüketimi (KMT) %1.80-2.54, nispi yem değeri (NYD) 74.66-122.52 ve net enerji (NE) laktasyon 1.23-1.41 mcal/kg KM arasında değiştiği saptanmıştır. Ayrıca mineral elementlerden kalsiyum (Ca) %0.01-0.400, potasyum (K) %2.48-4.33, magnezyum (Mg) % 0.04-0.255 ve fosfor (P) %0.290-0.540 arasında değiştiği saptanmıştır. İncelenen özellikler arası ilişkilerde ham protein oranı ile NDF, ADF, Mg, P, SKM oranı, KMT, NYD ve NE arasında da olumlu ve önemli ilişkiler saptanmıştır. Ülkemiz GAP koşullarında inci darısı popülasyonlarının saptanan bazı kalite özellikleri ile inci darısının ülkemizde kaba yem açığının kapatılması için üretimi yapılabilecek potansiyel yem bitkisi olduğu görülmektedir.

Anahtar Kelimeler: İnci darısı (*Pennisetum glaucum*), kalite, korelasyon, popülasyon

**DETERMINATION OF FORAGE QUALITY AND ITS RELATED
CHARACTERISTICS OF SOME PEARL MILLET POPULATIONS UNDER GAP
CONDITIONS***

Abstract

There is a need for new feed crop species and cultivars with a high biomass yield and feed quality to meet the quality roughage deficit of stockbreeding operations of Turkey. Pearl millet, which is more tolerant to drought and high temperatures than other species, is an important species that should be considered as a forage crops in our country as in the World. In this research, some agricultural characteristics of the 225 Pearl millet (*Pennisetum glaucum* (L.) R. Br.) accessions/populations obtained from abroad were determined in the second crop conditions of the GAP region. This research was carried out as second crop under Akçakale/Şanlıurfa conditions during the second crop growing season of 2021. Experimental design was Alfa Latis experimental design (15 * 15) with 2 replications. The harvest were made during the milk-dough stage of the grains in the spike. Significant statistical differences were found among the populations in terms of the examined characteristics. Neutral detergent fiber (NDF) contents of the populations varied between 47.19 and 66.85%, acid detergent fiber (ADF) between 34.33 and 46.89%, crude protein (CP) rates between 6.45 and 14.75%, digestible dry matter (DDM) ratios between 52.37 and 62.16%, dry matter Intake (DMI) between 1.80 and 2.54%, relative feed values (RFV) between 74.66 and 122.52 and net energy (NE) lactation between 1.23 and 1.41 mcal kg⁻¹ DM. It was determined that calcium content varied between 0.01 and 0.40%, potassium between 2.48 and 4.33%, magnesium between 0.04 and 0.26% and phosphorus values varied between 0.29 and 0.540%. Significant and positive relationships were found between hay yield per plant and crude protein ratio, NDF, ADF, Mg, P, DDM ratio, DMI, RFV and NE. It was seen that pearl millet is a potential forage crop that can be produced in order to close the roughage deficit in our country, with some quality characteristics of pearl millet populations determined in GAP regions.

Keywords: Pearl millet (*Pennisetum glaucum*), forage quality, correlation, population

GİRİŞ

Türkiye’de yaklaşık olarak 18 milyon büyük baş hayvan biriminin (BBHB) kaliteli kaba yem ihtiyacının 82 milyon ton olması gerektiği hesaplanmaktadır. Hayvanların kaba yem gereksinimi, doğal çayır-mera alanlarından ve tarla tarımı içerisinde yer alan yem bitkileri üretiminden karşılanmaya çalışılmaktadır. Tarla tarımı içerisinde yapılan yem bitkileri ekim alanı 2.27 mil. ha olarak belirlenmiştir. Bu ekim alanın, ekilebilir alanların %12’ine karşılık geldiği görülmektedir (TUİK, 2021). Yem bitkileri ekiminden yaklaşık 60.7 milyon ton yeşil ot veya eşdeğeri 15-16 milyon ton kuru ot üretiminin gerçekleştiği, çayır mera alanlarından ise yılda yaklaşık 12-15 milyon ton kuru ota eşdeğer yem elde edildiği bildirilmektedir (Altın ve ark., 2005). Ülkemizde doğal çayır-meralar ve yem bitkileri ekim alanlarından yaklaşık 30-32 milyon ton kaliteli kaba yem üretimi olduğu kabul edildiğinde, hala yaklaşık 50 milyon ton kaliteli kaba yem açığı bulunduğu ortaya çıkmaktadır. Ülkemizin en önemli kaba yem kaynağını oluşturan çayır mera alanlarının önemli bir kısmının, bitki örtüsünden yoksun ve verimlerinin düşük olması nedeniyle, kaba yem açığının kısa sürede kapatılmasında tarla tarımı içerisinde yetiştirilecek yem bitkileri önemli rol oynayacaktır. Bundan dolayıdır ki birim alanda yüksek verim potansiyeli ve yem kalitesine sahip yeni yem bitkisi tür ve çeşitlerine gereksinim duyulmaktadır. Bu türlerin başında da “darılar” gelmektedir. Darılar (millet) terimi birçok türü kapsar. Bunların arasında en önemli olanı İnci darısıdır (*Pennisetum glaucum* (L.) R. Br.). Darılar, kuraklığa dayanıklı/toleranslı en önemli bitkiler olup, dünya tarımsal üretimi açısından 6. sırada yer almaktadırlar. Ayrıca, önemli tahıllarla kıyaslandığında hastalık ve zararlılara dayanıklılığı, kısa yetiştirme mevsimine sahip olması ve kuraklık sorunu olan koşullardaki verimliliği ile dikkat çekmektedirler (Devi ve ark., 2011). İnci darının, sıcaklığa, kuraklığa ve tuzluluğa diğer ürünlere göre daha toleranslı olması, özellikle marjinal alanlarda yetiştirilecek olmasının yanı sıra, tarımının düşük girdilerle yapılması, hastalık ve zararlılar bakımından daha avantajlı olması nedeniyle önümüzdeki yıllarda tüm dünyada olduğu gibi ülkemizde ve özellikle de Ege, Akdeniz ve GAP bölgesinde önemli bir tür olarak karşımıza çıkacağı tahmin edilmektedir (Yücel ve Yücel, 2022). Sıcak iklim bitkisi olan İnci darı C4 bitkisi olup, kuraklığa dayanıklı tahılların başında yer almaktadır (Taylor ve ark., 2006; Lee ve ark., 2012), ancak susuz koşullarda yetiştirilmesi mümkün değildir. İnci darı, dik büyüyen, tek yıllık, 3-5 m’ye kadar boylanan, çok sap oluşturan bitki yapısına sahiptir. İnci darı, kısa gün bitkisi olup çiçeklenmesini kısa günde tamamlamaktadır. Gün uzunluğunun 12 saat ve günlük ortalama 28-30 °C sıcaklığın, bitki büyümesi için uygun olduğu bildirilmektedir (Bidinger ve Rai, 1989). İnci darı özellikle iklim değişikliği etkilerine karşı yüksek dirençleri ve kabul edilebilir

üretkenlik ve besin değerleri nedeniyle popülerlik kazandığı ifade edilmektedir (Jukanti ve ark., 2016). Aynı zamanda besin içeriği bakımından Sorgum ve Sudan otuna göre üstünlük sağlayan, söz konusu türlerin içerdiği hidrosiyanik ve prusik asit içermeyen bir türdür (Hassan ve ark., 2014).

Bu çalışma ile İnci darısının ülkemizin kurak ve sıcak iklim koşullarına sahip GAP bölgesinde, ot kalitesi ile ilişkili özelliklerin saptanmasının yanı sıra özellikler arasındaki ilişkilerde saptanmıştır.

MATERYAL VE YÖNTEM

Tarla Denemelerinin Yürütülmesi

Projede, toplam 225 inci darı popülasyonu bitki materyali olarak kullanılmıştır. Tarla denemeleri, GAP Tarımsal Araştırma Enstitüsü (GAPTAEM) Talat Demirören İstasyonunda (Akçakale/Şanlıurfa), 15 x 15 Alfa Latis deneme deseninde iki tekerrürlü olarak kurulmuştur. Her popülasyon, sıra arası 70 cm ve uzunluğu 4 m olan sıralara, sıra üzeri 25 cm olacak şekilde, 1'er sıra olarak ekilmiştir.

Deneme Alanı Toprak ve İklim Özellikleri

Toprak Özellikleri: GAP Lokasyonu denemeleri, bölgede geniş yayılım alanına sahip GAP toprak serisinde yer alan GAP Tarımsal Araştırma Enstitüsü Müdürlüğüne ait Talat Demirören Araştırma İstasyonunda (Akçakale) yürütülmüştür. Bu seri toprakları, alüvyon ana materyalli, düz ve düze yakın eğimli, derin profil topraklardır. Tipik kırmızı profilleri killi tekstürlü ve tüm profil çok kireçlidir. A,B,C horizonlu topraklar olup, pH 7,3 ile 7,8 arasında değişmekte, organik madde içeriği düşük, kation değişim kapasitesi yüksektir. KDK kil içeriğine bağlı olarak alt katmanlara doğru artmaktadır (Anonim, 2021 a).

İklim Özellikleri: Tarla denemelerinin yürütüldüğü Şanlıurfa ilinde Temmuz-Ekim döneminde ortalama sıcaklık 28.88 °C, ortalama maksimum sıcaklık 35.50 °C ve minimum ortalama sıcaklık 22.5 °C, nispi nem %30.48 ve toplam yağış ise 10 mm olarak saptanmıştır (Anonim, 2021 b).

Denemelerin Yürütülmesi

Deneme ekilecek alanı, buğdayları hasat edildikten sonra sulanıp, ikinci toprak işleme aletleri ile sürülüp markör çekilerek, deneme alanı ekime hazır hale getirilmiştir. Sulamadan sonra çıkan yabancı otlar deneme alanında temizlenmiştir. Ekimler, daha önce hazır hale getirilen sıralara sıra üzeri 3-5 cm olacak şekilde elle 2-3 Temmuz 2021 de yapılmıştır. Ekimden sonra 2-3 gün aralıklarla sürekli yağmurlama sulama yapılarak, sıra üzerinde istenilen bitki sayısı sağlanmıştır. Çıkiştan sonra sıra üzeri 25 cm olacak şekilde önce tekleme, daha sonra da

seyreltme yapılarak istenilen sıra üzeri sağlanmıştır. Ekimden önce toprak analizi sonuçlarına göre N ve P₂O₅ 8 kg/da'a tamamlanacak şekilde 20:20:0 kompoze gübre atılmıştır. Ağustos ayının ilk haftasında üst gübre olarak üre formunda 4 kg/da saf N, sıra arasına verilmiştir. Yağmurlama sulamanın dışında, 4 kez salma sulama yapılmıştır. Bazı genotiplerin geçi olması ve hasatlarının gecikmesi nedeniyle Eylül ayı içerisinde bir sulama daha yapılmıştır.

Kuru ot örneklerin analize hazırlanması ve yöntemler

Her genotipin ot hasadı, salkımdaki tanelerin süt-hamur olum dönemine denk gelen dönemde hasat edilmiş ve her sıradan 3'er bitki alınmıştır. Her bitkide alınan 500 g yaş ot örneği (mümkün olduğunca salkım, sap ve yapraklara sahip birer sap), 10-15 cm olacak şekilde parçalanarak kurutma dolabında 60-65 °C'de 3-4 gün (suca zengin olduğu için) kurutulmuş ve ağırlıkları sabitlendiğinde tartılmış ve kuru ot oranları saptanmıştır.

Bu kuru ot örnekleri, özel tasarlanmış değirmende öğütülüp 2 mm elekten geçirilerek ve kalite analizine tabi tutulmuştur. Kalite özelliği olarak ham protein (HP) oranı, nötral deterjan lif (NDF), asit deterjan lif (ADF), mineral elementler (P, K, Mg ve Ca), Doğu Akdeniz Tarımsal Araştırma Enstitüsü'ne ait kalite analiz laboratuvarında NIRS (Near Reflectance Spectroscopy) ve Foss XDS Rapid Content Analyser cihazında saptanmıştır. Sindirilebilir kuru madde (SKM) oranı ve kuru madde tüketimi (KMT), Schroeder (1994) tarafından açıklanan formüle göre hesaplanmıştır. Buna göre, sindirilebilir kuru madde oranı (SKMO)=88.9-(0.779 x %ADF); kuru madde tüketimi (KMT)=120/%NDF, nispi yem değeri (NYD) = (%SKM X %KMT)/1.29 eşitliğine göre hesaplanmıştır. Net Enerji (NE) Laktasyon (Mcal/kg)=1.892-(0.0141*ADF) formülünden hesaplanmıştır (Anononymous, 2018).

ARAŞTIRMA BULGULARI

GAP lokasyonunda 2021 yılında 225 genotipten elde edilen verilere Latis deneme deseninde (15 * 15) varyans analizi uygulanmış ve elde edilen varyan analizi sonuçlar, Çizelge 1'de verilmiştir.

İncelenen özelliklerle ilgili olarak popülasyonlarda saptanan en düşük, en yüksek, ortalama değerleri ve F değerleri (genotip) Çizelge 2'de verilmiştir. İncelenen özellikler bakımından genotipler arasında istatistiki olarak önemli farklılıklar saptanmıştır. Fosfor bakımından genotipler, P≤0.05 hata sınırları içinde istatistiki olarak önemli bulunmuştur. Diğer özelliklerin tamamı P≤0.01 hata sınırları içinde istatistiki olarak önemli bulunmuştur.

**) $P \leq 0.01$ hata sınırları içinde önemli ; *) $P \leq 0.05$ hata sınırları içinde önemli

Asit Deterjan Lif (ADF); Kalsiyum (Ca); Potasyum (K); Magnezyum (Mg); Nötr Deterjan Lif Ham (NDF); Ham Protein Oranı (HPO); Sindirilebilir KM Oranı (SKMO); Kuru Madde Tüketimi (KMT); Nispi Yem Değeri (NYD); Net Enerji Laktasyon (NEL)

Ham Protein (HP) Oranı (%): Çizelge 1’de görüleceği üzere HP bakımından genotipler $P \leq 0.01$ hata sınırları içinde istatistiki olarak önemli bulunmuştur. Çalışmada genotiplerin HP oranlarının %6.45-14.75 arasında değiştiği ve ortalamasının ise %10.23 olduğu saptanmıştır (Çizelge 2). Farklı ekolojilerde, uygulamalarda ve genotiplerle yapılan çalışmalarda; Abd El-Lattief (2011) Benin’de yürüttüğü araştırmada HP oranının biçim dönemine göre %7.4-9.6 arasında değiştiğini bildirmiştir. Sheahan (2014), inci darısının HP oranının %12-14 arasında değiştiğini ve bu değer mısır silajından daha yüksek olduğunu saptamıştır. Ayrıca, ham protein içeriğinin Pakistan şartlarında %6.73-10.35 arasında değiştiği (Hassan ve ark., 2014), Brezilya şartlarında %20.35-22.53 aralığında (Buso ve ark., 2014), Sudan koşullarında %6.6-17.0 aralığında (Babiker ve ark., 2015; Heuze ve ark., 2015), Meksika şartlarında %14 olarak saptandığı bildirilmiştir (Morales ve ark., 2015). Salama ve ark. (2020), Mısır’ın Alexandria koşullarında inci darısı popülasyonunun, HP oranının 61.2-113.3 g/kg arasında değiştiğini bildirmişlerdir. Saygıdar (2021) GAP koşullarında HP oranının %8.54-10.87 arasında değiştiğini bildirilmektedir.

Nötr Deterjan Lif (NDF) (%):Yapılan varyans analiz sonuçlarına göre NDF bakımından genotipler $P \leq 0.01$ hata sınırları içinde istatistiki olarak önemli bulunmuştur (Çizelge 1). Genotiplerin, NDF oranlarının %47.19-66.85 arasında değiştiği ve ortalamasının ise %56.78 olduğu saptanmıştır (Çizelge 2). Farklı ekoloji ve genotiplerde yapılan çalışmalarda; Buso ve ark. (2014) Brezilya şartlarında NDF değerinin %56.3-60.1 aralığında olduğunu, Heuze ve ark. (2015) %46.1-64.8 arasında, Salama ve ark. (2020), Mısır’ın Alexandria koşullarında inci darısı

popülasyonunun NDF oranının 616.0683.3 g/kg arasında değiştiğini bildirmişlerdir. Ülkemiz koşullarında yürütülen çalışmalarda; Dağtekin (2019) Çukurova koşullarında NDF ortalamalarının %78.3-87.5 arasında değiştiğini; Saygıdar (2021) GAP koşullarında çeşitlere göre değişmekle birlikte NDF oranlarının %63.98-74.24 arasında olduğunu bildirmişlerdir.

Asit Deterjan Lif (ADF) (%): Yapılan varyans analiz sonuçlarına göre ADF bakımından genotipler $P \leq 0.01$ hata sınırları içinde istatistiki olarak önemli bulunmuştur (Çizelge 1). Çizelge 2’de görüleceği üzere genotiplerin ADF oranları %34.33-46.90 arasında değişmiş ve ortalamasının ise %41.35 olduğu saptanmıştır. Farklı ekolojilerde ve farklı genotiplerle yapılan önceki çalışmalarda ADF oranının; Brezilya şartlarında %30.2-32.0 aralığında (Buso ve ark., 2014), Sudan koşullarında %30.7-45.1 aralığında değiştiği (Heuze ve ark., 2015), Salama ve ark. (2020), Mısır’ın Alexandria koşullarında inci darısı popülasyonunun, ADF oranının 305.2-358.9 g/kg arasında değiştiğini bildirmişlerdir. Ülkemiz koşullarında yapılan çalışmalarda ADF oranının; Çukurova koşullarında %42.6-51.5 aralığında değiştiği (Dağtekin, 2019), GAP koşullarında %35.28-39.71 arasında olduğu bildirilmiştir (Saygıdar, 2021).

Kalsiyum (Ca) (%): Çizelge 1’den görüleceği üzere Ca bakımından genotipler, %1’e göre istatistiki olarak önemli bulunmuştur. Çizelge 2’de görüleceği üzere genotiplerin Ca içerikleri %0.01-0.40 arasında değişmiş ve ortalamasının ise %0.15 olduğu saptanmıştır. Kalsiyumun özellikle hayvanların iskelet ve dişlerin yapı taşları için önemli olduğu bildirilmektedir (Kirchgesner, 1985). Hayvanların düzenli ve rasyonel bir şekilde beslenmeleri için, yemlerin yapısında %0.31 oranında Ca bulunması gerektiği bildirilmektedir (Kidambi ve ark., 1989). Farklı bölgelerde, uygulamalarda inci darısı genotipleri ile yapılan çalışmalarda Ca değerlerinin; Weichenthal ve ark. (2003) Nebraska sulu koşullarında Ca içeriğini %0.51 olarak bulmuştur. Heuze ve ark. (2015) Ca içeriğinin %0.29-0.85 arasında değiştiğini bildirmişlerdir. Saygıdar (2021) GAP koşullarında Ca içeriğinin %0.128-0.38 arasında değiştiğini bildirmiştir.

Potasyum (K) (%): Çizelge 1’den görüleceği üzere K bakımından genotipler, %1’e göre istatistiki olarak önemli bulunmuştur. Genotiplerin K içeriklerinin %2.48-4.33 arasında değiştiği ve ortalamasının ise %3.42 olduğu saptanmıştır. Hayvan beslemede ve yem rasyonlarının hazırlanmasında dengeli beslenme için diğer mineral madde içerikleri kadar K içeriği ve oranı da önemlidir. Hayvanların düzenli ve rasyonel bir şekilde beslenmeleri için, yemlerin yapısında %0.65 K bulunması gerektiği bildirilmektedir (Kidambi ve ark., 1989). Çalışmamızda elde edilen değerlerin bu değerlerin çok üzerinde olduğu görülmektedir. Ayrıca K vücuttaki asit baz dengesini sağlamakta önemli rol oynadığı bildirilmiştir (Kirchgesner, 1985). Weichenthal ve ark. (2003)’ün Nebraska koşullarında inci darısı kuru maddesinde K

değerini %4.3 olarak saptamışlar. Heuze ve ark. (2015) K içeriğinin %0.16-0.419 arasında değiştiğini bildirmişlerdir. Saygıdar (2021) GAP koşullarında potasyum içeriğinin %3.043-3.530 arasında olduğunu bildirmiştir.

Magnezyum (Mg) (%): Çizelge 1'den görüleceği üzere Mg bakımından genotipler, %1'e göre istatistiki olarak önemli bulunmuştur. Genotiplerin Mg içerikleri %0.040-0.255 arasında değiştiği ve ortalamasının ise 0.158 olduğu saptanmıştır (Çizelge 2). Hayvanların düzenli ve dengeli şekilde beslenmeleri için, yemlerin yapısında %0.1 Mg bulunması önerilmektedir (Kidambi ve ark., 1989). Çalışmamızda elde edilen değerlerin bu değerlerin çok üzerinde olduğu görülmektedir. Bu mineral maddelerden, Mg iskelet ve dişlerin yapı taşlarında önemli olduğu bildirilmektedir (Kirchgesner, 1985). Weichenthal ve ark. (2003) inci darısı otunun kuru maddesinde Mg değerinin %0.330 olduğunu, Heuze ve ark. (2015) Mg içeriğinin %0.24-0.45 arasında değiştiğini bildirmişlerdir. Dağtekin (2019) Çukurova koşullarında inci darısı genotiplerinde Mg oranının %0.201-0.343 arasında değiştiğini, Saygıdar (2021) GAP koşullarında yürütmüş olduğu araştırmada çeşitlere göre değişmekle birlikte Mg içeriğinin %0.256-0.343 arasında olduğunu bildirmişlerdir.

Fosfor (P) (%): Çizelge 1'den görüleceği üzere P bakımından genotipler, %5'e göre istatistiki olarak önemli bulunmuştur. Genotiplerin P içeriklerinin %0.29-0.54 arasında değiştiği ve ortalamasının ise %0.37 olduğu saptanmıştır (Çizelge 2). Hayvanların düzenli ve dengeli şekilde beslenmeleri için, yemlerin yapısında %0.21 oranında P bulunması önerilmektedir (Kidambi ve ark., 1989). Bu mineral maddelerden P, iskelet ve dişlerin yapı taşları için önemli olduğu bildirilmektedir (Kirchgesner, 1985). Weichenthal ve ark. (2003) Nebraska'da inci darısı kuru maddesinde P değerini %0.240 olarak saptamışlardır. Heuze ve ark. (2015) inci darısı otunun P içeriğinin %0.04-0.45 arasında değiştiğini bildirmişlerdir. Dağtekin (2019) Çukurova koşullarında P oranının %0.27-0.434 arasında, Saygıdar (2021) GAP koşullarında %0.27-0.30 arasında değiştiğini bildirmiştir.

Sindirilebilir Kuru Madde (SKM) Oranı (%): Yapılan varyans analiz sonuçları göre SKM oranı bakımından genotipler arasında istatistiki olarak önemli farklar saptanmamıştır (Çizelge 1). Sindirilebilir KM oranlarının %52.37-62.16 arasında değiştiği ve genotiplerin ortalamasının ise %56.69 olduğu saptanmıştır. Saygıdar (2021) GAP koşullarında sindirilebilir kuru madde (SKM) oranının %57.97-61.42 arasında olduğunu bildirmiştir.

Kuru Madde Tüketimi (KMT) (%): Yapılan varyans analiz sonuçlarına KMT bakımından genotipler, %1'e göre istatistiki olarak önemli bulunmuştur (Çizelge 1). İnci darı genotiplerin KMT %1.80-2.54 arasında değiştiği ve genotiplerin ortalamasının ise %2.13 olduğu

saptanmıştır (Çizelge 2). Saygıdar (2021) GAP koşullarında yürütmüş olduğu araştırmada, çeşitlere göre değişmekle birlikte kuru madde tüketimi (KMT) oranının %1.624-1.890 arasında olduğunu bildirmiştir.

Nispi Yem Değeri (NYD): Yapılan varyans analiz sonuçlarına göre NYD bakımından genotipler arasından %1'e göre istatistiki olarak önemli farklılıklar saptanmıştır. İnci darısı genotiplerin NYD 74.66-122.52 arasında değiştiği ve genotiplerin ortalamasının ise 93.59 olduğu saptanmıştır. Yem bitkilerinin önemli kalite parametrelerinden olan NYD'nin yem kalitesi ve hayvan beslenmesi açısından yüksek olması istenmektedir. Nispi yem değeri, sindirilebilir kuru madde oranı ve kuru madde tüketimi değerlerinden hesaplanan bir yem kalite göstergesi olup, temelinde NDF ve ADF değerleri baz alınmaktadır. Nötral deterjan lif ve ADF değerlerinin düşük olması nispi yem değerinin yüksek olmasını sağlamaktadır. Nispi yem değeri ile ADF ve NDF arasında önemli ve olumsuz, KMT ve SKM arasında önemli ve olumlu ilişkiler bulunduğu Saygıdar (2021) tarafından belirtilmiştir. Saygıdar (2021) GAP koşullarında yürütmüş olduğu araştırmada, çeşitlere göre değişmekle birlikte nispi yem değerinin 73.13-90.29 arasında değiştiğini bildirmişlerdir.

Net Enerji (NE) Laktasyon (Mcal/kg): Yapılan varyans analiz sonuçlarına göre NE bakımından genotipler, %1'e göre istatistiki olarak önemli bulunmuştur (Çizelge 1). Çizelge 2'de görüleceği üzere genotiplerin NE içerikleri %1.231-1.408 arasında değişmiş ve genotiplerin ortalamasının ise %1.309 olduğu saptanmıştır.

Çizelge 2. Genotiplerin incelenen özelliklere ait en düşük, en yüksek, ortalama değerler ve F değerleri (n=1350)

KMT ile NYD ve NE arasında önemli ve olumlu ilişkiler saptanırken saptanmıştır. NYD ile NE arasında önemli ve olumlu ilişkiler saptanmıştır.

SONUÇ

Özellikle son yıllarda etkisinin daha da belirgin olduğu iklim değişiklikleri nedeniyle, değişmekte olan ürün deseni içerisinde, yüksek sıcaklığa ve kurağa toleranslı inci darısının ot kalite değerleri de dikkate alındığında, GAP bölgesi gibi çok sıcak ve yarı kurak bölgelerde, kaliteli kaba yem açığının kapatılması için önemli bir tür olacağı görülmektedir. İncelenen

özellikler arası ilişkiler incelendiğinde, ot kalitesi bakımından yapılacak seleksiyonlarda NDF ve ADF içerikleri düşük ve HP içeriği yüksek genotiplerin seçilmesi önemli olacaktır.

Teşekkür

ÖZET

Artan sera gazları nedeniyle meydana gelen iklim değişiklikleri sonucu abiyotik strese toleranslı yeni türlerin üretime alınması ve yeni çeşitlerinin geliştirilmesi her geçen gün daha fazla önem kazanmaktadır. Darıların, kurağa ve yüksek sıcaklığa diğer ürünlere göre daha toleranslı olmaları ve çok amaçlı (gıda, yem ve enerji) kullanılmaları nedeniyle, üzerinde durulması gereken bitki türlerinin başında gelmektedir. Çalışmada, yurt dışından temin edilen 225 adet inci darısı (*Pennisetum glaucum* (L.) R. Br.) popülasyonunun, GAP bölgesi ikinci ürün koşullarında bazı tarımsal özellikleri saptanmıştır. Araştırma, Akçakale/Şanlıurfa'da 2021 yılında Alfa Latis deneme deseninde (15 *15) 2 tekrarlamalı olarak yürütülmüştür. Biçimler, baştaki tanelerin süt-hamur olum döneminde yapılmıştır. İncelenen özellikler bakımından popülasyonlar arasında istatistiksel olarak önemli farklılıklar saptanmıştır. Popülasyonlara bağlı olarak; çiçeklenme gün sayısının 67.5-88.0 gün, bitki boyunun 146.5-344.0 cm, salkım uzunluğunun 15.34-40.34, ana saptaki yaprak sayısının 7.67-17.0 adet, fertil sap sayısının 1.50-6.33 adet/bitki, vejetatif sap sayısının 0.00-2.33 adet/bitki, toplam sap sayısının 2.33-7.50 adet/bitki, yaş ot veriminin 438.0-2803.3 g/bitki, kuru ot veriminin ise 146.4-1054.2 g/bitki arasında değiştiği saptanmıştır. Bitki başına kuru ot verimi ile çiçeklenme gün sayısı, bitki boyu, sap sayısı, yaprak sayısı ve yaş ot verimi arasında önemli ve olumlu ilişkiler saptanmıştır. GAP koşullarında inci darısı popülasyonları ile yürütülen bu çalışmanın sonuçlarına dayanılarak, inci darısının ülkemizde kaba yem açığının kapatılması için üretimi yapılabilecek potansiyel yem bitkisi olabileceği sonucuna varılmıştır.

**DETERMINATION OF FORAGE YIELD AND ITS RELATED CHARACTERISTICS
OF SOME PEARL MILLET (*Pennisetum glaucum* (L.) R.Br.) POPULATIONS
UNDER GAP CONDITIONS**

ABSTARCT

As a result of climate changes caused by increasing greenhouse gases, putting into production of new species that are tolerant to abiotic stress and the development of their new varieties are gaining more and more importance day by day. Due to the fact that millets are more tolerant to drought and high temperatures than other crops and they are used for multiple purposes (food, feed and energy), they are the most important plant species that should be emphasized in our country in the future. This research was carried out as second crop under Akçakale/Şanlıurfa conditions during the second crop growing season of 2021. Experimental design was Alfa Latis experimental design (15 * 15) with 2 replications. The harvest were made during the milk-dough stage of the grains in the spike. Significant statistical differences were found among the populations in terms of the examined characteristics. Depending on the populations, days to flowering varied between 68.0 and 84.0 days, plant height between 248.5 and 306.16 cm, the number of leaves on the main stem between 9.83 and 16.0 number, the total number of stems per plant between 3.5 and 7.16 number/plant, the dry matter ratio between 17.66 and 45.17%. forage yield between 798.16 and 2569.83 g/plant and hay yield between 272.12 and 1054.18 g/plant. Significant and positive relationships were found between the hay yield per plant and days to flowering, plant height, number of stems per plant, number of leaves on the main stem and green herbage yield per plant. From the results of this study, it was concluded that pearl millet is a potential forage plant that can be produced to close the roughage deficit in our country.

GİRİŞ

Özellikle son yıllarda artan sera gazları nedeniyle meydana gelen iklim değışikleri sonucu, abiyotik strese toleranslı yeni bitki türlerin üretime alınması ve yeni çeşitlerinin geliştirilmesi her geçen gün daha fazla önem kazanmaktadır. Darıların, kurağa ve yüksek sığağa diğerk ürünler göre daha toleranslı olmaları ve çok amaçlı (gıda, yem ve enerji) kullanılmaları nedeniyle, ileriki yıllarda ülkemizde de üzerinde durulması gereken en önemli bitki türlerinin başında gelmektedir (Yücel ve Yücel, 2022). İnci darısı (*Pennisetum glaucum* (L.) R. Br.), *Poaceace* familyasına bağılı, diploid (2n) ve 14 kromoza sahip, yabancı döllen ve yüksek oranda heterosis gösteren, küçük taneli bir sıcak iklim C4 bitkisidir. İnci darısı dik büyüyen tek yıllık, 3-5 m'ye kadar boylanan, kökleri 3 m'ye kadar ulaşan, çoklu kök sitemine sahiptir. İnci darısı, kısa gün bitkisi olup çiçeklenmesini kısa günde tamamlamaktadır. Gün uzunluğunun 12 saat olduğı ve 28-30 °C sıcaklığın bitki büyümesi için uygun olduğı bildirilmektedir (Bidinger ve Rai, 1989; Gill, 1991; Andrews ve Kumar, 1992; Upadhyaya ve ark., 2008). Derin kök sistemi ve kısa yaşam döngüsü, hızlı tane dolumu ve olağanüstü kurağa dayanımı nedeniyle yıllık yağışı 200-600 mm arasında değışen alanlarda yetişen ve mısır, sorgum gibi diğerk tahıllar için uygun olmayan alanlarda rahatlıkla yetiştirilebilen bir bitkidir (Burton, 1983; Panaud, 2006). İnci darısı, kumlu ve hafif yapılı verimli olmayan ve pH 6.2-7.7 arasındaki topraklarda yetişen, düşük girdilere iyi cevap veren, optimum büyüme sıcaklığının 33 °C (12 ila 45 °C) olduğı bir bitkidir (Kumar, 1989; Andrews ve Kumar, 1992; Fribourg, 1995). İnci darısının, asidik kumlu toprakları tolere ettiğı ve tuzlu topraklarda yetiştigi bilinmektedir (Heuze ve ark., 2015).

Türkiye hayvancılığı yıllardan beri süregelen popülasyon, sağıık, yeterli ve dengeli beslenememe gibi birçok sorunla karşı karşıya olmakla birlikte, bu sorunlardan en önemlisini yem girdileri oluşturmaktadır. Ülkemiz hayvancılığı ekonomik olarak beslenememekte ve bunun sonucunda yeterli ve kaliteli hayvansal ürün elde edilemediğı için, insanlarımız yeterli ve sağııklı beslenememektedir. İnci darısı gibi düşük girdilerle birim alanda yüksek ot verimine sahip bitkilerin tarımının yaygınlaşması ile bu sorunların çözümüne katkı sağlayacaktır.

Bu çalışma ile ülkemizin yarı kurak ve sıcak iklim koşullarına sahip GAP bölgesinde, bazı inci darısı popülasyonlarının (*Pennisetum glaucum* (L.) R.Br.), ot verimi ve verimle ilişkili özelliklerin ortaya konulmasının yanı sıra, incelenen özellikler arası ilişkiler saptanmıştır.

MATERYAL VE YÖNTEM

Projede, 225 inci darı popülasyonu bitki materyali olarak kullanılmıştır. Araştırma ile ilgili tarla denemesi 2021 yılında GAP Tarımsal Araştırma Enstitüsü (GAPTAEM) Talat Demirören İstasyonunda (Akçakale/Şanlıurfa) yürütülmüştür. Deneme, 15 x 15 Alfa Latis deneme desenine uygun olarak 2 tekerrürlü olarak kurulmuştur. Her popülasyon, sıra arası 70 cm ve uzunluğu 4 m olan sıralara, sıra üzeri 25 cm olacak şekilde, 1'er sıra olarak ekilmiştir.

Deneme Alanın Toprak ve İklim Özellikleri

Toprak Özellikleri: Tarla denemesi, bölgede geniş yayılım alanına sahip GAP toprak serisi topraklara sahip GAP Tarımsal Araştırma Müdürlüğüne ait Talat Demirören Araştırma İstasyonunda (Akçakale) yürütülmüştür. Bu seri toprakları, alüvyon ana materyalli, düz ve düze yakın eğimli, derin profil topraklardır. Tipik kırmızı profilleri killi tekstürlü ve tüm profil çok kireçlidir. A, B, C horizonlu topraklar olup, pH 7.3 ile 7.8 arasında değişmekte, organik madde içeriği düşük, katyon değişim kapasitesi (KDK) yüksektir. KDK kil içeriğine bağlı olarak alt katmanlara doğru artmaktadır (Anonim, 2021 a).

İklim Özellikleri: Tarla denemelerinin yürütüldüğü Temmuz-Ekim döneminde ortalama sıcaklığın 28.88 °C, ortalama maksimum sıcaklığın 35.50 °C ve minimum ortalama sıcaklığın ise 22.5 °C olduğu, nispi nemin %30.48 ve toplam yağışın ise 10 mm olduğu saptanmıştır (Anonim, 2021 b).

Tarla Denemelerin Yürütülmesi: Ekimler, 2-3 Temmuz 2021'de elle yapılmıştır. Ekimden önce toprak analizi sonuçlarına göre dekara 8 kg N ve P₂O₅ olacak şekilde 20:20:0 kompoze gübre uygulanmıştır. Ağustos ayının ilk haftasında üst gübre olarak üre formunda 4 kg/da saf N, sıra arasına verilmiştir. Yağmurlama sulamanın dışında, 4 kez salma sulama (karık usulü) yapılmıştır. Yabancı ot mücadelesi, üst gübre uygulamasına kadar mekanik olarak, sonrasında ise el ile yapılmıştır. 10 Eylül 2021 tarihinde proje kapsamında yapılması gereken gözlem ve ölçümler yapılmaya başlanmıştır. Her genotipin ot hasadı, salkımdaki tanelerin süt-hamur olum dönemine denk gelen dönemde hasat edilmiş ve her popülasyondan 3'er bitki hasat edilmiştir. Hasat edilen bitkilerde, Upadhyaya ve ark. (2008), Upadhyaya ve Gowda (2009) ve Kameswara ve Bramel (2000) tarafından açıklanan yöntemlere göre; bitki boyu (cm), salkım uzunluğu (cm), ana saptaki yaprak sayısı (adet/bitki), fertil sap sayısı (adet/bitki), vejetatif (steril) sap sayısı (adet/bitki), toplam sap sayısı (adet/bitki), yaş ot verimi (g/bitki), kuru ot verimi (g/bitki) ve kuru ot oranı (%) gibi özellikler saptanmıştır. Ayrıca, her parselde bitkilerin % 50'sinin çiçeklendiği tarih kaydedilmiş ve her parsel için bitki çıkışından çiçeklenmeye kadar geçen süre hesaplanmıştır.

ARAŞTIRMA BULGULARI

GAP lokasyonunda 2021 yılında 225 popülasyonda saptanan verilere Latis deneme desenine (15 * 15) uygun olarak varyans analizleri uygulanmış ve incelenen her özellik için varyans analiz tablosunda varyans kaynaklarının kareler ortalaması verilmiştir (Çizelge 1).

Yapılan varyans analizi sonuçları, kuru ot oranı ve ana sapta yaprak sayısı bakımından incelenen popülasyonlar arasında istatistiki olarak önemli bir fark bulunmadığını göstermiştir. Çiçeklenme gün sayısı, bitki boyu, fertil sap sayısı, toplam sap sayısı, salkım uzunluğu, yaş ve kuru ot verimi bakımından popülasyonların $P \leq 0.01$ hata sınırları içinde istatistiki olarak birbirinden önemli derecede farklı olduğunu göstermiştir (Çizelge 1). Popülasyonların incelenen özelliklerle ilgili en düşük, en yüksek, ortalama değerleri ve F değerleri Çizelge 2’de verilmiştir.

Çizelge 1. Populasyonların verim ve verimle ilişkili özelliklerine ilişkin varyans analizi sonuçları

ÇGS: Çiçeklenme Gün Sayısı; BB: Bitki Boyu; KOO: Kuru Ot Oranı; SU: Salkım Uzunluğu; AYS: Ana Saptaki Yaprak Sayısı; FSS: Fertil Sap Sayısı; SSS: Steril Sap Sayısı; TSS: Toplam Sap Sayısı; YOV: Yaş Ot Verimi; KOV: Kuru Ot Verimi

Çiçeklenme Gün Sayısı (Gün): Yapılan varyans analiz sonuçlarına göre çiçeklenme gün sayısı bakımından popülasyonlar %1 önem düzeyinde istatistiki olarak önemli derecede birbirilerinden farklı oldukları saptanmıştır. Çiçeklenme sürelerine ilişkin en düşük, en yüksek, ortalama ve F değerleri, Çizelge 2’de verilmiştir. Popülasyonların çiçeklenme gün sayılarının 67.5-88.0 gün arasında değiştiği ve ortalamasının ise 75.5 gün olduğu saptanmıştır. Farklı ekolojilerde ve farklı popülasyonlarla yapılan çalışmalarda yıllara ve uygulamalara göre değişmekle birlikte popülasyonların %50 çiçeklenme gün sayısının; Nijerya’nın Kuzeydoğu

koşullarında 53.5 ile 129 gün arasında (Izge ve ark., 2007; Angarawai ve ark., 2016), Hindistan koşullarında 33-159 gün arasında (Khairwal ve ark., 2007; Govindaraj ve ark., 2011; Upadhyaya ve ark., 2013; Athoni ve ark., 2016; Pattanashetti ve ark., 2016; Nayak ve ark., 2020), Pakistan koşullarında 67-77 gün arasında (Shah ve ark., 2012), Çad ülke koşullarında 62.0-78.67 gün arasında değiştiğini bildirmişlerdir (Naoura ve ark., 2020). . Bulgularımızın önceki çalışmalarda elde edilen çiçeklenme gün sayısı değerleri arasında yer aldığı, önceki çalışmalarda yer alan materyal sayısının fazla olması nedeniyle çiçeklenme gün sayısı değerleri bakımından da önemli varyasyonların olduğu görülmektedir.

Bitki Boyu (cm): Yapılan varyans analiz sonuçlarına göre bitki boyu bakımından popülasyonlar, %1 göre istatistiki olarak önemli bulunmuştur (Çizelge 1). Bitki boyuna ilişkin en düşük, en yüksek, ortalama ve F değeri, Çizelge 2’de verilmiştir, söz konusu tabloda görüleceği üzere popülasyonlar bitki boyu ortalamaları 146.5- 344.0 cm arasında değiştiği ve ortalamasının ise 268.1 cm olduğu saptanmıştır. Farklı ekolojilerde ve genotiplerle yapılan çalışmalarda genotiplere, yıllara ve uygulamalara göre değişmekle birlikte bitki boyu değerleri; Nijerya’da 137-377 cm (Izge ve ark., 2007; Angarawai ve ark., 2016), Hindistan ekolojik koşullarında 30-490 cm arasında (Upadhyaya ve ark., 2007; Govindaraj ve ark., 2011; Upadhyaya ve ark., 2013; Athoni ve ark., 2016; Pattanashetti ve ark., 2016), Pakistan koşullarında 143-262.4 cm arasında (Shah ve ark., 2012; Hassan ve ark., 2014) değiştiği bildirilmektedir. Khairwal ve ark. (2007) Hindistan’da 90-358 cm arasında, Naoura ve ark. (2020) Çad koşullarında 169.7-253.3 cm arasında, Nayak ve ark. (2020) Hindistan’da 129-182 cm arasında değiştiğini bildirmişlerdir. Ülkemizde yapılan çalışmalarda, Dağtekin (2019) Çukurova koşullarında popülasyonların bitki boyunun 174-449 cm arasında, Saygıdar (2021) GAP koşullarında 198.0-341.0 cm arasında değiştiğini bildirmişlerdir.

Salkım Uzunluğu (cm): Yapılan varyans analiz sonuçlarına göre salkım uzunluğu bakımından popülasyonlar, %1 göre istatistiki olarak önemli bulunmuştur (Çizelge 1). Salkım uzunluğuna ilişkin en düşük, en yüksek, ortalama ve F değeri, Çizelge 2’de verilmiştir, popülasyonların salkım uzunluğu ortalamalarının 15.34-40.34 cm arasında değiştiği ve popülasyonların ortalamasının ise 23.70 cm olduğu saptanmıştır. İnci darısı ile farklı genotip ve farklı ekolojilerde yapılan önceki çalışmalarda; popülasyonların başak uzunluğunun 22.67-66.25 cm arasında (Abdulhakeem ve ark., 2019), 5.00-135.00 cm arasında (Upadhyaya ve ark., 2007), 8.3-48.6 cm arasında (Khairwal ve ark., 2007) ve 15.00-31.00 cm arasında (Shah ve ark., 2012) değiştiği bildirilirken, Rao ve ark. (1985) Gana’da 227 inci darısı genotiplerinin salkım uzunluğunun 6-53 cm arasında değiştiğini bildirmişlerdir. Izge ve ark. (2007) Nijerya’nın kuzeydoğusu bölgesinde yürüttükleri araştırmada, salkım uzunluğunun 11.8-37.5 cm arasında

değiştirdiğini saptamışlardır. Govindaraj ve ark. (2011) Hindistan'da 61 inci darısı popülasyonu ile yürüttükleri araştırmada, popülasyonlara göre değişmekle birlikte salkım uzunluğunun 19.5-28.2 cm arasında değiştiğini saptamışlardır. Pucher ve ark. (2015) Batı ve Orta Afrika orijinli 347 yerel inci darısı hattı ve 13 ıslah edilmiş çeşit ile yürüttükleri araştırmada, genotiplere bağlı olarak salkım uzunluğunun 17-89 cm arasında değiştiğini saptamışlardır. Athoni ve ark. (2016) Hindistan'da 243 inci darısı popülasyonlar ile yürüttükleri araştırmada, popülasyonların salkım uzunluğunun 22-43.75 cm arasında değiştiğini saptamışlardır. Pattanashetti ve ark. (2016) ICRISAT'ta yaptıkları araştırmada inci darısında fertil kardeş sayısının 1-19 adet, salkım uzunluğunun 5-135 cm arasında değiştiğini saptamışlardır. Anuradha ve ark. (2018) Hindistan'da başak uzunluğunun 12.91-31.13 cm arasında değiştiğini bildirmektedirler. Abdulhakeem ve ark. (2019) Nijerya'da başak uzunluğunun 22.67-66.25 cm arasında değiştiğini bildirmişlerdir. Nayak ve ark. (2020) Hindistan'da salkım uzunluğunun 14.8-245 cm arasında değiştiğini bildirmişlerdir. Önceki çalışmalarda görüldüğü gibi bazı çalışmalarda popülasyon sayısının fazla olması nedeniyle başak uzunluğu bakımından popülasyonlar arasında büyük bir varyasyonun olduğu görülmektedir.

Ana Saptaki Yaprak Sayısı (adet): Yapılan varyans analiz sonuçlarına göre ana saptaki yaprak sayısı bakımından popülasyonlar arasındaki farkın istatistiksel olarak önemli olmadığı görülmektedir. Ana saptaki yaprak sayısına ilişkin en düşük, en yüksek, ortalama ve F değeri, Çizelge 2'de verilmiştir. Popülasyonların ana saptaki yaprak sayısı ortalamaları 7.67-17.00 adet arasında değiştiği ve ortalamasının ise 12.40 adet olduğu saptanmıştır. Önceki çalışmalarda yaprak sayısının; Nijerya'da 8.0-19.0 adet arasında (Izge ve ark., 2007; Abdulhakeem ve ark., 2019), Benin'de 6.9-9.7 adet (Abd-El-Lattief, 2011), Pakistan koşullarında 11-15 adet arasında (Shah ve ark., 2012) değiştiği bildirilmektedir. Ülkemiz GAP koşullarında yapılan çalışmalarda ana saptaki yaprak sayısının 11.13-15.66 adet arasında değiştiği bildirilmektedir (Saygıdar, 2021). Bulgularımız, çalışmamızın da yer aldığı aynı ekolojik koşullarda ve diğer koşullarda yürütülen çalışmalarla benzerlik gösterdiği görülmektedir.

Fertil Sap Sayısı (adet/bitki): Yapılan varyans analiz sonuçlarına göre fertil sap sayısı bakımından popülasyonlar, %1 göre istatistiksel olarak önemli bulunmuştur (Çizelge 1). Fertil sap sayısına ilişkin en düşük, en yüksek, ortalama ve F değeri, Çizelge 2'de verilmiştir. Söz konusu çizelgede görüleceği üzere popülasyonların, fertil sap sayısı ortalamaları 1.50-6.33 adet arasında değişmiş ve genotiplerin ortalamasının ise 3.75 adet olduğu saptanmıştır. Yapılan çalışmalarda fertil sap sayısının; Hindistan'da 1.0-17 adet/bitki arasında (Khairwal ve ark., 2007), Batı ve Orta Afrika orijinli popülasyonların fertil kardeş sayısının 2.0-6.5 adet arasında (Pucher ve ark., 2015), ICRISAT'ta fertil kardeş sayısının 1-19 adet arasında (Pattanashetti ve

ark., 2016), Hindistan'da 0.99-3.55 adet arasında (Anuradha ve ark., 2018), Gana koşullarında fertil kardeş sayısının 3-5 adet arasında (Asungre, 2014) değiştiği bildirilmektedir.

Steril (Vejetatif) Sap Sayısı (adet/bitki): Genotiplerin bazılarında bitki başına vejetatif (salkım oluşmayan sap) sap sayısı değerlerinin olmaması (0.00) nedeniyle varyans analizleri yapılamadığı için, varyans analiz tablosu oluşturulamamıştır. Ancak söz konusu özellik bakımından sadece en düşük, en yüksek, ortalama ve F değeri, Çizelge 2'de verilmiştir. Çizelge 2'de görüleceği üzere popülasyonların vejetatif sap sayısı ortalamalarının 0.00-2.33 adet arasında değiştiği ve popülasyonların ortalamasının ise 1.05 adet/bitki olduğu saptanmıştır. Yapılan önceki çalışmalarda vejetatif kardeş sayısının; Gana koşullarında 1-3 adet/bitki arasında (Rao ve ark., 1985), Nijerya'nın kuzeydoğu bölgesinde 1.7-2.3 adet arasında (Izge ve ark., 2007) değiştiği bildirilmiştir.

Toplam Sap Sayısı (adet/bitki): Yapılan varyans analiz sonuçlarına göre toplam sap sayısı bakımından popülasyonlar, %1 göre istatistiki olarak önemli bulunmuştur (Çizelge 1). Toplam sap sayısına ilişkin en düşük, en yüksek, ortalama ve F değeri, Çizelge 2'de verilmiştir. Söz konusu tablolarda görüleceği üzere popülasyonların toplam sap sayısı ortalamaları 2.33-7.50 adet arasında değişmiş ve popülasyonların ortalamasının ise 4.80 adet/bitki olduğu saptanmıştır. Sap sayısı birim alan verimini etkileyen önemli bitkisel özelliklerdendir. Toplam sap sayısı ile yaş ve kuru ot verimi arasında olumlu ve önemli ilişkiler saptanmıştır (Çizelge 3). Sap sayısı ile verim arasında önemli ve olumlu ilişkilerin olduğu bir çok çalışmada da bildirilmektedir (Kumari ve Nagaajan, 2008; Dağtekin, 2019; Saygıdar, 2021; Aswini ve ark., 2022). Farklı ekolojilerde ve popülasyonlarla yapılan çalışmalarda inci darısında sap sayısının; tek biçimlerde bitki başına 1.3 sap olduğu bildirilirken (Marshall ve Willey, 1983), Pakistan'da sap (kardeş) sayısının 0-3 adet/bitki arasında (Shah ve ark., 2012), Gana koşullarında 6-8 adet arasında (Asungre, 2014), Hindistan şartlarında 0.55-6.4 adet aralığında (Athoni ve ark., 2016), Cezayir şartlarında 5.3-12.5 adet arasında olduğu bildirilmektedir (Rahal-Bouziane ve Semiani, 2016). Abd El-Lattief (2011) Mısır ülkesinde çok biçimli inci darısı çeşitlerinde ilk hasat öncesinde bitki başına 10.3 adet sap olduğunu, ikinci ve üçüncü hasatlarda sırasıyla 13.9 ve 17.5 adet sap elde edildiğini bildirmişlerdir. Dağtekin (2019) Çukurova koşullarında bitki başına sap sayısının 5.4-15.2 adet arasında değiştiğini bildirmiştir. Saygıdar (2021) GAP koşullarında sap sayısının 9.94-13.29 adet/bitki arasında saptandığını bildirmiştir.

Yaş Ot Verimi (g/bitki): Yapılan varyans analiz sonuçlarına göre yaş ot verimi bakımından genotipler arasında istatistiki olarak önemli derecede farklılık olduğu bulunmuştur. Bitki başına yaş ot verimine ilişkin en düşük, en yüksek, ortalama ve F değeri (genotip), Çizelge 2'de

verilmiştir. Söz konusu tabloda görüleceği üzere popülasyonların bitki başına yaş ot ağırlık ortalamaları 438.0 ile 2803.3 g/bitki arasında değişmiş ve genotiplerin ortalamasının ise 1460.3 g/bitki olduğu saptanmıştır. Farklı ekoloji, uygulamalar ve popülasyonlarla yapılan çalışmalarda; Khairwal ve ark. (2007) Hindistan’da yaş ot veriminin 3.5-666.6 g/bitki arasında değiştiği bildirilmiştir. Dağtekin (2019) Çukurova koşullarında yaş ot veriminin 562-7808 g/bitki arasında değiştiğini bildirmektedir. Benin’de yürütülen çalışmada inci darısı yaş ot verimi 1689-2094 kg/da arasında (Abd El-Lattief, 2011), Suudi Arabistan koşullarında 7744-8615 kg/da arasında değiştiği bildirilmektedir (Al-Suhaibani, 2011). Shah ve ark. (2012) Pakistan koşullarında genotiplere göre değişmekle birlikte %50 olgunlukta biçilen inci darısı yeşil ot veriminin 3500-13000 kg/da ve tam olgunlaşmada yapılan biçimde ise yeşil ot veriminin 3300-10000 kg/da arasında değiştiğini bildirmişlerdir. Bunun yanı sıra Hassan ve ark. (2014) Pakistan şartlarında 870-440 kg/da arasında, Sheahan (2014) 750-1250 kg/da arasında, Medici ve ark. (2018) Brezilya koşullarında 1750-2270 kg/da aralığında yaş ot verimi aldıklarını belirtmişlerdir. Salama ve ark. (2020), Mısır’ın Alexandria koşullarında inci darısı popülasyonunun, yaş ot veriminin 18.1-24.3 t/ha arasında değiştiğini bildirmişlerdir. Ülkemizin GAP bölgesinde yürütülen çalışmada 5937.5-12571.4 kg/da arasında yeşil ot verimi alındığı bildirilmektedir (Saygıdar, 2021).

Kuru Ot verimi (g/bitki): Yapılan varyans analiz sonuçlarına göre bitki başına kuru ot verimi bakımından genotiplerin %1 göre istatistiki olarak önemli derece farklı olduğu bulunmuştur (Çizelge 1). Bitki başına kuru ot verimi ile ilgili en düşük, en yüksek, ortalama ve F değerleri ise Çizelge 2’de verilmiştir. Söz konusu Çizelgede görüleceği üzere popülasyonların bitki başına kuru ot veriminin ortalamaları 146.4 ilen 1054.0 g/bitki arasında değiştiği ve ortalamasının ise 528.1 g/bitki olduğu saptanmıştır. Farklı ekolojilerde, uygulamalarda ve genotiplerle yapılan çalışmalarda; Winkel ve ark. (1997) Nijer’de yerel bir inci darısı çeşidi ile farklı sulama uygulamaları ile yürütmüş oldukları çalışmada, bitki başına kuru ot veriminin 144 g olduğunu saptamışlardır. Abd El-Lattief (2011) Benin’de kuru ot veriminin birinci biçimde 284.9-400 kg/da, ikinci biçimde ise 340-448 kg/da arasında değiştiğini saptamıştır. Al-Suhaibani (2011) Suudi Arabistan koşullarında kuru ot veriminin 5715-6301 kg/da arasında değiştiğini saptamıştır. Pasternak ve ark. (2012) Nijer koşullarında yumuşak hamur olum dönemindeki hasatların kuru madde verimlerinin yüksek olduğunu ve Malgorou çeşidinde en yüksek kuru madde verimin (857 kg/da) hamur olum döneminde ve yüksek bitki sıklığında elde edildiğini saptamışlardır. Hassan ve ark. (2014) Pakistan şartlarında KM veriminin 169-347 kg/da arasında değiştiğini, Machicek (2018) Texas/ABD eyaletinde KM veriminin 396 ila 987 kg/da aralığında değiştiğini tespit etmiştir. Medici ve ark. (2018) Brezilya şartlarında kuru

madde veriminin 390-520 kg/da aralığında değiştiğini, Salama ve ark. (2020), Mısır'ın Alexandria koşullarında KM veriminin 2.74-3.82 t/ha arasında değiştiğini bildirmişlerdir.

Kuru Ot Oranı (%): Yapılan varyans analiz sonuçlarına göre kuru ot oranı bakımından genotipler arasında istatistiki olarak önemli farklar bulunmamıştır. Kuru ot oranına ilişkin en düşük, en yüksek, ortalama ve F değeri ise Çizelge 2'de verilmiştir. Söz konusu Çizelgede görüleceği üzere popülasyonların kuru ot oranı ortalamaları %26.48-45.24 arasında değişmiş ve popülasyonların ortalamasının ise %36.20 olduğu saptanmıştır. Buso ve ark. (2014) Brezilya şartlarında inci darısı bitkilerinin %50'sinin 70 cm'ye ulaştığında yapılan biçimden elde edilen otun kuru ot oranının %8.9-11.14 aralığında değiştiğini, Saygıdar (2021) GAP koşullarında yürütmüş olduğu araştırmada kuru ot oranının %26.47-33.35 arasında değiştiğini saptamışlardır. Buso ve ark. (2014) çalışmasında biçimlerin bitki gelişiminin çok erken döneminde hasat yapıldığı için, bitkinin olgunlaşmadığı ve hala taze döneminde olduğundan dolayı kuru ot oranının düşük çıkmasının normal karşılanması gerektiği savunmuşlardır.

Çizelge 2. GAP lokasyonunda inci darı popülasyonlarının ot verimi ve verimle ilişkili incelenen özelliklerin en düşük, en yüksek, ortalama ve F değerleri (n:1350)

İncelenen Özellikler	Birim	En Düşük	En Yüksek	Ortalama	F
Çiçeklenme Gün Sayısı	gün	67.5	88.0	75.5

*) $P \leq 0.01$ hata sınırları içinde önemli ; *) $P \leq 0.05$ hata sınırları içinde önemli

Steril Sap Sayısı: Varyans analizleri yapılamadığı için, sadece en düşük, en yüksek ve ortalamaları verilmiştir.

İncelenen özellikler Arasındaki İlişkiler

İnci darısı popülasyonlarında incelenen özellikler arasındaki ikili ilişkiler için saptanan korelasyon katsayıları, Çizelge 3'de verilmiştir. Çiçeklenme gün sayısı ile yaş ot verimi, kuru ot verimi, ana sapta yaprak sayısı ve steril sap sayısı arasında önemli ve olumlu ilişkiler

saptanırken, diğer özellikler arasında ise önemsiz ilişkiler saptanmıştır. Yaş ot verimi ile kuru ot verimi, bitki boyu, ana sapta yaprak sayısı, fertil ve steril sap sayısı ve toplam sap sayısı arasında önemli ve olumlu ilişkiler saptanırken, diğer özellikler arasında ise önemsiz ilişkiler saptanmıştır. Kuru ot verimi ile kuru ot oranı, bitki boyu, ana sapta yaprak sayısı, fertil ve steril sap sayısı ve toplam sap sayısı arasında önemli ve olumlu ilişkiler saptanırken, diğer özellikler arasında ise önemsiz ilişkiler saptanmıştır. Kuru ot oranı ile salkım uzunluğu, bitki boyu, ana sapta yaprak sayısı, fertil ve steril sap sayısı ve toplam sap sayısı arasında önemsiz ve olumsuz ilişkiler saptanmıştır. Bitki boyu, ana sapta yaprak sayısı, steril sap sayısı ve toplam sap sayısı arasında önemli ve olumlu ilişkiler saptanırken, salkım uzunluğu ve fertil sap sayısı arasında ise önemsiz ilişkiler saptanmıştır. Salkım uzunluğu ile toplam sap sayısı arasında önemli ve olumsuz ilişkiler saptanırken, ana saptaki yaprak sayısı ve fertil sap sayısı arasında ise olumsuz ve önemsiz, toplam sap sayısı arasında ise önemli ve olumsuz ilişkiler saptanmıştır. Ana saptaki yaprak sayısı ile steril sap sayısı ve toplam sap sayısı arasında önemli ve olumlu ilişkiler saptanırken, fertil sap sayısı arasında ise olumsuz ve önemsiz ilişkiler saptanmıştır. Fertil sap sayısı ile toplam sap sayısı arasında önemli ve olumlu ilişkiler saptanırken, steril sap sayısı arasında ise olumsuz ve önemli ilişkiler saptanmıştır. Steril sap sayısı ile toplam sap sayısı arasında önemli ve olumlu ilişkiler saptanmıştır.

SONUÇ

GAP koşullarında inci darısı popülasyonları ile yürütülen bu çalışmanın sonuçlarına dayanılarak, inci darısının ülkemizde kaba yem açığının kapatılması için üretimi yapılabilecek potansiyel yem bitkisi olabileceği sonucuna varılmıştır

Teşekkür

Bu çalışma, Türkiye Bilimsel ve Teknolojik Araştırma Kurumu (TÜBİTAK) tarafından “219O103” numaralı proje ile desteklenmiştir.

ÖZET

II. Ürün mısır-buğday üretim sisteminde, mısır bitkisinin hasadı sonrası anız yakılmadan buğday bitkisinin ekilmesi toprağın ve çevrenin korunması açısından oldukça önemlidir. Türkiye'nin Güneydoğu Anadolu Bölgesi'nin güney kısmında yaygın şekilde uygulanan II. ürün mısır-buğday ürün rotasyonunda mısır hasadından sonra tarlada kalan mısır anızları toprak işlemenin ve ekimin kolay bir şekilde yapılması amacıyla üreticiler tarafından yakılmaktadır. Çevresel sorunlara neden olan anız yakmanın önlenmesi amacıyla bu çalışma planlanmış ve 2021-2022 buğday üretim sezonunda yürütülmüştür. Mardin ili Kızıltepe ilçesi Çağıl köyünde üretici şartlarında yürütülmüş olan bu çalışmada II. ürün mısır bitkisinin hasadından sonra tarlada kalan saplar parçalanarak doğrudan ekim mibzeri ile buğdayın ekimi yapılmıştır. Doğrudan ekim, üreticiler tarafından uygulanan II. ürün mısır saplarının yakılması sonrası toprağın diskaro ile işlenmesiyle karşılaştırılmıştır. Bu iki uygulamanın karşılaştırılmasında t testi kullanılmıştır. Yapılan istatistiksel değerlendirme sonucunda bitki boyu, başakta tane sayısı, başakta tane ağırlığı, metrekarede başak sayısı, biyolojik verim ve birim alan tane verimi açısından iki uygulama arasında istatistiksel olarak farklılık bulunmamıştır. Hasat indeksi, anız yakma sonrası toprağın diskaro ile sürülmesi uygulamasında daha yüksek bulunmuştur. Çiftçi şartlarında yürütülen bu çalışma sonucunda, II. ürün mısır hasadının ardından anız parçalandıktan sonra doğrudan ekim mibzeri kullanılarak buğdayın yetiştirilebileceği sonucuna varılmıştır.

Anahtar Kelimeler: Anız yakma, II. ürün mısır-buğday üretim sistemi, doğrudan ekim

DIRECT SOWING IN WHEAT AFTER SECOND CROP MAIZE HARVESTING

ABSTRACT

Sowing a wheat without burning the stubble after harvesting second crop maize plant is very important for the protection of the soil and the environment in second crop maize-wheat crop rotation system. The maize stubble remaining in the field after the maize harvest is burned by the farmers for easy tillage and sowing in the second crop maize-wheat crop rotation which is widely applied in the southern part of the Türkiye's Southeastern Anatolia Region. This study was planned and carried out in the 2021-2022 wheat production season in order to prevent stubble burning, which causes environmental problems. In this study, which was carried out under farmer conditions in Çağıl village of Kızıltepe district of Mardin province, the stalks remaining in the field were shredded after the harvest of the second crop maize, and the wheat was sown with a direct sowing machine. Direct sowing was compared with the soil tillage with a disc harrow after burning the second crop maize stalks applied by the producers. The t test was used to compare these two applications. As a result of the statistical evaluation, there was no statistical difference between the two applications in terms of plant height, the number of grains per spike, grain weight per spike, the number of spikes per m², biological yield and grain yield per unit area. The harvest index was found to be higher in the application soil tillage with a disc harrow after stubble burning. As a result of this study carried out under farmer conditions, it was concluded that wheat can be grow by using direct sowing machine after the stubble is shredded after the second crop maize harvest.

Keywords: Stubble burning, second crop maize-wheat crop rotation, direct sowing

Giriş

GAP Projesi ile birlikte Türkiye'nin Güneydoğu Anadolu Bölgesi'nde sulanabilir alanlarda oldukça önemli artış olmuştur. Bu bölgede tarım alanlarının sulamaya açılması devam etmektedir. Sulu tarıma geçiş ile birlikte kuru tarımda yaygın olarak uygulanan bir yılda bir ürün uygulaması da azalmış ve bir yılda birden fazla ürün elde etme olanağı doğmuştur. Bölgenin daha sıcak olan ve ana ürün hasadının daha erken yapıldığı güney kesimlerinde üreticiler tarafından ana ürün buğday hasadından sonra yaygın olarak ikinci ürün mısır yetiştiriciliği yapılmaktadır. Haziran veya Temmuz aylarında ekilen mısırın hasadı Kasım-Aralık bazen de Ocak ayında olmaktadır. Mısır bitkisinin hasadından sonra üreticilerin zaman kaybetmeden hızlı bir şekilde buğday bitkisini ekmeleri gerekmektedir. Söz konusu zamanda üreticiler yaygın şekilde mısır anızını yakmaktadırlar. Mısır anızının fazla olması ve kök sisteminin çok güçlü olması nedeniyle toprak işleme zorluğu üreticiler tarafından anız yakmaya gerekçe olarak gösterilmektedir. Anız yakıldıktan sonra toprakta bulunan nem miktarı dikkate alınarak farklı sürüm teknikleri üreticiler tarafından kullanılmaktadır. Bazı yıllarda pulluk veya çizel kullanılarak toprak derin işlendikten sonra ikincil bir toprak işleme aleti (kültüvator, diskaro vb.) ile işlenmektedir. Bazı yıllarda ise anız yakıldıktan sonra sadece ikincil bir toprak işleme aleti ile tarla sürülerek ekime hazırlanmaktadır.

Üreticiler tarafından anızın yakılması birçok olumsuz durumu meydana getirmektedir. Bunların başında çevresel felaketler gelmektedir. Anız yakılarak atmosfere CO₂ ve CH₄ gibi zararlı gazların salınımına neden olunmaktadır (Şahin ve Avcıoğlu, 2016; Büyükşahin, 2018). Anız yakılan dönemlerde hava kirliliği meydana gelmekte ve bu durum insan ve hayvan sağlığına zarar vermektedir. Anız yangınları bazen yerleşim yerlerine sıçramakta, evlerin yanmasına ve insanların hayatlarını kaybetmeleri ile sonuçlanabilmektedir. Ayrıca anız yangınları tarlalarda yaşayan birçok canlının hayatını kaybetmesine neden olarak ekolojik dengeyi bozmaktadır.

Anız yakmanın neden olduğu çevresel felaketler kadar önemli olan bir diğer husus da toprak üzerine olan olumsuz etkileridir. Anız yakılması sonucunda toprağın birçok özelliği oldukça olumsuz etkilenmektedir. Toprağın özellikle üstte bulunan 1 cm'lik kısmında yaşayan canlılar anız yakılarak yok edilmektedir. Toprak canlılarının yok edilmesi toprağın verimsizleşmesine ve topraktaki dengenin bozulmasına neden olmaktadır. Anız yakma ile toprak nemi de büyük oranda kaybedilmekte ve bitkiler tarafından kullanılacak faydalı su yok edilmektedir. Gözübüyük ve ark. (2012) tarafından Erzurum kuru tarım koşullarında fiğ-buğday-nadas münavebe sisteminde farklı toprak işleme sistemlerinin toprakta nem muhafazasına etkisini inceledikleri çalışma sonucunda geleneksel ekim yönteminin bünyesinde en az nem biriktiren yöntem olduğu belirlenmiştir. Anız yangınları nedeniyle anızın yapısında yer alan fosfor,

potasyum, magnezyum, kalsiyum, mangan, çinko, demir, bakır gibi mikro elementler de bitkilerin yararlanamayacağı formlar olan oksitlere dönüşmektedir (Savcı ve Bağdatlı, 2016). Anız yakma sonucunda toprağın birçok fiziksel özelliği olumsuz yönde etkilenmektedir.

Anız yakma sonucunda meydana gelen en önemli hususlardan biri de toprak için oldukça faydalı olabilecek ve toprağın organik madde miktarının yükselmesini sağlayacak olan anızın yok edilmesidir. Tarlada bulunan anızın toprağa kazandırılması toprak organik maddesinin ve dolayısıyla toprak özelliklerinin iyileşmesini sağlar. Yapılmış araştırmalarda, genel olarak bitkisel artıkların toprağın fiziksel özelliklerine olumlu etkide bulunduğu, agregat stabilitesini artırdığı, erozyon kontrolü ile toprak havalanmasını düzelttiği görülmüştür (Gürsoy, 2012). Ancak anız yakma ile bu faydalı materyal yok edilmektedir.

Anız yakmadan yapılacak olan azaltılmış toprak işleme ve doğrudan ekim uygulamaları ile anızın toprağa kazandırılması sağlanabilir. Sessiz ve ark. (2010), azaltılmış toprak işleme ve doğrudan ekim yöntemlerinin ekonomik faktörlerin yanında tarlada bırakılan atıklardan dolayı aynı zamanda çevre dostu olduğunu bildirmiştir. Doğrudan ekim yönteminde tarlanın ekime hazır hale getirilmesi için uygulanan birincil ve ikincil toprak işleme aletleri kullanılmadığı için sürüm masrafı olmamaktadır. Bu nedenle yakıt, işgücü ve zamandan tasarruf sağlamaktadır. Toprak işleme yapılmaması bu avantajlarının yanı sıra toprakta nemin korunmasını da sağlamaktadır. Govaerts ve ark. (2007) 12 yıl boyunca yürüttükleri çalışmalarında, mısır ve buğdayı monokültür ve rotasyon uygulaması şeklinde, geleneksel ve sıfır toprak işleme uygulamaları altında, iki farklı anız yönetimi (anız muhafaza edilmiş ve anız uzaklaştırılmış) uygulaması altında inceledikleri çalışmalarında infiltrasyon ve toprak nem seviyesinin sıfır toprak işlemede daha yüksek bulunduğunu bildirmişlerdir.

Bu çalışma, Türkiye'nin Güneydoğu Anadolu Bölgesi'nin güneyinde uygulanan II. Ürün mısır-buğday münavebe sisteminde, II. Ürün mısırın hasadı sonrası anız yakılmasının önlenmesi amacıyla, mısır saplarının parçalanması sonrası doğrudan buğday ekiminin yapılarak sonuçlarının anız yakma uygulaması ile karşılaştırılması ve üreticilerin çalışma sonuçları hakkında bilgilendirilmesi amacıyla yapılmıştır.

Materyal ve Yöntem

Bu çalışma 2021-2022 buğday üretim sezonunda yürütülmüştür. Çalışma alanı Türkiye'nin Güneydoğu Anadolu Bölgesi'nin güney kesimlerinde bulunan Mardin ili, Kızıltepe ilçesi, Çağıl Köyü'dür. Mardin ili Kızıltepe ilçesinde yaygın olarak II. ürün mısır-buğday münavebe sistemi uygulanması nedeniyle, çalışma bu alanda yürütülmüştür.

Güneydoğu Anadolu Bölgesi ülkemizin en kaliteli makarnalık buğdaylarının yetiştiği bölgemizdir. Bu nedenle, bu çalışmada, makarnalık bir buğday çeşidi olan Ganem

kullanılmıştır. Bu çeşit, 2019 yılında Diyarbakır'da GAP Uluslararası Tarımsal Araştırma ve Eğitim Merkezi Müdürlüğü tarafından ıslah ettirilmiştir. Hem sulanan hem de yağışa dayalı koşullar için tavsiye edilen bu çeşidin sulu koşullardaki verimi 700-1050 arasındadır. Hektolitreye ağırlığı 80,2 – 84,4, bin dane ağırlığı 29,2 – 39,6 ve protein oranı 12,9 – 15,3 arasında değişmektedir (Anonim, 2023).

Çalışma, geleneksel ve anıza doğrudan ekim olmak üzere 2 farklı uygulama olarak 3 tekerrürlü yürütülmüştür. Geleneksel ekim uygulamasında, 11. ürün mısır hasadından sonra tarlada kalan anız yakılmıştır. Anız yakıldıktan sonra tarla diskaro ile sürülmüş ve ekime hazırlanmıştır. Denemenin yürütüldüğü alanda, üreticiler tarafından, geleneksel uygulamada anız yakma sonrası kullandıkları tarım aletlerinin yıllara göre değiştiği, toprak nem durumu dikkate alınarak farklı aletlerle toprak işleme yaptıkları bildirilmiştir. Bazı yıllarda pulluk veya çizel kullanılarak toprak derin işlendikten sonra ikincil bir toprak işleme aleti (kültivatör, diskaro vb.) ile işlenmektedir. Bazı yıllarda ise anız yakıldıktan sonra sadece ikincil bir toprak işleme aleti ile tarla sürülerek ekime hazırlanmaktadır. Çalışmanın yürütüldüğü yılda, anız yakma sonrası tarla diskaro ile sürüm yapılarak ekime hazır hale getirilmiştir. Doğrudan ekimin yapılacağı parsellerde ise hasat sonrası öncelikle sap parçalayıcı kullanılarak tarlada bulunan anız parçalanmıştır. Anız parçalama sonrası doğrudan ekim mibzeri kullanılarak buğday bitkisinin ekimi gerçekleştirilmiştir. Ekim, 15 Aralık 2021 tarihinde yapılmıştır. Ekimle birlikte 8 kg N ve 8 kg P₂O₅ 20.20.0 kompoze gübresi kullanılarak mibzerle uygulanmıştır. Ayrıca 12 kg saf N üst gübre olarak üre formunda uygulanmıştır. Çalışma sulu koşullarda yürütülmüştür. Damla sulama yöntemi ile sulanan parsellere eşit oranda su uygulanmıştır. Hasat olgunluğuna gelen bitkiler Haziran ayının sonunda hasat edilmiştir.

Her parselden rastgele seçilen 10 adet başaktaki taneler sayılarak ve ortalaması alınarak başakta tane sayısı, ağırlık ortalamaları alınarak ise başakta tane ağırlıkları belirlenmiştir. Her parselden rastgele seçilen 10 bitkinin toprak yüzeyinden en üst noktasına kadar olan mesafe ölçülerek ve ortalaması alınarak bitki boyu tespit edilmiştir. Biyolojik verim hasat dönemindeki bitkilerde belirlenmiştir. 0,25 metre karelik çerçeve içerisinde kalan bitki aksamı toprak yüzeyinden kesilerek ağırlığı belirlenmiş ve metre kareye çevrilmiştir. Her parselde 4 adet çerçeve atılarak ortalaması belirlenmiştir. Ayrıca atılan çerçeveler içerisindeki başaklar sayılarak ve ortalaması alınarak m²'de başak sayısı belirlenmiştir. Tane verimi her parselden elde edilen tane ağırlığının dekara çevrilmesiyle elde edilen değerdir. Hasat indeksi ise birim alandan elde edilen tane ağırlığının, sap + tane ağırlığına % olarak oranlanması ile bulunmuştur.

Çizelge 1: Çalışmada kullanılan doğrudan ekim mibzerinin bazı özelliklerine ait değerler

Özellikler	Doğrudan Ekim Mibzerine Ait Değerler
Toplam Uzunluk (a) m	3
Toplam Genişlik © m	3,42
Toplam Yükseklik (b) m	1,65
İş Genişliği (b) m	2,10
Tekerlek Ölçüleri	10.0/75-15.3
Gerekli Güç (Kw)	44-52
Ekici Ayak Sayısı (adet)	15
Ekici Ayak Ara Mesafe (cm)	14
Tohum Sandığı Kapasitesi (kg)	235
Gübre Sandığı Kapasitesi (kg)	235
Ağırlık (ton)	2,050
Ayak Tipi	Diskli

Çalışma sonucunda bitki boyu, başakta tane sayısı, başakta tane ağırlığı, metrekarede başak sayısı, biyolojik verim, hasat indeksi ve birim alan tane verimi parametreleri belirlenmiştir. Elde edilen veriler SPSS programında t testi uygulanarak değerlendirilmiştir.

ARAŞTIRMA ve BULGULAR

Çalışma sonucunda incelenen parametrelerin istatistiksel değerlendirmesi sonucunda elde edilen veriler şu şekildedir;

Çizelge 2: İncelenen parametrelere ait ortalamalar ve t testi karşılaştırma sonuçları

Uygulamalar	İncelenen Parametreler							
	Başakta tane ağırlığı (g)	Başakta tane sayısı (adet)	Bitki boyu (cm)	Biyolojik verim (g m ⁻²)	Hasat indeksi (%)	m ² 'de başak sayısı (adet)	Tane verimi (kg da ⁻¹)	
Anız parçalama sonrası doğrudan ekim	2,51	74,40	81,00	2051,40	40,04 b	506,67	806,67	
Anız yakma sonrası geleneksel üretici uygulaması	2,27	66,30	83,30	1455,73	53,05 a	534,67	774,00

Sigma (P)	0,121	0,275	0,889	0,259	0,047*	0,681	0,400	
D.K.	6,4	6,3	2,6	22,9	18,4	9,2	10,8	

*: %5 seviyesinde önemli

** : %1 seviyesinde önemli

Çizelge 2 incelendiğinde başakta tane ağırlığı, başakta tane sayısı, bitki boyu, biyolojik verim, m²'de başak sayısı ve tane verimi parametreleri açısından uygulamalar arasında istatistiksel

olarak farklılık olmadığı, hasat indeksi yönünden farklılık olduğu görülmektedir. Anızın yakıldığı ve toprağın diskaro ile işlendiği uygulamada hasat indeksi değeri daha yüksek bulunmuştur.

Yalçın ve ark. (2010) tarafından mısır sonrası buğday ve arpada farklı toprak işleme sistemlerinin (azaltılmış toprak işleme, doğrudan ekim teknikleri ve geleneksel toprak işleme) incelendiği çalışmada, buğday bitkisinde toprak işleme sistemleri arasındaki farklılık, istatistiksel olarak belirgin bulunmamıştır. Çıkman ve ark. (2017), buğday-mısır münavebesinde farklı toprak işleme sistemleri ile yürüttükleri 5 yıllık çalışma sonucunda en yüksek buğday verimini “ana ürün toprak işlemeli ikinci ürün toprak işlemesiz anıza direkt ekim” uygulamasından elde etmişlerdir. Aynı çalışmanın ekonomik analiz sonuçlarında ise en karlı yöntem “ana ürün ve ikinci ürün toprak işlemesiz” olarak belirlenmiştir (Çıkman ve ark., 2019). Kara ve Arslan (2021) soya hasadı sonrası buğdayda farklı toprak işleme yöntemlerini inceledikleri çalışmalarında, sırta ekim uygulamasında en düşük verim değerini elde etmişlerdir ancak geleneksel, azaltılmış ve doğrudan ekim istatistiksel olarak aynı grupta yer almıştır. Yapmış olduğumuz bu çalışmada, geleneksel çiftçi uygulaması ile anıza doğrudan ekim arasında istatistiksel olarak farklılık bulunmaması açısından Yalçın ve ark. (2010) ayrıca Kara ve Arslan (2021) ile benzer sonuçlar bulunmuştur.

Türkiye'nin Güneydoğu Anadolu Bölgesi'nin güney kesimlerinde bulunan Ceylanpınar TİGEM' de yapılmış olan bazı çalışmalar incelendiğinde ikinci ürün mısır tarımında doğrudan ekimin uygulanabileceği görülmektedir. Çalışkan (2015) tarafından yürütülmüş olan “Ceylanpınar Tarım İşletmesi'nde ikinci ürün mısır tarımında koruyucu toprak işleme uygulamaları” adlı yüksek lisans çalışmasında, tane verimi değerleri üzerine yapılan varyans analizi sonuçlarına göre, uygulamaların tane verimi üzerindeki etkisi istatistikî olarak önemli bulunmuş ve en iyi sonuç doğrudan ekim uygulamasından elde edilmiştir. Farklı uygulamalara ait verim değerleri dikkate alındığında ikinci ürün mısır üretiminde en yüksek verim değerine sahip olan doğrudan ekim uygulamasının daha karlı bir üretim tekniği olduğu bildirilmiştir. Gürsoy ve ark. (2015), TİGEM işletmelerindeki üretim alanlarındaki çalışmaların birçoğunda sulu koşullarda tarla tarımının yapıldığı bölgelerde II. Ürün tarımında doğrudan ekim yönteminin uygulanabileceğinin görüldüğünü belirtmişlerdir. Her ne kadar bu çalışmalar mısır bitkisinde yapılmış olsa da, aynı bölgede ve aynı ürün rotasyonunda yapılması sebebiyle önem arz ettiği düşünülmektedir.

Sonuç

Türkiye'nin Güneydoğu Anadolu Bölgesi'nin güney kesimlerinde uygulanan II. ürün mısır-buğday ekim nöbeti sisteminde buğday ekimi öncesi tarlada kalan mısır anızı üreticiler

tarafından yakılmakta, daha sonra yıllara göre deęişen şekilde farklı toprak işleme aletleri ile toprak işlenerek tarla buęday ekimine hazır hale getirilmektedir. Mısır anızının yakılması büyük sorun arz etmektedir. Hem çevresel sorunlara hem de topraęın verimsizleşmesine neden olan bu yöntemin yerine çevre dostu tarım tekniklerinin uygulanması gerekir. Anız parçalama sonrası doğrudan ekim bu yöntemlerden biridir. Bu çalışmada anız yakmaya alternatif olarak II. ürün mısırın hasadından sonra tarlada kalan saplar parçalanmış ve doğrudan ekim mibzeri ile buęday bitkisinin ekimi yapılmıştır. Bu iki uygulamanın karşılaştırılması sonucunda hasat indeksi deęeri dışında, dięer tüm parametreler yönünden uygulamalar arasında farklılık olmadığı görülmüştür.

Bu çalışma sonucunda, Güneydoęu Anadolu Bölgesi'nin güney kısmında, II. ürün mısır-buęday ekim nöbeti sisteminde buęday bitkisinin yetiştiricilięinde mısır saplarının sap parçalayıcı ile parçalanması sonucu doğrudan ekimin herhangi bir sorun yaşanmadan ve verim kayıpları olmadan uygulanabileceęi gözlenmiştir. Ancak daha uzun süreli ve toprak özelliklerinin detaylı şekilde incelendięi bilimsel çalışmaların yapılmasının faydalı olacağı düşünülmektedir.

Özet

Dünyada nüfus artışına bağlı olarak ulaşılabilir gıda miktarı değişim göstermektedir. Küresel ısınma ve çevresel faktörler sebebiyle yaşanan olumsuz durumlar tarımsal üretimi doğrudan etkilemektedir. Bu nedenle, alternatif üretim yöntemlerinin uygulanması ya da üretilen ürünlerin farklı şekillerde depolanması yönünde çalışmalar yapılmaktadır. Gıdaların depolama şartlarına bağlı olarak daha uzun süre muhafaza edilmesi, farklı şekillerde değerlendirilmesi ile tüketicilerin beslenme ihtiyacı karşılanmaktadır. Bu çalışma, 2022 yılında Bingöl Üniversitesi Ziraat Fakültesi Biyosistem Mühendisliği ve Tarla Bitkileri Bölümlerine ait laboratuvarlarda gerçekleştirilmiştir. Kuru gıda olarak değerlendirilen iki farklı bezelye çeşidine ait tanelerin bazı fiziksel özellikleri incelenmiştir. Elde edilen verilerin, üretim ve ürün işleme aşamasında uygun alet, makine ve sistemlerinin seçiminin yapılmasında faydalı olacağı ön görülmektedir.

Anahtar Kelimeler: Bezelye, *Pisum sativum* L., Tohum özellikleri, Ürün işleme

**DETERMINATION OF SOME PHYSICAL PROPERTIES OF PEAS (*Pisum sativum*
L.) EVALUATED AS DRY FOOD**

Abstract

The amount of accessible food varies depending on the population increase in the world. Negative conditions due to global warming and environmental factors affect agricultural production directly. For this reason, studies are carried out to apply alternative production methods or to store the products produced in different ways. The nutritional needs of the consumers are met by keeping the foods for a longer period of time depending on the storage conditions and evaluating them in different ways. This study was carried out in the laboratories of Bingol University Faculty of Agriculture, Biosystem Engineering and Field Crops Departments in 2022. Some physical properties of the grains of two different pea varieties, which are considered as dry food, were investigated. It is foreseen that the obtained data will be useful in the selection of suitable tools, machines and systems in the production and product processing stages.

Keywords: Pea, *Pisum sativum* L., Seed characteristics, Product processing

Giriş

Bezelye, *Leguminosae* familyasında, *Faboideae* alt familyasında, *Fabeae* takımında, *Pisum* genusuna bağlı baklagiller içerisinde yer alan bir türdür. Baklagiller, bitkiler aleminde 650'den fazla cins ve 18.000 kadar tür ile üçüncü en büyük familyayı oluşturmaktadırlar (Lewis ve ark., 2005). Bezelyenin kökeninin Doğu Akdeniz'in dağlık bölgeleri, Türkiye, Suriye Irak ve Lübnan'ın içerisinde yer aldığı verimli hilal olarak adlandırılan bölge ile İran, Kafkasya, Afganistan ve Tibet'e dayandığı belirtilmektedir (Adak, 2021) (Şekil 1).

Şekil 1. Bezelye (*Pisum sativum* L.,)

(https://commons.wikimedia.org/wiki/File:88_Pisum_sativum_L.jpg)

Baklagil türündeki bitkilerin büyük bir çoğunluğu insan beslenmesinde protein ve karbonhidrat kaynakları olarak kullanılmakta ve yüksek oranda protein (%18-31) ve önemli bazı amino asitleri içermeleri nedeniyle, özellikle gelir seviyesi düşük ülkelerin en önemli protein kaynaklarını oluşturduğu gibi (Özdemir, 2002), hayvan beslenmesinde ihtiyaç duyulan kaba ve kesif yem amacıyla da kullanılmaktadır (Karaköy ve ark., 2016). Son yıllarda tarla tarımı içerisinde yetiştiriciliği yapılan bezelyelerin toplandığı *Pisum sativum* L. türü, iki alt türü içermektedir. Bunlardan beyaz çiçekli olanı (ssp. *sativum*) yeşil veya kuru taneleri için yetiştirilen yemeklik bezelye veya diğer ismi ile bahçe bezelyesi, mor çiçekli olanı (ssp. *arvense*) ise ot veya tane yem olarak değerlendirilmek amacıyla yetiştirilen yem bezelyesidir (Açıkgöz, 2001).

Şekil 2. Bezelye taneleri

(<https://www.gardenia.net/plant/pisum-sativum>)

Kendine döllen bezelye, diploid kromozom sayısı $2n=2x=14$ olan önemli bir baklagil bitkisidir (Dolezel ve Greilhuber, 2010). Doğu Akdeniz, Kafkasya, Afganistan, İran ve Tibet'e kadar uzanan bölgeler bezelyenin birinci derecedeki, Güney Batı Arabistan'dan Etiyopya ve Kuzey Afrika'ya kadar uzanan bölgeler ise ikinci derecedeki orijin merkezini oluşturmaktadır (Govorov, 1937; Davies, 1976; Hagedorn, 1984) (Şekil 2).

Çizelge 1. Bezelye tanesinin kimyasal bileşimi (Leterne, 1990; Dahl ve ark., 2012, Adak, 2021)

KURU MADDE	%	AMİNOASİT	G/100 PROTEİN
YAĞ	1.2-2.4	İsoleucin	3.33
NİŞASTA	36.9-49.0	Leucin	6.58
PROTEİN	21.2-32.9	Lysin	6.84
LİF	14-24	Methionin	1.03
ŞEKER	5.3-8.7	Phenylalanin	4.19
KÜL	2.4-3.4	Threonin	3.59
NEM	13.04	Valin	3.89
KALORİ: KCAL/100 G	303	Tryptophan	0.94

Dünyada kuru bezelye üretim bakımından baklagiller içerisinde fasulyeden sonra ikinci sırada bulunurken (Skyrpetz, 2004), ülkemizde nohut, mercimek, fasulye ve bakladan sonra beşinci sırada bulunmaktadır. Ülkemizin değişik ekolojik bölgelerine adapte olabilen bezelye çeşitlerinin geliştirilememiş olması nedeniyle ülkemizdeki kuru bezelye üretimi istenilen seviyede değildir. Oysaki yapılan araştırmalara göre, bezelye tanesinin kimyasal bileşeninde %1.2-2.4 yağ, %36.9-49.0 nişasta, %21.2-32.9 oranında protein ve %14-24

oranında lif içerdiği belirlenmiştir. Protein bakımından bezelye tanesini incelendiğinde ise pek çok farklı aminoasit çeşidini içerdiği saptanmıştır (Çizelge 1).

Bezelye tanelerinin morfolojik olarak yapılarında farklılıklar gözlenebilmektedir. Tek yıllık serin iklim bitkisi olan bezelyenin tanesi, tohum kabuğu, kotiledonlar ve embriyodan meydana gelmektedir. Testa olarak da bilinen tohum kabuğu sert ve kalın bir yapıya sahiptir. Tanenin yaklaşık %6-10'unu meydana getirmektedir. Bezelye tane çapı 6-9 mm arasında değişiklik göstermektedir (Adak, 2021).

Genellikle 3-5 cm derinlikte ekilen bezelye tohumları, sonbahar aylarında 7-8 cm, erken ilkbaharda 5-6 cm, ilkbahar aylarında ise 4-5 cm civarında ekilmelidir. Bodur bezelyelerde ekim sıklığı sıra arası 30-40 cm ve sıra üzeri 5-10 cm, yatık ve sarılcı tip bezelyelerde ise ekim sıklığı sıra arası ve sıra üzeri mesafeler daha geniş olacak şekilde yapılmalıdır. Dekara atılacak tohumluk miktarı, ekim sıklığı ve çeşidin dane iriliğine bağlı olarak 6-18 kg arasında değişmektedir (Anonim, 2022).

Son yıllarda iş yükünün yoğunluğuna bağlı olarak hızlı, pratik ve lezzetli olan hazır gıdaların kullanımı artmıştır. Bu tarz beslenme ürünlerinin mümkün olduğunca içeriğinin (vitamin, protein, mineral vb.) zengin olması, uygun maliyetli ve ulaşılabilir olması tüketici alışkanlıklarında gün geçtikçe daha fazla kendisine yer edinmesine sebep olmuştur. Bezelye, kuru bakliyatlar içerisinde tanesi değerlendirilen önemli bitkisel ürünler içerisinde yer almaktadır. Hazır çorbalardan, bebek mamalarına kadar pek çok hazır gıda içerisinde farklı formlarda değerlendirilen bezelye ürün işleme pazarında önemli bir yer sahiptir (Göçmen ve Şahin, 2000). Çölyak hastalarının beslenmesinde gluten içermeyen gıdaların tüketilmesi gerekmektedir (Dumanoğlu ve Geren, 2020). Bu nedenle, gluten içermeyen gıdaların yer aldığı beslenme ürünlerinde yine bezelye değerlendirilen ürünler içerisinde yer almaktadır (İşleroğlu ve ark., 2009). Bunların yanında bezelye, vegan beslenen kişiler için hayvansal proteinlerine yerine kullanılacak protein içeriği yüksek bitkisel ürünler içerisinde yer almaktadır.

Bu araştırmanın amacı, özellikle kuru gıda olarak değerlendirilen bezelye bitkisine ait tanelerin bazı fiziksel özelliklerinin belirlenerek ürün işleme basamağında burada elde edilen verilerden faydalanılarak işlem basamaklarında kullanılması yönündedir. Ayrıca bu konuda yapılan ıslah çalışmalarına ve mekanizasyon aralığı ile yapılacak olan üretime de katkı sağlayacağı ön görülmektedir.

Materyal ve Metod

Bu çalışma, 2022 yılında Bingöl Üniversitesi Ziraat Fakültesine ait laboratuvarlarda yürütülmüştür. Çalışmada incelenen iki farklı kuru bezelye çeşidi (Deren ve Irmak) 2022 yılında Doğu Akdeniz Tarımsal Araştırma Enstitüsü Müdürlüğü'nden temin edilmiştir. Çimlenme kapasitelerinin yaklaşık olarak %98-99 oranlarında olduğu belirlenmiştir. Bezelye tanelerinin, uzunluk (mm), genişlik (mm), yüzey alan (mm²), ortalama aritmetik çap (mm), küresellik ve bin tane ağırlığı (g) gibi bazı fiziksel özellikleri incelenmiştir. Rastgele olacak şekilde 100'er adet seçilen taneler, kendine ait yazılımı olan Nikon SMZ 745T marka stereo mikroskop altında incelenmiştir (Dumanoğlu & Geren, 2020; Dumanoğlu ve ark., 2021). Buradan elde edilen değerlerden faydalanılarak tanelere ait ortalama aritmetik çap (mm) ((D:L+W)/2), küresellik (Φ : D_0/L) değerler belirlenmiştir (Alayunt, 2000; Kara, 2012; Kara, 2017; Mohsenin, 1970) (L: Tohum uzunluk, W: Tohum genişlik, D:Ortalama aritmetik çap, Φ : Küresellik). Bunların yanında yine rastgele olacak şekilde alınan örnekler içerisinde her bir çeşidin bin tane ağırlığı hassas terazi (0.001 g) aracılı ile saptanmıştır (Dumanoğlu ve ark, 2022). Elde edilen veriler Yağcıoğlu (2015) belirtmiş olduğu tohum tane özelliklerine göre sınıflandırılmıştır (Çizelge 2).

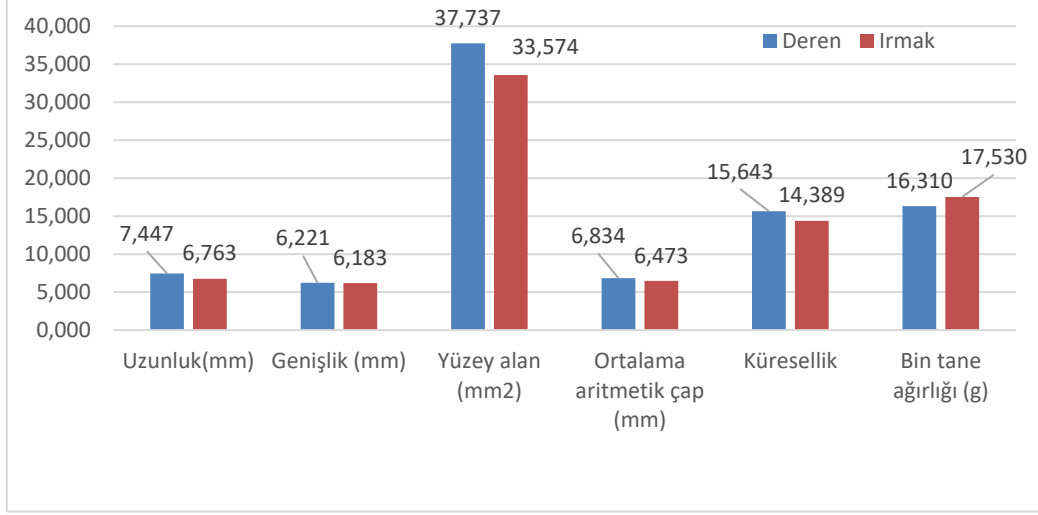

Çizelge 2. Tohumların geometrik ve şekil özelliklerine göre sınıflandırılması (Yağcıoğlu, 2015)

Geometrik özelliklerine göre tohumlar	Tane genişliği/Tane uzunluğu (b/a) (mm)
Uzun	< 0.6
Orta	0.6 – 0.7
Kısa	> 0.7
Şekil özelliklerine göre tohumlar	Uzunluk (a), Genişlik (b), Kalınlık (c) (mm)
Yuvarlak	$a \approx b \approx c$
Oval	$a/3 < b \approx c$
Uzun	$c < b < a/3$

Bulgular

Bu çalışmada incelenen iki farklı bezelye çeşitlerine ait tanelerin bazı fiziksel özellikleri; ortalama 7.105 mm uzunluk, 6.202 mm genişlik, 35.656 mm² yüzey alan, 6.654 mm aritmetik çap, 15.016 küresellik ve 16.920 g bin tane ağırlığı şeklinde belirlenmiştir. Deren çeşidinin, 7.447 mm uzunluk, 6.221 mm genişlik, 37.737 mm² yüzey alan, 6.834 mm ortalama aritmetik çap, 15.643 küresellik ve 16.310 g bin tane ağırlığına sahip olduğu belirlenmiştir. Irmak çeşidinin, 6.763 mm uzunluk, 6.183 mm genişlik, 33.574 mm² yüzey alan, 6.834 mm ortalama

aritmetik çap, 14.389 küresellik ve 17.530 g bin tane ağırlığına sahip olduğu saptanmıştır (Şekil 3). Yağcıoğlu (2015)' te yapmış olduğu sınıflandırmaya göre; her iki çeşide ait tanelerin kısa ve oval tohum özelliklerine sahip olduğu belirlenmiştir. Çalışmada elde edilen değerlerin Adak (2021) yapmış olduğu araştırmalar ile uyumlu olduğu belirlenmiştir.

Şekil 3. Kuru gıda olarak değerlendirilen bezelye çeşitlerinin tanelerine ait bazı fiziksel özellikler

Sonuç

Gün geçtikçe artan nüfusun bezlenmesine yönelik yapılan çalışmalar artmaktadır. Farklı yöntemler kullanılarak üretin tarımsal ürünlerin depolanması için bir yandan yeni yöntemler aranırken diğer yandan mevcut değerlendirme şekilleri kullanılmaktadır. Ürünlerin mümkün olduğunca tazeliğini kaybetmeden lezzetli ve standart bir kalitede tüketiciye ulaşması ana hedefler içerisinde yer almaktadır. Bu çalışma kapsamında kuru gıda olarak değerlendirilen bezelye bitkisine ait iki farklı çeşidin tanelerine ait bazı fiziksel özellikler belirlenmiştir. Elde edilen değerlerin, hem üretim aşamasında mekanizasyon olanaklarının değerlendirilmesinde, hem de ürün işleme aşamasında farklı basamaklarda alet, makine ve sistemlerin seçilerek kayıplar olmaksızın kullanılmasına olanak sağlayacağı ön görülmektedir. Ayrıca, bu çeşitlere ilişkin ileride yapılacak olan ıslah çalışmalarında fayda sağlayacağı düşünülmektedir.

Teşekkür

Bu çalışma kapsamında incelenen, iki farklı kuru bezelye çeşidine ait tanelerin (Deren ve Irmak) temini sağlayan, Doğu Akdeniz Tarımsal Araştırma Enstitüsü Müdürlüğü'ne ve Sayın Dr. Meltem TÜRKERİ'ye teşekkür ederiz.

ÖZET

Dünya nüfusunun 2050 yılında yaklaşık 9.5 milyar olacağı tahmin edilmekte olup üretim kaynaklarının azalması, gıda üretiminin dünya üzerinde dengesiz dağılımı ve ekolojik şartlar, dengesiz beslenmenin en önemli sebepleri arasında yer almaktadır. İklim değişikliklerinin ve yetiştirme koşullarının verimi direkt etkilemesinin yanı sıra, tane kalitesini de önemli düzeyde etkilemektedir. Nohutta verimi artırmak önemli amaçlar arasında yer alsa da tane kalitesi de insan beslenmesi ve sağlığı açısından önemli olduğu bilinmektedir. Bu çalışma, Diyarbakır'da yetiştirilen bazı nohut hat ve çeşitlerinin kalite özelliklerini belirlemek amacıyla yürütülmüştür. Çalışmada, 2021-2022 yazlık yetiştirme sezonunda Diyarbakır ekolojik koşullarında 25 nohut genotipinin, tesadüf blokları deneme desenine göre 4 tekrarlamalı yürütülen tarla çalışmasından elde edilen tanelerde teknolojik özellikler incelenmiştir. Araştırma sonucunda incelenen teknolojik özellikler bakımından nohut genotipleri arasında istatistiki olarak önemli fark bulunmuştur. Nohut genotiplerine göre değişimle birlikte kuru ağırlık 22.91-35.35 g; yaş ağırlık 49.75-79.55 g; kuru hacim 60.0-100.0 ml; yaş hacim 126.67-162.5 ml; su alma kapasitesi 0.267-0.443 g/tane; su alma indeksi % 0.150-0.667; şişme kapasitesi 0.05-0.167 ml/tane ve şişme indeksi %1.100-3.333 arasında değişmiştir. Sonuç olarak, Azkan, Botan, Hasanbey, FLIP 07-34C, FLIP 09-183 C ve FLIP 09-184 C genotipleri sahip olduğu teknolojik özellikleri ile daha erken pişebilecek genotipler olabileceği belirlenmiştir.

Anahtar Kelimeler: Nohut, genotip, tane, kalite, teknolojik özellik

**DETERMINATION OF SOME TECHNOLOGICAL CHARACTERISTICS OF
CHICKPEA GENOTYPES UNDER ECOLOGICAL CONDITIONS OF
DIYARBAKIR**

ABSTRACT

The world population is estimated to be around 9.5 billion in 2050, and the decrease in production resources, the unstable distribution of food production and ecological conditions are among the most important reasons for malnutrition. Climatic changes and growing conditions not only directly affect yield, but also significantly affect grain quality. Although increasing the yield of chickpea is among the important goals, it is known that grain quality is also important for human nutrition and health. This study was carried out to determine the quality characteristics of some chickpea genotypes and varieties grown in Diyarbakır. In the study, the technological properties of chickpea seeds obtained from the field experiment carried out in 4 replications according to the randomized blocks trial design of 25 chickpea genotypes in Diyarbakır ecological conditions in the 2021-2022 growing season were investigated. As a result of the research, a statistically significant difference was found between chickpea genotypes in terms of technological properties. According to chickpea genotypes, the dry weight; wet weight, dry volume, wet volume, water absorption capacity, water uptake index, swelling capacity varied between 22.91 and 35.35 g, between 49.75 and 79.55 g, between 60.0 and 100.0 ml, between 126.67 and 162.5 ml, between 0.267-0.443 g/seed, between 0.150 and 0.667%, between 0.05 and 0.167 ml/seed and between 1.100 and 3.333%, respectively. As a result, it has been determined that Azkan, Botan, Hasanbey, FLIP 07-34C, FLIP 09-183 C and FLIP 09-184 C genotypes can be cooked earlier with their technological features.

Keywords: Chickpea, genotype, seed, quality, technological properties

GİRİŞ

Nohut (*Cicer arietinum* L.), fasulyeden sonra Dünya’da en fazla üretimi yapılan yemeklik tane baklagil bitkisidir. Nohut, tane büyüklüğü, renk ve şekillerine göre Desi ve Kabuli tip olarak iki gruba ayrılır. Desi tipi nohut; küçük, düzensiz şekilli, renkli (sarı, yeşilimsi, kahverengi, siyah) tane yapısına sahiptir. Kabuli tipi nohut; iri, genellikle düzgün, koç başı şeklinde olup, beyaz veya açık-krem rengindedir.

İnsan yaşamının daha sağlıklı, kaliteli ve sürdürülebilir olması için tüm besin kaynaklarından yeteri kadar alması gerekmektedir. Et ve et ürünleri, süt ve süt ürünleri, meyve ve sebzeler ile beraber bakliyat ürünleri de dengeli beslenme açısından oldukça gereklidir. Baklagiller; ekonomik ve yüksek besin değerine sahip olması sebebiyle eski çağlardan beri yaygın olarak yetiştirilmekte ve tüketilmektedir.

Nohut, %20-40 protein içeriğinden dolayı insan ve hayvan beslenmesinde önemli bir yere sahiptir. Yüksek düzeyde karbonhidrat, vitamin ve mineraller (kalsiyum, potasyum, fosfor, magnezyum, demir ve çinko), lif, doymamış yağ asitleri ve β -karoten bakımından da zengindir (Jukanti ve ark., 2012). Nohut bitkisel kaynaklı, zengin bir beslenme programının bir parçası olarak tüketildiğinde çeşitli kronik hastalıkların gelişimini önlemeye yardımcı olabilecek bileşenlerde içermektedir. İçeriğindeki protein, kas kütlesi oluşturmaya yardımcı olur ve hücrelerin sağlığını iyileştirirken, magnezyum, manganez ve kalsiyum kemikleri güçlendirir. Nohudun yüksek lif ve protein içeriği obezitenin önlenmesinde ve obezite tedavisinde kullanılabilir. Lif ve doymamış yağlar da kan lipit seviyelerini olumlu yönde etkileyebilir ve düşük glisemik indekse sahip olması nedeniyle kan şekeri ve insülin seviyelerinde ani dalgalanmaları önlediği için diyabet hastalarını diyet programında önemli bir yere sahiptir. Nohut, bağırsaklarda fermente edilen bir oligosakkarit olan çözünebilir lif (rafinoz) içeri ile bağırsak çalışmasını düzenlemeyi teşvik ederek kolorektal kanseri önlemede rol almaktadır (Muzquiz ve Wood, 2007; Wood ve Grusak, 2007, Wang ve ark., 2010).

Dünya’da nohudun tüketim biçimleri etnik ve kültürlere göre değişebilmektedir. Hindistan’da, dhal olarak (kotiledonlar ayrılır) ve un (besan) yapmak için öğütülür. Dünyanın diğer bölgelerinde, özellikle Asya ve Afrika’da nohut, yemeklerde, çorbalarda/salatalarda haşlanmış, tuzlanmış ve fermente edilmiş formlarda tüketilmektedir. Ülkemizde nohut yemeklik olarak tüketiminin yanında leblebi ve firik olarak tüketimi de çok yaygındır. Son yıllarda, içeriğindeki yüksek protein oranı nedeni ile nohut unu çeşitli gıdaların içeriğini zenginleştirebilmek için kullanılmaktadır.

Dünya’da nohut tüketimi yıllık kişi başı 7 kg iken, Türkiye’de ise 5.4 kg’dır (TUİK, 2020). Nohut tanelerinin kalitesi sadece içerdiği besin değerleri ile değil pişme özellikleri ile de değerlendirilmelidir. Tanenin pişme kalitesi tanenin içeriği, tarımsal uygulamalar, iklim, toprak gibi birçok faktörden etkilenebilmektedir. Ülkemizde nohut alanında yapılan çalışmalarda yüksek verimli, iri taneli, hastalık ve zararlılara toleransı çeşitlerin geliştirilmesine odaklanılmaktadır. Ancak, geliştirilen çeşitlerin teknolojik özellikleri yeterince araştırılmamış ve bu konu ile ilgili az sayıda çalışma bulunmaktadır.

Bu çalışma ile, Diyarbakır ekolojik koşullarında yetiştirilen 25 nohut genotipinin teknolojik özellikleri ve bu özellikler arası ilişkiler incelenmiştir.

MATERYAL ve YÖNTEM

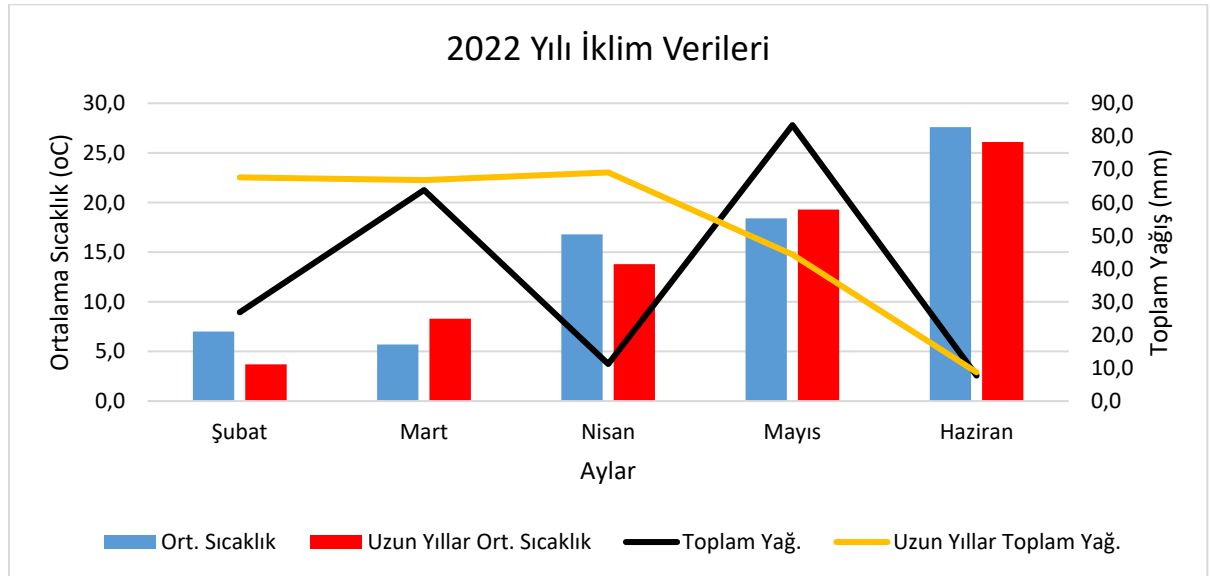

Araştırmada, ICARDA'dan temin edilen ve önceki çalışmalarda öne çıkmış 17 nohut genotipi ile 8 adet tescilli çeşit (Arda, Azkan, Botan, Hasanbey, Seçkin, Aksu, Diyar 95, Arslanbey) olmak üzere toplam 25 adet nohut genotipi materyal olarak kullanılmıştır.

Denemeler, Diyarbakır/Sur ilçesi GAP Uluslararası Tarımsal Araştırma ve Eğitim Merkezi Müdürlüğü deneme alanında (37° 30 ve 38° 43 Kuzey enlemleri ile 40° 37 ve 41° 20 Doğu boylamları, 570 m yükseklik) yürütülmüştür.

Araştırmanın yürütüldüğü Diyarbakır ili karasal iklimi yansıtmaktadır. Yazları çok sıcak ve kurak, kışları ise daha az yağışlı ve soğuktur. Araştırmanın yürütüldüğü Diyarbakır ili 2022 yılı vejetasyon dönemi ve uzun yıllar iklim verileri, Grafik 1'de verilmiştir. Grafik 1'den görüleceği gibi, vejetasyon süresince en düşük sıcaklık ortalaması Mart (0.3 °C) ayında görülürken, en yüksek sıcaklık ortalaması Haziran (31.7 °C) ayında görülmüştür. Vejetasyon süresi boyunca toplam 192.6 mm yağış düşmüştür.

Araştırmanın yürütüldüğü Diyarbakır ili Şubat-Haziran dönemine ait uzun yıllar iklim verilerine bakıldığında ise en sıcak ay ortalaması 33.6°C (Haziran) ve en soğuk ay ortalaması ise -1.0 °C' (Şubat) olarak kaydedilmiştir. Uzun yıllar yıllık toplam yağış ortalaması 256.5 mm olup bunun büyük bir kısmı bahar aylarında düşmektedir (Anonim, 2022).

Deneme alanı toprakları (0-30 cm) killi-tınlı, toplam tuz değerine göre orta tuzlu (% 0.400), organik madde açısından düşük (% 1.66), toprak pH bakımında alkali (pH: 8.07) ve CaCO₃ içeriği (%7.93) ile orta seviyedir.

Grafik 1. Araştırmanın Yürütüldüğü Diyarbakır İli 2022 Yetiştirme Sezonunu ile Uzun Yıllara İlişkin Önemli Meteorolojik Parametreler (Uzun Yıllar: 1929 – 2021 yılları arası veri grubu)

YÖNTEM

Denemeler tesadüf blokları deneme desenine göre 4 tekrarlamalı olarak 2021-2022 yetiştirme döneminde yürütülmüştür. Ekimler, sıra uzunluğu 6 m, sıra arası 0.30 m ve her parsel 4 sıradan oluşacak şekilde, 4 tekrarlamalı olarak kurulmuştur. Her parsel, $0.30 \times 6 \text{ m} \times 4 = 7.2 \text{ m}^2$ ve her sıraya 81 adet tohum gelecek şekilde (45 tohum/m^2 , $45 \times 7.2 \text{ m}^2 = 324 \text{ adet /parsel}$) 21 Şubat 2022 tarihinde yapılmıştır. Deneme hasatları, 08 Temmuz 2022'de yapılmıştır.

Teknolojik Özellikler

Hasat edilen tanelerde Tohumluk Tescil ve Sertifikasyon Merkezi (TTSM)'nin tarımsal değerleri ölçme denemeleri teknik talimatına göre Laboratuvar şartlarında kuru ağırlık (g), yaş ağırlık (g), su alma kapasitesi (g/tane), su alma indeksi (%), kuru hacim (ml), ıslak hacim (ml), şişme kapasitesi (ml/tane) ve şişme indeksi (%) ölçümleri yapılmıştır (Anonim, 2021).

Kuru Ağırlık(g): Yüz adet nohut tohumu sayılır, tartılır ve kuru ağırlık olarak kaydedilir.

Yaş Ağırlık (g): Yüz adet nohut tohumu 150 ml saf su içinde 16 saat bekletildikten sonra kurutma kâğıdı ile kurulanıp tartılır. Sonuç yaş ağırlık olarak kaydedilir.

Kuru Hacim (ml): Yüz adet nohut tohumu 100 ml'lik silindire alınır, 50 ml saf su ilave edilir ve sonuç kuru hacim olarak kaydedilir.

Yaş Hacim (ml): Yüz adet nohut tohumu 100 ml'lik silindire alınır 50 ml su ilave edilip 16 saat bekletildikten sonra kâğıt havlu ile kurutulur. Kurutulan tohumlara 100 ml saf su ilave edilir ve sonuç yaş hacim olarak kaydedilir.

Su Alma Kapasitesi (gr/tane) = Yaş ağırlık – Kuru ağırlık / 100

Su Alma İndeksi (%) = Şişme kapasitesi(g/tane) / (Kuru ağırlık / 100)

Şişme Kapasitesi (ml/tane)=[(Islak hac.-100)-(Kuru hac.-50)]-[Kuru hacim-50/100]xŞişmeyen tane sayısı] 100 – Şişmeyen tane sayısı

Şişme İndeksi (%) = (Yaş hacim – 100) / (Kuru hacim – 50)

Verilerin Değerlendirilmesi

Elde edilen veriler, tesadüf blokları deneme deseninde analiz edilmiştir. İstatistikî analizler, JMP ve GenStatRelease14.1 (Copyright 2011, VSN International Ltd.) versiyonu kullanılarak yapılmış, önemli çıkan ortalamalar, TUKEY testine göre gruplandırılmıştır (Gauch, 1988).

BULGULAR ve TARTIŞMA

Diyarbakır ekolojik koşullarında 2022 yetiştirme döneminde 25 nohut genotipinde incelenen özelliklerden; kuru ağırlık (g), yaş ağırlık (g), kuru hacim (ml) ve yaş hacim (ml) bakımından genotipler arasında istatistiki olarak önemli farklılıklar bulunmuştur. İncelenen özelliklere ait ortalama değerler ve oluşan gruplar, Çizelge 1'de verilmiştir.

Çizelge 1'den görüldüğü gibi kuru ağırlık değeri genotiplere göre değişmekle birlikte 22.91-35.35 g arasında değişmiş, Arslanbey çeşidinde en yüksek değer saptanırken Aksu ve EN 934 genotipleride istatistiki olarak aynı grubu paylaşmışlardır. Araştırmada incelenen genotiplerin ortalama kuru ağırlık değeri ise 28.40 g'dır. Bulgularımıza benzer şekilde kuru ağırlık değerinin

genotiplere göre deđiřtiđi deđiřik arařtırmacılar tarafından da belirtilmiřtir. Williams ve ark. (1983), 9.2 - 54.1 g, Kaya ve ark. (2016), 32.27-60.49 g; Mart ve Akın (2022), 29.70-53.74 g; Özaktan (2021), 37.17-49.35 g arasında deđiřtiđini belirtmiřlerdir. Tane iriliđi tüketiciler için ve pazar deđeri aısından önemli bir özelliktir. Tane iriliđinde tercih ülkelerin kullanım alışkanlıđına göre deđiřse de yaygın olarak iri taneli nohut eřitleri tercih edilmektedir.

Nohut genotiplerinin yař ađırlık deđerleri genotiplere göre deđiřmekle birlikte 49.75-79.55 g arasında deđiřmiř, Arslanbey nohut eřidi en yüksek ve FLIP06-138C genotipi ise en düşük yař ađırlık deđerine sahip oldukları saptanmıřtır (izelge 1). Nohutta yař ađırlık deđerinin genotiplere göre deđiřebileceđi deđiřik arařtırmalarda da belirtilmiřtir Kaya ve ark. (2016), yař ađırlık deđerinin genotiplere göre 72.06-132.82 g; Özaktan (2021), 78.41-103.85 g; Mart ve Akın (2022), 59.08-112.27 g arasında deđiřtiđini belirtmiřlerdir.

Nohut genotiplerinin kuru hacim deđerleri genotiplere göre deđiřmekle birlikte 60.0-100.0 ml arasında deđiřmiř, Botan, FLIP03-112C, FLIP06-133C, FLIP07-34C, FLIP09-183C, FLIP97-503C ve Hasanbey genotipleri en yüksek deđerde ve istatistiki olarak aynı grupta yer almıřlardır. Bulgularımıza benzer şekilde kuru hacim deđerinin genotiplere göre 27.0-91.0 ml arasında deđiřebileceđi belirtilmiřtir (Kaya ve ark., 2017; Bier ve ark., 2017). Nohutta kuru hacim deđerinin genotiplere ve evre kořullarına göre Sfayhi ve Kharrat (2011), 11.16-26.5; Özaktan (2021), 25.67-41.67 ml; Mart ve Akın (2022), 71.5-91.0 ml arasında deđiřtiđini belirtmiřlerdir.

Yař hacim deđerleri nohut genotiplerine göre deđiřmekle birlikte 126.67-162.50 ml arasında deđiřmiř olup tüm genotiplerin ortalama deđerleri 148.67 ml'dir. En yüksek yař hacim deđerleri FLIP07-34C genotipinde saptanmıřtır. Bulgularımıza benzer şekilde yař hacim deđerinin genotiplere göre deđiřebileceđi belirtilmiřtir (Bier ve ark., 2017; Kaya ve ark., 2017; Özaktan, 2021; Mart ve Akıncı, 2022). Arařtırmada kuru hacim deđerleri yüksek olan genotiplerin yař hacim deđerleri de yüksek bulunmuřtur.

*) Farklı harf ile gösterilen ortalamalar, Tukey testine göre ≤ 0.05 hata sınırları içinde birbirinden istatistiksel

Su alma kapasitesi, tane büyüklüğü, tane kabuğunun kalınlığı, tane kabuğunun geçirgenliği, tane dokusu ve doku oluşturan hücrelerin yapısına göre değişebilmektedir. İri taneli, geçirgenliği yüksek tane kabuğuna ve yumuşak bir kotiledon yapısına sahip genotiplerin su alma kapasiteleri de daha fazla olmaktadır. Ayrıca, su alma kapasitesi çeşit, yetiştirilen yerin toprak ve iklim özellikleri, olgunluk durumu, saklama koşulları, gibi birçok faktörden etkilenmektedir.

Su alma indeksi değeri, genotiplere göre % 0.150-0.667 arasında değişmiş olup, tüm çeşitlerin ortalaması % 0.375 olarak belirlenmiştir. En yüksek değer FLIP10-227C genotipinde saptanırken, FLIP97-503C ve FLIP09-183C genotipleri istatistiki olarak aynı grupta yer almış ve en düşük değere sahiplerdir. Su alma indeksinin genotiplere göre; Kaya ve ark. (2016) % 0.7-3.46, Cin ve Topal (2021) % 0.95-1.23, Özaktan (2021), %1.05-1.17; Mart ve Akın (2022) %0.91-1.12 arasında değiştiğini belirtmişlerdir.

Nohut genotiplerinin şişme kapasitesi değerleri genotiplere göre değişmekle birlikte 0.050-0.173 ml/tane arasında değişmiş, Azkan, Aksu, Arslanbey ve FLIP10-227C genotipleri istatistiki olarak ilk sırada yer almışlardır. En düşük şişme kapasitesi değeri FLIP97-503C genotipide saptanırken FLIP 10-279C, FLIP 09-183C ve FLIP 09-259C genotipleri istatistiki olarak son sırada yer almışlardır. Bu çalışmada belirlenen şişme kapasitesi değeri Özer ve ark. (2010), Mart ve Akıncı (2022) nın belirledikleri değerlerde daha yüksek iken Kaya ve ark. (2016) ve Shayfi ve Kharrat (2011)'ın bulduğu değerlerden daha düşük bulunmuştur. Şişme kapasitesi genotip ve çevre koşullarına göre değişebilmektedir.

Araştırmada incelen nohut genotiplerinin şişme indeksi değerleri % 1.100-3.333 arasında değişmiş, Aksu çeşidi en yüksek değere sahip olurken, FLIP 09-183C ve FLIP 95-503C genotipleri ise en düşük şişme indeksi değerine sahip olduğu saptanmıştır. Şişme indeksinin genotip ve genotipin yetiştirildiği çevre koşullarına göre Özer ve ark. (2010) %0.721-1.186; Özaktan (2021) % 2.183- 2.867; Mart ve Akın (2022) % 2.11-2.97 arasında değiştiğini belirtmişlerdir.

Çizelge 3. Diyarbakır koşullarında, 2022 yetiştirme döneminde Nohut Genotiplerinde İncelenen Teknolojik Özellikler Arası İlişkiler Ve Korelasyon Katsayıları (n=75)

	St. Sp	Kuru Ağırlık	Yaş Ağırlık	Kuru Hacim	Yaş Hacim	Su Alma Kapasitesi	Su Alma İndeksi	Şişme Kapasitesi
Kuru Ağırlık	3.37	1						
Yaş Ağırlık	7.39	0.967**	1

Diyarbakır koşullarında, 2022 yetiştirme döneminde nohut genotiplerinde incelenen teknolojik özellikler arası ilişkiler Çizelge 3'de verilmiştir. Yaş ağırlık kuru ağırlık ($r=0.967$) ile yaş hacim kuru hacim ile ($r=0.930$) önemli ve pozitif bir ilişkiye sahiptir. Su alma kapasitesi Kuru ağırlık ($r=0.888$), yaş ağırlık ($r=0.975$) ile önemli ve pozitif bir ilişkiye sahiptir. Daha önce yapılan çalışmalarda da nohutta tane ağırlığı ile su alma kapasitesi arasında önemli ve olumlu bir ilişki olduğu belirtilmiştir (Williams ve ark., 1983; Singh ve ark., 1992; Gil ve ark., 1996; Özer ve ark., 2010; Özaktan, 2021). Su alma indeksi kuru hacim ($r=-0.498$) ile önemli ve negatif bir ilişkiye sahiptir. Şişme kapasitesi kuru hacim ($r=-0.535$) ile önemli ve negatif, su alma indeksi ($r=0.956$) ile pozitif bir ilişkiye sahiptir. Benzer bulgular Özer ve ark. (2010) ve Özaktan (2021) tarafından da belirtilmiştir. Şişme indeksi kuru hacim ($r=-0.826$), yaş hacim ($r=-0.717$) ile önemli ve negatif, su alma indeksi ($r=0.457$) ve şişme kapasitesi ile ($r=0.559$) önemli ve pozitif bir ilişkiye sahiptir. Sonuç olarak, tane büyüklüğü su alma kapasitesi ve şişme indeksini etkileyebilen bir özellik olduğu belirlenmiştir.

SONUÇ

Diyarbakır ekolojik koşullarında yetiştirilen nohut genotiplerinin teknolojik özelliklerini ve bu özellikler bakımından genetik varyasyonun değerlendirildiği araştırma sonucunda, Azkan, Botan, Hasanbey ve FLIP 07-34C nohut genotiplerinin kuru ağırlık, yaş ağırlık, kuru hacim, yaş hacim, su alma kapasitesi ve su alma indeksi bakımından öne çıktıkları belirlenmiştir. Ayrıca, FLIP 09-183 C ve FLIP 09-184 C genotipleri kuru ağırlık, yaş ağırlık, kuru hacim, yaş hacim değerleri bakımından diğer genotiplerden daha yüksek değere sahip olmuşlardır. Belirtilen genotiplerin sahip oldukları bu teknolojik özellikleri ile araştırmada incelenen genotiplerden daha erken pişebilecek genotipler olabileceği söylenebilir.

Teşekkür

Bu çalışma, TÜBİTAK tarafından desteklenen 119 N 507 Nolu “Akdeniz havzasında mercimek ve nohut biyolojik çeşitliliğinin agronomik, fenotipik ve moleküler karakterizasyonu” projesinden elde edilen verilerinden üretilmiştir.

ÖZET

Son yıllarda etkisi daha belirgin hale gelen iklim değişiklikleri nedeniyle, yüksek sıcaklığa ve kuraklığa toleranslı tür ve çeşitler, önemli konuma gelmiş bulunmaktadır. Bu çalışma, bazı nohut genotiplerinin tarımsal özelliklerinin belirlenmesi amacıyla, 2021-2022 yılı yazlık yetiştirme sezonunda Diyarbakır koşullarında yürütülmüştür. Çalışma, 25 nohut genotipi ile tesadüf blokları deneme desenine göre 4 tekrarlamalı olarak kurulmuştur. Varyans analizi sonucuna göre, incelenen özelliklerden olgunlaşma gün sayısı ve dal sayısı dışında tüm özelliklerde genotipler arasında istatistiki olarak önemli farklılıklar belirlenmiştir. Araştırma sonucunda; çiçeklenme gün sayısı 81.3-91.0 gün ve fizyolojik olgunlaşma gün sayısı 121.8-143.8 gün arasında; bitki boyu 44.0-56 cm, ilk bakla yüksekliği 19.8-27.5 cm, bitkide dal sayısı 2.23-2.83 adet, bitkide toplam bakla sayısı 8.0-22.3 adet, bitkide tane sayısı 6.2-18.8 adet, bitkide tane ağırlığı 1.50-5.19 g, yüz tane ağırlığı 23.88-32.83 g arasında değiştiği belirlenmiştir. Tane verimi bakımından Botan çeşidi 112.75 kg/da ile en yüksek değere sahip olmuştur. Sonuç olarak, FLIP 06-39 C, FLIP 09-183 C, FLIP 09-259 C, FLIP 09-278 C ve FLIP 10-227 C genotipleri, erken çiçeklenen, bakla sayısı, tane sayısı, tane ağırlığı, yüz tane ağırlığı ve verim yönünden ümitvar hatlar olarak belirlenmiş olup ıslah çalışmalarında değerlendirilebilir.

**DETERMINATION OF AGRICULTURAL CHARACTERISTICS OF CHICKPEA
GENOTYPES IN DİYARBAKIR ECOLOGICAL CONDITIONS**

ABSTRACT

Due to the climatic changes, the effect of which has become more evident in recent years, species and varieties that are tolerant to high temperature and drought have become important. In order to determine the agricultural characteristics of some chickpea genotypes, this study was carried out in Diyarbakır conditions in the summer growing season of 2021-2022. The study was established with 25 chickpea genotypes in a randomized block design with 4 replications. According to the results of the analysis of variance, statistically significant differences were determined between the genotypes in all traits except the number of maturation days and the number of branches. As a result of the research; flowering days, physiological maturation day, plant height, first pod height, number of branches per plant, total number of pods per plant, number of seeds per plant, seed weight per plant, hundred seed weight was determined to vary between 81.3 and 91.0 days, between 121.8 and 143.8 days; between 44.0 and 56 cm, between 19.8 and 27.5 cm, between 2.23 and 2.83 unit, between 8.0 and 22.3 unit, between 6.2 and 18.8, between 1.50 and 5.19 g, between 23.88 and 32.83 g, respectively. In terms of seed yield, Botan variety had the highest value with 112.75 kg/da. In terms of flowering time, pod number, seed number, seed weight, hundred seed weight and seed yield FLIP 06-39 C, FLIP 09-183 C, FLIP 09-259 C, FLIP 09-278 C and FLIP 10-227 C genotypes have been determined as promising genotypes and can be evaluated in future breeding studies.

Keywords: Chickpea, yield, genotype, parameter

GİRİŞ

Nohut (*Cicer arietinum* L.), baklagil familyasından, diploid ($2n=16$), kendine döllen, tek yıllık bir bitki olup, iri tanelilerinin gen merkezinin Güneybatı Asya ile Akdeniz, küçük tanelilerin gen merkezinin Güney Asya ve Habeşistan olduğu belirtilmektedir (Auckland ve Maesen, 1980). Dünya’da yaklaşık 15 milyon ha ekim alanı ve 16 milyon ton üretimi ile Fasulyeden sonra en fazla tarımı yapılan yemeklik tane baklagil türüdür. Dünya’da nohut üretiminin en fazla yapıldığı ülkeler Hindistan (11.910.000 ton), Avustralya (876.468 ton), Etiyopya (478.211 ton), Türkiye (475.000 ton) ve Myanmar (467.340 ton) olarak göze çarpmaktadır (FAO 2021).

Ülkemizde 487.886 ha ekim alanı ve 475.000 ton üretimi ile mercimek ve kuru fasulyenin önünde ilk sırada bulunmaktadır. Nohut yetiştiren dünya ülkelerinde verim ortalaması dekara 103 kg iken, ülkemizde bu değer 121 kg civarındadır (TUİK, 2021).

Bir baklagil olarak nohut, tahıl-tahıl veya tahıl-nadas rotasyonu sistemlerine iyi uyum sağladığından, tarımsal üretimin sürdürülebilirliğini sağlar ve azotlu gübreleme ihtiyacını azaltır. Nohut tanelerinin % 18-36 gibi oldukça yüksek düzeyde protein içermesi, özellikle az gelişmiş veya gelişmekte olan ülkelerde, gelir düzeyinin düşüklüğü nedeni ile yeterince hayvansal ürün tüketemeyen insanlar için önemli bir gıda maddesidir. Ayrıca nohut taneleri mineraller (kalsiyum, potasyum, fosfor, magnezyum, demir ve çinko), lif, doymamış yağ asitleri ve β -karoten bakımından da zengindir (Jukanti ve ark., 2012).

Ancak nohut üretimini arttırarak, artan dünya nüfusunun protein ihtiyacını karşılamak mümkün değildir. Çünkü nohut, Ekvator kuşağından kuzeyde 50° - $52'$ paralel (Rusya) ve güneyde 35° - $36'$ paralele (Avustralya) kadar uzanan çok geniş bir bölgede yetişebilse de üretimde, kuraklık, düşük ve yüksek sıcaklıklar gibi çeşitli abiyotik stresler nedeniyle birçok zorlukla karşı karşıyadır. Kuraklık stresi, iklim değişikliği ve sürekli artan dünya nüfusu için ciddi bir sorun olup bitki büyümesi, fizyolojisi ve üremesini etkiler ve verimi azaltır. Serin mevsim baklagil bitkisi olan nohut, sıcak bölgelerde ve geç ekimlerde yüksek sıcaklık stresiyle karşı karşıyadır. Yüksek sıcaklık, çiçek tomurcuklarını, çiçekleri ve baklaları dökerek, tane iriliğini ve verimi azaltmaktadır.

Bu senaryoya göre, ıslah çalışmalarına yeni yaklaşımlar ile yüksek verimli nohut genotiplerinin geliştirilmesi gerekmektedir. Yakın ve orta vadeli gelecekte, gıda güvenliğini sağlayabilmek için iklim değişikliğine dayanıklı, farklı genetik özellikleri olan, erkenci, geniş adaptasyon yeteneğine sahip, yüksek verimli yeni çeşitlerin geliştirilmesi gerekmektedir. Bu anlamda, bu çalışmanın temel amacı, farklı nohut genotiplerinin verim ve verim komponentleri incelenerek, bölge tarımına uygun, abiyotik faktörlere toleranslı, nohut genotiplerinin belirlenmesidir.

MATERYAL ve YÖNTEM

Araştırmada, ICARDA’dan temin edilen ve önceki çalışmalarda öne çıkmış 17 nohut genotipi ile 8 adet tescilli çeşit (Arda, Azkan, Botan, Hasanbey, Seçkin, Aksu, Diyar 95, Arslanbey) olmak üzere toplam 25 adet nohut genotipi materyal olarak kullanılmıştır.

International Conference on Global Practice of Multidisciplinary Scientific Studies-IV
Turkish Republic of Northern Cyprus, April 28-30, 2023

Denemeler, Diyarbakır/Sur ilçesi GAP Uluslararası Tarımsal Araştırma ve Eğitim Merkezi Müdürlüğü deneme alanında (37° 30 ve 38° 43 Kuzey enlemleri ile 40° 37 ve 41° 20 Doğu boylamları, yükselti 570 m) yürütülmüştür.

Araştırmanın yürütüldüğü Diyarbakır ili karasal iklimi yansıtmaktadır. Yazları çok sıcak ve kurak, kışları ise daha az yağışlı ve soğuktur. Araştırmanın yürütüldüğü Diyarbakır ili 2022 yılı vejetasyon dönemi ve uzun yıllar iklim verileri, Çizelge 1’de verilmiştir. Çizelge 1’den görüleceği gibi, vejetasyon süresince en düşük sıcaklık ortalaması Mart (0.3 °C) ayında görülürken, en yüksek sıcaklık ortalaması Haziran (31.7 °C) ayında görülmüştür. Vejetasyon süresi boyunca toplam 192.6 mm yağış düşmüştür.

Çizelge 1. Araştırmanın Yürütüldüğü Diyarbakır İli 2022 Yetiştirme Sezonunu ile Uzun Yıllara İlişkin Önemli Meteorolojik Parametreler*

Aylar	Sıcaklık (°C)			Toplam Yağış (mm)
	Min.	Max.	Ort.	
Şubat-2022	2.6	11.8	7.0	26.8
Uzun Yıllar	-1.0	9.2	3.7	67.6
Mart-2022	0.3	13.2	5.7	63.8
Uzun Yıllar	2.5	14.5	8.3	66.8
Nisan-2022	8.1	21.3	16.8	11.2
Uzun Yıllar	7.0	20.4	13.8	69.1
Mayıs-2022	11.4	28.3	18.4	83.4
Uzun Yıllar	11.3	26.7	19.3	44.3
Haziran-2022	20.4	31.7	27.6	7.4
Uzun Yıllar	16.6	33.6	26.1	8.7

* Uzun Yıllar: 1929 – 2021 yılları arası veri grubu değerlendirilmiştir.

Araştırmanın yürütüldüğü Diyarbakır ili Şubat-Haziran dönemine ait uzun yıllar iklim verilerine bakıldığında ise en sıcak ay ortalaması 33.6°C (Haziran) ve en soğuk ay ortalaması ise -1.0 °C’ (Şubat) olarak kaydedilmiştir. Uzun yıllar yıllık toplam yağış ortalaması 256.5 mm olup bunun büyük bir kısmı bahar aylarında düşmektedir (Anonim, 2022).

Deneme alanı toprakları (0-30 cm) killi-tınlı, toplam tuz değerine göre orta tuzlu (% 0.400), organik madde açısından düşük (% 1.66), toprak pH bakımında alkali (pH: 8.07) ve CaCO₃ içeriği (%7.93) ile orta seviyededir.

Yöntem

Denemeler tesadüf blokları deneme desenine göre 4 tekrarlamalı olarak 2021-2022 yetiştirme döneminde yürütülmüştür. Ekimler, sıra uzunluğu 6 m, sıra arası 0.30 m ve her parsel 4 sıradan oluşacak şekilde, 4 tekrarlamalı olarak kurulmuştur. Her parsel, 0.30 x 6 m x 4 = 7.2 m² ve her sıraya 81 adet tohum gelecek şekilde (45 tohum/m², 45 x 7.2 m² = 324 adet /parsel) 21 Şubat 2022’de, hasatlar ise 08 Temmuz 2022’de yapılmıştır. Hasat edilen parseller kurutulmaya bırakıldıktan sonra harman işlemi elle yapılmıştır. Araştırmamızda, çiçeklenme ve olgunlaşma gün sayısı, bitki boyu, ilk bakla yüksekliği, bitkide dal, bitkide toplam bakla ve tane sayısı, bitki tane ağırlığı, 100 tane ağırlığı ve tane verimi karakterine ait gözlem ve ölçümleri yapılmıştır (Anonim, 2021).

Elde edilen veriler, tesadüf blokları deneme deseninde analiz edilmiştir. İstatistikî analizler, JMP ve GenStatRelease14.1 (Copyright 2011, VSN International Ltd.) versiyonu kullanılarak yapılmış, önemli çıkar ortalamalar, Tukey testine göre gruplandırılmıştır (Gauch, 1988).

BULGULAR ve TARTIŞMA

Diyarbakır ekolojik koşullarında nohut genotipinde incelenen özelliklerden; çiçeklenmeye kadar geçen gün sayısı (gün), bitki boyu (cm), ilk bakla yüksekliği (cm), bitkide toplam bakla sayısı (adet), bitkide tane sayısı (adet), bitkide tane ağırlığı (g), 100 tane ağırlığı (g) ve tane verimi (kg/da) bakımından genotipler arasında istatistiki olarak önemli farklılıklar bulunmuştur. Kültüre alınan nohut genotiplerinde istenilen tarımsal özellikler yönünden yapılan seleksiyonlar nedeniyle nohudun genetik çeşitliliği dardır. Araştırmada incelenen özelliklerin çoğunda genotipler arasında önemli farklılıkların olması, istenilen özelliklere sahip yeni bir çeşit geliştirebilmek için bu genotipler arasından seleksiyon yapılabileceğini göstermektedir. Benzer bulgular Yücel, 2020; Matur ve Yücel, 2022 tarafından da belirtilmiştir.

Çiçeklenmeye kadar geçen gün sayısı değerleri 81.3- 91.0 gün arasında değişmiş olup ortalama 86.08 gün 'dür. Araştırmada incelenen genotiplerden FLIP 06-39C, FLIP 09-183C, FLIP 09-259C, FLIP 09-278C, FLIP 10-227C ve Hasanbey nohut genotipleri ortalama çiçeklenme süresinden daha erken çiçeklenebildikleri için vejetatif dönemden generatif döneme daha kısa zamanda geçmişlerdir (Grafik 1). Nohutta generatif dönem, çiçeklenme ile başlar ve çiçeklenme dönemindeki abiyotik stres faktörleri nedeni ile tane veriminde azalmalar olabilmektedir. Generatif dönemde kuraklık ve terminal sıcaklık stresi özellikle yağışa bağlı tarımsal üretimin yapıldığı yerlerde tane verimini azaltmaktadır. Bu durum dikkate alındığında erkencilik, verimi etkileyen önemli bir faktör olarak değerlendirilebilir. Erken çiçeklenme, nohudun yetiştirme sezonu sonlarında oluşabilecek abiyotik stres koşullarından (kuraklık, yüksek sıcaklık) kaçmasına yardımcı olduğu için, generatif döneminin uzamasına ve oluşacak mevsimsel yağışlardan daha fazla faydalanarak verim artmasını sağlamaktadır. Çiçeklenmeye kadar geçen gün sayısı değeri genotipik bir özellik olmakla birlikte çevre koşullarından da etkilenmektedir. Farklı ekolojilerde ve farklı genotiplerle çiçeklenmeye kadar geçen gün sayısı 97.7-161.7 gün arasında değiştiği belirtilmiştir (Anlarsal ve ark., 1999; Demirci ve Bildirici, 2020; Nalbant, 2021; Yücedağ, 2021; Özcan ve Yücel, 2022,; Matur ve Yücel, 2022).

Grafik 1. Nohut Genotiplerinin Çiçeklenme Süresi (gün) ve Tane verimi (kg/da) Ortalamaları

Nohut genotiplerinin olgunlaşmaya kadar geçen gün sayısı değerleri genotiplere göre değişmekle birlikte 121.8-147.8 gün arasında değişmiştir (Çizelge 1). Erken genotipler terminal kuraklık stresinden etkilenmedikleri için strese bağlı verim kayıplarından daha az etkilenmektedirler. Bu nedenle yüksek verimli ve erkenci çeşit geliştirebilmek bitki ıslah programlarının önemli hedeflerden biridir (Kumar ve ark., 2015).

Bitki boyu değeri genotiplere göre değişmekle birlikte 44.0-56.0 cm arasında değişmiş olup tüm genotiplerin ortalama değeri 50.41 cm'dir. En yüksek değer FLIP 06-133C genotipinde ölçülürken, 17.POP/3, Arda, Azkan, Diyar, EN 934, FLIP 06-138C, FLIP 07-34C, FLIP 09-183C, FLIP 09-184C, FLIP 10-125C, FLIP 10-227C, FLIP 97-503C, Hasanbey ve Seçkin genotipleride istatistiki olarak aynı grubu paylaşmışlardır. Bulgularımıza benzer şekilde, bitki boyu değerinin genotiplere göre 27.5-54.7 cm arasında değişebileceği belirtilmiştir (Ağsakallı ve ark., 2001; Demirci ve Bildirici, 2020 Matur ve Yücel, 2022; Özcan ve Yücel, 2022). Nohut yetiştiriciliğinde makinalı hasat için uzun boylu bitkiler tercih edilmesine karşın, olgunlaşma döneminde önemli verim kayıplarına neden olabilmektedir (İsmail ve ark., 2017). Vejetatif dönemde yapraklarda fotosentezle üretilen şeker, olgunlaşma döneminde floemlerle taneye taşınır. Ancak, bitki boyunun uzunluğu nedeni ile yapraklardaki şekerin tamamı taneye taşınmadan bitkiler olgunlaşabilirler ve tane verimi düşer. Bu nedenle, yüksek tane verim için nohutta orta uzunlukta bitkiler tercih edilmelidir.

Denemeye alınan nohut genotiplerinin ilk bakla yüksekliğinin 19.8-27.5 cm arasında değişmiştir. En yüksek ilk bakla yüksekliği Arslanbey çeşidinde ölçülürken araştırmada incelenen çeşitlerin önemli bir kısmı da istatistiki olarak aynı grubu paylaşmışlardır. İlk bakla yüksekliği değeri çeşitlere, ekolojik koşullara, ekim zamanı gibi bir çok faktöre göre değişebilmektedir. Bulgularımıza benzer olarak, farklı çeşitlerle ve farklı çevrelerde yürütülen çalışmalarda ilk bakla yüksekliğinin 10.7-44.3 cm arasında değişebileceğini belirtmişlerdir (Demirci ve Bildirici, 2020; Karadavut ve Sözen, 2020; Yücedağ, 2021; Şakar ve Yücel, 2022). Daha önce yürütülen araştırmalarda bitki boyu ve ilk bakla yüksekliği değerlerinde geniş bir varyasyonun olduğu görülürken çalışmamızdaki bitki boyu ve ilk bakla yüksekliği değerlerine ait varyasyon ise daha dardır. Bunun sebebinin çalışmamızda yer alan çeşit sayısının az olması,

International Conference on Global Practice of Multidisciplinary Scientific Studies-IV
Turkish Republic of Northern Cyprus, April 28-30, 2023

seçilen genotipler ile çalışmanın yürütülmesi ve bu nedenle çevreden daha az etkilenmelerinden kaynaklanabileceği düşünülmektedir.

Nohut genotiplerinin dal sayısı değerleri genotiplere göre 2.23-2.83 adet arasında değişmiştir (Çizelge 1). Mardin koşullarında yürütülen çalışmalarda dal sayısının 2.5-5.2 adet/bitki (Doğan ve Doğan, 2023; Kurtarıcı ve Yücel, 2023), olduğunu bildirmişlerdir. Bitkide dal sayısı genotip, çevre, toprak yapısı, kültürel uygulamalar ve yetiştirme tekniklerinden etkilenebilmektedir.

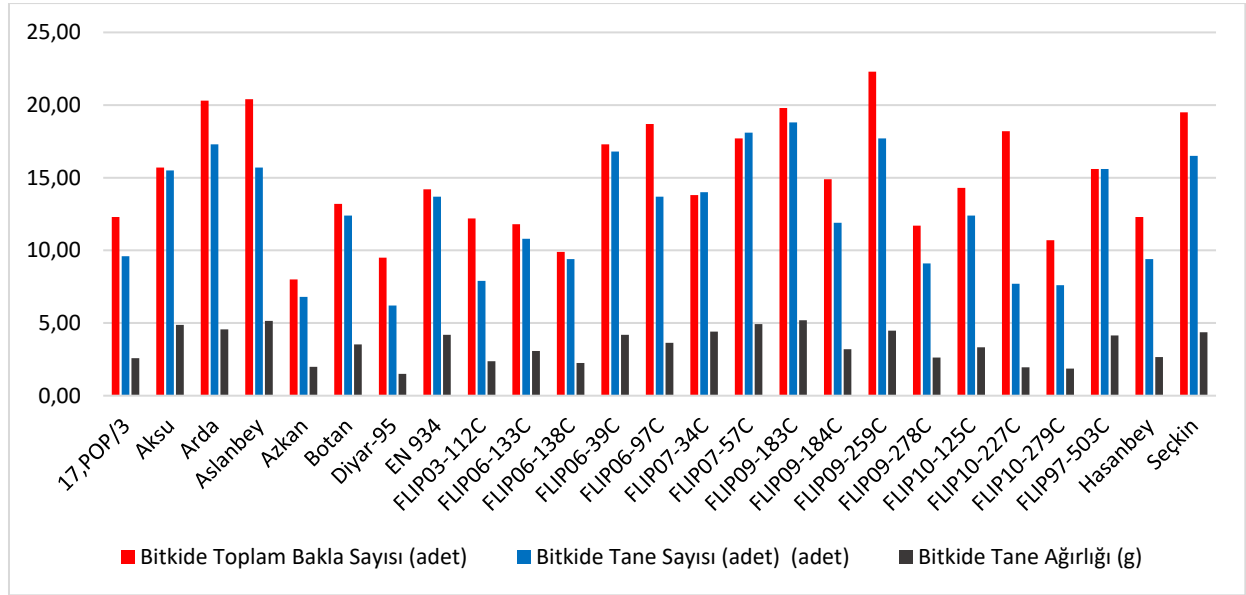

Çizelge 1. Diyarbakır ekolojik koşullarında, nohut genotiplerinde saptanan olgunlaşmaya kadar geçen gün sayısı, bitki boyu, ilk bakla yüksekliği, bitkide dal sayısı ve 100 tane ağırlığı değerlerine ilişkin ortalamalar ve oluşan gruplar

Genotip	Olgunlaşmaya Kadar Geçen Gün Sayısı (gün)	Bitki Boyu (cm)	İlk Bakla Yüksekliği (cm)	Bitkide Dal Sayısı (adet)	100 Tane Ağırlığı (g)	Tane

*) Farklı harf ile gösterilen ortalamalar, Tukey testine göre ≤ 0.05 hata sınırları içinde birbirinden istatistiksel olarak farklıdır.

Bitkide toplam bakla sayısı, değeri genotiplere göre 8.0-22.3 adet arasında değişmiştir. Araştırmada incelenen genotiplerden FLIP 09-259C genotipi en yüksek değere sahip olurken Arda, Arslanbey, FLIP 06-39C, FLIP 06-97C, FLIP 07-57C ve FLIP 09-183 C, FLIP 09-278C ve Seçkin genotipleri istatistiki olarak aynı grupta yer almaktadırlar. Farklı ekolojilerde ve farklı genotiplerle yapılan çalışmalarda nohutta bitki başına toplam bakla sayısının Adana'da 15.8-27.3 adet (Anlarsal ve ark., 1999); Diyarbakır koşullarında 15.3-34.7 adet (Biçer ve Anlarsal, 2004; Biçer ve ark., 2017), Şanlıurfa ekolojik şartlarında 6.9-13 adet (Demirci ve Bildirici, 2020); Şırnak'da 15.0-44.2 adet (Özcan ve Yücel, 2022) arasında değiştiğini bildirmişlerdir. Çalışmada elde edilen bitkide bakla sayısı değerleri, önceki çalışmalar ile

farklılıkların kaynağı, çeşitlerin genetik özellikleri, ekolojik, yağış rejimi veya toprak özellikleri olabilir.

Grafik 3. Nohut Genotiplerinin Bitkide Toplam Bakla Sayısı (adet), Bitkide Tane Sayısı (adet) ve Bitkide Tane Ağırlığı (g) Ortalamaları

Bitkide tane sayısı değeri genotiplere göre 6.2-18.8 adet arasında değişmiş olup, en fazla tane sayısı FLIP 09-183C genotipinde saptanırken FLIP 07-57C genotipi ile istatistiki olarak bir fark bulunmamaktadır. Aksu, Arda, Arslanbey, Botan, EN934, FLIP 06-39C, FLIP 06-97C, FLIP 07-34C ve FLIP 09-184 C, FLIP 09-259C, FLIP 10-125C ve FLIP 97-503C ve Seçkin genotipleride istatistiki olarak yüksek değere sahip olmuşlardır. Bitkide tane sayısı bakımından daha önce yapılan çalışmalarda; Yücedağ (2021), Şanlıurfa'da 22.0-46.2 adet; Kırşehir'de 11.3-30.2 adet arasında değiştiğini bildirmişlerdir (Karadavut ve Sözen 2020; Nalbant, 2021). Bitkide tane ağırlığı değeri genotiplere göre 1.50-5.19 g arasında değişmiş olup, en yüksek tane ağırlığı değeri FLIP 09-183 genotipinde saptanırken Aksu, Arda, Arslanbey, Botan, EN934, FLIP 06-39C, FLIP 06-97C, FLIP 07-34C, FLIP 07-57C, FLIP 09-184 C, FLIP 09-259C, FLIP 10-125C ve FLIP 97-503C genotipleride istatistiki olarak yüksek değere sahip olmuşlardır. Çalışmada, elde edilen bitkide tane ağırlığı değerleri diğer çalışmalar ile kıyaslandığında; Adana'da 5.3-8.6 g (Anlarsal ve ark., 1999; Biçer ve Anlarsal 2004), Diyarbakır koşullarında 4.2-7.2 g; (Biçer ve ark. 2004), Şırnak'da 8.7-15.7 g (Şakar ve Yücel, 2022) arasında değiştiğini belirtmişlerdir.

Bitkide bakla sayısı, tane sayısı ve tane ağırlığının verim için önemli bir parametre olduğu bilinmekle birlikte çevresel faktörlerden etkilense de asıl etkili faktör çeşidin genetik potansiyelidir. Bitki başına daha fazla bakla bağlamasına paralel olarak da bitkideki toplam tane sayısı da yüksek olmuştur. Toplam bakla sayısı ile tane sayısı arasında önemli ve olumlu ilişkilerin olduğu bir çok araştırmacı tarafından da bildirilmektedir (Yücel ve ark., 2006).

Yüz tane ağırlığı değeri genotiplere göre 23.88-32.83 g arasında değişmiş olup, en yüksek yüz tane ağırlığı değeri Arslanbey genotipinde saptanırken Aksu, Azkan, Botan, EN934, FLIP 03-

112C, FLIP 06-133C, FLIP 07-34C, FLIP 09-184 C, FLIP 09-278C, Hasanbey genotipleride istatistiki olarak yüksek değere sahip olmuşlardır. Araştırmada yüz tane ağırlığı yüksek olan genotiplerin seçilmesi, iri taneli yeni çeşitlerin geliştirilebilmesi için önemli olacaktır. Böylece, ileride yapılacak ıslah çalışmalarında bu nohut hatlarının kullanılması ticari bakımdan önemli bir kriter olan tane iriliğini arttırarak yeni geliştirilecek çeşitlerin iç ve dış pazardaki talebini de arttıracaktır.

Tane verimi değeri genotiplere göre 42.10-112.75 kg/da arasında değişmiş olup, en yüksek değer Botan çeşidinden saptanırken EN934, FLIP 06-39C, FLIP 07-34C, FLIP 09-183 C, FLIP 09-259C, FLIP 09-278C, FLIP 10-227C ve FLIP 97-503C genotipleride istatistiki olarak yüksek değere sahip olmuşlardır. Tane verimi bakımından elde edilen ortalama değerler daha önce yapılan çalışmalarda elde edilen veriler ile karşılaştırıldığında, farklılıkların çalışmaların yapıldığı çevre, kullanılan genotip ve iklim koşullarının farklılığından kaynaklanabilir. Ayrıca, yetiştirme döneminde özellikle bakla doldurma dönemi olan Nisan-Mayıs aylarında yağış değerlerinin çok düşük olması düşük tane veriminin nedeni olabilir (Çizelge 1). Tane verimi, bitkinin hem genetik yapısı hem de çevre faktörlerinden etkilenebilen nicel bir özelliktir. Farklı nohut genotipleri ile yapılan bir çok çalışmada tane veriminin genotiplere göre değiştiği bir çok çalışmada bildirilmiştir (Anlarsal ve ark., 1999; Toker ve Çancı, 2003; Yücel, 2004, Doğan, 2014). Ayrıca, ekim zamanı, ekim sıklığı ve farklı kültürel uygulamalar (sulama, yabancı ot kontrolü, gübreleme, farklı toprak işleme yöntemleri gibi) da tane verimini etkileyebilmektedir.

SONUÇ

Araştırma sonucunda, incelenen genotipler arasında verim ve verimle ilgili özellikler bakımından önemli varyasyon saptanmıştır. Bu durum, incelenen genotipler ile yapılacak melezleme ve seleksiyon çalışmaları ile istenilen özelliklere sahip yeni çeşit geliştirilebileceğini göstermektedir. Ülkemizde nohut tarımının yapıldığı Güneydoğu Anadolu bölgesinde, üreticiler, kış mevsimine uyum sağlayabilen ve aynı zamanda bakla doldurma aşamasında kuraklık ve terminal sıcaklığından kaçabilen, erken olgunlaşan ve yüksek verimli çeşitleri tercih ediyor. Araştırma sonucunda, FLIP 06-39 C, FLIP 09-183 C, FLIP 09-259 C, FLIP 09-278 C ve FLIP 10-227 C genotipleri, erken çiçeklenen, bakla sayısı, tane sayısı, tane ağırlığı, yüz tane ağırlığı ve verim yönünden ümitvar hatlar olarak belirlenmiş olup ve ıslah çalışmalarında değerlendirilebilir.

Teşekkür

Bu çalışma, TÜBİTAK tarafından desteklenen 119 N 507 Nolu “Akdeniz havzasında mercimek ve nohut biyolojik çeşitliliğinin agronomik, fenotipik ve moleküler karakterizasyonu” projeden elde edilen verilerinden üretilmiştir.

ÖZET

Yaygın fiğ (*Vicia sativa* L), tek yıllık bir baklagil yem bitkisi olup, dünyanın birçok bölgesinde yaş ve kuru ot, yeşil gübreleme ve tane amaçlı olarak, bitkisel ve hayvansal üretim sistemlerinde yetiştirilmekte ve ruminantların beslenmesinde yaygın olarak kullanılmaktadır. Yurdumuzda en fazla yetiştirilen fiğ türü yaygın fiğdir. Yaygın fiğ yem bitkisinin gen merkezi Akdeniz havzası olarak bilinmektedir. Günümüzde ise besin değerinin yüksek olması, ekonomik ve ekolojik avantajlara sahip olması nedeniyle tüm dünyada yetiştirilmektedir. Bu çalışma, beş farklı yaygın fiğ genotipinin Sivas ekolojik koşullarında agronomik ve ot verimi özellikleri bakımından performanslarının değerlendirilmesi amacıyla yürütülmüştür. Tarla denemesi 2022 yılı nisan ayında tesadüf blokları deneme desenine göre dört tekrarlamalı olarak kurulmuştur. Hasat 2022 yılı ağustos ayında gerçekleştirilmiştir. Çalışmada kullanılan yaygın fiğ genotipleri arasında incelenen özellikler bakımından büyük oranda varyasyon gözlenmiştir. Genotipler arasında ortalama ilk çiçeklenme gün sayısı 53.9 gün, ilk bakla bağlama gün sayısı 64.85 gün, doğal bitki boyu 38.9 cm, yeşil ot verimi 653.2 kg/da ve kuru ot verimi 247.7 kg/da olarak saptanmıştır. Yapılan korelasyon analizi sonucunda, kuru ot verimi ile yeşil ot verimi, doğal bitki boyu ile yeşil ot verimi ve kuru ot verimi, ilk çiçeklenme gün sayısı ile ilk bakla bağlama gün sayısı arasında pozitif ve anlamlı bir korelasyon saptanmıştır. Araştırma sonucunda, değerlendirmeye alınan yaygın fiğ genotiplerinden 3 nolu genotip, çeşitli agronomik ve ot verimi ile ilgili özellikler açısından daha üstün bulunmuştur ve Sivas iklim koşullarında büyük ölçekli yetiştiricilik için değerlendirilebileceği düşünülmektedir.

Anahtar Kelimeler: *Vicia sativa*, Yem Bitkisi, Yeşil Ot, Kuru Ot

**EVALUATION OF THE PERFORMANCES OF SOME COMMON VETCH
GENOTYPES UNDER SIVAS ECOLOGICAL CONDITIONS**

ABSTRACT

Common vetch (*Vicia sativa* L.) is an annual leguminous forage crop and is widely used in plant and animal production systems in many regions of the world for green and dry herbage, green fertilization and grain purposes and is widely used in the nutrition of ruminants. The most commonly grown vetch species in Turkey is common vetch. The origin center of this crop is considered Mediterranean basin, now it is cultivated all over the world due to having high nutrition and economic and ecological advantages. Current investigation involved five common vetch genotypes for the assessment of their performance for various agronomic and hay yield traits. Field experiment was conducted in April 2022 using randomized complete block design with three replications and harvesting was performed in August 2022. A good range of variations was observed for various studied traits. Among the genotypes, the average number of first flowering days was 53.9 days, the number of first pod tying days was 64.85 days, the natural plant height was 38.9 cm, the green herbage yield was 653.2 kg/da and the hay yield was 247.7 kg/da. As a result of the correlation analysis, a positive and significant correlation was found between hay yield and green herbage yield, natural plant height with green herbage yield and hay yield, first flowering days and first pod setting days. As a result of the research, genotype 3, among the common vetch genotypes, was found to be superior in terms of various agronomic and forage yield-related characteristics and it is thought that it can be evaluated for large-scale cultivation in Sivas climate conditions.

Keywords: *Vicia sativa*, Fodder Crop, Green Herbage, Dry Herbage

GİRİŞ

Ülkemizde kaba yem üretimi, hayvancılık işletmelerinin ihtiyaçlarını karşılamakta son derece yetersiz kalmaktadır. Ülkemiz hayvancılığı çoğunlukla meraya dayalıdır. Ancak yıllar içerisinde mera alanlarının yanlış ve tek yönlü kullanımı nedeniyle bu alanlar verimliliklerini kaybetmiş, hayvanlar besleme değeri daha düşük kaynaklarla beslenmek mecburiyetinde kalmışlardır. Kaliteli yemler kullanılarak hayvan besleme yapılması, hayvansal üretimin artırılması için oldukça önemli bir konudur. Bu açıdan bakıldığı zaman tarımsal üretim sistemleri içerisinde kaliteli yem bitkilerinin dahil edilmesi zorunlu hale gelmiştir (Ünaldı, 2008).

Fiğler, hayvan besleme bakımından besin içeriklerinin yüksek olması nedeniyle yem kalitesi yüksek ot ve tohum üretmek amacıyla yetiştirilen oldukça önemli yem bitkilerindedir (Kurt, 2012). Dünyanın farklı bölgelerine yayılmış 150 kadar fiğ (*Vicia spp.*) türü bulunmaktadır (Er ve ark., 2011; Ekiz ve ark., 2011). Tarımsal üretimde ekonomik öneme sahip bazı fiğ türleri Macar fiği (*Vicia pannonica*), koca fiğ (*Vicia narbonensis*), tüylü fiğ (*Vicia villosa*), burçak (*Vicia ervilia*) ve yaygın fiğ (*Vicia sativa*)'dir. Ülkemizde genel olarak yetiştiriciliği yapılan fiğ türü yaygın fiğdir (Er ve ark., 2011). Yaygın fiğ dünyanın ekonomik açıdan en önemli tek yıllık tohumluk baklagil bitkilerinden biridir (Mikić ve ark., 2009). Yaygın fiğ otunun lezzetli ve besleyici olması nedeniyle büyükbaş ve küçükbaş hayvan beslenmesinde başarılı bir şekilde kullanılabilir (Açıkgöz, 2011).

Hayvan beslemenin yanında yaygın fiğ, sürülerek toprağa karıştırılması halinde iyi bir yeşil gübre bitkisi, tek yıllık baklagil bitkisi olması sebebiyle toprağı azot yönünden zenginleştirir, ekim nöbetlerinde yer alabilir ve bıraktığı artıklar sayesinde toprağın organik madde oranını artırır. Ülkemizde 2022 yılı verilerine göre fiğden yaklaşık 3 421 760 da alandan 4 020 433 ton yeşil ot elde edilmiştir. Dekar başına yeşil ot verimi ise ortalama 1175 kg olarak gerçekleşmiştir (TÜİK, 2022). Kuru ot verimi hakkında istatistiki bir bilgiye rastlanılmamıştır. Fakat genel olarak yem bitkilerinde kuru ot hesabı $\frac{1}{4}$ oranında yapılmaktadır. Buna göre kuru ot veriminin dekara yaklaşık olarak 294 kg olarak elde edilebileceği söylenebilir (Çaçan ve ark., 2018).

Bu çalışma, bazı yaygın fiğ çeşitlerinin Sivas ekolojik koşullarına adaptasyonunu ve agromorfolojik özellikler bakımından performanslarını değerlendirmek amacıyla yürütülmüştür.

MATERYAL VE METOT

Araştırma, Sivas Bilim ve Teknoloji Üniversitesi, Tarım Bilimleri ve Teknoloji Fakültesi, Tarımsal Ar-Ge Merkezinde, 2022 yılı yazlık ürün yetiştirme sezonunda yürütülmüştür. Denemenin yürütüldüğü Sivas ili 39° 56' kuzey paralelleri ile 32° 51' doğu meridyenleri

arasında yer almakta olup, denizden yüksekliği 1285 m'dir. Araştırmanın yürütüldüğü Nisan 2022-Ağustos 2022 ayları arasında en düşük sıcaklık değeri Nisan ayında (-4.2°C), en yüksek sıcaklık değeri ise Ağustos ayında (36.0°C) gerçekleşmiştir. Denemenin yürütüldüğü yetiştirme sezonunda en düşük ortalama nispi nem değeri Nisan ayında (%44.5), en yüksek ortalama nispi nem değeri ise Haziran ayında (%55.8) saptanmıştır. Araştırma sürecinde gerçekleşen toplam yağış miktarlarına bakıldığında ise en düşük değer Temmuz ayında (0 mm), en yüksek değer ise Haziran ayında (116.6 mm) saptanmıştır (Anonim, 2022). Denemenin yürütüldüğü 2022 yetiştirme sezonuna ait iklim verileri Çizelge 1'de verilmiştir.

Çizelge 1. Sivas ili 2022 yetiştirme sezonuna ait iklim verileri

Çalışmada 5 adet yaygın fiğ (Alper, Görkem, Kubilay, Selçuk, Soner) çeşidi materyal olarak kullanılmıştır. Tarla denemeleri, tesadüf blokları deneme desenine göre 4 tekrarlamalı olarak yürütülmüştür. Ekimler ve hasatlar el ile yapılmıştır. Ekimde her bir parsel 5 m uzunluğunda ve sıra arası 25 cm olacak şekilde 6 sıradan oluşmuştur. Yetiştirme süresi boyunca gerekli kültürel işlemler eksiksiz olarak yerine getirilmiş, dekara 4 kg azot (N) ile 10 kg fosfor (P₂O₅) olacak şekilde gübreleme yapılmıştır. Araştırmada, ilk çiçeklenme gün sayısı (ÇGS), ilk bakla bağlama gün sayısı (İBGS), doğal bitki boyu (DBB), yeşil ot verimi (YOY) ve kuru ot verimi (KOV) özellikleri incelenmiştir. Çalışma sonucunda elde edilen veriler SAS 9.3 istatistik paket programında varyans analizine tabi tutulmuştur (SAS, 2013).

BULGULAR ve TARTIŞMA

Farklı yaygın fiğ çeşitlerinde incelenen ilk çiçeklenme gün sayısı (gün), ilk bakla bağlama gün sayısı (gün), doğal bitki boyu (cm), yeşil ot verimi (kg/da) ve kuru ot verimi (kg/da) özelliklerine ait ortalama değerler Çizelge 2'de, korelasyon analizine ait veriler ise Çizelge 3'te verilmiştir.

İlk çiçeklenme gün sayısı bakımından yaygın fiğ çeşitleri arasında, istatistiki olarak 0.01 önem düzeyinde farklılık olduğu saptanmıştır. Ortalama ilk çiçeklenme gün sayısı 53.9 gün olurken, çeşitler arasında ilk çiçeklenme gün sayısı 52.0-55.25 gün arasında değişiklik göstermiştir.

Görkem çeşidi en kısa (52.0 gün) ilk çiçeklenme gün sayısı, Alper çeşidi ise en uzun (55.25 gün) ilk çiçeklenme gün sayısına sahip çeşit olmuştur (Çizelge 2). Bir başka ifade ile Görkem çeşidinin en erkenci, Alper çeşidinin ise en geççi çeşit olduğu anlaşılmıştır. Yürütülen benzer çalışmalarda çiçeklenme gün sayısını, Yücel ve ark. (2008) 123.9-133.8 gün olarak bildirirlerken, Çukurova koşullarında 110.0-136.7 gün arasında (Yücel ve ark., 2004; Yücel ve ark., 2005; Anlarsal ve ark., 2006), Harran Ovası koşullarında 125-146 gün arasında (Çil ve ark., 2006; Yücel ve ark., 2006) değiştiği bildirilmiştir.

Varyans analizi sonucunda yaygın fiğ çeşitleri arasında ilk bakla bağlama gün sayısı bakımından istatistiki olarak 0.01 önem düzeyinde fark olduğu belirlenmiştir. Çeşitler arasında ilk bakla bağlama gün sayısı 62.75-66.25 gün arasında değişiklik göstermiştir. Ortalama ilk bakla bağlama gün sayısı 64.85 gün, en kısa ilk bakla bağlama gün sayısı (62.75 gün) Görkem çeşidinde, en uzun ilk bakla bağlama gün sayısı (66.25 gün) ise Alper çeşidinde saptanmıştır. Araştırma bulguları incelendiğinde ilk çiçeklenme gün sayısı ile ilk bakla bağlama gün sayısı arasında önemli bir ilişki olduğu görülmektedir.

Doğal bitki boyu bakımından yaygın fiğ çeşitleri arasında istatistiki olarak önemli bir fark bulunamamıştır. Çeşitler arasında doğal bitki boyu 37.8-39.8 cm arasında değerler almıştır. Ortalama doğal bitki boyu 38.9 cm olurken, en kısa doğal bitki boyu (37.8 cm) Alper çeşidinden, en uzun doğal bitki boyu (39.8 cm) ise Görkem çeşidinden elde edilmiştir. Konuyla ilgili farklı çalışmalar incelendiğinde bitki boyunu, Babat ve Anlarsal (2011) 26.6-55.8 cm arasında, Kökten (2011) 20.3-26.2 cm arasında, Seydoşoğlu (2014) ise 33.9-62.6 cm arasında değerler aldığını bildirmişlerdir.

Çizelge 2. Yaygın fiğ çeşitlerinin incelenen özelliklere ait ortalama ve CV değerleri

Genotip	İÇGS (gün)	İBBGS (gün)	DBB (cm)	YOV (kg/da)	KOV (kg/da)
Alper	55,25 ^a	66,25 ^a	37,80	634,93 ^{ab}	208,68 ^b
Görkem	52,00 ^c	62,75 ^b	39,80	635,07 ^{ab}	229,44 ^b
Kubilay	55,00 ^a	65,75 ^a	39,20	761,25 ^a	309,20 ^a
Selçuk	52,75 ^{bc}	63,75 ^b	39,75	676,53 ^{ab}	255,66 ^{ab}
Soner	54,50 ^{ab}	65,75 ^a	37,95	558,13 ^b	235,42 ^b
ÖD	**	**	NS	**	**
CV	6,05	8,37	18,37	6,39	7,60

İÇGS: İlk Çiçeklenme Gün Sayısı, İBBGS: İlk Bakla Bağlama Gün Sayısı, DBB: Doğal Bitki Boyu, YOV: Yeşil Ot Verimi, KOV: Kuru Ot Verimi, ÖD: Önem düzeyi, **: 0.01 düzeyinde önemli, NS: Önemli Değil

Yeşil ot verimi bakımından yaygın fiğ çeşitleri arasında istatistiki olarak 0.01 önem düzeyinde fark olduğu belirlenmiştir. Çeşitler arasında yeşil ot verimi 558.13-761.25 kg/da arasında değişiklik göstermiştir. Ortalama yeşil ot verimi 653.2 kg/da olurken, Soner çeşidi en az (558.13 kg/da) yeşil ot verimine, Kubilay çeşidi ise en fazla (761.25 kg/da) yeşil ot verimine sahip çeşit

olmuştur. Yeşil ot verimi ile ilgili yürütülen benzer çalışmalarda, Babat ve Anlarsal (2011) 545.0-1233.0 kg/da arasında, Kökten (2011) ortalama yeşil ot verimini 792.2 kg/da olarak bildirmişlerdir. Bulgularımızın yürütülen benzer çalışmalardan daha düşük verilere sahip olmasının sebebi olarak, denemenin kurulmuş olduğu bölgenin gece-gündüz sıcaklık farklarının fazla olması, yani gündüz fotosentez yoluyla üretilen enerjinin gece solunum ile kaybedilmesi ve yağmura bağımlı şartlarda denemenin yürütülmüş olması gösterilebilir.

Varyans analizi sonucunda yaygın fiğ çeşitleri arasında kuru ot verimi bakımından istatistiki olarak 0.01 önem düzeyinde farklılıklar olduğu saptanmıştır. Çeşitler arasında kuru ot verimi 208.68-309.2 arasında farklı değerler almıştır. Ortalama kuru ot verimi 247.7 kg/da olurken, en az kuru ot verimi Alper çeşidinden, en fazla kuru ot verimi ise Kubilay çeşidinden elde edilmiştir. Yürütülen benzer çalışmalarda, Şilbır ve Sağlantimur (1991) 190.0-425.0 kg/da, Başbağ (2004) 337.1-583 kg/da, Kökten (2011) ortalama kuru ot verimini 220.1 kg/da olarak bildirmişlerdir.

Çizelge 3. Çeşitler arasında incelenen özelliklere ait korelasyon katsayıları

	İÇGS	İBBGS	DBB	YOY	KOV
İÇGS	1.000				
İBBGS	0.813**	1.000			
DBB	-0.078	-0.146	1.000		
YOY	0.063	0.012	0.705**	1.000	
KOV	0.077	0.056	0.635**	0.857**	1.000

İÇGS: İlk Çiçeklenme Gün Sayısı, İBBGS: İlk Bakla Bağlama Gün Sayısı, DBB: Doğal Bitki Boyu, YOY: Yeşil Ot Verimi, KOV: Kuru Ot Verimi, **: 0.01 düzeyinde önemli

İncelenen özellikler arasındaki ilişkileri incelemek amacıyla ortalama veriler üzerinden yapılan korelasyon analiz sonuçları Çizelge 3'te verilmiştir. İlgili çizelge incelendiğinde, ilk çiçeklenme gün sayısı ile ilk bakla bağlama gün sayısı ($r=0.813$) arasında, doğal bitki boyu ile yeşil ot verimi ($r=0.705$) ve kuru ot verimi ($r=0.635$) arasında, yeşil ot verimi ile kuru ot verimi ($r=0.857$) arasında pozitif ve anlamlı bir ilişki olduğu saptanmıştır. İlk çiçeklenme gün sayısı ile doğal bitki boyu ($r=-0.078$) arasında ve ilk bakla bağlama gün sayısı ile doğal bitki boyu ($r=-0.146$) arasında negatif fakat önemsiz bir ilişki olduğu, diğer özellikler arasında ise pozitif ancak önemsiz bir ilişki olduğu belirlenmiştir.

SONUÇ

Yem bitkileri tarımı, bitkisel ve hayvansal üretimde, yem üretiminin yanında, toprağın fiziksel ve kimyasal yapısını iyileştiren, kendisinden sonra yetiştirilecek bitkiler için zengin bir toprak bırakması açısından oldukça önemli bir yere sahiptir. Bu nedenle bölgeye uyumlu yem bitkilerinin belirlenebilmesi bakımından adaptasyon çalışmalarının yürütülmesi büyük önem

arz etmektedir. Sivas ekolojik koşullarına uyumlu olabileceği düşünölen beş yaygın fiğ çeşidi ile yürütölen çalışmada, Görkem ve Kubilay çeşitlerinin farklı özellikler bakımından üstün performans gösterdikleri saptanmıştır. Bu kapsamda deęişen iklim faktörleri göz önüne alındığında, adaptasyon çalışmalarının sürdürölmesinin faydalı olacağı düşünölmektedir.

ÖZET

Macar fiği (*Vicia pannonica* Crantz.)'nin besin değeri oldukça yüksek olup, hayvanlar için son derece besleyici ve lezzetli bir yem bitkisidir. Toprak özellikleri bakımından pek seçici olmayıp, kuraklığa ve soğuğa karşı dayanıklıdır. Bunun yanında ot verimi ve protein içeriği bakımından yüksek olması sebebiyle hayvansal beslenmede çokça tercih edilmektedir. Bu araştırma, beş adet Macar fiği çeşidinin Sivas ekolojik koşullarında bazı agronomik özelliklerinin belirlenmesi amacıyla 2020-2021 yılları arasında yürütülmüştür. Araştırmada, Macar fiği çeşitlerinin çiçeklenme gün sayısı (gün), doğal bitki boyu (cm), yeşil ot verimi (kg/da) ve kuru ot verimi (kg/da) gibi özellikleri incelenmiştir. Araştırma sonucunda, incelenen Macar fiği çeşitlerinin Sivas ekolojik koşullarındaki performanslarında önemli farklılıklar olduğu belirlenmiştir. Çeşitler arasında çiçeklenme gün sayısı 168.25-170.25 gün arasında değişim göstermiştir. Çalışmadan elde edilen verilere göre, çeşitler arasında yeşil ot verimi 1146-1894 kg/da arasında değişim gösterirken, kuru ot verimi 244-546 kg/da arasında değişim göstermiştir. Doğal bitki boyu incelenen çeşitler arasında 54.3-67.8 cm arasında değişim göstermiş olup ortalama 61.5 cm olarak saptanmıştır. Yapılan korelasyon analizi sonucunda yeşil ot verimi ile kuru ot verimi arasında pozitif ve anlamlı bir korelasyon olduğu saptanmıştır. Macar fiği, soğuğa ve kuraklığa gösterdiği yüksek adaptasyon kabiliyeti sayesinde özellikle İç Anadolu ve Doğu Anadolu Bölgeleri'nde kaba yem ihtiyacının karşılanması noktasında değerlendirilmesi ve yetiştirilmesi gereken önemli bir bitki olup, bu bölgelere uyum sağlamış çeşitlerin geliştirilmesi büyük önem arz etmektedir.

Anahtar Kelimeler: Macar fiği, yeşil ot, verim

**EVALUATION OF SOME HUNGARIAN VETCH (*Vicia pannonica* Crantz.)
GENOTYPES IN TERMS OF AGRO-MORPHOLOGICAL TRAITS UNDER SIVAS
ECOLOGICAL CONDITIONS**

ABSTRACT

Hungarian vetch (*Vicia pannonica* Crantz.) has a very high nutritional value and is an extremely nutritious and delicious forage plant for animals. It is not very selective in terms of soil properties and is resistant to drought and cold. In addition, it is highly preferred in animal nutrition due to its high grass yield and protein content. This research was carried out between 2020-2021 to determine some agronomic characteristics of five Hungarian vetch varieties in Sivas ecological conditions. In the study, the number of flowering days (day), natural plant height (cm), green herbage yield (kg/da) and hay yield (kg/da) characteristics of Hungarian vetch cultivars were investigated. As a result of the research, it was determined that there were significant differences in the performance of the examined Hungarian vetch varieties in Sivas ecological conditions. The number of flowering days among the cultivars varied between 168.25-170.25 days. According to the data obtained from the study, green herbage yield varied between 1146-1894 kg/da, while hay yield varied between 244-546 kg/da. The plant height varied between 54.3-67.8 cm among the examined varieties, with an average of 61.5 cm. As a result of the correlation analysis, it was determined that there was a positive and significant correlation between green herbage yield and dry herbage yield. Thanks to its high adaptability to cold and drought, Hungarian vetch is an important plant that should be evaluated and grown especially in Central Anatolia and Eastern Anatolia Regions to meet the roughage need, and it is of great importance to develop varieties adapted to these regions.

Keywords: Hungarian vetch, green herbage, yield

GİRİŞ

Ülkemizde, yem bitkileri yetiştiriciliği ve üretim miktarının yeterli olmaması nedeniyle gerekli olan besin ihtiyacı doğal çayır mera alanları ve tarımsal artıklardan karşılanmaktadır (Özkan ve Şahin Demirbağ, 2016; Budak, 2017). Ülkemizde kaliteli kaba yem üretimi kuru ot bazında yaklaşık olarak 22.2 milyon tondur. Çayır mera alanlarında yanlış ve tek yönlü kullanımı, bu alanlarda ciddi azalmalara neden olmuştur. Buna bağlı olarak yeterli besin miktarının karşılanabilmesi için yem bitkileri yetiştiriciliği önemi daha da artmıştır. Özellikle baklagil yem bitkilerinin potansiyel olarak yüksek verim değerine ek olarak, havadaki serbest azotu toprağa bağlayabilmeleri, toprağın organik madde, karbon ve fosfor içeriğini zenginleştirmeleri, yabancı otları toprakta bulunan su ve besin maddeleri açısından baskı altına alabilmeleri değerlerini arttırmaktadır (Ashworth ve ark., 2012).

Fiğ (*Vicia spp.*) otlatma, yeşil gübre, tane üretimi, yeşil ve kuru ot üretimi amaçları için dünyanın birçok bölgesinde yetiştiriciliği yapılan önemli bir baklagil yem bitkisi (Bakoğlu ve ark., 2004). Fiğ, kumlu topraklardan ağır killi topraklara kadar çok farklı toprak yapısında yetiştirilebilmektedir. Bununla birlikte ekim nöbeti sistemleri içerisinde yer alarak hastalıkların gelişimini sınırlamaktadır (Tenikecier ve ark., 2020). Dünya üzerinde yayılış gösteren 150 kadar fiğ türü bulunmaktadır (Ekiz ve ark., 2011; Er ve ark., 2011). Macar fiği (*Vicia pannonica* Crantz.), yaygın olarak yetiştiriciliği yapılan fiğ türlerinden birisidir. Macar fiğinin önemli özelliklerinden bir tanesi de kışları sert geçen bölgelerde diğer fiğ türlerine göre daha toleranslı olmasıdır (Taş ve ark., 2007).

Macar fiğinin ince gövde ve yaprak bakımından zengin bir bitki yapısına sahip olması yem değerini oldukça yükseltmektedir (Aksoy ve Nursoy, 2010). Bunun yanı sıra tanesinde protein oranının yüksek olması, kesif yem olarak kullanılmalarına olanak tanımaktadır (Turan, 2019). Macar fiği ekiliş alanları ülkemizde giderek yaygınlaşmakta olup, yetiştiricilik bakımından Orta ve Doğu Anadolu bölgelerinin daha uygun olacağı belirtilmiştir (Açıkgöz, 2001). Kaliteli kaba yem ihtiyacının karşılanabilmesi yem bitkileri ekiliş alanların artırılmasına, dolayısıyla bölgelerin ekolojik koşullarına uygun yeni çeşitlerin geliştirilmesine bağlıdır. Bu çalışma ile bazı Macar fiği çeşitlerinin Sivas ili ekolojik koşullarına adaptasyonu ve ot verimlerinin değerlendirilmesi amaçlanmıştır.

MATERYAL VE METOD

Araştırma Sivas Bilim ve Teknoloji Üniversitesi, Tarım Bilimleri ve Teknoloji Fakültesi bünyesinde yer alan Tarımsal Ar-Ge Merkezinde 2020-2021 yılı ürün yetiştirme sezonunda, 4 tekerrürlü olacak şekilde tesadüf blokları deneme desenine göre yürütülmüştür. Denemenin

yürütüldüğü 2020-2021 yetiştirme sezonuna ait iklim verileri Çizelge 1’de verilmiştir. Araştırmanın yürütüldüğü Kasım 2020-Temmuz 2021 ayları arasında en düşük sıcaklık 2021 yılı Şubat ayında -18.4°C olarak, en yüksek sıcaklık ise 2021 yılı Temmuz ayında 39.2°C olarak belirlenmiştir (Çizelge 1). En düşük ortalama nispi nem değeri 2021 yılı Mayıs ayında %44.4 olarak, en yüksek ortalama nispi nem ise yine 2020 yılı Aralık ayında %75.2 olarak saptanmıştır. Araştırma sürecinde gerçekleşen toplam yağış miktarı en düşük 2021 yılı Temmuz ayında 6.0 mm olarak; en yüksek ise 2021 yılı Ocak ayında 75.2 mm olarak kaydedilmiştir (Anonim, 2022).

Çizelge 1: Sivas ili 2020-2021 yetiştirme sezonuna ait iklim verileri

	Yıl	Aylar									Toplam veya Ortalama

1: Kasım, 2: Aralık, 3: Ocak, 4: Şubat, 5: Mart, 6: Nisan, 7: Mayıs, 8: Haziran, 9: Temmuz

Çalışmada materyal olarak 5 farklı Macar fiği çeşidi (Budak, Aygün, Sarı Efe, Tarm Beyazı-98, Efes) kullanılmıştır. Sıra arası 25 cm, parsel sıra sayısı 6, parsel sıra uzunluğu 5 m, parsel alanı $0.25 \times 6 \times 5 = 7.5 \text{ m}^2$ olacak şekilde ekim işlemi gerçekleştirilmiştir. Araştırmada ekim, bakım vb. işlemlerin tamamı eksiksiz olarak yerine getirilmiştir. Bitkilerin yetiştirme dönemi boyunca saf olarak 4 kg/da azot (N), 10 kg/da fosfor (P_2O_5) verilmiştir. Fide döneminde, elle yolma ve çapalama suretiyle 2 kez yabancı otlarla mücadele yapılmıştır. Bakım işlemleri iklim koşullarına bağlı olarak gerektiğinde eksiksiz olarak yerine getirilmiştir. Elde edilen sonuçlar SAS 9.3 (2013) istatistik paket programı kullanılarak varyans analizine tabi tutulmuştur.

BULGULAR VE TARTIŞMA

Araştırmada, farklı Macar fiği çeşitlerinde incelenen çiçeklenme gün sayısı (gün), doğal bitki boyu (cm), yeşil ot verimi (kg/da) ve kuru ot verimi (kg/da) özelliklerine ait ortalama değerler Çizelge 2’de verilmiştir.

Çiçeklenme gün sayısı bakımından Macar fiği çeşitleri arasında, istatistiki olarak önemli bir fark bulunamamıştır. Ortalama çiçeklenme gün sayısı 169.3 gün olurken, çeşitler arasında

çiçeklenme gün sayısı 168.25-170.25 gün arasında değişiklik göstermiştir. En kısa çiçeklenme gün sayısı (168.25 gün) Sarıefe çeşidinde, en uzun çiçeklenme gün sayısı ise Budak çeşidinde gerçekleşmiştir (Çizelge 2). Tahtacıoğlu ve ark. (1996), Erzurum ekolojik koşullarında yürütmüş oldukları çalışmada bitki boyunu 72-75 cm arasında, Orak ve ark. (2004), Trakya Bölgesinde farklı Macar fiği hatlarının bölgeye adaptasyonunu belirlemek amacıyla yürüttükleri çalışmada bitki boyunun 55.87-88.03 cm arasında farklı değerler aldığını bildirmişlerdir.

Çizelge 2 incelendiğinde doğal bitki boyu bakımından çeşitler arasında istatistiki olarak önemli bir fark görülmemiştir. Ortalama doğal bitki boyu 61.5 cm, çeşitler arasında ise 54.3-64.8 cm arasında farklı değerler aldığı saptanmıştır. Budak çeşidi en kısa (54.3 cm) doğal bitki boyuna, Sarıefe çeşidi ise en uzun doğal bitki boyuna sahip çeşitler olduğu belirlenmiştir. Yürütülen benzer çalışmalarda Sayar ve ark. (2012) Mardin ili çiftçi şartlarında doğal bitki boyunu 45.6-54.3 cm arasında, Tenikecier ve ark. (2020) Kırklareli şartlarında doğal bitki boyunu 42.6-47.7 cm arasında ve Kutlu ve ark. (2022) Bingöl şartlarında Macar fiğinde doğal bitki boyunu 36.2-42.6 cm arasında bildirmişlerdir.

Çizelge 2. Macar fiği çeşitlerinin incelenen özelliklere ait ortalama ve CV değerleri

Genotip	ÇGS (gün)	DBB (cm)	YOY (kg/da)	KOV (kg/da)
Budak	170.25	54.3 ^b	1700 ^{ab}	375 ^{a-c}

CV	0.99	10.06	5.92	18.77

ÇGS: Çiçeklenme gün sayısı, DBB: Doğal bitki boyu, YOY: Yeşil ot verimi, KOV: Kuru ot verimi, ÖD: Önemlilik düzeyi, **: 0,01 düzeyinde önemli

Yeşil ot verimi bakımından Macar fiği çeşitleri arasında, istatistiki olarak 0.01 önem düzeyinde farklılıklar olduğu saptanmıştır. Ortalama yeşil ot verimi 1556 kg/da olurken, çeşitler arasında yeşil ot verimi 1146-1894 kg/da arasında değişiklik göstermiştir. En az yeşil ot verimi Sarıefe çeşidinden (1146 kg/da) elde edilirken, en fazla yeşil ot verimi Tarm beyazı-98 çeşidinden (1894 kg/da) elde edilmiştir (Çizelge 2). Yürütülen benzer çalışmalarda yeşil ot verimini, Kendir ve Sevimay (1996) 1586-1633 kg/da arasında, Sayar ve ark. (2012) 1227-2336 kg/da arasında ve Kaplan ve ark. (2019) 1430-1936 kg/da arasında değerler aldığını bildirmişlerdir. Kuru ot verimi bakımından Macar fiği çeşitleri arasında, istatistiki olarak 0.01 önem düzeyinde farklılıklar olduğu belirlenmiştir. Ortalama kuru ot verimi 398 kg/da olurken, çeşitler arasında kuru ot verimi 244-546 kg/da arasında farklı değerler aldığı saptanmıştır. En az kuru ot verimi

Sarıfe çeşidinden (244 kg/da), en fazla kuru ot verimi Tarm beyazı-98 çeşidinden (546 kg/da) elde edilmiştir (Çizelge 2). Farklı bölgelerde yürütülen çalışmalarda kuru ot verimini, Sayar ve ark. (2012) 295-575 kg/da arasında ve Kaplan ve ark. (2019) 298-381 kg/da arasında bildirmişlerdir.

Çizelge 3. Çeşitler arasında incelenen özelliklere ait korelasyon katsayıları

	ÇGS	DBB	YOV	KOV
ÇGS	1.000	0.043	0.388	0.217
DBB		1.000	-0.117	0.184
YOV			1.000	0.781**
KOV				1.000

ÇGS: Çiçeklenme gün sayısı, DBB: Doğal bitki boyu, YOV: Yeşil ot verimi, KOV: Kuru ot verimi, **: 0,01 düzeyinde Önemli

İncelenen özellikler arasındaki ilişkileri incelemek amacıyla ortalama veriler üzerinden yapılan korelasyon analiz sonuçları Çizelge 3'te verilmiştir. Çizelge incelendiğinde, kuru ot verimi ile yeşil ot verimi arasında ($r=0.781$) pozitif ve anlamlı bir ilişki olduğu saptanmıştır. Yeşil ot verimi ile doğal bitki boyu arasında ($r=-0.117$) negatif fakat istatistiki olarak önemsiz bir ilişki olduğu belirlenmiştir. Diğer özellikler arasında ise pozitif ancak istatistiki olarak önemsiz bir ilişki olduğu belirlenmiştir.

SONUÇ

Orta ve Doğu Anadolu bölgelerinde Macar fiğın yetiştiriciliği yaygın olarak yapılmaktadır. Bu bölgelerimizde kışları soğuk ve sert geçmesi nedeniyle geliştirilen yeni çeşitlerin sert iklim koşullarına uyum sağlaması ve üreticilere tavsiye edilmesi önemlidir. Araştırmada, Sivas ekolojik koşullarına adaptasyonu değerlendirilen beş farklı Macar fiği çeşitleri arasında, Tarm Beyazı-98 çeşidi, yeşil ve kuru ot verimi bakımından diğer çeşitlere kıyasla daha üstün performans göstermiştir. Elde edilen bulgular doğrultusunda, Tarm Beyazı-98 çeşidinin Sivas ekolojik koşullarında yetiştiriciliği için değerlendirilebileceği düşüncesini uyandırmaktadır. Bununla birlikte değişen iklim koşulları göz önüne alındığında, daha güvenilir sonuçlar elde edilebilmesi için adaptasyon çalışmalarının uzun yıllar ve farklı lokasyonlarda sürdürülmesi önem arz etmektedir.

ÖZET

Kuraklığa, düşük sıcaklığa ve orta derecede tuzluluk stresine, sel baskınlarına da toleranslı geniş bir adaptasyon yeteneğine sahip olan mürdümük (*Lathyrus sativus* L.), baklagil familyası içerisinde yer alan yem ve tohum verimi amacıyla yetiştirilen tek yıllık serin iklim bitkisidir. Mürdümük yeşil ot, kuru ot ve tane yem olarak hayvan beslenmesinde, yeşil gübre olarak toprak yapısının iyileştirilmesinde kullanılmak üzere yetiştiriciliği yapılan önemli bir baklagil yem bitkisidir. Bitkinin en belirgin özellikleri kuraklık ve su baskınlarına karşı dirençli olmasıdır. Ürün miktarı ve kalitesinin artırılması için bölge ekolojisine uygun çeşit adaptasyon çalışmalarının tamamlanması gerekmektedir. Bu çalışmada GAP mavisini ile Gürbüz 2001 çeşidi ve Sivas Bilim ve Teknoloji Üniversitesi kapsamında geliştirilen SBTÜ 101, SBTÜ 102 ve SBTÜ 103 hat (çeşit aday) olmak üzere beş adet farklı mürdümük genotipi Sivas ekolojik koşullarında bazı agronomik özelliklerinin belirlenmesi amacıyla 2022 yılı yazlık ürün yetiştirme sezonunda tesadüf blokları deneme desenine göre 4 tekerrürlü olacak şekilde yürütülmüştür. Araştırmada mürdümük genotiplerinin çiçeklenme gün sayısı (gün) (ÇGS), bitki boyu (cm) (BB), ilk bakla yüksekliği (cm) (İBY), bitki başına bakla sayısı (adet) (BBBS), biyolojik verim (kg/da) (BV), fizyolojik olum gün sayısı (gün) (FOGS), tane verimi (kg/da) (TV), kes verimi (kg/da) (KV), bin tane ağırlığı (g) (BinTA) ve hasat indeksi (%) (Hİ) özellikleri incelenmiştir. Çiçeklenme gün sayısı, fizyolojik olum gün sayısı ve bin tane ağırlığı istatistiksel olarak önemli bulunurken, diğer incelenen özellikler istatistiksel olarak önemli bulunmamıştır. Çalışma sonucunda ortalama ÇGS 49 gün, BB 43.8 cm, İBY 12.26 cm, BBBS 33.23 adet, BV 324.82 kg/da, FOGS 112.6 gün, TV 148.53 kg/da, KV 176.29 kg/da, BinTA 149.72 gr ve Hİ %45.91 olarak saptanmıştır. Yapılan korelasyon analizi sonucunda BB ile BBBS, ÇGS ile FOGS, TV ile BV, KV ile BV ve TV arasında pozitif ve anlamlı, Hİ ile BV, TV ve KV arasında ise negatif ve anlamlı bir ilişki olduğu saptanmıştır.

**EVALUATION OF AGRO-MORPHOLOGICAL PERFORMANCE OF SOME
GRASSPEA (*Lathyrus sativus* L.) GENOTYPES UNDER SIVAS ECOLOGICAL
CONDITIONS**

ABSTRACT

Grasspea (*Lathyrus sativus* L.), which has a wide range of adaptation abilities tolerant to drought, low temperature, and moderate salinity stress and floods, is an annual cool climate plant grown for forage and seed yield in the legume family. Grasspea is an important legume fodder plant that is cultivated for animal nutrition as green herbage, hay, and grain feed and for improving soil texture as green manure. The most prominent characteristics of the plant are its resistance to drought and flooding. To increase the quantity and quality of the product, variety of adaptation studies suitable for the ecology of the region should be completed. In this study, GAP mavisı and Gurbüz 2001 cultivars and five different grasspea genotypes including SBTÜ 101, SBTÜ 102 and SBTÜ 103 lines (cultivar candidate) developed within Sivas of Science and Technology University were used. The study was carried out in the summer crop growing season of 2022 with 4 replications according to the coincidence blocks experimental design to determine some agronomic characteristics in Sivas ecological conditions. In the study, days to flowering (day) (DF), plant height (cm) (PH), first pod height (cm) (FPH), number of pods per plant (piece) (NPP), biological yield (kg/da) (BY), number of days to physiological maturity (day) (NDPM), grain yield (kg/da) (GY), straw yield (kg/da) (SY), thousand kernel weight (g) (TKW) and harvest index (%) (HI) traits of grasspea varieties were investigated. While days to flowering, days to physiological maturity, and thousand-grain weight were found to be statistically significant, the other traits were not statistically significant. As a result of the study, the average DF was 49 days, PH 43.8 cm, FPH 12.26 cm, NPP 33.23 pieces, BY 324.82 kg/da, NDPM 112.6 days, GY 148.53 kg/da, SY 176.29 kg/da, TKW 149.72 g and HI 45.91%. As a result of the correlation analysis, it was determined that there was a positive and significant relationship between PH and NPP, DF and NDPM, GY and BY, SY and BY, GY and a negative and significant relationship between HI and BY, GY and SY.

GİRİŞ

Protein oranı yüksek olması, bünyelerinde mineral ve vitamin içermeleri ve yetiştiriciliği yapılan alanları organik madde içeriğince zenginleştirmeleri gibi nedenlerden dolayı baklagil yem bitkileri hayvanların kaliteli beslenebilmesi amacıyla yaygın olarak kullanılan bir kaba yem kaynağıdır. Baklagiller (*Fabaceae*) familyası içerisinde birçok tek yıllık ve çok yıllık yem bitkisi bulunmakta olup, yem ve tohum verimi amacıyla yetiştirilen tek yıllık serin iklim bitkisi mürdümük bunlardan birisidir (Tekele-Haimanot ve ark., 1990). Mürdümük türlerinin taneleri ara sıra insan beslenmesi için kullanılmasının yanı sıra, daha çok hayvan beslenmesi amacıyla yetiştirilmektedir. Baklagiller zengin protein ihtiva ettikleri için tek başlarına silolanma güçlüğü oluşturmaktadır. Hayvanların yeterli ve dengeli beslenebilmesi için önemli bir husus olan enerji/protein dengesinin oluşturulabilmesi için ya tek başına silolanan yemlere katkı ilave edilerek ya da baklagillerle buğdaygillerin birlikte silolanması gerekmektedir (Seydoşoğlu ve Gelir, 2019). Tane, yeşil ve kuru ot olarak hayvanlar için, yemeklik tane baklagil ve sebze olarak ise insanların beslenmesi için yararlanılabilen bir baklagil bitkisi olan mürdümük (*Lathyrus sativus* L.), *Fabaceae* (*Leguminosea*) familyasının, 15 bölüme sahip, 187 taksonlu kalabalık bir cinse mensuptur (Allkin ve ark., 1983). Türkiye doğal florasında toplam 58 mürdümük türünün varlığı ve bunların 18'inin endemik olduğu belirlenmiştir (Davis, 1970). Dünya genelinde *Lathyrus* cinsine ait en fazla kültürü yapılan tür *L. sativus*'tur. Ot ve tohumları ile hayvan beslenmesinde *L. sativus*, *L. cicera* vb. gibi türler, süs bitkisi olarak ise *L. odoratus* ekonomik öneme sahiptir (Vaz Patto ve Rubiales, 2014). Mürdümük türlerine ait ilk belirtiler Hindistan bölgesinde M.Ö. 4000-3500 yılları arasına, Batı Asya bölgesinde ise M.Ö. 3800-3200 yılları arasına dayanmaktadır (Saraswat, 1980). Irak ve Türkiye'de gerçekleştirilen arkeolojik kazılar sonucu mürdümük tohumlarına rastlanılmıştır. Mürdümük Asya ülkeleri olan özellikle Pakistan, Çin, Bangladeş, Hindistan, Nepal vb. ülkelerde önemli bir ana ürün durumunda iken, Güney Avrupa (Fransa ve İspanya), Orta Doğu (Afganistan, Irak, İran, Suriye ve Lübnan) ve Afrika (Etyopya, Fas, Cezayir, Mısır ve Libya)'da daha az dağılım göstermektedir (Milczak ve ark., 2001).

Son yıllarda meydana gelen artan nüfus, küresel ısınmaya bağlı iklim değişikliği, kuraklığın belirtilerini göstermesi, doğal afet olaylarının sık görülmesi ile birlikte dünyada gıda ve gıda güvenliği sorunu bazı bölgelerde kritik bir hal almış durumdadır. Ortalama yıllık yağış miktarının 250 mm'ye kadar azaldığı bölgelerde yetiştirilebilen mürdümük bu özelliğiyle kuraklığa dayanıklılık gösteren kültür bitkilerinin ilk sıralarında yer almaktadır (Tekele-Haimanot ve ark., 1990). Ayrıca, mürdümük yıllık yağış miktarının yüksek olduğu

lokasyonlarda dahi yetiŖebilme özelliđine sahiptir. Mürdümük kuraklık, düşük sıcaklık ve tuzluluk (orta derecede) stresine dayanıklı olup, adaptasyon kabiliyeti yüksek bir bitkidir (Sönmez ve Türk, 2022). Kurak iklim bölgelerine adapte kabiliyetleri yüksek olan mürdümük aynı zamanda sel baskınlarına da toleranslı olan bir baklagil yem bitkisidir (Özdemir ve ark., 2022). Mürdümük farklı iklim ve toprak ve Ŗartlarına uyumlu olup, bu Ŗartlar içerisinde gübre verilmesine ve pestisit gibi kimyasal uygulamalara gerek duymadan iyi bir verim ortaya koyabilmesi nedeniyle sürdürülebilir tarım ve münavebe için de önemlidir. İlave olarak mürdümük canlı ve cansız stres etmenlerine karşı gösterdiđi başarı nedeniyle baklagil ıslahında oldukça önemli bir genetik kaynak olarak görülmektedir. TÜİK (2022) verilerine göre ülkemizde mürdümük (*L. sativus* L.) ekim alanı 83 140 dekar'dır. Ot üretim miktarı 55 208 ton, tane üretim miktarı ise 2 056 tondur. YeŖil ot verimi ortalama olarak 824.07 kg/da, tane verimi de 127.33 kg/da'dır. *Lathyrus* türlerine Türkiye'de birçok bölgede özellikle de baklagillerin en fazla yayılıŖ gösterdiđi Güneydođu ve Dođu Anadolu Bölgelerinde rastlanmaktadır. Türkiye'de en fazla mürdümük Balıkesir, Diyarbakır, Adıyaman, Elâzığ, Kütahya, KahramanmaraŖ, Tunceli ve UŖak illerinde yetiŖtirilmektedir (Özdemir ve ark., 2022). Ayrıca ülkemiz içerisinde bazı bölgelerde ve az bir miktarda *Lathyrus* türlerinden sadece *L. sativus* ve *L. cicera*'nın tarımı yapılmaktadır (Genç ve Ŗahin, 2001).

Bu araŖtırma, mürdümük çeŖidi olan GAP mavisi ve Gürbüz 2001'in, Sivas Bilim ve Teknoloji Üniversitesi kapsamında geliŖtirilen tescile sunulacak olan SBTÜ 101, SBTÜ 102 ve SBTÜ 103 hatlarının (çeŖit adayı) çiçeklenme gün sayısı, bitki boyu, ilk bakla yüksekliđi, bitki başına bakla sayısı, biyolojik verim, fizyolojik olum gün sayısı, tane verimi, kes verimi, bin tane ađırlıđı, hasat indeksi gibi agro-morfolojik özellikleri belirlenerek Sivas ekolojik koŖullara uyum sađlayabilecek çeŖit veya çeŖit adayı hatların tespit edilmesi amacıyla yapılmıŖtır.

MATERYAL VE METOT

ÇalıŖma Sivas Bilim ve Teknoloji Üniversitesi, Tarım Bilimleri Teknoloji Fakültesi, Tarımsal AR-GE Merkezinde 2022 yılı yetiŖtirme sezonunda yürütölmüŖtür. Deneme alanı rakımı 1285 m olup, N39,720656-E36,917248 konumunda yer almaktadır. Denemenin yürütöldüđu 2022 yılı yetiŖtirme sezonuna ait iklim verileri Çizelge 1'de verilmiŖtir. Sivas ili iklim özelliđi kışları sođuk ve karlı, yazları ise sıcak ve kurak geçmektedir. Mürdümük vejetasyon süreci boyunca sıcaklık nisan ayında-4.2 (°C)'de minimum, ađustosta ise 23.7 (°C)'de maksimum deđer göstermiŖtir. Nisan-ađustos vejetasyon ayları arasındaki toplam yađıŖ 137.9 mm ile uzun dönem ortalamasının (133.5 mm) üzerinde seyretmiŖtir. Aylara göre ortalama bađıl nem deđerleri %44.5-55.8 arasında deđiŖmiŖ ve uzun dönem ortalamasının (%51.6) altında kalmıŖtır.

Çizelge 2. Denemenin alanı toprağının fiziksel ve kimyasal özellikleri

Derinlik	Yapı	pH	Kireç (%CaCO ₃)	Salinity (%)	P ₂ O ₅ (kg/da)	K ₂ O (kg/da)	Organik madde (%)
0-30 cm	Siltli killi tınlı	7.28	19.6	0.33	3.40	93.59	1.7

Çalışma alanının toprağı siltli-killi-tınlı tesktür yapısına sahip olup, pH değeri 7.28'dir. Kireç (%19.6), potasyum içeriği yüksek (93.59 kg/da), fosfor (3.40 kg/da), tuz (0.33 mmhos/cm) ve organik madde (%1.7) içeriği ise düşüktür (Çizelge 2). Deneme alanının drenajı yapısı iyi ve taban suyu problemi bulunmamaktadır. Araştırmada, GAP mavisini ve Gürbüz 2001 çeşidi ve SBTÜ 101, SBTÜ 102 ve SBTÜ 103 hattı olmak üzere 5 adet mürdümük genotipi deneme materyali olarak kullanılmıştır. Ekimde her bir parsel 5 m uzunluğunda ve sıra arası 25 cm olacak şekilde 12 sıradan oluşmuştur. Ekimden önce taban gübresi olarak dekara 4 kg N (azot) ile 10 kg P₂O₅ (fosfor) olacak şekilde gübreleme gerçekleştirilmiştir. Deneme parselinde mürdümük yetiştirme süresi boyunca yabancı ot mücadelesi elle ve çapa yardımı ile yapılmıştır. Araştırmada, çiçeklenme gün sayısı, bitki boyu, ilk bakla yüksekliği, bitki başına bakla sayısı, biyolojik verim, fizyolojik olum gün sayısı, tane verimi, kes verimi, bin tane ağırlığı, hasat indeksi gibi agro-morfolojik özellikler incelenmiştir. Elde edilen sonuçlar SAS 9.3 istatistik paket programı kullanılarak varyans analizine tabi tutulmuştur (SAS, 2013).

BULGULAR VE TARTIŞMA

Denemede materyal olarak kullanılan GAP mavisini, Gürbüz 2001, SBTÜ 101, SBTÜ 102, SBTÜ 103 genotiplerine ait çiçeklenme gün sayısı, bitki boyu, ilk bakla yüksekliği, bitki başına bakla sayısı, biyolojik verim, fizyolojik olum gün sayısı, tane verimi, kes verimi, bin tane ağırlığı, hasat indeksi Çizelge 3'de, özellikler arasında genotipik düzeyde korelasyon katsayılarının tahmin değerleri Çizelge 4'de verilmiştir.

Mürdümük genotiplerinin Sivas ekolojik koşullarına uyumu çalışması kapsamında çiçeklenme gün sayısı, fizyolojik olum gün sayısı ve bin tane ağırlığı interaksyonu bakımından çeşitler arasında önemli bir varyasyon olduğu tespit edilmiştir (P<0.01). Çiçeklenme gün sayısı bakımından sırasıyla Gürbüz 2001 (47.3 gün), SBTÜ 102 (47.8 gün), SBTÜ 103 (49.3 gün), SBTÜ 101 (50.0 gün), GAP mavisini (50.8 gün); fizyolojik olum gün sayısı bakımından sırasıyla

Gürbüz 2001 (111.5 gün), SBTÜ 102 (112.0 gün), GAP mavisi (113.0 gün), SBTÜ 103 (113.5 gün), SBTÜ 101 (114.3 gün); bin tane ağırlığı bakımından sırasıyla GAP mavisi (155.6 g), SBTÜ 102 (155.2 g), SBTÜ 101 (148.9 g), SBTÜ 103 (146.6 g), Gürbüz 2001 (142.4 g) en yüksek değerlere sahip genotiplerdir. Çiçeklenme ve fizyolojik olum gün sayısı bakımında erkencilik açısından Gürbüz 2001 çeşidi ve SBTÜ 102 hattı ön plana çıkmaktadır. Çiçeklenme ve fizyolojik olum gün sayısı ve bin tane ağırlığı göz önüne alındığında, çeşit adayı hat SBTÜ 102 üstün özellik göstermektedir. Küresel ısınmaya bağlı olarak iklimsel olayların değişikliğiyle hastalık ve zararlı etmenler göz önünde de bulundurulduğunda, Sivas ekolojik koşullarında erkencilik sağlanması düşünüldüğünde çiçeklenme gün sayısı ile fizyolojik olum gün sayısı ve bin tane ağırlığı açısından Gürbüz 2001 çeşidi ve SBTÜ 102 hattı uygun görülmektedir. Bitki boyu, ilk bakla yüksekliği, bitki başına bakla sayısı, biyolojik verim, tane verimi, kes verimi ve hasat indeksi istatistiki olarak önem arz etmediği görülmektedir. Her ne kadar çeşit ve çeşit adayı hatlar arasında tane verimi ve kes verimi açısından istatistiki olarak bir fark olmasa da GAP mavisi çeşidi ve SBTÜ 102 çeşit adayı hattın bin tane ağırlığı bakımından istatistiki olarak diğer çeşit veya çeşit adayı hatlara göre üstün olduğu tespit edilmiş olup, Sivas ekolojisinde GAP mavisi ve SBTÜ 102 genotiplerinin yetiştirilebileceği kanısına varılmıştır.

Çizelge 3. Mürdümük çeşitlerine ait ortalama değerler

Sönmez ve Türk (2022), 2020-2021 yetiştirme sezonunda Isparta ekolojik koşullarında bazı mürdümük genotiplerinin bazı agronomik özelliklerinin ve tohum veriminin belirlenmesi amacıyla, 120 adet genotipi ve 4 adet (İptaş, Gürbüz, Corea ve Karadağ) çeşidi bitki materyali olarak kullanmışlardır. Araştırma kapsamında bitkide bakla sayısı, bitki boyu, bakla eni, bakla boyu, 1000 tane ağırlığı, baklada tane sayısı, biyolojik ve tohum verimi incelenen özellikler bakımından genotipler arasında istatistiki olarak önemli anlamda farklılıklar olduğunu bildirmişlerdir. Araştırma sonuçlarına göre; genotip bitki boyları 14.48-76.80 cm, bakla boyu 2.10-4.10 cm, bitki bakla sayısı 2.81-62.00 adet, baklada tane sayısı 1.23-4.32 adet, bakla eni 0.71-1.40 cm, biyolojik verim 3.06-82.40 g/bitki, 1000 tane ağırlığı 41.69-238.00 g, tohum verimi ise 0.34-33.00 g/bitki arasında değişmiş ve Isparta ili toprak ve iklim koşullarında GP18, GP40, GP145 ve GP161 mürdümük genotiplerinin diğerine göre daha üstün olduğu tespit edilmiştir. Özdemir ve ark. (2022), 2014 ve 2015 yıllarında ilkbahar ekimlerinde bazı mürdümük genotiplerinin kes kalitelerinin belirlenmesi amacıyla 31 adet mürdümük genotipi kullanmışlardır. İki yıllık yapılan çalışmada incelenen tüm özellikler açısından genotipler arasında istatistiki olarak çok önemli düzeyde farklılıklar tespit edilmiştir. Tohum amacıyla hasat edilen mürdümük genotiplerinin keslerine ait ham kül oranı, ham protein oranı ve verimi, nötral deterjan lif (NDF), asit deterjan lif (ADF), kuru madde tüketimi (KMT) ve sindirilebilir kuru madde (SKM) oranları, nispi yem değeri (NYD), sindirilebilir enerji (SE) ve metabolik enerji (ME) değerleri sırasıyla %7.12-9.52, %4.71-7.36, 6.03-11.9 kg/da, %50.53-62.66, %39.73-47.42, %1.92-2.38, %51.96-57.95, 77.46-106.47, 2.49-2.75 Mcal/kg ve 2.05-2.26

Mcal/kg arasında deęişim göstermiştir. Eren ve Biflorus mürdümük genotiplerinin daha üstün özellik göstermiş olduęu tespit edilmiş olup, Elâzığ İli ve benzer ekolojik koşullarda kes kalitesi amacıyla yetiştiricilięinin yapılması önerilmiştir. Türkoęlu ve ark. (2021), Orta Anadolu ekolojik koşullarına adaptasyon kabiliyeti ve verim performansının belirlenmesi amacıyla 2018 yılında Kahramanmaraş (Elbistan) mürdümük (*Lathyrus sativus* L.) popülasyonunu Tarla bitkileri Merkez Araştırma Enstitüsünün Ankara-Gölbaşı-İkizce istasyonunda yürüttükleri çalışmada bitkinin morfolojik, fenolojik ve tarımsal özelliklerini incelemiştir. Bir bitkide incelenen morfolojik özelliklerden ana sap kalınlığı, sap sayısı, ana sap uzunluęu ve doęal bitki boyunu sırayla 1.43 mm, 2.66 adet, 33.86 cm ve 27.58 cm olarak bulmuşlardır. Tarımsal özelliklerden bitkideki bakla sayısı, bakladaki tohum sayısı, yeşil ot verimi, biyolojik verim, tane verimi, kes verimi, hasat indeksi sırayla 13.82 adet, 2.85 adet, 7.41 g/bitki, 12.01 g/bitki, 5.13 g/bitki, 6.54 g/bitki, %43.66 olarak tespit edilmiş olup, çalışma sonuçlarına göre Elbistan popülasyonlarının Orta Anadolu ekolojik koşullarına uyum sağladığı ve verim performansının da iyi olduğunu bildirilmiştir. Özdemir ve ark. (2020), Elâzığ ekolojik koşullarında 2014-2015 yıllarında yazlık ekimi yapılan mürdümük genotiplerinde biyolojik verim, tane verimi, dolu bakla sayısı, boş bakla sayısı, bakla boyu, bakla genişliği, bitkide tane sayısı, bitkide tane aęırlığı gibi agro-morfolojik özellikleri incelemiştir. İki yıllık çalışmada her iki yılda da biyolojik verim dışında incelenen dięer tüm özellikler bakımından genotipler arasında istatistiki anlamda önemli fark mevcuttur. Araştırma sonucunda genotiplerin tane verimi 75.10-117.72 kg/da, biyolojik verimi 188.72-271.18 kg/da, boş bakla sayısı 0.06-1 adet, dolu bakla sayısı 7.16-16.15 adet, bakla genişliği 0.83-1.23 cm, bakla boyu 2.78-3.45 cm, bitkide tane sayısı 16.73-45.08 adet ve bitkide tane aęırlığı 2.03-4.23 g arasındadır. Sonuçlara göre Elâzığ ili toprak ve iklim koşullarında tohum üretimi için “Hat-17” genotipinin dięerlerine göre verim bakımından üstün olduęu tespit edilmiştir. Özyazıcı ve Açıkbaş (2019), 2016-2017 yıllarında 22 yaygın mürdümük (*Lathyrus sativus* L.) genotipleri ve 2 adet tescilli çeşit kullanarak Siirt Üniversitesi Ziraat Fakültesi, Araştırma ve Uygulama Arazisinde yarı kurak iklimine sahip olan Güneydoęu Anadolu Bölgesi koşullarında yetiştirilebilmesi amacıyla bazı agronomik parametreleri ile tohum ve ot verimlerini belirlemiştir. Deneme parsellerin yarısı ot, dięer yarısı da tohum verimine ait özelliklerin belirlemek için ikiye ayrılmıştır. Tohum verim özellikleri kapsamında ana sap uzunluęu, doęal bitki boyu, kuru ot verimi, ana sap sayısı, bitkide bakla sayısı, yeşil ot verimi, tohum verimi, biyolojik verim, baklada tane sayısı, bin tane aęırlığı ve hasat indeksi verileri alınmıştır. Araştırma sonucuna göre, doęal bitki boyunun 38.35-44.87 cm, ana sap sayısının 3.20-4.70 adet/bitki, ana sap uzunluęunun 55.25-61.82 cm, kuru ot veriminin 331.1-448.4 kg/da, yeşil ot veriminin 1348.1-1890.4 kg/da, baklada tane

sayısının 2.0-3.1 adet, bitkide bakla sayısının 11.3-17.7 adet, bin tane ağırlığının 79.36-125.87 g, biyolojik verimin 444.8-707.5 kg/da, tohum veriminin 101.3-194.5 kg/da ve hasat indeksinin % 18.3-36.4 arasında değiştiğini tespit etmişler ve ot üretimi için ETH WIR-70 ile IFLS 257, tohum üretimi için ise Sel 1794 genotiplerinin Güneydoğu Anadolu Bölgesi koşullarına uygun olacağını bildirmişlerdir.

SONUÇ VE ÖNERİLER

Bu araştırmada mürdümük çeşidi olan GAP mavisi ve Gürbüz 2001'in, Sivas Bilim ve Teknoloji Üniversitesi kapsamında geliştirilen tescile sunulacak olan SBTÜ 101, SBTÜ 102 ve SBTÜ 103 hatlarının (çeşit adayı) agro-morfolojik özellikleri bakımından Sivas ekolojik koşullarına uyum sağlayabilecek çeşit veya çeşit adayı hatların tespit edilmesi amacıyla yapılmış çalışmada, incelenen genotipler içerisinde ümitvar olanlar bulunmaktadır. Sivas ekolojik koşullarında güneşlenme gün sayısı ve güneş ışığı geliş açısı düşüklüğüyle vejetasyon süresinin kısa olması nedeniyle erkenci çeşitlerin tercih edilme olasılığı artmaktadır. Küresel ısınmaya bağlı olarak iklimsel olayların değişikliğiyle hastalık ve zararlı etmenler göz önünde de bulundurulduğunda Sivas İli ve benzer ekolojik koşullarında erkencilik sağlanması düşünüldüğünde çiçeklenme gün sayısı ile fizyolojik olum gün sayısı ve bin tane ağırlığı açısından Gürbüz 2001 çeşidi ve SBTÜ 102 hattı ön plana çıkmaktadır. Çiçeklenme ve fizyolojik olum gün sayısı ve bin tane ağırlığı göz önüne alındığında SBTÜ 102 hattı üstün özellik göstermektedir. Bitki boyu, ilk bakla yüksekliği, bitki başına bakla sayısı, biyolojik verim, tane verimi, kes verimi ve hasat indeksi istatistiki olarak önem arz etmediği görülmektedir. Her ne kadar çeşit ve hatlar arasında tane verimi ve kes verimi açısından istatistiki olarak bir fark olmasa da GAP mavisi çeşidi ve SBTÜ 102 hattın bin tane ağırlığı bakımından istatistiki olarak diğer çeşit veya çeşit adayı hatlara göre üstün olduğu tespit edilmiş olup, Sivas ekolojisinde GAP mavisi ve SBTÜ 102'in yetiştirilebileceği kanısına varılmıştır. Verim ve verim özellikleri bakımından Gölyazı çeşidi Sivas ekolojik koşullarına uygun olduğu belirlenmiştir. Genotipler karşılaştırıldığında, Sivas ili iklim ve toprak koşullarında SBTÜ 102 hattı mürdümük genotipinin diğer genotiplere göre üstün olduğu belirlenmiştir. İslah materyali olarak diğer çalışmalarda da kullanılmasının uygun olduğu sonucuna varılmış ve bu açıdan da tohumluk için önemli ıslah materyalleri olabileceği düşünülmektedir. Böylece, Sivas İli ve benzer ekolojik koşullar için üretimi yaygın olmayan alanlarda mürdümük bitkisinin bölge tarım ve ekonomisine kazandırılmasıyla geniş alanlarda üretiminin yapılmasına katkı sağlanacağı düşünülmektedir. Yapılan çalışmalar kapsamında öne çıkan veya ümitvar söz konusu olan genotiplerin tarla deneme çalışmalarının sürdürülmesinin uygun olacağı ve bölge ekolojik koşullara uygun yeni çeşitlerin geliştirebileceği öngörülmektedir.

ÖZET

Alliaceae familyasına ait olan sarımsak (*Allium sativum* L.) ÷lkemizde ve dñnyada yetiřtiricilięi yapılan önemli bir sebze türüdür. Sarımsaęın besin deęeri aısından zengin, iřtah aıcı ve bir ok hastalıęa karřı koruyucu özellięi bulunmaktadır. Sarımsak yetiřtiricilięi bařı oluřturan diřlerle vejetatif olarak yapılmaktadır. Buna göre bu alıřmada, farklı genotiplerdeki sarımsakların sürgün ucu alınarak *in vitro* kořullar altında oęaltılması hedeflenmiřtir. alıřma Sivas Bilim ve Teknoloji Üniversitesi Tarım Bilimleri ve Teknoloji Fakóltesine ait bitki doku kùltürü laboratuvarında yürütölmüřtür. Arařtırma kapsamında ÷lkemizde yaygın olarak yetiřtiricilięi yapılan Tařköprü sarımsaęı ile Alata sarımsaęı, Kırklareli ve Kilis illerinden toplanan yerel sarımsaklar kullanılmıřtır. Denemede bařlangı ortamı olarak, MS (Murashige ve Skoog 1962) + 30 g Őeker + 7 g Agar, kardeřlendirme ařamasında, Baktemur ve ark. (2010)'na göre, MS + 30 g Őeker + 2 mg/l BAP + 0.5 mg/l IBA + 7 g Agar, köklendirme ařamasında MS + 30 g Őeker + 1 mg/l IBA + 7 g Agar ieren besin ortamları kullanılmıřtır. Arařtırma süresince enfeksiyon oranları (%), bařlangı ortamında geliřen bitki sayılarının oranı (%), kardeř sayıları (adet), kök sayıları (adet), köklenme oranları (%) ve kök uzunlukları (mm) belirlenmiřtir. Arařtırma sonuçlarına göre bařlangı ortamında en fazla geliřim Alata sarımsaęı (%95.00) ve Kırklareli'den toplanan (%94.00) sarımsaklardan elde edilmiřtir. Kök sayısı bakımından en fazla Kilis'den toplanan (8.00 adet) sarımsaklar ile Tařköprü sarımsaęından (6.40 adet) elde edilmiřtir.

Anahtar Kelimeler: *In vitro*, sürgün ucu, sarımsak

PROPAGATION OF GARLIC GENOTYPES GROWN IN TURKEY BY SHOOT TIP CULTURE

ABSTRACT

Garlic (*Allium sativum* L.), which belongs to the Alliaceae family, is an important vegetable species grown in our country and in the world. Garlic is rich in nutritional value, appetizing and has a protective feature against many diseases. Garlic cultivation is done by vegetative methods with the clove forming the head. Accordingly, the experiment was carried out in the form of shoot tip culture in different genotypes *in vitro*. The study was carried out in the Plant Tissue Culture Laboratory of Sivas Science and Technology University, Faculty of Agricultural Sciences and Technology. Within the scope of the research, Taşköprü garlic, which is widely grown in our country, and Alata garlic, local garlic collected from Kırklareli and Kilis provinces were used. MS (Murashige and Skoog 1962) + 30 g Sugar + 7 g Agar was used as the starting medium, shoot proliferation phase, Baktemur et al. According to (2010), nutrient media containing MS + 30 g Sugar + 2 mg/l BAP + 0.5 mg/l IBA + 7 g Agar, for rooting MS + 30 g Sugar + 1 mg/l IBA + 7 g Agar were used. During the research, infection rates (%), number of plants growing in the starting medium (%), number of siblings (number), root number (number), rooting rate (%) and root length (mm) were determined. According to the results of the research, the highest growth in the starting medium was obtained from the garlic of Alata (95.00%) and the garlic collected from Kırklareli (94.00%). In terms of root number, the highest number of garlics collected from Kilis (8.00 number) and Taşköprü garlic (6.40 number) were obtained.

Keywords: *In vitro*, shoot tip, garlic

Giriş

Sarımsak (*Allium sativum* L.), Alliaceae familyasına ait olup, Akdeniz bölgelerine yayıldığı Orta Asya kökenli (Tindal, 1986), dünyada ve ülkemizde yetiştiriciliği yapılan soğanlı bitkilerden birisidir. Sarımsak (*Allium sativum* L.), besleyici, antimikrobiyal ve antioksidan özellikleri nedeniyle eski çağlardan beri geleneksel tıpta kullanılan en önemli türlerinden birisidir (Hirata 2016; Reiter2017). Dünya genelinde taze ve kuru olarak sarımsak, iki şekilde üretilmektedir. Yeşil yapraklı, gövde ve baş yüzeyinin taze olması ve dişlerin tam olgunlaşmadığı dönemde hasat edilmesi sebebiyle taze sarımsak veya yeşil sarımsak olarak adlandırılmaktadır. Hasat sonrası doğal küreme yapılarak yaprak, gövde ve başların tamamen kurduğu ürünlere ise kuru sarımsak denir (Akan ve ark., 2019a; Anonymous, 2019). Sarımsak vejetatif olarak çoğaltılan bir türdür. Vejetatif yöntemlerden biri olan doku kültürü çalışmaları sarımsak bitkisinde son zamanlarda hız kazanmıştır. Doku kültürü, hücre, doku, organ veya bütün bitki gibi bitki parçalarından besin ortamında steril koşullar altında yeni doku, bitki veya bitki üretimleri olarak tanımlanabilir. Ayrıca doku kültürü bitkilerin çoğaltılması zor olan veya çözümü uzun zaman/emek gerektiren sorunları klasik tekniklerle çözmeyi amaçlamıştır. Bu çalışmada ülkemizde yaygın olarak yetiştiriciliği yapılan Taşköprü sarımsağı ile birlikte Alata sarımsağı, Kırklareli ve Kilis illerinden toplanan yerel sarımsakların *in vitro* koşullar altında sürgün ucu kültürü ile çoğaltılması hedeflenmiştir.

Materyal ve Metot

Materyal

Bu çalışma Sivas Bilim ve Teknoloji Üniversitesi Tarım Bilimleri ve Teknoloji Fakültesine ait bitki doku kültürü laboratuvarında yürütülmüştür. Araştırmada Taşköprü Sarımsağı, Alata Sarımsağı, Kırklareli ve Kilis illerinden toplanan yerel sarımsaklar materyal olarak kullanılmıştır. Deneme de kullanılan Alata Sarımsağı, Kırklareli ve Kilis illerinden toplanan yerel sarımsaklar Alata Bahçe Kültürleri Araştırma Enstitüsü Müdürlüğünden temin edilmiştir.

Metot

Deneme kapsamında başlangıç ortamı olarak MS (Murashige ve Skoog 1962) besin ortamı kullanılmıştır. Besin ortamında karbon kaynağı olarak sakkaroz, katılaştırmak için agar ilave edilmiştir. Ortam pH'ı 5.8 olacak şekilde ayarlanarak kaynatmaya bırakılmıştır. Kaynayan ortam belli oranlarda kavanozlara dökülerek, sterilizasyon amaçlı 121°C sıcaklıkta 1.2 atmosfer basınçta 15 dakika süre ile otoklavda bekletilmiştir. Otoklav sonrası ortamlar soğuyup katılaşması beklenilmiştir. Sarımsak dişleri %25' lik sodyum hipoklorit çözeltisinde 20 dakika bekletilmiştir. Süre sonunda steril saf su ile 4-5 defa çalkalanarak materyaller steril hale

getirilmiştir. Sterilize edilen sarımsak dişleri steril pens ve bistüri yardımı ile steril kabin içerisinde daha önce hazırlanan MS (Murashige ve Skoog 1962) besin ortamına dikilerek bitki büyütme odasında belirli ışık ve sıcaklıktaki $25 \pm 2^{\circ}\text{C}$ sıcaklık 3.000 lüks' lük ışık altında 16 saat aydınlık 8 saat karanlık periyotta bekletilmiştir.

Sürgünlerin gelişimi ile birlikte bitkiciklerin kardeşlenmesi için Baktemur ve ark. (2010)'na göre MS + 30 g Şeker 2 mg/l BAP + 0.5 mg/l IBA + 7 g Agar içeren besin ortamına aktarılmıştır. Kardeşlendirme ortamında bitkiler 3-4 hafta tutularak 2 alt kültür gerçekleştirilmiştir. Bitkiciklerin kardeşlenmesi ile birlikte MS + + 30 g Şeker 1 mg/l IBA + 7 g Agar içeren köklendirme ortamına alınmıştır.

Araştırmada; başlangıç ortamında gelişen bitki sayılarının oranı (%), enfeksiyon oranı (%), kardeş sayısı (adet), kök sayısı (adet), köklenme oranı (%), kök uzunluğu (mm) belirlenmiştir.

İstatistik Analiz

Çalışma 4 tekerrür ve her tekerrürde 5 kavanoz olacak şekilde, tesadüf parselleri deneme desenine göre kurulmuştur. Araştırmada elde edilen verilere varyans analizleri gerçekleştirilmiş ve önemli çıkan ortalamalar arasındaki farklılıklar LSD testi ile belirlenerek harflendirme yapılmıştır. İstatistik analizlerinde JMP 8.01 programı kullanılmıştır.

Bulgular ve Tartışma

Farklı sarımsak genotiplerinin başlangıç ortamında gelişimi Çizelge 1'de verilmiştir. Çizelgeye göre en fazla gelişim Alata sarımsağı (%95.00) ve Kırklareli (%94.00) ilinden toplanan sarımsakta gözlenirken, en az gelişim ise Taşköprü (%72.00) sarımsağında saptanmıştır.

Çizelge 1. Farklı sarımsak genotiplerinin başlangıç ortamı gelişen bitki sayısı (%)

Genotipler	Başlangıç Ortamı (%)
Taşköprü	72.00c
Alata	95.00a
Kırklareli	94.00a
Kilis	85.00b
LSD	1.88***

Çizelge 2'de farklı sarımsak genotiplerinin iki alt kültürdeki kardeş sayıları (adet) belirlenmiştir. Çalışma boyunca yapılan alt kültürler istatistiksel olarak önemli bulunmuştur. Birinci alt kültürde en fazla kardeş sayısı Alata (6.83 adet) sarımsağında elde edilmiştir. Bu genotipi Taşköprü (3.70 adet) sarımsağı izlemiştir. İkinci alt kültürde kardeşlenme sayıları incelendiğinde en fazla gelişim sırasıyla Alata (3.78 adet) ve Taşköprü (3.00 adet) sarımsağında görülmüştür. En az gelişim ise Kilis sarımsağında tespit edilmiştir.

Humberto ve ark. (2004), sarımsakta (*A. sativum*) 5 çeşitle sürgün ucu kültürü yöntemiyle farklı büyüme düzenleyicilerin kombinasyonlarını denedikleri çalışmada, kardeşlenme oranı en yüksek %89 ile NAA (0.1 mg/l) + kinetin (0.1 mg/l) bulunan besin ortamında elde edildiğini bildirmişlerdir. Baktemur ve ark. (2010) üç farklı sarımsak tipinin sürgün ucu kültürü ile çoğaltılmasını hedefledikleri çalışmada, en fazla kardeşlenmenin 14.10 bitki ile *Allium tuncelianum*'da olduğunu bunu 7.17 bitki ile Andırın 2 sarımsağının takip ettiğini bildirmiştir. Acay (2018), yaptığı tez çalışmasında Tunceli sarımsağı'nın (*Allium tuncelianum*) farklı hormon uygulamaları ile olgunlaşmamış embriyoların mikroçoğaltımı sonrası uygun hormon ve dozunu tespit ettikleri çalışmada, 2,4-D uygulamasında diğer uygulamalara göre yüksek düzeyde kallus oluşumunu saptamıştır. Kallus oranı en yüksek %20 ile 0.3 ve 1.2 mg/L dozlarından belirlemiştir. Olgunlaşmamış embriyodan direkt rejenerasyon ile soğan oluşumu BAP, BAP + 0.5 mg/L NAA, BAP + 300 mg/L Putresin, BAP + 300 mg/L Putresin + 0.5 mg/L NAA ortamlarında elde etmiştir. Karjadi ve Gunaeni (2021), yaptıkları çalışmada farklı sarımsak çeşitlerinin büyüme düzenleyicilerle takviyeli MS besin ortamı kullanarak meristem ve sürgün ucu yöntemiyle çoğaltmayı hedeflemişlerdir. Buna göre MS besin ortamına; Sukroz 30 gL⁻¹ + IAA 2 mgL⁻¹ + Kinetin 2 mgL⁻¹ + GA3 0.01 mgL⁻¹ + gelgro 2 gL⁻¹ ilave etmişlerdir. Sonuç olarak tüm çeşitlerde sürgün ucu ile çoğaltma meristem kültürüne göre daha yüksek olduğunu bildirmişlerdir.

Çizelge 2. Farklı sarımsak genotiplerinin iki alt kültürdeki kardeş sayıları (adet)

Genotipler	Birinci alt kültür (adet)	İkinci alt kültür (adet)
Taşköprü	3.70b	3.00ab
Alata	6.83a	3.78a
Kırklareli	1.55c	2.00bc
Kilis	1.80c	1.00c
LSD	1.18***	1.09***

Sürgün ucu kültürü ile farklı genotiplerin köklendirme ortamı sonrası gelişimi Çizelge 3'de belirtilmiştir. Kök sayısı, kök uzunluğu ve köklenme oranı elde edilen sonuçlara göre, istatistiksel olarak önemli bulunmuştur. Kök sayısı bakımından en fazla gelişim Kilis (8.00 adet) ve Taşköprü (6.40 adet) sarımsaklarından elde edilmiştir. Kök uzunluğu incelendiğinde istatistiksel olarak aynı grupta yer alan Taşköprü (39.36 mm) ve Kilis (33.30 mm) sarımsaklarından elde edilmiştir. Köklenme oranı bakımından ise en fazla Taşköprü (%87.80) sarımsağı en az köklenme Alata (%32.54) sarımsağında elde edilmiştir.

Ayed ve ark. (2018), Tunus yerel sarımsağının (*Allium sativum* L.) sürgün ucu kültürüyle *in vitro* çoğaltılmasını amaçladığı çalışmada, herhangi bir büyüme düzenleyicisi (M0) içermeyen MS ortamının, sürgün ucu başlangıcı (%96 eksplant gelişimi) ve bitkicik uzaması (56.26 mm) bakımından en uygun ortam olarak tesğit etmiştir.

Çizelge 3. Farklı sarımsak genotiplerinde köklendirme ortamı sonrası kök sayısı (adet), kök uzunluğu (mm) ve köklenme oranı (%) değerleri

Genotipler	Kök Sayısı (adet)	Kök Uzunluğu (mm)	Köklenme Oranı (%)
Taşköprü	6.40a	39.36a	87.80a
Alata	3.80b	21.42b	32.54d
Kırklareli	2.25b	23.18b	71.20b
Kilis	8.00a	33.30a	50.40c
LSD	2.53***	6.08***	1.54***

Çalışma kapsamında farklı sarımsak genotiplerinde enfeksiyon oranları belirlenmiş ölçülmüş (Çizelge 4) ve genotipler arasındaki farklar istatistiksel olarak önemli bulunmuştur. Başlangıç ortamında enfeksiyon oranı en fazla Taşköprü (%27.00) sarımsağında olurken, en az Alata (%5.00) sarımsağı ve Kırklareli (%5.00) ilinden toplanan sarımsaklardan elde edilmiş ve istatistiksel olarak aynı grupta yer aldığı belirlenmiştir. Birinci alt kültür sonucu en fazla enfeksiyon Kırklareli (%35.71) sarımsağı, ikinci alt kültürde ise en fazla Kilis (%51.00) ilinden toplanan sarımsaklarda görülmüştür. Alata sarımsağının birinci ve ikinci alt kültür aşamalarında ve Kırklareli sarımsağının ikinci alt kültür aşamasında enfeksiyon ile karşılaşılmasıdır.

Çizelge 4. Farklı sarımsak genotiplerinde başlangıç, 1 ve 2. Alt kültür sonrası enfeksiyon oranları (%)

Genotipler	Başlangıç Enfeksiyon Oranı (%)	Birinci Alt Kültür Enfeksiyon (%)	İkinci Alt Kültür Enfeksiyon (%)
Taşköprü	27.00a	21.43b	7.67b
Alata	5.00c	-	-
Kırklareli	5.00c	35.71a	-
Kilis	12.00b	13.64c	51.00a
LSD	1.88***	1.63***	1.33***

Sonuç

Araştırmada 4 farklı sarımsak genotipinin sürgün ucu kültürü ile çoğaltılması araştırılmıştır. Çalışma süresince en fazla kardeşlenme Alata (6.83 adet) ve Taşköprü (3.70 adet)

sarımsaklarından elde edilmiştir. Köklenme oranı en yüksek Taşköprü (%87.80) sarımsağı olarak tespit edilmiştir.

ÖZET

Şeker pancarı dünyada şeker, biyoetanol ve hayvan yemi ihtiyacının karşılandığı önemli bir tarla bitkisidir. Şeker pancarı üreticileri şeker pancarında kök verimi ve şeker içeriği yüksek çeşitleri tercih etmektedirler. Bu nedenle bitki ıslahçıları bu özellikleri iyileştirmeye çalışmakta ve bu doğrultuda ıslah yapmaktadırlar. Ancak bu iki özellik de genetik olarak karmaşık bir altyapıya sahiptir. Bu durum moleküler destekli ıslah çalışmalarını oldukça önemli bir noktaya getirmektedir. Moleküler markörler, bitki ıslahı çalışmalarında ıslah sürecine doğrudan etki etmektedirler. Bu durumda moleküler markörler, bitki tohum koleksiyonlarını karakterize etmede önemli rol oynamaktadırlar. Bu çalışma, Sivas Bilim ve Teknoloji Üniversitesi, Tarım Bilimleri ve Teknoloji Fakültesi bünyesinde, şeker pancarı ıslah çalışmalarında kullanılması amacıyla yürütülmüştür. Araştırmada, USDA (ABD Tarım Bakanlığı) gen bankasından temin edilen 20 farklı genotip ile 4 adet tescilli çeşit bitki materyali olarak kullanılmış ve 6 adet IPBS retro-transposon markörü ile taranmıştır. Çalışma sonucunda, 6 primerden toplamda 119 adet polimorfik bant elde edilmiş ve primer başına ortalama bant sayısı 19.83 adet olarak saptanmıştır. En az bant üreten primer 2382 olurken (14 adet), en fazla bant üreten primer ise 2385 (22 adet) olmuştur. Ortalama polimorfizm bilgi içeriği (PIC) değeri %69.98 olarak hesaplanmıştır. Tüm genotipler arasında en az genetik benzerlik Genotip 10 ile Genotip 18 arasında (%41.3), en fazla genetik benzerlik ise Genotip 22 ile Genotip 24 arasında (%80.8) saptanmıştır.

Anahtar kelimeler: Şeker pancarı, IPBS retro-transposon, moleküler markör

**IPBS-RETROTRANSPOSONS VARIATIONS: THE EVALUATION OF GENETIC
DIVERSITY AND POPULATION STRUCTURE IN INTERNATIONAL SUGAR
BEET GERMPLASM**

ABSTRACT

Sugar beet is an important field crop where sugar, bioethanol and animal feed needs are met in the world. Sugar beet producers prefer varieties with high root yield and sugar content in sugar beet. For this reason, plant breeders are trying to improve these characteristics and they are breeding in this direction. However, both of these features have a genetically complex background. This situation brings molecular assisted breeding studies to a very important point. Molecular markers directly affect the breeding process in plant breeding studies. In this case, molecular markers play an important role in characterizing plant seed collections. This study was carried out as a parent in sugar beet breeding studies at Sivas Science and Technology University, Faculty of Agricultural Sciences and Technology. In the study, 20 different genotypes and 4 registered cultivars obtained from the USDA (US Department of Agriculture) gene bank were used as plant material and were screened with 6 iPBS retro-transposon markers. As a result of the study, a total of 119 polymorphic bands were obtained from 6 primers and the average number of bands per primer was determined as 19.83. While the primer producing the least band was 2382 (14), the primer producing the most band was 2385 (22). The mean polymorphism information content (PIC) value was calculated as 89.39%. The least genetic similarity among all genotypes was found between Genotype 10 and Genotype 18 (41.3%), and the highest genetic similarity was found between Genotype 22 and Genotype 24 (80.8%).

Keywords: Sugar beet, IPBS retro-transposon, molecular marker

GİRİŞ

Şeker pancarı (*Beta vulgaris* L.), Amaranthaceae (eski adıyla Chenopodiaceae) familyası ve C₃ fotosentetik sisteme sahip Caryophyllales takımının üyeleri arasında yer alan iki yıllık önemli bir endüstri bitkisidir (Zicari vd., 2019). Bitki ilk yıl köklerinde sukroz biriktirmeye başlamakta, ikinci yılda ise vernalize olduktan sonra köklerinde depoladığı sukrozu kullanarak sapa kalkmakta ve tohum bağlamaktadır.

Şeker pancarı ekonomik açıdan önemli olan sukrozu vakuollerinde depolamaktadır. Bitkinin sukroz içeriği, 18. ve 19. yüzyıllarda yem pancarları arasından morfolojik ve fizyolojik özellikler dikkate alınarak yapılan seleksiyon çalışmaları sonucu, %6'lardan %18'lere kadar artırılmıştır (Fasahat vd., 2022). Yaklaşık 200 yıllık bir yetiştirme süresine sahip olan şeker pancarının şeker içeriği yanında üretici, tüketici ve şeker pancarı endüstrisi için önemli olan birçok özelliği klasik ıslah yöntemleri ile önemli ölçüde geliştirilmiştir. Ancak son yıllarda biyoteknolojik uygulamaların klasik ıslah programlarına dâhil edilmesi ile ıslah sürecini daha etkin bir hale getirmek amaçlanmaktadır. Markör destekli seleksiyon, biyoteknolojik uygulamalar arasında yer alan genotipler arasındaki vasyosyonu genotip x çevre interaksiyonundan etkilenmeksizin belirleyerek hızlı ve güvenilir bir şekilde belirlenmesini sağlayan önemli bir uygulamadır.

Bitki genotipleri arasındaki genetik varyasyonlar günümüzde en yaygın olarak DNA markörleri ile belirlenmektedir. DNA markörlerinden yararlanılarak, hangi lokusta olduğuna bakılmaksızın bitkiler arasında farklılık gösteren DNA lokuslarının oranı belirlenmektedir. Bu analizlerden elde edilen sonuçlar, bitki ıslah programına alınacak ebeveynlerin seçiminde kullanılmaktadır. Böylece, varyasyonu yüksek olan genotiplerin kullanımı ile ıslahçıların geliştirilmesi istenen özellikleri seçme ihtimalleri artmaktadır. Çalışmada bazı avantajları nedeni ile iPBS retrotranspozon markör sistemi kullanılmıştır. Bu avantajlar, retrotranspozonların bitki genomunun büyük bir kısmına yayılması sebebi ile genomun büyük bir bölümünün taransaması (Kalendar vd., 2010), tüm bitki türlerinde kullanılması yani evrensel bir nitelik taşıması, PCR ve standart agaroz jel elektroforez yöntemlerinin kullanılarak uygulanabilmesi şeklinde sıralanabilmektedir.

Şeker pancarı Türkiye'de tarım sektöründe ve tarıma dayalı sanayi üretiminde önemli bir rol oynamakta ve ülke için önemli katma değer sağlamaktadır. Ayrıca tarım sektörünün yanı sıra hayvancılık, gıda, kimya, ilaç, tarımsal makine ve taşımacılık sektörüne de ekonomik katkı sağlamaktadır (Eştürk, 2018). Bu sebepler ile yetiştiriciliğinin yapılacağı bölgenin ekolojisine uygun, verimi ve kalitesi yüksek hem üreticinin hem de tüketicinin ihtiyaçları dâhilinde yeni şeker pancarı çeşitlerinin geliştirilmesi önemli bir konudur. Bu çalışmada farklı orijine sahip

genotipler ve yetiştiriciliği yapılan ticari şeker pancarı çeşitlerinde genetik çeşitliliği belirleyerek yürütülecek şeker pancarı ıslah programlarında uygun ebeveynlerin seçilerek nihayetinde istenilen özelliğe sahip çeşitlerin geliştirilebilmesinde moleküler olarak kimliklendirilerek elde edilen verilerden yararlanmak hedeflenmiştir.

MATERYAL VE METOT

Bu çalışma, Sivas Bilim ve Teknoloji Üniversitesi, Tarım Bilimleri ve Teknoloji Fakültesi bünyesinde yürütülen şeker pancarı ıslahı kapsamında şeker pancarı genotipleri arasındaki genetik varyasyonu belirlemek amacıyla yürütülmüştür. Bitki materyali olarak USDA (ABD Tarım Bakanlığı) gen bankasından temin edilen 10 farklı ülke orijinli (Türkiye, Çin, İngiltere, Fransa, Amerika, İran, Karadağ, Hindistan, İrlanda, Şili) 20 adet genotip ile 4 adet tescilli şeker pancarı çeşidi (Serenada, Varias, Evelina, Jaguar) kullanılmış (Çizelge 1) ve 6 adet IPBS retrotransposon markörü ile taranmıştır (Çizelge 2). DNA izolasyonu için CTAB yöntemi (Doyle ve Doyle, 1987) ve Diversity Arrays Technology tarafından tavsiye edilen metodoloji (<https://www.diversityarrays.com/orderinstructions/plant-dnaextraction-protocol-for-dart/>) kullanılmıştır. Elde edilen DNA, ultra saf su (ddH₂O) ile seyreltilerek denatürasyonu engellemek için -20 °C’ de muhafaza edilmiştir. Genomik DNA’ nın konsantrasyon ve kalitesini kontrol etmek için Nanodrop ölçümleri yapılmıştır. Ayrıca DNA kalitesi %0,8’lik bir agaroz jel kullanılarak kontrol edilmiştir.

Şeker pancarında polimorfizm gösteren iPBS retrotranspozon primerlerini belirlemek için Kalendar vd. (2010) tarafından geliştirilen primerlerden 40 tanesi, rastgele seçilen 4 adet

genotipte taranmıştır. Tarama sonucunda, yüksek polimorfik bant üreten 6 adet iPBS retrotranspozon primeri çalışmada incelenen tüm şeker pancarı genotiplerinin moleküler karakterizasyonunu yapmak ve genetik çeşitliliğini belirlemek için kullanılmıştır.

Çizelge 2. Şeker pancarı genotipleri arasındaki varyasyonu belirlemede kullanılan primerler

Primer No	Sekans	Optimum Bağlanma Sıcaklığı (C°)
2245	GAGGTGGCTCTTATACCA	50.0
2402	TCTAAGCTCTTGATACCA	50.0
2246	ACTAGGCTCTGTATACCA	49.0
2382	TGTTGGCTTCCA	50.5
2385	CCATTGGGTCCA	51.2
2389	ACATCCTTCCCA	50.0

PCR reaksiyonu; 2 µL dNTP, 0.2 µL U Taq DNA polimeraz, 2 µL PCR tamponu, 2 µL MgCl₂, 3.2 µL primer (5mM), 3 µL DNA (5ng), 7.6 µL ultra saf su olacak şekilde toplam hacim 20 µL' dir.

Amplifikasyon döngüleri; 94 °C' de 3 dakika süreyle ilk denatürasyon; 94 °C' de 15 saniye süreyle denatürasyon; 49 °C - 51.2 °C arasında 1 dakika 30 döngü ve son uzama 72 °C' de 5 dakika süre olacak şekildedir. PCR ürünleri %2 agaroz jel kullanılarak 110 W' t'a 2.5 saat süreyle analiz edilmiş ve jel boyama için etidyum bromür kullanılmıştır. Jel görüntüsü için moleküler ağırlık belirteci olarak 3000 bp'lik bir lamda DNA ve Gel Doc XR sistemi kullanılmıştır.

Şekerpancarı genotiplerinin genetik benzerlikler ve alleller hakkında bilgi, NTSYSpc 2.21q (Rohlf, 2005) programında Dice indeks kullanılarak hesaplanmıştır. Jel görüntüsünde bantların varlığı 1 ile, yokluğu ise 0 ile ifade edilerek jel skorlaması yapılmıştır. 0 veya 1 olarak kodlanılan ikili (binary) veri matrisi UPGMA (Unweighted Pair Group Method Arithmetic Average) kullanılarak genotiplerin birbiriyle olan benzerliklerini gösteren dendogram oluşturulmuştur. Moleküler analizlerde kullanılan her bir DNA markörü için polimorfizm bilgi içerikleri Weir (1996)'e göre aşağıdaki formülle hesaplanmıştır.

$$PIC=1-\sum Pi^2$$

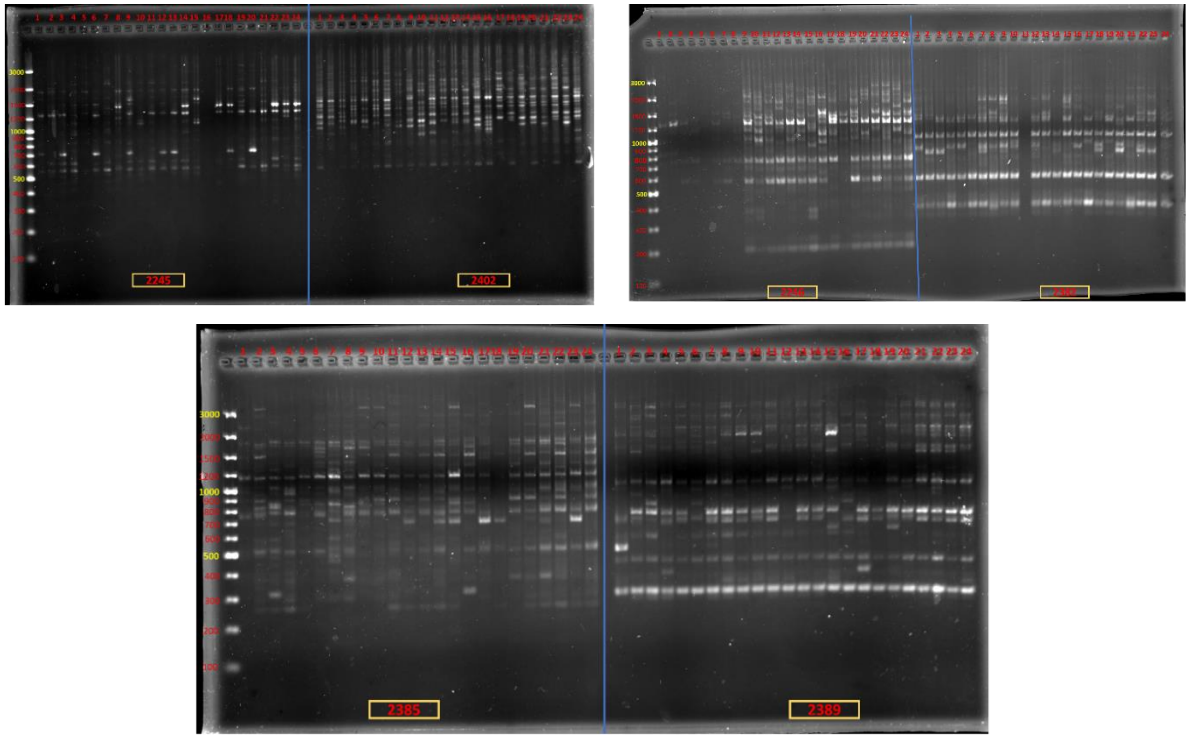

Pi; araştırmada çalışılan 24 şekerpancarı genotipinde i'inci allelin frekansıdır.

BULGULAR VE TARTIŞMA

Genotipler arasındaki genetik varyasyonun belirlenmesi ıslah çalışmaları için kritik öneme sahiptir. Şeker pancarı germplazmındaki genetik değişkenliği belirlemek için farklı moleküler

belirteçler kullanılmıştır (De Riek vd., 2001; Li vd., 2010; Simko vd., 2012; Izzatullayeva vd., 2014; Srivastava vd., 2017). iPBS-retrotranspozon DNA markörleri genetik çeşitliliğin değerlendirilmesinde bitkiler aleminde başarıyla kullanılmaktadır (Comertpay vd., 2016). iPBS-retrotranspozon belirteci birçok çalışmada genetik çeşitliliği belirlemek için kullanılmıştır (Barut vd., 2020; Öztürk, 2020; Yıldız vd., 2020; Nadeem, 2021).

Çalışmada kullanılan USDA (ABD Tarım Bakanlığı) gen bankasından temin edilen 10 farklı ülke orijinli (Türkiye, Çin, İngiltere, Fransa, Amerika, İran, Karadağ, Hindistan, İrlanda, Şili) 20 adet genotip ile 4 adet tescilli şeker pancarı çeşidi (Serenada, Varias, Evelina, Jaguar) arasındaki benzerlik ilişkisi, 6 adet IPBS retro-transposon markörü ile taranmıştır. IPBS retro-transposon markörü ile taranan 24 adet genotip jel görüntüleri Şekil 1’ de verilmiştir.

Şekil 1. Şeker pancarı genotiplerinde iPBS retrotranspozon primeri jel görüntüsü

Çalışmada iPBS retrotranspozon primeri 2245, 2402 ve 2246’da 21, 2382’de 14, 2385’de 22 ve 2389’da 20 olmak üzere toplam 119 adet polimorfik bant bulunmuştur. En fazla allel üreten primer 2385 (CCATTGGGTCCA) olurken en az allel polimorfizim üreten primer 2382 (TGTTGGCTTCCA)’dir. Primer başına düşen allel sayısı 19.83 iken genotip başına düşen allel sayısı ise 4.96’dır. TaskiAjdukovic vd. (2017), şeker pancarı genotiplerinde genetik çeşitliliği araştırdıkları bir çalışmada, SSR markörlerini kullanarak toplam 129 allel ve primer başına 3.2 allel tespit etmişlerdir. El-Mouhamady vd. (2021) ise ISSR markörleri ile şeker pancarında

genetik varyasyonu arařtırdıkları bir arařtırmada toplamda 169 allel belirlemiřlerdir. Benzer bir alıřmada ise ISSR markörlerini kullanarak toplam 178 allel elde edilmiřtir (Izzatullayeva vd., 2014). alıřmalarda farklı sayıda allel elde edilmesinin sebebi alıřmada kullanılan genotip sayıları kullanılan DNA markörü ve sayısı ile ilgili olabilmektedir.

izelge 3. IPBS retrotransposon primerlerine ait allel sayısı ve PIC deęerleri

Primer No	Allel Sayısı	PIC
2245	21	0.77
2402	21	0.64
2246	21	0.81
2382	14	0.56
2385	22	0.71
2389	20	0.72
Ortalama	19.83	0.70

Genotiplerin taranmasında kullanılan DNA markörlerinin allel sayıları ve polimorfizm bilgi ierięi (PIC) deęerleri izelge 3’de gösterilmiřtir. Arařtırmada ortalama polimorfizm bilgi ierięi (PIC) deęeri ortalama 0.70 olarak hesaplanmıřtır. En yüksek PIC deęeri 0.81 olarak hesaplanırken, en düşük PIC deęeri 0.56 olarak hesaplanmıřtır. Izzatullayeva vd. (2021), 42 adet řeker pancarı genotipinde benzer bir alıřma yapmıř, ISSR markörleri tarafından ortaya ıkarılan polimorfizm düzeyinin (%97.2) RAPD primerlerinden (%93) daha yüksek olduęunu belirtmiřlerdir. Yapılan farklı bir alıřmada 10 adet řeker pancarı genotipinde 6 adet ISSR markörü kullanılarak yüksek bir polimorfizm (%86.3) elde edildięi belirtilmiřtir (Srivastava vd., 2007). ISSR markörlerinin kullanılarak yapılan bir bařka alıřmada ise řeker pancarı genotipleri iin ortalama polimorfizm oranı %87.5 olarak belirtilmiřtir 20 adet genotip ile 4 adet eřit toplam 24 genotipin 6 adet IPBS retro-transposon DNA markörleri ile tarandıktan sonra elde edilen veriler UPGMA (Unweighed Pair Group Method of Arithmetic Averages) yöntemi kullanılarak Weir, (1996)’nın genetik mesafe matrisine göre filogenetik aęaç oluřturulmuřtur. (řekil 2).

Şekil 2. iPBS-retrotranspozonların şekerpancari genotiplerine göre oluşturulmuş filogenetik ağaç

Şekerpancari genetik varyasyon özelliği bakımından verilerin analizi sonucunda oluşan filogenetik ağaç ilk basamakta iki ana gruba ayrılmıştır. İkinci grup ise iki alt gruba (Alt Grup 1 ve Alt Grup 2) ayrılmıştır. Grup 1, ABD 2 genotipinden oluşurken, Grup 2, İngiltere 1, İran1 İngiltere 2, Çin 1, İran 2, Çin 2, Türkiye1, Türkiye 2, Hindistan 1, İrlanda 1, Hindistan 2, Fransa 1, Karadağ 2, Karadağ 1, Şili 2, Serenada, Evelina, Varias, Jaguar, Şili 1, Fransa 2, ABD 1, İrlanda 2 ve ABD 2 genotiplerinden oluşmuştur.

Genetik benzerlik, Weir 1996'ya göre hesaplanarak, genotipler arasındaki benzerlik katsayısı yüzde (%) olarak hesaplanmıştır. Tüm genotipler arasında en az genetik benzerlik %42.4 ile İrlanda 2-ABD 2 genotipleri arasında, en fazla genetik benzerlik ise % 81.2 ile Serenada ile Evelina (KWS çeşidi) genotipleri arasında gözlemlenmiştir. Tecilli çeşitler dışındaki USDA genotiplerinde ise en fazla %75,73 ile Hindistan 1 ve İrlanda 1 genotipleri arasında gözlemlenmiştir. İslah çalışmaları kapsamında genetik varyasyonu sağlayabilmek için genetik benzerliği birbirine en uzak olan İrlanda 2 ve ABD 2 genotipleri tercih edilmektedir.

SONUÇ VE ÖNERİLER

Germplasmadaki varyasyonun değerlendirilmesi, ıslah programlarında önemli bir adımdır çünkü daha yüksek çeşitliliğe ve belirli koşullar altında daha iyi performansa sahip çeşitlerin ve hatların seçilmesine yardımcı olabilir. Genetik varyasyon araştırmaları, özellikle melezleme çalışmalarında üzerinde durulan özelliğe uygun ebeynlerin seçilmesini kolaylaştırır. Ayrıca mevcut genetik temeli genişletmek için kullanılır. Moleküler belirteçler ıslah çalışmaları için önemli araçlar haline gelmiş ve ıslah çalışmalarının daha kısa sürede sonuçlandırılmasına

olanak sağlamıştır. Moleküler belirteçler çevresel koşullardan bağımsızdır ve DNA düzeyinde genetik varyasyonun doğrudan tahminini sağlar. Çalışmada genotipler arasındaki genetik çeşitliliğin belirlenmesi yürütülen şeker pancarı ıslah çalışmaları açısından önem arz etmektedir.

TEŞEKKÜR

Bu çalışma Sivas Bilim ve Teknoloji Üniversitesi Bilimsel Araştırma Projeleri Koordinatörlüğü 2023-GENL-TBT-0001 No' lu projesinden üretilmiştir.

ÖZET

Geniş bir adaptasyon yeteneğine sahip olan yem bezelyesi (*Pisum arvense* L.), baklagil familyası içerisinde yer alan tek yıllık bir türdür. Yem bezelyesinin azotlu gübre ihtiyacının fazla olmaması, azot bağlayarak toprağı zenginleştirmesi ve geniş bir uyum yeteneğine sahip olması sebebi ile önemli bir serin iklim yem bitkisidir. Ürün miktarı ve kalitesinin artırılması için bölge ekolojisine uygun çeşit adaptasyon çalışmalarının tamamlanması gerekmektedir. Bu çalışmada, Sivas ekolojik koşullarında bazı yem bezelyesi genotiplerinin morfolojik özellikleri yanında ot verimlerinin değerlendirilmesi amaçlanmıştır. Deneme tesadüf blokları deneme desenine göre 4 tekerrürlü olacak şekilde yürütülmüştür. Araştırmada yem bezelyesi genotiplerine ait çiçeklenme gün sayısı (gün) (ÇGS), ilk bakla bağlama gün sayısı (gün) (İBGS), doğal bitki boyu (cm) (DBB), ana sap uzunluğu (cm) (ASU), yeşil ot verimi (kg/da) (YOV), kuru ot verimi (kg/da) (KOV), dal sayısı (adet) (DS) ve bakla sayısı (adet) (BS) özellikleri incelenmiştir. Yem bezelyesi genotiplerinde yeşil ot verimi ve kuru ot verimi haricinde diğer bütün özellikler istatistiki olarak önemli bulunmuştur. Çalışma sonucunda yem bezelyesi genotiplerinin ortalama çiçeklenme gün sayısı 61.38 gün, ilk bakla bağlama gün sayısı 69.8 gün, doğal bitki boyu 68.4 cm, ana sap uzunluğu 77.7 cm, yeşil ot verimi 1020 kg/da, kuru ot verimi 254 kg/da, dal sayısı 3.6 adet ve bakla sayısı 9.2 adet olarak saptanmıştır. Yapılan korelasyon analizi sonucunda yeşil ot verimi ile kuru ot verimi ve dal sayısı arasında pozitif ve anlamlı bir korelasyon olduğu tespit edilmiştir.

Anahtar Kelimeler: Yem bitkileri, *Pisum arvense*, ot verimi, korelasyon

EVALUATION OF AGRO-MORPHOLOGICAL PERFORMANCE OF SOME
FORAGE PEA (*Pisum arvense* L.) GENOTYPES UNDER SIVAS ECOLOGICAL
CONDITIONS

ABSTRACT

Forage pea (*Pisum arvense* L.), which has a wide adaptation ability, is an annual species in the legume family. It is an important cool-climate fodder plant because it does not need much nitrogen fertilizer, enriches the soil by binding nitrogen, and has a wide adaptability. In order to increase the amount and quality of the product, it is necessary to complete the adaptation studies in accordance with the ecology of the region. In the study, it was aimed to evaluate the herbage yields as well as some morphological traits of some forage pea genotypes in Sivas ecological conditions. The experiment was carried out in a randomized complete block design with 4 replications. In the study, the number of flowering days (day) (NFD), number of days to first pod (piece) (NDFP), natural plant height (cm) (NPH), main stem length (cm) (MSL), green herbage yield (kg/da) (GHY), hay yield (kg/da) (HY), number of branches per plant (piece) (NBPP) and number of pods per plant (piece) (NPP) characteristics of forage pea genotypes were investigated. Except for green herbage yield and hay yield, all other characteristics were found to be statistically significant in forage pea genotypes. At the end of this study, the average number of flowering days is 61.38 (day), number of days to first pod 69.8 (day), natural plant height 68.4 (cm), main stem length is 77.7 (cm), green herbage yield is 1020 (kg/da), hay yield is 254 (kg/da), number of branches per plant 3.6 (piece) and number of pods per plant 9.2 (piece) were found in forage pea genotypes. As a result of the correlation analysis, it was determined that there was a positive and significant correlation between green herbage yield, dry grass yield and number of branches.

Keywords: Fodder crops, *Pisum arvense*, forage yield, correlation

GİRİŞ

Hayvansal ürünler, insanların dengeli ve düzenli beslenmesinde önemli bir role sahiptir. Hayvansal üretimin yeterli bir şekilde gerçekleştirilebilmesi için hayvancılığın temel girdisi olan kaba yemin, ekonomik bir şekilde üretilmesi ile mümkündür. Geviş getiren hayvanların (ruminantların) üretiminde yemleme girdileri maliyetlerinin yaklaşık %50 ila 70'ini oluşturmaktadırlar (Alçıçek ve Karaayvaz, 2002; Yılmaz vd., 2020). Kaliteli kaba yemler ekonomik şekilde temin edildiği sürece hayvancılık işletmelerinde verimliliği dolayısıyla kârlılığı artırmaktadır (Tan ve Menteşe, 2003). İşletmeler için ekonomik olmasının yanı sıra protein, selüloz, yağ, mineral ve vitamin içerikleri ile rumen gelişimini destekleyerek kaliteli hayvansal üretim sağlamaktadırlar (Alçıçek ve Karaayvaz, 2003; Gümüş, 2018). Yem bitkilerinde üretimin artırılabilmesi için kaliteli kaba yem üretimi açısından mevcut ekolojilere uyumlu potansiyeli yüksek bitkilerin tarımının yaygınlaştırılması gereklidir. Bu nedenle Sivas ekolojisine ve bölgenin ürün desenine uygun olarak planlanacak ekim nöbeti sistemlerinde tek yıllık yem bitkileri hayati role sahiptir.

Yem bezelyesi (*Pisum arvense* L.) otu ve tanesi için yetiştirilen değerli bir yem bitkisidir. Ülkemizin Kuzeydoğu Anadolu Bölgesinde yetiştiriciliği yapılan yem bezelyesi, serin ve nemli ortamları seven tek yıllık bir baklagil bitkisidir (Tekeli ve Ateş, 2003). Bitkinin en önemli özelliklerinden biri otunun %15-20 ham protein içermesidir (Tan vd., 2011; Seydoşoğlu, 2019). Bununla birlikte fosfor, kalsiyum, A ve D vitaminleri yönünden zengin bir içeriğe sahiptir (Tekeli ve Ateş, 2003). Tohumları ise önemli bir esansiyel amino asit olan lizin yönünden zengindir (Çeri ve Acar, 2019). Bitki özellikle hayvancılık sektörünün geliştiği bölgelerde kesif yem üretiminde kullanılmaktadır. Ancak yem bezelyesi önemli ölçüde kaba yem üretim potansiyeline de sahiptir. Bitkinin sindirilebilirliğinin %70-80 gibi yüksek bir değerde olması, ruminantların yemden yeterli enerjiyi karşılamasını sağlamaktadır (Fraser vd., 2001; Uzun vd., 2005). Yem bezelyesi ot ve tane üretiminin yanında kes, yeşil gübre, silaj ve otlatma amacıyla da üretilebilmektedir (Açıkgöz vd., 2005). Diğer taraftan, bitki hem tahıllarla karışık ekime uygun hem de ekim nöbetinde başarıyla kullanılabilir. Protein içeriğinin ve dolayısıyla sindirilebilirliğinin yüksek olması sebebiyle karışık ekimlerde kullanılması ile ruminantlar için üretilen kaba yemin daha dengeli olmasını sağlamaktadır. Baklagil bitkisi olması sebebiyle kendinden sonraki bitki için daha uygun bir ortam oluşturmakta ve hastalık, zararlı ve yabancı otların kontrolünde etkin rol alabilmektedir.

Bu çalışmada, Sivas ekolojik koşullarında bazı yem bezelyesi genotiplerinin morfolojik özellikleri ve ot verimlerinin değerlendirilmesi amaçlanmıştır.

MATERYAL VE METOT

Çalışma Sivas Bilim ve Teknoloji Üniversitesi, Tarım Bilimleri ve Teknoloji Fakültesi, Tarımsal Ar-Ge Merkezinde 2022 yılı yetiştirme sezonunda yürütülmüştür. Denemenin yürütüldüğü alanın denizden yüksekliği 1285 m olup, N39,720656-E36,917248 konumunda yer almaktadır. Denemenin yürütüldüğü 2022 yılı yetiştirme sezonuna ait iklim verileri Tablo 1’de verilmiştir. Sivas ilinde kışları soğuk ve karlı, yazları sıcak ve kurak geçen karasal bir iklim hakimdir. En düşük sıcaklık değeri (-4.2 °C) Nisan ayında, en yüksek sıcaklık değeri ise (23.7 °C) Ağustos ayında gözlemlenmiştir. Nisan-Ağustos ayları arasındaki toplam yağış (137.9 mm), uzun yıllar ortalamasının (133.5 mm) üzerinde seyretmiştir. Aylara göre ortalama bağıl nem değeri %44.5 ile %55.8 arasında değişmiş ve uzun dönem ortalamasının (%51.6) altında kalmıştır.

Çalışma alanının toprağı siltli killi tın bünyeye sahip olup, pH değeri 7.28, kireçli (%19.6), potasyum içeriği (K₂O) yüksek (93.59 kg/da), fosfor içeriği (P₂O₅) düşük (3.40 kg/da), tuzsuz (0.33 mmhos/cm) ve organik maddece (%1.7) düşüktür (Tablo 2). Deneme alanının drenajı iyi ve taban suyu problemi bulunmamaktadır.

Tablo 1. Sivas ilinin deneme yılı ve uzun yıllar ortalamasına ait bazı iklim verileri*

	Yağış (mm)		Sıcaklık (°C)		Nispi Nem (%)

Araştırmada, GAP Pembesi, Taşkent, Kirazlı, Töre, Gölyazı yem bezelyesi çeşitleri ve Sivas Bilim ve Teknoloji Üniversitesi ıslah çalışmalarında kullanılmak üzere geliştirilen SBTÜ 1002 hattı olmak üzere 6 adet yem bezelyesi genotipi kullanılmıştır. Yem bezelyesi ekimleri 25 Nisan tarihinde yapılmıştır. Ekimde her bir parsel 5 m uzunluğunda ve sıra arası 25 cm olacak şekilde 12 sıradan oluşmuştur. Deneme tesadüf blokları deneme desenine göre 4 tekerrürlü olacak şekilde kurulmuştur. Ekimle birlikte dekara 4 kg N (azot) ile 10 kg P₂O₅ (fosfor) olacak şekilde

gübreleme yapılmıştır. Yetiştirme süresi boyunca deneme alanında yabancı ot mücadelesi elle ve çapa ile yapılmıştır. Araştırmada, yem bezelyesi genotiplerine ait çiçeklenme gün sayısı (gün), ilk bakla bağlama gün sayısı (gün), doğal bitki boyu (cm), ana sap uzunluğu (cm), yeşil ot verimi (kg/da), kuru ot verimi (kg/da), dal sayısı (adet), bakla sayısı (adet) parametreleri incelenmiştir. Elde edilen sonuçlar SAS 9.3 istatistik paket programı kullanılarak varyans analizine tabi tutulmuştur (SAS, 2011).

BULGULAR VE TARTIŞMA

Yem bezelyesi genotiplerinde incelenen çiçeklenme gün sayısı (gün), ilk bakla bağlama gün sayısı (gün), doğal bitki boyu (cm), ana sap uzunluğu (cm), yeşil ot verimi (kg/da), kuru ot verimi (kg/da), dal sayısı (adet), bakla sayısı (adet) özelliklerine ait ortalama değerler Tablo 3'te verilmiştir.

ÇGS: Çiçeklenme gün sayısı, İBGS: İlk bakla bağlama gün sayısı, DBB: Doğal bitki boyu, ASU: Ana sap uzunluğu, YOV: Yeşil ot verimi, KOV: Kuru ot verimi, DS: Dal sayısı, BS: Bakla sayısı, ÖD: Önem düzeyi, NS: Önemli değil, *: 0.05 düzeyinde önemli, **: 0.01 düzeyinde önemli

Çalışmada incelenen yem bezelyesi çeşitlerinde en erken çiçeklenme gün sayısına sahip Töre çeşidi (59.75 gün) ve SBTÜ 1002 hattı (58.75 gün) olup, en geç çiçeklenen çeşit ise Gölyazı (63.5 gün) olmuştur. Sonuçlar SBTÜ 1002 hattının diğer çeşitlerden daha erkenci olduğunu göstermiştir. Özdemir ve Tamkoç (2019), yazlık ürün yetiştirme döneminde ikinci ürün olarak ekimi yapılan yem bezelyesi çeşitlerinde çiçeklenme gün sayılarının 51.6 gün ile 72.0 gün arasında değiştiğini belirtmiştir. Araştırmacılar ile bulgularımız benzerlik göstermiştir. Diyarbakır'da ana ürün koşullarında yapılan bir araştırmada ise çiçeklenme gün sayısı 157.8-175.5 gün (Seydoşoğlu, 2013) olarak bulunmuş olup, bulgularımızla farklılık göstermektedir. Çiçeklenme gün sayısı ekolojik koşullara, çalışmanın yürütüldüğü yıllara ve kullanılan çeşitlere göre değişim gösterebilmekte olup, olgunlaşma süresini belirleyerek üretim desenindeki yerinin belirlenebilmesi için önemli bir kriterdir (Tan ve Kadioğlu, 2018). Çalışmada kullanılan

genotipler arasında ilk bakla bağlama gün sayısı 67-72 gün arasında değişim göstermiştir. Geç çiçeklenme gösteren Gölyazı çeşidi daha geç olgunlaşarak en uzun bakla bağlama gün sayısına (72 gün) sahip olmuştur. Doğal bitki boyu bakımından değerlendirilme yapıldığında en kısa boylu yem bezelyesi çeşidi (67.45 cm) GAP Pembesi olarak belirlenmiş, ancak istatistiksel açıdan GAP Pembesi ve Taşkent çeşitleri Kirazlı çeşidi ile aynı grupta yer almıştır. En uzun doğal bitki boyuna sahip çeşit ise (77.70 cm) Gölyazı olmuştur. Yemlik olarak yetiştirilen bezelye için daha uzun boylu çeşitler tercih edilmektedir (Koivisto vd., 2003). Ekolojik koşullara iyi uyum sağlayan çeşitlerin daha fazla boylandığını belirten Tan ve Kadioğlu (2018), Taşkent ve Özkaynak çeşitlerinde bitki boyunu sırası ile 109.6 cm ve 128.4 cm olarak tespit etmişlerdir. Elde edilen sonuçlar bu çalışma ile farklılık sergilemiştir. Bu farklılığın bitkilerin yetiştirildiği dönem (kışlık-yazlık) veya çalışmada kullanılan çeşitlerin farklılığından ileri geldiği belirtilebilmektedir. Gölyazı çeşidi ana sap uzunluğu bakımından en yüksek değere (95.70 cm) sahip olurken, Kirazlı çeşidi en düşük değere (62.50 cm) sahip olmuştur. Ana sap uzunluğu ile doğal bitki boyu arasındaki bu farklılık tüm yem bezelyesi çeşitlerinde yaygın olarak özellikle bakla doldurma dönemiyle birlikte görülen yatmadan kaynaklanmaktadır (Sayar, 2021). Yaş ot verimi bakımından çeşitler arasında istatistiksel olarak bir fark bulunmamıştır. Ateş ve Tekeli (2017), Edirne ekolojik koşullarında yaptıkları bir çalışmada Töre yem bezelyesi çeşidinin ortalama yeşil ot veriminin 5215 kg/da olduğunu belirtmişlerdir. Bahsedilen farklılığın sebebi araştırmacıların sonbaharda ekim yapmasından kaynaklı olarak, bitkilerin daha uzun fotosentez süresine sahip olmaları ve daha az biyokütle üretmeleri ile ilgili olduğu belirtilebilmektedir. Konuk ve Tamkoç (2018), Konya’da yem bezelyesinin ekim zamanı ile ilgili yaptıkları bir çalışmada yazlık ekimlerdeki yaş ot veriminin 1453- 4444 kg/da arasında değiştiğini ifade etmişlerdir. Çalışmamız ile bahsedilen çalışma arasındaki farklılığın ekolojik koşullardan ileri geldiği belirtilebilmektedir. Kuru ot verimi bakımından çeşitler arasında istatistiksel açıdan bir fark bulunamamıştır. Yapılan benzer bir çalışmada araştırmacılar, yem bezelyesinde kuru ot verimini 204-398 kg/da olarak tespit etmişlerdir (Temel ve Yazıcı, 2021). Temel vd. (2021) ise yazlık olarak ekilen yem bezelyesi ile ilgili yaptıkları çalışmada kuru ot veriminin 288-372 kg/da arasında değiştiğini belirtmişlerdir. Çaçan vd (2019) ise kuru ot veriminin 129-232 kg/da arasında değiştiğini belirtmişlerdir. Çalışmada en fazla dal sayısına sahip çeşit Gölyazı (5 adet) olurken, en düşük dal sayısına sahip çeşit Taşkent (2.10 adet) olmuştur. Yapılan benzer çalışmalarda dal sayısının, Tan ve Kadioğlu (2018) 2-3.7 adet arasında; Ateş ve Tekeli (2017) 4-6 adet arasında; Temel ve Yazıcı (2021) 2.1-3 adet arasında değişim gösterdiğini bildirmişlerdir. Çeşitler arasında bakla sayısı 7.15-12.55 adet arasında değişmiş ve yüksek bakla sayısına SBTÜ 1002 hattı sahip olmuştur. Diğer çeşitler istatistiksel

açından aynı grupta yer almıştır. Bezelye ile yapılan çalışmalarda bitkideki bakla sayısının 7.6-18.5 adet arasında değiştiği belirtilmiştir (Uzun ve Açıkgöz, 1998; Uzun vd., 2005; Tamkoç, 2007; Sayar vd., 2009).

Tablo 4. Yem bezelyesi genotiplerinde incelenen özelliklere ait korelasyon katsayıları*

ÇGS: Çiçeklenme gün sayısı, İBGS: İlk bakla bağlama gün sayısı, DBB: Doğal bitki boyu, ASU: Ana sap uzunluğu, YOV: Yeşil ot verimi, KOV: Kuru ot verimi, DS: Dal sayısı, BS: Bakla sayısı, *: 0.05 düzeyinde önemli, **: 0.01 düzeyinde önemli

İncelenen özellikler arasındaki korelasyon katsayıları Tablo 4’te verilmiştir. Tablo 4’e göre çiçeklenme gün sayısı ile ilk bakla yüksekliği (0.8768) arasında %1 düzeyinde önemli ve anlamlı bir korelasyon saptanmıştır. Doğal bitki boyu ile çiçeklenme gün sayısı (0.6663) ve ilk bakla bağlama gün sayısı (0.5164) arasında pozitif ve %1 düzeyinde önemli bir ilişki belirlenmiştir. Ana sap uzunluğu ile doğal bitki boyu arasında (0.4515) arasında pozitif ve %5 düzeyinde önemli bir korelasyon bulunmuştur. Yaş ot verimi ile ana sap uzunluğu arasında (0.4708) pozitif ve önemli düzeyde (%5) ilişki belirlenmiştir. Bunun yanında kuru ot verimi ile ana sap uzunluğu arasında pozitif ve %5 düzeyinde, yaş ot verimi ile (0.9413) pozitif ve %1 düzeyinde önemli bir korelasyon bulunmuştur. Dal sayısı ile ana sap uzunluğu arasında (0.5180) %1 düzeyinde, kuru ot verimi ile (0.4545) %5 düzeyinde pozitif bir korelasyon belirlenmiştir. Bakla sayısı ile ilk bakla gün sayısı arasında ise (-0.7374) negatif ve önemli düzeyde (%1) ilişki belirlenmiştir.

SONUÇ VE ÖNERİLER

Elde edilen sonuçlar bir bütün olarak değerlendirildiğinde, yem bezelyesinin yaş veya kuru ot için üretiminde GAP Pembesi, Taşkent, Kirazlı, Töre Gölyazı çeşitlerinin kullanılabilirliği belirlenmiştir. Sivas Bilim ve Teknoloji Üniversitesi tarafından ıslah çalışmalarında kullanılmak üzere geliştirilen SBTÜ 1002 çeşit adayının ot verimi bakımından önemli bir potansiyel taşıdığı tespit edilmiştir.

ABSTRACT

This study was conducted to determine and compare the some microelement contents of alfalfa cultivars. A total of 16 alfalfa cultivars were used as plant material in the study. Fe, Cu, Zn and Cu contents of microelements were investigated in this 16 alfalfa cultivars. Microelement contents of alfalfa samples taken from the second harvest of the third year of experiment, and was determined with the help of an ICP-MS device. It was determined that the differences among the microelement contents of cultivars were statistically significant. The Fe contents of alfalfa cultivars varied between 208-307 mg kg⁻¹, Cu contents 26.3-38.1 mg kg⁻¹, Zn contents 24.9-50.1 mg kg⁻¹ and Mn contents 30.4-49.0 mg kg⁻¹. It has been determined that these contents are within the limit values that should be in plants. In addition, as a result of the correlation analysis, it was seen that there was a statistically significant and positive relationship between Mn and Cu and Mn and Zn.

Keywords: *Medicago sativa*, iron, copper, zinc, manganese

Introduction

Alfalfa is considered the most important forage plant globally due to its high adaptability, high yield and quality, and lots of cutting (Bhattarai et al., 2021). It is cultivated on 35 million hectares of land in many continents and more than 80 countries around the World (Radovic et al., 2009). Alfalfa cultivation is done in every region of Turkey and it is known as the queen of forage crops in Turkey because it is a very valuable forage plant (Tongel and Ayan, 2010).

One of the most important features of alfalfa is that it contains protein, energy, vitamin, and mineral substances for farm animals (Bouton, 2001). Among the mineral substances, those that are needed more than 100 ppm are called macro elements (Ca, Mg, P, K, Na, Cl, and S), those that are needed below this amount are called micro minerals (Fe, Cu, Zn, Mn, I, Co, Se, Cr, Fl, Pb, V, As, Mo, Li, Si, Sn, Ni, and Br) (Kutlu et al. 2005). These minerals are present in different amounts and ratios both in animal tissues and in all feeds.

The mineral content of alfalfa is generally satisfactory, and it has high yield and quality thanks to the presence of useful elements (Gjoroska et al., 2019). The mineral content of alfalfa may differ according to the cultivars (Tongel and Ayan, 2010). For this reason, this study was carried out to determine and compare the microelement contents of some alfalfa cultivars.

Material and Methods

Material

A total of 16 cultivars were used as material in the study. The seeds of the cultivars used in the research were obtained from some public and private institutions (Table 1).

Table 1. Alfalfa cultivars used in the study

1	Alsancak	9	Magnum-V
2	Basbag	10	Nimet
3	Bilensoy 80	11	Omerbey
4	Elci	12	Ozpinar
5	Gea	13	Savas
6	Gozlu-1	14	Sunter
7	Kayseri	15	Verdor
8	Magna-601	16	Verko

The research was carried out in irrigated conditions at Bingol University Agricultural Application and Research Center in 2014-2016. The Agricultural Application and Research Center is 15 km away from the city center of Bingol, and its area is 1091 m above sea level.

Climate data were obtained from the Bingol Provincial Meteorology Directorate. The average temperature of the province of Bingol for long years (1990-2015) was 12.3 °C, the precipitation

amount was 917.8 mm, and the humidity was 56.6%. July and August are the months when the temperature is the highest, the precipitation and humidity are the lowest. It has been recorded that most of the precipitation falls in the winter months and the lowest temperature values and the highest humidity values are obtained from these months.

According to the results of the analysis made in the Soil-Plant Analysis Laboratory of the Faculty of Agriculture of Bingol University; the soil structure of the experimental area was loamy (saturation 43.31%), pH slightly acidic (6.37), salt-free (0.0066%), organic matter content was low (1.26%), slightly calcareous (0.15%), potassium content was low (24.45 kg da⁻¹) and phosphorus rate was found to be medium (7.91 kg da⁻¹).

Method

The experiment was conducted in randomized blocks design with three replications between 2014 and 2016. In the experiments, the plot length was 5 m, the spacing between the rows was 20 cm and the sowing was done with the help of a hand marker, with 6 rows in each plot. Seeds of 3 kg per decare were used in sowing. Before sowing, 4 kg of nitrogen (N) and 10 kg of phosphorus (P₂O₅) fertilizer were given over the pure substance per decare (Basbag et al., 2009). Irrigation of the experiment was done by sprinkler irrigation. The harvest was done in the period when the plots were 10% flowering (Avcioglu et al., 2009), and 3 harvests were made in the first year and 4 in the other years in experiment.

Plant samples were taken in the third year of experiment and before the second cutting. 0.5 kg samples were taken from the green forage samples harvested from each plot and dried in the drying oven at 70 °C for 48 hours (Anonim, 2001). The dried forage samples were ground and made ready for analysis. Analyzes were made at Bingol University Central Laboratory Application and Research Center. In the study; Iron (Fe), Copper (Cu), Zinc (Zn), and Manganese (Mn) contents of microelements were determined in alfalfa cultivars. ICP-MS (Inductively Coupled Plasma-Mass Spectroscopy) device was used to determine the elemental contents of alfalfa cultivars. The findings obtained as a result of the study were applied to the analysis of variance by the randomized block design with three replications with the help of the JMP statistical package program. According to the results of the analysis of variance, statistically, significant means were compared with the Tukey test (JMP, 2018).

Results

Microelement contents of alfalfa cultivars

The contents of Fe, Cu, Zn, and Mn from microelements detected in alfalfa cultivars were given in Table 2. It was seen that the difference between the cultivars in terms of microelement contents was statistically significant. It was seen that the average Fe content was 250 mg kg⁻¹, Cu content was 32.3 mg kg⁻¹, Zn content was 37.4 mg kg⁻¹ and Mn content was 41.2 mg kg⁻¹ in alfalfa cultivars. The highest Fe content was obtained from Nimet, the highest Cu content was obtained from Omerbey, the highest Zn content was obtained from Magna-601 and the highest Mn content was obtained from Nimet cultivars. The lowest Fe content was obtained from Omerbey, the lowest Cu content was obtained from Kayseri, the lowest Zn content was obtained from Ozpinar and the lowest Mn content was obtained from Sunter (Table 2).

Table 2. Microelement contents of alfalfa cultivars

*: $P \leq 0.05$, **: $P \leq 0.01$, CV: Coefficient of variation

In alfalfa, Fe content should be between 20-400 mg kg⁻¹, Cu content should be between 5-50 mg kg⁻¹, Zn content should be between 10-100 mg kg⁻¹ and Mn content should be between 20-250 mg kg⁻¹ (Jones, 1967).

In alfalfa cultivars, Fe contents varied between 208-307 mg kg⁻¹, Cu content between 26.3-38.1 mg kg⁻¹, Zn contents between 24.9-50.1 mg kg⁻¹ and Mn contents between 30.4-49.0 mg kg⁻¹

(Table 2). It was seen that the Fe, Cu, Zn and Mn contents obtained in alfalfa cultivars were within the limit values determined by Jones (1967).

In the previous studies; it was reported the Fe content as 185.38-275.06 mg kg⁻¹, Cu content as 14.50-16.16 mg kg⁻¹, Zn content as 23.37-33.26 mg kg⁻¹ and Mn content as 43.55-54.27 mg kg⁻¹ in Serbia by Marković et al. (2009). It was reported the Fe content as 104.7 mg kg⁻¹, Cu content 4.3 mg kg⁻¹, Zn content as 13.5 mg kg⁻¹ and Mn content as 23.5 mg kg⁻¹ in Serbia by Zivkov-Balos et al. (2011). It was reported the Cu content as 3.9 mg kg⁻¹, Zn content as 11.8 mg kg⁻¹ and Mn content as 25.1 mg kg⁻¹ in Turkey by Cevheri et al.(2013). It was reported the Cu content as 8.86 ppm, Zn content as 19.21 ppm and Mn content as 27.11 ppm in Turkey by Gürsoy and Macit (2017). It was determined Fe content as 213-491 mg kg⁻¹, Cu content as 4-5 mg kg⁻¹, Zn content as 16-21 mg kg⁻¹ and Mn content as 20-26 mg kg⁻¹ in North Macedonia by Gjoroska et al. (2019).

It was seen that these results obtained in previous studies were within the limits given by Jones (1967) similar to the results of the study.

Correlation analysis between microelement contents of alfalfa cultivars

The correlation analysis between microelement contents of alfalfa cultivars was given in Table 3. It was seen that there was a positive and significant relationship between Mn and Cu, and between Mn and Zn in alfalfa cultivars. There is a negative relationship between Fe and Cu, Fe and Zn, and Zn and Cu, and a positive relationship between Fe and Mn. However, these relationships are statistically insignificant (Table 2). It was reported by other researchers that there was a significant relationship between Fe and Mn in some alfalfa cultivars and genotypes (Sengul and Haliloglu, 2008).

Table 3. Correlation analysis of microelement contents of cultivars

	Fe (mg kg ⁻¹)	Cu (mg kg ⁻¹)	Zn (mg kg ⁻¹)
Cu (mg kg ⁻¹)	-0.0844	---	---
Zn (mg kg ⁻¹)	-0.2605	-0.1473	---
Mn (mg kg ⁻¹)	0.0483	0.3201*	0.3207*

*: $P \leq 0.05$

Conclusion

In this study, the lowest and highest values of microelement contents were determined in different cultivars. it was determined that the Fe, Cu, Zn and Mn contents of alfalfa cultivars were within the limit values. In addition, as a result of the correlation analysis, it was seen that there was a statistically significant and positive relationship between Mn and Cu, and Mn and Zn.

ABSTRACT

This study was conducted to determine and compare the microelement contents of alfalfa populations cultivated in the Eastern Anatolian Region. A total of 29 alfalfa populations were used as plant material in the study. Fe, Cu, Zn and Cu contents were investigated in these 29 alfalfa populations. Microelement contents of alfalfa samples taken from the second harvest of the third year of experiment, and was determined with the help of an ICP-MS device. It was determined that the differences among the microelement contents of populations were statistically significant. The Fe contents of alfalfa populations varied between 209-621 mg kg⁻¹, Cu contents 12.3-29.2 mg kg⁻¹, Zn contents 17.6-80.4 mg kg⁻¹ and Mn contents 18.8-60.9 mg kg⁻¹. In the study, it was determined that the Fe content of some of the alfalfa populations was above the limit values and only Cu content of one population (Celtiksuyu-1) was below the limit value. It was determined that the Fe and Cu contents of the remaining populations and the Zn and Mn contents of all populations were within the limit values that should be in alfalfa.

Keywords: *Medicago sativa*, iron, copper, zinc, manganese

Introduction

In our country, there is a livestock population equivalent to 19 million animal units (AU) and the amount of roughage required for these animals is 86 million tons (Acar et al., 2020). The roughage needs of our current livestock population are met through pasture and meadow areas, and forage crops grown in field fields. Among the forage crops, alfalfa is one of the most commonly grown plants for agriculture both worldwide and in our country.

The highest quality roughage used in animal feeding is alfalfa, and it is grown in many countries around the world. In our country, alfalfa cultivation is mainly carried out with populations. Although there are improved varieties of alfalfa, their numbers are limited (Oten and Albayrak, 2014).

Local varieties (populations) that have emerged through conscious and natural selection over thousands of years and have a great genetic diversity are very valuable materials for breeding programs. With the development of commercial varieties that have high yields, populations are facing the danger of extinction. Therefore, it is necessary to conserve and develop local varieties (Ertus et al., 2012).

In our country and the world, many studies have been carried out to determine the forage yield and quality of alfalfa (Cacan et al. 2018, 2020; Karayilanli and Ayhan, 2016; Singh and Garg, 2015; Turan et al., 2017), as well as to determine the element contents (Engin and Mut, 2018; Ferreira et al., 2015; Gjoroska et al., 2019; Touil et al., 2009). However, the studies on the nutrient content of the alfalfa populations grown in our region is insufficient. For this reason, this study was conducted to determine and compare the microelement contents of some alfalfa populations cultivated in the Eastern Anatolian Region.

Material and Methods

Material

A total of 29 populations were used as material in the study. Seeds belonging to the populations were obtained from producers engaged in alfalfa cultivation in the villages and neighborhoods of Bingol and Mus provinces and their districts. The populations were named after the village or neighborhood where were taken. Populations taken from the same village but different farmers were numbered within themselves (Celtiksuyu, Mesedali, Saricicek, Sungu, and Senkoy) (Table 1).

The research was carried out in irrigated conditions at Bingol University, Vocational School of Genc, Agricultural Application and Research Area in 2016-2018. The Genc district is 20 km

away from the city center of Bingol, and its area is 986 m above sea level. The research area is located at the coordinates of 38° 44' 58.41" north latitude and 40° 32' 15.29" east longitude.

Climate data were obtained from the Bingol Provincial Meteorology Directorate. The average temperature of the province of Bingol for long years (1990-2015) was 12.3 °C, the precipitation amount was 917.8 mm, and the humidity was 56.6%. July and August are the months when the temperature is the highest, the precipitation and humidity are the lowest. It has been recorded that most of the precipitation falls in the winter months and the lowest temperature values and the highest humidity values are obtained from these months.

According to the results of the analysis made in the Soil-Plant Analysis Laboratory of the Faculty of Agriculture of Bingol University; the soil structure of the experimental area was sandy (59.5%), slightly alkaline (pH: 7.26), unsalted (0.34 mS cm⁻¹), organic matter content was medium (2.1%) and calcareous (3.48%), potassium (43.6 kg da⁻¹) and phosphorus contents were found to be low (5.1 kg da⁻¹).

Method

The experiment was conducted in randomized blocks design with three replications between 2016 and 2018. In the experiment, the plot length was 5 m, the spacing between the rows was 20 cm and the sowing was done with the help of a hand marker, with 6 rows in each plot. Seeds of 3 kg per decare were used in sowing. Before sowing, 4 kg of nitrogen (N) and 10 kg of phosphorus (P₂O₅) fertilizer were given over the pure substance per decare (Basbag et al., 2009). Irrigation of the experiment was done by sprinkler irrigation. The harvest was done in

the period when the plots were 10% flowering (Avcioglu et al., 2009), and 3 harvests were made in the first year and 4 in the other years in experiment.

Plant samples were taken in the third year of experiment and before the second cutting. 0.5 kg samples were taken from the green forage samples harvested from each plot and dried in the drying oven at 70 °C for 48 hours (Anonim, 2001). The dried forage samples were ground and made ready for analysis. Analyzes were made at Bingol University Central Laboratory Application and Research Center. In the study; Iron (Fe), Copper (Cu), Zinc (Zn), and Manganese (Mn) contents of microelements were determined in alfalfa populations. ICP-MS (Inductively Coupled Plasma-Mass Spectroscopy) device was used to determine the elemental contents of alfalfa populations.

The findings obtained as a result of the study were applied to the analysis of variance by the randomized block design with three replications with the help of the JMP statistical package program. According to the results of the analysis of variance, statistically, significant means were compared with the Tukey test (JMP, 2018).

Results

Microelement contents of alfalfa populations

The contents of Fe, Cu, Zn, and Mn from microelements detected in alfalfa populations were given in Table 2. It was seen that the difference between the populations in terms of microelement contents was statistically significant.

In terms of microelement contents, it was seen that Fe content was 377 mg kg⁻¹, Cu content was 21.4 mg kg⁻¹, Zn content was 35.7 mg kg⁻¹ and Mn content was 41.5 mg kg⁻¹ in alfalfa populations. The highest Fe content was obtained from Garip, the lowest Fe content was obtained from Cevirme and Saricicek-1, the highest Cu content was obtained from Arslanbeyli and Varto and the lowest Cu content was obtained from Sungu-3 populations. The highest Zn content was obtained from Ucdere, the lowest Zn content was obtained from Celtiksuyu-3, the highest Mn content was obtained from Kucuktekoren, and the lowest Mn content was obtained from Celtiksuyu-1 populations (Table 2).

In alfalfa, Fe content should be between 20-400 mg kg⁻¹, Cu content should be between 5-50 mg kg⁻¹, Zn content should be between 10-100 mg kg⁻¹ and Mn content should be between 20-250 mg kg⁻¹ (Jones, 1967).

In alfalfa populations, Fe contents varied between 209-621 mg kg⁻¹, Cu content between 12.3-29.2 mg kg⁻¹, Zn contents between 17.6-80.4 mg kg⁻¹ and Mn contents between 18.8-60.9 mg kg⁻¹ (Table 2). It was seen that the Cu and Zn contents obtained in alfalfa populations were within the limit values reported by Jones (1967). However, the Fe contents of Arslanbeyli,

International Conference on Global Practice of Multidisciplinary Scientific Studies-IV
Turkish Republic of Northern Cyprus, April 28-30, 2023

Celtiksuyu-2, Garip, Kadran, Kucuktekoren, Kultur Mesedali-1, Mesedali-2, Servi, Senkoy-2 and Ucdere populations were found to be above the limit values reported by Jones (1967), and the Cu content of Celtiksuyu-1 was below the limit values reported by Jones (1967).

In previous studies, the Fe content of alfalfa was reported as 60 ppm, Cu content as 48.5 ppm, Zn content as 40.0 ppm, and Mn content as 35.0 ppm by Yildirim et al. (2006). Juknevicus and Sabiene (2007) reported the Cu content as 5.10 mg kg⁻¹ and Zn content as 18.0 mg kg⁻¹ in alfalfa. Dugalic et al. (2008) reported the Fe content as 201.7 mg kg⁻¹, Zn content as 32.3 mg

kg⁻¹, and Mn content as 72.5 mg kg⁻¹ in alfalfa. Sosnowski et al. (2014) reported the Cu content as 6.39 mg kg⁻¹, Zn content as 23.7 mg kg⁻¹, and Mn content as 47.8 mg kg⁻¹ in alfalfa. Petkovic et al. (2019) reported the Fe content as 113-417 mg kg⁻¹, Cu content as 6.41-7.19 mg kg⁻¹, and Mn content as 26.17-54.65 mg kg⁻¹ in alfalfa. Lakic et al. (2020) reported the Fe content as 76-132 mg kg⁻¹, Cu content as 3.0-9.6 mg kg⁻¹, Zn content as 18-23 mg kg⁻¹, and Mn content as 16-22 mg kg⁻¹ in alfalfa. Samoraj et al. (2023) reported the Cu content as 11.1 mg kg⁻¹, Zn content as 29.4 mg kg⁻¹, and Mn content as 32.2 mg kg⁻¹ in alfalfa. It was observed that these results were in line with the limits given by Jones (1967), which is similar to the findings of the present study.

Correlation analysis between microelement contents of alfalfa populations

The correlation analysis between microelement contents of alfalfa populations was given in Table 3. It was seen that there was a positive and significant relationship between Cu and Fe, between Mn and Fe, and between Mn and Cu in alfalfa populations. There was a negative relationship between Zn and Fe, and a positive relationship between Zn and Cu, and between Mn and Zn. However, these relationships were statistically insignificant (Table 3).

	Fe (mg kg ⁻¹)	Cu (mg kg ⁻¹)	Zn (mg kg ⁻¹)
Cu (mg kg ⁻¹)	0.2581*		
Zn (mg kg ⁻¹)	-0.2025	0.0424	
Mn (mg kg ⁻¹)	0.5306**	0.4867**	0.0710

*: $P \leq 0.05$, **: $P \leq 0.01$

Conclusion

In the study, it was determined that the Fe content of some of the alfalfa populations was above the limit values and only Cu content of one population (Celtiksuyu-1) was below the limit value. It was determined that the Fe and Cu contents of the remaining populations and the Zn and Mn contents of all populations were within the limit values that should be in alfalfa. In addition, as a result of the correlation analysis, it was seen that there was a positive and significant relationship between Cu and Fe, between Mn and Fe, and between Mn and Cu in alfalfa populations.

Abstract

The Aronia genus (Rosaceae family, Maloideae subfamily) includes two species of native North American shrubs: *Aronia melanocarpa* (Michx.) Ell. (black chokeberry) and *Aronia arbutifolia* (L.) Pers. (red chokeberry). Its shrubs are around 1.8-3 meters, and the crown width is up to 0.9-1.5 meters. Aronia (*Aronia* spp.) species are mostly used as ornamental plants, but their berry fruits can also be consumed as fruit. Their fruits contain very rich tannins. Aronia, a significant berry fruit source of natural anthocyanin antioxidants, has shown a broad spectrum of biomedical functions. These contain cardiovascular disorders, advancing age-induced oxidative stress, inflammatory responses, and diverse degenerative diseases. Moreover, Aronia anthocyanins are demonstrated that improve neuronal and cognitive brain functions and ocular health. However, it is known that the protein content in its fruits is low. The fruits of *Aronia melanocarpa* have been traditionally used as folk medicine by Potawatomi Native Americans to cure many diseases such as colds. In the first half of the 20th century, cultivars of black chokeberry were introduced to the Soviet Union and other European countries, providing fruits used by the food industry. *Aronia* spp. is also used extensively in the production of fruit juice, food colorant, wine in Western Europe, Denmark, Poland, and Russia (especially Siberia). This study aims to give information about the botanical characteristics and distribution of the Aronia plant, its usage areas, and its benefits to human health.

Keywords: Aronia, Rosaceae, biochemical compounds, usage areas, human health

INTRODUCTION

Aronia (*Aronia* spp.) is a multi-stemmed, shrub-shaped and deciduous plant from the Rosaceae family native to Northeast America (Anonymous, 2017a). The fruits of *P. prunifolia* (purple aronia) are small, scarlet, purple-black, and slightly hairy berries. Red aronia bushes range in height from 1.8 to 3 meters, with crown widths ranging from 0.9 to 1.5 meters. These species typically grow upright. Although the majority of Aronia (*Aronia* spp.) species are grown for their decorative value, its berry fruits can also be eaten. Its fruits are high in tannins (Anonymous, 2017c). However, the protein level of the fruits is known to be poor. As a result, birds prefer not to consume its fruits. At the end of summer, the leaves on the branches turn true red, and the lowest sections of the leaves are hairy while the higher parts are vividly colored. The leaves are oval or elliptical in form, with serrated edges. In the New England region of America, they bloom in the first week of May. Its panicles of little white blooms measure 3.8 cm in diameter. It blooms for an extended period of time. In late September and early October, red ripe fruits emerge from its blossoms. Small fruits with a diameter of 0.64 cm are present in clusters. The fruits can keep their hardness, brightness, and attractiveness until December. There are usually two or three well-known species. One of them was grown in Europe. The most common type is *Sorbaronia mitschurinii* (Anonymous, 2017b). This species is related to *Aronia melanocarpa*. In recent years, regarding *Sorbaronia mitschurinii*, eminent pomologist Ivan Vladimirovich in Russia, has been working on crossbreeding. Black aronias are shorter than red aronias and peak economic efficiency at plant heights ranging from 1.2 to 4.8 meters. In terms of climate requirements, the aronia plant prefers sunny conditions. It can also grow in the shade, although the yield is reduced. They may grow in both moist and dry environments. They prefer acidic and neutral soils (pH 5.1-6.5), but can thrive in a variety of soils (pH 5-8.5). It is typically grown from seed. However, seedlings need to rest for 12-13 weeks. In the summer, semi-woody cuttings can be used to propagate it. Bastards can multiply when the plants are dormant at the end of fall and in winter (Anonymous, 2017g). Aronia (*Aronia* spp.) is also widely used in the production of fruit juice and wine and food colorant in Western Europe, Denmark, Poland, and Russia (particularly Siberia). The most common bred varieties are “Nero” and “Viking”. In Western Europe, the average yield per bush on mature plants ranges between 10 and 17 kg. Commercial aronia production first began in Russia in the 1940s. In the 1950s, this product began to be produced mostly in Poland, out of the Western European countries. According to 2010 statistics, Poland's production area expanded to 15,000 decares (90% of global aronia production) (Anonymous, 2017f).

The purpose of this research is to provide information on the botanical characteristics and distribution, usage areas, importance and benefits of cultivation, and benefits to human health of the aronia plant, which is not widely known in our country but has high polyphenol and antioxidant properties in terms of fruit and leaf characteristics.

Studies on the benefits of aronia for human health, usage areas, physical and biochemical components

The aronia plant's fruits and leaves are both beneficial to human health. Anthocyanins, flavonoids, and antioxidants were shown to be 10 times greater in aronia juice than in the same grape (*Vaccinium oxycoccos*) (Anonymous, 2017e). In a study conducted in Ukraine, Korenet et al. (2017) added aronia to wheat flour. The use of aronia in wheat dough products as a source of vitamins, minerals, pectin components, and phenolic compounds has been shown to reduce sugars, organic acids, and some other chemicals. In order to investigate the effect of adding aronia to wheat dough, an algorithm including theoretical analysis and physico-chemical experiments was developed and powdered aronia was added to wheat dough. Aronia additions to wheat flour were found to have amylolytic and proteolytic effects on wheat flour, as well as the ability to generate sugar. The gathered data was statistically evaluated using a computer tool called MS Excel 97 2003. It was determined that the addition of aronia powder to wheat flour prevented the swelling of gluten proteins by reducing the gluten content in wheat flour. They stated that it allowed them to make dough faster and to preserve it for a long period before cooking. They reported that using aronia ingredients in dough technology not only boosted nutritional contents, but also improved dough quality.

Many studies have been conducted on the phenolic components, antioxidant content, and health benefits of aronia. In one study, they investigated the effect of climatic conditions on the phenolic compounds and antioxidant capacity of *Aronia melanocarpa* fruit juice over three years and determined that the total phenolic and total flavonoid content ranges ranged from 8834 to 11093 mg / L and 6993 to 9710 mg / L, respectively. They reported that this alteration was caused by erratic precipitation and temperature fluctuations. In their study, the highest anthocyanin and phenolic content was discovered in fruits gathered in 2012. They stated that favorable weather conditions (temperature and number of hours of direct sunshine) was the possible reason behind this. As stated above, aronia juice, indeed, contains a lot of antioxidants (12.9-14.6 mmol/L; 128-167 mmol/L). Therefore, according to this study, it is concluded that flavonoid and non-flavonoid components formed the antioxidant activity, and aronia juice could be a beneficial dietary source in human nutrition (Toli et al., 2017).

In another study conducted by Tolić et al., (2015), the quality, phenolic compounds and antioxidant contents of different products of the aronia plant (powder, dried fruit, juice, tea and capsule) was investigated. They used the spectroscopic method (Folin-Ciocalteu and different methods in pH) to determine the properties of phenolic compounds, and DPPH and FRAP methods to determine the antioxidant activity of aronia. According to the findings of the study, there are 3002 to 6639 mg of phenolic compounds in each liter of fruit juice and 1494 to 5292 mg in 100 grams of dried fruit.

In the clinical study designed to evaluate the effects of its polyphenols on platelet function, it was aimed to develop a formulation for the use of aronia juice as a placebo. Three formulations with the same nutritional composition as Aronia (*Aronia* spp.) fruit juice were prepared by mixing with various nutrients, artificial colors, flavors and water. Six food panel experts assessed the resemblance of aronia juice and other formulations in terms of taste, color, odor, and texture. The final 4-week placebo study tested for effects on platelet function, biochemical and anthropometric parameters. They found no alterations in platelet functioning or other cardiovascular systems. As a result, they discovered that aronia juice can be used as a food supplement with no adverse effects in people (Kardum et al., 2017).

In addition, an aronia orchard was established in 1997 at the North Willamette Research Center in Aurora, Oregon, using rooted *Aronia melanocarpa* cuttings. As a result of the studies, 'Albigowa', 'Darbrowice', 'Egerta', 'Kutno', 'Nero', and 'Nowa Wies' varieties were bred. All varieties were planted in 1998, however due to damage caused by birds, no fruit was collected the first year. The net was then placed around the area to manage bird damage (1999-2001), and in 1999, 4.4 to 12.4 kg/plant crop per plant was harvested. The highest yield was obtained from the Nero variety with 12.4 kg. In 2001, the highest yield was obtained from Kutno variety with 22.1 kg/plant. Fruit weights ranged between 2.7 g and 2.8 g in 2001, according to measurements. The amount of water-soluble dry matter in all cultivars was found to range between 15.8% and 18.3%. It was mentioned that berry antioxidant concentration ranges between 440 and 574 mg/100 g (Strik et al (2002)).

Likewise, in a study conducted in Poland, Ochmian et al. (2012) studied fruit quality and several physical aspects of Aronia (*Aronia melanocarpa*) cultivars such as Nero, Polish, Galicjanka, Viking, and Hugin. In fruit samples, the lowest fruit weight (32 g) and the least fruit juice (73.6%) were obtained from Hugin variety. However, when compared to other types, it has the maximum amount of water-soluble solids (18.7°Bx), titratable acidity (1.05 g), polyphenols (2340 mg), particularly cyanidin 3-galactoside, as well as nitrate (98.5 mg) and nitrite (1.87

mg). In terms of color features, exterior skin color, and inside color, it has been discovered that the Hugin variety is lighter in color than other fruit types. According to them, the largest fruited variety was Galicjanka (100 fruit weight 111.7 g), whereas individual component content was lowest in fruits of the 'Nero' and 'Viking' cultivars when compared to the other cultivars.

Lee et al. (2014) used liquid chromatography to investigate the distribution ratios of polyphenol compounds and antioxidants in *Aronia melanocarpa* species in a study they conducted in South Korea. In the same study, they used 70% methanol to extract aronia (*Aronia melanocarpa*) leaves that were fresh, mature, and aged. The polyphenols in the leaves were analyzed using liquid chromatography (HPLC-MS/MS) and the results were reported. Among the 12 components in the leaves of Aronia (*Aronia* spp.), polyphenol components such as 5 flavonoids, 3 Apigenin 7, 4'-di-glucoside, 4 quercetin dirhamnosylehexoside, and 10-12 kaempferol coumaroylglycoside were detected. Each polyphenol component was confirmed by comparing it to the same group's reference polyphenol standards. The samples were taken at three different phases of the Aronia (*Aronia* spp.) plant's leaves. According to the antioxidant capacity measurements, it was determined that fresh leaves had the highest antioxidant capacity as compared to mature and old leaves. As a result, they reported that the antioxidant and polyphenol levels in tea produced from fresh aronia leaves will be higher.

In a study conducted in Poland, Borowska and Brzóska (2016) showed that the fruit of *Aronia melanocarpa* contains several compounds that are beneficial to human health. They stated that these substances contain polyphenols, anti-oxidative, anti-inflammatory, antiviral, anti-cancer, antiatherosclerotic, hypotensive, antiplatelet and antidiabetic properties. Thus, they reported that the eating of aronia grapes is critical for the continuation of human health. According to researchers, homemade pharmaceuticals containing harmful compounds for diseases may cause major health problems in the future, even if they leave a very little amount of residue in the human body for therapeutic purposes. Therefore, the fruits of *A. melanocarpa* can play an important role in this regard. So far, scientists, nutritionists and health practitioners have also stated that aronia products play an active role in the prevention and treatment of non-communicable diseases; on the other hand, they have determined that xenobiotic-containing drugs have negative effects on the human body.

Croatian cuisine rarely uses the aronia plant (*Aronia melanocarpa*), although its berry fruits have been shown to possess high levels of polyphenolic chemicals and antioxidant activity. The quality, phenolic content, and antioxidant power of various Aronia products (juices, powders, fruit teas, capsules, and dried fruits) were compared in a study. According to those researchers,

the antioxidant activity and phenolic content of the finished products that are consumed by customers may be affected by the processing method used to produce the product. Spectroscopic techniques (Folin-Ciocalteu and pH different methods) were used in this study to characterize and analyze phenolic chemicals. Utilizing the 2,2-diphenyl-2-picrylhydrazyl (DPPH) and ferric reducing antioxidant power (FRAP) methods, the antioxidant activity of aronia products was evaluated. It has been discovered that aronia products have high phenol contents (3002–6639 mg/L and 1494–5292 mg/100 g of dry matter, respectively), but low anthocyanin contents (150–1228 mg/L and 141–2468 mg/100 g, respectively). It has been reported that high antioxidant capacity can be found in the juices and other chokeberry products under examination (12.09 to 40.19 mmol per L or 58.49 to 191.31 mmol per 100 g of dry matter, respectively). According to reports, consumers choose phenolic- and antioxidant-rich capsules and powders over other aronia products. In conclusion, it was emphasized that the products of the aronia plant have more protective properties than curing some diseases. The results of the experiments showed that *A. melanocarpa*'s leaves and products, in addition to its fruit, may be useful in preventing and treating the toxic impact of some xenobiotics on humans; and added that more thorough research on the topic should be done for more understandable findings (Toli et al. 2015).

In another study carried out in Korea, Thi and Hwang (2014) assessed the bioactive elements and antioxidant properties of aronia leaves by obtaining samples at various stages of maturation (leaves at about 2 months and 4 months, respectively). Researchers have determined that fresh leaves contain more polyphenols and flavonoids than old leaves. HPLC tested three phenolic substances (chlorogenic acid, p-pumaric acid, and rutin). The 2,2-di-phenyl-1-picrylhydrazyl (DPPH), 2,2'-azino-bis(3-ethylbenzothiazoline-6-sulphonic acid) (ABTS), and superoxide anion radical scavenging assays were used to assess antioxidant activity. As a result, it was mentioned that depending on the concentration (0-100 g/mL), aronia leaf extracts had a greater reducing power. In comparison to distilled water extract, the 80% ethanol extract has higher antioxidant activity. They stated that thanks to their high concentration, phenolic chemicals are known to have antioxidant properties. They concluded that fresh aronia leaves have a higher concentration of bioactive substances and polyphenols and may also be better suited for extracting their antioxidant content.

Žlabur, et al., (2017) conducted a study in Croatia to develop a new functional food product. The purpose of this study is to determine the feasibility of using aronia powder as a final product to increase the nutritional value of apple juice. They added aronia powder to apple juice by

ultrasound extraction method and analyzed the content of bioactive compounds, nutritional composition and antioxidant potential of aronia powder. It was discovered that the antioxidant capacity was higher in the juice samples with aronia powder regardless of the extraction technique. At the same time, the researchers reported that the content of all bioactive compounds increased significantly as a result of the analysis of apple juice samples treated with high-intensity ultrasound and containing aronia powder. They also stated that high-intensity ultrasonic applications dramatically shortened extraction time of plant material. In conclusion, they determined that there was a positive correlation between vitamin C concentration, total phenols, flavonoids and anthocyanin content and antioxidant capacity in juice samples with aronia powder applied through high-intensity ultrasound.

CONCLUSION AND RECOMMENDATIONS

The aronia plant's popularity has grown in recent years as a result of increased media coverage and scientific research. The purpose of this study was to provide information about the botanical characteristics and distribution, usage areas, importance and benefits of cultivation, and benefits to human health of the aronia plant, which is not widely known in our country although having high polyphenol and antioxidant properties in terms of fruit and leaf characteristics. The fact that the aronia plant includes a high concentration of phenolic compounds, that its antioxidant activity is high, that fresh aronia leaves have more bioactive components, and that it is rich in polyphenols improve its popularity as a diet fruit among health-conscious customers. Furthermore, growers prefer it as an alternative berry fruit because it is less picky in terms of temperature and soil need than other berry fruits. As a result of this review, we feel that this information concerning aronia will shed light on future investigations.

ABSTRACT

Rubus idaeus L. (raspberry) is a plant belonging to the genus *Rubus* from the Rosoideae subfamily of the Rosaceae (Rosaceae) family. Raspberry (*Rubus idaeus* L.) has been cultivated in many parts of the world for hundreds of years. Turkey has an extremely suitable location and ecology for raspberry cultivation, as it is the homeland of raspberries. Raspberry production increases the importance of raspberry production due to its wide consumption range and easy cultivation. Raspberry seedlings are easy to produce and cost-effective. There are many varieties with different growing requirements and fruiting periods (summer and autumn raspberries). Raspberries, which are in the group of berry fruits, have a very special place in the food industry as well as fresh consumption with their unique appealing color, taste and aroma, structure and smell. Raspberries are evaluated both as fresh consumption and economically in the food industry. It is one of the most popular fruits of the fruit juice and beverage industry. It is consumed intensely in canning, deep-freezing, pastry and confectionery areas, jam, marmalade and ice cream, etc. In addition, raspberry is a dietary fruit and is very beneficial for human health due to the pigments, phenols, flavones, flavonoids, vitamins and fibers it contains. The aim of this study is to give information about the botanical characteristics and distribution of the raspberry plant, its usage areas and its benefits to human health.

Keywords: Raspberry, biochemical compounds, utilization, human health

INTRODUCTION

Turkey has a significant potential for raspberry production thanks to its status as the raspberry's homeland as well as its ecological superiority. In Turkey, berry has recently become one of the fruit species that are continually in demand in domestic and foreign trade and can find consumers at high prices. Furthermore, raspberry cultivation is gaining popularity among both producers and consumers due to the health benefits of berry fruits. As a result, small family companies or intermediate farmers generate significant economic benefit by producing raspberries. Raspberries have a significant role since they regularly bear fruit year after year and are easy to grow; they can be used as an industrial product such as jam, marmalade, beverage, ice cream, frozen food, pastry, and canned food production; and they can be sold fresh in small garden enterprises (Pehlivan ve Güleriyüz, 2004). The raspberry (*Rubus idaeus* L.) belongs to the Rosaceae family's Rubus genus. The genus Rubus is divided into two subgenera: Idaeobatus and Eubatus, and it contains a large number of highly diverse species. Raspberry is extensively grown around the world, particularly in Turkey, where the Black Sea region is located inside the limits of the raspberry's motherland. It grows naturally in the north of Turkey, along a belt running west to east, at altitudes of 1000 m or higher, in areas with high relative humidity (Jennings 1988; Polat ve Göçmen 2008). It is a berry plant that produces red, tasty fruits in the summer and autumn. It is also high in phenols, flavones, flavonoids, vitamins, and antioxidants (Kähkönen ve ark., 1999; Halvorsen ve ark., 2001, Pehlivan ve Güleriyüz, 2004; Onur, 2006; Eydurhan ve ark., 2006). Due to its superior qualities, such as being simple to produce, affordable, requiring little expertise in rootstock and other technical matters, easy pruning and finishing, beginning to bear fruit soon after planting, and fruiting consistently every year; raspberries are preferred by producers. Its roots are fringe-rooted, numerous, and tight and thin. Under ideal soil root conditions, it can reach a depth of 1-1.5 m. Although its roots are perennial, its stems are only two years old and renew every year. This feature distinguishes it from other fruits. On the other hand, annual shoots are those that have survived one winter (Ağaoğlu ve Gerçekçioğlu, 2013). Being in the form of a bush facilitates the harvesting process. Since the harvest takes 4-6 weeks, labor requirements are lower than for other berry fruits. In general, it is successfully grown in places with plenty of sun, sheltered from the wind and sufficient soil moisture (Atila 2002, Göktaş 2011, Çalışkan 2019, Akkurt 2021). The cultivation of raspberries has spread throughout Turkey. Despite the fact that the Marmara Region has advanced to a significant level of cultivation, "covered raspberry orchards" can still be found across the region. The Marmara Region, particularly Bursa Province, is the leading producer of raspberries, accounting for 98% of total production. The country's output rises in parallel with

the rise in the Bursa. Increased production in suitable regions is required to meet domestic and foreign market demand, particularly in Bursa province. The purpose of this research is to provide information by thoroughly researching the herbal qualities, biochemical contents, and human health advantages of raspberry, one of the berry fruits with high medical value and increasing market value.

RASPBERRY PRODUCTION AND POTENTIAL IN TURKEY

Raspberry varieties are classified based on their fruit color and annual output. Raspberries are classified into three types. These are; a) *R. idaeus var. vulgatus* and *var. strigosus*; red and yellow colored type, b) *R. occidentalis*; black colored type, c) *R. neglectus*; purple colored type. Red raspberries are the most produced species among blackberries and other raspberries (Crandall, 1995). Sucker shoots are typically used to propagate raspberry. Because of its steep development, it is kept growing after three or four years as long as it is supported by a thick stake. Black colored raspberries are not preferred for production because they are sensitive to diseases, especially anthracnose. Since black raspberries cannot be reproduced with sucker shoots, they can be propagated by tip or simple dipping methods. The shoots of black raspberries are not very steep and a wire training system is needed. Purple raspberries are the result of a mix between red and black raspberries. Purple raspberries ripen later in the summer than red raspberries. Purple raspberries grow strong and have large fruits. Purple raspberries are between red and black raspberries in terms of development and are generally grown with a wire training system. Yellow-fruited raspberries are not preferred by consumers. However, it is used in research and breeding of new varieties.

Table 1 shows raspberry output in Turkey over the last three years. When we look at raspberry production in Turkey during the previous three years, we can see that there has been no major rise in planting area or production amount. However, an increase of 1038 decares was observed in the planting area. On the other hand, while 784 kg/da of raspberry was produced in 2020, the growth in 2022 was only 49 kg/da. The annual production volume increased by 1213 tons between 2020 and 2022. As can be observed, there has been no discernible growth in raspberry output in Turkey.

Table 1. Turkey raspberry production amount, production area, yield per decare and annual production

Years	Areas (da)	Yield (kg/da)	Production quantity (Tonnes)
2020	6.943	784	5.445
2021	7.095	718	5.093
2022	7.981	833	6.652

Source: TÜİK, 2022

In Table 2, the world raspberry production and the amount of raspberry planted area, yield per decare and annual production amounts of the countries that produce the most raspberries are given. According to Table 2, the global raspberry planted area is 110.567.00 hectares. The raspberry yield per hectare in the world is 80.181.00 hg/ha and the yield in 2021 is 48.830.00 tons. Russian Federation leads the globe in raspberry planted area, yield per hectare, and yearly output amount, with 23.809.00 ha, 83.035.00 hg/ha, and 97.700.00 tons, respectively (Table 2). Serbia is second and Poland is third (Table 2).

Table 2. Raspberry production amount in the world in 2021

Countries	Areas (ha)	Yield (hg/ha)	Production quantity (Tonnes)
Russian Federation	23.809.00	83.035.00	197.700.00
Mexico	8.520.00	194.449.00	165.676.62
Serbia	20.807.00	53.150.00	110.589.00
Poland	19.800.00	52.475.00	103.900.00
United States of America	6.758.00	120.080.00	81.150.00
Spain	2.420.00	201.777.00	48.830.00
Ukraine	5.400.00	67.204.00	36.290.00
Bosnia and Herzegovina	2.686.00	62.669.00	16.833.00
Chile	3.824.00	41.664.00	15.934.27
Azerbaijan	2.636.00	45.014.00	11.866.05
World	110.567.00	80.181.00	886.538.58

Source: FAO, 2022

Table 3 shows the annual raspberry production amount, production area, and yield per decare in Turkey by provinces. Isparta has the largest raspberry planted area in Turkey, with 50 decares. The yield per decare at Isparta is 760 kg/da, with an annual production of 38 tons. The production area in Adana, on the other hand, is 24 decares, the yield per decare is 2000 kg/da, and the annual output amount is 48 tons. According to TUIK data for 2022, Adana has the

greatest raspberry production in Turkey. This is followed by the provinces of Isparta, Konya and Kahramanmaraş.

Table 3. Raspberry production amount, production area and yield in Turkey by provinces

Provinces	Areas (da)	Yield (kg/da)	Production quantity (Tonnes)
Adana	24	2.000	48
Konya	10	1.500	15
Kahramanmaraş	10	1.400	14
Samsun	1	1.000	1
Bursa	8	833	6
Yalova	14	929	13
Isparta	50	760	38

In general, it is known that phenol and flavonoid compounds containing gallic acid, rutin, isoquercitin and ellagic acid are high in berries. The most important one is ellagic acid, which has antitumor properties. The highest total amount of ellagic acid was detected in black raspberries (Häkkinen, et al., 2000; Kähkönen et al, 2001) Ellagic acid has significant anticarcinogenic/antimutagenic properties. It has also been reported to have antibacterial and antiviral effects (Akiyama et al., 2001, Šmerák, et al., 2002). Among all fruits and vegetables, the highest amount of ellagic acid is found in red (*Rubus ideaus*) and black (*Rubus occidentalis*) raspberries. As stated above, it is reported that its anticarcinogenic activity prevents the formation of cancer by inactivating the chemical components that cause cancer in the body (Stoner, and Mukhtar, 1995). In addition to these benefits, ellagic acid has anti-aging properties (7,14,17). Furthermore, there is evidence that ellagic acid prevents or reduces the majority of oxidative damage in DNA. It has been found that raspberry extracts, particularly myricetin, have a high antibacterial action and limit the growth of several bacteria that are detrimental to human health (Kresty et al., 2001; Peiffer, et al., 2014). It is known that raspberries are higher in antioxidant compounds than other berry fruits.

Table 4 shows that 100 g of fresh raspberry fruit contains thiamine (0.032 mg), riboflavin (0.038 mg), niacin (0.598 mg), vitamin B6 (0.055 mg), A (2 µg), C (26.2 mg) in terms of vitamins; and it contains Calcium (25 mg), Iron (0.69 mg), Magnesium (22 mg), Phosphorus (29 mg), Potassium (151 mg), Sodium (1 mg) and Zinc (0.42 mg) in terms of minerals (USDA, 2022).

Table 4. Nutritional contents of raspberry fruit (per 100 g of edible fresh fruit)

Food component	Amount
Water	85.8 g
Energy	52 kcal
Protein	1.2 g
Total lipid (fat)	0.65 g
Carbohydrate, by difference	11.9 g
Minerals	
Calcium, Ca	25 mg
Iron, Fe	0.69 mg

Vitamin C	26.2 mg

Source: USDA, 2022

CONCLUSION

In conclusion, it has been discovered that raspberries (*Rubus ideaus L.*) are particularly beneficial fruits for humans due to their high content of phenol and flavonoid flavonoids, both of which are essential for health, as well as their anticarcinogenic and antioxidant properties. It has also been discovered that raspberry, being a diet fruit, reduces the risk of Alzheimer's, cardiovascular disease, diabetes mellitus, obesity, and many metabolic disorders that are common today. Furthermore, bioactive compounds found in raspberry fruits have been shown to slow the progression of disease factors in the body. It has been discovered that red raspberry (*Rubus idaeus L.*) in particular is a fruit high in nutritional content and bioactive components. They contain critical minerals, dietary fibre, and polyphenolic compounds. As a result, scientists have discovered that raspberry fruits, due to their metabolic qualities in the human body, render them inactive by lowering the risk of pathophysiology, which includes illness components. Raspberry fruit has been determined to be both a nutritious fruit and extremely advantageous to human health. This study, we feel, will give light on more extensive investigations on the impact of raspberry on human health.

ABSTRACT

In the Mediterranean region, the most early-season mulberry production is carried out in Mersin province and Anamur, Silifke districts. Today, mulberry production in Turkey continues with 1 964 724 mulberry trees. As of 2022, 72 89 tons of mulberry are produced annually in an area of 16 334 decares in Turkey. There are 30 380 mulberry trees that bear fruit in Mersin, and mulberry production has been carried out on a total area of 765 decares. However, 1000 decares of this production consist of greenhouse mulberry production. For the remaining 15 334 decares of land, mulberry cultivation has been carried out in the open. However, the amount of mulberry production in Mersin is 1 120 tons. *Morus laevigata* Wall. *Morus alba* var. It is a type of *laevigata* (mulberry with long fruit) and is known by names such as finger mulberry and black mulberry. Finger mulberry berries have a dark red colour. It has a high antioxidant capacity thanks to the high amount of anthocyanin, phenolic substances and ascorbic acid it contains. With this feature, finger mulberry is a type of mulberry that is consumed by consumers with highly attractive, long, large, red-black fruits, and its production has become widespread especially in the Mediterranean Region in recent years. Harvest begins in the open and in the greenhouse in February and ends in June. If hard pruning is aimed in the open and single harvest in the greenhouse, normal pruning is done if there is a second harvest target. In addition, the

second harvest in the greenhouse is carried out in December, January and February. There are buyers at high prices in the market as fresh fruit rather than dried finger mulberry. As is known since the Mediterranean region is the region where many products, especially strawberries, citrus fruits, bananas and tomatoes, are grown thanks to its warm and mild climate, farmers prefer the first-year mulberry, which can produce both in the open and the greenhouse, provides earliness and can find buyers at high prices, as an alternative product. This study has been carried out to evaluate the current situation, production techniques, profitability and production potential of early mulberry cultivation in the Mediterranean region.

Keywords: Mulberry, Mediterranean, Greenhouse, Earliness

INTRODUCTION

Morus laevigata Wall is a commercially important mulberry species belonging to the Moraceae family. (Jain and Kumar 1989; Vijayan et al. 2011). *M. laevigata* Wall species global range extends from the Indus to Assam, Arunachal Pradesh, Bangladesh to Myanmar, and the tropical and subtropical Himalayas. (Brandis, 1906; Kanjilal et al. 1940; Tikader and Dandin, 2005; Tikader, 2011). The fruits of *Morus alba* var *laevigata* are elongated and dark red in color. Its fruits are often eaten fresh. Like with other mulberry species, the flowers of *M. laevigata* wall species are in clusters; male flowers are 5-12 cm long, while female flowers are 5-6 cm long. Male flowers hang loosely from the branch; and after the flowers wilt, the male flowers dry and fall off. Male flowers have four stamens and four perianth lobes. Male flowers can also be present in flower buds as curled fibers. Female flowers are typically shorter and more compact than male blooms, with four persistent perianth lobes. The stigma is bipartite and the ovary is unicellular. These eggs have a pendulous shape. Its pollination is an anemophile process. Because *M. laevigata* has a long flowering period, the fruit harvest season is likewise longer than in other mulberry species. As a result, a product can be derived from *M. laevigata* for an extended period of time. The fruits of *M. laevigata* Wall species are large, rich in anthocyanins, and their fruits vary from sweet to sour. (Vijayan, et al.2011). Tikader and Kamble (2008) showed in a study they conducted in India that several cultivars of *M. laevigata* Wall mulberry are salt tolerant. As it can be understood from here, they reported that mulberry production can be made in saline barren soils. *M. laevigata* is a suitable raw material for the paper industry as well as for silkworm breeding; the powder obtained from the stem and stem is a good nutrient medium for mushroom production. In addition, its shade-dried leaves are an excellent feed for poultry. At the same time, it has been stated that when the leaves are used as feed for chickens, it has positive effects on the formation of the desired yellow color in the eggs, egg vitality and egg quality (Narayana ve Setty 1977). With this feature, *M. laevigata* (finger mulberry) is a mulberry species that is liked by consumers due to its high attractive, long, large, red-black fruits, and its production has increased in greenhouse and open areas in the Mediterranean region in recent years (Sally, 2006; Polat, 2013). It is extensively produced in the Mediterranean regions of Mersin, Anamur, and Silifke. Locals have given it names such as Finger Mulberry and Black Mulberry. The fruit weighs about 15 g and is quite huge. It is consumed as fresh fruit rather than dried mulberry and commands high market prices. The purpose of this study was to evaluate the profitability of early mulberry cultivation in greenhouse and open field, production techniques, and marketing in the Mediterranean Region to other fruit species.

GREENHOUSE AND OUTDOOR PRODUCTION TECHNIQUE

M. laevigata (finger mulberry) mulberry is collected in the Mediterranean region in February when cultivated in greenhouses, and in late March and early April when grown outdoors.

Mersin has 102,000 decares of greenhouse space, which produces 47,000 decares of bananas, 10,000 decares of strawberries, and 1,000 decares of mulberry, according to data from the Provincial Directorate of Agriculture and Forestry. Harvesting begins in April and continues until June. Furthermore, harvesting in the greenhouse occurs in December, January, and February. In recent years, Mersin's Anamur and Silifke districts have seen a surge in greenhouse mulberry production.

Figure 1. Reproduction with steel (Mersin Mezitli)

Steel is commonly used for reproduction in mulberry production in the region. Cuttings are taken from healthy and somewhat vigorous yearly shoots. Cuttings should be taken from branches with nodes that are not too far apart or from shoots that are not too short. *Morus leaviata* cuttings are harvested in November and December, after the shoots have gone dormant. As shown in Figure 1; the steel thickness is 1-1.5 cm on average, the length is 15-25 cm, the lower part is cut straight from just below the bottom node, and the top section is tilted 1-1,5 cm above it. If you want to use green cuttings, take leafy summer cuttings from slightly lignified branches. In July, green cuttings are taken from one-year branches by cutting 15-20 cm in length. Because these cuttings are leafy, they must be rooted in humid circumstances to create water balance. The possibilities of multiplication of the mulberry plant by cuttings have been examined by numerous researchers and different auxin derivatives, which are natural plant hormones, are used in these investigations. IBA (Indole-3-butyric acid) and NAA are the most widely used (1-Naphthene acetic acid). In addition, new products with different trade names containing these hormones have been employed in cuttings rooting in recent years. (Yıldız et al., 2009; Ekizoğlu, 2010; Erdem, 2015).

Figure 2. Pruning and finishing (Mersin Mezitli)

As seen in Figure 2., rooted tuberous mulberry seedlings are planted in greenhouses in September and October, and outdoors in February, after the planting areas are prepared. The saplings are planted in such a way that 5 m row spacing is 3.5 m above the row. The fruits are taken from annual fresh shoots. In greenhouse mulberry production, an average of 60-70 saplings are planted per decare. According to the preference of the manufacturers, open planting is also planted at the same intervals, however it might be planted more frequently or sparsely at times. After planting, depending on the development status of the seedlings, a hard pruning is done 20 cm above the main body. Pruning in the greenhouse is done in May. In open production, pruning is done in July. As a pruning technique, cutting is made on the main trunk in the form of an inverted umbrella, leaving 3 or 4 main branches, and the trees are left to develop. Later, 4-5 branches develop on annual shoots and bear fruit on them. In order for the developing branches not to hang down, wire grids with a height of approximately 2.5 m formed within the greenhouse roof are created with 4 wires in each row. These wires are used so that the branches do not sag. The wires must be thick enough to carry the branches (Figure 2). In early mulberry production, both in the open and in the greenhouse, producers do not use as many chemical pesticides, fertilizers and fertilizers as in other plant production. Spraying is done only to combat spider mites (*Tetranychus urticae*) and mealybug (*Planococcus citri*). When there is no fruit on the mulberry plants, this spraying is not done once a year. In addition, as a result of pruning, 1% burgundy slurry is given before the bud burst. For this reason, the products produced are cultivated in accordance with natural conditions. Therefore, the market value of the mulberry products produced is quite high.

Figure 3. Mulberry production in greenhouse (Mersin Mezitli)

The first harvest in greenhouse mulberry production begins in January. Harvest continues from January to the end of March. Because the first products are fresh, they find buyers at very high prices in the market. Thus, producers get high profits. In open field production, the first harvest starts in the first week of April and continues until the end of June. In greenhouse mulberry farming, one decare can yield 3 tons of mulberry in one season. Harvesting is typically done by hand by women. Thus, it also contributes to the women's employment. In general, mulberry producers in the greenhouse used to produce vegetables (Tomato, pepper, eggplant) in the greenhouse. Due to the high expenses of both maintenance and disease and pest control methods in greenhouse vegetable growing, the producers could not earn enough money, and the market condition was not stable and lucrative. Producers, on the other hand, shifted to greenhouse mulberry cultivation. Mulberry production is simpler than vegetable production, therefore input costs are lower, and fresh mulberry fruits command high market prices. As a result, producers choose to grow mulberries in ancient vegetable greenhouses.

ECONOMIC EVALUATION OF MULTI PRODUCTION IN GREENHOUSE

When we compare mulberry agriculture in the Mediterranean region to strawberries and bananas, which are also abundantly produced in the region, we can find that the input cost of mulberry cultivation is cheaper. There are fewer diseases and pests in mulberry farming than in strawberries and bananas. As a result, insecticides and fertilizers are inexpensive in mulberry production. Mulberry cultivation is more advantageous due to the fact that they begin producing in the first year, are easier to care for, and use less water than strawberry and banana plants. The downsides are high harvest labor, short fruit shelf life, and high input expenses such as greenhouse iron frame, irrigation system, plastic cover, and labor in a one-decare mulberry greenhouse setup. Strawberry has advantages such as being able to be grown without soil,

requiring less harvesting effort than mulberry, having a longer shelf life of its fruits, and not requiring a heating system in greenhouse cultivation. The strawberry plant, on the other hand, is more susceptible to illnesses and pests than the mulberry plant, so the cost of pesticides, fertilizers, and watering is more; it requires new seedlings virtually every year; and the cost of a strawberry greenhouse is higher per decare (greenhouse iron skeleton, plastic cover, irrigation system, , plastic cover, workmanship, etc.). On the other hand, when comparing greenhouse banana production to mulberry cultivation, banana has advantages such as inexpensive maintenance and labor expenses, as well as high product yield per unit area. However, because the banana plant is susceptible to certain illnesses and pests (such as worms, red spiders, and fusarium), chemical pesticides, fertilizers, and greenhouse expenditures (greenhouse iron skeleton, plastic cover, irrigation system, plastic cover, labor, etc.) There are other drawbacks, such as becoming more dependent and susceptible to cold. The most crucial thing to consider in these comparisons is that the manufacturing model with the best profit at the lowest cost should be preferred. Yet, given the value of the produced product in foreign trade and the supply and demand condition in the domestic market, strawberry and banana production has a significant impact on the Turkish economy. The term "independent" refers to a person who does not work for a company.

CONCLUSION AND RECOMMENDATIONS

In terms of mulberry production in the greenhouse, the Mediterranean region, which is Turkey's fruit and vegetable paradise due to its ecological superiority, should be viewed as a variety and an alternative production method among other greenhouse fruit producing types. Furthermore, because of the low input costs compared to other greenhouse fruits and the excellent profitability of the farmers, mulberry production in the greenhouse is becoming more popular. Due to the stunted nature of the mulberry plant, which is also called as the Australian Mulberry, producers are turning old vegetable greenhouses into mulberry greenhouses. Thus, producers both reduce greenhouse costs and gain higher profits from vegetables. In addition, since mulberry production in the greenhouse does not require more fertilizers, pesticides and maintenance costs like vegetables, it offers producers an easy-to-care and high-income production model. However, planned production is one of the most important issues. Manufacturers must be informed about this. In addition, it is suggested that it would not be right to choose a production pattern that will compete with the economically and strategically important products of the region, and that these productions should be made in planned, small enterprises and local places.

Özet

Eleştiri, bilginin temellerini ve doğruluk durumunu inceleme, sınama, yargılama anlamına gelmektedir. Eleştirel düşünme kavramı ise, herhangi bir durumun olumlu veya olumsuz özelliklerini tarafsız şekilde değerlendirme, yargılama ve sonuca varma sürecidir. Tarafsız düşünme biçimi olan eleştirel düşünmenin; beceri, tutum ve alışkanlıklar bütünü olduğu söylenebilir. Bir tür akıl yürütme sayılan eleştirel düşünme, analiz ve değerlendirme gibi zihinsel süreçlerden oluşan bir düşünme biçimidir. Çağlar boyunca tüm alanlarda kullanılan eleştirel düşünme yaklaşımları, ilerleme ve gelişim adımlarının atılmasını hızlandıran bir unsur olmuştur. Sanatsal üretici düşünme biçimi, düşünme ile uygulama-deneme arasındaki etkileşimi ve karşılıklı ilişkiyi içeren bir kavramdır. Sanatsal alanlarda da etkinlik bağlamında üretici düşünce, sanat etkinliği süreçlerini olumlu etkilemiştir. Sanatsal anlamda eleştirel düşünce, doğru iletişim kurabilme yöntemleri arasında yer almaktadır. Bu çalışmada, insanın çevreyi tanımasının, sanat eseriyle ilgili bilimsel sonuçlara varabilmenin eleştirel ve analitik düşünme yoluyla olabileceğinin vurgulanması amaçlanmıştır. Bu özelliklerin ve alışkanlıkların bireylere, eğitimin ilk aşamalarından itibaren verilmesinin önemi vurgulanmaktadır.

Anahtar kelimeler: Sanat, eleştiri, analitik, düşünme, yaklaşım.

CRITICAL AND ANALYTICAL APPROACHES TO ART

Abstract

Criticism means examining, testing, and judging the foundations of knowledge and its accuracy. The concept of critical thinking, on the other hand, is the process of objectively evaluating, judging, and reaching conclusions about the positive or negative aspects of any situation. Critical thinking, which is an impartial way of thinking; can be said that it is the whole of skills, attitudes, and habits. Critical thinking, which is considered a type of reasoning, is a way of thinking that consists of mental processes such as analysis and evaluation. Critical thinking approaches, which have been used in all fields throughout the ages, have been an element that accelerated the progress and development steps. Artistic productive thinking is a concept that includes the interaction and reciprocal relationship between thinking and practice-experiment. In the context of activity in artistic fields, productive thinking has positively affected the processes of art activity. In the artistic sense, critical thinking is among the methods of establishing correct communication. This study, it is aimed to emphasize that people can get to know the environment and reach scientific conclusions about the work of art through critical and analytical thinking. The importance of giving these characteristics and habits to individuals from the first stages of education is emphasized.

Keywords: Art, criticism, analytical, thinking, approach.

Giriş

Tarihsel sürece bakıldığında, iki yüz bin yıl önce ortaya çıkan eleştirel düşünme kavramı tarihte bilinen zihinsel düşünmeye sahip Homo Sapiens canlı türü ile ortaya çıkmıştır. Her yaşamsal amaçlı adımın, eleştirel bir düşünme sonucunda atıldığına inanılmaktadır. İlk tarih çağlarındaki mağara duvarlarına yapılmış resimler, eser üretim süreci, eleştirel ve analitik algının başladığını kanıtlamaktadır. İnsanoğlunun antik çağdan itibaren temellerini attığı bu kavram, mantıksal bir yaklaşımla günümüze dek uzanmıştır. Genel açıdan bakıldığında, bilimsel olarak ilk eleştirel düşünme M.Ö. 600 yılında Sokrates'in geliştirdiği bir beceri ve sanat alanıdır (Şenşekerci ve Bilgin, 2008, 21). İlerleyen zamanlarda ise, özellikle Rönesans döneminde bilimsel çalışmalara öncülük etmiştir. “Descartes, Machiavelli, Erasmus, Moore, ve Newton” gibi öncü isimler eleştirel düşünme yaklaşımlarını günümüzün gelişmiş düzeyine ulaştırmıştır (Akarsu, 2018, 3). Eleştiri kelimesinin, genellikle olumsuzluk içeren bir algıya sahip olduğu söylenebilir. Aksine eleştiri sözcüğünün nesnel anlamı, bir durumu iyi ve kötü yanlarıyla değerlendirmek olarak tanımlanmaktadır (Karabulut ve ark. 2008: 240). Sanat eleştirisi ise bir sanat eserini öncelikle eser ve sanatçı olmak üzere farklı bilgi ve belgelerden yola çıkarak, o eser hakkında olabildiğince doğru bir yargıya ulaşma çabası olarak tanımlanabilir. Eleştirel düşünme; analiz, sentez, problemi ortaya koyma ve çözme, çıkarım ile değerlendirme gibi üst düzey becerileri içermektedir. Tıpkı sanat eseri üretim sürecinde karşılaşılan aşamalar gibi. Eleştirel düşünme ve analitik yaklaşımlar, bilimsel yollarla eser üretmeyi ve üretilen eserler hakkında tarafsız yorum yapabilmeyi gerekli kılmaktadır.

Sanata Eleştirel ve Analitik Bakış

Özellikle günümüz teknoloji çağında eleştirel düşünme sosyal bir varlık gösterebilmek adına son derece önemlidir. Yeni fikir ve düşünceler üretmek, sosyolojik açıdan insanlara rehberlik edebilecek bir yaklaşımdır. Üretilen yeni fikirlerin, her alanda olduğu gibi sanat alanında ve günlük yaşamın içinde yer aldığı görülmektedir. Sanat alanında bir tür keşif kabul edilen bu yenilikçi fikirlerin; gözlem, merak, nesnellik, çıkarım, açık fikirlilik, yaratıcı düşünce ve farkındalığa dayandığını söylemek doğru olacaktır. Yaratıcı, sosyal, bütüncül ve yansıtıcı düşünme biçimleriyle fikirlerin çözüme dönüştüğü de ifade edilebilir. Sanat eleştirisi, bazı yaklaşımlara dayalı sanat eserini tarafsız olarak inceleyip en nesnel sonuçlara ulaşmayı amaçlamaktadır (Ülger, 2021, 33). Ayrıca eleştirel düşünme ve analitik yaklaşım sanatta; yaratıcı, yenilikçi ve sürdürülebilir bir tavır gerektirmektedir. Eleştirel düşünme yönteminin göz ardı edilmesi, toplumları; sosyolojik, bilimsel ve sanatsal açılardan olumsuz yönde etkilemektedir. Sanat açısından değerlendirildiğinde, araştırmacı, inceleyici; sorgulayıcı eleştirel bir anlayışın geliştirilebilmesi için, öncelikle bu alanda yenilikçi bir anlayışın benimsenmesi

gerekmektedir. Özellikle günümüzün 21.yy. ileri beceri düzeyinde; kritik düşünme, iletişim kurabilme, işbirlikçilik, paylaşımcılık ve yaratıcılık gibi unsurların önemi vurgulanmaktadır (Akarsu, 2018, 9). Kişisel gelişimde; öncelikle kendini eleştirebilmenin, eleştirilere açık ve anlayışlı olmanın etkin olduğu söylenebilir. Ayrıca sanatsal temelli eleştirel düşünce biçimi; eseri oluşturan sanatçılar ile tamamlayıcı rolde olan izleyiciler arasında bir etkileşim ve iletişim anlamı taşımaktadır. Sanatta yaratıcı ve sağlıklı ilişkilerin biçimlendirilmesinde önemli bir etken olduğu gibi, sanat eserlerinde estetik bir algılayış ortaya koyacak mantıksal beceriye sahip olmak gerekmektedir.

Tarihsel perspektiften bakıldığında; önceleri çağlarla ifade edilen sanat; daha sonraları dönemlerle, modernizm boyunca akımlarla, post modern süreçte ise, anlayış, kavram ve düşüncelerle açıklanmaya ve betimlenmeye doğru evrilmiştir. Tüm bu süreçler boyunca, sanatla olan temas her zaman irdelenmiştir. Sanatçı eser ve izleyici profilleri ile devamında sanat eserinin algılanması, çözümlenmesi, yorumlanması ve çıkarım yapılması gibi süreçleri içinde eleştirinin varlığı ve analitik çözümlenmeler kesinleşmiştir. Daha da öteye gidildiğinde eleştiri, sanatsal bir eylemin ya da kurgunun kimliği olmuştur. Eleştirel bakış açısıyla birlikte analitik düşünme, hem sanat eseri oluşumunda hem de eleştiri süreçlerinde oldukça önemli bir rol taşımaktadır. Genel olarak analitik düşünme; bir bütündeki her bir parçanın analiz edilmesi, parçaların bütünlükle ilişkisinin incelenmesi ve bir sentez yapılarak çözüme varılması anlamı taşımaktadır

(<https://mail.baskent.edu.tr/~21293301/%C3%B6%C4%9Frenmeyi-%C3%B6%C4%9Frenme.html>.) Bu bağli olarak, bir durumu, olayı veya kavramı parçalara ayırarak anlamlandırmak şeklinde ifade edilmektedir. Böyle bir sistemin sanatta yansımaları da eleştirel ve çözümleneci bir yaklaşım olarak görülmektedir.

Sanat; hem bireyler hem de toplumlar için bir kimlik ortaya koyma ve varlık gösterme yöntemi olması nedeniyle, zamanlar arası bir üretim sürecidir. Bu kavrama hizmet eden eleştiri, bireyi ve toplumu kişisel sanat olaylarını veya eserlerini onaylamaya ve anlamaya doğru yönlendirir. Sanat eseri karşısında kendini bir yön belirleme konusunda zorunlu hisseden insan; eseri bazı bireysel tecrübeler ya da akademik ilkeler kullanarak anlama ve çözme çabasına girmektedir. Sanat eseri eleştirisinde, sadece duygusal değil, teknik ve bilimsel olarak da anlamlandırmaya yönelmek gerekir. Sanat eserlerine yapılan eleştiriler, genellikle kesin doğrular bulmayı amaçlamaz. Öncelikle eleştiri yapacak kişi; eleştiri boyunca algılarını tüm unsurlara karşı açık tutmalıdır. Esere yönelik doğru ipuçlarıyla, bilimsellik taşıyan, sistematik ve nesnel bir eleştiri yapabilmelidir.

Sanat eseri eleştirisinde, kullanılacak sanat diline hakim olmak, konuyla ilgili tecrübe ve bilgiye sahip olmak önemli faktörlerdir. Ayrıca sanat eleştirisinde, mitoloji ve ikonografik inceleme,

estetik ve eleştiri bilgisinin yanı sıra; bilimsel sanat eleştirisi ve analitik düşünme becerisi gibi bazı teorik bilgilerden yararlanmak akademik bir sanat eleştirisi yapabilmek için gereklidir. Mevcut bilgilere dayanarak, sanat eserinin bağlı olduğu akımlar, dönem özellikleri ve bilimsel gelişmeler ışığında incelenmesi, eseri anlamada daha bütüncül bir algıyı içerebileceği söylenebilir (Ülger, 2021, 34).

Sanatı oluşturan temel unsurlar arasında; sanatçı, sanat eseri, sanat izleyicisi, eserin ortaya çıktığı zaman veya dönem, sanatın içinde bulunduğu doğal ve toplumsal çevre etkinlik göstermektedir. Sanat eseri eleştirisinin amacı; bir eserin, görüşün veya tutumun değeri ile ilgili durum belirtmek ve eserden hareketle çıkarım, çözümleme ve değerlendirme yapmaktır. Böylece, eleştirel yaklaşım esere sanatsal bir çizgi belirlerken, aynı zamanda sanatçıya da eleştirici gözüyle yeni bir kimlik kazandırmaktadır. Bireylerin; müze ve sanat galerileri gibi farklı mekanlarda, eserle doğrudan karşılaşabileceği, sanat eleştirisi yapabileceği imkanların yaratılması bu kimlik oluşum sürecinde etkilidir (Mercim ve Alakuş, 2005, 45).

Sonuç

Yapılan araştırmalarda; sanat ve insan iç içe olduğu sanatsal eleştiri ve analitik çözümleme sisteminin; gelişen bir yapıya sahip olduğu, sürekli evrildiği, şekil değiştirdiği, yeni anlayış ve değerlere sahip olduğu görülmüştür. Bu nedenle, eleştiri sonucunda sanat eserinin insan üzerinde oluşturduğu durumun temelinde, insanların eser karşısındaki duyguları, algı ve izlenimleri, tepkileri ve yargıları aslında eserin alt anlamları olarak görülmektedir. Bilgiye dayalı yorum, bilim ve sezgiler bütünlük içerisinde olduğunda sanat eseri hakkında doğru karar verilebilir. Böylece eleştiri de amacına yönelik bir tutum sergilemiş olur.

Sanatın toplumsal bir değer ve kültürel bir unsur olduğu düşünüldüğünde, sanatsal yaklaşımların alışkanlık, tecrübe ve kimlik kazanmış olması sanat kültürünün doğmasına neden olmaktadır. Sanat kültürünün gelişmesi için eleştirmenlerin yanı sıra, sanatın kültür merkezli olarak gelişmesi, sanatın ve sanatçının tanımı, estetik, temel sanat eğitimi tasarım ilke ve öğelerinin bilinmesi ve uygulanması, ayrıca bunların sanat eseri üzerinden incelenerek açıklanması büyük önem taşımaktadır. Ayrıca bireylerin; müze ve galeriler gibi farklı mekanlarda sanat eleştirisini ve güncel sanat değerlendirmelerinin yapılabileceği ortamlarda daha fazla bulunmasının, sanat faaliyetlerinin hayatın içinde yer almasının, sanat, eser yorumlaması, eleştirisi ve analitik bakabilmeye ilgili bilgilerin temel eğitim düzeyinden itibaren verilmesindeki önemin anlaşılmasının bilincine varılmalıdır.

SERAMİK SANATINDA ALTERNATİF ŞEKİLLENDİRME YÖNTEMLERİ

Assist. Prof. Dr. Seda DİLAY (Orcid ID: 0000-0002-5239-8589)

Karamanoğlu Mehmetbey University Vocational School of Technical Sciences, Karaman

E-mail: sdilay@kmu.edu.tr

Özet

İnsanoğlu, varoluşuyla birlikte seramik malzemeyle oluşturduğu nesnelere, günlük ihtiyaçlarını karşılamak için hız kesmeden üretmiştir. Tarihin başlangıcından itibaren doğal bir malzeme olan seramik; yaşamın her alanında kullanılmış, kullanıldıkça da gelişmeye ihtiyaç duymuştur. Her türlü günlük kullanım eşyası, dini ritüel objeleri, mimari ve dekoratif unsurlar, kil tabletler olarak adlandırılan yazılı belgeler şeklinde günümüze dek ulaşmıştır. Seramik malzemelerle üretilen ürünlerin işlevi, sanatsal değeri ve kültürel özellikleri dikkate alınarak çeşitli şekillendirme yöntemleri tercih edilmiştir. Seramik ürünler sanatsal açıdan ele alındığında; çeşitli şekillendirme, dekor ve pişirim yöntemleri kullanılarak önem kazanmaktadır. Astar ve sır kullanımıyla su geçirmez özellik kazanan ilk kaplar, seramik sanatı tarihi adına önemli bir dönüm noktası olmuştur. Şekillendirme ve dekorlama özellikleri ile üretildikleri çağın sanat anlayışı ve teknolojisini yansıtan bu seramik ürünler; insanlık adına değerli izler taşımakta ve o döneme ışık tutmaktadır. Bu çalışmada, seramik sanatında kullanılan çeşitli yöntemlerin kullanımını ve gelişimi incelenmiştir. Bunlardan, şekillendirme yöntemlerinin tarihsel süreçte ortaya çıkan, gelişim gösteren ve yaygın olanların yanı sıra, günümüzde alternatif olarak kullanılan yöntemler de ortaya konulmuştur. Alternatif bir şekillendirme yöntemi olan akitma ile şekillendirmenin aynı zamanda da bir dekor yöntemi olduğu da belirtilmiştir.

Anahtar kelimeler: Seramik, sanat, dekor, şekillendirme, alternatif.

ALTERNATIVE FORMING METHODS IN CERAMIC ART

Abstract

With its existence, mankind has produced ceramic material without slowing down to meet its daily needs. Ceramic, which has been a natural material since the beginning of history; has been used in all areas of life, and it needs improvement as it is used. All kinds of daily use items, religious ritual objects, architectural and decorative elements, and written documents called clay tablets have survived to the present day. Various shaping methods have been preferred considering the function, artistic value, and cultural characteristics of the products produced with ceramic materials. When ceramic products are considered artistically; It gains importance by using various shaping, decoration, and firing methods. The first vessels that gained waterproof features with the use of lining and glaze became an important turning point in the history of ceramic art. These ceramic products reflect the artistic understanding and technology of the era in which they were produced, with their shaping and decoration features; It carries valuable traces on behalf of humanity and shed light on that period. In this study, the use and development of various methods used in ceramic art were examined. Among these, in addition to the shaping methods that emerged, developed, and common in the historical process, methods used as alternatives today have also been revealed. It has also been stated that shaping by pouring, which is an alternative shaping method, is also a decoration method.

Keywords: Ceramics, art, decor, shaping, alternative.

Giriş

İnsanoğlu; kendi tarihi kadar eski olan toprağı şekillendirerek, kullanılabilir hale getirmeyi başarmıştır. Zamanla bu toprak objeleri pişirmeyi keşfetmiştir. İlk başlarda bu toprak ürünleri elleri ve parmaklarıyla şekillendirmiş, doğal yollarla renklendirip boyamayı öğrenmiştir. Sonrasında, şekillendirme ve dekorlama tekniklerini geliştirerek birbirinden farklı pek çok seramik ürüne özgün görünüm kazandırmıştır. Yüzyıllar boyunca süregelen bu gelişmeler seramik yolculuğunu başlamasını sağlamıştır. Varoluşu süresince çevreyi, kendini, günlük kullanım eşyalarını veya barınmak amacıyla yaptıkları mekânları çeşitli malzemelerle süsleme çabasına girmişlerdir. Kullandıkları malzemeler, genellikle doğal ve kolay ulaşılabilen türde olmuştur.

İşlevselliğin yanı sıra estetik bir algı oluşturmak amacıyla da zamanla çeşitli şekillendirme ve dekorlama teknikleri üretmişlerdir. Tarihin ilk dönemlerinden bugüne dek hem şekillendirme hem de dekorlama tekniklerinde pek çok malzeme kullandıkları gibi, seramik malzeme ile de bunu denemişlerdir. Seramik malzemeyle kullanılarak farklı yöntemlerle yapılan şekillendirmeler sonucu oluşan ürünlere çeşitli dekorlama teknikleri uygulanabilmektedir.

Teknolojik gelişmelerle seramik alanında da çağın gerektirdiği ilerlemeler yaşanmış, 19. yüzyılın sonlarında özellikle de 20. yüzyılın başlarında endüstriyel gelişmelerle birlikte Modernizmin doğmuştur. Bu andan itibaren şekillendirme ve dekorlama tekniklerindeki yaklaşımlarda değişimler görülmüştür. Bu değişimler sanatın diğer alanlarında olduğu gibi seramik alanında da daha kavramsal anlamlar kazanmasını sağlamıştır. Artık güzel olanı üretmenin sanat olduğu anlayışının yerine, üretilen sanat nesnelерinin güzeli temsil ettiği anlayışı gelişmiştir. Bu açıdan bakıldığında sanatsal üretim sürecindeki şekillendirme, dekor ve çeşitli üretim tekniklerinde de kavramsal ifadelerin ön plana çıktığı gözlenmektedir.

Seramik Sanatında Uygulanan Teknikler

Farklı ihtiyaçlar doğrultusunda şekil alan seramik ürünlerin kullanımı ve üretimi, günümüzde teknik ve teknolojik gelişmeler ışığında hız kazanmıştır. Seramik üretim sürecinde genel anlamıyla; şekillendirme, dekorlama ve pişirim teknikleri olmak üzere 3 ana başlık bulunmaktadır. Bu durum, kullanılan çamurun türüne, üretilecek miktara, ürünün işlevselliğine bağlı olarak çeşitli sınıflara ayrılmaktadır. Bunlar geleneksel, artistik, endüstriyel ve ileri teknoloji seramikler şeklinde nitelendirilmektedir. Ayrıca ürün türüne göre de; çimdikleme, plaka, sucuk, kalıp içi ve kalıp dışı sıvama, torna, döküm, presleme, şablon gibi genel kullanılan tekniklerin yanı sıra, akıtma, daldırma ve kurinuki gibi alternatif şekillendirme teknikleri de bulunmaktadır.

İlk bakışta en ilkel teknik gibi görünen çimdikleme yöntemi, hiçbir alet olmadan sadece el ile yapılmasından dolayı tercih edilir bir yöntemdir. Aslında oldukça fazla bir hassasiyet gerektiren bu yöntem, bir formun içini ve dışını aynı anda şekillendirebilmeyi ve dokunsal deneyimi öğretmektedir. Plaka ve sucuk teknikleri plastik seramik çamuru ile yapılabilecek en yaygın şekillendirme yöntemleri arasında yer alırken, kalıp içi ve kalıp dışı sıvama teknikleri de anı kıvamda uygulanabilecek farklı tekniklerdir. İster iç yüzey, ister dış yüzey dekorları olsun her ikisinde de kesin sonuçlar elde edilebilmektedir.

Seramik üretiminin genellikle şekillendirme, bazen de düzeltme ve rötuş aşamalarında kullanılan tornalar ise; alçı tornası, şablon tornası ve çömlekçi tornası olarak üç farklı şekilde görülmektedir (Canbolat, 2014, 4). Sıvı döküm çamurunun alçı kalıpların içine dökülmesi prensibiyle şekillendirilen döküm yönteminin yanı sıra, pres ve şablon gibi yöntemler ise genel olarak endüstriyel şekillendirme yöntemleri arasında yer almaktadır.

Seramik üretiminde alışılmışın biraz daha dışında farklı şekillendirme teknikleri de kullanılmaktadır. Kimi hassas, ince ve kırılğan; kimi ise daha detaylı olması nedeniyle daha az tercih edilmektedir. Seramik üretim sürecinde bazen şekillendirme ve dekor ayrı ayrı tekniklerle yapılıyor olsa da, bazı şekillendirme türleri aynı zamanda ürüne dekor özelliği de kazandırmaktadır. Dünyanın çeşitli coğrafyalarında, farklı kültürlerde ve farklı işlevlerde çeşitli tekniklerle dekorlu pek çok seramik ürün bulunmaktadır. Dönemlere ve toplumlara göre farklılıklar gösteren bu ürünler, kullanılan kültürel ve sanatsal öğeler ile yansıttıkları konular açısından farklılıklar taşımaktadır. Her dönemin kendisine ait bir bakış açısı ve her toplumun da kendisine ait bir kimliği bulunmaktadır. Tüm bu unsurlar, sanat eserlerinin karakteristik özelliklerini yansıtmaktadır. Kullanılan geometrik, bitkisel desenlerden ya da stilize insan, hayvan motiflerinden, dekorların hangi döneme ve uygarlığa ait olduğu anlaşılabilir. Çeşitli sahneler, tarihsel olaylar veya dini inanışlar gibi toplumların yaşayış biçimleri ile ilgili her şey seramik ürünlerin dekorlarında ifade edilmeye çalışılmıştır. Astar kazıma, çamur akıtma, ajur, kesme, oyma, rölyef, mayolika, sıraltı ve sır üstü dekorlama transfer tekniklerinin yanı sıra; raku, sagar ve obvara gibi artistik pişirim yöntemleri ile de dekorlama uygulamaları gerçekleştirilebilmektedir. Her ne kadar hepsi ayrı ayrı kendine has farklı malzeme kullanımı, dikkat ve üslup gerektirse de, çamur akıtma, ajur, kesme, parça çıkartma gibi delikli şekillendirme türlerinin diğerlerine oranla çok daha kırılğan ve hassas olduğu ifade edilebilir.

Seramik Şekillendirmede Alternatif Teknikler

Alternatif seramik şekillendirme olarak tanımlanan tekniklerden akıtmayla şekillendirmede ajurlu, delikli ve boşluklu özellikler; daldırma olarak tanımlanan teknik ile ürün üzerine çeşitli rastlantısal doku özellikleri kazandırılmaktadır. Kurinuki tekniği ise, kütleli şekillendirme

prensibine dayalı bir yöntem olup, bütünden detaya doğru bir şekillendirme yolu izlenmektedir. Uzakdoğu seramik şekillendirme tekniği olan kurinuki, geleneksel seramik şekillendirme tekniklerine göre daha az uygulanmaktadır. Kütleli seramik çamurunun öncelikle dıştan kazıma tekniği, sonrasında da iç boşluğun elde edilebilmesi suretiyle ürün oluşturulmaktadır (Karakurt, 2021, 90).

Çalışma kapsamında ele alınacak olan alternatif seramik şekillendirme tekniği olan akıtma ile şekillendirme, bazı kaynaklarda bir tür ajur tekniği olarak ifade edilmektedir. Ajur kelimesi, terminolojik açıdan ele alındığında ise, delikli, örgü, gözenek şeklinde tanımlanmaktadır (TDK, 1994: 20). Ajur; ahşap, mermer, taş gibi malzemelerde kafes biçimli oyuk bezeme; seramik, çini, porselen gibi ürünlerin üzerinde görülen desenli delikleri bezeme tanımlaması yapılmaktadır.

Her toplum yaşadığı çağın teknik, teknolojik ve malzeme imkânlarıyla ürettikleri ürünlerde ve dekor çalışmalarında kendilerini ifade etmiştir. Bu dekorlardan ajur tekniği de pek çok medeniyette farklı teknik ve yöntemlerle ortaya çıkmaktadır. Örneğin; bu teknik, bazı Selçuklu seramiklerinde etkileyici beyazlığından dolayı araştırmacılar tarafından “Selçuklu Beyazları” olarak adlandırılan özel bir kategoride ele alınmaktadır (Görsel 1). Bu eserler genellikle boyasız ve beyaz, bazen de kobalt mavisi veya mangan moru boya akıtmalı olarak üretilmiştir. Bazı örneklerde ise, sadece bu ürünlere has “pirinç delikleri” şeklinde tanımlanan delikli dekorlar görülmektedir. Ajurlu delikli seramik yüzeyler, şeffaf sırla kaplanmakta, bu delikler gövdenin su geçirmemesini önlemekte ve ışığın süzülmesini sağlayarak, gövdenin porselene benzer, saydam ve zarif yüzey özelliğini vurgulamaktadır (Avşar, 2015, 102). Bu dönemde üretilen seramik kapların yüzeylerinde, çeşitli desenlerde önceki örneklerde kabartmalar sonrasında ise, küçük delikler açılarak üretilmiştir. Seramik yüzeylerde ışığın geçmesi sağlanmıştır (Poyraz, 2019, 78).

Görsel 1. Selçuklu beyazı pirinç delikli kase, 12.yy.

<http://artgallery.yale.edu/collections/objects/bowl-seljuk-white-ware>

Boşluklu veya ajurlu olarak adlandırılan dekorlarda iki farklı yöntem kullanılmaktadır. İlki; kesme, oyma veya delme yöntemiyle diğeri ise; akıtma ile şekillendirme yöntemidir. Geleneksel açıdan el alındığında yaygın olan delikli, boşluklu veya ajur görünümü keserek oluşturulmaktadır. Plastik kıvamda şekillendirilen seramik ürünler deri sertliğine yakın bir kıvamda iken, üzerine çizilen desenler kesilerek parçalar çıkartılır. Seramik yüzey üzerinde kesilen boşluklar; her ne kadar risk teşkil etse de, hem işlevsellik hem de dekoratif açıdan farklı dönemlerde, uygarlıklarda ve kültürlerde uygulandığı görülmektedir. Kesilerek oluşturulan ajur tekniği seramikte; şekillendirilme işlemi bitmiş forma geçirilen desenlerin, form yaş iken yüzeyden kesilerek çıkarılması ya da delinmesiyle oluşturulan bir dekor yöntemidir. Ajur tekniği ile yapılan dekorlara “kesme” veya “delik işi” de denilmektedir. Bu dekor uygulamalarında tekrar eden motifler, yan yana gelen birimler, örüntü ve ritmiklerle delikli süslemeler oluşturulmaktadır. Seramik yüzeylere ince ve sivri uçlu aletlerle uygulanan ajur dekor tekniği, estetik özelliklerin yanı sıra, ürüne farklı işlevsel özellikler de kazandırmaktadır. Boşluklu veya delikli izlenimini veren bir teknik olan ajur tekniği öncelikli olarak Yunanistan sonrasında ise, Uzak Doğu, Anadolu Selçuklu ve İran' da yayılımını sürdürmüştür. Uygulanması oldukça güç ve zahmetli bir yöntem olduğu için bu teknik şeytan işi olarak tanımlanmıştır (Aktaş, 2015, 1). Teknik; Çin'den İran'a, oradan da Avrupa'ya taşınarak İngiltere, Almanya, İtalya seramik fabrikalarında fonksiyonel ürünler yapılmıştır.

Seramik şekillendirmede doluluk ve boşluk algısını ortaya koyan, yüzeylerde açılan delikler şeklinde oluşturulan boşluklar, ajur yönteminin pek çok kültürde karakteristik örnekleri görülmektedir. Ajurlu dekorlar uygulaması zor ve riskli olması nedeniyle, genel olarak deri sertliğinde olan formlarda uygulanmaktadır (Gökçe, 2011, 44). Bu tür uygulamaların seramik sanatında en çok risk taşıyan yöntem olduğu söylenebilir. Yinede, seramik yüzeylerde bırakılan boşluklar veya delikler başta ışığı geçirmesiyle dikkat çekici bir özellik taşımaktadır. Ayrıca ince ve narin bir görünüme sahip olmasıyla da estetik bir değer taşımaktadır.

Yüzeyde delikler açmak suretiyle sağlanan boşluklar şeklinde tanımlanabilen, geçmişte pek çok örneği görülebilen ajur tekniği, 18.yy. da yapılmış pek çok seramik ürünlerde kullanılmıştır. Victoria and Albert Müzesi' nde bulunan ajur süslemeli tabaklar yiyecek koymaya yarayan, derin olmayan kaplardır (Görsel 2). Müzede yer alan ajur dekorlu tabakların genelde kenar kısımları bordür şeklinde ajur (delik) dekorlarıyla süslenmiştir. Müzede bulunan koleksiyonda ajur dekorlu tabakların genellikle İngiltere ve Fransa'da üretildiği belirtilmektedir (Gökçe, 2011, 50).

Görsel 2.

Yüksek Derece Pişirilmiş Seramik Çamuru Tabak, Victoria and Albert Müzesi, 18. Yy.

Gelişimini kesintisiz şekilde sürdüren bu dekor tekniği, günümüz sanatçılarının seramik üretimlerinde tercih ettiği alternatif şekillendirme ve dekor uygulaması olarak varlığını devam ettirmektedir.

Türkiye'de çeşitli üniversite ve ünvanlarda akademisyen olarak görev yapan sanatçı, Olgu Sümengen Berker, Türkiye ve Almanya'da 11 kişisel sergisi açmıştır. Sanatçı, dünya çapında 70'in üzerinde ulusal ve uluslararası karma ve yarışma sergisine katılmıştır. 4 ödülü ve uluslararası süreli yayınlarda yayınlanmış makaleleri bulunan Berker'in eserleri çeşitli özel veya müze koleksiyonlarında yer almaktadır. 2017'de Almanya'ya yerleşen sanatçı, stüdyosunda bağımsız olarak çalışmaktadır. Ayrıca Hollanda'daki NATO Müşterek Kuvvet Karargahı Brunssum, Sanat ve El Sanatları Merkezi'nde sanat üzerine dersler vermektedir (<https://www.olguarts.com/about/>). Alternatif seramik şekillendirme yöntemlerini kullanan sanatçının eserlerinde kendisine özgü yaklaşımlar dikkat çekmektedir.

Görsel 3. Olgu Sümengen Berker eserlerinden örnekler.

Aslen Koreli olan Mimi Joung, Kraliyet Sanat Koleji'nden Seramik ve Sanat eğitimi almıştır. Bazen sıradan, yün, ipek iplik, iğne kutusu gibi buluntu malzemeleri, bazen de, doğal malzemeleri bir araya getirip kili, hikâyelere dönüştürerek yeni düşünceler oluşturduğu belirtilmektedir. Çalışmalarını, insan durumlarına ve deneyimlerine atıfta bulunmak için yapığını, köken ve yerinden edilme gibi konularına odaklandığını da ifade etmektedir (Görsel). Evinden ve oradaki önemli izlerden çok uzakta, kendi kökleri ve değişim döngüsünü vurgulayan bir yorumcu, gözlemci ve tarihçi kimliğiyle eserlerini üretmektedir. Mimi Joung için elleri içgüdüsel olarak kendi hayatını ve okuduklarını yansıtmaktadır. Sanatçı diğer insanlardan ve durumlardan öğrendiklerini yansıtarak eğlenceli bir yaklaşım sergileyerek fikirleri çözmeye çalıştığını söylemektedir. Malzeme ve tekniklerdeki rahatlığının, seramik malzemelerin, formların ve renklerin tarihsel bağlamında daha derin bir anlam aramasına olanak tanıdığı eserlerindeki dilden anlaşılmalıdır (<https://cavalierofinn.com/artists/39-mimi-joung>). Malzemelerin en önemli kısmının, eserlerindeki kırılmanın en son noktasında olduğunu ifade eden sanatçı, buna izin vermenin, çalışmanın fiziksel gücünü gerçeğe dönüştüren bir özgürlük olduğu tanımlamasını yapmaktadır.

Görsel 4. Mimi Joung, eserlerinden örnekler

<https://mimijoung.com/about>

Seramik üretiminde farklı şekillendirme yöntemlerinde değişik kimyasal ve fiziksel yapılarla sahip seramik çamurları kullanılmaktadır. Endüstriyel veya seri üretim olarak bilinen, alçı kalıba döküm yönteminde kullanılan döküm çamuru, alternatif bir şekillendirme yöntemi olan akıtma suretiyle yapılmaktadır. Akıtma ile şekillendirme olarak tanımlanabilen bu yolla, yine döküm çamuru ve alçı yüzey kullanılmaktadır. Bütünü oluşturacak parçalar tek tek ve birbirlerinden bağımsız olarak şekillendirilmektedir. Yüzeyden kalkabilecek kıvama geldiğinde ise parçalar birbiri ile yapıştırılarak bütün oluşturulmaktadır. Şekillendirme süresince parçaların

kıvamın korumak ve dayanımını sağlamak gerekmektedir. Oldukça kırılan ve hassas bir et kalınlığına sahip olmaları nedeniyle her bir parça özenle kullanılmalıdır.

Kişisel uygulama aşamalarında, akıtma ile şekillendirme yönteminde, boşluk ve doluluk algısı sorgulanırken, denge ve bütünlük unsurlarına da vurgu yapılmaktadır. Parçaların oluşturulmasından yapıştırılmasına, ürünün şekillendirilmesinden kurutulup pişirilmesine kadar her aşamasında büyük bir özen ve tecrübe gerekmektedir. Herhangi bir aşamada oluşabilecek hata veya dikkatsizlik geri dönüşü olmayan sonuçlar doğurabilmektedir. Her ne kadar risk teşkil eden bir üretim yöntemi olsa da, herhangi farklı bir dekora gerek kalmadan ürünler tamamlanmaktadır. Aslında dekoru, şekillendirme yönteminin kendisidir denilebilir. Akıtma ile şekillendirilmiş ürünler kuruduktan sonra 1100 °C de pişirilmektedir. Çalışmalar isteğe bağlı sırlı veya sırsız olarak sergilenebilme özelliğine sahiptir.

Görsel 5. Akıtma ile şekillendirilmiş özgün parça örnekleri.

Seda Dilay kişisel eser arşivinden

Görsel 6. Akıtma ile şekillendirilmiş özgün çalışma örnekleri.

Seda Dilay kişisel eser arşivinden.

Sonuç

Sanat eserlerinin güncel değer kazanabilmesi adına atılan adımlarda yenilikçi yöntemlerin kullanılması gerekliliği görülmektedir. Seramik malzemenin, tarihsel, kültürel, sanatsal ve teknolojik özellikler taşıması nedeniyle gelişime oldukça imkân veren bir seçenek olduğu söylenebilir. Seramik ürünlerin değerinin artırılması için, zaman zaman farklı şekillendirme, dekor ve pişirim yöntemleri kullanılmaktadır. Tarihi süreçte işlevselliğin estetik algıyla birlikte değerlendirilmiş olması, seramik ürünlerde yenilikçi ve sürdürülebilir bir yaklaşım olarak görülmektedir. Günümüzde seramik sanatında, en yaygın kullanılan şekillendirme tekniklerinin yanı sıra alternatif yöntemlerinde tercih ediliyor olması da bu nedenlerden kaynaklanmaktadır.

Farklı kıvamlarda farklı şekillendirme ve dekorlama teknikleri

Sonuç olarak; seramik şekillendirmede kullanılan alternatif üretim yöntemleri, plastik sanatlarda daima güncel ve sürdürülebilir bir tutum oluşturmaktadır. Yenilikçi şekillendirme yöntemleri ile yapılan çalışmalara bakıldığında, alışılmış seramik şekillendirme yöntemlerine göre farkındalık oluşturduğu ve özgün bir kimlik taşıdığı gözlenmektedir. Şekillendirme sonucunda ortaya çıkan estetik ya da kavramsal etkilerin de diğer sanatçılara ve sanat disiplinlerine olumlu etkiler sağlayabileceği öngörülmektedir.

Abstract

The task of the soil for agricultural production is to grow plants selected and planted according to the needs and wishes of people. For this, it starts by appropriately cultivating the soil. Applying agricultural techniques reveals the necessity of using various tools according to the type of soil and plant. In this sense, one of the soil tillage tools is the leveling shovel. Leveling shovels are used in agricultural enterprises for works such as leveling, paving, shoveling, channel opening, and channel closing. The leveling shovel is used for cleaning the land, breaking down the stones and plant residues on the surface of the land, and allowing the residues on the surface of the land to mix with the soil, while the amount of organic matter in the soil becomes fertile for the soil. Machine manufacturers, thinking that the products they produce after the sale will be operated under difficult conditions in the field, use thicker materials than they should be without performing strength analysis. While this increases the cost of the machine, it also increases the energy consumption of the machines used to drive the machine. Choosing the ideal material with a strength analysis using finite element methods before production will reduce costs and ensure the sustainability of agriculture. In this study, a leveling shovel used in soil tillage was solid modeled with Solidworks software. Then, the stress distributions occurring on the leveling shovel were simulated with the finite element package software Ansys Workbench in different load and working environments. As a result of the study, the maximum stress value was found to be 103.79 MPa, and the maximum total displacement value was found to be 406.23 mm.

Keywords: Leveling shovel, finite element method, Ansys Workbench.

Introduction

The task of the soil for agricultural production is to grow plants that are selected and planted according to the needs and wishes of people. For this, it starts by appropriately cultivating the soil. By applying agricultural techniques, it is necessary to use various tools according to the type of soil and plant. The available land sometimes creates a limited situation for adequate production. New agricultural lands are needed to increase the amount and yield of agricultural products [1]. In this sense, one of the tillage tools is the leveling shovel. Leveling shovels are designed for works such as leveling, paving, shoveling, channel opening, and channel closing. The leveling shovel increases the amount of organic matter in the soil while cleaning the land, breaking down the stones and plant residues on the surface of the land, and mixing the residual materials on the land surface into the soil [1-5]. Therefore, it also improves the soil structure.

Many benefits are obtained with the operations performed with the leveling shovel. These are;

- Erosion control
- Ensuring that the water the plant will receive reaches it evenly
- Create the required planting method and planting depth
- Eliminating the drainage problem by making the pits on the land uniform
- By preparing a smooth seedbed, it is possible to ensure smooth movement areas for other production machinery [6-8].

Since leveling shovels work on hard ground and in difficult conditions, the surfaces in contact with the soil are extremely abraded. The blades of leveling shovels need to be made of high-strength, high-strength materials such as steel to prevent easy abrasion.

Materials and Methods

The material of the research was the leveling shovel produced by the manufacturer. The 30MNB5 steel used in the shovel part of the leveling shovel and the manufacturing steel used in the body of the leveling shovel are widely used in the market, some technical specifications of the materials are given in Table 1 and the technical dimensions of the leveling shovel are given in Figure 1.

Table 1. Leveling shovel material properties

Shovel (30MNB5)	
Modulus of Elasticity	210 GPa
Yield Strength	510 MPa
Poisson's ratio is	0,3
Density	7860 kg/m ³

Body (Manufacturing Steel St50)	
Modulus of Elasticity	211 GPa
Tensile Strength	470 MPa
Yield Strength	295 MPa
Poisson's ratio	0,3

Figure 1. 3D solid model of leveling shovel

The leveling shovel was solidly modeled with Solidworks software (Fig.2). Then, the stress distributions occurring on the leveling shovel were simulated with the finite element package software Ansys Workbench in different load and working environments. The analyzes were carried out as three-dimensional linear static. The stress analysis results obtained are given as outputs of Ansys Workbench package software. The operation of the leveling shovel was evaluated and simulated for the application conditions. The forces on the leveling shovel were

$$\text{calculated by equation (1) [8]. } R_c = a \cdot b \cdot n \cdot k_o \cdot \sqrt{v} \quad (1)$$

Inequality;

R_{ϕ} : Towing Force (daN)

a: Work depth (dm)

b: Working width of a body (dm)

n: Number of bodies (Pieces)

k_o : Specific soil resistance (kp/dm^2) (40 kp/dm^2 was taken in the study)

v: Advance speed (km/h) (Advance speed was taken as 5.4 km/h).

Figure 2. Solid model drawings of the leveling shovel

In the first step of the analysis process performed in the simulation environment with the finite element method, the meshing of the leveling shovel model, in other words, the separation of the model into the most appropriate small parts, was performed (Fig.3). The "meshing" functions of Ansys Workbench software were utilized to create the finite element structure of the leveling shovel. A total number of 786.908 elements and 1.182.837 total nodes were obtained for the leveling shovel.

Figure 3. Finite element structure of the leveling shovel model

Towing force is a horizontal force consisting of the soil-vegetation resistance required to pull an agricultural machine and the rolling resistance required to overcome the weight of the tractor and agricultural machine [9]. Although the forces in the vertical direction are smaller than the forces in the horizontal direction, they were used in the analysis. During tillage, the soil is pushed by the leveling shovel in the opposite direction to the vertical component of soil resistance in an attempt to go deeper. Forces of 1350 N (Fig.4) and 100 N (Fig.5) were applied at certain points in the opposite direction to the direction of advance of the leveling shovel (Fig.4).

Figure 4. Defining boundary conditions and loads

Research Findings and Discussion

After the stress analysis solution process, the stress distributions occurring on the leveling shovel are given in Figure 5. When the structure of the leveling shovel is examined, it is seen that the maximum equivalent stress is at the connection part of the leveling shovel with the body. The maximum stress value is 103.79 MPa. When this value is evaluated in terms of shovel material, it is below the yield strength of the shovel. When the stresses on the body were examined (Fig.6), it was determined that the stress distribution under the applied loads remained within the yield strength limits of the material. The maximum equivalent stress and the safety coefficients obtained according to the yield strength of the material for Figures 5-7 are given in Table 2. When the equivalent stress values of all structural elements are analyzed, it is seen that the leveling shovel works safely without damage under the application conditions.

Figure 5. Distribution of equivalent stresses for the whole structure

Figure 6. Equivalent stress distributions for the body

Figure 7. Equivalent stress distributions for the paddle element

Table 2. Working safety coefficients calculated for leveling shovel

Leveling Shovel Elements	Material Yield Strength [σ_{yield}] [mpa]	Max. Equivalent Stress [σ_{es}] [mpa]	Safety Coefficient [k_{em}]=[$\sigma_{yield} / \sigma_{es}$]
Shovel	510	103,79	4,914
Body	295	18,623	15,84

Figure 8. Maximum total displacement distribution of the leveling shovel

In the research, displacement analysis was performed under the loads applied to the leveling shovel. As a result of the analysis, the maximum total displacement value was found to be 406.23 mm (Fig.8).

Conclusion

In this study, three-dimensional solid modeling of the leveling shovel obtained from the market was made and the stress analysis of the modeled leveling shovel under normal field conditions was simulated. The results obtained as a result of the analysis are given below.

- a. For the whole leveling shovel construction, the maximum equivalent stress value is 103.79 MPa at the connection part of the leveling shovel with the body.
- b. The maximum equivalent stress value is 103.79 MPa at the connection of the leveling shovel with the body.
- c. The maximum equivalent stress value was determined as 18.623 MPa on the body.
- d. The maximum total displacement for the leveling shovel was found to be 406.23 mm.
- e. In the simulation, no damage was found in the construction of the leveling shovel. It was determined that the leveling shovel and its body carried the forces applied at different points within the elastic deformation limits of the materials used.

It is necessary to carry out material tests of agricultural tools and machines designed by personnel and produced from different materials and shapes. Since the trials carried out in real

field conditions are time-consuming and costly, the strength analysis of the products to be designed with 3D solid modeling techniques and finite element method will minimize unnecessary time loss [10]. In this context, the data obtained in the virtual environment should be interpreted very well before manufacturing, and experimental studies should be directed when necessary.

Abstract

Despite the transition to automation systems in many areas with technological innovations, most enterprises still need a physical labor force. Especially in jobs that require intensive labor, inappropriate working postures of employees cause musculoskeletal system disorders and cause a decrease in production efficiency. The main goal of ergonomics is to achieve the best performance with the least manpower. It is known that inappropriate postures during work cause permanent musculoskeletal disorders in employees in the long term. Various methods are used to detect and analyze this situation. In this study, the work of the employees in the machine shop on various benches was recorded, the data obtained were processed and the working postures were analyzed with the REBA (Rapid Entire Body Assessment) Method. As a result of the evaluations, the REBA score of the employees was calculated as 4. This value indicates that a medium-risk work stoppage has occurred and measures should be taken. As a precautionary measure, it is recommended to make the necessary ergonomic arrangements to improve the working postures of the employees.

Keywords: Working postures, REBA Method, workshop.

Introduction

Despite the transition to automation systems as a result of technological innovations in many sectors, many industrial enterprises still need physical labor. In jobs requiring intensive labor, employees' inappropriate working postures cause musculoskeletal system disorders and cause a decrease in production efficiency. With the idea that the main goal of ergonomics is to achieve the best performance with the least manpower, the examination of working postures, which is an important issue for both businesses and employees, has an important place in the science of ergonomics.

In the most general sense, posture is defined as the alignment of the body, head, torso, arms, and legs in space. According to this definition, working posture can be defined as the alignment of the body parts according to the work performed or the characteristics of the work [1]. Inappropriate working postures are defined as the deviation of one or more body parts from normal posture [2]. It is known that various musculoskeletal disorders often occur in sedentary or low-mobility workers and even cause serious disorders in the long term [3]. If the posture during work is not correct, this causes stress, fatigue, and pain in the worker. In this case, it would be the best decision to wait for the active muscles of the worker to regenerate themselves. The factors that make improper working postures important in machine shops can be analyzed in two groups: disorders in the body and inefficiencies in production.

Musculoskeletal disorders are caused by ordinary body movements such as bending, straightening, holding, grasping, twisting, and reaching, while production inefficiencies occur due to these disorders. These movements may not be harmful in normal life, but their repetition, forceful behaviors, and fast movements in work make them harmful to the body. These disorders are not instantaneous. They are long-term and slowly developing disorders [4]. It can be said that the most common musculoskeletal disorders in machine shop workers are low back and back pain.

A study conducted in the USA reported that the total direct and indirect costs of musculoskeletal diseases to the industry in 1997 were \$13-\$14 billion. Musculoskeletal disorders accounted for 42% of occupational diseases [5]. It can be said that these disorders are caused by fixed postures, continuous and repetitive movements, duration and frequency of work, strains caused by inappropriate postures in certain parts of the body, and work that does not allow appropriate movement and vibrations.

REBA Method

The REBA method is an observation-based posture analysis method that analyses the posture of the employee during static or dynamic whole-body activities, enabling the detection of the working style that may cause occupational musculoskeletal disorders and taking precautions. REBA was developed by two researchers, Hignett and McAtamney, in 1995 and published in 2000, utilizing RULA (Rapid Upper Limb Assessment) methods based on the OWAS (Ovako Working Posture Analysis System) method used in the metal industry [6]. The REBA method evaluates the whole-body posture. To apply the method and to analyze posture, it is recommended to analyze the study with photographs or videos. From the images obtained, posture analysis is performed by selecting frequently repeated movements that require more physical force, strain the employee more, and take time. In the REBA method, the risk score is determined by giving points to the postures by taking into account the instantaneous posture of the neck, torso, legs, upper arm, and lower arm during the posture to be analyzed [7]. In this study, the working postures of the employees in the machine shop were examined and the REBA method was used in the risk analysis with the data obtained.

Materials and Methods

Material

For the ergonomic evaluation of the employees working in the machine shop, the employees working in Karamanoğlu Mehmetbey University Vocational School of Technical Sciences Machining Workshop were selected as the research material. In the workshop, there are machines such as universal lathe, milling machine, drill machine, and grinding machine, which are actively used in production. The data were collected without interrupting the work of the employees. To determine the physical loads and postural disorders of the workers in the machine shop, the data in the study were taken in real-time from 5 people randomly selected from 10 employees who volunteered and allowed the data to be taken. During the recording of the measurements with the camera, the employees continued their normal work. The images obtained were analyzed in a computer environment.

Method

In each process group monitored within the scope of the study, randomly selected employees were filmed with a camera. Camera recordings were used to make timeliness calculations and the images were analyzed and analyzed during the work of the workers in the machine shop. Physical load scores of employees can be determined using REBA methods [7,8].

The REBA method is a practical method that allows all parts of the body to be analyzed. It numerically expresses the risk caused by a working posture or movement to be analyzed. In the REBA method, a score ranging from 1 to 15 is determined depending on the flexions and extensions that occur in the torso, neck, legs, upper arms, lower arms, and wrists during a working posture and the loads that the employee is exposed to during these postures. When determining the REBA score of a working posture according to the REBA method, the body parts are first divided into two Group A and Group B. Group A includes the torso, neck, and legs, while Group B includes the upper arms, lower arms, and wrists [7].

The scores of the trunk, neck, and legs are determined separately and a score consisting of the combination of these scores is determined with the help of Table A. A score is obtained by adding the Load/Strength score to this score. The scores of the upper arm, lower arm, and wrists are also determined separately and a score consisting of a combination of these scores is determined with the help of Table B. The grip score is added to this score to obtain a score of B [9,10]. Then, using Table C, a score C is obtained, which is a combination of scores A and B. The REBA score is obtained by adding the activity score to the C score (Figure 1).

REBA Method

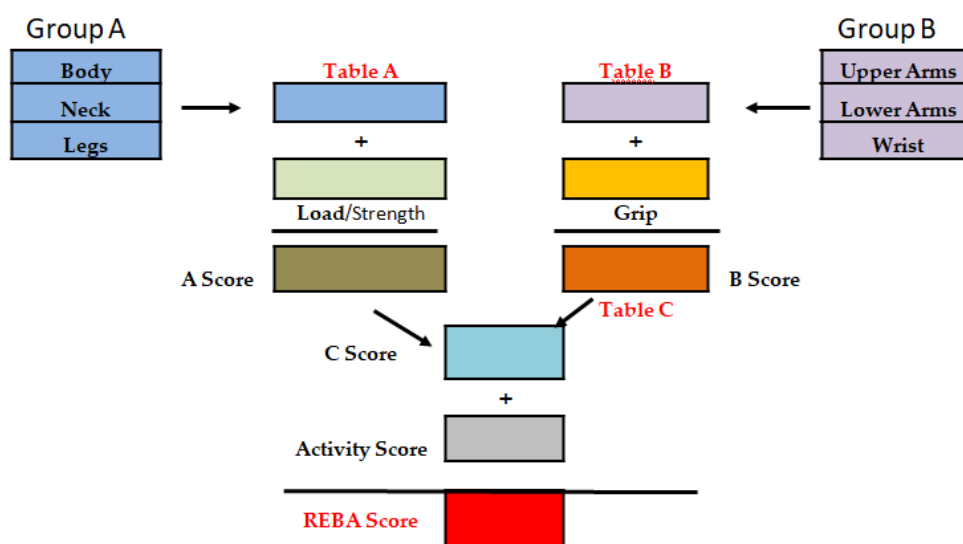

Figure 1. REBA Method flow diagram [9].

According to the posture position of the workers; separate scores of the trunk, neck, and legs are determined (Fig. 2). With the help of Table A shown in Table 1, the posture angles are converted into a numerical value with a score consisting of a combination of these scores.

Body:

Movement	Score	Score Change
Upright	1	
0° – 20° Stretching	2	
0° – 20° Reach		If there is sideways flexion or rotation +1
20° – 60° Stretching	3	
> 20° Reach		
> 60° Stretching	4	

Neck:

Movement	Score	Score Change
0° – 20° Stretching	1	If there is sideways flexion or rotation +1
> 20° Stretching or Reach	2	

Legs:

Movement	Score	Score Change
Bilateral weight bearing, walking or sitting	1	Knee flexion between 30°-60° +1
Unilateral weight bearing or unstable posture	2	

Figure 2. Group A score determinat

Table 1. REBA Method Table A

		Neck											
		1				2				3			
		Legs				Legs				Legs			
Body	1	1	2	3	4	1	2	3	4	1	2	3	4
	2	2	3	4	5	3	4	5	6	4	5	6	7
	3	2	4	5	6	4	5	6	7	5	6	7	8
	4	3	5	6	7	5	6	7	8	6	7	8	9
	5	4	6	7	8	6	7	8	9	7	8	9	9

After obtaining the numerical data for group A, Score A is obtained by adding the Load/Strength score (Table 2).

Table 2. Load/Strength Score Table

Load/Strength	Score
< 5 kg	0
5 – 10 kg	1
> 10 kg	2
The sudden or rapid increase in force	+1

After the numerical values of group A are obtained, the parts in group B are evaluated. As shown in Fig.3, separate scores for the upper arm, lower arm, and wrists are determined according to the posture position.

Upper Arms:

Movement	Score	Score Change
20° Stretching 20° Reach	1	+1 if there is arm rotation
20° – 45° Stretching > 20° Reach	2	+1 if the shoulder is raised
45° – 90° Stretching	3	If gravity support is effective in arm posture -1
> 90° Stretching	4	

Lower Arms:

Movement	Score
60° – 100° Stretching	1
< 60° Stretching or > 100° Reach	2

Wrist:

Movement	Score	Score Change
0° – 15° Stretching or Reach	1	If there is side flexion or rotation of the wrists +1
> 15° Stretching or Reach	2	

Figure 3. Group B score determination template

After the scores of the posture angle of the employees are obtained with the help of the template given in Fig.3, they are analyzed in Table B using Table 3. The first stage of the B group score value is realized by combining the determined arm and wrist angle score values in Table B.

Table 3. REBA Method Table B

		Lower Arm					
		1			2		
		Wrist			Wrist		
		1	2	3	1	2	3
Upper Arm	1	1	2	2	1	2	3
	2	1	2	3	2	3	4
	3	3	4	5	4	5	5
	4	4	5	5	5	6	7
	5	6	7	8	7	8	8
	6	7	8	8	8	9	9

In the second stage, the Group B score is determined by adding the grip score value given in Table 4 to the value in Table B.

Table 4. Grip Score Value

Degree	Description	Score
Good	Grip handle and medium grip strength	0
Good	A suitable Hand grip is suitable but not ideal or a grip with another part of the body is suitable	1
Poor	Hand grip possible although not suitable	2
Not Suitable	Difficult and unsafe grip, and no handle. Using another part of the body, the grip is not suitable	3

According to the REBA flowchart given in Figure 1, the A and B score values obtained are combined in the C table shown in Table 5. Thus, the C score is obtained.

Table 5. REBA Method Table C

		B Score											
		1	2	3	4	5	6	7	8	9	10	11	12
A Score	1	1	1	1	2	3	3	4	5	6	7	7	7
	2	1	2	2	3	4	4	5	6	6	7	7	8
	3	2	3	3	3	4	5	6	7	7	8	8	8
	4	3	4	4	4	5	6	7	8	8	9	9	9
	5	4	4	4	5	6	7	8	8	9	9	9	9
	6	6	6	6	6	8	8	9	9	10	10	10	10
	7	7	7	7	7	9	9	9	10	10	11	11	11
	8	8	8	8	8	10	10	10	10	10	11	11	11
	9	9	9	9	9	10	10	11	11	11	12	12	12
	10	10	10	10	10	11	11	11	12	12	12	12	12
	11	11	11	11	11	12	12	12	12	12	12	12	12
	12	12	12	12	12	12	12	12	12	12	12	12	12

The angles of the body parts, load/force ratios, and grip conditions for the work performed were examined in detail for the workers. It is seen that the work is mobile. The activity score is added to the obtained C score according to the activity status of the employees (Table 6).

Table 6. Activity Score Schedule

Activity	Score
Holding one or more body parts still (e.g., holding for longer than 1 minute)	+1
Repetitive work at short intervals (e.g. more than four repetitive tasks in 1 minute)	+1
If the work causes rapid and large changes in posture or works on unstable ground	+1

The REBA score is obtained by adding the activity score to the C score. The score is evaluated using the REBA risk rating chart shown in Table 7. The REBA risk rating consists of 5 grades from 0 to 4. The grades are separated by numerical values 1-15. With the REBA score obtained, an ergonomic risk assessment of working conditions is performed.

Table 7. REBA Risk Assessment Schedule

Grade	REBA Score	Risk Level	Measure
0	1	Negligible	Not Required
1	2 - 3	Low	May be necessary
2	4 - 7	Medium	Required
3	8 - 10	High	In a short time Required
4	11 - 15	Very High	Immediately Required

Research Results and Discussion

A and B group values were determined according to the REBA method. The neck, trunk, and legs in group A were scored according to flexion and rotation values. Firstly, data were taken for the trunk as shown in Figure 4. When Figure 4 is analyzed, it is seen that the body of the employee flexes approximately 20°-60°. The score 3 corresponding to this angular value was converted into numerical values using the REBA A score determination template in Fig.4. Thus, the body score will be 3 since there is a 20°-60° flexion.

Body

Movement	Score	Score Change
Upright	1	If there is sideways flexion or rotation +1
0° – 20° Stretching 0° – 20° Reach	2	
20° – 60° Stretching > 20° Reach	3	
> 60° Stretching	4	

Figure 4. Body posture angles during operation

As seen in Figure 5, it was observed that the length was flexed approximately 0°-20°. These angular values were converted into numerical values using the REBA A score determination template in Fig.2. Thus, the neck score will be 1 because it stretches from 0°-20°.

Neck

Movement	Score	Score Change
0° – 20° Stretching	1	If there is sideways flexion or rotation +1
> 20° Stretching or Reach	2	

Figure 5. Neck posture angles during operation

For the legs, which is the last component in group A, it is seen that there is unilateral weight bearing or unstable posture and 30°-60° flexion in the knees as seen in Fig.6. Therefore, the numerical value of the neck score was taken as 1+1=2.

Legs:

Movement	Score	Score Change
Bilateral weight bearing, walking or sitting	1	Knee flexion between 30°-60° +1
Unilateral weight bearing or unstable posture	2	Knee flexion >60° +2

Figure 6. Leg stance angles during the study

Load/Strength	Score
< 5 kg	0
5 – 10 kg	1
> 10 kg	2
The sudden or rapid increase in force	+1

Figure 7. Load/Strength Score

In determining the force/load score in the machine shop, material weight, and pulling force were taken into consideration. The weight score was determined as 0 with the assumption that the applied force was less than 5 kg. Thus, the force/load score was 0 (Fig.7). Table A value was obtained as 5 by using Table A in Table 8 with these data obtained.

Table 8. REBA Method Table A

	5	4	6	7	8	6	7	8	9	7	8	9	9

When finding the Table B score, the upper arm, lower, arm, and wrist posture position should be analyzed. during work, the worker's upper arm holds the machine parts at an angle of 20° (Fig.8). The upper arm 20° posture position is determined as 1 point.

Upper Arms:

Movement	Score	Score Change
20° Stretching 20° Reach	1	+1 if there is arm rotation
20° – 45° Stretching > 20° Reach	2	
45° – 90° Stretching	3	+1 if the shoulder is raised If gravity support is effective in arm posture - 1
> 90° Stretching	4	

Figure 8. Upper arm posture angles during operation

During the machine shop, it is seen that the worker's lower arm grasps the machine parts at an angle between 60° and 100° (Fig.9). In this case, 1 point was assigned for the lower arm 60° and 100° reaching position.

Lower Arms:

Movement	Score
60° – 100° Stretching	1
< 60° Stretching or > 100° Reach	2

Figure 9. Lower arm posture angles during the operation

During the work in the machine shop, it was determined that the wrists of the worker had extension or flexion between 0° and 15°. No lateral flexion or rotation of the wrists was observed (Fig.10). In this case, the score for the wrists was determined as 1 point.

Wrist:

Movement	Score	Score Change
0° – 15° Stretching or Reach	1	If there is side flexion or rotation of the wrists +1
> 15° Stretching or Reach	2	

Figure 10. Posture angles of the wrists during the operation

**International Conference on Global Practice of Multidisciplinary Scientific Studies-IV
Turkish Republic of Northern Cyprus, April 28-30, 2023**

The grip score was assumed to be 0, assuming a good grip in the processes studied in machine shops (Table 9).

Table 9. Grip Score Value

Degree	Description	Score
Good	Grip handle and medium grip strength	0
Good	A suitable Hand grip is suitable but not ideal or a grip with another part of the body is suitable	1
Poor	Hand grip possible although not suitable	2
Not Suitable	Difficult and unsafe grip, and no handle. Using another part of the body, the grip is not suitable	3

Table B value was obtained as 1 by using Table B in Table 10 with these data.

Table 10. REBA Method Table B

		Lower Arm					
		1			2		
		Wrist			Wrist		
		1	2	3	1	2	3
Upper Arm	1	1	2	2	1	2	3
	2	1	2	3	2	3	4

	4	4	5	5	5	6	7
	5	6	7	8	7	8	8
	6	7	8	8	8	9	9

With the help of Score, A and Score B, Score C value was found as 3 with the help of Table 11.

Table 11. REBA Method Table C

		B Score											
		1	2	3	4	5	6	7	8	9	10	11	12
A Score	1	1	1	1	2	3	3	4	5	6	7	7	7
	2	1	2	2	3	4	4	5	6	6	7	7	8
	3	2	3	3	3	4	5	6	7	7	8	8	8
	4	3	4	4	4	5	6	7	8	8	9	9	9
	5	4	4	4	5	6	7	8	8	9	9	9	9
	6	6	6	6	6	8	8	9	9	10	10	10	10
	7	7	7	7	7	9	9	9	10	10	11	11	11
	8	8	8	8	8	10	10	10	10	10	11	11	11
	9	9	9	9	9	10	10	11	11	11	12	12	12
	10	10	10	10	10	11	11	11	12	12	12	12	12
	11	11	11	11	11	12	12	12	12	12	12	12	12
	12	12	12	12	12	12	12	12	12	12	12	12	12

Since the work performed was repetitive with short intervals, the Activity Score was taken as +1 (Table 12).

Table 12. Activity Score Schedule

Activity	Score
Holding one or more body parts still (e.g., holding for longer than 1 minute)	+1
Repetitive work at short intervals (e.g. more than four repetitive tasks in 1 minute)	+1
If the work causes rapid and large changes in posture or works on unstable ground	+1

When the values obtained from the A score, B Score, C Score, and Activity scores are placed on the REBA Flow Diagram in Figure 1, the REBA Score used in ergonomic and risk assessment during work in the machine shop was found to be 4. As can be seen from Table 7, this value is in the 2-degree risk zone. Precautions need to be taken.

Employees working in the machine shop should be given breaks at short time intervals. Öz and Çakmak (2017) state that a safety culture should be developed for employees [8].

Abstract

TiO₂ photocatalysis faces significant challenges for its practical and commercial exploitation due to its low visible light photoconversion efficiency, low quantum yield, and high recombination rate. Therefore, in order to decrease recombination, it is crucial to increase TiO₂'s capacity for light utilization and photogenerated electron-hole pair separation. Modifying the surface of TiO₂ with graphene, silver, iron is frequently used methods because it offers a simple method for increasing its photoactivity. The main goal of this work has consisted of a comparison study of TiO₂, AgNO₃ and Fe(NO₃)₂ nanocomposites in photocatalysis of textile wastewater at lab scale photoreactor. The effect of type of oxidant agent (H₂O₂, PMS) was analyzed to determine the synthesized hybrid photocatalysts reach the best performance. It has been observed that the iron-based titanium form is more efficient with the result of 59.12% and 100% COD and color removal efficiency respectively.

Keywords: TiO₂, AOPs, Heterogeneous photocatalyst.

Introduction

Advanced Oxidation Processes (AOPs) are recent developments in wastewater treatment, effectiveness of processes is determined by their capacity to generate the second-strongest oxidant after fluorine. Utilizing oxidizing agents such as homogeneous or heterogeneous photocatalysts, ozone (O_3), hydrogen peroxide (H_2O_2), or UV radiation to reduce free hydroxyl radicals (OH^\bullet). It is very likely that these OH^\bullet will attack organic matter in an aggressive and non-selective manner, producing only water and carbon dioxide as byproducts at a total mineralization level or species with molecular weights below an intermediate level. Heterogeneous photocatalysis, an advanced oxidation technology, is a useful technique for reducing and mineralizing persistent organic pollutants in water [1, 2].

Titanium dioxide (TiO_2) is a widely accepted candidate among the many semiconductor heterogeneous photocatalysts because of its photostability, inherent electronic and surface properties, non-toxicity, cost-effectiveness, and environmental friendliness. To apply semiconductor photocatalysts for water treatment, the following needs to be fulfilled; the operation needs to be performed at room temperature or pressure, complete mineralization without secondary pollution, repetitive cycles and low costs for operations. TiO_2 photocatalysis is a photo-induced charge separation phenomenon that occurs on the TiO_2 surface, and very high reactive oxygen species can cause microbial inactivation and organic mineralization without secondary pollution [3-5].

The majority of common photocatalysts are semiconductors and are extensively investigated in the past decades. TiO_2 is having high photocatalytic efficiency, typical morphology, photostability, and chemical and biological stability. The high bandgap energy (3.2 eV) of TiO_2 is responsible for excitation itself by ultraviolet (UV) radiation to cause separation of the charges within the particles. TiO_2 can produce reactive oxygen species (ROS) after UV irradiation that can completely degrade pollutants within a very short time. Modifying the surface of TiO_2 with graphene, silver, iron is frequently used methods because it offers a simple method for increasing its photoactivity. [4, 6].

The main goal of this work has consisted of a comparison study of TiO_2 , $AgNO_3$ and $Fe(NO_3)_2$ doped TiO_2 for photocatalysis of textile wastewater in lab scale photoreactor. The effect of type of oxidant agent (H_2O_2 , PMS) was analyzed to determine the synthesized hybrid photocatalysts reach the best performance.

Methods

The photocatalytic oxidation experiments were done under artificial solar radiation in a closed reactor. The degradations were monitored by measuring chemical oxygen demand (COD) and color. Experiment were carried out in a glass vessel batch on an aluminum plate to reflect light. In all cases, the pH of wastewater was initially adjusted to 3, 100 mL of wastewater sample and 0.02 g of catalyst were added the vessel, then 1 hour degradation was initiated by adding the 5 mM oxidant and turning the lamp on simultaneously. At the end of the reaction, the treated wastewater samples were centrifuged at 9000 rpm for 10 min. to separate the catalyst. The COD and color measurements of the treated wastewater were made after filtering through the glass fiber filter, 0.45 μ m syringe filters respectively. For COD analyses closed reflux colorimetric method was used. After were digestion at 148 °C for 2 hours in a thermoreactor, the absorbance of samples were measured by using a Hach Lange DR 6000 model spectrophotometer at 420 nm, also color measurements were performed with the same spectrophotometer.

Results

The results of heterogeneous oxidation experiments are given in Table 1.

Table 1. Experimental results of heterogeneous photocatalysts.

	Oxidant	Color (Pt-Co)	COD (mg/L)	COD %	Color %
Textile Wastewater	—	160	70.13	0	0
TiO₂	—	30	41.58	40.70	81.25
TiO₂	H₂O₂	21	48.25	31.19	86.88
TiO₂	PMS	4	37.18	46.98	97.50
Ag-TiO₂	—	30	60.96	13.07	81.25
Ag-TiO₂	H₂O₂	10	46.58	33.57	93.75
Ag-TiO₂	PMS	0	56.99	18.73	100.00
Fe-TiO₂	—	72	53.88	23.17	55.00
Fe-TiO₂	H₂O₂	0	28.67	59.12	100.00
Fe-TiO₂	PMS	9	45.74	34.77	94.38

According to the obtained data, the maximum COD removal efficiency was observed in heterogeneous photocatalysts oxidation performed using H₂O₂ oxidant with Fe-TiO₂ catalyst with 59.12%. At the same conditions color removal efficiency was 100%. The results obtained by using other photocatalysts are shown in detail in Table 1.

Fig. 1. Color and COD concentrations of textile wastewater after oxidation with heterogeneous photocatalysts.

As can be understood from Fig. 1, the color concentration value has generally been halved for all heterogeneous photocatalysts. The highest color concentration value of 72 Pt-Co was observed in the heterogeneous oxidation of iron-based titanium dioxide (Fe-TiO₂) without oxidant. In heterogeneous oxidations of iron-based titanium dioxide (Fe-TiO₂) in the presence of hydrogen peroxide (H₂O₂), silver-based titanium dioxide (Ag-TiO₂) in the presence of peroxymonosulfate (PMS), the color was completely eliminated.

Fig. 2. Color and COD removal efficiency of heterogeneous photocatalysts.

COD removal efficiency usually remains below 50% as it shown Fig.2. The highest efficiency was achieved using H₂O₂ oxidant with Fe-TiO₂ catalyst as 59.12%. The minimum COD removal efficiency was observed in heterogeneous photocatalytic oxidation performed without oxidant with Ag-TiO₂ catalyst as 13.07%. This value is also lower than the efficiency obtained by using titanium dioxide alone. It is expected that the photocatalytic activity of titanium dioxide will increase with the modification of its surface [6, 7]. However, this did not apply to all photocatalysts used. The COD removal efficiency for modified photocatalysts is higher in cases where H₂O₂ is used as an oxidant. According to the results obtained from the heterogeneous catalysts used, the use of titanium alone and modified versions were compared. It has been understood that the iron-based titanium form is more efficient. By taking advantage of this superiority, it is thought that the efficiency of titanium-based iron heterogeneous catalyst can be increased by testing different fractions and investigating the optimal conditions.

ABSTRACT

The world population has increased rapidly since the industrial revolution which has led to an increase in demand for food. To meet this demand, various agricultural control tools have been used including pesticides which are very effective in protecting crops from harmful organisms and increasing agricultural productivity. However, pesticides are hazardous and can pollute water resources when used excessively. It is important to treat pesticides properly to avoid negative effects on human health and environmental life. The biodegradability of pesticides is very difficult and it has been observed that sufficient pesticide removal cannot be achieved in studies using biological treatment methods. Today, alternative treatment methods are being developed for pesticides whose removal is quite low with conventional wastewater treatment methods. The Electro-Fenton process, which is one of the electrochemical treatment methods, shows very successful results in pesticide removal. In this study, treatability studies of pesticide industry wastewater were carried out using the Electro-Fenton Process. Within the scope of the study, process optimization will be made to determine the optimum conditions of the operational parameters (pH, current density, H₂O₂ concentration and reaction time) in the process. For this purpose, COD analysis will be performed in wastewater before and after the Electro-Fenton application. In this way, the advantages of the treatment method on pesticide removal will be determined.

Keywords: Electro-fenton, iron electrode, optimization, operating parameters

INTRODUCTION

The industrial revolution caused a fast increase within the world population. This situation has led to a tremendous increase in the demand for food, which is one of the basic needs. In response to current increasing demand, the inadequacy to achieve the desired increase in the amount of food production has brought along supply and access drawbacks. To solve this problem in food supply, it was planned to get more products per unit area. To that end, various agricultural control tools have been used. One of the most prevalent methods used in agricultural control is undoubtedly chemical control using pesticides (Kaur et al., 1998). Pesticides are extremely effective, provide fast results and might additionally shield the merchandise from harmful organisms (De Ward et al., 1993). These benefits are the foremost vital reasons why pesticides still be a necessary methodology in plant protection today.

The utilization of pesticides causes a rise in agricultural productivity, however because of their hazardous nature, pesticides are highly harmful and constitute a pollutant class for water resources. Excessive use of those product ends up in accumulations within the soil and water, and these accumulations are mixed with surface waters through rainwater (Arias-Estevéz et al., 2008). Although the main source of pesticides in surface waters is agricultural spraying, high-concentration wastewater from agrochemical industries that manufacture pesticides is also discharged into these surface waters without being sufficiently treated (Burçak and Kaya, 2000). Treatment of pesticides is incredibly vital because of the negative effects they have on human health and environmental life.

Pesticides are compounds that are very tough to biodegrade. Within the literature, it has been determined that adequate pesticide removal could not be achieved in studies using the biological treatment method (Katsayiannis A. and Constantini S., 2005, Bernard M. et al., 2006). Today, alternative treatment ways are being developed for pesticides whose removal is kind of low with conventional wastewater treatment methods. Electro-Fenton process, which is one of the electrochemical treatment methods, shows very successful results in pesticide removal (Nidheesh et al., 2012).

In the Electro-Fenton method, the Fenton process and electrocoagulation are used together to increase the degradability of organic compounds found in high-strength wastewater (Pushpalatha and Krishna, 2017). The increased production of hydroxyl radicals within the presence of electricity provides a remarkable improvement in the removal of pollutants. There are two different configurations of the Electro-Fenton process. The first of these is the system in which Fenton reagents are added to the system from the outside and inert electrodes with high catalytic activity are used as the anode material, and the second is the system in which

H_2O_2 is added from the outside and Fe^{+2} is produced from sacrificial iron anodes. The widely accepted mechanism of the Electro-Fenton process involves the formation of H_2O_2 at the cathode and Fe^{+2} production at the anode. Within the Electro-Fenton process, the source of hydroxyl radicals is not simply Fenton oxidation. In this method, OH^\cdot radicals can also be formed by the hydrolysis of water on the anode surface.

In this study, treatability studies of pesticide industry wastewater were carried out using the Electro-Fenton Process. Within the scope of the study, process optimization will be made to determine the optimum conditions of the operational parameters (pH, current density) in the process. As a result of the experimental studies, the operational conditions that provide the highest Chemical Oxygen Demand (COD) removal will be determined. For this purpose, COD analysis will be performed in wastewater before and after the Electro-Fenton application. In this way, the advantages of the treatment method on pesticide removal will be determined.

MATERIAL AND METHOD

Experimental Set up

A synthetic wastewater sample containing an average of 3000 – 4000 mg/L of Malathion pesticide, prepared to represent the pesticide industry wastewater, was provided. The Electro-Fenton reactor has an effective operating volume of 0.5 L and also acts as a cathode. The iron anode electrode has an effective surface area of 91.5 cm^2 .

Current and voltage control is provided by GW Instek SPD-3606 (0-30 V & 0-6 A) brand digitally controlled direct current power supply. WTW pH 330i brand pH meter was used to adjust the initial pH value of the wastewater and to see the pH change as a result of the reaction. During the reaction, mixing was done with a Heidolph RZR 2102 Control mechanical stirrer. Experimental studies were carried out in the batch reactor setup whose schematic illustration is given in Figure 1.

Figure 1. Schematic illustration of the experimental setup

Experimental Plan

Process optimization will be made to determine the optimum conditions of the operational parameters (pH, current density) in the process. During these studies, the initial H_2O_2 concentration was kept constant at 2000mg/L and the reaction time was 45 minutes. In optimization studies, pH (A), current density (B) parameters are considered as factors directly affecting removal efficiency. Process factors and levels are shown in Table 1.

Table 1. Process factors and levels used for optimization work

Factors	Unit	Levels		
		-1	0	1
pH (A)	-	2	3	4
Current Density (B)	mA/cm ²	20	30	40

Table 2. Experimental Plan

pH	Current Density (mA/cm²)	H₂O₂ Concentration (mg/L)	Reaction Time (min)
2	20	2000	45
	30	2000	45
	40	2000	45
3	20	2000	45
	30	2000	45
	40	2000	45
4	20	2000	45
	30	2000	45
	40	2000	45

Electrochemical Treatment and Chemical Analysis

After the provision of synthetic wastewater, the parameters that are thought to influence the performance of Electro-Fenton (pH, current density) are modified and COD removals in wastewater will be examined. The main purpose here is to work out the optimum conditions for the Electro-Fenton process and to treat the wastewater underneath these conditions. For optimization of variables, 0.4 L wastewater was put into the reactor and pH adjusted. Then the electrodes were connected to the power supply and reaction was initiated by adjusting the required current density. The wastewater was stirred at a speed of a 75 rpm. At the end of the treatment, treated water was centrifuged before parameter analysis. Then, COD analysis was performed on samples taken from the upper part (supernatant). Determination of Chemical Oxygen Demand was performed according to Standard Methods: 5220C - Closed Reflux Titrimetric Method (APHA 2005).

RESULTS

The results of COD removal optimization experiments obtained using Fe electrodes are given in Table 3. All experimental studies were carried out under the same conditions (H₂O₂ concentration = 2000 mg/L, Reaction time = 45 min, NaSO₄ = 0.05M and Stirring speed = 75 rpm). In the experimental studies carried out at the operating parameters (pH, current density) determined according to the lower and upper limit values, the COD removal efficiency (R) ranged from 42.86 % to 72.29%.

Table 3. Results of COD removal for the Electro-Fenton process

Initial pH	Current Density (mA/cm ²)	H ₂ O ₂ Con. (mg/L)	Time (min.)	Initial COD Conc. (mg/L)	Final COD Conc. (mg/L)	COD Removal (%)	Final pH
2	20	2000	45	3360	1920	42,86	3,59
3	20			3445	1365	60,38	6,70
4	20			3344	1083	67,61	7,57
2	30	2000	45	3216	1600	50,25	5,82
3	30			3616	1248	65,49	8,40
4	30			3185	896	71,87	9,17
2	40	2000	45	3264	1568	51,96	4,65
3	40			3000	1008	66,40	8,20
4	40			3696	1024	72,29	9,30

Effect of pH and Current density

In this optimization study, the effect of pH and Current density on COD removal efficiency was investigated using pH=2–3–4 and Current density=20–30–40 mA/cm². During these experiments, the H₂O₂ concentration was kept constant at 2000 mg/L and the reaction time was 45 minutes. As can be seen from the Figure 2, COD Removal increased with increasing pH despite the application of different current densities.

Figure 2. Effect of pH and Current density on COD Removal efficiency

For example, at 20 mA/cm² current density, while the initial pH value was 2, the removal was 42.86%, and when the initial pH value was increased to 3, this removal value increased to

60.38%. When pH increased from 3 to pH 4, the increase in removal efficiency continued, albeit small, and increased from 60.38% to 67.61%.

When the literature is examined, Lin and Lo (1997) and Kang and Hwang (2000) stated that the initial pH is a very effective parameter in the degradation of pollutants in the Fenton process. In electrofenton processes, the highest removal/degradation efficiency was reported by Atmaca and Panizza and Cerisola (2009), mostly in the pH 2-4 range.

COD removal efficiency was examined according to the current density and it was found that when 20 mA/cm² current density was applied at pH 4, the COD removal efficiency was 67.61%. When the current density was increased to 30 mA/cm², the removal value increased significantly to 71.87%. However, when the current density was applied as 40 mA/cm², the increase in removal efficiency was very small. It was 72.29%, an increase of only 0.42%. It has been observed that the applied excess current only causes an increase in energy consumption and does not affect the removal efficiency.

Current density is another important operational parameter in the Electro-Fenton method. As the current applied to the electrodes increases, the production of Fe⁺² required for fenton oxidation also increases. In this case, it increases H₂O₂ dissociation to produce OH[•] radicals (Atmaca 2009, Wang et al, 2019). Insufficient Fe⁺² production leads to a decrease in oxidation efficiency. However, excessive production of Fe⁺² at the anode both causes a decrease in reaction efficiency by making a radical scavenging effect and increases the formation of sewage sludge (Şahinkaya, 2017). While the efficiency obtained does not change significantly even when high current is applied, the energy consumption of the system increases considerably. Therefore, it is important to determine the current density to be used (Atmaca, 2009).

CONCLUSION

As the experimental output, the optimum operational parameters (pH, Current density, H₂O₂ concentration and Reaction time) at which COD is maximally removed were determined as pH 4, 30 mA/cm² current density, 2000 mg/L H₂O₂ concentration and 45 minutes reaction time, respectively. In this optimum condition, a removal efficiency of 71.87% can be achieved.

In line with the results obtained; It has been determined that the Electro-Fenton process is effective in the treatment of wastewater with high COD concentration. It is thought that it can be an alternative to convectional processes in removing COD from wastewater.

By storing the H₂ gas formed in the system or combining it with fuel cell technology, some of the energy need in the system can be met, thus minimizing the energy cost. Thus, a sustainable and environmentally friendly treatment system is provided.

In the experimental studies, a yellow-brown color was formed in the wastewater after treatment. According to Water Pollution Control Regulation, additional color removal should be done in these wastewaters in order to ensure the color parameter of the effluent.

Özet

Salatalık (*Cucumis sativus*) hasadı, olgunlaştıktan itibaren iki-üç günde bir, tam verimlilik döneminde ise her gün yapılmaktadır. Hasat zamanı gün içinde sabah erken veya akşam saatlerinde yapılmalıdır. Hasat yaparken yardımcı olarak bıçak kullanılmalıdır. Hasat vakti gelmiş meyveler vaktinde toplanmalıdır aksi taktirde üstte meyve tutumu engellenmektedir. Yaprak rengi ile meyve rengi aynı olduğundan seçici hasat açısından tanımlanması zordur. Bu çalışma ile yetiştirildiği tarım alanında renginden dolayı seçilmesi ve toplanması vakit alabilen bir meyve olan salatalık meyvesinin hasadüzerine bir makine öğrenimi çalışması gerçekleştirilmiştir. Derin öğrenme özellikle robotik sistemlerin çalışmasını kontrol etmek için günümüzde yaygın bir şekilde kullanılmaya başlanmıştır. Bu metod için hergün yeni öğrenme algoritmaları geliştirilmektedir. Bu çalışmada derin öğrenme algoritmalarından YOLOv5 (nano) modeli kullanılmıştır. Oluşturulan modelin tüm metrik değerleri incelenmiştir. En başarılı model YOLOv5n algoritmasıyla, 640x640 boyutundaki görsellerin 10 Batch, 150 Epoch ile eğitilmiş model olduğu görülmüştür. Model değerleri sonuçları “metrics/precision”, “metrics/recall”, “metrics/mAP_0.5” ve “metrics/mAP_0.5:0.95” olarak incelenmiştir. Bunlar, bir modelin tespit başarısını ölçen anahtar metriklerdir ve ilgili modelin doğrulama veri kümesinde gösterdiği performansını belirtmektedir. “YOLOv5 nano” modelinin metrik verilerinin, diğer modellerle kıyaslandığında daha yüksek olduğu tespit edilmiştir. Ölçülen değer Model1: Size: 640, Batch: 10, Epoch: 150, Algorithm: YOLOv5n ‘dur. Buradan “Model 1”in robotik salatalık hasadında salatalığın dal ile ayrılmasında kullanılacak en iyi tespit modeli olduğu anlaşılmıştır.

Anahtar Kelimeler: Derin Öğrenme, salatalık, konum, hasat

**DETERMINING THE POSITION OF THE CUCUMBER ON THE SEEDLING
WITH DEEP LEARNING FOR ROBOTIC CUCUMBER HARVESTING**

Abstract

Cucumber (*Cucumis sativus*) is harvested every two to three days after ripening and every day during full productivity. Harvesting should be done in the early morning or evening hours during the day. A knife should be used as an assistant while harvesting. Harvested fruits should be collected on time, otherwise fruit retention on the top is prevented. Since the leaf color and fruit color are the same, it is difficult to identify in terms of selective harvesting. In this study, a machine learning study was carried out on the harvesting of cucumber fruit, which is a fruit that can take time to select and collect due to its color in the agricultural field where it is grown. Deep learning has been widely used today, especially for controlling the operation of robotic systems. New learning algorithms are being developed every day for this method. In this study, YOLOv5 (nano) model from deep learning algorithms was used. All metric values of the model were analyzed. It was seen that the most successful model was the model trained with the YOLOv5n algorithm with 10 Batches and 150 Epochs for 640x640 images. The results of the model values were analyzed as "metrics/precision", "metrics/recall", "metrics/mAP_0.5" and "metrics/mAP_0.5:0.95". These are key metrics that measure the detection success of a model and indicate the performance of that model on the validation dataset. The metric data of the "YOLOv5 nano" model was found to be higher compared to the other models. The measured value is Model 1: Size: 640, Batch: 10, Epoch: 150, Algorithm: YOLOv5n. From this, it is understood that "Model 1" is the best detection model to be used in robotic cucumber harvesting to separate cucumber from the branch.

Keywords: Deep learning, cucumber, location, harvesting

1.GİRİŞ

Derin öğrenme (deep learning), yapay sinir ağları kullanarak karmaşık problemleri çözmek için tasarlanmış bir makine öğrenmesi yöntemidir. Derin mimariye dayanan, gizli katmanların sayısı arttırılmış ve her katmanda probleme dair bir özneliğin (feature) öğrenildiği yapay sinir ağlarından oluşan yöntemler bütünüdür. Bu mimaride her katmanda probleme ait bir öznelik öğrenilir ve bu öğrenilen nitelik bir üst katmana bir girdi oluşturur. Böylelikle en alt katmandan en üst katmana doğru en basitten en karmaşık niteliğin öğrenildiği bir yapı kurulmuş olur(Anonim,2023).Derin öğrenme algoritmaları, bir dizi katman veya tabaka arasındaki veri işleme sürecini ifade eden ve çıkışları girdi olarak kullanarak nihai sonucu üreten bir model oluşturur. Bu katmanlar, her biri farklı türden işlemler gerçekleştiren düğümlerden oluşur. Bu düğümler, çıktıklarına göre ağı daha yüksek katmanlarına veya nihai sonuca giden bir sonraki katmana sinyal gönderirler.

Derin öğrenme algoritmaları, ses, görüntü ve doğal dil işleme gibi birçok alanda başarılı bir şekilde kullanılmaktadır. Örnek olarak, yüz tanıma, nesne tanıma, doğal dil işleme ve oyun oynama gibi alanlarda önemli başarılar elde edilmiştir.

Günümüzde birçok uygulama alanı bulan derin öğrenme tarımsal otomasyonda da kendine yer bulmuştur. Özellikle hasat uygulamalarında görüntü işleme ve tahminleme alanlarında kullanılmaktadır. Tarım alanındaki hasat uygulamaları için kullanılan tarım robotlarının, arazi tarımı faaliyetlerini yürütmek için kullanıldığı durumlarda, bitkilerin büyümesi, bitkilerin sağlık durumu ve verimliliklerinin belirlenmesi için derin öğrenme teknikleri kullanılabilir. Ayrıca, hasat öncesi tahminler yapmak için derin öğrenme teknikleri kullanılabilir. Bu, çiftçilerin hasat zamanlamasını, hasat verimliliğini ve kalitesini arttırmalarına yardımcı olabilir. Böylece hasat uygulamalarında derin öğrenme teknikleri, tarımsal verimliliği artırmak ve çiftçilerin işlerini daha kolay hale getirmek için önemli bir araç haline gelmiştir.

Salatalık hasadı için derin öğrenme, özellikle otomatik hasat makinelerinin geliştirilmesinde kullanılan bir teknolojidir. Derin öğrenme, yapay sinir ağlarının çok katmanlı yapılarını kullanarak karmaşık verileri işleyebilen bir makine öğrenme yöntemidir.

Bu hasat uygulamasında kullanılan derin öğrenme, öncelikle salatalık tarlasından elde edilen görüntü verilerini işleyerek salatalıkların nerede olduğunu, hangi olgunluk seviyesinde olduklarını ve hangi salatalıkların hasat edilebileceğini belirlemek için kullanılır. Bu işlem, salatalık hasadı sırasında işgücü maliyetlerini azaltırken hasat verimliliğini artırabilir.

Bir derin öğrenme algoritması, salatalıkların rengini, şeklini ve büyüklüğünü analiz edebilir ve olgunlaşmış salatalıkları hasat etmek için uygunluğunu belirleyebilir. Öncelikle, konum belirleme için kullanılacak veriler toplanmalıdır. Bu veriler, salatalık tarlasından elde edilen görüntüler veya sensörler tarafından toplanan veriler olabilir. Bu veriler derin öğrenme algoritmaları tarafından işlenebilir. Görüntüler öncelikle ön işleme adımlarından geçirilebilir ve ardından bir yapay sinir ağı kullanılarak konum belirleme yapılabilir. Sensör verileri de benzer bir şekilde işlenebilir. Derin öğrenme algoritmaları, salatalık bitkilerinin fiziksel özellikleri ve hasat edilecek salatalıkların belirtileri gibi çeşitli özellikleri öğrenebilir. Bu özellikleri kullanarak, algoritma salatalık bitkilerinin konumunu tespit edebilir ve hasat edilecek salatalıkları belirleyebilir.

Bu şekilde, işçilerin manuel olarak her bir salatalığı kontrol etmesi yerine, otomatik hasat makineleri tarafından tarama yapılabilir ve olgunlaşmış salatalıklar hızlı ve verimli bir şekilde toplanabilir. Mao ve ark.(2020) yılında yapmış oldukları bir çalışmada salatalık hasat robotları için tanıma algoritması geliştirmişlerdir. Bu çalışmada renk analizi kullanarak salatalığın fide üzerinde tanımlamasını yapmışlardır. Yapılan çalışma sonucunda doğru tanıma oranını %90 dan fazla , yanlış tanıma oranını %22'den düşük ve doğru yanlış oranını %4 'ün üzerinde bulmuşlardır. Bir başka çalışmada Sane ve ark.(2021) yılında robotik hasat uygulamasında derin öğrenme metodu kullanmışlardır. Derin öğrenme ile robotik hasat uygulamalarında mahsulün yerini tespitinde kullanılabileceğini tespit etmişlerdir. Bai ve ark(2023) yılında yapmış oldukları çalışmada robotik domates hasadı için derin öğrenme yöntemi kullanarak görüntü analizi yöntemi kullanmışlardır. Domatesin robotik olarak toplanmasında kesme noktasının belirlenmesini yapmışlardır. Li ve ark.(2023) yılında elma hasadı için çoklu robot kol kullanımı için derin öğrenme çalışmasında daha az kayıpla daha hızlı hasat yapılabileceğini tespit etmişlerdir. Droukas ve ark..(2023) robotik hasat sistemleri ve etkinleştirici teknolojiler üzerine yaptıkları araştırmada özellikle derin öğrenme yönteminin robotik sistemlerde büyük kolaylık sağlayacağını belirtmişlerdir. Meyve ve sebze hasadı için yeni bir uç-efektör robot: mekanizma ve saha deneyi çalışmasında görüntü işleme yöntemi ile hasat uygulaması yapılmıştır. Bu çalışmada toplam 160 küme domatesler hasadı yapılmış. Toplam başarı oranı %80,6 ve toplam hasat süresi her bir giriş açısı için başarı oranları sırasıyla %75.0, %71.9, %93.8, %81.2 ve %81.2 ve hasat süreleri sırasıyla 20,2, 16,0, 13,5, 13,7 ve 14,1 sn olmuştur.(Park ve ark.(2022))

Derin öğrenme teknolojileri, tarım sektöründeki sadece hasat uygulamalarında değil bitki hastalıklarının tespit edilmesinde, sulama sistemlerinin kontrol edilmesinde, toprağın analizi ve daha pek çok alanda tarımsal üretim verimliliğini arttırmada da kullanılabilir.

Sonuç olarak, derin öğrenme yöntemleri kullanılarak meyve ve sebzelerin hasadında konum belirleme yapmak mümkündür. Bu yöntemler, çiftçilere daha verimli bir hasat süreci sağlayabilir ve tarım sektöründe dijitalleşmeye katkıda bulunabilir.

2.MATERYAL VE YÖNTEMLER

Veri Setinin Hazırlanması:

Proje kapsamında nesne tespiti ve analizi hedeflenen salatalık meyvesinin veri setini hazırlarken, sera ve tarlada çekilmiş hasat fotoğrafları kullanılmıştır. Salatalık, yeşil ve dikenli salatalık olarak çeşitlenen bir meyve olduğu için, elde edilen fotoğraflarda iki çeşit salatalığa rastlamak mümkündür. Hasat esnasında ve yetiştirme sırasında bağında çekilmiş pek çok salatalık görseli toplanmıştır. Elde edilen görseller arasında, yapmış olduğumuz proje kapsamında değerlendiremeyeceğimiz görseller elenmiştir. Yapacağımız nesne tespit çalışması için sağlıklı olacak 64 adet görsel belirlenmiştir. Ayrıca her bir görselde birden fazla salatalık bulunabilmektedir.

Etiketleme:

Bir nesne tespiti modelinin, bir veri seti üzerinde eğitim gerçekleştirebilmesi için, tespit edilmesi hedeflenen nesnelere eğitileceği veri setinde etiketlenmiş/imzalanmış olması gerekmektedir. Bu sebeple 64 görselin her birinde salatalık görüntüsünü içeren kısımların sınırlayıcı kutu alanı ile işaretlenmesi ve ait olduğu nesne sınıfı olan “yeşil salatalık veya dikenli salatalık” sınıfına atanması gerekmektedir. Görsel etiketleme yapmak için, açık kaynak topluluklarında çok sayıda program, internet sitesi ve yardımcı araç bulunmaktadır. Bu araçlardan bir tanesi ise, nesne tespiti projelerinde sıklıkla kullanılan, popüler bir web sitesi olan Roboflow’dur. Roboflow, ham görüntüleri özel olarak eğitilmiş bir bilgisayar görme modeline dönüştürmek ve onu uygulamalarda kullanmak üzere dağıtmak için gereken tüm araçları sağlayan; görüntüler üzerinde alan seçimleri, işaretlemeleri ve sınıf etiketlemeleri yapılmasını sağlayan bir web sitesidir. Bu işaretleme ve etiketleme işlemi, sitenin sahip olduğu grafiksel kullanıcı arayüzü aracılığıyla kolaylıkla yapılmaktadır. Şekil 1 ve Şekil 2’de Label (Etiket) ekranı gösterilmiştir.

Şekil 1.Label Ekranı(yeşil salatalık)

Şekil 2.Label Ekranı(dikenli salatalık)

Açılan görsel arayüzün sol ve sağ kısımları kullanılarak, programın genel işlevleri yerine getirilmektedir. Açılan görüntünün işaretlemesi, sağdaki menüden “Bounding Box Tool” seçeneği ile aktifleşen işaretleme aracı ile yapılmaktadır. Araç ile ilgili nesnenin sınırlayıcı kutu (Bounding Box) alanının belirlenmesinin ardından, belirtilen nesnenin sınıf adının etiketlenmesi gerekmektedir. Projemiz dahilinde, bu sınıf adlarını “green cucumber ve prickly cucumber” olarak belirledi. İlgili nesne tespit modelinin eğitimi bu görüntülerle yapılacağından dolayı, seçim işleminin nesneyi içeren şekliyle doğru bir biçimde yapılması gerekmektedir. Seçim ve etiketleme işleminin ardından, ana menü kısmındaki “generate” sekmesinden yapılan işaretlemelerin çıktı formatı seçilmelidir. Proje kapsamında, kullanılacak modele uygun olan YOLO seçeneği seçilmiştir. Tüm bu işlemlerin ardından görüntü işlenerek otomatik kaydedilebilmektedir.

Veri seti kullanılarak, derin öğrenme modelinin eğitimine başlanması:

Ön Gereksinimler:

YOLOv5 modelinin, projenin hedeflediği amacı tamamlayabilmesi ve eğitimin yapılabilmesi için, aşağıdaki gereksinimler karşılandı:

Python ile geliştirilmiş araçların, programların ve YOLOv5 modelinin kodlarının çalıştırılabilmesi için, Python'un proje geliştirilmesi sırasında son sürümü olan Python 3.11.1 kurulumu yapıldı.

Modelinin eğitiminin yapılmasını, eğitimi yapılan model kullanılarak projenin çalıştırılmasını ve gerçek zamanlı salatalık tespiti sağlayacak kodların çalıştırılabilmesi için, Torch kütüphanesine dayanan, Facebook AI Araştırma laboratuvarı tarafından geliştirilen bir açık kaynaklı makine öğrenme kütüphanesi olan PyTorch kurulumu yapıldı.

Project Jupyter projesi dahilinde geliştirilen, Python programlama dili ve diğer bazı programlama dilleri için interaktif bir defter görevi gören, yazılan kodların hem saklanıp sunulmasını hem de adım adım çalıştırılabilmesini sağlayan bir sunucu-istemci uygulaması olan Jupyter Notebook kurulumu yapıldı.

YOLOv5 modelinin ve diğer programlama bileşenlerinin çalışması için bağlı oldukları paketlerin bilgisayara indirilmesini ve indirildikten sonra yönetilmesini sağlayan Pip (PIP Instann Packages) aracının kurulumu yapıldı.

YOLOv5 modelinin GitHub deposu, projenin yürütüldüğü bilgisayara aktarıldı ve repo içerisinde bulunan, modelin sağlıklı çalışabilmesi için gerekli olan araçları içeren "requirements" metin belgesi içerisinde bulunan paketlerin kurulumu, Pip aracılığıyla yapıldı.

YOLOv5 modelinin reposunun "releases" kısmında bulunan, bu proje kapsamında kullanılacak YOLOv5n modelinin eğitilmiş ağırlık katsayılarını içeren "yolov5n.pt" dosyası indirilerek, bilgisayara aktarılan YOLOv5 klasörü içerisine aktarıldı.

Eğitim Model Seçimi:

Yapmış olduğumuz projede, CNN yöntemiyle geliştirilmiş YOLO model ailesinin açık kaynak olarak geliştirilen YOLOv5 ailesi tercih edilmiştir. RCNN benzeri iki aşamalı ağ kullanan modellere göre oldukça avantaja sahip olan YOLO model ailesinin YOLOv5 modeli, kendisinden önce geliştirilmiş sürümlere doğruluk değerleri ve hız oranı açısından avantaj sağladığı için tercih edilmiştir. YOLOv5 modeli de kendi içerisinde modeller barındırmaktadır. YOLOv5n (nano) modeli derin öğrenme eğitimi için tercih edilmiştir.

Eğitimin Başlatılması:

Salatalık tespiti yapacak olan modelin eğitiminin başlatılması için, YOLOv5 modelinin bilgisayardaki konumuna gidildi ve burada bir Python çalıştırıcı editör açıldı. Ana dizinde bulunan ve YOLOv5 eğitimini sağlayan train.py programı, çalıştırılmak üzere kontrol edildi. Bu Python programının çalıştırılması, çeşitli parametreler ile özelleştirilebilmektedir.

Proje dahilinde, salatalık meyvesi için aşağıda yazılı olan kod içerisindeki parametreler ve düzenlemeler tercih edildi.

```
python train.py --img 640 --batch 100 --epochs 400 --data dataset.yaml --weights yolov5n.pt
```

--img: Eğitimi yapılacak görsellerin YOLOv5 modeli tarafından düşürüleceği piksel boyutu. Varsayılan değeri 640x640 olarak belirlenmektedir ve burada da bu şekilde seçilmiştir.

--batch: Modeli eğitirken, ekran kartı tarafından bir seferde kullanılacak veri noktası paketi sayısıdır.

--epochs: Modelin eğitimi yapılırken, tüm eğitim verilerinin eğitilen ağa gösterilme, ağırlıkların güncellenmesi sayısıdır.

--data: Veri setini içeren dosyanın genel yol ve sınıf bilgisini içeren .yaml dosyasının yoludur.

--weights: Modelin eğitiminde kullanılacak eğitim katsayılarını içeren ağırlık dosyasının konumudur.

Bu kod satırlarının doğru şekilde çalıştırılması sonucunda, modellerin eğitim işlemi başlamıştır. Program, öncelikle YOLOv5 dosyalarını kontrol edip, herhangi bir güncelleme durumunu kontrol etmektedir. Ardından, belirlenen döngü sayısı (epoch) boyunca eğitim işlemi yapılmaktadır.

YOLOv5 algoritmalarının sonuçlarının hata matrisi metriklerine göre incelenmesi:

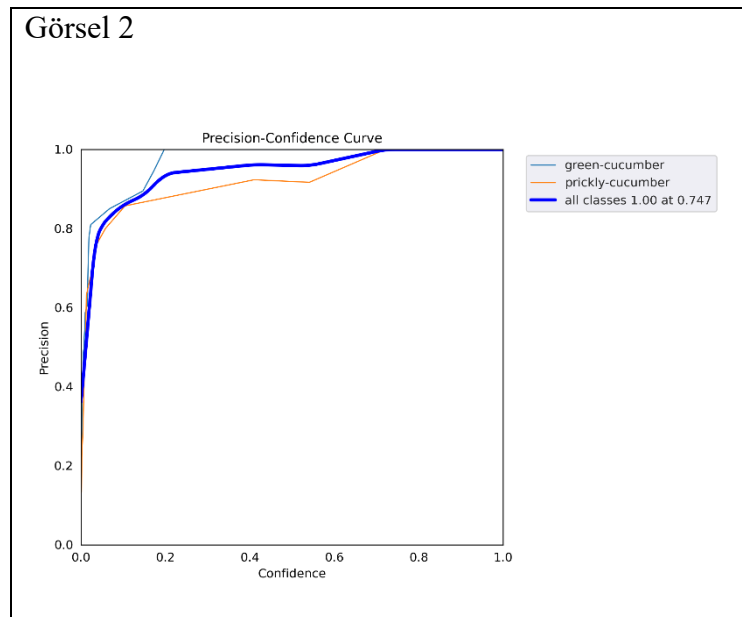

F1 Score:

Görsel 1: Size: 640x640, Batch: 100, Epoch: 400, Algorithm: YOLOv5n

Precision:

Görsel 2: Size: 640x640, Batch: 100, Epoch: 400, Algorithm: YOLOv5n

Recall:

Görsel 3: Size: 640x640, Batch: 100, Epoch: 400, Algorithm: YOLOv5n

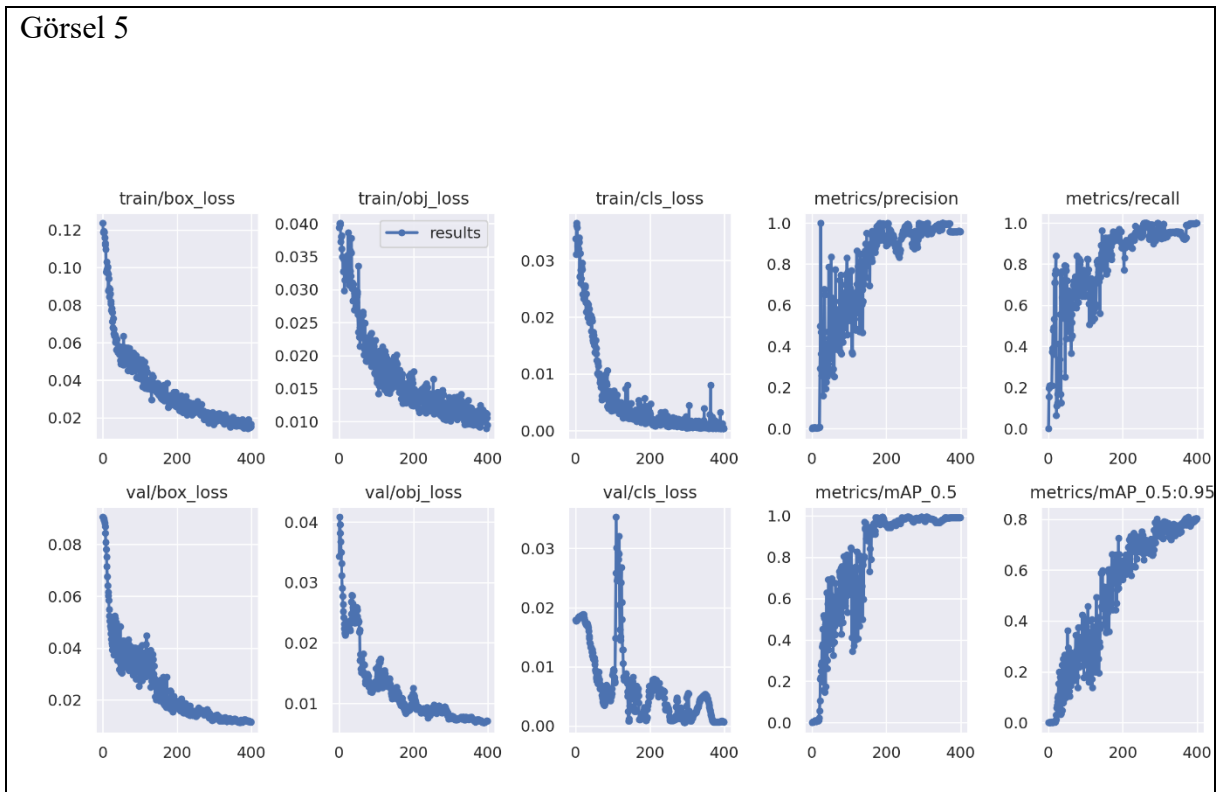

Precision Recall:

Görsel 4: Size: 640x640, Batch: 100, Epoch: 400, Algorithm: YOLOv5n

Loss Function:

Görsel 5: Size: 640x640, Batch: 100, Epoch: 400, Algorithm: YOLOv5n

Eđitimde Kullanılan Veri Seti:

Şekil 3 ve 4’de eğitim sırasında kullanılan salatalık çeşitlerinin veri setinin hazırlanması gösterilmiştir.

Şekil 3.Modellerin eğitimmesi sırasında kullanılan eğitim setinden görüntüler (yeşil salatalık)

Şekil 4.Modellerin eğitimmesi sırasında kullanılan eğitim setinden görüntüler (dikenli salatalık)

Eđitim Sonucu:

Şekil 6’ da eğitim sonucunda elde edilen sonuç ekranları gösterilmiştir.

Şekil 5. Modellerin eğitimlerinin sonucunda ortaya çıkan "Validation Batch" tahmin işaretlemeleri

SONUÇ

YOLOv5 Nano modeli ve hazırlanan veri seti ile yapılan örnek eğitim ve doğrulama görsellerindeki nesne tespiti doğrulukları incelenmiştir. Modellerin nesne tespit başarılarını

belirten metrik verileri ve doğruluk tahmin oranları incelendiğinde, modelin eğitim sonucunun başarılı olduğu doğrulanmıştır. Fakat farklı büyüklükteki ve çeşitlilikteki veri kümeleri üzerinde çalışıldığında veya eğitim algoritmalarına bağlı hiperparametreler ve genel çalışma parametreleri üzerinde değişiklik yapıldığında veya nesne tespit başarısından ziyade hız performansı odaklı bir başarı sıralaması yapıldığında bu sonuçların değişebileceği göz önünde bulundurulmalıdır.

ÖZET

Buğday, üretimi yapılan bölgelerde, özellikle Akdeniz bölgesinde, tane dolun döneminde abiyotik ve biyotik streslere maruz kalmaktadır. Buğdayda yaprak hastalıkları çiçeklenmeye doğru ve çiçeklenme sonrası yayılma ve artma eğilimindedir. Buğdayda sarı pas (*Puccinia striiformis f. sp. tritici*) hastalığı tane dolun döneminde toplam yaprak deformasyonuna sebep olabilir. Yapılan araştırmada 20 makarnalık buğday genotipinde doğal şartlarda ortaya çıkan sarı pas hastalığı değerlendirilmiştir. Araştırma 2021-2022 yetiştirme sezonunda Çukurova Üniversitesi Ziraat Fakültesi Tarla Bitkileri Bölümü Uygulama ve Araştırma alanlarında (taban ve kıraç koşullarında) gerçekleştirilmiştir. Araştırmada, iki farklı lokasyonda yirmi makarnalık buğday genotipinde $G \times E$ (Genotip x Çevre) interaksiyonunun sarı pas hastalığına karşı stabilitesi üzerindeki etkileri araştırılmıştır. Deneme her bir lokasyonda yedi tekerrürlü tesadüf blokları deneme desenine göre kurulmuştur. Sarı pas hastalığı için yapılan birleştirilmiş varyans analizinde, genotipler, çevre ve ($G \times E$) interaksiyonu arasındaki varyasyonlar önemli ($p < 0.01$) bulunmuştur. Birleştirilmiş varyans analizinde toplam $G + E + (G \times E)$ varyasyonunun sırasıyla %55.7, %44.3 olarak saptanarak; genotip x çevre etkileşimi ana bileşen ile açıklanmış ve hangi genotiplerin, nerede, nasıl kararlı oldukları genotip, çevre, genotip x çevre interaksiyon biplot grafiği ile gösterilmiştir. Bu çerçevede biplot analiz yöntemi kullanılarak hastalığa dayanıklı/toleranslı genotiplerin belirlenmesinin ıslah çalışmalarına katkı sağlayabileceği saptanmıştır.

EVALUATION OF YELLOW RUST (*Puccinia striiformis* f. sp. *tritici*) DISEASE IN
DURUM WHEAT (*Triticum durum* L.) GENOTYPES BY BILOT METHOD IN
CUKUROVA CONDITIONS

ABSTRACT

Wheat is exposed to abiotic and biotic stresses during the grain-filling period in the regions where it is produced, especially in the Mediternean region. Leaf diseases in wheat tend to spread and increase towards flowering and after flowering. In wheat, yellow rust (*Puccinia striiformis* f.sp.*tritici*) disease can cause total leaf deformation during the grain-filling period. In the research, the occurrence of yellow rust disease under natural conditions in 20 durum wheat genotype was evaluated. The research was carried out at the Application and Research Areas (low land and arid land) of Field Crops Department of Agricultural faculty, Cukurova University, Adana during the growing season of 2021-2022. The experiment was arranged in a randomized block design with seven replications at each location. In the combined analysis of variance for yellow rust disease, variations between genotypes, environments, and (G × E) were found to be significant ($p < 0.01$). In the combined analysis of variance, total G + E + (G × E) variation was determined as 55.7% and 44.3%, respectively; genotype x environment interaction was explained with the principal component, and which genotypes, where and how they were stable, was shown with the genotype, environment, genotype x environment interaction biplot graph. From the results of the study, it was concluded that by using the biplot analysis method, the determination of disease-resistant/tolerance genotypes can contribute to breeding studies.

GİRİŞ

Buğday, üretimi yapılan bölgelerde ve özellikle Akdeniz iklim kuşağında, tane dolum döneminde çeşitli abiyotik ve biyotik streslere maruz kalmaktadır. Buğdayda yaprak hastalıkları çiçeklenmeye doğru ve çiçeklenme sonrası yayılma ve artma eğilimindedir. Sarı pas, kahverengi pas ve yaprak leke hastalıkları tane dolum döneminde toplam yaprak deformasyonuna sebep olabilir. Biyotik stres faktörleri arasında Basidiomycota bölümü Uredinales takımında yer alan *Puccinia* türlerinin sebep olduğu pas hastalıkları tüm dünyada ve ülkemizde buğday üretimini ayrıca beslenmesi buğdaya dayalı olan ülkelerin gıda güvenliğini tehdit etmektedir. Buğdayda pas hastalığına sebep olan önemli türlerden bir tanesi de sarı pas etmeni *Puccinia striiformis* f. sp. *tritici* (*Pst*)'dir (Resim 1). Buğdayda sarı pas hastalığı ilk kez 1777 yılında Gadd tarafından tanımlanmıştır (Roelfs ve ark. 1992). Daha sonra Eriksson (1894) bu sarı pas hastalığının ayrı bir patojen tarafından oluşturulduğunu bildirmiş ve hastalık etmenini *Puccinia glumarum* olarak isimlendirmiştir. En sonunda hastalık patojeninin ismi, Hylander ve ark. (1953) tarafından günümüzde de kullanılan şekliyle *Puccinia striiformis* olarak değiştirilmiştir (Singh ve ark. 2012). Sarı pas hastalık etmeninin, coğrafi olarak Amerika kıtasından Avustralya'ya, Avrupa'dan Doğu Afrika'ya ve Batı Asya'ya, Orta Doğu'dan Güney Afrika'ya kadar çok geniş buğday üretim alanlarına taşınabildiği bilinmektedir (Boshoff ve ark. 2002, Wellings 2007, Çat ve ark. 2017). Hastalık sporlarının uzak mesafelere taşınması; rüzgâr/böcek, ayrıca insanların eşya/kıyafetleriyle gerçekleşebilir (Resim2). Sarı pas etmeni (*Puccinia striiformis* f. sp. *tritici*), bitkilerin tek yapraklı döneminden olum dönemine kadar hastalık için şartlarının uygun olduğu her zaman bitki yapraklarını enfekte edebilmektedir. Bu durum enfekte olan yapraklarda ve özellikle bayrak yaprakta fotosentezi sınırladığı için verim ve kalite kayıplarına neden olmaktadır (Chen, 2005).

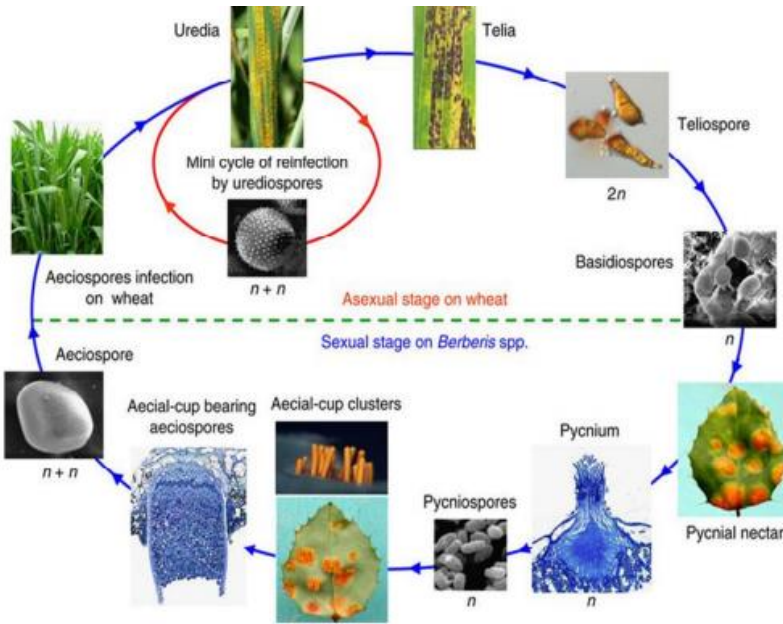

Resim1. Sarı pas (*Puccinia striiformis f. sp. Tritici*) hastalığına genel bakış bakış

Biyotik bir stres faktörü olan ve buğday üretimini sınırlayan sarı pas hastalığı (*Puccinia striiformis f. sp. tritici*) çok önemlidir ve dünya buğday üretiminin % 88'inin bu hastalığa karşı hassas olduğu bilinmektedir. Bu nedenle, yıllık beş milyon ton ürün kaybının gerçekleştiği, yok olan bu ürünün pazar değerinin en az bir milyar dolar olduğu düşünülmektedir (Wellings 2011, Beddow ve ark. 2015, Çat ve ark. 2017, Schwessinger 2017). Hassebrauk ve Schröder (1964), hastalık etmeninin üredosporlarının çimlenmesi için maksimum sıcaklığın 26°C olduğunu bildirmişlerdir. Düşük sıcaklıkta ve ılıman bölgelerde ve yüksek nem seviyesindeki iklim koşullarında sarı pas hastalığı (*Puccinia striiformis f. sp. tritici*) hastalığının etkileri görülebilmektedir. Sarı pas hastalığının yaşam döngüsü Resim 3'te verilmiştir. Son yıllarda hastalığın az veya rastlanmadığı sıcak iklim koşullarında da önemli epidemilerin olduğu bilinmektedir. Bu durum, sarı pas hastalığının yüksek sıcaklıklara adapte olan yeni bir ırk geliştirdiği yönünde değerlendirilmektedir (Milus ve ark. 2008, Mboup ve ark. 2009; Hovmoller ve ark. 2010). Biplot analiz yöntemi, birleşik analiz yöntemi olup, G (Genotip) ve GE (Genotip x Çevre) interaksiyon etkisini iki temel değerlendirme faktörünü aynı görsel grafik üzerinde bir araya getirerek ilgili konu üzerinde araştırma yapan araştırmacılara, çalışmalarını sonucu elde ettikleri verileri görsel olarak çift yönlü değerlendirme olanağı sağlamaktadır ve bu şekilde yapılan değerlendirme biplot analizi olarak tanımlanmaktadır. Denemelerde kullanılacak materyallerin farklı çevrelerde bulunan aynı hastalığın farklı popülasyonlarında yürütülen araştırmalarda elde edilen verilerin biplot analiz yöntemi kullanarak değerlendirilmesi sonucu, incelenen özellikler birlikte görsel olarak değerlendirilebilmektedir. Ayrıca amaca yönelik materyal seleksiyonunda başarıyı olumlu yönde etkilediği için bitki ıslahı çalışmalarında yenilikçi bir uygulama olarak kabul edilebilir (Yan 2001). Yapılan bu çalışmanın amacı sarı pas hastalığının farklı baskın ırk/ırklarında hastalık tesirine göre oluşturulan biplot grafiğinin, hastalığa dayanıklılık ıslah programlarında sarı pas hastalığına toleranslı/ dayanıklı hatların seçilmesi ve etkin bir şekilde kullanılabilirliğini saptamaktır.

Resim2. Sarı pas patojeni popülasyonlarının orijini ve olası taşınma yolları (Ali ve ark. 2014).

Resim3. Sarı pas (*Puccinia striiformis f.sp. tritici*) Zheng et al., 2013.

ARAŞTIRMA VE BULGULAR

Deneme Yeri ve Bitki Materyali; Araştırma 2021/2022 yetiştirme sezonunda Çukurova Üniversitesi Ziraat Fakültesi Tarla Bitkileri taban ve kıraç alanlarında yürütülmüştür. Bu araştırmada bitki materyali olarak, yirmi adet makarnalık buğday hattında doğal şartlarda gerçekleşen sarı pas hastalığı değerlendirilmiştir (Çizelge1).

International Conference on Global Practice of Multidisciplinary Scientific Studies-IV
Turkish Republic of Northern Cyprus, April 28-30, 2023

Çizelge 1. Sarı pas Hastalığının Değerlendirilmesi İçin Makarnalık Buğday Hatlarının İsimleri

2021/2022 makarnalık buğday yetiştirme sezonuna ait meteorolojik veriler Çizelge2’de verilmiştir. Çizelge 2’nin incelenmesinden anlaşılacağı üzere çalışmada kritik dönemler olarak bilinen sapa kalkma, çiçeklenme, dölleme ve tane dolun dönemlerine rastlayan Nisan, Mayıs ve Haziran aylarında düşen yağış miktarı beklenenden düşük gerçekleşmiştir.

Çizelge 2. Adana ilinde Makarnalık Buğday Yetiştirme Sezonuna Ait İklim Verileri

Ekim-bakım ve hasat; araştırmada, ekim işlemi 10 Aralık 2021 yılında gerçekleştirilmiştir. Tarla denemeleri iki farklı lokasyonda her bir lokasyonda yedi tekerrürlü olacak şekilde tesadüf blokları deneme desenine göre kurulmuştur. Denemede parsel boyutları 3.5 m*1.2 m (4.2 m²) olarak belirlenmiş, makarnalık buğdayların çimlenmesi tamamlandıktan sonra doğal çevre koşullarında sarı pas (*pst*) hastalık gözlemleri yapılmıştır. Bitkiler olgunlaştıktan sonra 6 Haziran 2022 tarihinde hasat işlemi gerçekleştirilmiştir.

Elde edilen verilerin değerlendirilmesi; iki farklı lokasyonda yirmi makarnalık buğday hattında G × E (Genotip x Çevre) interaksyonunun sarı pas hastalığına karşı stabilitesi üzerindeki etkileri araştırılmıştır. Araştırma sonunda elde edilmiş olan hastalık derecelerine (0-9 skalası)

ait analizler ve tanımlayıcı analizler GGE-biplot Version 4.1 istatistik paket programı kullanılarak yapılmıştır.

Araştırmada kullanılan makarnalık buğday hatlarının tanımlayıcı analizi Çizelge3'te verilmiştir. Buna göre, birleştirilmiş genotipler gruplandırıldığında; f grubu cuzf00031 genotipi ortalama değeri 4.57 skoru ile sarı pasa orta düzeyde hassasiyet gösterdiği tespit edilmiştir, a grubunda bulunan cuzf00044 genotipi ortalama değeri 0.86 skoru ile sarı pasa iyi tolerans gösterdiği saptanmıştır.

Araştırmanın sonucuna göre; sarı pas hastalığı için yapılan birleştirilmiş varyans analizinde, genotipler, çevre ve (G × E) interaksiyon arasındaki varyasyonlar önemli (p < 0.01) bulunmuştur (Çizelge3).

Çizelge 3. İncelenen makarnalık buğday hatlarında saptanan sarı pas hastalığı skor değerlerine uygulanan birleştirilmiş varyans analizi sonuçları

	Kareler Toplamı (SS)	Kareler Ortalaması (MS)	Serbestlik derecesi (df)	F	Toplam Varyasyon Oranı

Çizelge 4'e göre makarnalık buğday hatlarının sarı pas hastalığının tanımlayıcı analiz tablosunda iki farklı lokasyonun birleştirilmiş genotip gruplandırılması incelendiğinde, istatistiksel olarak farklılık olmasına rağmen elde edilen değerlerin genelde birbirine yakın olduğu görülmüştür. cuzf00044 nolu genotip değeri a birleştirilmiş grubunda sarı pasa toleranslı olarak yer alırken, cuzf00031 nolu genotip değeri ise f birleştirilmiş grubunda sarı pasa hassas olarak yer almıştır. Bu bağlamda, iki farklı lokasyondaki birleştirilmiş gruplandırmalarda aynı harfi alan gruplar arasında sarı pasa hassasiyet ya da tolerans bakımından önemli bir fark saptanmamıştır.

Aynı harfi alan ortalamalar arasındaki fark $p \leq 0.01$ 'e göre önemli değildir

Birleştirilmiş varyans analizinde toplam $G + E + (G \times E)$ varyasyonunun sırasıyla %55.7, %44.3 olarak saptanarak; genotip x çevre etkileşimi ana bileşen ile açıklanmış ve hangi genotiplerin, nerede, nasıl kararlı oldukları genotip, çevre, genotip x çevre etkileşimini biplot grafiği ile gösterilmiştir (Şekil1). GGE-biplot grafiğinde; dar açı oluşmuşsa özellikler arasında pozitif

ilişkili, geniş açı varsa negatif ilişkili, dik açı ya da dik açuya yakınsa özellikler arasında ilişki yok veya bağımsız özellikler olarak adlandırılmaktadır (Yan, 2001). Şekil 1'e göre A, B, C ve D olmak üzere 4 ana bölüm oluşmuştur. Bölüm A'da, cuzf00042 genotipi sarı pasa tolerans özelliği ile yer almıştır. Bölüm B'de ise cuzf00032 genotipi sarı pas tolerans özelliği ile öne çıkmıştır. C bölümünde sarı pas bakımından cuzf00001, cuzf00040, cuzf00045, cuzf00051 genotipleri yer almıştır. Son olarak D bölümünde sarı pasa tolerans yönünden cuzf00044 genotipi dikkat çekmektedir.

Şekil 1. Makarnalık buğdayda genotiplerinde incelenen özelliklerin gruplandırılmasına ait genotip*sarıpas biplot grafiği

Genel olarak genotipin bulunduğu dairede bulunmayan bir özellik varsa genotip sarı pasa hassasiyet özelliği bakımından zayıf olduğunu söylemek mümkündür. Bir başka deyişle genotip, sarı pas hastalığına (*Puccinia striiformis f. sp. tritici*) toleranslıdır (Şekil 2).

Şekil2. Makarnalık buğdayda genotiplerinde ortalamasına göre stabilitesi

Araştırmada tespit edilen sarı pas özelliklerinin ortalama verileri üzerinden stabilite çizgisini oluşturan ve genotipleri bu stabilite çizgisine göre sıralayan 'ranking biplot' metodu Şekil 3'te gösterilmiştir. Çok özellikli çalışmalarda tüm özellikler bakımından stabilite (yatay) ve ortalamayı (dikey) temel eğrilerine göre sıralayan bir modeldir. Şekil 3'te dikey eğrinin üzerinde ve yatay eğriye yakın olan cuzf0001, cuzf00040, cuzf00042 ve cuzf00051 genotipleri sarı pas özelliği bakımından stabil genotipler olarak tespit edilmiştir. cuzf00032 genotipi ise en zayıf stabiliteye sahip olarak tespit edilmiştir. cuzf00044 genotipi eğrinin dikey altında ancak sarı pas hastalığına tolerans/dayanıklılık bakımından iyi performans göstermiştir.

Şekil3. Makarnalık buğday genotiplerinin sarıpas özelliği bakımından sıralanması

SONUÇ

Genotip özellik biplot yönteminde PC1 varyasyonu %55,7, PC2 varyasyonu ise 44,3 ve toplam varyasyon %100 olarak açıklanmıştır. Yetiştirme sezonunda iki farklı lokasyonda çevre faktörlerine bağlı olarak sarı pas hastalığına tolerans ve hassasiyet (cuzf00044/cuzf00031 genotiplerinde) saptanmıştır. Dünya’da ve Türkiye’de *Puccinia striiformis* hastalığının özellikle serin ve nemli koşullarda çok etkili olduğu, ancak son yıllarda hastalığın az ya da gözlenmediği sıcak iklim koşullarında da önemli epidemiler meydana getirdiği bilinmektedir. Bu durum, *Puccinia striiformis f. sp. tritici* ’nin yüksek sıcaklıklara adapte olan yeni bir ırk geliştirdiği yönünde değerlendirilmektedir. Hastalığın epidemi oluşturduğu yetiştirme sezonlarında ürünün verim ve kalitesinin negatif yönde çeşitli düzeylerde etkilenecek ekonomik kayıplara neden olduğu bilinmektedir. Hastalığın kontrolünde toleranslı/dayanıklı çeşitlerin kullanımı üretici tarafından tercih edilmeli, böylece üretim alanlarında hastalığın kontrolünde pratik ve ekonomik bir yöntem olmalıdır. Ayrıca sarı pas patojenine ait ırk ve ırkların farklı bölgelere göre dağılımı ve oranı belirlenmeli, ırkların

bölgelere göre deęişiklik göstermesi fazlaysa, hedef bölge bazında farklı dayanıklılık genlerinin kullanıldığı ıslah programları yürütülmelidir. Bu çerçevede GGE-biplot analiz yöntemi kullanılarak sarı pas hastalığına toleranslı/dayanıklı kabul edilebilir genotiplerin belirlenerek seçilmesi amacıyla etkin bir şekilde ıslah çalışmalarına katkı sağlayabileceęi saptanmıştır. Gelecekte yapılacak farklı çalışmalarda hastalık deęerlendirmelerinin derecelerine göre daha fazla genotiplerin deęerlendirilebileceęi ortaya konulmuştur.

ÖZET

İnsanların dengeli ve yeterli beslenmeleri için vazgeçilmez ürünlerin başında hayvansal ürünler gelmektedir. Tüm tarımsal ürünlerde olduğu gibi hayvansal ürünlerin de arzını etkileyen en önemli unsur fiyattır. Fiyatlardaki tahmin edilemeyen dalgalanmalar tarımsal ürün piyasalarında önemli bir risk oluşturmaktadır. Fiyatlardaki kalıcı dalgalanmalar belirsizliğin sürekli hale gelmesinde baş rol oynamaktadır. Bu çalışmada Türkiye'de kırmızı et tüketiminin %95'ini oluşturan dana ve koyun etinin 2008-2021 dönemindeki üretici ve tüketici fiyatları analiz edilmiştir. Veriler Türkiye İstatistik Kurumu web sayfasından elde edilmiştir. Cari fiyatlar Tüketici Fiyat Endeksi değerleri kullanılarak reel fiyatlara dönüştürülmüştür. 2008 yılında 828,5 bin ton olan kırmızı et üretimi 2021 yılında 1,95 milyon tona yükselmesine rağmen tüketimi karşılayacak düzeyde değildir. Sonuçlar dana ve koyun eti reel üretici fiyatlarının 2011 yılına kadar sürekli bir artış, 2011 yılından sonra dalgalı bir seyir izlediğini göstermiştir. Reel üretici fiyatları koyun ve dana etinde 2010 yılına kadar birbirine yakın değerler almış, 2015-2017 yılları hariç diğer yıllarda koyun lehinde artmıştır. Reel tüketici fiyatlarında da benzer bir durum gözlemlenmiştir. Pazarlama marjı incelenen dönemde koyun etinde sürekli bir artış gösterirken, dana etinde 2015 yılına kadar bir artış, 2015 yılından sonra stabil hale gelmiştir. Gerek üretici gerekse tüketici kırmızı et fiyatları aylara göre değişim göstermiştir. Türkiye'de uygulanan hayvancılık politikalarında gerekli düzenlemelerin yapılmasıyla kırmızı et fiyatlarında istikrarın sağlanabileceği düşünülmektedir.

Anahtar Kelimeler: Fiyat Analizi, indeks, mevsimsel dalgalanma, dana eti, kuzu eti.

CHANGES IN RED MEAT PRICES AND MARKETING MARGIN IN TÜRKİYE

ABSTRACT

Livestock products are the most indispensable products for a balanced and adequate diet. As with all agricultural products, the most important factor affecting the supply of animal products is price. Unpredictable fluctuations in prices constitute an important risk in agricultural product markets. Permanent fluctuations in prices play a leading role in making uncertainty permanent. In this study, producer and consumer prices of veal and lamb meat, which constitute 95% of red meat consumption in Türkiye, were analyzed for 2008-2021. Data were obtained from the web page of the Turkish Statistical Institute. Ruling prices are converted to real prices using Consumer Price Index values. Although red meat production of 828.5 thousand tons in 2008 increased to 1.95 million tons in 2021, it is not enough to meet consumption. The results showed that real producer prices of veal and lamb followed a steady increase until 2011 and a fluctuating course after 2011. Real producer prices for lamb and veal were close to each other until 2010 and increased in favor of lamb in all years except 2015-2017. A similar situation was observed in real consumer prices. While the marketing margin showed a continuous increase in lamb during the period analyzed, it increased in veal until 2015 and stabilized after 2015. Both producer and consumer red meat prices varied by month. It is thought that red meat prices can be stabilized by making the necessary adjustments in the livestock policies implemented in Türkiye.

Giriş

Hayvansal ürünler, yüksek besin değerleri, kolaylıkla bulunabilmeleri ve erişilebilmeleri nedeniyle insan beslenmesinde önemli rol oynamaktadır. Et, süt ve yumurta gibi hayvansal ürünler, temel amino asitler, yağ asitleri ve demir, çinko, kalsiyum, A, E ve B1 vitamini gibi diğer birçok temel mikro besin ögesini içeren değerli tam protein kaynaklarıdır (Idamokoro vd., 2020). Bu besinler büyüme, sağlıklı olma ve vücudun düzgün çalışması için önemlidir. Çoğu ülkede hayvansal ürünler, kalsiyum ve proteinin diyetle alımında en büyük kaynaktır. Bazı hayvansal kaynaklı gıdaların, özellikle de yağ ve doymuş yağ asidi içeriklerinin bazı yönleri, bu gıdaların kardiyovasküler hastalık ve metabolik sendrom gibi kronik hastalık riskine önemli ölçüde neden olduğuna dair endişelere yol açmıştır (Givens, 2005). Hayvansal ürünler içerisinde önemli bir paya sahip olan kırmızı et, protein ve temel besin maddeleri bakımından zengin dengeli beslenmenin önemli bir parçasıdır (Wyness, 2015). Kırmızı et esansiyel amino asitler, vitaminler (B12 dahil) ve mineraller (demir ve çinko dahil) açısından zengin bir kaynaktır (Williams, 2007). Ancak yüksek miktarda işlenmiş kırmızı et tüketimi kalp hastalıkları, tip 2 diyabet ve kolorektal kanser gibi kronik hastalık riskinin artmasıyla ilişkilendirilmiştir (Cocking et al., 2020; Sanders et al., 2023). Bu nedenle, kırmızı etin ölçülü tüketilmesi önerilmektedir (Holman et al., 2020).

Fiyat analizi, tarım da dahil olmak üzere çeşitli alanların önemli bir yönüdür. Yapılan araştırmalar fiyat dalgalanmalarının tarım piyasalarının normal bir özelliği olduğunu göstermektedir (Gilbert, 2010; Naylor ve Falcon, 2010). Tarımsal emtia fiyatları artmaktadır ve bu beklenen bir durumdur. Çünkü tarımsal ürün piyasalarında sadece yıldan yıla fiyat dalgalanmaları değil, aynı zamanda nispeten istikrarsız arz ve talep koşulları ve düşük talep ve arz esneklikleri nedeniyle değişken fiyatlar da yaşanmaktadır (Gilbert, 2010). Döviz kuru dalgalanmaları da tarımsal ürünlerin ihracatını ve fiyatını etkilemektedir (Piot-Lepetit ve M'Barek, 2011). Makroekonomik politikaların tarımdaki ekonomik koşulların önemli bir belirleyicisi olduğunu ve tarımsal fiyatlardaki dalgalanmaların geleneksel tarımsal faktörler kadar önemli bir kaynağı olduğunu unutmamak gerekir (Frankel, 1986). Fiyat dalgalanmaları tarım piyasalarının normal bir özelliğidir ve arz ve talep, mevsimsellik ve makroekonomik politika gibi çeşitli faktörler tarımsal mal fiyatlarını etkilemektedir (Goodman ve Thibodeau, 1998; Piercy et al., 2011; Zielke, 2011). Dolayısıyla fiyat analizi, piyasa dinamiklerini anlamak ve çeşitli alanlarda bilinçli kararlar almak için önemli bir araçtır.

Türkiye'de kırmızı et fiyatları, birçok faktörden etkilenmektedir. Kırmızı et, insan beslenmesindeki öneminin yanı sıra sosyal ve ekonomik fonksiyonları ile ülkelerin gelişmişlik

düzeylerini de ortaya koymaktadır. Kırmızı et tüketimi; nüfus, gelir seviyesi, kırmızı et fiyatları, ikame ürünlerin fiyatları ile tüketici zevk ve tercihlerindeki değişimler çerçevesinde ele alınmaktadır. Türkiye'de canlı hayvan ve kırmızı et ithalatının sürmesi yapısal çözümler getirecek politikaların gerekliliğini ortaya koymaktadır (Saygın ve Demirbaş, 2017). Ayrıca, et ithalatı, et fiyatları, et üretim miktarı vb. süreçlerde yaşanan değişimler kırmızı et sektörünü etkilemektedir (Öztürk ve Baysan, 2022). Sonuç olarak, Türkiye'de kırmızı et fiyatları, nüfus, gelir seviyesi, ikame ürünlerin fiyatları, tüketici zevk ve tercihleri, canlı hayvan ve kırmızı et ithalatı, et fiyatları, et üretim miktarı vb. birçok faktörden etkilenmektedir.

Pazarlama marjı, bir ürünün üretici satış fiyatı ile tüketici alış fiyatı arasındaki farktır. Pazarlama sisteminin verimliliğinin önemli bir ölçüsüdür ve iş sürdürülebilirliğinde teşvik edici veya caydırıcı bir rol oynayabilmektedir. Pazarlama marjları, pazarlama sistemlerinin etkinliğinin ya da etkinsizliğinin göstergesi olarak değerlendirilebilir (Achike ve Anziku, 2010). Pazarlama marjı pazarlama sisteminin etkinliğinin önemli bir ölçütüdür. Pazarlama marjlarının belirleyicileri sektöre ve pazar yapısına bağlı olarak değişmektedir. Araştırma sonuçları, pazar yoğunlaşması ve verimliliğin bazı sektörlerde pazarlama marjlarının önemli belirleyicileri olduğunu göstermektedir.

Tarımsal ürünlerin fiyat analizinin ve kar marjlarının değerlendirildiği çok sayıda çalışma yapılmıştır. Akpınar ve Gül (1998), Adana'da kütlü pamuk fiyatlarındaki gelişmeleri ve mevsimsel dalgalanmaları incelemiş, 1981-1996 döneminde fiyatların mevsimsel dalgalanma gösterdiği, Ekim ayında en düşük, Haziran ayında ise en yüksek seviyesine ulaştığını bildirmiştir. Ayrıca hasat dönemi boyunca pamuk fiyatlarının düştüğünü, Mart ayından sonra ise bir artış eğilimine girdiğine vurgu yapmıştır. Demirtaş ve Erkan (2002), Türkiye'de ve Mersin ilinde üretimi en yüksek sebze olan domatesin fiyatları ve mevsimsel dalgalanmaları analiz edilmiştir. Çalışmada fiyat dalgalanmalarının ana nedeni olarak tarım ürünlerinde arzın hasat mevsiminde artması ve buna karşılık talebin yıl boyunca sürekli olması gösterilmiştir. Ayrıca domates fiyatlarındaki reel artış trendi 7.678 TL/kg olarak hesaplanmıştır. Gül vd. (2009), 1997-2006 yıllarına ait verileri kullanarak 16 sebze için fiyat değişimlerini ve mevsimsel dalgalanmaları incelemiştir. İncelenen dönemde sebze fiyatlarının azalan bir eğilime sahip olduğu bildirilmiştir. Yılmaz ve Gül (2014) Antalya ili muz fiyatlarını inceledikleri çalışmada, muz reel fiyatlarının 1999-2013 periyodunda azalma eğiliminde olduğu, aylara göre fiyatın değiştiğini belirlemiştir. Kadanalı vd. (2010) limonda, Küzeci vd. (2019) kuru fasulyede, Ertek vd. (2020) portakalda, Bozdemir vd. (2021) domateste pazarlama marjlarını hesaplamışlardır.

Tarımsal ürünlerde olduğu gibi literatürde kırmızı et fiyatlarının incelendiği birçok çalışma bulunmaktadır. Cevger ve Sakarya (2006), Turhan vd. (2010) ve Aydın vd. (2011)) kırmızı et fiyat oluşumunu ve bu oluşumu etkileyen faktörleri incelemiştir. Kan ve Direk (2004) ise Konya ilinde kırmızı et fiyatındaki gelişmeleri değerlendirmiştir. Ayyıldız ve Çiçek (2018) kırmızı et fiyatlarını GARCH yöntemiyle analiz etmiştir. Saygın ve Demirbaş (2017), kırmızı et sektörüne ait sorunları ve çözüm önerilerini ortaya koymuştur. Topçu (2002), Erzurum ilinde sığır eti maliyeti ve pazarlama marjını hesaplamıştır.

Bu çalışmada, Türkiye İstatistik Kurumu internet sitesinden elde edilen 2008-2021 dönemindeki üretici ve tüketici fiyatları analiz edilmiştir.

Materyal ve Metot

Çalışmanın ana materyali Türkiye İstatistik Kurumundan elde edilen ikincil veriler oluşturmaktadır. Kırmızı et fiyatları 2008-2021 dönemini içeren 19 yıllık zaman dilimini kapsamaktadır. Cari fiyatların reel fiyatlara dönüştürülmesinde 2003=100 bazlı Türkiye İstatistik Kurumu tarafından periyodik olarak yayınlanan tüketici fiyat endeksi (TÜFE) kullanılmıştır. Fiyat serisinin basit indeksleri hesaplanmış ve yorumlanmıştır. Mevsimsel fiyat dalgalanmaları basit oran yöntemi ile belirlenmiştir (Güneş ve Arıkan, 1988). Ayrıca çalışmada kırmızı et fiyatlarının zaman içindeki değişimini farklı bir açıdan değerlendirebilmek için elma fiyatları ile karşılaştırılmıştır.

Araştırma Bulguları ve Tartışma

Kırmızı et sektörü, hayvan yetiştiriciliği, et işleme ve pazarlama faaliyetlerini içeren çok kapsamlı bir sektördür. Son yıllarda, et tüketimindeki artan sağlık endişeleri nedeniyle, bazı tüketiciler alternatif protein kaynaklarına yönelse bile dünya genelinde hala yüksek miktarda kırmızı et tüketilmektedir. Özellikle artan nüfusun yeterli ve dengeli beslenmesi kırmızı et sektörünü, dolayısı ile kırmızı et sektörünün kaynağı olan hayvancılığa olan ilgiyi daha da artırmaktadır. Çizelge 1’de Türkiye’de son beş yıldaki canlı hayvan sayısı, kesilen hayvan sayısı ve et üretim miktarı verilmiştir (TOB, 2023; TÜİK, 2023). Son beş yıllık veriler incelendiğinde tüm istatistiklerde yıllara göre bir artışın olduğu görülebilir. Ancak bu artışın kırmızı et talebini karşılamadığını belirtmek gerekir.

Çizelge 1. Türkiye canlı hayvan sayısı, kesilen hayvan sayısı ve et üretim miktarı

		2017	2018	2019	2020	2021
Büyükbaş	Canlı Hayvan Sayısı (1000 adet)	16.105	17.221	17.872	18.158	18.036
	Kesilen Hayvan Sayısı (1000 adet)	4.363	4.877	4.892	4.854	5.186
	Et Üretim Miktarı (1000 ton)	1.100	1.288	1.337	1.350	1.472
Küçükbaş	Canlı Hayvan Sayısı (1000 adet)	44.312	46.117	48.481	54.113	57.519
	Kesilen Hayvan Sayısı (1000 adet)	17.592	18.526	19.060	20.493	22.033
	Et Üretim Miktarı (1000 ton)	341	374	403	436	480
Toplam	Canlı Hayvan Sayısı (1000 adet)	60.417	63.338	66.353	72.271	75.555
	Kesilen Hayvan Sayısı (1000 adet)	21.955	23.403	23.952	25.347	27.219
	Et Üretim Miktarı (1000 ton)	1.440	1.662	1.741	1.786	1.952

Türkiye 2008-2021 arasındaki kırmızı et (koyun ve dana) fiyatları ile elma fiyatları arasındaki parite Şekil 1’de verilmiştir. 2008 yılında 1 kg kuzu eti ile 7,7 kg, 1 kg dana eti ile 9,2 kg elma alınabiliyorken, 2010 yılında 1 kg dana ve kuzu eti ile yaklaşık aynı miktarda elma alınabilmektedir. 2021 yılına gelindiğinde fiyat paritesi kuzu eti lehinde gelişmiş ve 1 kg dana eti ile yaklaşık 11 kg, 1 kg kuzu eti ile 12,5 kg elma alınır duruma gelmiştir. Kırmızı et-elma fiyat paritesi yıllara göre değişken bir yapı göstermiştir. Örneğin 2010-2013 ve 2018-2021 dönemlerinde kuzu eti ile daha fazla elma alınabiliyorken, 203-2017 döneminde dana eti lehine bir değişim olmuştur.

Şekil 1. Türkiye’de 2008-2021 dönemi kırmızı et-elma fiyatı paritesi

Koyun ve dana eti üretici reel üretici fiyatları Çizelge 2’de verilmiştir. Reel fiyatlar incelendiğinde koyun etinde 2011 yılına kadar sürekli bir artış, 2011-2014 döneminde bir düşüş, 2014 yılından sonra inişli çıkışlı bir artış olmuştur. Dana eti reel fiyatlarında da benzer bir seyir olmakla birlikte koyun eti lehine artışın daha fazla olması dana ve koyun eti fiyatı arasındaki makasın açılmasına neden olmuştur. Nitekim 2021 yılında 2008 yılına göre koyun eti reel fiyatları %21,93 artarken, dana eti fiyatları %2,18 oranında artmıştır.

Çizelge 2. Yıllara göre koyun ve dana eti reel üretici fiyatlarındaki gelişmeler

Yıllar	Koyun Eti Üretici Fiyatı (TL/kg)		Dana Eti Üretici Fiyatı (TL/kg)	
	Reel Fiyat	İndeks	Reel Fiyat	İndeks
2008	49,29	100,00	52,07	100,00
2009	55,34	112,28	55,95	107,45
2010	72,79	147,68	70,82	136,01
2011	73,66	149,44	67,11	128,90
2012	65,28	132,44	58,20	111,79
2013	56,08	113,77	48,92	93,97
2014	51,88	105,26	48,51	93,16
2015	54,60	110,78	55,69	106,97
2016	59,28	120,26	61,23	117,61
2017	61,20	124,16	60,40	116,01
2018	60,37	122,49	54,55	104,77
2019	58,80	119,29	51,47	98,85
2020	58,96	119,61	52,18	100,22
2021	60,10	121,93	53,20	102,18

Kırmızı et reel tüketici fiyatları Çizelge 3’te verilmiştir. Tüketici fiyatlarının üretici fiyatlarına göre daha fazla artmıştır. 2021 yılında 2008 yılına göre koyun eti fiyatı %49,78, dana eti fiyatı %10,18 oranında artmıştır.

Çizelge 3. Yıllara göre koyun ve dana eti reel tüketici fiyatlarındaki gelişmeler

Yıllar	Koyun Eti Tüketici Fiyatı (TL/kg)		Dana Eti Üretici Fiyatı (TL/kg)	
	Reel Fiyat	İndeks	Reel Fiyat	İndeks
2008	56,63	100,00	68,01	100,00
2009	71,43	126,12	72,50	106,60
2010	91,53	161,62	92,92	136,63
2011	94,63	167,09	84,16	123,75
2012	84,50	149,21	79,06	116,25
2013	77,90	137,55	76,18	112,02
2014	75,97	134,15	80,64	118,57
2015	77,47	136,80	94,35	138,74
2016	82,45	145,59	93,98	138,18
2017	89,00	157,15	91,64	134,75
2018	90,90	160,50	81,72	120,17
2019	84,82	149,78	74,93	110,18
2020	88,93	157,03	75,23	110,62
2021	86,82	153,31	76,47	112,44

Koyun ve dana eti pazarlama marjları yıllara göre değişim göstermektedir. Koyun eti pazarlama marjı %13,02-33,70 arasında değişirken, dana etinde bu oranlar %20,31-40,97 arasında seyretmiştir. 2021 yılında hem dana hem de koyun etinin pazarlama marjı yaklaşık %31 olarak gerçekleşmiştir (Şekil 2).

Şekil 2. Türkiye’de kırmızı et pazarlama marjı (%)

Kırmızı et fiyatındaki mevsimsel dalgalanmalar reel tüketici fiyatları için hesaplanmıştır. Reel fiyatlar koyun etinde 79,24 TL/kg ve dana etinde 79,29 TL/kg ile en düşük Ocak ayında gerçekleştiği belirlenmiştir. Koyun eti fiyatı Ağustos ayında, dana eti Eylül ayında en yüksek değere ulaşmıştır. Koyun eti fiyatlarına ait varyasyon katsayısının dana eti fiyatlarına göre daha yüksek olması koyun eti fiyatının daha değişken olduğunun göstergesidir.

Çizelge 4. Kırmızı et reel fiyatlarında mevsimsel dalgalanmalar

Aylar	Koyun Eti			Dana Eti		
	Reel Fiyat (TL/kg)	Varyasyon Katsayısı	Mevsimsel İndeks	Reel Fiyat (TL/kg)	Varyasyon Katsayısı	Mevsimsel İndeks
Ocak	79,24	13,77	96,22	79,29	11,59	97,23
Şubat	80,17	12,38	97,35	79,49	11,47	97,46
Mart	81,60	12,43	99,08	79,60	11,15	97,60
Nisan	82,47	13,30	100,14	80,67	11,56	98,91
Mayıs	82,73	13,32	100,45	81,09	10,44	99,43
Haziran	83,15	13,79	100,96	82,09	10,66	100,66
Temmuz	83,67	13,87	101,60	82,98	11,42	101,75
Ağustos	84,19	13,44	102,23	83,64	11,14	102,56
Eylül	84,03	12,79	102,03	84,00	11,39	103,00
Ekim	82,81	12,26	100,55	82,55	11,62	101,21
Kasım	82,35	11,71	99,99	81,79	10,96	100,29
Aralık	81,86	11,4	99,39	81,48	10,46	99,91

Sonuç ve Öneriler

Bu çalışmada önemli besin kaynaklarından biri olan kırmızı etin fiyat analizleri yapılmış, fiyatların mevsimsel dalgalanmaları incelenmiştir. Sonuçlar yıllara göre değişmekle birlikte reel fiyatların genel bir artış eğiliminde olduğunu göstermiştir. Koyun ve dana eti fiyatları aylara göre değişiklik göstermiştir. Genel olarak kış aylarından yaz aylarına doğru kırmızı et fiyatları artış, sonbahara doğru ise bir azalış eğiliminde olmuştur.

Türkiye et üretimi yıllara göre artmasına rağmen yurtiçi talep karşılanamamaktadır. Türkiye'nin kırmızı et tüketimi diğer ülkelere kıyasla nispeten düşüktür ve ülke kırmızı et talebini karşılamak için büyük ölçüde ithalata bağımlıdır. Bu nedenle, ithalata olan bağımlılığı azaltmak için ülkede kırmızı et üretiminin artırılması gerekmektedir. Üretimde verimliliği artıracak politikalara hız verilmelidir. Bunun için modern teknolojiler kullanarak hayvanların beslenmesi, barındırılması ve kesimi gibi süreçlerde daha verimli yöntemler kullanılmalıdır.

Bu, üretim maliyetlerini azaltacak ve kırmızı et fiyatlarını düşürecektir. Türkiye'de küçük ve orta ölçekli işletmeler kırmızı et üretiminde büyük bir rol oynamaktadır. Bu işletmelerin desteklenmesi, hayvanların sağlıklı yetiştirilmesi, hastalıkların önlenmesi ve beslenme sorunlarının giderilmesi için gerekli kaynakların sağlanması gerekmektedir. Pazarlama marjı, pazarlama sisteminin etkinliğinin önemli bir ölçüsüdür. Bu nedenle, pazarlama marjını azaltmak ve sektörün karlılığını artırmak için pazarlama sisteminin iyileştirilmesi gerekmektedir.

Kırmızı etin kalitesi ve güvenliği, kırmızı et talebini etkileyen temel faktörlerdir. Bu nedenle, ülkede kırmızı ete olan talebi artırmak için kırmızı etin kalitesini ve güvenliğini iyileştirmek gerekmektedir. Kırmızı et sektöründe Ar-Ge çalışmalarının da teşvik edilmesi diğer önemli bir konudur. Özellikle hayvanların daha verimli beslenmesi, hastalıkların önlenmesi ve kırmızı et kalitesinin artırılması için Ar-Ge çalışmaları desteklenmelidir.

Sonuç olarak, Türkiye'de kırmızı et sektörünün gelişmesi için yenilikçi uygulamaların benimsenmesinin artırılması, kırmızı et üretiminin artırılması, pazarlama sisteminin iyileştirilmesi, kırmızı et tüketiminin teşvik edilmesi ve kırmızı etin kalite ve güvenliğinin iyileştirilmesi gerekmektedir.

ÖZET

Bu çalışmanın amacı dünyada ve Türkiye’de elmacılık sektörünün mevcut durumunu ortaya koymaktır. Bu amaçla TUIK, FAO ve USDA verilerinden yararlanılarak üretim, alan ve verim ile ilgili değişimler incelenmiştir. Elma, dünya üretiminde muzdan sonra en fazla üretilen ve ticarete konu olan meyve türüdür. Dünya elma üretiminin yaklaşık %85,5’i Asya ve Avrupa kıtasında üretilmektedir. Çin %49,4’lük üretim payıyla dünya elma üretiminin yaklaşık yarısını karşılamaktadır. Türkiye ve ABD Çin’den sonra en fazla üretim yapan ülkelerdir. Dünya elma alanlarında önemli bir artış olmazken üretim miktarlarında sürekli bir artış trendinin varlığı birim alandan alınan ürünün arttığına bir göstergesidir. Son yıllarda elma verimliliğini artırmaya yönelik politikaların uygulanmasıyla Türkiye’de birim alandan alınan elma miktarı dünya ortalamasının üstünde olmasına rağmen, önemli elma üreten Şili, İtalya, Fransa, ABD, Yeni Zelanda ve Güney Afrika gibi ülkelere göre düşük bir verimliliğe sahiptir. Nüfusunun yüksekliği Çin’i en fazla elma tüketen ülke konumuna getirmiştir. Türkiye’de kişi başı elma tüketimi dünya ortalamasının çok üstünde yaklaşık 36 kg’dır. Dünya elma ticareti değerlendirildiğinde sırasıyla Çin, Polonya, İtalya, ABD ve Şili en fazla ihracat yapan ülkeler olarak ilk sıralarda yer alırken, ithalatta bu sıralama Rusya, Almanya, Hindistan, İngiltere ve Hollanda şeklindedir. Türkiye’de ihracatın üretime oranı yaklaşık %7,9’dur. Türkiye dünya elma ticaretinden %4,2’lik bir pay almakla birlikte bu payın artırılmasına yönelik politikaların etkin bir şekilde yürürlüğe koyulması elmacılık sektörünün gelişimi açısından önemli olduğu değerlendirilmektedir.

Anahtar Kelimeler: Elma, ithalat, ihracat, verim, tüketim

ABSTRACT

This study aimed to lay out the current situation of the apple sector in the world and Türkiye. For this purpose, changes in production, area, and yield were analyzed by using TurkStat, FAO, and USDA data. Apple is the most produced and traded fruit after bananas in the world. Approximately 85.5% of the world's apple production was made in Asia and Europe. China accounted for about half of the world's apple production, with a production share of 49.4%. Türkiye and the USA had the highest production after China in 2021. While there is no significant increase in the world apple area, a continuous upward trend in production indicates that the product obtained from the unit area is increasing. With implementing policies to increase apple productivity in recent years, Türkiye has low productivity compared to major apple-producing countries such as Chile, Italy, France, the USA, New Zealand, and South Africa, although the yield of apples obtained from the unit area is above the world average. China's high population has made it the country with the highest apple consumption. Per capita, apple consumption in Türkiye is about 36 kg, much higher than the world average. When the world apple trade is evaluated, China, Poland, Italy, the USA, and Chile were the leading exporting countries, while Russia, Germany, India, the UK, and the Netherlands were the leading importing countries. In Türkiye, the ratio of exports to production was approximately 7.9%. Although Türkiye has a share of 4.2% in the world apple trade, effective implementation of policies to increase this share is considered important for developing the apple sector.

Keywords: Apple, import, export, yield, consumption

Giriş

Meyvecilik sektörü, insan beslenmesinde rol alması, istihdam sağlaması, meyve işleyen sanayiye hammadde sağlaması, katma değerinin diğer tarım ürünlerine göre daha yüksek olması ve dış ticarete konu olmasından dolayı önemli bir sektördür. Son yıllarda pazara erişimin kolaylaşması, tüketici tercihlerinin değişmesi, soğuk zincirle taşıma olanaklarındaki ve gelişmiş soğuk hava depo sayısındaki artış nedeniyle meyvecilik sektöründe önemli gelişmeler sağlanmıştır. 2002 yılında 600,9 milyon ton olan dünya meyve üretimi 20 yıllık süreçte %51,38 artarak 909.6 milyon tona ulaşmıştır. Aynı dönemde meyve üretim alanı %22,1 artarak 2021 yılında 66.482.017 ha'ya yükselmiştir. Söz konusu 2002-2021 yıllarını kapsayan 20 yıllık süreçte Türkiye'de meyve üretimi %47,33, meyve alanı ise %0,66 artarak sırasıyla 25 milyon ton ve 1.34 milyon ha olarak gerçekleşmiştir. Türkiye 25 milyon tonluk meyve üretimiyle dünya meyve üretiminin yaklaşık %2.75'ini karşılamakta; Çin, Hindistan ve Brezilya'nın ardından dördüncü sırada yer almaktadır. 2021 yılında dünya meyvecilik sektörü yaklaşık 556,6 milyar dolar, Türkiye ise 8,1 milyar dolar brüt üretim değerine sahiptir (FAO, 2023). Bu sektörde 2021 yılı verilerine göre elma %11,53'lük üretim payıyla; muzdan sonra en fazla üretilen ikinci büyük türdür (Şekil 1).

Şekil 1. Türler'e göre dünya meyve üretim oranları (FAO, 2023)

Son yıllarda kronik hastalıkların artışı tüketicilerin meyveye olan ilgisini teşvik etmiş, bu nedenle tüm dünyada meyve üretim ve ticareti artmıştır (Güneş vd., 2017).

Elma ılıman iklim bölgelerinde kolayca yetiştirilebilmesine rağmen, ticari elma üretimi, üretim ve pazarlamada karşılaştırmalı üstünlüğe sahip ülkelerde ve bölgelerde artan bir şekilde yoğunlaşmaktadır (O'Rourke, 2003). Sıcağa toleranslı çeşitlerin geliştirilmesi, uzun yetiştirilme periyodu gerektiren çeşitlerin popülaritesinin artması (Granny Smith ve Fuji gibi) ve sulama teknolojisinin gelişmesi elma üretiminin başarılı bir şekilde sıcak iklimlerde yetiştirilmesine olanak tanımaktadır (O'Rourke, 1994).

Türkiye'de birçok meyve türü sahip olduğu coğrafi konum nedeniyle yetiştirilebilmekte, bu nedenle Türkiye bahçe bitkileri kültürünün doğuş yeri ve çok sayıda meyve türünün anavatanı olarak kabul edilmektedir (Ağaoğlu vd., 1997). Türkiye'de yaklaşık 5,32 milyon ton yumuşak çekirdekli meyve üretimi gerçekleştirilmektedir. Yumuşak çekirdekli meyve grubunda yer alan elma %84,53 ile en fazla üretilen türdür (Şekil 2). Dünya ticaretine de konu olan elma, değişik ekolojilere adaptasyon kabiliyetinin yüksek olmasından dolayı çok geniş bir yayılma alanında üretilen bir türdür. Son yıllarda depolama, taşıma ve işleme teknolojilerindeki gelişmeler elmanın uluslararası ticarete önemini artırmıştır (Öztürk vd., 2011).

Şekil 2. Türkiye'de türlere göre yumuşak çekirdekli meyve üretim oranları (TUİK, 2023)

Elmanın bu derece yaygın olmasında; türün değişik ekolojilere uyabilme yeteneği, klonal anaçlı bahçelerin erken meyveye yatması, meyvelerin kendine has güzel rengi, kokusu ve tadı ile organik ve mineral maddelerce zengin olan bir meyve olması, çeşitlerin değişik zamanlarda olgunlaşması nedeni ile üretimin geniş bir periyotta yapılabilmesi ve kolay depolanabilmesi gibi özellikleri önemli rol oynamaktadır.

Materyal ve Metot

Materyal

Çalışmanın materyalini ikincil veriler oluşturmuştur. Türkiye İstatistik Kurumu (TUIK), Birleşmiş Milletler Tarım ve Gıda Örgütü (FAO) ve ABD Tarım Bakanlığı (USDA) sitelerinde yayınlanan verilerden ve bu konuda yayınlanmış yayın, rapor ve belgelerden yararlanılmıştır.

Metot

Çalışmada dünya ve Türkiye elma üretim, tüketim ve ticaret yapısı değerlendirilmiştir. Elde edilen verilerle basit indeksler hesaplanmış, artış ve azalışlar yorumlanmıştır.

Araştırma Bulguları ve Tartışma

Üretim ve Alan

2021 yılı verilerine göre dünyada yaklaşık 93 milyon ton elma üretilmiştir. Çin 45,98 milyon tonluk üretimiyle dünya elma üretiminin yaklaşık yarısını (%49,37) tek başına gerçekleştirmektedir. Çin'i sırasıyla Türkiye (%4,82), ABD (%4,80), Polonya (%4,37) ve birbirine yakın oranlarıyla Hindistan, İran, Rusya Federasyonu, İtalya, Fransa ve Şili takip etmektedir. Bu on ülke dünya elma üretiminin %76,38'ini karşılamaktadır (Çizelge 1). İklim kuşağında bulunan alanlarının çokluğu ve elmanın anavatanı olması nedeniyle en fazla üretim (%65,78) Asya kıtasında yapılmaktadır. Avrupa kıtası %19,72'lik üretimiyle ikinci, %9.78'lik üretimiyle Amerika kıtası üçüncü sırada yer almaktadır (FAO, 2023). Dünya elma üretimi son 20 yılda %68,43 artmış; bu artışın %70,67'lik kısmı Çin'deki üretim artışından kaynaklanmıştır. II. Dünya savaşından sonra Çin'de elma üretimi sürekli artmakta ve bu artışın nedeni olarak ekonomik büyümenin etkisi ile ülkede meyve için var olan gizli talebin ortaya çıkması ve neticesinde hükümetin tarım üzerindeki baskıyı azaltması, tarım işletmelerinin birim alandan daha yüksek getirisi olan meyve üretimine yönelmeleri şeklinde açıklanabilir (Öztürk vd., 2011).

Çizelge 1. Elma üretiminde lider ülkelerin üretim miktarları ve payları

Ülke	Üretim Miktarı (ton)			Pay (%)	Değişim (%)*
	2002	2012	2021		
Çin	19.240.984	38.491.000	45.983.400	49,37	138,99
Türkiye	2.200.000	2.888.985	4.493.264	4,82	104,24
ABD	3.866.376	4.078.839	4.467.206	4,80	15,54
Polonya	2.167.518	2.877.336	4.067.400	4,37	87,65
Hindistan	1.160.000	2.203.400	2.276.000	2,44	96,21
İran	2.333.896	3.103.883	2.241.100	2,41	-3,98
Rusya Federasyonu	1.950.000	1.403.000	2.216.200	2,38	13,65
İtalya	2.199.219	1.991.312	2.211.740	2,37	0,57
Fransa	1.995.306	1.306.333	1.633.080	1,75	-18,15
Şili	1.150.000	1.607.415	1.556.805	1,67	35,37
İlk 10 Ülke	38.263.298	59.951.503	71.146.195	76,38	85,94
Diğer Ülkeler	17.038.400	18.646.575	21.998.163	23,62	29,11
Dünya	55.301.698	78.598.078	93.144.358	100,00	68,43

* 2002 yılına göre 2021 yılındaki değişimi ifade etmektedir.

Ilıman iklim meyve türlerinden biri olan elma çok geniş bir yayılma alanına sahiptir. Dünyada 2021 yılında yaklaşık 4,82 milyon ha'lık alanda elma yetiştiriciliği yapılmaktadır. Elma alanlarının %69,22'si (3,34 milyon ha) Asya kıtasında, %20,28'i (0,98 milyon ha) Avrupa kıtasında yer almaktadır (FAO, 2023). Elma üretiminde önemli ülkelerin 2021 yılı elma üretim alanları Çizelge 2'de verilmiştir. Elma üretiminde önde gelen ilk 10 ülke dünya elma üretim alanlarının yaklaşık %69,47'sini karşılık gelen 3,35 milyon ha alanda elma üretimi gerçekleştirmektedir. Çin ve Hindistan dünya elma alanlarının yaklaşık yarısına sahiptir. Son 20 yıllık veriler dikkate alındığında dünya elma üretim alanı %3,93 azalmıştır. Mutlak olarak üretim alanını en fazla artıran ülke Çin, en fazla azaltan ülke ise Rusya Federasyonu olmuştur. Elma üretim alanının azaldığı, buna karşın elma üretiminin %68,43 arttığı dikkate alındığında birim alandan alınan ürün miktarında önemli miktarlarda artış olduğunu söylemek mümkündür. Bu çarpıcı tablonun ortaya çıkmasının en büyük nedeni Çin'in son 20 yılda üretim miktarını yaklaşık 2,38 kat artırmasına karşılık üretim alanında 1,08 kat artmış olmasından kaynaklanmaktadır. Çizelge 2 incelendiğinde önemli elma üreticisi ülkelerden ABD, Polonya, İran, Rusya Federasyonu, İtalya, ve Şili'de elma üretim alanları azalmıştır.

Çizelge 2. Elma üretiminde lider ülkelerin üretim alanları ve payları

Ülke	Üretim Alanı (ha)			Pay (%)	Değişim (%)*
	2002	2012	2021		
Çin	1.938.300	2.231.350	2.092.326	43,39	7,95
Türkiye	150.000	174.811	168.811	3,50	12,54
ABD	159.770	131.604	117.441	2,44	-26,49
Polonya	168.456	194.680	161.900	3,36	-3,89
Hindistan	240.000	321.900	313.000	6,49	30,42
İran	149.457	197.348	131.815	2,73	-11,80
Rusya Federasyonu	523.000	182.000	225.256	4,67	-56,93
İtalya	60.529	54.684	54.470	1,13	-10,01
Fransa	49.477	38.714	54.210	1,12	9,57
Şili	34.865	35.667	30.967	0,64	-11,18
İlk 10 Ülke	3.473.854	3.562.758	3.350.196	69,47	-3,56
Diğer Ülkeler	1.545.524	1.474.101	1.472.030	30,53	-4,76
Dünya	5.019.378	5.036.859	4.822.226	100,00	-3,93

* 2002 yılına göre 2021 yılındaki değişimi ifade etmektedir.

Şekil 3'te 1993-2021 yıllarında dünya elma üretim miktarı ve üretim alanları verilmiştir. Dünya elma üretimi yıllara göre değişmekle beraber sürekli bir artış eğilimindedir. Buna karşın dünya elma üretim alanları 1995 yılına kadar artış, 1995 yılından sonra azalış eğiliminde olmuş, 2007 yılından sonra küçük oranlarda artış-azalış göstermiştir.

Şekil 3. Dünya elma üretimi (ton) ve alanı (ha) (1992-2021)

Çizelge 1'de görüleceği üzere Türkiye dünya elma üretiminde 2021 yılında ikinci sırada yer almaktadır. Ancak dünya üretiminde ön sıralarda olmasına rağmen Türkiye'de hala büyük bir

çoğunlukla geleneksel metotlarla üretim yapılmaktadır. Son yıllarda yeni çeşit ve klonal anaçlarla tesis edilen bahçeler modern yetiştiricilik metotlarına uygun olarak tesis edilmekle birlikte bu dönüşümün arzu edilen seviyede olmadığı ve yavaş bir dönüşüm yaşandığı söylenebilir. Bu dönüşüm bir taraftan yeni alanların tesisi şeklinde, diğer taraftan ekonomik ömrünü tamamlamış eski bahçelerin sökülmesi şeklinde de olmaktadır. Modern yetiştiricilik metotlarına geçiş hızının düşük olmasının en önemli nedeni işletmelerin küçük ölçekli olmasıdır.

Türkiye İstatistik Kurumu (TÜİK) verilerine göre Türkiye’de tüm illerde elma yetiştiriciliği yapılmaktadır. Ancak ticari olarak değerlendirildiğinde Isparta, Niğde, Karaman, Antalya, Kayseri, Denizli ve Konya illeri ön plana çıkmaktadır (Çizelge 3). En fazla üretimin yapıldığı Isparta ili aynı zamanda depolama kapasitesi ve Ar-Ge alt yapısıyla da öne çıkmaktadır.

Çizelge 3. Türkiye Elma üretiminde önemli illerin üretim miktarları

Elma Çeşidi	Üretim Miktarı (ton)							Türkiye
	Isparta	Niğde	Karaman	Antalya	Kayseri	Denizli	Konya	
Golden	487.095	87.195	74.528	78.156	39.664	15.781	26.017	1.091.226
Starking	542.089	114.630	289.738	335.887	81.404	40.857	31.929	1.698.067
Amasya	0	159.858	151	1	13.781	292	5.948	242.251
Granny Smith	23.745	15.364	30.117	16.990	3.802	8.032	14.987	184.709
Diğer Çeşitler	77.495	175.570	140.816	20.893	143.532	192.805	150.277	1.277.011
TOPLAM	1.130.424	552.617	535.350	451.927	282.183	257.767	229.158	4.493.264

En fazla üretimin yapıldığı ilk yedi il, Türkiye elma üretiminin %76,55’ini karşılamaktadır. Sırasıyla illerin üretimdeki payı Isparta %25,16, Niğde %12,30, Karaman %11,91, , Antalya %10,06, Kayseri %6,28, Denizli %5,74 ve Konya %5,10’ dur (Şekil 4).

Şekil 4. Elma üretiminde lider illerin elma üretimindeki payları

Verim

Dünyada elma üretim alanlarının daralmasına rağmen elma üretiminin sürekli bir artış eğiliminde olması verimlilik artışının bir göstergesi olarak karşımıza çıkmaktadır. Son 20 yılda yetiştirme tekniklerindeki gelişim, girdi kullanımı ve birim alandan yüksek verim alma eğilimindeki gelişmeler sonucunda verimlilik yaklaşık %75 artış sağlanmıştır (Çizelge 4). Özellikle klonal anaçlarla bodur ve yarı bodur kapama elma bahçesi tesisiyle birim alana dikilen fidan sayısındaki artış beraberinde birim alandan alınan ürünün artışını da sağlamaktadır.

Çizelge 4. Elma üretiminde lider ülkelerin verim durumu (ton/ha) ve değişimleri

Ülkeler	2002	2012	2021	% Değişim*
Çin	9,93	17,25	21,98	121,39
Türkiye	14,67	16,53	26,62	81,48
ABD	24,20	30,99	38,04	57,18
Polonya	12,87	14,78	25,12	95,25
Hindistan	4,83	6,85	7,27	50,45
İran	15,62	15,73	17,00	8,88
Rusya Federasyonu	3,73	7,71	9,84	163,88
İtalya	36,33	36,41	40,60	11,76
Fransa	40,33	33,74	30,13	-25,30
Şili	32,98	45,07	50,27	52,41
Dünya	11,02	15,60	19,32	75,32

* 2002 yılına göre 2021 yılındaki değişimi ifade etmektedir.

Çin hektara verimini yaklaşık iki kattan fazla artırarak dünya verim artışını en fazla etkileyen faktör olmuştur. Çizelgede yer almayan ancak önemli elma üretici ülkelerinden biri olan Yeni Zelanda hektara yaklaşık 58 ton verimlilikle en verimli ülkelerin biridir. Şili, İtalya, Fransa ve ABD dünya ortalamasının çok üzerinde bir verimliliğe sahip ülkeler olarak ön plana çıkmaktadır. Üretimde ilk onda yer alan ülkeler içerisinde verimliliğini azalan tek ülke Fransa'dır. Türkiye'nin hektara verimliliği 26,62 ton olarak gerçekleşmiş ve dünya ortalamasının üstünde yer almıştır.

Tüketim

Küresel taze elma tüketim oranları dikkate alındığında Çin baskın liderliğini burada da devam ettirmektedir. 2020 yılı verilerine göre dünya taze elma tüketiminin %44,87'sini Çin tüketmektedir. Çin'i sırasıyla ABD (%7,82), Türkiye (%4,55), Hindistan (%4,09) ve Rusya Federasyonu (%3,51) takip etmektedir. Kişi başı tüketim dikkate alındığında Türkiye 35,68 kg ile ilk sırada yer alırken, 32,96 kg ile Arnavutluk ikinci sırada ve 31,05 kg ile Macaristan üçüncü sırada yer almaktadır (USDA, 2023). Dünya kişi başı ortalama elma tüketimi 8,53 kg olarak

hesap edilmiştir. Türkiye kişi başı elma tüketiminin bu derece yüksek olmasının en büyük nedeni ihracatının düşüklüğünden kaynaklanmaktadır.

Uluslararası Ticaret

Uzun yıllar ortalaması dikkate alındığında dünya elma üretiminin % 9-10'u uluslararası ticarete konu olmaktadır. Elma ticaretinin desteklenmesi, pazarlama stratejilerinin gelişmesi, insanların sağlıklı beslenme eğilimi, nüfusun ve gelirin artması beraberinde dünya elma ticaretini de geliştirmektedir ve geliştirmeye de devam edecektir.

İhracat

Dünya elma üretiminde önde olan ülkeler bu özelliğini ihracatta da sürdürmektedir. Ancak aynı şeyi Türkiye için söylemek mümkün değildir. Türkiye dünya elma ihracatından %4,23'lük pay almış, ihracatının üretime oranı %7,9 gibi düşük oranlarda gerçekleşmiştir. Yeni Zelanda üretimde ilk on ülke arasında yer almamasına rağmen ihracattan aldığı pay %5,35, ihracatın üretime oranı ise %79'dur. Şekil 5'te dünya ihracat miktar ve değerleri verilmiştir. Yıllara göre değişmekle beraber ihracat değeri sürekli bir artış eğilimindedir.

Şekil 5. Dünya elma ihracat miktar ve değerleri

Çizelge 5'te verilen önemli ihracatçı ülkelerin ihracat miktarı, ihracat değeri ve ihracattan aldıkları paylar değerlendirildiğinde; Çin gerek miktar ve gerekse değer bakımından aldığı pay ile ilk sırada yer almaktadır. Ürünü 1,70 \$/kg ile en iyi fiyata pazarlayan ülke Yeni Zelanda'dır. Türkiye ihracattan %4,23 pay alırken değer bakımından aldığı pay %2,22'ye düşmektedir. Bu durum Türkiye'nin ürünü düşük fiyata sattığının göstergesidir. Nitekim

International Conference on Global Practice of Multidisciplinary Scientific Studies-IV
Turkish Republic of Northern Cyprus, April 28-30, 2023

hesaplamalar Türkiye'nin 1 kg elmayı 0,50 \$'a sattığını, Yeni Zelanda elmasını Türkiye'ye göre 3,37 kat, Fransa 2,81 kat daha fazla fiyata pazarladığını göstermiştir.

Çizelge 5. Dünya elma ihracatında önemli ülkelerin ihracat miktar ve değerleri

Ülke	İhracat (ton)	Aldığı Pay (%)	İhracat (1.000 \$)	Aldığı Pay (%)
Çin	1.078.352	12,87	1.429.582	17,75
Polonya	921.863	11,00	414.324	5,14
İtalya	920.271	10,98	1.037.372	12,88
ABD	752.738	8,98	916.434	11,38
Şili	644.442	7,69	614.621	7,63
Güney Afrika	589.186	7,03	485.404	6,03
Yeni Zelanda	448.528	5,35	760.816	9,45
Türkiye	354.560	4,23	178.718	2,22
Fransa	308.227	3,68	437.206	5,43
Moldova	206.123	2,46	87.616	1,09
Dünya	8.378.082	100,00	8.053.441	100,00

Dünya elma ihracatında önde giden ilk on ülke toplam ihracatın %74,29'unu gerçekleştirmektedir. Türkiye'de diğer birçok meyve türünde olduğu gibi elma üretiminin de ihracatla desteklendiği söylenemez (Bayav vd., 2005). İhracata konu olan çeşitler Starking Delicious, Golden Delicious, Granny Smith ve Starkrimson Delicious'dır. 2021 yılında 354.560 ton elma 77 ülkeye ihraç edilmiştir. Ancak ihracatın %85'inden fazlası Hindistan, Rusya Federasyonu, Suriye, Libya ve Irak'a yapılmıştır (ITC-TRADE MAP, 2023). Irak ve Suriye, Türkiye'nin en önemli elma pazarları olarak değerlendirilmektedir.

İthalat

Dünya elma ithalatı ihracatın artmasıyla birlikte artmıştır. Dünya elma ithalatında önde giden ilk on ülke toplam ithalatın %43,61'ini gerçekleştirmektedir (Çizelge 6)(FAO, 2023). Türkiye elma ithalatı dikkate alınmayacak düzeyde düşüktür ve genellikle sezon sonunda Güney Yarımküre ülkelerinden yapılmaktadır.

Çizelge 6. Dünya elma ithalatında önemli ülkelerin ithalat miktar ve değerleri

Ülke	İthalat (ton)	Payı (%)
Rusya	615.999	7,36
Almanya	606.143	7,24
Hindistan	436.194	5,21
İngiltere	327.473	3,91
Hollanda	300.964	3,59
Meksika	299.875	3,58
Vietnam	295.144	3,52
Irak	282.910	3,38
Bangladeş	262.742	3,14
Fransa	224.054	2,68
İlk 10 Ülke	3.651.497	43,61
Diğer Ülkeler	4.721.494	56,39
Dünya	8.372.991	100,00

Belarus önemli bir elma üreticisi ülke olmadığı halde ihracatçı ülkeler arasında yer alması re-export yaptığını göstermektedir. Rusya %7,36'lık payla dünya ülkeleri arasında en fazla ithalatı yapan ülke konumundadır. Dünya elma ithalat miktar ve değerleri Şekil 6'dan da görüldüğü gibi sürekli bir artış eğilimindedir. Elma ithalat değerleri zaman zaman dalgalanmalar gösterse de üretim artışına paralel bir gelişim göstermektedir.

Şekil 6. Dünya elma ithalat miktar ve değerleri

Sonuç ve Öneriler

Üretim, tüketim ve ticaret bakımından değerlendirildiğinde elma sektörü meyvecilik sektörü içerisinde önemli bir paya sahiptir. Bu sektörün sürdürülebilirliği için etkin bir politikaya,

mevcut gerçekler dikkate alınarak bir genişleme vizyonuna ve bu vizyonun uygulanmasında cesaretli ve istekli uygulayıcılara ihtiyaç vardır.

Bu sektörü sürdürülebilir kılmak için sektörün desteklenmesi, paketleme, depolama ve pazarlama seviyelerinin daha uygun hale getirilmesi gereklidir. Sürdürülebilirliğini sağlayabilmek için üretici ülkeler birim alandan fazla ürün alabilmek ve maliyetleri düşürebilmek için gelişmiş teknolojileri kullanmak zorundadır. İslah programlarıyla tüketici isteklerine cevap veren yeni çeşit arayışlarının ve ürünleri pazarlayabilmek için yeni pazarlama stratejileri çabaları devam etmelidir.

Elma dünya genelinde gerek gelir seviyesi gerekse damak tadı bakımından büyük bir kesime hitap etmesinden dolayı geniş bir üretim ve ticaret hacmine sahiptir. Bu özelliğiyle en fazla ticarete konu olan ve tüketici talebinin en hızlı değiştiği meyvelerden biridir (Bayav ve Armağan, 2008). Uluslararası arenada rekabet edebilmek ancak kalite odaklı yüksek verim ile mümkün olacaktır.

Özet

Bu araştırma, 2018 ve 2019 yıllarında Bursa ekolojik koşullarında farklı ekim zamanı (15 Nisan, 1 Mayıs, 15 Mayıs ve 1 Haziran) ve hasat dönemlerinin (çiçeklenme öncesi, çiçeklenme ve tohum bağlama) kinoa bitkisinin silaj kalitesi üzerine etkilerini belirlemek amacıyla yürütülmüştür. Denemeler tesadüf blokları bölünmüş parseller düzenlemesine göre 3 tekrarlamalı olarak Bursa Uludağ Üniversitesi Ziraat Fakültesi Tarımsal Uygulama ve Araştırma Merkezi deneme alanlarında, Tarla Bitkileri Bölümü ile Toprak Bilimi ve Bitki Besleme Bölümü Laboratuvarları'nda yapılmıştır. Çalışmada silajların kuru madde oranı, pH, ham protein, ADF, NDF, P, K, Ca, Mg, Na, Fe, Cu, Zn ve Mn içerikleri gibi özellikler incelenmiştir. İki yıllık ortalama verilere göre; en yüksek kuru madde oranı 1 Haziran, en yüksek ham protein oranları 15 Nisan ve 1 Haziran, en düşük pH değeri ise 15 Nisan tarihlerinde yapılan ekimlerden elde edilen bitkilerle yapılan silajlarda tespit edilmiştir. Silajlarda ekim zamanı geciktikçe (1 Haziran ekimi hariç) pH değerleri artış eğilimi göstermiştir. Ekim zamanlarının K, Ca, Mg, Na, Fe, Cu, Zn ve Mn içerikleri üzerine etkileri de önemli bulunmuştur. Hasat dönemleri bakımından en yüksek kuru madde oranı tohum bağlama döneminde, en yüksek ham protein ile en düşük ADF ve NDF içerikleri ise çiçeklenme öncesi dönemde hasat edilen bitkilerden yapılan silajlarda tespit edilmiştir. Hasat dönemlerinin silajların P, K, Mg, Na, Fe, Cu, Zn ve Mn içerikleri üzerine etkileri de önemli bulunmuştur.

Anahtar Kelimeler: Kinoa, ekim zamanı, hasat dönemi, silaj, makro ve mikro besin elementleri

THE EFFECTS OF SOWING DATE AND HARVEST STAGES ON SILAGE
QUALITY IN QUINOA (*Chenopodium quinoa* Willd.)

Abstract

This study was carried out to determine the effect of different sowing dates (15 April, 1 May, 15 May and 1 June) and harvest stages (beginning of flowering, full flowering and seed setting) on the silage quality of quinoa. Field experiments were conducted in 2018 and 2019 in Bursa Uludag University Agriculture Faculty Agricultural Application and Research Center experiment areas and laboratories of Department of Field Crops and Department of Soil Science and Plant Nutrition. The experiment arranged a randomized complete block design with split plot arrangement having three replications. Several parameters such as dry matter rate, pH, crude protein, ADF, NDF, P, K, Ca, Mg, Na, Fe, Cu, Zn and Mn contents have been examined in the experiment. According to the two-year average results; the highest dry matter content was determined on June 1, the highest crude protein content was determined on April 15 and June 1, the lowest pH value was determined on April 15. As the sowing dates was delayed (except June 1), the pH of the silages tended to increase. The effects of sowing date on K, Ca, Mg, Na, Fe, Cu, Zn and Mn contents were also found to be significant. In terms of harvest stages, the highest dry matter content was determined in the seed setting stage, the highest crude protein and the lowest ADF and NDF contents were determined in the silages made from the plants harvested during the beginning of flowering stage. The effects of harvest stages on the P, K, Mg, Na, Fe, Cu, Zn and Mn contents of silages were also found to be significant.

Keywords: Quinoa, sowing date, harvest stage, silage, macro and micro nutrients

1.GİRİŞ

Kinoa (*Chenopodium quinoa* Willd.) Amaranthaceae familyasına ait tek yıllık otsu bir bitki olup, 30-150 cm boylanabilmektedir. Genellikle kendine döllenen kinoa bitkisinde yabancı dölllenme oranı %10-15'tir (Erdemli, 2020). Orijinini Güney Amerika'nın And dağlarından alan kinoanın en önemli tarımsal özelliklerinden birisi toprak tuzluluğuna dayanıklı olmasıdır (Vega-Galvez ve ark., 2010).“Süper Besin” veya “Mucize Tahıl” olarak adlandırılan kinoa sahip olduğu yüksek vitamin, mineral, protein ve antioksidan içeriğinden dolayı insan ve hayvan beslenmesinde yaygın olarak kullanılmaktadır (Tan ve Temel, 2019). En iyi gelişmesini tınlı-kumlu topraklarda yapmasına rağmen her türlü toprağa uyum sağlayabilen kinoa bitkisinde; gelişme süresi çeşitlere bağlı olarak 90-220 gün arasında değişmektedir (Geren ve ark., 2014). Kinoa bitkisinin kalın, dik ve odunsu gövde yapısı ile kazayağına benzeyen sarmal dizilişli geniş yaprakları vardır (Tan ve Yöndem, 2013).

Ekstrem koşullara yüksek toleransıyla bilinen kinoa; birim alanda üretmiş olduğu yüksek miktar ve kaliteli otu ile hayvan beslenmesinde alternatif kaba yem kaynağı olarak tercih edilmektedir (Güner ve Temel, 2022). Kinoa kurutulduğunda yaprakları ufalanarak döküldüğü ve sapları da sertleştiği için sindirilebilirlik oranı ve lezzeti azalmaktadır. Bunun için kinoanın kuru ot olarak kullanımından daha çok otunun silaj olarak değerlendirilmesi bir avantaj olarak görülmektedir (Güner ve Temel, 2022).

Kinoa silajının değerlendirilmesine yönelik sınırlı sayıda çalışma yapılmış olmakla birlikte ekim zamanları ve hasat dönemlerinin kinoa silajının kalitesi üzerine etkilerini inceleyen çalışmalar bulunmamaktadır. Podkówka ve ark., (2018) Polonya koşullarında yaptıkları bir çalışmada kinoa silajının ADF oranının % 34.24 ve NDF oranının ise % 45.31 olduğu tespit etmişlerdir. Güner ve Temel (2022), Iğdır koşullarında yürüttükleri bir çalışmada kinoa çeşitlerinin kuru madde oranının % 23.64-24.39, ham protein oranının % 16.67-17.20, NDF oranının % 37.02-37.62 ve ADF içeriğinin ise %17.60-17.91 arasında değiştiğini tespit etmişlerdir.

Bu çalışma farklı ekim zamanı ve hasat dönemlerinin kinoa silajının bazı kalite özellikleri üzerine etkilerini incelemek amacıyla yürütülmüştür.

2. MATERYAL ve METOD

Araştırma 2018 ve 2019 yıllarında Bursa ekolojik koşullarında Bursa Uludağ Üniversitesi Ziraat Fakültesi Tarımsal Uygulama ve Araştırma Merkezi deneme alanlarında, Tarla Bitkileri Bölümü ile Toprak Bilimi ve Bitki Besleme Bölümü Laboratuvarları'nda Tesadüf Blokları Bölünmüş Parseller düzenlemesine göre üç tekrarlamalı olarak yürütülmüştür. Araştırmada, bitki materyali olarak Titicaca çeşidi kullanılmıştır. Araştırmada ana parsellere ekim zamanı,

alt parsellere ise hasat dönemleri yerleştirilmiştir. Denemede dört farklı ekim zamanı (15 Nisan, 1 Mayıs, 15 Mayıs ve 1 Haziran) ile üç farklı hasat dönemi (çiçeklenme öncesi, çiçeklenme ve tohum bağlama dönemi) ele alınmıştır. Denemede sıra arası mesafe 35 cm, parsel boyu ise 5 m'dir. Her parsel 6 sıradan oluşup, alt parsel büyüklüğü 10.5 m²'dir. Araştırmada ekimle birlikte 7.5 kg N/da ve 8 kg P₂O₅/da gübre uygulanmıştır. Bitkiler 30-40 cm boya ulaştığında 5 kg N/da gübre verilmiştir. Denemede damla sulama sistemi kullanılarak sulamalar yapılmıştır. Yetiştirme dönemi boyunca yabancı otlara karşı elle mekanik mücadele yapılmıştır.

Denemede her bir hasat döneminde alınan bitki örnekleri 1.5-2 cm büyüklükte parçalanmış ve torbalara doldurularak etiketlenip çok kısa bir süre içerisinde laboratuvara götürülmüştür. Laboratuvara getirilen örnekler 1 litrelik anaerobik kavanozlara (Weck) bir pres ile sıkıştırılarak doldurulmuştur. Silaj kavanozları karanlık bir odaya yerleştirilerek 60 gün fermantasyona tabi tutulmuştur. Bu dönem sonunda, açılan kavanozların her birinden 150 g örnek alınmış ve 70 °C'de 48 saat kurutularak kuru madde oranları belirlenmiştir. Ayrıca açılan silajlardan örnekler alınarak pH değerleri ölçülmüştür (Budaklı Çarpıcı ve ark., 2017). Kuru madde oranını belirlemek amacıyla kullanılan örnekler öğütülmüş ve bu örneklerde ham protein, ADF, NDF, P, K, Ca, Mg, Na, Fe, Cu, Zn ve Mn içeriklerini belirlemek amacıyla analizler yapılmıştır (AOAC, 1997; Van Soest et al., 1991; Kacar 2014).

Araştırma sonucunda ölçüm ve analizlerden elde edilen veriler JUMP paket programı yardımıyla 'Tesadüf Blokları Deneme Deseni'ne uygun olarak varyans analizine tabi tutulmuştur. Hesaplamalarda paket programı kullanılmıştır. Önemlilik testlerinde % 1 ve % 5, farklı grupların belirlenmesinde ise % 5 olasılık düzeyi kullanılmış ve farklı grupların belirlenmesinde Asgari Önemli Fark testinden yararlanılmıştır.

3. BULGULAR ve TARTIŞMA

İki yıllık ortalama verilere ilişkin varyans analiz sonuçlarına göre; ekim zamanlarının kinoa silajının kuru madde, pH, ham protein, Mg, Na ve Zn içerikleri üzerine etkisi % 1, K, Ca, Fe, Cu ve Mn içerikleri üzerine etkisi % 5 düzeyinde önemli çıkmıştır. Hasat dönemlerinin ise kinoa silajının kuru madde, pH, ham protein, ADF, NDF, K, Mg, Na, Fe, Cu, Zn ve Mn içerikleri üzerine etkisi % 1, P içerikleri üzerine etkisi ise % 5 olasılık düzeyinde önemli olmuştur. Ekim zamanı x hasat dönemi interaksyonunun kinoa silajının P, Mg, Na ve Mn içerikleri hariç incelenen tüm özellikler üzerindeki etkisi % 1 olasılık düzeyinde önemli olmuştur.

Ekim zamanı bakımından en yüksek kuru madde oranı % 18.47 ile 1 Haziran, en düşük ise 15 Nisan ve 1 Mayıs tarihlerinde yapılan ekimlerden elde edilmiştir. Araştırmada en düşük pH değeri 15 Nisan tarihinde ekilen bitkilerden yapılan silajlarda tespit edilmiştir. Kinoa

silajlarında en yüksek ham protein oranı (% 18.96 ve % 19.20) 15 Nisan ve 1 Haziran tarihlerinde yapılan ekimlerde ortaya çıkmıştır. Ekim zamanının ADF ve NDF içerikleri üzerine etkisinin önemsiz olduğu belirlenmiştir (Çizelge 1). ADF içerikleri % 21.95 - % 23.18 değerleri arasında değişim gösterirken, NDF içerikleri ise % 33.81 ve % 34.33 değerleri arasında değişmiştir (Çizelge 2).

Çizelge 1. Ekim Zamanı ve Hasat Dönemlerinin Kinoa Silajının Bazı Kalite Özelliklerine İlişkin Varyans Analiz Sonuçları (Kareler Ortalaması)

**,* Sırasıyla % 1 ve % 5 düzeyinde önemlidir.

Kinoa silajının kuru madde oranı hasat döneminin gecikmesine bağlı olarak artmış ve bunun sonucunda en yüksek kuru madde oranı % 21.78 ile tohum bağlama döneminde yapılan biçimlerden elde edildiği belirlenmiştir. Silajın pH değeri en düşük 4.40 ile çiçeklenme döneminde hasat edilen bitkilerden yapılan silajlarda tespit edilmiştir. Kinoa silajında ham protein oranı hasat dönemlerinin gecikmesine bağlı olarak azalmış ve bunun sonucunda en yüksek ham protein oranı % 21.15 ile çiçeklenme öncesinde hasat edilen bitkilerden yapılan silajdan elde edilmiştir. ADF ve NDF oranlarının hasat dönemlerinin gecikmesine bağlı olarak arttığı tespit edilmiştir. En düşük ADF oranları % 18.48 ile çiçeklenme öncesi hasat döneminde, en düşük NDF oranları ise % 27.73 ile çiçeklenme öncesi hasat döneminde biçilen bitkilerden yapılan silajlardan elde edilmiştir (Çizelge 2).

Çizelge 2. Farklı Ekim Zamanı ve Hasat Dönemlerinin Kinoa Silajının Kuru Madde, pH, Ham Protein, ADF ve NDF İçeriklerine Etkisi (iki yıllık ortalama veriler)

2019	17.62 a	4.76 a	18.13	21.80 b	31.82 b

Yılların kinoa silajının ham protein oranı üzerine etkisi önemsiz bulunmuştur (Çizelge 1). Denemede en yüksek kuru madde oranı % 17.62 ile 2019 yılında hasat edilen bitkilerden yapılan silajlarda tespit edilmiştir. Kinoa silajının en düşük pH değerleri 4.32 ile 2018 yılında hasat edilen bitkilerin silajlarından elde edilmiştir. En düşük ADF ve NDF içerikleri ise 2019 yılında hasat edilen bitkilerden yapılan silajlarda belirlenmiştir.

Ekim zaman x hasat dönemi interaksyonu bakımından en yüksek kuru madde oranı (% 24.47 ve % 21.38) 15 Mayıs ve 1 Mayıs ekimlerinin tohum bağlama döneminde hasat edilen bitkilerden yapılan silajlarda belirlenmiştir. İkili interaksyonun silajın pH değeri üzerine etkisi incelendiğinde, en düşük pH değeri 4.14 ile 1 Haziran tarihinde ekilen ve çiçeklenme öncesi hasat döneminde biçilen bitkilerle yapılan silajlardan elde edilmiştir. Kinoa silajının ekim zamanlarında hasat dönemlerinin geciktirilmesiyle silajın ham protein oranı azalış göstermiştir. Araştırmada en yüksek ham protein oranı (% 23.08 ve % 22.50) 15 Nisan ve 1 Haziran tarihlerinde ekilen çiçeklenme öncesi hasat döneminde hasat edilen bitkilerinden yapılan silajlardan elde edilmiştir. Silajın ADF içerikleri incelendiğinde, en düşük ADF içerikleri % 17.02 ile 15 Nisan tarihinde ekilen ve çiçeklenme öncesinde hasat edilen bitkilerden yapılan silajlarda tespit edilmiştir. NDF içerikleri en düşük % 24.14 ile 15 Nisan ekimlerinin çiçeklenme öncesi hasat döneminde hasat edilen bitkilerden yapılan silajlarda belirlenmiştir (Çizelge 3).

Silajların ekim zamanı bakımından P içerikleri 3.21-3.37 g kg⁻¹ değerleri arasında değiştiği tespit edilmiştir. Fakat bu değişimin istatistiki anlamda önemsiz olduğu belirlenmiştir (Çizelge 1). Deneme en yüksek K içerikleri (74.43 g kg⁻¹ ve 76.83 g kg⁻¹) 15 Nisan ve 1 Mayıs tarihlerinde ekilen bitkilerden yapılan silajlarda tespit edilmiştir. Kinoa silajlarının Ca ve Mg içerikleri incelendiğinde en yüksek değerler 1 Mayıs, 15 Mayıs ve 1 Haziran tarihlerinde yapılan ekimlerden elde edilmiştir. En yüksek Na içeriği 1 Mayıs tarihlerinde yapılan ekimlerde belirlenmiştir. Silajlarda en yüksek Fe içerikleri 15 Mayıs ve 1 Haziran tarihlerinde yapılan ekimlerde ortaya çıkmıştır (Çizelge 4). Silajların en yüksek Cu içerikleri 7.04 mg kg⁻¹ ile 1 Haziran tarihinde yapılan ekimlerden elde edilmiştir. Araştırmada Zn içerikleri incelendiğinde 15 Nisan tarihleri hariç diğer ekim zamanları arasında istatistiki anlamda bir farklılık ortaya çıkmamış ve bunun sonucunda da 1 Mayıs, 15 Mayıs ve 1 Haziran ekimlerinden yapılan silajlarda en yüksek içerik belirlenmiştir. En yüksek Mn içerikleri 1 Mayıs ve 1 Haziran tarihlerinde yapılan ekimlerden yapılan silajlarda tespit edilmiştir (Çizelge 4).

Kinoa silajının hasat dönemleri incelendiğinde; Ca içerikleri üzerine hasat dönemlerinin etkisinin önemsiz olduğu belirlenmiştir (Çizelge 1). Hasat döneminin geçikmesiyle Mg ve Mn

İçerikleri arttığı tespit edilmiştir. Araştırmada en yüksek P, Fe ve Cu içerikleri çiçeklenme öncesi hasat döneminde hasat edilen bitkilerden yapılan silajlardan elde edilmiştir. Silajların en yüksek K, Na ve Zn içerikleri incelendiğinde ise çiçeklenme öncesi ve çiçeklenme döneminde hasat edilen bitkilerden yapılan silajlarda belirlenmiştir (Çizelge 4).

Çizelge 4. Farklı Ekim Zamanı ve Hasat Dönemlerinin Kinoa Silajının P, K, Ca, Mg, Na, Fe, Cu, Zn ve Mn İçeriklerine Etkisi

Yılların kinoa silajının mineral madde içerikleri üzerine etkisi incelendiğinde P içerikleri üzerine etkisinin önemsiz olduğu tespit edilmiştir (Çizelge 1). Araştırmada en yüksek K, Ca, Mg, Na, Fe ve Mn içerikleri 2019, Cu ve Zn içerikleri ise 2018 yılında tespit edilmiştir (Çizelge 4).

Ekim zamanı x hasat dönemi interaksyonunun kinoa silajının P, Mg, Na ve Mn içerikleri üzerine etkisinin önemsiz olduğu belirlenmiştir (Çizelge 1). Araştırmada en yüksek K içerikleri 86.67 g kg⁻¹ ile 1 Mayıs tarihinde ekilen ve çiçeklenme öncesi hasat döneminde hasat edilen bitkilerden yapılan silajlardan elde edilmiştir. İkili interaksyonun silajın Ca ve Zn içerikleri üzerine etkisi incelendiğinde; 15 Mayıs tarihinde ekilen ve çiçeklenme öncesi hasat döneminde hasat edilen bitkilerden yapılan silajlarda belirlenmiştir. En yüksek Fe içerikleri 301.12 mg kg⁻¹ ile 15 Nisan tarihinde ve çiçeklenme öncesi hasat döneminde hasat edilen bitkilerden elde edilirken, en yüksek Cu 8.74 mg kg⁻¹ ile 1 Haziran tarihinde ve çiçeklenme öncesi hasat döneminde hasat edilen bitkilerden elde edilmiştir (Çizelge 5).

4. SONUÇ

Sonuç olarak; farklı ekim zamanı ve hasat dönemlerinin kinoa bitkisinin silaj kalitesi üzerine etkilerinin incelendiği bu çalışmada, incelenen özelliklerin ekim zamanı ve hasat dönemi bakımından önemli farklılıklar gösterdiği tespit edilmiştir. Ekim zamanının gecikmesine bağlı olarak silajların kuru madde oranı artış göstermiştir. Yüksek kuru madde ve düşük pH bakımından 1 Haziran tarihinde ekilen bitkilerden yapılan silajlar ön plana çıkmıştır. Hasat dönemlerinin silaj kalitesi üzerine etkisi önemli olmuş ve hasat döneminin gecikmesine bağlı olarak silaj kuru madde oranı artmasına karşılık diğer kalite özelliklerinde önemli düşüşler tespit edilmiştir. Araştırmadan elde edilen sonuçlar bir bütün olarak değerlendirildiğinde; kinoa bitkisinin silaj için 1 Mayıs tarihinden sonra ekilmesi ve çiçeklenme döneminde hasat edilmesi gerektiği tespit edilmiştir. Ayrıca kinoa bitkisinden kaliteli bir silaj elde etmek için kuru madde oranını artıran ve pH'yı düşüren katkı maddelerinin ilave edilmesine yönelik çalışmaların yapılması gerekmektedir.

ÖZET

Fazla verim alma amacıyla yıllardan beri yoğun olarak işlenen tarım alanlarında zamanla meydana gelen bozulmalar, ürün miktar ve kalitesini de olumsuz olarak etkilemektedir. Özellikle yoğun olarak kullanılan bazı kimyasal tarım ilaçları ve kimyasal gübreler, zamanla toprak reaksiyonu (pH) değerini bozacak nitelikte etkilemektedir. Bu çalışmada Edirne ili, Keşan ilçesini temsilen alınan toplam 20 adet toprak örneği analiz edilmiş ve sonuçları bilimsel kıstaslara göre incelenip, toprakların pH değerleri ön planda tutularak elde edilen veriler değerlendirilmiştir. Toprak örneklerinin pH içerikleri en düşük 5,84 ve en yüksek 8,10 olarak belirlenmiştir. Tuz içerikleri bakımından en düşük %0,01 ve en yüksek %0,22; organik madde içerikleri en düşük %0,92, en yüksek %2,91 ve kireç (CaCO₃) içerikleri ise en düşük %0,00 ile en yüksek %22,07 olarak ölçülmüştür. Tekstür sınıfı olarak toprakların 9 tanesinin “kil (C)” sınıfında olduğu belirlenmiştir. Toprak pH değerinin, tarımsal alanlarda uygulanan gübre etkinliğine doğrudan etkisi bulunmaktadır. Bu nedenle gübreleme programlarının yapılması için toprakların pH ve akabinde organik madde değerleri göz önünde bulundurulmalı ve doğru gübreleme yapılarak sürdürülebilir tarımın desteklenmesi sağlanmalıdır. İlçe üreticilerinin yoğunlukla kimyasal gübre kullandıkları bilinmektedir. İhtiyaç kadar kimyasal ve beraberinde organik gübre kullanılması, ancak toprak analizlerinin yaptırılması ve sonuçlarına uyularak gübreleme yapılması ile mümkündür. İlçe genelinde bundan sonraki gübreleme uygulamalarında pH değerinin olumsuz etkileriyle karşılaşmamak için toprakları iyileştirme özelliği bulunan organik gübreleri de (örneğin vermikompost, leonardit vb.) kullanmak gerektiği konusunda üreticiler bilgilendirilmelidir. Özellikle vermikompost uygulaması toprak organik madde miktarını ve su tutma kapasitesini artırır ve ayrıca topraklar için önemli bir besin kaynağı olarak görev alır.

Anahtar Kelimeler: Toprak reaksiyonu, organik gübre, vermikompost.

PRODUCTIVITY PARAMETERS DESTROYED OVER TIME IN AGRICULTURAL SOILS: Soil Reaction (pH) and The Case of Keşan District of Edirne Province

ABSTRACT

Deterioration in agricultural lands, which have been intensively processed for years for the purpose of obtaining higher yields, also negatively affects the amount and quality of the product. Particularly, some chemical pesticides and chemical fertilizers, which are used intensively, affect the soil reaction (pH) value over time. In this study, a total of 20 soil samples taken from Edirne province, Keşan district were analysed and the results were determined according to scientific criteria and the data obtained by keeping the pH values of the soils in the foreground. The pH contents of the soil samples were determined as the lowest 5,84 and the highest 8,10. In terms of salt content, the lowest 0,01% and the highest 0,22%. The lowest soil organic matter contents were 0,92%, the highest 2,91%, and the lime (CaCO₃) contents were measured as the lowest 0,00% and the highest 22,07%. As a texture class, it was determined that 9 of the soils were in the "clay (C)" class. Soil pH has a direct effect on the effectiveness of fertilizer applied in agricultural lands. For this reason, soil pH and organic matter values should be taken into account in order to make fertilization programs, and sustainable agriculture should be supported by correct fertilization. It is known that Keşan district producers use chemical fertilizers intensively. The use of chemical and organic fertilizers as needed is only possible with soil analysis and fertilization according to the soil analysis results. Producers should be informed that it is necessary to use organic fertilizers (for example, vermicompost, leonardite, etc.) that have property of improving the soil in order not to encounter the negative effects of pH value in future fertilization applications throughout the district. In particular, the application of vermicompost increases the amount of soil organic matter and water holding capacity, and also acts as an important nutrient source for the soil.

Keywords: Soil reaction, organic fertilizer, vermicompost.

GİRİŞ

Buğday ve ayçiçeği, Trakya Bölgesi için son derece yaygın olarak yetiştirilen iki ana münavebe bitkisidir. Ayçiçeği ülkemizin bitkisel yağ ihtiyacını karşılamak için bölgenin birçok yöresinde hem kuru ve hem de sulu koşullarda yetiştirilse de buğdaydan sonra kuru koşullarda en fazla yetiştirilen ana münavebe bitkisidir. Edirne ilinin Keşan ilçesinde de ağırlıklı olarak buğday, ayçiçeği ve arpa yetiştiriciliği yapılmaktadır. İlçe, iklim ve toprak yapısı bakımından tarıma son derece uygundur. Bitkisel ve hayvansal üretimde elde edilen verimlerin Türkiye ortalamasının üzerinde olduğu bilinmektedir. Ancak bölgede tarımsal açıdan önemli sorunlar arasında ise yoğun tarımsal faaliyetler nedeniyle toprak yapısının bozulması (pH bakımından asitleşme, organik maddenin düşmesi vb.) ve amaç dışı tarım arazilerinin kullanılması olduğu görülmektedir.

Toprak pH değeri çok yüksek (alkali) veya çok düşük (kuvvetli asit) olduğu durumlarda kimyasal gübrelerden ziyade organik gübrelemenin etkisi oldukça fazladır. Bu nedenle toprak ıslah programlarında organik gübrelemenin mutlaka “gübreleme programlarında” yer alması hem pH düzenleme ve hem de organik maddenin artırılması yanında tarım topraklarının su tutma kapasitelerinin de yükseltilmesi açısından oldukça önemlidir. Küresel ısınmanın ve kuraklığın giderek arttığı ülkemizde bu konu oldukça önemlidir (Bellitürk ve ark. 2018; Bellitürk, 2019; Bellitürk ve Vardar, 2019).

Marmara Bölgesi’ndeki tarım topraklarının bitki besin maddesi durumlarının belirlenmesi amacıyla yapılan bir çalışmada, toplam 1752 farklı noktadan GPS ile koordinatları belirlenerek alınan toprakların pH bakımından %50,6’sının hafif alkali, %30’unun nötr, %13,8’inin hafif asit, %5,1’inin orta derecede asit, %0,3’ünün kuvvetli asit, %0,2’sinin ise kuvvetli alkali topraklar olduğu belirtilmiştir. Aynı çalışmada Toprak reaksiyonu bakımından Marmara bölgesinin %19,2’sini asit karakterli toprakları kapsamaktadır. Özellikle Kırklareli ve Tekirdağ illerinin kuzeyinde, Edirne ilinin kuzey ve kuzey-batı bölümünde, Kocaeli ve Sakarya illerinin genelinde geniş alanlar kaplayan asit karakterli topraklar bulunduğu da belirtilmiştir (Taşova ve Akın, 2013).

Solucanların topraklardaki pH, organik madde, tekstür ve strüktür yapılarına olan çeşitli olumlu etkilerinin yanında, toprak nemi ve toprak sıcaklığı gibi çevresel parametreler için de olumlu katkılar sağladığı ve hatta toprakta bulunan olası ağır metallerin biyoakümülatör olarak tutulmasında da solucanların önemli rol oynadığı belirtilmektedir (Richardson ve ark., 2020). Topraklar üzerindeki birçok olumlu etkileri yanında vermikompost yapımında bitkisel ve hayvansal atıklar da değerlendirilmiş olmaktadır. Organik atıkların mutlak surette geri dönüşümünün özellikle vermikompost yöntemi ile sağlanması ve elde edilen materyalin de

tarım ve peyzaj alanlarına “organik gübre” olarak kazandırılması ülkemizin gelecek kuşaklara verimli tarım topraklarını ve peyzaj alanlarını taşıyabilmelerinde oldukça önemlidir (Bellitürk ve Goldmann Benardete, 2020). Kale ve ark. (1992) yaptığı bir araştırmada, vermikompost uygulanmış topraklarda birçok iyileşme görmüş olup, ayrıca azot fikse eden bakteriler, mikorizal mantarlar ve aktinomisetlerin sayısında artış olduğu buna bağlı olarak da topraktaki azot miktarının yükseldiği de ifade edilmiştir.

Bu araştırmada buğday-ayçiçeği münavebesinin yaygın olduğu Edirne ili Keşan ilçesini temsilen alınan 20 adet toprak örneğinin analiz sonuçları bilimsel kıstaslara göre incelenmiş ve son yıllarda karşılaşılan sorunlardan birisi olan pH dengesinin bozulması açısından alınacak önlemlere ilişkin bazı değerlendirmeler yapılmıştır. Ülkemiz tarım sisteminde önemli bir toprak yapısına sahip olan Keşan ilçesindeki tarım topraklarının sürdürülebilir olarak kullanılması, gelecek nesiller açısından son derece önemlidir.

MATERYAL VE METOT

Araştırmada kullanılan toprak örnekleri ekimden önce son toprak hazırlığı yapıldığında (herhangi bir gübre ve tarım ilacı uygulaması yapılmadan önce) 0-30 cm derinlikten Edirne ili, Keşan ilçesinin değişik köy ve merkeze bağlı mevkilerinden (Çizelge 1) usulüne uygun olarak zig zag yöntemiyle alınmış ve akabinde analiz yapılacak laboratuvara getirildikten sonra, havada kurutulup ardından 2 mm’lik elekten geçirilerek analize hazır hale getirilmiştir (Jackson, 1958). Toprak örneklerinin tekstür sınıfı su ile doymuşluğuna göre; toprak reaksiyonu, Uluslararası Toprak İlmi Derneğinin önerdiği üzere 1:2.5 (toprak:su) oranında toprağın sulandırılarak, cam elektrotlu pH metre ile ölçülerek; tuz içeriği ise EC-metre ile ölçülüp % birimi cinsinden belirlenmiştir (Lindsay ve Norvell 1978, Richards 1954). Kireç miktarlarının belirlenmesi Scheibler Kalsimetresi ile volümetrik olarak yapılmıştır (Ülgen ve Yurtsever 1974).

Topraklarda organik madde, Walkley-Black yöntemi ile belirlenmiştir (Sağlam, 2012). Toprak analizlerinin değerlendirilmesinde önceki çalışmalarda belirtilen standart değerler kullanılmıştır (Lindsay ve Norwell, 1969; FAO, 1990; TOVEP, 1991; Güneş ve ark., 1996; Güneş ve ark., 2010; Bellitürk, 2013).

Toprak örneklerinin alındığı yerlere ait bilgiler Çizelge 1’de gösterilmiştir.

SONUÇLAR VE ÖNERİLER

Araştırma bölgesine ait incelenen toprak örneklerinin bazı kimyasal ve fiziksel analiz sonuçları Çizelge 1’de topluca gösterilmiştir.

Çizelge 1. Toprak örneklerine ait bazı fiziksel ve kimyasal analiz sonuçları.

Min.	-	5,84	0,01	0,92	0,00	45,1	-
Maks.	-	8,10	0,22	2,91	22,07	111,1	-

Çizelge 1’den de görüldüğü gibi, Edirne ili, Keşan ilçesi topraklarının pH değerleri en düşük 5,84 ile “hafif asit”, en yüksek 8,10 ile “hafif alkalın” sınıfında olduğu görülmektedir. Toplam tuz içerikleri bakımından en düşük %0,01 ile “tuzsuz”, en yüksek %0,22 ile “hafif tuzlu” sınıfında girdiği görülmektedir. Öte yandan toplam 20 adet toprak örneğinin organik madde içerikleri en düşük %0,92 (çok az) ve en yüksek %2,91 (orta) olarak tespit edilmiştir (Lindsay ve Norwell, 1969; FAO, 1990; TOVEP, 1991; Güneş ve ark., 1996; Güneş ve ark., 2010; Bellitürk, 2013). Toprakların pH değerlerinde ve kireç içeriklerinde çok farklı değerler olduğu görülmektedir (Çizelge 1). Toprakların kireç durumu birinci derecede ana materyale bağlıdır. Yörede hem volkanik ve hem de sedimenter ana materyal üzerinde toprak oluşumu, farklı kireç içeriğine sahip toprakların oluşmasına neden olmaktadır (Gürbüz ve ark., 2019). Keşan ilçesinde yapılan bu çalışmada 5,84 ile 8,10 arasında değişen aralıklarda pH değerine sahip topraklar olduğu Çizelge 1’den açıkça görülmektedir. Bu nedenle söz konusu topraklardaki pH ve kireç miktarındaki değişkenlikler yöre topraklarının gübrenenmesinde hem gübre çeşidi ve hem de uygulama zamanı açısından dikkat edilmesi gerektiğini ortaya koymaktadır.

Organik madde bakımından yetersiz, pH bakımından dengesiz olan tarım topraklarında kullanılan kimyasal gübrelerin etkinliği oldukça düşük olup, kullanılan potasyumun en fazla %70’i, azotun %50’si ve fosforun ise %15’i topraklarda tutulmakta ve bitkilere yararlı

olabilmekte, geriye kalan NPK miktarları ise K genellikle sızarak-yıkanarak, N buharlaşarak, P ise tutularak (fikse olarak) kaybolmaktadır (Şekil 1).

Şekil 1. Bitkilerin ortalama besin element alım oranları.

Trakya Bölgesi tarım topraklarının bugün en önemli problemlerinin başında “düşük organik madde”ve “değişen, asitleşen pH” parametreleri gelmektedir. Trakya Bölgesi tarım toprakları ile ilgili olarak daha önce yapılmış olan bir çalışmada incelenen toprakların pH değerlerinin en düşük 2,97 ve en yüksek 7,74 değerinde olduğu ifade edilmiştir (Bellitürk, 2019). Toprak örneklerinin pH değerleri ile elde edilen verim arasında önemli ilişkiler mevcuttur. Bu konuda yapılan bir çalışma Çizelge 2’de açıkça görülmektedir (Halliday ve ark., 1992).

Çizelge 2. Toprak pH değeri ile verim arasındaki ilişki.

Ürün	Toprak pH Değeri				
	4,7	5,0	5,7	6,8	7,5
Ortalama Verim (En İyi 100, En Kötü 0)					
Mısır	34	73	83	100	85
Buğday	68	78	89	100	99
Arpa	0	23	80	95	100
Yonca	2	9	42	100	100

Yukarıdaki Çizelge 2'den de görüldüğü gibi, pH değerinin değişmesi ile elde edilen verim miktarlarında ürünlere göre değişkenlik olduğu ve uygun olmayan pH değerlerinde de ürün miktarlarında önemli düzeylerde kayıplar olduğu anlaşılmaktadır.

Trakya Bölgesi tarım söz konusu olduğunda verimli toprakları ve bazen de fazla kimyasal gübre kullanan bölge olması ile gündeme gelmektedir. Ancak kimyasal gübreler ile birlikte organik gübrelerin de kullanılmış olması ile hem gübrenin etkinliği artacak ve hem de sadece bitkiler değil, topraklar da iyileştirilmiş olacaktır. Organik gübrelerden vermikompost üreten firmaların bölgede fazla olması bir avantaj olup, çiftçilerin tarım ve peyzaj amacıyla giderek artan vermikompost kullanım taleplerinin olduğu konusunda çeşitli araştırmalar mevcuttur (Bellitürk, 2018; Bellitürk ve Soytürk, 2020; Çelik ve ark., 2022; Bellitürk ve ark., 2022; Bellitürk ve Çelik, 2022; Kocagöz ve ark., 2022).

Yoğun kimyasal gübre kullanımından kaynaklı olarak pH dengesi bozulmuş olan topraklara mutlaka organik gübre kullanmak gereklidir. Aksi halde, pH dengesi bozulmuş olan topraklardaki besin maddeleri, ne kadar çok kimyasal gübre kullanılırsa kullanılsın, kayıplar artacaktır. Ancak organik gübre kullanıldığında N, P, K başta olmak üzere toprakta mevcut olan besin maddeleri ve organik gübreden ilave edilen tüm besin maddelerinin bitkilere elverişliliği artacak ve gübrelemeden kaynaklanan kayıplar azalacaktır (Şekil 2).

Şekil 2. Organik gübrelerden toprağa geçen ve bitkilere elverişli olan elementler.

Düşük organik maddeden sonra Trakya Bölgesi ve dolayısıyla Keşan ilçesi tarım topraklarını en fazla tehdit eden ikinci sorun toprakların bozulan pH dengesidir. Özellikle bilinçsizce toprakları asitleştirme etkisi yüksek olan gübrelerin kullanılması neticesinde toprakların pH değerleri giderek yıldan yıla düşmekte ve tarımsal üretim değerleri de olumsuz olarak etkilenmektedir (Bellitürk, 2019). Toprak örneklerinin pH değerlerinin bilinmesi, bilimsel açıdan oldukça önemli olup, kullanılacak gübre cins ve miktarı, laboratuvarlarda özellikle elverişli fosfor analizlerinin yöntemlerinin belirlenmesi gibi birçok konu toprak pH ile yakından ilişkilidir. Kaldı ki son yıllarda artan gübre fiyatları karşısında, doğru miktarda gübre kullanılması için toprakların analiz edilmesi, analiz sonuçlarının bitki besleme uzmanlarınca değerlendirilerek doğru gübreleme programlarının oluşturulması ve uygulanmasının sağlanması hem topraklar ve hem de çevre ve ekonomi için oldukça büyük önem taşımaktadır. Toprak örneklerinin pH analizleri incelendiğinde, tekrar asit çıkanlar için “kireç ihtiyacı analizi”, alkali çıkanlar için ise “jips ihtiyacı analizi” yapılarak, ekimden, taban gübrelemesinden önce gerekli olan kireç veya jips-kükürt uygulamaları yapılmalı ve topraklar önce ıslah edilmeli, ardından ekim-dikim işlemlerine geçilmelidir. Sürdürülebilir tarım için bu şekilde toprak ıslahı mutlak bir zorunluluk olup, verim ve kaliteyi direkt olarak etkilemektedir. Tarım topraklarının pH değerlerinin düşerek asitleşmesi ile toprakların verimlilikleri arasındaki ilişki öneli olup, bu konuda daha fazla akademik çalışmaların yapılması ve sonuçlarının üreticilerle paylaşılması gerekmektedir.

ÖZET

Son yıllarda özellikle aşırı ve bilinçsiz olarak yoğun biçimde kullanılan kimyasallar nedeniyle tarım topraklarının verimlilik parametreleri olumsuz olarak etkilenmiştir. Toprakların organik madde miktarları olması gerekenin çok altına gerilemiş ve bu da tarımsal ürünlerin miktar ve kalitesinde azalmalara neden olmuştur. Bu çalışmada Tekirdağ ili, Süleymanpaşa ilçesinden temsilen alınan toplam 25 adet toprak örneği analiz edilmiş olup, toprakların organik madde içerikleri ön planda tutularak bilimsel kıstaslara göre elde edilen sonuçlar değerlendirilmiştir. İlçeyi temsilen alınan örneklerin bulunduğu alanlarda genellikle bir yıl buğday, ikinci yıl ise ayçiçeği bitkisinin ekim nöbeti olacak şekilde yoğunlukla yetiştirildiği bilinmektedir. Tekirdağ ili genelinde kimyasal gübrelerin fazla kullanıldığı tarımsal istatistiklerde yer alsa da organik ve-veya organo mineral gübre kullanım oranının günden güne arttığına ilişkin bilgiler de mevcuttur. İncelenen toprak örneklerinin ortalama organik madde miktarlarının %1,53 oranında “düşük” yani yetersiz olduğu görülmektedir. En düşük organik madde miktarı %0,29, buna karşın en yüksek organik madde miktarı ise %4,44 olarak belirlenmiştir. Toprakların tamamı tuzsuzdur. Ortalama kireç (CaCO₃) içerikleri %2,19 ile “orta düzeyde kireçli” topraklar olduğu bulunmuştur. İncelenen toprak örneklerinin 18 tanesi tın (L) ve 7 tanesi de killi tın (CL) sınıfındadır. Tekirdağ ili, Süleymanpaşa ilçesinde yoğun olarak tarımsal faaliyet yapılan söz konusu toprakların organik madde miktarı bakımından yetersiz olduğu görülmektedir. Bu nedenle sürdürülebilir tarım yapılabilmesi yanında topraklardan yüksek ve kaliteli verim alınabilmesinin sağlanması için üreticiler mutlaka toprak ve bitki analizlerini yaptırmalı ve gübreleme programlarında sadece kimyasal gübrelere değil, organik ve organo mineral gübrelere de yer vermelidirler.

Anahtar Kelimeler: Buğday, ayçiçeği, organo mineral gübre, sürdürülebilir tarım.

**PRODUCTIVITY PARAMETERS DECREASED OVER TIME IN AGRICULTURAL
SOILS: SOIL ORGANIC MATTER AND THE CASE OF SÜLEYMANPAŞA
DISTRICT OF TEKIRDAG PROVINCE**

ABSTRACT

In recent years, the productivity parameters of agricultural lands have been adversely affected, especially due to the excessive and unconscious use of chemicals. The amount of soil organic matter has decreased far below what it should be, and this has led to a decrease in the amount and quality of agricultural products. In this study, a total of 25 soil samples taken from Tekirdağ province, Süleymanpaşa district were analysed, and the results obtained according to scientific criteria were evaluated by keeping the soil organic matter content in the foreground. It is known that in the areas where the samples taken from the district are present, wheat is grown in one year and sunflower in the second year. Although it is included in the agricultural statistics that chemical fertilizers are used extensively throughout the province of Tekirdağ, there is also information that the rate of use of organic and-or organo mineral fertilizers is increasing day by day. It is seen that the average organic matter content of the examined soil samples is “low”, that is, insufficient at a rate of 1,53%. The lowest amount of organic matter was determined as 0,29%, while the highest amount of organic matter was determined as 4,44%. All soils are saltless. It was found that the average lime (CaCO₃) contents were 2,19% and “medium calcareous” soils. Eighteen of the examined soil samples are in the loam (L) class and 7 of them are in the clay loam (CL) class. It is seen that the soils in question, where intensive agricultural activities are carried out in the Süleymanpaşa district of Tekirdağ province, are insufficient in terms of soil organic matter. For this reason, producers must have soil and plant analyses done and include not only chemical fertilizers but also organic and organo mineral fertilizers in their fertilization programs in order to ensure sustainable agriculture as well as obtaining high and quality yields from the soil.

Keywords: Wheat, sunflower, organo mineral fertilizer, sustainable agriculture.

GİRİŞ

Tarım, Dünyada rekabete dayalı stratejik bir sektördür. Sürdürülebilir tarımsal üretim ile gıda güvencesini sağlamak, çiftçilerin refah düzeyini arttırmak, küresel rekabette daha fazla söz sahibi olmak, gelecek kuşaklara daha iyi bir ülke bırakmak için toprak yönetimi konusu oldukça önemlidir. Buğday ve ayçiçeği, Trakya Bölgesi'nde en fazla ekimi yapılan bir kültür bitkisi olup, değişen iklim ve toprak özelliklerinden dolayı, gübrenmesine günden güne daha fazla önem gerektiği artık bilinen bir gerçektir. Yani diğer bir deyişle, iklim ve toprak özelliklerinin günden güne farklılaşması neticesinde verim-gübreleme ilişkisi artık daha da önemli olmaya başlamıştır. Ancak son yıllarda artan kimyasal gübre fiyatlarından dolayı organik ve organo mineral gübre üretimine ve tarımsal amaçlarla kullanılmasına yönelik çalışmalar ve uygulamalar ağırlık kazanmış durumdadır.

Bitkisel üretimde verimliliği arttırmak amacıyla son yıllarda üretim girdilerinde, ciddi bir artış söz konusudur. Üretimde kullanılan kimyasal gübreler verimi arttırırken, çevre ve insan sağlığı üzerinde olumsuz etkileri olmaktadır. Son yıllarda mevcut alandan daha fazla ürün elde etmek gayesi ile bitkisel üretimde kontrolsüzce kullanılan kimyasal gübre ve ilaçların insan sağlığına olan zararlı etkileri birçok bilimsel çalışma ile ortaya koyulmuştur. Bu sebeple çevre ve insan sağlığı önemsizlenerek doğal kaynaklarımız kontrolsüzce tüketilmekte; yenilenemeyen kaynaklarımız, gelecek nesiller düşünülmeden bilinçsizce kullanılmaktadır (Bellitürk, 2012).

Nüfusun hızlı artışı ile orantılı olarak artan gıda ihtiyacı, doğru orantılı olarak toprak üzerindeki tarımsal faaliyetlerin artmasına sebebiyet vermektedir (Bellitürk ve ark., 2017). Başta tarım arazilerinin amacı dışında kullanımı olmak üzere, tarım arazilerinin bilinçsizce ve yoğun bir şekilde (fazla gübre, yoğun ilaç kullanımı, su, anız yakma vb.) kullanılması sonucunda tarım arazileri hızlı bir şekilde azalmakta ve tarım arazilerinin sürdürülebilirliği ve verimliliği sınırlanmaktadır (Sağlam ve ark., 2012). Bunun sonucunda mevcut tarım arazilerinin korunması ve topraklarımızın en iyi şekilde değerlendirilmesi gereklidir.

Marmara Bölgesi'ndeki tarım topraklarının bitki besin maddesi durumlarının belirlenmesi amacıyla yapılan bir çalışmada, toprakların %67,7'sinin organik madde kapsamının çok az, azot bakımından çok fakir ve fakir olduğu, buna karşın sadece 1752 adet topraktan %7,2'sinin ise iyi ve çok iyi düzeyde olduğu belirtilmiştir (Taşova ve Akın, 2013).

Gürbüz ve Bellitürk (2021)'ün bildirdiğine göre, Tekirdağ, ülke genelinde buğday üretiminde önemli bir paya sahiptir. Tekirdağ'da 2020 yılında buğday üretim alanı 1.966,333 da ve üretim miktarı 769,915 ton, ortalama verim ise 392 kg/da'dır (TÜİK, 2021). Türkiye'de 2019 yılında kullanılan toplam gübre miktarı 12.167,571 tondur. Bunun 8.010,324 tonu azotlu, 3.924,248 tonu fosforlu ve 233.000 tonu ise potasyumlu gübredir (TÜİK, 2021). Azot bitkilerin fazlasıyla

ihtiyacı olan fakat toprakların mineral kısmında çok az miktarda bulunan bir elementtir. Organik madde, toprakta azotun esas kaynağı olarak kabul edilmekte, toprağın fiziksel, kimyasal ve biyolojik özelliklerinin oluşmasında önemli rol oynamaktadır (Gürbüz ve Bellitürk, 2021). Ülkemizdeki, topraklarda bitki besin elementlerinin eksikliğine verilebilecek en iyi iki örnek azot ve çinko besin elementlerinin eksikliğidir. Ülkemizde topraklarımızın büyük bir çoğunluğunda organik madde az düzeydedir ve organik madde azotun esas kaynağını oluşturmaktadır. Bu nedenle gübreleme yapılmadığı takdirde nadir durumlar hariç topraklarımızda azot noksanlığının olması normal bir durumdur (Hamurcu ve Gezgın, 2006). Bellitürk (2019) tarafından bildirildiğine göre, organik maddece fakir olan topraklara uygulanan kimyasal gübreden yararlanma oranı düşük olmaktadır. Bunu önlemek için, hazırlanacak gübreleme programlarına mutlaka uygun organik gübrelerin (yosun gübresi, mikrobiyal gübreler, solucan gübresi, kompost, hümik asit, yarasa gübresi vs.) ve yeşil gübreleme uygulamasının ilave edilmesi gerekmektedir.

Bu çalışmada yoğun olarak kimyasal gübre kullanan illerden birisi olan Tekirdağ'ın Süleymanpaşa ilçesindeki tarım topraklarının özellikle organik madde açısından durumunu ortaya koymak ve sürdürülebilir tarım açısından yapılması gerekenleri değerlendirmek amaçlanmıştır.

MATERYAL VE METOT

Toprak örnekleri ekimden önce son toprak hazırlığı yapıldığında (herhangi bir gübre ve tarım ilacı uygulaması yapılmadan önce) 0-30 cm derinlikten Tekirdağ ili, Süleymanpaşa ilçesinin değişik köy ve merkeze bağlı mevkiilerinden (Çizelge 1) usulüne uygun olarak zig zag yöntemiyle alınmış ve akabinde analiz yapılacak laboratuara getirildikten sonra, havada kurutulup ardından 2 mm'lik elekten geçirilerek analize hazır hale getirilmiştir (Jackson, 1958). Toprak örneklerinin tekstür sınıfı su ile doymuşluğuna göre; toprak reaksiyonu, Uluslararası Toprak İlmi Derneğinin önerdiği üzere 1:2.5 (toprak:su) oranında toprağın sulandırılarak, cam elektrotlu pH metre ile ölçülerek; tuz içeriği ise EC-metre ile ölçülüp % birimi cinsinden belirlenmiştir (Lindsay ve Norvell 1978, Richards 1954). Kireç miktarlarının belirlenmesi Scheibler Kalsimetresi ile volümetrik olarak yapılmıştır (Ülgen ve Yurtsever 1974). Toprak örneklerindeki organik madde, Walkley-Black yöntemi ile belirlenmiştir (Sağlam, 2012).

Araştırmada kullanılan toprakların analiz sonuçlarının değerlendirilmesinde önceki çalışmalarda belirtilen standart değerler dikkate alınmıştır (Lindsay ve Norwell, 1969; FAO, 1990; TOVEP, 1991; Güneş ve ark., 1996; Güneş ve ark., 2010; Bellitürk, 2013).

Araştırmada kullanılan 25 adet toprak örneklerinin alındığı yerlere ait bilgiler Çizelge 1'de gösterilmiştir.

SONUÇLAR VE ÖNERİLER

Araştırma bölgesine ait incelenen toprak örneklerinin bazı kimyasal ve fiziksel analiz sonuçları Çizelge 1’de topluca gösterilmiştir.

Çizelge 1. Toprak örneklerine ait bazı fiziksel ve kimyasal analiz sonuçları.

Çizelge 1’den de görüldüğü gibi, Süleymanpaşa ilçesi topraklarının organik madde içerikleri en düşük %0,29 ve en yüksek %4,44 olarak tespit edilmiştir. Aslında organik maddenin verimli topraklar için ortalama %4-5 civarında olması gerekmektedir (Şekil 1).

Toprak Bileşimi

Şekil 1. Verimli bir toprağı oluşturan faktörler.

Ancak bu ülkemiz koşullarında organik madde miktarını %4-5 civarında içeren toprakları görmek giderek zorlaşmaktadır. Üreticiler yaşadıkları verim düşüklüğünü çözmek için kimyasal gübre miktarını artırma yöntemini seçmektedirler, oysa ki, kimyasal gübrelerin toprağı değil, bitkiye faydası olduğu bilinen bir gerçektir. Bellitürk (2011) tarafından yapılan benzer bir çalışmada 66 adet toprak örneğı incelenmiş ve tüm topraklarda organik maddenin düşük olduğu belirtilmiştir. Organik maddenin yöre için düşük olduğuna yönelik birçok akademik çalışma mevcuttur (Bellitürk, 2011; Bellitürk, 2013; Açıkbaş ve Bellitürk, 2016; Bellitürk ve ark., 2018; Bellitürk, 2019; Mumcuoğlu ve Bellitürk, 2021). İlçe toprakları yerinde incelendiğinde ve analiz sonuçları değerlendirildiğinde maalesef Şekil 2’de görülen toprak katmanlarından bazıları zamanla kaybolmuştur. Bu artık bir zorunluluk olarak görülmektedir, yörede yıllara bağlı olarak sıklıkla yapılan buğday-ayçiçeğı ekim nöbeti neticesinde toprakların üst katmanlarındaki “Humus” ve verimli katman olan pulluk tabakasındaki “Üst toprak” artık kalmamış ve yöre çiftçilerinin değımiyle toprak kusmaktadır. Bu konuda 15 nolu toprak örneğı ilçenin Yağı Köyü’nden alınmış olup, üst katmanın (pulluk katmanı) durumu açık olarak gözle de görülmektedir (Şekil 2).

Şekil 1. İdeal bir toprağın katmanları.

Şekil 2. Süleymanpaşa ilçesinden alınan 15 nolu örneğe ait görüntü.

Toprak örneklerinin pH değerleri açısından en düşük 5,84 (hafif asit) ve en yüksek 8,03 (hafif alkalın) olduğu bulunmuştur (Lindsay ve Norwell, 1969; FAO, 1990; TOVEP, 1991; Güneş ve ark., 1996; Güneş ve ark., 2010; Bellitürk, 2013). Bellitürk (2011) tarafından Edirne ili Uzunköprü ilçesinde yapılan çalışma sonucuna göre toprak örneklerinin çoğunun giderek asitleştiği ve bunda da kullanılan kimyasal gübrelerin etkili olduğu belirtilmiştir. Toprak örneklerinin kireç miktarı bakımından en düşük %0,0 ve en yüksek %9,44 oranında CaCO_3 içerdiği ve toprakların genellikle killi tın (CL) ve tın (L) tekstür sınıfında olduğu ortaya çıkmıştır. Tuzluluk bakımından yöre topraklarında önemli bir sorun olmadığı görülmektedir.

Trakya Bölgesi tarım topraklarının bugün en önemli problemlerinin başında “düşük organik madde” içermesi gelmektedir. Trakya Bölgesi tarım toprakları ile ilgili olarak daha önce yapılmış olan birçok çalışmada organik maddenin yetersiz ve hatta bazı çalışmalarda toprakların %80-85’inde düşük organik madde olduğu ifade edilmiştir (Bellitürk, 2019).

Trakya Bölgesi’nin yoğun tarımsal faaliyet yapılan illerinden biri olan Tekirdağ ilinin Süleymanpaşa ilçesinden alınan 25 adet toprak örneği genel olarak organik madde içeriği bakımından fakirdir. Bu durum yaklaşık son 10 yıldır yöre açısından önemli bir sorun olarak ortaya çıkmakta olup, üreticiler genellikle kimyasal gübre kullanım oranlarını artırmak suretiyle toprakları işlemektedirler. Oysa kimyasal gübre uygulamaları, beraberinde organik ve organo mineral gübrelerce de desteklenmiş olsa hem topraklar ve hem de bitkiler açısından daha iyi sonuçlar ortaya çıkacaktır. Bu nedenle gübreleme programlarında mutlaka organik gübreler (örneğin vermikompost, kompost, leonardit vb.) de yer almalıdır (Çelik ve ark, 2022; Bellitürk ve Çelik, 2022a; Bellitürk ve Çelik, 2022b).

Yapılan toprak analizlerinin bilimsel kıstaslara göre değerlendirilmesi ve önceki çalışmaların da incelenmesi neticesinde varılan kanı; toprak analizleri yaptırmaksızın asla gübre uygulanmaması gerektiği, gübreleme programlarının mutlaka organik gübre diye adlandırılan vermikompost, kompost, yarasa gübresi, yeşil gübreleri veya son zamanların ikinci popüler gübresi olan organo mineral gübreleri de içerecek şekilde bitki besleme konusunda uzman olan kişilerce hazırlanması gerektiği ortaya çıkmaktadır. Üreticilerin tarımsal girdi kullanımı konusunda gübre söz konusu olduğunda önce geleceğini ve sonra da çevreyi düşünerek seçimler yapması gerektiği de ortaya çıkan önemli sonuçlardandır. Çünkü kimyasal gübreler hiçbir zaman topraklara yarar sağlamaz, çevreci değildir, sadece bitki ve verim artışı göz önünde tutularak üretilirler. Oysa organik gübreler çevreyle dost tekniklerle, bitkisel ve hayvansal kökenli atıkların değerlendirilmesi ile üretilir ve topraklara olduğu kadar bitkilere ve verime de olumlu katkılar sağlarlar.

ÖZET

Bu çalışma, Türkiye’de yoğun bir şekilde tarımsal üretim yapılan Edirne ilinin İpsala ilçesine bağlı farklı alanlardan alınan toplam 25 adet toprak örneğinin bazı fiziksel ve kimyasal özelliklerini incelemek ve mevcut verimlilik durumlarını ortaya çıkarmak amacıyla yapılmıştır. Toprak örnekleri, 0-30 cm derinlikten alınmıştır. Araştırma sonuçlarına göre; toprakların pH değerleri en düşük 4,85 (orta asit) ve en yüksek 8,10 (hafif alkalın) olarak bulunmuştur. Toprakların tuz içerikleri en düşük %0,01 (tuzsuz), en yüksek %0,23 (hafif tuzlu); organik madde içerikleri en düşük %0,18 (çok az), en yüksek %4,69 (yüksek); kireç (CaCO₃) içerikleri en düşük %0,00 (az kireçli), en yüksek %24,79 (fazla kireçli) ve %68’inin (17 tanesinin) “Tın (L)” tekstür sınıfına girdiği belirlenmiştir. Toprakların toplam N içerikleri en düşük %0,01 (çok az azotlu) ve en yüksek %0,23 (fazla azotlu) olarak tespit edilmiştir. Buna ilaveten en düşük-en yüksek P, K, Ca, Mg, Fe, Mn, Zn ve Cu içerikleri sırası ile 4,68-72,47; 73,93-571,74; 211,46-6346,63; 71,32-1035,40; 10,64-102,34; 16,23-139,30; 0,23-16,23 ve 0,49-7,66 ppm olarak tespit edilmiştir. Elde edilen bu çalışma sonuçlarının, Edirne ili İpsala ilçesinde tarımsal faaliyet sürdüren çiftçilere toprak analiz sonuçlarına göre yapılacak olan bilinçli gübrelemenin yararları konusunda yol göstereceği düşünülmektedir. Sürdürülebilir toprak yönetiminin sağlanması için gübreleme programlarında mutlaka organik gübrelere yer verilmesi gerektiği de elde edilen önemli sonuçlar arasındadır.

Anahtar Kelimeler: Toprak analizi, organik madde, gübreleme.

**DETERMINATION OF PLANT NUTRITION CAPACITIES OF AGRICULTURAL
AREAS BY SOIL ANALYSIS: THE CASE OF İPSALA DİSTRİCT OF EDİRNE
PROVINCE**

ABSTRACT

This study was carried out in order to examine some physical and chemical properties of 25 soil samples taken from different areas of the İpsala district of Edirne province, where intensive agricultural production is made in Turkey, and to reveal their current productivity status. Soil samples were taken from a depth of 0-30 cm. According to the research results; the lowest pH values of the soils were 4,85 (low acid) and the highest 8,10 (low alkaline). The salt content of the soils is the lowest 0,01% (saltless), the highest 0,23% (low salty); soil organic matter contents are the lowest 0,18% (very low), the highest 4,69% (high); it was determined that the lowest lime (CaCO₃) contents were 0,00% (low lime), the highest 24,79% (highly lime) and 68% (17 of them) were in the “Loam (L)” texture class. The total N contents of the soils were determined as the lowest 0,01% (too low nitrogen) and the highest 0,23% (too high nitrogen). In addition, the lowest-highest P, K, Ca, Mg, Fe, Mn, Zn and Cu contents were determined 4,68-72,47; 73,93-571,74; 211,46-6346,63; 71,32-1035,40; 10,64-102,34; 16,23-139,30; 0,23-16,23 and 0,49-7,66 ppm respectively. It is thought that the results of this study will guide the farmers, who have been carrying out agricultural activities about the benefits of conscious fertilization, which will be made according to the soil analysis results in İpsala district of Edirne province. It is also among the important results that organic fertilizers should be included in fertilization programs in order to ensure sustainable soil management.

Key words: Soil analysis, organic matter, fertilization.

GİRİŞ

Buğday ve ayçiçeği, Trakya Bölgesi için son derece yaygın olarak yetiştirilen iki ana münavebe bitkisidir. Ayçiçeği ülkemizin bitkisel yağ ihtiyacını karşılamak için bölgenin birçok yöresinde hem kuru ve hem de sulu koşullarda yetiştirilse de buğdaydan sonra kuru koşullarda en fazla yetiştirilen ana münavebe bitkisidir. Edirne ilinin Keşan ilçesinde de ağırlıklı olarak buğday, ayçiçeği ve arpa yetiştiriciliği yapılmaktadır. İlçe, iklim ve toprak yapısı bakımından tarıma son derece uygundur. Bitkisel ve hayvansal üretimde elde edilen verimlerin Türkiye ortalamasının üzerinde olduğu bilinmektedir. Ancak bölgede tarımsal açıdan önemli sorunlar arasında ise yoğun tarımsal faaliyetler nedeniyle toprak yapısının bozulması (pH değerleri bakımından asitleşme, organik maddenin düşmesi, geç tava gelmesi vb.) ve amaç dışı tarım arazilerinin kullanılması olduğu görülmektedir. Verimli bir tarım toprağında olması gereken O ve A horizonlarının (Şekil 1) artık bozulduğu ve A horizonunun (katmanının) içermesi gereken organik madde miktarının olması gereken %4-5 oranının çok altında ve hatta %0,5'den bile düşük olduğu yapılan çalışmalarda ortaya çıkmaktadır.

Şekil 1. Verimli bir toprağın katmanları.

Türkiye’de, Trakya birim alana en çok gübre kullanan yöredir. Burada birim alana kullanılan toplam gübre miktarı, yaklaşık olarak Türkiye ortalamasının iki katı kadardır. Bununla birlikte bölgede son zamanlarda bilinçsizce ve aşırı oranlarda gübre kullanıldığı da vurgulanmaktadır (Bellitürk ve ark., 2012). Çeltik üretiminde gereğinden fazla azotlu gübre kullanma eğilimi bir

tarafından milli gelir kaybına yol açarken, diğer yandan da üretimde girdi maliyetlerini yükseltmektedir. Bununla birlikte azot uygulama zamanlarının ve uygulama sayılarının çeltiğin tane ve sap verimine, ayrıca azotlu gübrelerden yararlanması üzerine önemli etkileri olduğu bilinen bir gerçektir (Korkmaz ve Bayraklı, 1987). Marmara Bölgesi'ndeki tarım topraklarının bitki besin maddesi durumlarının belirlenmesi amacıyla yapılan bir çalışmada, toplam 1752 farklı noktadan alınan toprakların pH bakımından %50,6'sının hafif alkali, %30'unun nötr, %13,8'inin hafif asit, %5,1'inin orta derecede asit, %0,3'ünün kuvvetli asit, %0,2'sinin ise kuvvetli alkali topraklar olduğu belirtilmiştir (Taşova ve Akın, 2013). Toprak ıslah programlarında organik gübrelemenin mutlaka "gübreleme programlarında" yer alması hem pH düzenleme ve hem de organik maddenin artırılması yanında tarım topraklarının su tutma kapasitelerinin de yükseltilmesi açısından oldukça önemlidir (Bellitürk ve ark. 2018; Bellitürk, 2019; Bellitürk ve Vardar, 2019). Tarımsal üretimde ana hedeflerden biri bitkisel üretimde kaliteyi diğeri ise verimin artırılmasıdır. Organik gübrelerin kalite üzerindeki etkileri önceki birçok çalışmada belirtilmiştir (Bellitürk, 2016; Bellitürk, 2017; Bellitürk ve Goldmann Benardete, 2020; Aslam ve ark., 2023).

Bu çalışmada Türkiye'de çeltik üretiminde önemli bir yere sahip olan Edirne ilinin İpsala ilçesinde, çeltik başta olmak üzere rulo çim, buğday, arpa vb. üretimleri yoğun olarak yapan üreticilerin tarlalarından alınan toplam 25 adet toprak örneğinin mevcut verimlilik durumları ortaya konulmaya çalışılmış ve doğru gübreleme ve toprak yönetimi açısından gelecekte alınması gereken önlemler üzerinde durulmuştur.

MATERYAL VE METOT

Bu çalışmada kullanılan toprak örnekleri ekimden önce son toprak hazırlığı yapıldığında (herhangi bir gübre ve tarım ilacı uygulaması yapılmadan önce) 0-30 cm derinlikten Edirne ili, İpsala ilçesinin değişik köy ve merkeze bağlı mevkilerinden ve özellikle yoğun olarak tarımsal üretim yapılan alanlardan (Çizelge 1) usulüne uygun olarak zig zag yöntemiyle alınmış ve akabinde analiz yapılacak laboratuvara getirildikten sonra, havada kurutulup ardından 2 mm'lik elekten geçirilerek analize hazır hale getirilmiştir (Jackson, 1958). Toprak örneklerinin tekstür sınıfı su ile doymuşluğuna göre; toprak reaksiyonu, Uluslararası Toprak İlmi Derneğinin önerdiği üzere 1:2.5 (toprak:su) oranında toprağın sulandırılarak, cam elektrotlu pH metre ile ölçülerek; tuz içeriği ise EC-metre ile ölçülüp % birimi cinsinden belirlenmiştir (Lindsay ve Norvell 1978, Richards 1954). Kireç miktarlarının belirlenmesi Scheibler Kalsimetresi ile volümetrik olarak yapılmıştır (Ülgen ve Yurtsever 1974). Topraklarda organik madde, Walkley-Black yöntemi ile belirlenmiştir (Sağlam, 2012). Alınabilir fosfor Spektrofotometre-Olsen metoduna göre yapılmıştır. Yarıyıllı Ca ve Mg ICP-OES (DTPA), Fe, Mn, Cu ve Zn

içerikleri ise ICP-OES yöntemi ile yapılmıştır (Linsay ve Norvell 1978). Değişebilir K ise fleymfotometrede (amonyum asetat) belirlenmiştir (Jackson 1958, Sağlam 2012). Toprak analizlerinin değerlendirilmesinde önceki çalışmalarda belirtilen standart değerler kullanılmıştır (Lindsay ve Norwell, 1969; FAO, 1990; TOVEP, 1991; Güneş ve ark., 1996; Güneş ve ark., 2010; Bellitürk, 2013).

Toprak örneklerinin alındığı yerlere ait bilgiler Çizelge 1’de gösterilmiştir.

SONUÇLAR VE ÖNERİLER

Araştırma bölgesine ait incelenen toprak örneklerinin bazı kimyasal ve fiziksel analiz sonuçları Çizelge 1’de topluca gösterilmiştir.

Çizelge 1. Toprak örneklerine ait bazı fiziksel ve kimyasal analiz sonuçları.

Çizelge 1'den de görüldüğü gibi, Edirne ili, İpsala ilçesi topraklarının pH değerleri en düşük 4,95 ile “orta asit”, en yüksek 8,10 ile “hafif alkalin” sınıfında olduğu görülmektedir. Toplam tuz içerikleri bakımından en düşük %0,03 ile “tuzsuz”, en yüksek %0,42 ile “orta derecede tuzlu” sınıfında girdiği görülmektedir. Öte yandan toplam 25 adet toprak örneğinin organik madde içerikleri en düşük %0,18 (çok az) ve en yüksek %4,69 (çok fazla) olarak tespit edilmiştir (Lindsay ve Norwell, 1969; FAO, 1990; TOVEP, 1991; Güneş ve ark., 1996; Güneş ve ark., 2010; Bellitürk, 2013). Tekirdağ ilinin Ergene ilçesinde 70 adet toprak örneği üzerinde yapılan bir araştırma sonuçlarına göre; toprakların %40'ı “nötr”dür. Toprakların tamamının organik madde içerikleri ortalama bir değer olarak %1,25 olup, “çok az” ve “az” sınıfında ve organik maddece yetersiz olarak değerlendirilmektedir. Toprakların tamamı tuzsuz ve CaCO₃ içerikleri bakımından %82,61'inin “az” kireç içerdiği belirlenmiştir. İncelenen toprak örneklerinin büyük bir çoğunluğunun (%49,28) “tınlı” tekstür sınıfına girdiği görülmüştür (Gürbüz ve Bellitürk, 2021). Toprak örneklerinin bazı makro ve mikro bitki besin element durumları Çizelge 2'de gösterilmiştir.

Çizelge 2'den de görüldüğü gibi, toprakların toplam N içerikleri en düşük %0,01 ve en yüksek %0,23 olarak belirlenmiştir. Yarayışlı P içerikleri bakımından topraklarda en düşük 4,68 ppm ve en yüksek 72,47 ppm değeri ölçülmüştür. Değişebilir K, Ca ve Mg içerikleri bakımından en düşük sırasıyla 73,93; 211,46 ve 71,32 ppm olduğu tespit edilmiştir. Değişebilir K, Ca ve Mg içerikleri bakımından en yüksek sırasıyla 571,74; 6346,63 ve 105,40 ppm olduğu bulunmuştur. İlçeyi temsilen alınan toprakların yarayışlı mikro bitki besin element içeriklerinin (Fe, Mn, Zn ve Cu) en düşük-en yüksek değerleri sırasıyla 10,64-102,34; 16,23-139,30; 0,23-16,23 ve 0,49-7,66 ppm olduğu bulunmuştur. Toprak örneklerinin tamamına yakının yarayışlı Fe ve Cu bakımından yeterli olduğu görülmektedir. Yarayışlı Zn değeri az (0,2-0,7 ppm arası) olanların oranı %20 (5 adet) olup, toprakların genellikle yeterli ve fazla Zn içerdiği görülmektedir. Yarayışlı Mn içerikleri bakımından ise toprakların yeterli ve fazla sınıflarında yer aldığı görülmektedir.

Çizelge 2. Toprak örneklerine ait bazı makro ve mikro bitki besin element sonuçları

Gürbüz ve Bellitürk (2021) tarafından Ergene ilçesinde yapılan benzer bir çalışma sonuçlarına göre incelenen 70 adet toprağın %69,57'sinde toplam azot "az", %55,07'sinde elverişli fosfor "yeterli", %49,28'de değişebilir potasyum "yeterli", %42,03'ünde değişebilir Ca "yeterli" ve %57,97'de değişebilir Mg'un "yeterli" olduğu görülmüştür. Elverişli mikro besin elementlerinden, Cu ve Mn'in "yeterli", Fe'in "fazla" ve Zn'in "az" olduğu tespit edilmiştir. Bu çalışmalardan elde edilen sonuçlar birçok yönüyle benzerlik taşımaktadır. Bellitürk ve ark. (2012) tarafından çeltik tarımı yapılan İpsala ve Meriç ilçelerinde yürütülmüş olan bir çalışmada toprak örneklerinin % N içerikleri bakımından tamamının organik maddede olduğu gibi "düşük" olduğu görülmektedir. Ortalama P, K, Ca, Mg, Fe, Mn, Zn ve Cu değerleri incelendiğinde, sırasıyla 19.25, 90.79, 1294.26, 171.32, 37.51, 38.52, 0.78 ve 1.31, ppm olduğu bulunmuştur. Buradan da açıkça görüldüğü gibi, Trakya Yöresi toprakları genel anlamda azot yönünden fakirdir. Bu durum yörede yapılan birçok çalışmada da benzer şekilde görülmüştür (Şinik, 2011; Bellitürk ve ark., 2011). Toplam N miktarının ve beraberinde topraklardaki organik maddenin artırılmasında son yıllarda Trakya Bölgesi'nde vermikompostun

kullanılmaya başlandığı görülmektedir. Vermikompost sadece topraklara değil, bitkilerin beslenmesine de olumlu katkılar sağlayan bir organik gübredir. Tarla koşullarda tesadüfi deneme desenine göre yürütülen çalışmada; farklı oranda vermikompost, inek ve koyun gübresi uygulamanın kıvırcık marulun gelişimine etkisi karşılaştırılmıştır. Vermikompostun özellikle Ca, Cu ve Zn elementlerinin kıvırcık marul bitki bünyesine alımında iyi sonuçlar verdiği ve erkencilik özelliğinde etkisinin önemli olduğu belirtilmiştir. Koyun gübresi uygulamalarının genel olarak bitki besin elementlerinin alınabilirliği açısından olumlu sonuçlar verdiği, inek gübresinin ise N alımında önemli rol oynadığı belirtilmiştir (Bellitürk, ve ark., 2017). Tarla koşullarında toprakların fiziksel ve kimyasal özelliklerini iyileştirerek buğday bitkisinin daha iyi büyümesini gözlemlemek amacıyla farklı organik materyallerden hazırlanan (inek gübresi, kâğıt atığı ve pirinç samanı) vermikompost ve inorganik gübrelerin farklı kombinasyonları kullanılarak buğday denemesi kurulmuştur. Üç farklı vermikompostun fiziko-kimyasal özellikler ve topraktaki besin mevcudiyeti üzerindeki etkisi, kimyasal gübrelerle birlikte etkinlikleri incelenmiştir. Elde edilen en iyi sonuçlar N:P:K 100:50:50 kg ha⁻¹ + 10 t ha⁻¹ inek gübresi vermikompostu uygulanan denemede görülmüştür. Bununla birlikte, toprağın hasat sonrası analizi yapılmış ve sadece vermikompost uygulanan örneklemelerin toprağın fiziko-kimyasal özelliklerini geliştirerek toprak sağlığını iyileştirdiğini ortaya çıkarmıştır. Sonuç olarak, önerilen N:P:K ile birlikte inek gübresi vermikompostu uygulaması ile sadece ürün verimi, toprak sağlığı, yaprak biti istilası değil, aynı zamanda Zn ve Fe ile zenginleştirilmiş tahıllar yetiştirilebileceği belirtilmiştir (Aslam, ve ark., 2019).

Trakya Bölgesi'nde yapılan çeltik tarımında çoğunlukla amonyum sülfat gübresi ile fosfor içeren 20-20-0 gibi kompoze gübreler tercih edilmektedir. Yanlış gübre kullanımı neticesinde hem toprakların pH değerlerinde istenmeyen düşüşler olduğu ve hem de toprakların artık bu derecede yalnızca fosfora değil potasyuma da ihtiyacı olduğu bilinmektedir. Ayrıca topraklardaki çinko eksikliği de önemsenmeli ve doğru gübre kullanımına gereken önem verilmelidir (Bellitürk ve ark., 2012). Trakya Bölgesi sınırlarında özellikle sulu tarım modeliyle çim yetiştirilen ve hatta çeltik üretimi yapılan İpsala, Meriç, gibi ilçelerde fazla kimyasal gübre kullanıldığına yönelik çok fazla araştırmalar mevcuttur. Ancak kimyasal gübreler ile birlikte organik gübrelerin de kullanılmış olması ile hem gübrelemenin etkinliği artacak ve hem de sadece bitkiler değil, topraklar da iyileştirilmiş olacaktır. Organik gübrelerden vermikompost üreten firmaların bölge genelinde çok fazla olması bir avantaj olup, çiftçilerin tarım ve peyzaj alanlarında giderek artan vermikompost kullanım alışkanlıklarının olduğu da görülmektedir (Bellitürk, 2018; Çelik ve ark, 2022; Bellitürk ve ark., 2022; Kocagöz ve ark., 2022; Aslam ve ark., 2023). Toprakları asitleştirme etkisi yüksek olan gübrelerin kullanılması neticesinde

toprakların pH deęerleri giderek yıldan yıla düşmekte ve tarımsal üretim deęerleri de olumsuz olarak etkilenmektedir (Bellitürk, 2019).

Artan üretim isteęi, iklimsel deęişiklikler, kullanılan kimyasal gübre ve tarımsal ilaçlar doğanın kendine özel yapısını bozarak, tarımsal üretimin sürdürülebilirliğini olumsuz yönde etkilemektedir. Hedeflenen ana unsur, tarımsal üretimi gerçekleştirirken yüksek düzeyde verimin yanında doğal varlıklar açısından sürdürülebilirliğin çok önemli bir kavram olmasıdır. Organik gübreler, toprak kalitesini ve verimlilięi artıran en önemli parametrelerden biridir. Bitkisel ve hayvansal atıkların kompost, vermikompost olarak deęerlendirilmesi ile, tarımsal üretimde kullanılan kimyasal gübrelere olan talebin azalması, ekonomik ve çevresel anlamda büyük faydalar sağlayacaktır. Özellikle İpsala gibi yorgun tarım topraklarına sahip ilçelerde kimyasal gübrelerin beraberinde organik gübreler ile birlikte veya uygun gübreleme programı dahilinde kullanılması hem gübrelemenin etkinlięi artıracak hem de sadece bitkiler deęil topraklar da beslenmiş olacak ve verimde yüksek-kaliteli deęerler elde edilmiş olacaktır.

ÖZET

Bu araştırmanın amacı; ülkemizde yapılan kanola (*Brassica napus oleifera s.p*) tarımında çok önemli bir paya sahip olan Trakya Bölgesinde kanola yetiştirilen toprakların yarayışlı kükürt miktarının belirlenmesinde kullanılabilecek en uygun yöntem veya yöntemleri seçmektir. Bu amaçla toprak ve bitki örneklemeleri bölgede yaygın olarak kanola (*Brassica napus oleifera s.p*) tarımı yapılmakta olan yöreleri en iyi temsil edecek şekilde (Tekirdağ, Kırklareli, İstanbul ve Çanakkale) illerinden alınmıştır. Bölge topraklarının kükürt durumu ile bu topraklara uygulanacak en uygun yöntemin seçimi için 53 adet toprak örneklerinin alındığı alanlarda yetiştirilen kanola (*Brassica napus oleifera s.p*) bitkisinin yapraklarındaki kükürt miktarları tespit edilmiştir. Bitki yapraklarında tespit edilen kükürt miktarları ile alınan 53 adet toprak örneğinin her birine uygulanan 7 farklı kükürt tayin yöntemleri (saf su, KH_2PO_4 , NaCl, NH_4OAc , CaCl_2 , $\text{Ca}(\text{H}_2\text{PO}_4)_2$, KCl) ile belirlenen kükürt içerikleri karşılaştırılmıştır. Yapılan bu çalışma ile Trakya Bölgesi toprakları için tavsiye edilebilecek en uygun yarayışlı kükürt tayin yöntemleri olarak $\text{Ca}(\text{H}_2\text{PO}_4)_2$ ve KH_2PO_4 yöntemleri önerilmiştir.

Anahtar kelimeler: toprak, yarayışlı kükürt, ekstraksiyon yöntemi, ICP.

**INVESTIGATION OF SUITABLE EXTRACTION METHODS FOR DETERMINING
THE AVAILABLE SULPHUR CONTENTS OF TRAKYA REGION SOILS WHICH
GROWING CANOLA (*Brassica Napus Oleifera S.P*)**

ABSTRACT

The aim of this research is to choose the most suitable extraction method which will be used for determining the quantity of appropriate sulphur of Trakya Region soils growing canola (*Brassica napus oleifera s.p*). Soil and plant samples directed to this aim have been taken from the province (Tekirdağ, Kırklareli, İstanbul and Çanakkale) which will symbolize the region's best where canola (*Brassica napus oleifera s.p*) grown. To select best suitable methods which will apply this soil with the sulphur state of region soils, quantity sulphur had been determined in the leaf of canola plant (*Brassica napus oleifera s.p*) which was grown on the lands taking number of fifty-three soils samples. Quantity sulphurs which were determined with seven different extraction methods (pure water, KH_2PO_4 , NaCl , NH_4OAc , CaCl_2 , $\text{Ca}(\text{H}_2\text{PO}_4)_2$, KCl) applying to each of fifty-three soil samples with quantity sulphurs which were determined from plant leaf compared with this search which was made, the most suitable sulphur extraction methods that is advised for Trakya region soils are $\text{Ca}(\text{H}_2\text{PO}_4)_2$ and KH_2PO_4 .

Keywords: Soil, available sulphur, extraction method, ICP

1.GİRİŞ

Kanola bitkisi tohumlarında bulunan % 38-50 arası yağ oranı ile önemli bir yağ bitkisi olup, 15 günde 100 kg bal ve yaklaşık 1 kg balmumu yapabilmektedir Kanola dünyada yaklaşık 27 milyon hektar ekiliş alanı ve 46 milyon ton üretimi ile soya fasulyesinden sonra ikinci sırada yer almaktadır. Avrupa Birliği ülkeleri, Dünya’da fosil yakıtlarının artması sonucu kanola üretimi için üye ülkeleri teşvik ve 2006 yılı itibariyle tüketmekte oldukları yıllık ortalama 160 milyon ton dizel yakıtı 2020 yılına kadar % 10 civarına biodizel yakıtı karıştırılması hedeflemektedir (Süzer, 2008).

Kanola ekim alanları 2006 yılında 27 bin dönüm iken 2007 yılında 50 bin dönüme çıkmıştır. Trakya Bölgesinde ekimi 2007-2008 yıllarında 200 000 da alanı geçmiştir (Hacaloğlu, 2008). 2021 yılında ise 269 148 da’lık bir alanda kanola üretimi gerçekleştirilmiştir (Anonim, 2022) <https://blog.agcurate.com/>).

Kanola ülkemiz yağ açığının kapatması yağ fabrikalarına Haziran, Temmuz, Ağustos aylarında hammadde sağlaması toprağın yapısını düzeltmesi, küspesinde % 38-40 protein bulunması ve Kanola bitkisinde kükürt, noksanlığı, bitkide dal sayısını, verimli çiçek sayısını harnupta tane sayısını ve bir tane sağrılığını olumsuz etkilemekte, bitki bodurlaşmakta ve ince gövde çalimsı bir görünüm almaktadır. Bitkide kloroz belirtisi görülmekte kök kuvvetli bir şekilde gelişmemektedir.

Kükürt noksanlığında bitkilerde/çiçeklenme polen az olduğundan arılar etkilenmemektedir. Kükürt elementi Kanola bitkisinde yağ, protein ve glukosinolat oranı üzerine etkilidir. Ayrıca kanola küspesinin protein oranı üzerinde de etkili olmaktadır. Arı ve arıcılara polen sağlaması bakımından çok önemli bir bitkidir.

İstenen kalite ve verime ulaşılabilme için kültür topraklarında yetiştirilmesi düşünülen bitkinin isteklerine cevap verebilecek miktar ve çeşitlerde bitki besin maddesi sağlanmış olması ve üretim süresince bu düzeyin korunması gerekmektedir. Bu nedenle bitki besin elementlerinin miktarlarının tespitlerinin yapıp buna göre gübre takviyesi yapılmalıdır.

Topraklarda bitkiye yarayışlı besin maddesi miktarlarının belirlenmesinde kullanılan yöntemler; laboratuvar, sera ve tarla yöntemleridir. Bu yöntemlerden sera ve tarla yöntemleri fazla zamana, işgücü ile paraya ihtiyaç duyulması sebebi ile kullanımları sınırlıdır.

Buna karşın laboratuvar yöntemleri (ekstraksiyon yöntemleri) diğer yöntemlere oranla daha avantajlı olmalarından dolayı topraklarda tespiti yapılması gereken bitkiye yararlı besin maddesi miktarının belirlenmesinde yaygın olarak kullanılan yöntemlerdir.

Günümüzde araştırmacılar bitkiye yararlı kükürdün belirlenmesi amaçlı birçok ekstraksiyon yöntemi belirlemişlerdir. Fakat her bölgenin farklı ekolojik koşullara bağlı değişik toprak oluşum öğeleri sonucu oluşan ayrı özelliklere sahip topraklarda yararlı kükürdün belirlenmesine ait tek bir ekstraksiyon yöntemi tespit edilmemiş yukarıda bahsedilen sebeplerden dolayı da tespit edilmesi mümkün değildir.

Bu araştırmada Trakya Bölgesinde yaygın olarak ekimi yapılan kanola bitkisinin yetiştirildiği topraklarda yararlı kükürt miktarının belirlenmesinde kullanılabilecek en uygun ekstraksiyon yöntemi veya yöntemleri ortaya konulmuştur.

2.MATERYAL VE YÖNTEM

2.1. Materyal

2.1.1. Toprak ve Bitki Örneklerinin Alınması ve Analize Hazırlanması

Bu araştırmada Trakya Bölgesinde yaygın olarak kanola tarımı yapılan alanları en iyi şekilde temsil eden arazilerden örnekleme yapılmasına dikkat edilmiştir. Bölgede yer alan Tekirdağ, Kırklareli, İstanbul, Çanakkale (Avrupa kesimi) illerinin kanola yetiştirilen 53 adet tarım arazisinden toprak örneği kanola ekiminden hemen önce Ekim ayı içerisinde usulüne uygun bir biçimde 2010- 2011 ve 2011- 2012 ekim ve dikim döneminde alınmıştır (Jackson, 1962). Toprak örneklerinin alındığı arazilerden Nisan ayı içerisinde de bitki örnekleri alınmıştır (Jones ve ark., 1991).

2.2. Yöntemler

2.2.1. Toprak Örneklerinde Yapılan Bazı Fiziksel ve Kimyasal Analizler

Toprak örneklerinde yapılan bazı fiziksel ve kimyasal analizler; Organik madde, kireç, toprak reaksiyonu (pH), tekstür, bitkiye yararlı fosfor, değişebilir katyonlar (K, Ca, Mg), toprak örnekleri yararlı mikro element analizi için 0.005 M DTPA+ 0.01 M CaCl₂ + 0,1 M TEA (pH 7.3) ile ekstrakte edilmiştir (Lindsay ve Norvell, 1978). Ekstrakttaki yararlı Fe, Cu, Zn ve Mn miktarları ICP-OES'de belirlenmiştir.

Topraklarda bitkilere yararlı kükürdün belirlenmesinde toprak örnekleri 7 farklı ekstraksiyon yöntemi ile ekstrakte edilmiş ve aşağıdaki çizelgede verilmiştir

Çizelge 1. Toprakların yarıyışlı kükürt miktarının belirlenmesinde kullanılan yöntemler

Ekstraksiyon çözeltisi	Toprak: çözelti oranı	Çalkalama süresi, dakika	Kaynak
Saf su	1: 5	30	Spencer ve Freney (1960)
KH ₂ PO ₄ (500 mg kg ⁻¹)	1: 5	30	Ensminger (1954)
NaCl (% 1)	1: 5	30	Williams ve Steinbergs (1959)
NH ₄ OAc (1 N)	1: 5	30	Mc Clung ve ark.(1959)
CaCl ₂ (% 0,15)	1: 6	30	Williams ve Steinbergs (1959)
Ca(H ₂ PO ₄) ₂ (500 mgkg ⁻¹)	1: 5	30	Fox ve ark. (1964)
KCl	1: 5	30	Maynard ve ark. (1987)

3. BULGULAR VE TARTIŞMA

3.1. Toprak Örneklerinin Bazı Fiziksel ve Kimyasal Özellikleri

Araştırma alanına ait toprak örneklerinin tekstür sınıfları Bouyoucos Hidrometre yöntemi ile yapılmıştır (Demiralay, 1993), çoğunlukla Tın ve Killi Tın sınıfına girmektedir kimyasal analiz sonuçlarının minimum, maksimum ve ortalama değerleri Çizelge 2’de verilmiştir.

Çizelge 2. Toprak örneklerinin bazı kimyasal özellikleri

	pH	Tuz, %	Kireç, %	Organik madde, %	Yarıyışlı P, mg kg ⁻¹	Değ. K, mg kg ⁻¹	Değ. Ca, mg kg ⁻¹	Değ. Mg, mg kg ⁻¹
Min	3,95	0,014	0,01	0,26	0,35	47	398	42
Max	8,00	0,120	44,00	3,00	73,00	735	7056	1179
Ort.	6,51	0,06	2,35	1,34	21,86	188	3470	326

Çizelge 2’ye göre toprakların pH değerleri elektrometrik olarak ölçülmüş (Sağlam, 2012) ve 3,95 ile 8,00 arasında; kireç içerikleri Scheibler Kalsimetresiyle belirlenmiş (Sağlam, 2012) ve % 0,01 ile % 44,00 arasında; organik madde içerikleri Smith-Weldon yöntemi ile tayin edilmiş (Sağlam, 2012) ve % 0,26 ile % 3,00; bitkilere yarıyışlı P içerikleri Olsen yöntemi ile ekstrakte

edildikten sonra (Sağlam, 2012), ICP-OES (Inductively Coupled Plasma Optical Emission Spectrometry) cihazında okunarak belirlenmiş ve $0,35 \text{ mg kg}^{-1}$ ile 73 mg kg^{-1} arasında; değişebilir katyonlar (K, Ca, Mg) (Sağlam, 2012)'e göre ekstrakte edilmiş ve ICP-OES ile belirlenmiştir. Değişebilir K değerleri 47 ile 735 mg kg^{-1} arasında, değişebilir Ca değerleri 398 ile 7056 mg kg^{-1} ve değişebilir Mg içerikleri ise 42 ile 1179 mg kg^{-1} arasında değişmektedir.

Toprak örnekleri yarayışlı mikro element analizi için $0.005 \text{ M DTPA} + 0.01 \text{ M CaCl}_2 + 0,1 \text{ M TEA}$ (pH 7.3) ile ekstrakte edilmiştir (Lindsay ve Norvell, 1978). Ekstrakttaki yarayışlı Fe, Cu, Zn ve Mn miktarları ICP-OES'de belirlenmiştir.

Araştırmada kullanılan Trakya Bölgesi kanola tarımı yapılan toprak örneklerinin yarayışlı bazı mikro besin elementi (Fe, Cu, Zn, Mn) içeriklerinin minimum, maksimum ve ortalama değerleri aşağıdaki Çizelge 3'de verilmiştir.

Çizelge 3. Toprak örneklerinin yarayışlı bazı mikro besin elementi içerikleri, mg kg^{-1}

	Fe	Cu	Zn	Mn
Min	3,00	0,07	eser	1,10
Max	73,00	6,00	1,99	87,64
Ort.	19,14	1,29	0,46	25,05

Toprakların Fe içerikleri yeterli düzeydedir (Lindsay ve Norwell, 1978), yarayışlı Cu içerikleri bir örnek hariç yeterlidir (Lindsay ve Norwell, 1978), yarayışlı Zn içerikleri çoğunlukla yetersiz düzeydedir (Lindsay ve Norwell, 1978), yarayışlı Mn içerikleri üç örnek hariç yeterli düzeydedir (Lindsay ve Norwell 1978).

3.2. Farklı Ekstraksiyon Yöntemleri ile Topraklarda Belirlenen Bitkilere Yarayışlı Kükürt Miktarları

Trakya Bölgesinde yaygın olarak kanola tarımı yapılmakta olan topraklarda bitkilere yarayışlı kükürt miktarlarının belirlenmesinde yedi farklı ekstraksiyon yöntemi kullanılmıştır. Söz konusu bu yöntemler göre belirlenen bitkilere yarayışlı kükürt miktarları Çizelge 4'de verilmiştir.

Çizelge 4. Trakya Bölgesinde kanola tarımı yapılan topraklarının farklı ekstraksiyon yöntemleri ile belirlenen bitkilere yarayışlı kükürt miktarları, mg kg⁻¹

	Saf su	KH ₂ PO ₄	NaCl	NH ₄ OAc	CaCl ₂	Ca(H ₂ PO ₄) ₂	KCl
Min	6,58	5,64	3,78	4,79	4,47	4,59	5,89
Max	79,44	65,15	86,22	65,57	60,66	65,26	75,41
Ort.	19,63	13,46	14,08	12,21	13,91	13,58	13,72

Çizelge 4. incelendiğinde 7 farklı ekstraksiyon yöntemi ile toprak örneklerinde belirtilen yarayışlı S miktarları birbirlerinden farklılıklar göstermektedir. Bu durumun nedeni olarak çözeltilerin ekstraksiyon güçlerinin farklı oluşu gösterilmiştir (Çelebi, 1977; Erdoğan, 2004)

3.3. Bitki Örneklerinin Kükürt İçerikleri

Araştırma alanındaki bitki örneklerinin kükürt içeriği ICP-OES ile yapılan belirlemede; % 0,24-3,97 aralığında değişmekte ve ortalama % 1,18 olarak bulunmuştur. Bitki örneklerinin kükürt içeriklerinin % 52,83'ü yeterli düzeydedir. Araştırmada ele alınan bitki örneklerinin % 47,17'nin kükürt miktarları ise yüksek düzeyde tespit edilmiştir (Jones ve ark., 1991).

3.4. Bitki Örneklerinin Kükürt İçerikleri İle Farklı Ekstraksiyon Yöntemleri ile Belirlenen Toprakların Bitkilere Yarayışlı Kükürt Miktarları Arasındaki İstatistiksel İlişkiler

Araştırma konusu için ele alınan topraklara uygulanan farklı ekstraksiyon yöntemleri ile elde edilen bitkilere yarayışlı kükürt miktarları ile bitki örneklerinin kükürt içerikleri arasında belirlenen korelasyon katsayıları aşağıdaki Çizelge 5'de verilmiştir.

Çizelge 5. Bitkilerin kükürt içerikleri ile toprakların farklı ekstraksiyon yöntemlerine göre yarayırlı kükürt içerikleri arasındaki korelasyon katsayıları, (r)

Uygulanan ekstraksiyon yöntemi	Bitki örneğinin kükürt içeriği
Saf su	0,823**
KH ₂ PO ₄	0,917**
NaCl	0,874**
NH ₄ OAc	0,880**
CaCl ₂	0,915**
Ca(H ₂ PO ₄) ₂	0,945**
KCl	0,873**

** : %1 düzeyinde önemli

Çizelge 5 incelendiğinde görüleceği üzere denemede kullanılan bütün yöntemler ile bitkilerin kükürt kapsamaları arasında istatistiksel olarak % 1 düzeyinde önemli ilişkiler elde edilmiştir.

Ancak bu yöntemler arasında Trakya Bölgesi kanola tarımı yapılan toprakların bitkilere yarayırlı kükürt miktarlarının belirlenmesinde kullanılabilir en uygun yöntemin Ca(H₂PO₄)₂ ekstraksiyon yöntemi olduğu (r: 0,945**) anlaşılmaktadır. İkinci sırada KH₂PO₄ yöntemi (r: 0,917**); üçüncü sırada CaCl₂ yöntemi (r: 0,915**); dördüncü sırada NH₄OAc yöntemi (r: 0,880**); beşinci sırada NaCl yöntemi (r: 0,874**); altıncı sırada KCl yöntemi (r: 0,873**) ve son sırada ise safsu yöntemi (r: 0,823**) izlemiştir. Bütün yöntemler ile belirlenen korelasyon katsayıları istatistiksel olarak % 1 düzeyinde önemli bulunmuştur

4. SONUÇ VE ÖNERİLER

Geniş alanlarda kanola tarımı yapılan Trakya Bölgesi topraklarında bitkilere yarayırlı kükürt miktarının tayininde kullanılabilir en uygun ekstraksiyon yönteminin belirlenmesi amacıyla 7 farklı ekstraksiyon yöntemi kullanılmıştır.

Bu araştırmada ele alınan yedi farklı ekstraksiyon yöntemi içinde yapılan istatistiksel değerlendirmeler yorumlandığında;

Yaygın olarak kanola tarımı yapılan Trakya Bölgesi topraklarında alınabilir kükürt miktarının belirlenmesinde araştırma topraklarına uygulanan yedi farklı ekstraksiyon yönteminin her biri bitkilerin kükürt içerikleri ile korelasyona tabi tutulmuş olup, en uygun yöntemin (r: 0,945**) korelasyon katsayısı ile Ca(H₂PO₄)₂ ekstraksiyon yöntemi olduğu anlaşılmaktadır. Çünkü bu

yöntem ile belirlenen toprakların bitkilere yarayışlı kükürt içerikleri ile bitkilerin kükürt içerikleri arasında en yüksek korelasyon katsayısı bulunmuştur. Bu yöntemi ($r: 0,917^{**}$) korelasyon katsayısı ile KH_2PO_4 yöntemi izlemektedir. Bütün yöntemler ile belirlenen korelasyon katsayıları istatistiksel olarak % 1 düzeyinde önemli bulunmuştur.

Bu araştırma daha önce Trakya Bölgesi toprakları için böyle bir çalışmanın yapılmamış olması ve pratikte koşullara bağımlı olarak uygulanabilirlik açısından iki farklı yöntemin tespit edilmiş olması nedenlerinden dolayı önem taşımaktadır.

Sonuç olarak bölgemizde kanola yetiştirilen toprakların yarayışlı kükürt miktarları bu iki yöntemden birisi ile belirlenip bitkinin ihtiyacı olan kükürt besin elementi kanola bitkisinde uygulanmalıdır. Aksi takdirde gereğinden fazla veya az miktarda kükürt uygulaması kanola bitkisinin verim ve kalitesini olumsuz bir şekilde etkileyecektir.

Teşekkür

ÖZET

Bu araştırma, Edirne ilinden geçen otoban kenarlarındaki topraklarda bazı ağır metallerin kirliliğinin belirlenmesi amacıyla yapılmıştır. Bunun için Edirne merkez ilçe ve Havsa ilçelerinden 56 farklı yerden toprak örneği alınmıştır. Elde edilen bulgulara göre topraklar genellikle nötr pH'da ve tuzsuz özelliktedir. Toprakların tekstürleri genellikle "Kumlu Killi Tın (SCL)" tekstür sınıfında olup, kireç kapsamları bakımından "az kireçli" sınıfına girmektedir. Toprakların organik madde kapsamları "yetersiz" düzeydedir. Toprakların yarayışlı P, değışebilir K, Ca ve Mg kapsamları ise "yeterli" düzeydedir. Toprakların bitkilere yarayışlı Fe ve Cu kapsamları "yeterli", ancak Zn ve Mn kapsamları "yetersiz" düzeydedir. Toprakların ekstrakte edilebilir Cd, Co, Cr, Ni ve Pb içerikleri sırasıyla 0.005-0.087; 0.011- 0.583; 0.044-0.182; 0.360-6.761; 1.212-5.561 mgkg⁻¹ arasında bulunmuştur. Bu sonuçlar göre, topraklarda Cd, Cr ve Ni kirliliğı saptanamamıştır. Ancak Co kirliliğı ve önemli boyutlarda da Pb kirliliğı saptanmıştır.

Anahtar kelimeler: Edirne, otoban, toprak, ağır metal, kirlilik, Cd, Co, Cr, Ni, Pb.

**AN INVESTIGATION OF SOME HEAVY METAL POLLUTION ALONG THE TEM
MOTORWAY AGRICULTURAL AREAS IN EDİRNE**

ABSTRACT

The aim of this research was to determine the heavy metal pollution of near the motorway soils in Edirne Province. For this purpose, soil samples were taken from 56 different agricultural lands near the motorway in Edirne. According to the results, the soils were generally neutral pH and saltless. The texture of soils was generally sandy-clay-loam (SCL) and less lime as classified. Organic matter amount is insufficient in soils. The contents of soils available P, exchangeable K, Ca and Mg are sufficient. Available Fe and Cu contents of soils are sufficient, but available Zn and Mn contents are insufficient. Extractable Cd, Cr, Co, Ni and Pb contents of the soil samples are between 0.005-0.087; 0.011- 0.583; 0.044-0.182; 0.360-6.761; 1.212-5.561 mgkg⁻¹, respectively. According to these results, Cd, Cr and Ni pollution were not determined in the soils. But beginning of Co pollution and important level Pb pollution were determined.

Keywords: Edirne, motorway, soil, heavy metal, pollution, Cd, Co, Cr, Ni, Pb.

1.GİRİŞ

Son yıllarda dünyadaki bu nüfus artışına paralel olarak endüstriyel faaliyetlerin yoğunlaşması sonucunda su, hava ve toprak kirlenmesi canlı yaşamını tehdit eden boyutlara ulaşmıştır. Ülkemizde hızlı sanayileşme ve nüfus artışı sonucu bu sorunlar daha sık gündeme gelmeye başlamıştır. Endüstriyel faaliyetlerle çevreye sızan ağır metaller çok önemli kirlilik unsuru olup, canlı ekosistemlere zarar vermektedirler. Doğal ve yapay yollarla ortama katılan ağır metaller kolayca birikip çevrede ve toprakta kompleks yapılar oluşturmaları nedeniyle tehlikeli kirleticiler olarak tanımlanmaktadır. Ağır metaller, çoğunlukla buldukları ortamda biyodegradasyona uğramadıklarından kolayca birikirler ve çok kompleks yapılar oluşturarak zehirlilik etkilerini de arttırabilirler. Günümüzde endüstrileşmenin artmasıyla çevrede ve toprakta ağır metal kirliliği yüksek miktarlara ulaşmıştır.

Ağır metaller periyodik tablonun 2A grubundan 6A grubuna kadar geniş bir alanda yer alan elementler olarak tanımlanmaktadır. Ağır metaller yoğunluğu 5 g/cm^3 den büyük olan metallerdir. Bu grupta Pb, Cd, Cr, Fe, Co, Cu, Ni, Hg ve Zn başta olmak üzere 60'tan fazla metal yer almaktadır. Bu elementler dünyamızda çoğunlukla karbonat, oksit, silikat ve sülfür halinde stabil bileşik veya silikatlar ile kompleks oluşturmuş şekilde bulunurlar (Haktanır ve Arcak, 1998).

Topraklarda Cd birikimi endüstriyel faaliyetler, fosforlu gübreler, lağım atıkları, yoğun trafik olan otoban kenarlarındaki tarım alanlarında motor yağları ile taşıt lastikleri yoluyla oluşmaktadır. Nitekim Brümmer ve ark. (1991) Almanya'nın Bonn şehrinde araç trafiğinin yoğun olduğu yol kenarlarından uzaklaştıkça topraktaki Cd miktarının $9,4 \text{ mgkg}^{-1}$ 'den $0,7 \text{ mgkg}^{-1}$ 'a düştüğünü belirlemiştir. Ayrıca bitki ve topraklarda Cd'un birikmesinde Cd içeren toz zerreciklerinin havadan çökmesinin de etkileri vardır. Yoğun trafik akışı gösteren yolların yakınındaki topraklarda toz çökelmeleriyle yılda metrekareye $0,2-1,0 \text{ mg Cd}$ ilave olduğu belirlenmiştir. Kirlenmeyen alanlarda ise toprağın toplam Cd kapsamı genellikle 1 mgkg^{-1} 'in altındadır (Kacar ve İnal, 2010).

Kadmiyum doğada oldukça az bulunan bir elementtir. Toprakta Cd'un toplam tolere edilebilir miktarı 3 mgkg^{-1} (Topbaş ve ark. 1998); ekstrakte edilebilir Cd'un tolere edilebilir miktarı ise $0,2 \text{ mgkg}^{-1}$ ' dir (Alloway, 1995).

Tarım alanlarındaki toplam Pb konsantrasyonu 100 mgkg^{-1} 'i, ekstrakte edilebilir Pb miktarı ise 4 mgkg^{-1} 'i aşmadığı sürece bitki ve insan sağlığı bakımından herhangi bir sorun

oluşturmamaktadır. Ancak bu rakamlar aşıldığında potansiyel olarak insan sağlığı tehlike altındadır (Chapman, 1971; Dürüst ve ark. 2004).

Toprakta bulunan Ni'in tolere edilebilir toplam miktarı 50 mgkg^{-1} (Kabata- Pendias ve Pendias, 1992); ekstrakte edilebilir miktarı ise 10 mgkg^{-1} (Gerendas ve ark., 1999) civarındadır. Topraklarda Ni'in temel kaynağı bazik kayalar içerisinde çoklukla bulunan Pentlandit (Fe, Ni)₈S₈ mineralidir. Nikel az ya da çok bütün tarım topraklarında bulunmaktadır. Ancak killi topraklarda daha fazla bulunmaktadır (Kacar ve İnal, 2010). Trafiğin yoğun olduğu yerlerde yol kenarlarından uzaklaştıkça topraktaki Ni miktarı da azalmakta ve bu durum da Ni içeren yakıtların kullanılması ile açıklanmaktadır (Tok, 1997).

Tarım topraklarında izin verilebilir toplam Cr düzeyi 100 mgkg^{-1} ve ekstrakte edilebilir Cr düzeyi ise 1 mgkg^{-1} dolayındadır. Serpantin ana maddesinden oluşan topraklar Cr yönünden zengindir. Doğada daha çok Cr-demir taşı şeklinde bulunmaktadır. Kromun topraklardaki miktarı ana materyale göre değişmekle birlikte $7- 750 \text{ mgkg}^{-1}$ arasındadır. Topraklar krom içeriklerine bakımından tekstürlerine göre değerlendirildiğinde ortalama olarak kumlu topraklarda 30 mgkg^{-1} , killi topraklarda 40 mgkg^{-1} ve kireçtaşından oluşmuş topraklarda ise 83 mgkg^{-1} bulunmaktadır. Krom toksisitesi özellikle ultrabazik kayalardan oluşan topraklarda görülmektedir (Bowen, 1966; Tok, 1997; Kacar ve İnal, 2010).

Toprakların toplam Co içeriği $1 - 40 \text{ mgkg}^{-1}$, ekstrakte edilebilir Co içeriği ise $0,03 - 0,09 \text{ mgkg}^{-1}$ arasında değişmektedir. Toprakta ekstrakte edilebilir Co'ın izin verilebilir sınır değeri $0,09 \text{ mgkg}^{-1}$ 'dir (Carrigan ve Erwin, 1951).

Bu araştırmada Edirne Merkez İlçe ve Havsa İlçesinden geçerek yurt dışı ile İstanbul'u birbirine bağlayan TEM Otoyolu güzergâhı boyunca otoban kenarlarındaki tarım arazilerinde meydana gelen karayolu taşımacılığında kaynaklanabilecek ağır metal kirliliğinin boyutlarını ortaya konulmuştur.

2.MATERYAL VE YÖNTEM

2.1. Materyal

Araştırmada kullanılan toprak örnekleri Edirne ili Havsa İlçesi ve Merkez ilçelerden geçerek Kapıkule sınır kapısı ile yurtdışına açılan TEM Otoban Yolunun Edirne İli içerisinde kalan yol kenarlarında bulunan tarım arazilerinden ve 56 farklı noktadan alınmıştır. Toprak örnekleri

otoban yolunun her iki yanından hemen otobanın bitiminde yer alan tarım arazilerinin uygun noktalarından 0-30 cm derinlikten alınmıştır (Jackson, 1967).

2.2. Yöntemler

2.2.1. Toprak Örneklerinde Yapılan Bazı Fiziksel ve Kimyasal Analizler

Toprak örneklerinde organik madde, kireç, toprak reaksiyonu (pH), tekstür, bitkiye yararışlı fosfor, değişebilir katyonlar (K, Ca, Mg) (Sağlam, 2012; Demiralay, 1993), yararışlı bazı mikro besin elementi (Fe, Cu, Zn ve Mn) analizi (Lindsay ve Norvell, 1978)'e göre yapılmıştır. Toprak örnekleri ekstrakte edilebilir bazı ağır metal analizi için 0.005 M DTPA + 0.01 M CaCl₂ + 0,1 M TEA (pH 7.3) ile ekstrakte edilmiştir (Lindsay ve Norvell, 1978). Ekstrakttaki Cd, Co, Cr, Ni, Pb miktarları ICP-OES'de belirlenmiştir.

3. BULGULAR VE TARTIŞMA

3.1. Toprak Örneklerinin Bazı Fiziksel ve Kimyasal Özellikleri

Araştırma alanına ait toprak örneklerinin tekstür sınıfları Bouyoucos Hidrometre yöntemi ile belirlenmiştir (Demiralay, 1993) ve çoğunlukla Kumlu Killi Tın (SCL) sınıfına girmektedir. Toprak örneklerinin bazı kimyasal analiz sonuçlarının minimum ve maksimum değerleri Çizelge 1'de verilmiştir.

Çizelge 1. Toprak örneklerinin bazı kimyasal özellikleri

	pH	Tuz, %	Kireç, %	Organik madde, %	Yararışlı P, mg kg ⁻¹	Değ. K, mg kg ⁻¹	Değ. Ca, mg kg ⁻¹	Değ. Mg, mg kg ⁻¹
Min	4,82	0,018	0,12	0,82	10,85	97,2	1724	140,0
Max	8,10	0,074	4,28	1,59	61,41	564,0	9197	885,6

Çizelge 1'e göre toprakların pH değerleri 4,82 ile 8,10; tuz içerikleri % 0,018 ile % 0,074; kireç içerikleri % 0,12 ile % 4,28; organik madde içerikleri % 0,82 ile % 1,59; bitkilere yararışlı P içerikleri 10,85 mg kg⁻¹ ile 61,41 mg kg⁻¹ arasında, değişebilir K içerikleri 97,2 ile 564 mg kg⁻¹; değişebilir Ca değerleri 1724 ile 9197 mg kg⁻¹ ve değişebilir Mg içerikleri ise 140 ile 885,6 mg kg⁻¹ arasında değişmektedir. Elde edilen bulgulara göre topraklar genellikle nötr pH'da ve tuzsuz özelliktedir. Topraklar kireç kapsamı bakımından "az kireçli" sınıfına girmektedir. Toprakların organik madde kapsamı "yetersiz" düzeydedir. Toprakların yararışlı P, değişebilir K, Ca ve Mg kapsamı ise "yeterli" düzeydedir.

Toprak örneklerinin bitkilere yararılı bazı mikro besin elementi (Fe, Cu, Zn, Mn) içeriklerinin minimum ve maksimum değerleri aşağıdaki Çizelge 2’de verilmiştir.

Çizelge 2. Toprak örneklerinin yararılı bazı mikro besin elementi içerikleri, mg kg⁻¹

	Fe	Cu	Zn	Mn
Min	2,84	0,22	0,08	3,48
Max	17,41	3,22	2,05	56,14

Toprakların bitkilere yararılı Fe içerikleri 2,84 ile 17,41 mg kg⁻¹ arasında ve yeterli düzeydedir (Lindsay ve Norvell, 1978), yararılı Cu içerikleri 0,22 ile 3,22 mg kg⁻¹ arasında olup, bir örnek hariç yeterlidir (Lindsay ve Norvell, 1978), yararılı Zn içerikleri 0,08 ile 2,05 mg kg⁻¹ arasında ve çoğunlukla yetersiz düzeydedir (Lindsay ve Norvell, 1978), yararılı Mn içerikleri 3,48 ile 56,14 mg kg⁻¹ arasında ve üç örnek hariç yeterli düzeydedir (Lindsay ve Norvell, 1978).

3.2. Araştırma Alanı Topraklarının Bazı Ağır Metal İçerikleri

Toprak örneklerinin ağır metal analizi sonuçlarına göre ekstrakte edilebilir kadmiyum (Cd), kobalt (Co), krom (Cr), nikel (Ni) ve kurşun (Pb) içeriklerinin minimum ve maksimum değerleri Çizelge 3.’de görülmektedir.

Çizelge 3. Toprak örneklerinin bazı ekstrakte edilebilir ağır metal içerikleri, mg kg⁻¹

	Cd	Co	Cr	Ni	Pb
Min	0,005	0,011	0,044	0,360	1,212
Max	0,087	0,583	0,182	6,761	5,560

Araştırma alanı topraklarının ekstrakte edilebilir Cd içerikleri 0,005 mgkg⁻¹ ile 0,087 mgkg⁻¹ arasında değişmektedir. (Alloway, 1995)’ e göre yapılan değerlendirmede, toprakların % 100’ünde “izin verilebilir” düzeyde Cd bulunduğu gözlenmiştir. Bu durum Şekil 1’den de açıkça görülmektedir. Bu sonuç araştırma alanı topraklarında şimdilik bitkilere zarar verecek boyutta Cd kirliliğinin bulunmadığını göstermektedir.

Şekil 1. Araştırma alanı topraklarında belirlenen Cd kirliliği (%)

Araştırma alanı topraklarının ekstrakte edilebilir Co içerikleri $0,011 \text{ mgkg}^{-1}$ ile $0,583 \text{ mgkg}^{-1}$ arasında değişmektedir. (Carrigan ve Erwin, 1951)'e göre yapılan değerlendirmeye göre toprakların % 32,14'ünde "toksik", 67,86'sında "izin verilebilir" düzeyde Co bulunduğu gözlenmiştir. Bu sonuç ayrıca Şekil 2'den de görülmektedir. Bu bulgu araştırma alanı topraklarının 1/3'ünde bitkilere zarar verecek düzeyde Co bulunduğu belirlenmiştir. Bu durum yöredeki tarım alanlarında gerekli önlemler alınmazsa Co kirliliğinin daha da artabileceğini düşündürmektedir.

Şekil 2. Araştırma alanı topraklarında belirlenen Co kirliliği (%)

Araştırma alanı topraklarının ekstrakte edilebilir Cr içerikleri $0,044 \text{ mgkg}^{-1}$ ile $0,182 \text{ mgkg}^{-1}$ arasında değişmektedir. (Bowen, 1966)'ya göre yapılan değerlendirmede, toprakların %

100'ünde "izin verilebilir" düzeyde Cr bulunduğu gözlenmiştir (Şekil 3). Bu sonuç araştırma alanı topraklarında bitkilere zarar verecek boyutta herhangi bir Cr kirliliğinin bulunmadığını göstermektedir.

Şekil 3. Araştırma alanı topraklarında belirlenen Cr kirliliği (%)

Araştırma alanı topraklarında ekstrakte edilebilir Ni içerikleri $0,360 \text{ mgkg}^{-1}$ ile $6,761 \text{ mgkg}^{-1}$ arasında değişmektedir. (Gerendas ve ark 1999)'e göre toprakların % 100'ünde "izin verilebilir" düzeyde Ni bulunduğu gözlenmiştir. Bu durum ayrıca Şekil 4'de de görülmektedir. Bu durum araştırma alanı topraklarında şimdilik bitkilere zarar verecek boyutta Ni kirliliğinin bulunmadığını ancak gerekli önlemler alınmadığı takdirde ileriki yıllarda söz konusu tarım alanlarında Ni kirliliğinin de gündeme gelebileceğini göstermektedir. Çünkü bazı topraklarda yüksek değerlerde Ni belirlenmiştir.

Şekil 4. Araştırma alanı topraklarında belirlenen Ni kirliliği (%)

Araştırma alanı topraklarının ekstrakte edilebilir Pb içerikleri $1,212 \text{ mgkg}^{-1}$ ile $5,560 \text{ mgkg}^{-1}$ arasında değişmektedir. (Chapman, 1971)'e göre yapılan değerlendirmede toprakların % 42,85'inde "toksik", % 57,15'inde "izin verilebilir" düzeyde Pb bulunduğu gözlenmiştir (Şekil 5). Bu durum araştırma alanı topraklarının yaklaşık olarak yarıya yakınında bitkilere zarar verebilecek düzeyde Pb kirliliğinin bulunduğu belirlenmiştir.

Şekil 5. Araştırma alanı topraklarında belirlenen Pb kirliliği (%)

4. SONUÇ VE ÖNERİLER

Tarımsal üretim faaliyetinin yoğun olarak yapıldığı Edirne Merkez İlçeye bağlı Kemalköy, Yenikadın, Eskikadın ve Köşen Köyleri ile Yeniimaret, Yıldırım, Menzilahir, Şükrüpaşa ve Fatih Mahalleleri ile Havsa İlçesi Oğulpaşa, Söğütlüdere, Hasköy, Köseömer ve Bostanlı Köylerinden geçen Edirne-İstanbul TEM otoyolunun her iki kenarında yer alan tarım arazilerinden alınan toprak örneklerinde bazı analizler yapılmış ve aşağıdaki sonuçlar elde edilmiştir:

Toprak örneklerinin yarıya yakınında nötr reaksiyon tespit edilmiş olup, hafif asit ve hafif alkali reaksiyon sınıflamasına giren değerlerde de toplam oran nötr reaksiyona yakın olarak belirlenmiştir.

Araştırma alanı toprakları kireç kapsamlarına göre değerlendirildiğinde, büyük çoğunluğunun kireç içerikleri bakımından az kireçli grubuna girdiği gözlenmiş ve tarımsal üretim açısından kireç yönünden önemli bir sorunun olmadığı görülmüştür.

Araştırma alanı topraklarının tamamında organik madde miktarları yetersiz bulunmuştur. Bu sonuç, araştırma yapılan alanın tamamında çiftçilerin tarımsal üretimde organik gübrelere yeterince kullanmadıklarının bir göstergesidir.

Araştırma alanı topraklarının bitkilere yararlı fosfor miktarlarının yeterli ve yüksek düzeylerde olduğu belirlenmiştir. Çalışma yapılan arazilerde değişebilir potasyum içerikleri genelde yeterli düzeylerde tespit edilmiştir. Araştırma sahasında değişebilir Ca ve Mg miktarlarının yeterli ve yüksek düzeylerde olduğu belirlenmiştir.

Çalışma bölgesinde toprakların bitkilere yararlı Fe ve Cu miktarlarının yeterli olduğu görülmüştür. Araştırma alanı arazileri bitkilere yararlı Zn ve Mn içerikleri bakımından değerlendirildiğinde, toprakların önemli bir bölümünde bu elementlerin eksikliklerinin bulunduğu gözlenmiştir.

Araştırma bölgesinde, karayolu taşımacılığında kaynaklanan ağır metal kirlenmesi tespiti çalışmalarında yapılan analiz sonuçlarına göre Cd miktarı bakımından yapılan değerlendirmede, toprakların tamamında Cd içeriğinin henüz bitki, hayvan ve insan sağlığını tehdit edebilecek boyutlarda olmadığı belirlenmiştir.

Araştırma alanı topraklarında Co yönünden yapılan incelemede toprakların % 32,14'ünde Co kirliliği tespit edilmiştir. Mevcut Co kirliliği, Edirne şehir merkezi, Kapıkule sınır kapısının civarı ve köy yerleşimlerine yakın mevkilerden alınan toprak örneklerinde yoğunlaşmaktadır. Ayrıca araştırma alanlarında Co kirliliğinin tespit edildiği en yüksek değerin bulunduğu arazi Edirne ilinde uzun yıllardır kullanılmış bulunan şehir çöplüğüne yakın bir alandır. Bu durum mevcut Co kirliliğinin karayolu taşımacılığına ilave olarak yoğun yerleşimden ve mevcut çöplükten de kaynaklanmış olabileceğini düşündürmektedir.

Araştırma alanı toprakları Cr bakımından değerlendirildiğinde, toprakların tamamında Cr içeriğinin ekstrakte edilebilir sınır değeri olan 1 mgkg^{-1} 'in altında olduğu ve Cr kirliliğinin şimdilik söz konusu olmadığı saptanmıştır.

Araştırma sahası arazilerinin tamamında toprakların ekstrakte edilebilir Ni miktarları düşük düzeylerde tespit edilmiş ve toprakların Ni kirliliğinden şimdilik etkilenmediği gözlenmiştir. Bununla birlikte bazı topraklarda dikkate alınabilecek yüksek değerlerde Ni saptanmıştır.

Çalışma alanı toprakları Pb içeriklerine göre değerlendirildiğinde, toprakların % 42,85'inde, ekstrakte edilebilir kritik değer olan 4 mgkg^{-1} 'in üzerinde Pb tespit edilmiş olup, bu durum

karayolu taşımacılığında kaynaklanan Pb kirliliğinin mevcut olduğunu göstermektedir. Genel olarak Pb kirliliğinin yoğun olduğu araziler, TEM otoyolunun güney istikametinden yer almaktadır. Bu durum, hâkim rüzgâr yönü olan kuzey rüzgârlarının etkisiyle egzoz gazlarının güneye sürüklenerek tarım topraklarında çökme yoluyla güney tarım arazilerine Pb bulaşması sonucu Pb kirliliğinin ortaya çıkmış olabileceğini düşündürmektedir.

Sonuç olarak bu araştırmadan elde edilen bulgulara göre, Edirne İli TEM otoyolu kenarındaki tarım alanlarında Pb ve Co kirliliği mevcuttur. Topraklarda belirlenen bu ağır metal kirliliğinin bitkilere de bulaşmış olması muhtemeldir. Yörede ağır metal kirliliğinin artışının önlenmesi için gerekli yasal ve kültürel önlemler vakit geçirilmeden alınmalıdır.

ÖZET

Fabaceae (Baklagiller) familyasının *Trigonella* cinsinde yer alan çemen (*Trigonella foenum graecum* L.) önemli endüstri bitkileri arasında yer almaktadır. Bitkinin tohumları ve vejetatif aksamaları hayvancılıkta yem, gıda endüstrisinde baharat ve yağı kozmetik ürünlerde kullanılmaktadır. *Trigonella foenum graecum* L. ince saplı yapısı ve toprakta iyi çözünmesinden kaynaklı yeşil gübre bitkisi olarak da kullanılma potansiyeline sahiptir. Ayrıca tıbbi olarak da tüketilen önemli bir bitki türüdür. Materyalini Geçit Kuşağı Tarımsal Araştırma Enstitüsü Müdürlüğü adına tescil edilmiş “Çiftçi” çemen çeşidinin oluşturduğu çalışma Van Yüzüncü Yıl Üniversitesi Ziraat Fakültesi Tarla Bitkileri Bölümü İklim Odası’nda Tesadüf Parselleri Deneme Deseni’ne göre faktöriyel düzende kurulmuştur. Üç tekerrürlü yürütülen çalışmada bitkiler 25°C sıcaklık, 8/16 saatlik karanlık/aydınlık fotoperiyotta ve % 65 neme sahip olan ortamda 500cc’lik saksılarda yetiştirilmiştir. Çalışmada faktör olarak dört farklı yetiştirme ortamı (1. Ortam: tarla toprağı + %20 perlit, 2. Ortam: %50 tarla toprağı + %30 solucan gübresi + %20 perlit, 3. Ortam: %40 tarla toprağı + %40 solucan gübresi + %20 perlit, 4. Ortam: %30 tarla toprağı + %50 solucan gübresi + %20 perlit) ve dört tuz dozu konsantrasyonu (kontrol (0), 50, 100, 150 mM NaCl) kullanılmıştır. Yürütülen çalışmanın sonucunda renk değerleri (L*, a*, b*, Chroma ve Hue), yaprak alanı ve klorofil miktarları belirlenmiştir. Tuz dozu x Ortam interaksiyonunda istatistiksel olarak yaprak alanı, klorofil miktarı, b* değeri ve Hue değeri %1 düzeyinde, a* değeri ve Chroma değeri %5 düzeyinde önemli görülürken L* değeri önemsiz görülmüştür. Çalışmanın sonucunda, günümüzde önemli bir sorun olan tuzluluğa karşı, çiftçi çemen çeşidinde organik gübre olarak kullanılan solucan gübresinin bitki gelişimi, bazı fizyolojik parametreler ve renk değerleri üzerinde olumlu etkileri olduğu belirlenmiştir.

Anahtar Kelimeler: Çemen, Renk değerleri, NaCl, Vermikompost.

**DETERMINATION OF THE EFFECT OF SALT STRESS ON PLANT GROWTH
AND COLOR VALUES IN FENUGREEK (*Trigonella Foenum Graecum* L.) GROWN
IN MEDIUM CONTAINING DIFFERENT LEVELS OF VERMICOMPOST**

ABSTRACT

Fenugreek (*Trigonella foenum graecum* L.), which is in the *Trigonella* genus of the Fabaceae (Legumes) family, is among the important industrial plants. The seeds and vegetative parts of the plant are used in animal feed, food industry, spices and cosmetic products. *Trigonella foenum graecum* L. has the potential to be used as a green manure plant due to its thin-stemmed structure and high solubility in the soil. It is an important plant species that is also consumed medicinally. Study material is the "Çiftçi" fenugreek variety registered in the name of the Transitional Zone Agricultural Research Institute. The study was established in the factorial order according to the Random Plots Trial Design in Climate Room of Van Yüzüncü Yıl University, Faculty of Agriculture, Department of Field Crops. In the study carried out with three replications, the plants were grown in 500cc pots at 25°C temperature, 8/16 hour dark/light photoperiod and 65% humidity. In the research were used four different growing media (1st medium: field soil + 20% peat, 2nd medium: 50% field soil + 30% vermicompost + 20% perlite, 3rd medium: 40% field soil + 40% vermicompost + 20% perlite, 4. Medium: 30% field soil + 50% vermicompost + 20% perlite) and four salt dose concentrations (control (0), 50, 100, 150 mM NaCl). As a result of the study were determined of color values (L*, a*, b*, Chroma and Hue), leaf area and chlorophyll amounts. In the interaction of salt dose x medium, leaf area, chlorophyll amount, b* value and Hue value were statistically significant at the 1% level, a* value and Chroma value were significant at the 5% level, while L* value was insignificant. As a result of the study, it was determined that vermicompost, which is used as an organic fertilizer in çiftçi fenugreek variety, has positive effects on plant growth, some physiological parameters and color values against salinity, which is an important problem today.

Keywords: Fenugreek, Color values, NaCl, Vermicompost.

GİRİŞ

Çemen Fabales takımının, Fabaceae (Baklagiller) familyasının, *Trigonella* cinsinde yer almaktadır. Türkiye’de yaygın olarak *Trigonella foenum graecum* L. türü yetiştirilmektedir. Çemen bitkisinin vejetatif kısmı ve tohumları çeşitli amaçlar için kullanılmaktadır. Bitkinin yeşil aksamı, kuru otu ve tohumları yüksek yem verimi ve kalitesinden dolayı yem bitkisi olarak kullanılmaktadır. Tohumları öğütülerek gıdalara lezzet vermek ve gıdaları korumak için baharat olarak kullanılmaktadır. Bunlara ilaveten bitkinin tohumlarından elde edilen boya ve yağın çeşitli kozmetik ürünlerde kullanıldığı bilinmektedir. Çemen, ince saplı yapısı ve toprakta iyi çözünmesi nedeniyle iyi bir yeşil gübre bitkisidir. Bu özelliklerinin yanında, tıbbi ve aromatik bitkiler içerisinde önemli bir yere sahiptir. Öğütülmüş tohumunun toz halinde tüketilmesi ile insan sağlığı üzerinde kan şekerini ve kolestrolü düşürücü özelliği yapılan çalışmalarla kanıtlanmıştır. Çemen tohumunun tedavi edici özelliğinin, embriyosunda bulunan, steroidal yapılu bir saponin olan diosgeninden kaynaklandığı bilinmektedir. Diosgenin kortikosteroidlerin sentezi için değerli bir maddedir. Çemen bitkisinden halk hekimliğinde ise, sindirimi kolaylaştırıcı, süt artırıcı, balgam söktürücü, ateş düşürücü, boğaz ağrısı giderici, yara iyileştirici olarak faydalanılmaktadır (Gökçe ve Efe, 2016).

Hem insan sağlığını hem de çevre güvenliğini riske atan, toprak kalitesini düşüren, patojen dayanıklılığını arttıran yoğun agro-kimyasal kullanımı doğal kaynakların güvenliği konusunda oldukça ciddi endişelere sebep olmuştur. Tüm bunlar, bilim adamlarını ve karar vericileri, biyolojik gübre ve pestisit olarak etkili organik ürünler kullanımını hedefleyen sürdürülebilir tarımsal üretim sistemlerinin geliştirilmesine yöneltmiştir. Bu alanda, her bakımdan toprak kalitesini arttıran aerobik kompost ve vermikompost ürünleri çok büyük önem kazanmıştır (Şimşek Erşahin, 2007).

Tuzluluk sorununun olduğu tarımsal üretimde etkin olarak kullanılmayan alanlarda toprak yapısını iyileştirici organik maddelerin kullanımının çözüm noktasında ön plana çıktığı görülmektedir. Tuzluluğun yanı sıra organik maddece fakir olan alanlarda verimliliği ve sürekliliği sağlama açısından da önemli bir girdi olduğu bilinmektedir. Bu noktada vermikompost, humik asit gibi organik maddelerin kullanımına yönelik çalışmalar yapılmış ve bitkilerin stres fizyolojisi üzerinde olumlu etkileri olduğu bilimsel araştırmalar ile ortaya konmuştur (Kıran, 2019; Benazzouk ve ark., 2020; Tunçtürk ve ark., 2020; García-Galindo ve ark., 2021, Şelem ve ark., 2021). Solucan gübresi ile organik materyallerin birlikte kullanılmasıyla elde edilen vermikompostun ürün verimi ve besin elementi alımı üzerine olumlu etkileri olduğu bildirilmiştir (Garg et al., 2010; Küçükyumuk ve ark., 2014).

Vermikompost içerdiği makro ve mikro yararlı elementler bakımından da toprak düzenleyicisi olarak büyük yarar sağlamaktadır (Bellitürk, 2016).

Yürütülen çalışmada farklı vermikompost oranlarının çemen bitkisinde klorofil, yaprak alanı ve renk değerleri üzerindeki etkisinin incelenmesi amaçlanmıştır.

MATERYAL VE YÖNTEM

Materyalini Geçit Kuşağı Tarımsal Araştırma Enstitüsü Müdürlüğü adına tescil edilmiş çiftçi çemen çeşidinin oluşturduğu çalışma Van Yüzüncü Yıl Üniversitesi Ziraat Fakültesi Tarla Bitkileri Bölümü İklim Odası' nda Tesadüf Parselleri Deneme Deseni' ne göre faktöriyel düzende kurulmuştur. Üç tekerrürlü yürütülen çalışmada bitkiler 25°C sıcaklık, 8/16 saatlik karanlık/aydınlık fotoperiyotta ve % 65 neme sahip olan ortamda 500cc'lik saksılarda yetiştirilmiştir. Çalışmada faktör olarak dört farklı yetiştirme ortamı (1. Ortam: tarla toprağı + %20 perlit, 2. Ortam: %50 tarla toprağı + %30 solucan gübresi + %20 perlit, 3. Ortam: %40 tarla toprağı + %40 solucan gübresi + %20 perlit, 4. Ortam: %30 tarla toprağı + %50 solucan gübresi + %20 perlit) ve dört tuz dozu konsantrasyonu (kontrol (0), 50, 100, 150 mM NaCl) kullanılmıştır. Tohumlar 31.08.2020 tarihinde ekilmiştir. Denemede farklı konsantrasyonlara sahip tuz (NaCl) solüsyonları bitkilerin 10-15 cm olduğu dönemde uygulanmıştır. İlk tuz dozları 14. 10. 2020 tarihinde uygulanmış ve üçer gün arayla toplamda beş uygulama olacak şekilde yapılmıştır. Çalışma 26.10.2020 tarihinde gerekli ölçüm ve gözlemler yapılmak üzere sonlandırılmıştır. Çalışmada kullanılan torfa ait özellikler; pH 6, 160-260 mg/L N, 180- 280 mg/L P₂O₅, 200- 150 mg/L K₂O₅, 80- 150 mg/L Mg, % 0.8 N, % 70 organik madde, % 35 C şeklindedir. Çalışmada kullanılan toprak killi kumlu tın tekstür yapısında, pH alkali reaksiyonlu (8.18), kireçli (% 17.9) olup organik madde (% 1.17), tuz oranı (% 0.021), yararlı fosfor içeriğı (6.70 ppm) ve azot içeriğı (0.049 me/100g) ile potasyum (488 ppm) miktarı belirlenmiştir.

Yaprak alanı Easy Leaf Area programı kullanılarak ölçülmüştür. Klorofil miktarlarının ölçümü taşınabilir özellikte olan Dualex Scientific+™ cihazı ile gerçek zamanlı ve tahribatsız olarak yapılmıştır.

Renk değerleri Minolta CR-400 (Osaka, Japan) marka renk ölçer ile L* , a* , b* C ve Hue° açı değeri olarak ifade edilmiştir. L* açıklık ((L*=0 siyah ve L*=100 beyaz), a* kırmızı/yeşil (+a* kırmızı, - a* ise yeşil), b* sarı/mavi (+b* sarı, -b* mavi), Chroma canlılık veya matlık, Hue ise algılanan renk ve rengin ismini belirleyen değerlerdir (Anonim, 2021).

Şekil 1. L*, a*, b*, Chroma ve Hue değerinin renk aralığı (Anonim, 2021).

Elde edilen verilerin hesaplanması COSTAT (6.3 versiyonu) bilgisayar analiz programı kullanılarak yapılmış olup önemli çıkan uygulamalar Duncan Çoklu Karşılaştırma Yöntemi' ne göre karşılaştırılmıştır.

BULGULAR VE TARTIŞMA

Bitki gelişimi üzerinde olumlu etkisi olduğu bilinen solucan gübresinin, farklı tuz dozlarında yetiştirilen çemen bitkisinin bazı morfolojik, fizyolojik ve renk özelliklerinde meydana getirdiği değişimler Tablo 1 ve Tablo 2' de verilmiştir.

Yaprak alanında tuz ve solucan gübresi dozları arasındaki farkın istatistiksel olarak %1 düzeyinde önemli olduğu belirlenmiştir. Yaprak alanı artan tuz stresine paralel olarak azalış göstermiş olup en yüksek değer kontrol grubundan 2.0 cm² en düşük değer ise T3 uygulamasından 1.46 cm² olarak alınmıştır. Farklı solucan gübresi miktarlarının kullanıldığı ortamlarda ise en yüksek yaprak alanı 1.98 cm² ile O2 ortamından elde edilmiştir.

Klorofil miktarında tuz ve solucan gübresi dozları arasındaki farkın istatistiksel olarak %1 düzeyinde önemli olduğu belirlenmiştir. Klorofil miktarında en yüksek değer kontrol ile aynı duncan grubunda yer alan T1 uygulamasından sırasıyla 38.43 ve 38.57 dualeks indeksi olarak alınmıştır. Farklı solucan gübresi miktarlarının kullanıldığı ortamlarda ise Klorofil miktarında en yüksek değer 40.76 dualeks indeksi ile O2 ortamından elde edilmiştir.

Tablo 1. Farklı ortam ve tuz dozlarında yetiştirilen çemen bitkisinde yaprak alanı ve klorofil miktarı.

*P<0.05 düzeyinde, ** P<0.01 düzeyinde önemli olup, ortalamalar arasındaki fark Duncan çoklu karşılaştırma metoduyla P<0.05 seviyesinde değerlendirilmiştir.

Yapılan renk ölçümlerinin sonucunda tuz dozlarının tüm renk parametrelerinde istatistiksel olarak önemli olmadığı görülmüştür. Renk değerlerinden olan L* değerinin uygulamalardaki farkının istatistiksel olarak önemsiz olduğu görülmüştür. Yapılan istatistik analizinin sonucunda a* değerinin ortam ile ortam x tuz interaksyonunun %5 düzeyinde önemli olduğu belirlenmiştir. Ortamlarda en yüksek a*değeri -9.96 ile O1'den en düşük değer ise aynı duncan grubunda yer alan O2, O3 ve O4 ortamlarından elde edilmiştir. b* renk değerinde ortam ve ortam x tuz interaksyonunun %1 düzeyinde önemli olduğu görülmüştür. Farklı solucan gübresi

International Conference on Global Practice of Multidisciplinary Scientific Studies-IV
Turkish Republic of Northern Cyprus, April 28-30, 2023

miktarlarının kullanıldığı ortamlarda en yüksek b* renk değeri aynı duncan grubunda yer alan O3 (17.37) ve O4 (17.78) ortamlarından alınırken, en düşük değer ise solucan gübresinin olmadığı O1 (13.80) ortamından elde edilmiştir. Chroma renk değerinin ortamlar arasındaki farkı %1 düzeyinde önemli görülürken ortam x tuz dozu uygulamaları interaksyonunda %5 düzeyinde önemli görülmüştür. Farklı ortamlarda en yüksek chroma renk değeri aynı duncan grubunda yer alan O3 (20.63) ve O4 (21.43) ortamlarından alınırken, en düşük değer ise solucan gübresinin olmadığı O1 (17.14) ortamından elde edilmiştir. Hue değerinde ortamlar arası fark istatistiksel olarak %5, ortam x tuz dozu interaksyonu ise %1 düzeyinde önemli görülmüştür. Farklı ortam uygulamalarında en yüksek değer aynı Duncan grubunda yer alan O1, O2 ve O3 uygulamalarından elde edilirken en düşük değer O4 uygulamasından elde edilmiştir.

Tuzluluk ülkemiz topraklarında karşılaşılan en önemli sorunlardan biridir. Yağış oranının az ve buharlaşmanın fazla olduğu, kurak ve yarı kurak bölgelerde tuzluluk doğal olarak bulunmakta, sulanan alanlarda ise aşırı sulamayla oluşmaktadır (Keser ve ark., 2009). Tuz stresi bitkilerde stomaların kapanması, klorofilin yapısının değişmesi ve fotosentetik mekanizmasının bozulmasına neden olarak fotosentetik aktiviteyi olumsuz etkilemektedir (Çulha ve Çakırlar, 2011). Shahid ve ark. (2011) farklı bezelye genotiplerinde NaCl stresinin bitkilerin klorofil içeriklerini azalttığını belirlemiştir. Kaymak ve Acar (2020), orman üçgölünde topraktaki tuz yoğunluğu arttıkça yapraklardaki klorofil a ve klorofil b miktarının azaldığını vurgulamıştır. Önal Aşçı ve Zambı, (2020)'de çalışmamıza benzer şekilde arta tuz stresinin klorofil miktarında düşümlere sebep olduğunu belirtmiştir. Araştırma sonuçlarımız, tuz stresine maruz kalan bitkilerde stomaların kapalı olduğu, bünyelerindeki nemi asgariye indirmek için yaprak alanlarının küçüldüğü (Yaşar, 2003), aspir ve yerfıstığı bitkilerinde tuz stresi uygulamalarında artan tuz konsantrasyonlarına bağlı olarak yaprak alanında azalmaların olduğu belirlenmiş (Kara ve ark., 2019; Yolci ve ark., 2021) ve çalışmamızla uyum içerisinde olduğu tespit edilmiştir. Araştırmacılar renk değerlerinin farklı bitkilerde ve uygulamalarda değişiklik gösterdiğini ortaya koymuştur (Dadali ve ark., 2007; Tekin ve Çavuşoğlu, 2018, Şelem ve ark., 2021). Yürütülen çalışmada yeşil renge sahip olan çemen bitkisi yapraklarının tuz uygulamalarından kaynaklı renk parametrelerinde değişimin olmadığı belirlenmiştir. Ortam uygulamalarında rengin ismini belirleyen değerin istatistiksel olarak önemli olduğu görülmüştür.

SONUÇ

Tüm dünyada önemi gün geçtikçe artan tıbbi ve aromatik bitkiler ülkemiz için de önem kazanmaktadır. Türkiye, tıbbi ve aromatik bitkiler üretimi bakımından, iklim ve zengin bitki çeşitliliği bulundurması nedeniyle önemli bir potansiyele sahiptir. Çemen bitkisi birçok kullanım alanına sahip ve ülkemiz ekolojisinde kolaylıkla yetiştirilebilecek bir bitki olmasına rağmen, ülkemizde üretimi ve ihracatı istenilen seviyelere ulaşamamıştır. Üretimin ve buna bağlı olarak da çemen ihracatının artırılması için, bu bitkinin tanıtımına önem verilmeli, kullanım alanları genişletilmeli ve halkımızın tüketim alışkanlıkları içinde daha fazla yer edinmesi sağlanmalıdır. Çemen bitkisinden elde edilen ürünlerin standartlarının iyileştirilmesi ve en iyi yetiştirme koşullarının saptanması da bu bitkinin önemini giderek artıracaktır.

ÖZET

Yürütülen bu çalışmada doğal olarak yetişen *Colchicum szovitsii* Fisch. Et Mey. ve *Colchicum kurdicum* (Bornm.) Stef. türlerinin morfo-anatomik özellikleri belirlenmiştir. Van ilinde yapılan flora çalışmasından elde edilen örnekler morfo-anatomik olarak karşılaştırılmıştır. Materyalini *Colchicum szovitsii* ve *Colchicum kurdicum* türlerinin oluşturduğu çalışmada bitki yaprak boyu, yaprak eni, stoma boyu, stoma eni, stoma orta açıklığı ve stoma yoğunluğu belirlenmiştir. Stoma ölçüm ve sayımları yaprağın üst ve alt yüzeyinden ayrı ayrı yapılmış ve alt yüzeydeki değerlerin üst yüzeyden daha yüksek olduğu görülmüştür. Stoma boyu, *Colchicum kurdicum* türünde alt yüzeyde $59.35 \pm 3.54 \mu\text{m}$ üst yüzeyde $48.25 \pm 0.88 \mu\text{m}$ iken *Colchicum szovitsii* türünde sırasıyla $48.84 \pm 2.10 \mu\text{m}$ ile $40.12 \pm 1.82 \mu\text{m}$ olarak tespit edilmiştir. *Colchicum kurdicum* ile *Colchicum szovitsii* türlerinde alt yüzeydeki orta açıklık ve stoma yoğunluğunun üst yüzeydekinden daha yüksek çıktığı belirlenmiştir. Stoma eninin ise iki türde de üst yüzeyde daha yüksek olduğu saptanmıştır. Yaprak boyunun *Colchicum kurdicum* ve *Colchicum szovitsii* türlerinde sırasıyla $6.33 \pm 1.75 \text{ cm}$ ve $2.90 \pm 0.26 \text{ cm}$ olduğu belirlenmiştir. Yaprak eninin ise *Colchicum kurdicum* türünün (5.5 ± 1.73) *Colchicum szovitsii* (0.76 ± 0.25) türünden daha yüksek değere sahip olduğu ortaya konmuştur.

Anahtar Kelimeler: Geofit, Acı çiğdem, Stoma, Van.

MORPHO-ANATOMICAL OBSERVATIONS ON *Colchicum Szovitsii* Fisch. Et Mey.
And *Colchicum Kurdicum* (Bornm.) STEF. IN VAN REGION

ABSTRACT

In this study, the morpho-anatomical properties of *Colchicum szovitsii* Fisch. Et Mey and *Colchicum kurdicum* (Bornm.) Stef. species were determined. Samples obtained from the flora study in Van region were compared morpho-anatomically. In the study, which used of *Colchicum szovitsii* and *Colchicum kurdicum* species, determined plant leaf height, leaf width, stomatal length, stomatal width, stomatal opening and stomatal density. Stoma measurements and counts were made separately from the upper and lower surfaces of the leaf, and it was observed that the values on the lower surface were higher than the upper surface. Stoma length was determined as $59.35 \pm 3.54 \mu\text{m}$ on the lower surface and $48.25 \pm 0.88 \mu\text{m}$ on the upper surface in *Colchicum kurdicum* species, while it was $48.84 \pm 2.10 \mu\text{m}$ and $40.12 \pm 1.82 \mu\text{m}$ in *Colchicum szovitsii* species. In *Colchicum kurdicum* and *Colchicum szovitsii* species, it was determined that the middle opening and stoma density on the lower surface were higher than those on the upper surface. Stoma width was found to be higher on the upper surface in both species. Leaf length was determined as $6.33 \pm 1.75 \text{ cm}$ and $2.90 \pm 0.26 \text{ cm}$ in *Colchicum kurdicum* and *Colchicum szovitsii* species, respectively. Leaf width was found to be higher in *Colchicum kurdicum* (5.5 ± 1.73) than *Colchicum szovitsii* (0.76 ± 0.25).

Keywords: Geophyte, Bitter crocus, Stoma, Van.

GİRİŞ

Acı çiğdem, Zambakgiller (Liliaceae) familyasına ait otsu ve kormlu yapıda olan çok yıllık bitkilerdir. Son yıllarda yapılan çalışmalarda tüm dünyada 99 civarında türün doğal yayılış gösterdiği ve bununla birlikte 49 tür ile Türkiye florasının ana gen merkezi olduğu kabul edilmektedir (Kaya, 2011). Türkiye’de doğal olarak yayılış gösteren yaklaşık 50 adet acı çiğdem türünün 22 tanesi endemiktir (Güner ve ark., 2002). Cinsine ait türlerin bir kısmı ilkbaharda çiçek açarken bir kısmı da son baharda çiçek açmaktadır. Çalışma materyalini oluşturan türlerin ilkbaharda çiçek açtığı bilinmektedir (Kulaksız-Pişkin, 2022). Colchicum türleri zehirli alkaloidler içermelerinden dolayı insan ve hayvan sağlığı açısından çok tehlikeli bitkilerdir (Yaldız ve ark., 2010). Acı çiğdem türlerinin içerdiği en önemli alkaloid kolşisin (colchicine, C₂₂H₂₂NO₆)’dir. Liliaceae familyasındaki Colchicum cinsine ait bitkilerin tedavi edici etkileri yüzyıllar öncesine dayanmakta olup Dioscorides, Galen ve Tralesli İskender gibi birçok Yunan hekiminin tedavide kullandıkları kaydedilmiştir (Suhail ve ark. 2017).

Antik çağlardan beri bilinen biyolojik aktif bileşenlerden biri olan kolşisin Colchicum türlerinde doğal olarak bulunmaktadır (Ebadi 2006). Kolşisin ilk kez 1820’de Colchicum autumnale L. türünden Pelletier ve Caventou tarafından izole edilmiştir (Pandey ve Banik 2012; Kavita 2021). Kolşisin, bitki ve hayvanlarda hücre bölünmesi üzerine güçlü inhibitör etki göstermektedir. Metafaz evresinin durdurulmasıyla hücre bölünmesi tamamlanamamakta ve antikanser etki ortaya çıkmaktadır (Akhtar ve ark. 2018; Molkova ve ark. 2022). Kolşisin’in antimitotik ve antiinflamatuvar aktivite göstermesinden dolayı, kolşisin terapötik olarak gut artriti, ailevi Akdeniz ateşi, Behçet hastalığı, osteoartrit, çeşitli kardiyovasküler hastalıklar ve farklı kanser türlerinde kullanılmaktadır Türkiye’de preparatları olarak kolşisin ve türevlerinden hazırlanan ColchicumDispert®, Kolsin®, MuscoRil®, Muscoflex®, Adeleks®, Thiospa® bulunmaktadır (Kayaalp 2002; Kavalalı 2014; Ergül ve Bakar-Ateş 2021). İzole edilen Colchicum alkaloidleri *C. szovitsii* türü için Kolşisin ve 2-demetilkolşisin (Rocchetti ve ark. 2019) iken *C. kurdicum* türü için Kolşisin, Kolşikozit 2-demetilkolşikozit, 2-demetilkolşisin, Kolşifolin, Demekolsin, N-deasetil-N-formilkolşisin ve 3-demetilkolşisin’dir (Azadbakht ve ark. 2020a, b). Ülkemizde yetişen Colchicum türleri üzerinde yapılan aktivite çalışmalarında *C. szovitsii* türünün analjezik aktivite, antimikrobiyal aktivite ve aitotoksik aktivite (Heidari ve ark. 2005; Türker ve Usta 2008)gösterdiği, *C. kurdicum* türünün ise antiinflamatuvar aktivite, antioksidan aktivite, sitotoksik aktivite ve hemolitik aktivite gösterdiği ortaya konmuştur (Azadbakht ve ark. 2020a, b).

Bitkilerdeki içsel su düzeninin kurulmasında yapraklarda bulunan stomalar önemli rol oynamaktadır. Stomalar, bitkilerin daha çok yaprak epidermisinde bulunan çok ufak

gözenekciklerdir. Stomaların büyüklükleri ve yoğunluklarının, bitkilerin tür ve çeşidi ile yetiştirme koşullarına göre farklılık gösterdiği yapılan çalışmalarla ortaya konulmuştur (Yanmaz ve Eriş, 1984; Eriş, 1998; Çağlar ve ark., 2004; Ilgın ve Çağlar, 2009). Araştırmacılar stomaların sayısı ve biyometrik özelliklerinin, tür ve çeşitlerin kuraklığa direncinin artırılmasında kullanılabileceğine dikkat çekmektedir (Scienza ve Boselli, 1981; Forlani ve ark., 1983). Benzer şekilde kültür bitkilerinde çeşitlere ve yetiştirme koşullarına göre bitki-su dengesinin kontrolü açısından stoma yoğunluğu ve yapılarının saptanmasının önemli bir konu olarak görülmektedir (Çağlar ve ark. 2004). Farklı bitki tür ve çeşitlerinin stoma yoğunluk ve büyüklükleri ile ilgili dünyada ve ülkemizde çeşitli araştırmalar yapılmıştır (Hassan ve ark. 2008; Gokbayrak ve ark. 2008; Aslantaş ve Karakurt 2009; Kurt ve Doğan, 2020; Şelem ve ark., 2020a,b).

Dünyada giderek artan su açığı özellikle kurak ve yarıkurak bölgelerde bitkisel üretimde fotosentez ve üretkenliği sınırlayıcı en önemli faktör olarak karşımıza çıkmaktadır. Bütün bitkilerde olduğu gibi geofitlerde de su stresine karşı geliştirilmiş kuraklık dirençli hat ve çeşitlerin kullanılması üreticiler tarafından arzu edilmektedir. Araştırmacılar kurağa dayanıklılık bakımından stoma yoğunluğu ve stoma boyutlarının seleksiyon kriteri olarak değerlendirilebileceğini bildirmişlerdir (Venora ve Calcagno, 1991; Maghsoudi ve Maghsoudi, 2008; Mehri ve ark., 2009). Bu çalışma ile Türkiye florasında doğal olarak yetişen ve ilkbaharda çiçeklenen *Colchicum szovitsii* Fisch. Et Mey. ve *Colchicum kurdicum* (Bornm.) Stef. türlerinin morfo-anatomik özelliklerinin belirlenmesi amaçlanmıştır.

MATERYAL VE YÖNTEM

Van ilinde yapılan flora çalışmasından elde edilen örnekler morfo-anatomik olarak karşılaştırılmıştır. Materyalini *Colchicum szovitsii* ve *Colchicum kurdicum* türleri oluşturmaktadır.

Bitkilerden alınan çiçek ve yaprak örnekleri analizlerin için Tarla bitkileri bölümüne ait Fizyoloji ve Sitoloji laboratuvarlarına taşınmıştır. Bitkilerden alınan yaprak örnekleri stoma analizleri için Tarla Bitkileri Bölümü'ne ait Fizyoloji ve Sitoloji Laboratuvarları'na taşınmıştır. Polen Leica DM500 ışık mikroskobu, mikroskoba bağlı Leica ICC50 HD kamera ile Leica LAS EZ (versiyon 3.0) yazılımı kullanılmıştır. Alana düşen stoma sayısı mm² 'lik alana düşen sayı olarak belirlenirken stoma boyu, stoma eni ve stoma orta açıklığı µm olarak belirlenmiştir.

BULGULAR VE TARTIŞMA

Çalışmada kullanılan *Colchicum* türlerine ait yaprak boyu ve eni farklılıklar göstermiş olup bu değerler sırasıyla *C. szovitsii* türünde 2.9 cm ve 0.76 cm, *C. kurdicum* türünde 6.33 ve 5.5 cm olarak tespit edilmiştir (Tablo 1.).

Tablo 1. *Colchicum kurdicum* ve *Colchicum szovitsii* türlerinin yaprak boyu ve eni.

	Yaprak boyu (cm)	Yaprak eni (cm)
<i>Colchicum kurdicum</i>	6.33±1.75	5.5±7.73
<i>Colchicum szovitsii</i>	2.9±0.26	0.76±0.25

Yapraktan alt ve üst yüzeyli olarak yapılan stoma ölçüm ve sayımlarının her iki türde de farklılar gösterdiği belirlenmiştir. *Colchicum kurdicum* türünde yaprak alt ve üst yüzeyli stoma ölçümlerinde tüm parametreler açısından yaprak alt yüzeyinin daha yüksek değerlere sahip olduğu görülmüştür. Stoma boyu, eni, orta açıklığı ve yoğunluğunun *Colchicum kurdicum* türünde alt ve üst yüzeylerinin sırasıyla 59.35-48.25 µm, 31.50-43.55 µm, 9.97-7.27 µm ve 127.33-94.00 adet/mm² olduğu tespit edilmiştir.

Tablo 2. *Colchicum kurdicum* türünde yaprak alt ve üst yüzeyli stoma ölçüm ve sayımları

	Stoma boyu (µm)	Stoma eni (µm)	Orta açıklık (µm)	Yoğunluk (adet/mm ²)
Alt yüzey	59.35±3.54	31.50±0.85	9.97±0.39	127.33±2.51
Üst yüzey	48.25±0.88	43.55±1.09	7.27±0.91	94.00±4.58

Colchicum szovitsii türünde ise stoma boyu, orta açıklık ve stoma yoğunluğu alt yüzeyde daha yüksek iken stoma eninin üst yüzeyde daha yüksek olduğu belirlenmiştir. Yaprak alt yüzeyinde stoma boyu, stoma eni, orta açıklık ve yoğunluk sırasıyla 48.84 µm, 29.28 µm, 3.96 µm ve 102.66 adet/mm² iken üst yüzeyde 40.12 µm, 36.18 µm, 3.04 µm ve 96.66 adet/mm² olarak tespit edilmiştir.

Tablo 3. *Colchicum szovitsii* türünde yaprak alt ve üst yüzeyli stoma ölçüm ve sayımları

	Stoma boyu (µm)	Stoma eni (µm)	Orta açıklık (µm)	Yoğunluk (adet/mm ²)
Alt yüzey	48.84±2.10	29.28±2.23	3.96±0.15	102.66±2.98
Üst yüzey	40.12±1.82	36.18±2.00	3.04±0.33	96.66±5.50

Yapılan çalışmalarda; stoma yoğunluğunun kuraklıktan etkilendiği, miktarında düşüşlerin olduğu, aynı zamanda stoma yoğunluğundaki azalmaların kuraklık direncini artırabileceği ve fotosentetik kapasiteyi etkileyebileceği bildirilmiştir (Franks ve ark., 2015; Yang ve ark., 2017). Bazı araştırmacılar, stoma sayısı ve boyutlarının yaprağın alınma konumu(güneş/gölge), sulama, çevre koşulları ve gübreleme gibi uygulamalardan kaynaklı farklılık gösterdiğini belirtmişlerdir (Eriş ve Soylu, 1990, Marasalı ve Aktekin,2003, Doğan ve ark., 2020). Pektaş (2007) yaptığı çalışmada stomaların adaptasyon açısından önemli olduğunu ve geofitlerdeki aynı cinsteki türlerinde stoma boyutlarının farklılıklar gösterdiğini vurgulamıştır. 2x ve 4x kromozom sayısına sahip genotiplerde ploidi ilgili yapılan çalışmalarla stoma boyutları belirlenmiş ve

tetraploid bitkilerin stoma boyutlarında artışla birlikte birim alandaki stoma sayısında azalma meydana geldiğini bildirmişlerdir. stoma boyutlarındaki artışa bağlı olarak yoğunluğunda azalışlar kaydedilmiştir. (Sinski ve ark. 2014; Kara ve Yazar, 2020).

SONUÇ

Stoma ölçüm ve sayımları yaprağın üst ve alt yüzeyinden ayrı ayrı yapılmış ve alt yüzeydeki değerlerin üst yüzeyden daha yüksek olduğu görülmüştür. Stoma boyu, *Colchicum kurdicum* türünde alt yüzeyde $59.35 \pm 3,54 \mu\text{m}$ üst yüzeyde $48.25 \pm 0.88 \mu\text{m}$ iken *Colchicum szovitsii* türünde sırasıyla $48.84 \pm 2.10 \mu\text{m}$ ile $40.12 \pm 1.82 \mu\text{m}$ olarak tespit edilmiştir. *Colchicum kurdicum* ile *Colchicum szovitsii* türlerinde alt yüzeydeki orta açıklık ve stoma yoğunluğunun üst yüzeydekenden daha yüksek çıktığı belirlenmiştir. Stoma eninin ise iki türde de üst yüzeyde daha yüksek olduğu saptanmıştır. Yaprak boyunun *Colchicum kurdicum* ve *Colchicum szovitsii* türlerinde sırasıyla $6,33 \pm 1.75 \text{ cm}$ ve $2,90 \pm 0.26 \text{ cm}$ olduğu belirlenmiştir. Yaprak eninin ise *Colchicum kurdicum* türünün ($5,5 \pm 1.73$) *Colchicum szovitsii* ($0,76 \pm 0.25$) türünden daha yüksek değere sahip olduğu ortaya konmuştur.

ÖZET

Yoğun üretim sisteminin benimsendiği kanatlı hayvan sektöründe uzun yıllar boyunca antibiyotikler yem katkı maddesi olarak kullanılmıştır. Antibiyotiklerin insan sağlığı üzerine olan zararlı etkilerin anlaşılması ve tüketicilerin satın alma davranışlarındaki farklılaşma sebebiyle alternatif yem katkı maddesi arayışları başlamıştır. Alternatif yem katkı maddelerinden birisi de tıbbi aromatik bitkilerdir. Moringa oleifera üzerinde durulan tıbbi aromatik bitkilerden birisi olup; içerdiği biyoaktif bileşenler dışında protein bakımından zengindir. Moringa steroller, terpenoidler, flavonoidler, fitokimyasallar açısından zengin olmakla birlikte, tanen ve diğer antibesleme faktörlerini çok az miktarda içermesi sebebiyle de kanatlı hayvan sektörü için alternatif bir yem katkı maddesidir. Bu derlemede Moringa oleifera'nın yumurta tavuklarının beslenmesinde kullanımı ile ilgili araştırmalar incelenmiştir.

Anahtar Kelimeler: Moringa oleifera, Besleme, Yumurta tavuğu

THE USE OF MORINGA OLIEIFERA IN THE NUTRITION OF LAYING HENS

ABSTRACT

Antibiotics have been used as feed additives for many years in the poultry sector, where intensive production system has been adopted. Due to the understanding of the harmful effects of antibiotics on human health and the differentiation in the purchasing behavior of consumers, the search for alternative feed additives has begun. One of the alternative feed additives is medicinal aromatic plants. Moringa oleifera is one of the medicinal aromatic plants focused on. The bioactive components contained in moringa are rich in other proteins and crude cellulose. Moringa sterols, terpenoids, flavonoids, phytochemicals, although Rich in tannins and other factors antibesleme contain a very small amount of a feed additive in poultry industry due to the alternative. In this review, the researches related to the use of Moringa oleifera in the nutrition of laying hens were examined.

Keywords: Moringa oleifera, Feeding, Laying hens

GİRİŞ

Son yıllarda yem katkı maddesi olarak hayvan beslemede antibiyotiklerin yasaklanması üzerine, onların yerine ikame edilecek yeni inovatif yem katkıları arayışları başlamıştır. Fitojenik yem katkıları, fitobiyotikler, tıbbi ve aromatik bitkiler, bitki ekstraktları, eterik yağlar bu gruba girmekte olup, çiftlik hayvanlarının verim performanslarını iyileştirmede öncülük edebilecek sonuçlar elde edilmiştir. (Moreno-Mendoza ve ark., 2021). Bunlar içerdikleri fitokimyasallar ile antioksidan, antiinflamatuvar, antimikrobiyal, antibakteriyel, antelmintik, koksidiyostatik, antiviral ve immünomodülatör gibi özellik göstermektedirler (Kikusato, 2021; Ullah ve ark., 2022). Son yıllarda üzerinde durulan bitkilerden bir tanesi de *M. Oleifera*'dır.

M. oleifera, Moringaceae familyasından olup yaygın isimleri arasında moringa, baget ağacı, yaban turpu ağacı, ben yağı ağacı, benzoil ağacı veya mucize ağacı diye adlandırılmaktadır. *M. oleifera* ağacı Güney Asya'ya, özellikle Hindistan, Sri Lanka, Pakistan, Bangladeş, Afganistan'a özgüdür. *M. oleifera*'nın tohumu ve yaprakları gıda endüstrisinde yaygın olarak kullanılmaktadır. *M. oleifera*'nın, yapraklarının besleyici değerinin yüksek olduğu için hayvanların beslenmesinde kullanılmaktadır. *M. oleifera*'nın yaprakları, diğer temel besinlerin yanı sıra önemli bir vitamin B kompleksi, C vitamini, beta-karoten olarak A vitamini, K vitamini, manganez ve protein kaynağı olan en besleyici kısmıdır. Yaprakları antimikrobiyal özelliklere sahiptir ve yağ, protein, vitamin ve mineraller açısından zengindir. *M. oleifera*'nın yapraklarından elde edilen ekstraktlar, kan lipid metabolizması üzerinde etkileri olabilecek düşük miktarda polifenol içerir. *M. oleifera*, kümes hayvanlarında bir mikro besin kaynağı ve besin takviyesi olarak kullanılabilir. Ek olarak, *M. oleifera* yaprak tozu, yapraklarda farklı fitokimyasalların (quercetin, kaempferol vb.) varlığından dolayı antimikrobiyal, antifungal, bağışıklık güçlendirici, anti tümör ve karaciğer koruyucu olarak kullanılmaktadır (Mahfuz ve Piao, 2019).

M. oleifera'nın tıbbi kullanımını dışında hayvanlar için yem materyali olması, tohumundan yağ elde edilmesi, lif kaynağı gibi sayısız kullanımı, biyolojik ve ekonomik olasılıkları, özellikle de içerdiği biyoaktif bileşenler üzerinde daha fazla araştırmayı gerektirmektedir

Bu derlemede, yumurtacı kanatlıların beslenmesinde kullanılan moringa bitkisi ve ondan elde edilen ürünlerin söz konusu hayvanlar üzerindeki etkileri ele alınmıştır.

Moringa Yapraklarının Besin Madde Kompozisyonu

M. oleifera birçok tropikal ve subtropikal ülkede yaygın olarak yetişen küçük boylu bir ağaçtır. Tohumu, yaprakları, yağı, ekstraktı, ağaç kabuğu, kökleri ve çiçekler geleneksel tıpta yaygın olarak kullanılmaktadır. Moringa yapraklarının vitaminler, mineraller, amino asitler ve yağ

asitleri içeren arzu edilen bir besin dengesi içermesi ile karakterize edilmiştir (Stohs ve Hartman, 2015)

M. oleifera yapraklarının besin bileşimi söz konusu olduğunda; kuru maddesi yaklaşık %93,63-95,0; ham proteini %17,01-22,23, karbonhidrat %63,11-69,40, selüloz %6,77-21,09, ham yağ %2,11, yağ asidi de %1,69-2,31 arasında değişmektedir (Mahfuz ve Piao, 2019).

M. oleifera yapraklarının besin madde içeriği Çizelge 1 verilmiştir. Çizelge 1 incelendiğinde moringanın yapraklarında protein içeriğinin yüksek olduğu görülmüştür.

Moringa bitkisinin yaprakları yüksek düzeyde kalsiyum ve fosfor içermektedir. Yeterli düzeyde de çinko içermektedir. Vitaminler bakımından da iyi bir kaynaktır. Moringa zeatin, quercetin, kaempferom fenolik bileşikler bakımından zengindir (Patel ve ark., 2014).

Çizelge 1. Moringa yapraklarını besin madde içeriği (Mahfuz ve Piao, 2014)

Besin Madde İçeriği	Taze Yaprak	Kuru Yaprak	Yaprak (Toz form)
Protein (g)	6,7-17,1	29,4-40,0	25,4-27,1
Yağ (g)	1,7-2,11	5,2-6,5	2,3
Karbonhidrat (g)	6,3-12,5	38,0-41,2	34,3-38,2
Ham selüloz (g)	0,9-7,09	12,5-21,09	19,2
Mineraller			
Fosfor (mg)	30,15-70	204-252	204
Kalsiyum (mg)	440	2185-3050	2003
Bakır (mg)	0,07	0,08-0,49	0,57
Demir (mg)	0,85-10,7	25,6-49,0	28,2
Çinko (mg)	6,7	3,25-13,03	-
Magnezyum (mg)	42-82	86-448	368
Vitaminler			
Vitamin A	0,9-11,05	16,3-18,90	-
Vitamin C	220	15,8-17,3	173
Vitamin E	448	10,8-77,0	113

Moringa oleifera yapraklarında bulunan antibesinsel maddeler Çizelge 2’de verilmiştir.

Çizelge 2. Moringa oleifera yapraklarında bulunan antibesinsel maddeler (% KM)

Anti besinsel faktörler	Balami ve ark., (2018)	Teixeira ve ark., (2014)
Taninler	2.19	2.06
Saponinler	1.06	-
Fitat	2.57	-
Oksalat	0.45	1.05
Tripsin inhibitör	-	1.45 TUI/g
Siyanid	0.1	-

Moringa yaprakları 12 gr/kg tanen, 80 gr/kg saponin içermektedir. Saponinin sahip olduğu keskin ve tahriş edici tat ve yüksek konsantrasyonda yem alımını ve dolayısıyla vücut büyümesini azaltabilir (Amad ve ark., 2022). Farklı çalışmalarda rakamlar arasında görülen farklılıkların sebebi genetik, yaş, büyüme ve çevre koşullarında görülen farklılıklardır. Moringa yapraklarının oksalat içeriği çözünmez olup, ispanaktakinin (822 mg) altındadır ve tavuklar için zararlı değildir. Tripsin inhibitörleri ile ilgili olarak, nispeten düşük seviyede bulunmuştur.

Moringa Oleifera Yapraklarının Yumurta Tavuklarında Beslenmesinde Kullanımı

Son yıllarda yumurta tavuklarında M.oleifera yaprak ekstratının kullanıldığı birçok çalışma yürütülmüş olup çalışmaların sonuçları farklılık arz etmektedir. Yumurtacı tavuklarla olan çalışmalar incelendiğinde performans, yumurta kalitesi ile kan parametreleri ile ilgili çalışmalara rastlanılmıştır.

Lohman tavukları üzerinde yürütülen bir çalışmada Abdel-Azeem ve ark. (2017), karma yeme %0.5, %1.0, %1.5 ve %2.0 seviyesinde M. oleifera yaprak tozu ilave etmişlerdir. Araştırmacılar %2.0 seviyesinde M. oleifera yaprak tozunun yem katkı maddesi olarak kullanılabileceğini bildirmişlerdir.

Vanaraja yumurta tavuklarının karma yemlerine 0.5, 1.0, 1.5 ve 2.0 kg seviyelerinde M. oleifera yaprak tozu ilavesinin rasyon maliyetini azalttığı, yumurta üretimini ve yemden yararlanma oranını iyileştirdiği ifade edilmiştir (Swain ve ark., 2017).

Yumurta tavukları üzerinde yürütülen bir çalışmada karma yeme %2, %4 ve %6 seviyesinde M. oleifera yaprak tozu ilave edilmiştir. Çalışma sonucunda karma yeme %4-6 seviyesinde toz formu ilavesinin yumurta tavuklarında yem sindirilebilirliğini ve yumurtalarda dış kaliteyi artırdığını bildirmişlerdir (Siti ve ark., 2019).

Yumurta tavuğu karma yemlerine %2, %4 %6 seviyesinde M. oleifera yaprak tozu ilavesinin performans, yumurta sarısı kolesterol ve mineral içeriği üzerine etkilerinin araştırıldığı başka bir çalışmada karma yeme %4-6 seviyesinde M. oleifera yaprak tozu ilavesi ile yumurta veriminin, yumurta kitlesinin, yemden yararlanma oranının, yumurta sarısı beta karoten, Ca ve Mg içeriğinin arttığını, kolesterol seviyesinin azaldığı görülmüştür (Bidura ve ark., 2020).

Gayathri ve ark., (2020), %1 düzeyinde M. oleifera yaprak tozu ilavesinin performans ve yumurta kabuğu kalite özellikleri üzerine olumlu etkisinin olduğunu bildirmiştir.

Abdel-Wareth ve Lohakare (2021), M. oleifera yaprak tozunun 64-72. haftalık yaşlar arasındaki yumurtacı tavuklara %0-0.3-0.6 ve 0.9 düzeyinde verilmesinin, yumurta performansı söz konusu olduğunda, yumurta ağırlığı, yumurta verimi ve yemden yararlanma oranını istatistiki olarak artırdığını, buna karşılık yem tüketimini etkilemediğini bildirirken; yumurta kalitesi söz

konusu olduğunda Haugh birimi ve kabuk kalınlığının istatistiki olarak arttığı, buna karşılık albumen ve sarı üzerine etkisinin olmadığını ifade etmiştir. Sharmin ve ark., (2021) ise *M. oleifera* yaprak tozunun 26-42 haftalık yaşlar arasındaki yumurtacı tavuklara %0-0.5 ve 1 düzeyinde verilmesinin canlı ağırlık, yem tüketimi, yumurta ağırlığı, verimi, yumurta şekil indeksi, Haugh birimi, kabuk kalınlığının uygulamalardan etkilenmediğini, sadece sarı renginin istatistiki olarak etkilendiğini tespit etmiştir.

Rajesh ve ark., (2021), *M. oleifera* yaprak tozunun 34-49 haftalık yaşlar arasındaki yumurtacı tavuklara %0-5-7.5 ve 10 düzeyinde verilmesinin kolesterol düzeyinde önemli bir azalmaya yol açtığını bildirmiştir. Konu ile ilgili yapılan bir başka çalışmada ise Shen ve ark. (2022), 37 haftalık yumurta tavukları karma yemlerine %2.5, %5.0, %7.5 ve %10.0 seviyesinde *M. oleifera* yaprak tozu katılmasının etkilerini araştırmışlardır. Çalışma sonucunda karma yeme %2.5 seviyesinde *M. oleifera* yaprak tozu ilavesinin hormon sentezi ve gen regülasyonu açısından üreme fiziolojisi üzerinde potansiyel etkilerinin olduğunu bildirmişlerdir.

Sonuç olarak *M.oleifera* yaprak tozunun içerdiği besin maddeleri göz önüne alındığında yumurta tavuklarında potansiyel bir yem katkı maddesi olarak kullanılabileceği bununla birlikte farklı parametreler üzerindeki etkilerinin araştırıldığı çalışmalara ihtiyaç olduğu söylenebilir.

Özet

Acil servisler akut gelişen durumlarda değerlendirme, tanımlama, stabilizasyon ve tedavi uygulamalarının gerçekleştirildiği özel birimlerdir. Herhangi bir nedenle başka birimde hizmet alınamadığında hizmet istemi çoğu zaman acil servislere yönelmektedir. Asıl amacı acil durumlarda kritik sağlık bakımına ihtiyacı olanlara hizmet etmek olan acil servislerin, sağlık durumu acil olmayan ve birinci basamak bir sağlık kuruluşunda tedavi olabilecek bireyler tarafından kullanımı olan “Acil servislerin uygunsuz kullanımı”, küresel bir sorundur. Bu derleme acil servislerin kullanımını etkileyen faktörler, acil servislerin uygunsuz kullanım nedenleri ve sonuçlarına ilişkin bilgi sunmaktadır.

Anahtar Kelimeler: Acil Servis; Uygunsuz Kullanım; Sağlık hizmetleri

IMPROPER USE OF EMERGENCY SERVICES

Abstract

Emergency services are special units where evaluation, identification, stabilization and treatment applications are carried out in cases such as an acute health problem. When service cannot be received in another unit due to some reason, most of the time the service request is directed to the emergency services. The use of emergency services, whose main purpose is to serve people in need of critical health care in emergencies, by individuals whose health condition is not urgent and can be treated in a primary health care institution, named as "Inappropriate use of emergency services" is a global problem. This review provides information on the factors affecting the use of emergency services, the reasons for inappropriate use of emergency services and their consequences.

Keywords: Emergency room; Improper Use; Health Service

1. GİRİŞ

Acil servisler sağlık sorunu veya ani yaralanma gibi durumlarda değerlendirme, teşhis, stabilizasyon ve tedavinin uygulandığı özel birimlerdir (Edirne, Edirne, Atmaca, & Keskin, 2008; Şimşek & Gürsoy, 2015). Acil servislerdeki sağlık hizmetleri, kurtarma ve hayatta kalmayı sağlamaya yönelik olup sakatlık ve ölüm risklerinin kontrolünde kesintisiz hizmet verilmesini hedeflemektedir.(Ersel et al., 2006). Sunulan hizmetin önceliğin en acil vakaya verilmesi ve zamanında tedavi yapılması gibi temel ilkeleri bulunmaktadır.

Sağlanan bakım ve tedavinin kalitesi acil servisleri tıbbi bakım için özel bir seçenek haline getirmiştir. Semptomların ortaya çıkması veya sağlık sisteminin yoğunluğu nedeniyle başka bir birimden hizmet alınamadığında hizmet istemi acil servislere yönelmektedir. Bu nedenle günümüzde acil servis hizmetleri modern sağlık sisteminin giriş kapısı ve yapı taşlarından biridir (Carret, Fassa, & Domingues, 2009). Birincil amacı acil durumlarda kritik tıbbi bakıma muhtaç olan kişilere hizmet etmek olan acil servislerin, sağlık durumu acil olmayan ve birinci basamak bir sağlık kuruluşunda tedavi olabilecek bireyler tarafından kullanımı küresel çapta bir sorundur (Uğrak, Cihangiroğlu, Uzuntarla, & Teke, 2016).

2. ACİL SERVİSLERİN KULLANIMINI ETKİLEYEN UNSURLAR

Son yıllarda dünya nüfusunun artmasıyla birlikte dünya çapında acil sağlık hizmetlerine yönelik talep artmıştır (Pines, Pilgrim, Schneider, Siegel, & Viccellio, 2011). Gelir durumu, eğitim durumu ve sosyal destek sistemleri gibi sosyodemografik özellikler de acil servislerin kullanımını etkileyen önemli faktörlerdendir (He, Hou, Toloo, Patrick, & Gerald, 2011). Yaşam tarzının da acil servislere başvuruları önemli oranda etkilediği dikkat çekmektedir. Yaşam tarzı özellikleri acil servislerin sık kullanılmasına neden olan kronik hastalıklar, alkol ve madde bağımlılığı düzeyi ile de ilişkilidir (Johar, Jones, & Savage, 2013).

Acil servislerin kullanımını etkileyen bir diğer unsur da kişinin yaşadığı sağlık sorununun aciliyet algısıdır. Yürütülmekte olan pek çok çalışma bu algıyı etkilemekte ve bu durumda dolaylı olarak acil servislerin kullanımını etkilemektedir. Ülkelerin sağlık sistemleri ve sağlık politikaları da acil servislerin kullanımını önemli ölçüde etkilemektedir (Callen, Blundell, & Prgomet, 2008).

3. ACİL SERVİSLERİN UYGUNSUZ KULLANIMI

Kaza veya yaralanma olmadan gelişen, acil servis hizmeti gerektirmeyen ve birinci basamak sağlık kuruluşlarında güvenle tedavi edilebilecek sağlık sorunları için acil servislerin kullanılması uygunsuz kullanım olarak kabul edilmektedir (McHale et al., 2013). Uygunsuz kullanım kavramının öznel olması ve aciliyet kavramının nicel bir ölçüsü olmaması gibi nedenlerle, bilim dünyası bu kavram için net bir fikir birliğine ulaşmamaktadır (Schull, Kiss,

& Szalai, 2007). Bilim dünyası başvuruların aciliyet düzeyi ile uygunluğu arasındaki ilişki üzerinde de durmaktadır. Birkaç saat bekletildiğinde herhangi bir olumsuz sonuç gelişme riski bulunmayan sağlık sorunlarına yönelik acil servis başvuruları “acil olmayan başvurular” şeklinde tanımlanmaktadır (Durand et al., 2011). Acil olmayan başvurular, sağlık sorunlarının ciddiyetini yansıtan bir ifade olarak ele alınmaktadır. Uygunsuz kullanım ise sağlık sorununun ciddiyet düzeyi, olası hizmet birimlerinin ulaşılabilirlik ve hastaların acil servisi tercih etme nedenleri gibi sosyal ve psikolojik boyutları olan bir kavram olarak kabul edilmektedir (Bullard et al., 2014). Çeşitli çalışmalarda uygunsuz kullanım tanımı, farklı kriterlere dayandırılmakta ve kriterlerin belirlenmesinde genellikle Kanada Triyaj Skalası (CTAS) ve Hastane Aciliyet Uygunluğu Protokolü (HUAP) kullanılmaktadır (Durand et al., 2011).

Sıklıkla kullanılan uygunsuz kullanım ölçütleri; hastanın hiçbir olumsuz sonuç gelişme olasılığı olmadan tıbbi bakım alıncaya kadar bekleyebileceği süre, ölüm riski ya da organ hasarı varlığı, acil tedavi ve gözlem gereksinimi, tıbbi bakım için acil servis kaynaklarının gerekliliği, özel tanı yöntemlerinin gerekliliği, tedavi için başka bir hizmet biriminin uygunluğu, yakınmaların akut olarak gelişip gelişmediği, sağlık sisteminin bir başka basamağından sevk edilme durumu olarak açıklanmıştır (Durand et al., 2011).

4. ACİL SERVİSLERİN UYGUNSUZ KULLANIM NEDENLERİ

Yapılan çalışmalar incelendiğinde uygunsuz kullanıma neden olan birçok faktörün olduğu görülmektedir. Birinci basamak sağlık hizmetlerine erişim, acil serviste verilen hizmetin özellikleri ve kişinin yaşadığı sağlık sorununa ilişkin problemler, acil servisleri sağlık hizmetinin ön planına yerleştirmekte ve bu durumda acil servislerin uygunsuz kullanımına neden olmaktadır (Edirne et al., 2008). Bu nedenler;

- Acil servislerin yer ve işlev olarak zamandan kazanım sağlaması (Lega & Mengoni, 2008),
Sigorta açısından sıkıntı yaşayan bireylerin diğer birimlerden yararlanamaması nedeniyle acil servisleri tek adres olarak kullanmalarındır (Harris, Patel, & Bowen, 2011),
- Halkın birinci basamak sağlık kuruluşlarının işlevlerine dair bilgi düzeyinin düşük olması (Breen & McCann, 2013),
- Bireylerin soruna yönelik aciliyet algısı (Yürütülmekte olan çeşitli sağlık kampanyaları ve sağlıkla ilişkili yapılan programlar aciliyet algısının şekillenmesinde rol almakta ve bu durumda acil servislerin kullanımı üzerinde etkili olmaktadır),
- Basit sağlık sorunlarında bakım alma konusunda sağlık çalışanları ya da hasta yakınlarının acil servislere başvuru yönündeki önerileri,

- Barınmada sorun yaşayan kişilerin açlık, güvenlik gibi ihtiyaçlarını karşılama düşünceleri (Şimşek & Gürsoy, 2015) şeklinde sıralanabilir.

5. ACİL SERVİSLERİN UYGUNSUZ KULLANIM SONUÇLARI

Uygun kullanım acil tıbbi bakıma gereksinimi olan bireylerin acil servis kaynaklarından yararlanmasını engelleyerek, değerlendirme ve teşhis sürecinde gecikmelere, tedavi sürecinin aksamasına, verilen hizmetin kalitesinin ve yaşamsal risklerin kontrol altına alınması için zamana karşı verilen mücadelenin başarısını etkilemektedir (Ersel et al., 2006; Şimşek & Gürsoy, 2015). Uygun kullanım sebebiyle başvuran hasta sayısındaki artış;

- iş yükünün artmasına, çalışan memnuniyetinin azalmasına,
- çalışanlar arasındaki iletişimi etkileyerek tıbbi hata yapılmasına,
- hasta muayenesinde aceleci davranılmasına
- hastaların bekleme sürelerinin uzamasına,
- hasta memnuniyetinin azalmasına neden olmaktadır (Şimşek & Gürsoy, 2015).

Acil müdahale gerektiren durumlar dışında acil servislerin kullanılmasıyla bilimsel temelden uzaklaşmakta ve bu durum acil servislerde çalışan bireylerin psikolojilerinde de bozulmalara neden olmaktadır (Durand et al., 2011).

Acil servislerin kronik hastalıkların takibi için kullanılması, bu hastalıkların gerektirdiği özel, önleyici ve sürekli bakıma yönelik hizmetlerden mahrum kalınmasına yol açmaktadır (McWilliams, Tapp, Barker, & Dulin, 2011). Uygun kullanımın sağlık bakım maliyetlerini de arttırdığı görülmektedir. Birinci basamak sağlık kuruluşunda verilen hizmetlerin yeterli olduğu durumlarda acil servisler kullanılmayarak sağlık bakım maliyetlerinde %69-%86 oranında tasarruf sağlanabileceği yapılan çalışmalar sonucunda ortaya konmuştur. (McWilliams et al., 2011). Uygun kullanım verilen hizmetin kalitesini düşürüp, maliyetini arttırmanın yanısıra kalabalıklaşmaya sebep olarak servis hizmetlerinin sağlanmasını güçleştirmektedir (Olshaker, 2009).

6. SONUÇ

- Acil servislerde sunulan hizmetin kalitesini arttırmak için etkili bir triyaj uygulaması yapılmalıdır. Acil servislerde triyajın önemi ve bu kapsamda yeşil alana başvuru yapan hastaların bekletilebileceği konusunda halk bilgilendirilmelidir

- Aile hekimliklerinin ileri tetkik ve tedavi gerektirmeyen durumlar ve sađlık eđitimi/yařam tarzı deđiřiklikleriyle kontrolü sađlanabilecek sađlık sorunlarına ynelik verdiđi hizmetler konusunda halk eđitimi yapılmalıdır (Brim, 2008).
- Medya tarafından yayınlanan sađlık bilgilerinin aciliyet algısı üzerinde etkili olduđu bilinmektedir. Bu yzden yayınlanan sađlık bilgilerinin dođruluđu yetkililer tarafından kontrol edilmelidir (Cantrk, Eřiyok, Polat, Korkusuz, & Akduman, 2005).
- Sađlık sorunlarının tedavi ve kontrolnde bařarı,maliyetinde etkinlik ve acil servis hizmetlerinde kalite sađlanması iin uygun bakımın uygun birimlerden alınmasına ynelik alıřmalar planlanmalıdır. Bu ama dođrultusunda mesai saatleri dıřında acil olmayan hastalar iin hizmet birimlerinin oluřturulması konusu ncelikli olarak ele alınmalıdır (McWilliams, Tapp, Barker, & Dulin, 2011).

ABSTRACT

It is estimated that more than half of the complications that occur in the hospital setting are related to surgical procedures. In areas where safety is important, such as the operating room, most errors are due to poor communication and poor teamwork. Operating theaters are complex spaces by nature. Team communication is extremely important here. The purpose of this exercise is to systematically examine the impact of team communication on patient safety in the operating room. The keywords "operating room", "team communication" and "patient safety" were searched in Pubmed, Science Direct and Cochrane databases between 2000-2022. Of the 498 studies reached, 4 studies that met the inclusion criteria were included in the study. Team members who work together and communicate well can detect mistakes quickly and prevent them more easily. The use of briefing and handover checklists in the operating room can increase team communication, which can directly positively affect patient safety. In addition, with the decrease in the operation time and the time to start the operation, the efficiency of the surgical process may increase. Studies have shown that the satisfaction of the surgical team and the perception of operating room safety will also increase.

Keywords: Operating room, team communication, patient safety

ÖZET

Hastane ortamında meydana gelen komplikasyonların yarısından fazlasının cerrahi prosedürlerle ilişkili olduğu tahmin edilmektedir. Ameliyathane gibi güvenliğin önemli olduğu alanlarda çoğu hata yetersiz iletişim ve zayıf ekip çalışmasından kaynaklanmaktadır. Ameliyathaneler doğası gereği karmaşık alanlardır. Buradaki ekip iletişimi son derece önemlidir. Bu çalışmanın amacı ameliyathanede ekip iletiminin hasta güvenliğine etkisini sistematik olarak incelemektir. 2000-2022 yılları arasında Pubmed, Science Direct ve Cochrane veri tabanlarında “operating room”, “team communication” ve “patient safety” anahtar kelimeleri taranmıştır. Ulaşılan 498 araştırmadan dahil edilme kriterlerine uyan 4 araştırma çalışmaya dahil edilmiştir. Birlikte çalışan ve iyi iletişim kuran ekip üyeleri, hataları hızla algılayabilir ve daha kolay önleyebilir. Ameliyathanede brifing ve devir teslim kontrol listelerinin kullanımı ile ekip iletişimi artabilir, bu da hasta güvenliğini doğrudan olumlu yönde etkileyebilir. Ayrıca ameliyat süresinde ve ameliyata başlama zamanında azalma ile cerrahi süreç verimlilik artış meydana gelebilir. Cerrahi ekibin memnuniyeti ve ameliyathane güvenlik algısının da artacağı yapılan çalışmalarla gösterilmiştir.

Anahtar Kelimeler: Ameliyathane, ekip iletişimi, hasta güvenliği

GİRİŞ

Ameliyathanede güvenlik önemli bir sorundur. Ek olarak hastane ortamında meydana gelen komplikasyonların yarısından fazlasının cerrahi prosedürlerle ilişkili olduğu tahmin edilmektedir. Her ameliyatın, doğru bir şekilde gerçekleştirilebilmesi için birçok adımı ve aşaması vardır. Hatalar, hasta güvenliğini tehdit etme potansiyeline sahip herhangi bir adımda meydana gelebilir (Pugel ve ark., 2015). Ameliyathane gibi güvenliğin önemli olduğu alanlarda çoğu hata yetersiz iletişim ve zayıf ekip çalışmasından kaynaklanmaktadır. Ameliyathaneler doğası gereği karmaşık alanlardır. Buradaki ekip iletişimi son derece önemlidir. Ameliyathanede hataları azaltma ve ekip iletişimi artırma stratejileri olarak eğitim verilmesi, güvenli cerrahi kontrol listeleri kullanılması, brifingler gibi yöntemler kullanılabilir. Bu yöntemler ile ekibin iletişimi, iş birliği, motivasyonu ve hasta güvenliği sonuçları olumlu yönde gelişebilir (Fudickar ve ark., 2012; van Dalen ve ark., 2022).

Cerrahi süreçte hasta bakımında cerrahlar, hemşireler, anestezi uzmanları başta olmak üzere birçok sağlık profesyoneli etkin rol almaktadır. Bu ekip içerisindeki herkesin anahtar bir rolü bulunmaktadır. Herhangi bir ekip üyesinden kaynaklanan aksaklıklar ciddi sonuçlara yol açabilir. Bu aksaklıkların giderilmesinde ekip iletişimi doğrudan etkilidir (Einav ve ark., 2010; ElBardissi ve Sundt, 2012).

GEREÇ VE YÖNTEM

Çalışmanın amacı ameliyathanede ekip iletişiminin hasta güvenliğine etkisini sistematik olarak incelemektir. 2000-2022 yılları arasında Pubmed, Science Direct ve Cochrane veri tabanlarında “operating room”, “team communication” ve “patient safety” anahtar kelimeleri taranmıştır. Ulaşılan 498 araştırmadan dahil edilme kriterlerine uyan 4 araştırma çalışmaya dahil edilmiştir. Dahil edilen çalışmalar Tablo 1’de özetlenmiştir.

BULGULAR

Weld ve ark. tarafından TeamSTEPPS’in ameliyathane verimliliği ve hasta güvenliği üzerindeki etkisini değerlendirmek amacıyla bir çalışma yapılmıştır. TeamSTEPPS, o gün için planlanan her bir vakaya özgü konuları tartışmak üzere ilgili ameliyathaneye atanan tüm sağlık personelinin katıldığı brifinglerden oluşmaktadır. Bu çalışmada üroloji ameliyathanesinde gerçekleştirilen ameliyatlara; ameliyatlara başlama süreleri, ameliyata zamanında başlama süreleri ve hasta güvenliği ile ilgili sorunlar açısından bir önceki yıllarla karşılaştırılmıştır. Çalışmanın sonunda TeamSTEPPS ile ortalama ameliyat süreleri 12.7 dakika daha kısa ve ameliyata

International Conference on Global Practice of Multidisciplinary Scientific Studies-IV
Turkish Republic of Northern Cyprus, April 28-30, 2023

zamanında başlama oranı %21 oranında daha iyi olarak belirlenmiştir. Ayrıca hasta güvenliği ile ilgili sorunlar %16'dan %6'ya düşerek hasta güvenliğinde artış bulunmuştur (Weld ve ark., 2016).

Araştırmayı Yapan Kişiler	Araştırma Tipi	Sonuç
Weld ve ark., 2016	Performans Geliştirme Projesi	Çalışmanın sonunda TeamSTEPPS ile ortalama ameliyat süreleri 12.7 dakika daha kısa ve ameliyata zamanında başlama oranı %21 oranında daha iyiydi. Ayrıca hasta güvenliği ile ilgili sorunlar %16'dan %6'ya düşerek hasta güvenliğinde artış bulunmuştur.
Leong ve ark., 2017	Prospektif Çalışma	Cerrahi ekibin ekip ikliminin anlamlı derecede arttığı; bilgilendirme ve brifinglerin olumlu etki yarattığı; ameliyat süresinin çalışma öncesinden daha kısa sürdüğü; hem cerrahi verimliliğinin hem de hasta güvenliğinin arttığı sonucuna ulaşılmıştır.
Defontes ve Surbida, 2004	Brifing Projesi	Çalışmanın sonunda yanlış alan cerrahisinin yılda 3'ten 0'a (%300) düştüğü; ekibin memnuniyetinin %19 arttığı, hemşirelerin değişim hızının %16 azaldığı ve ameliyathanedeki güvenlik iklimi algısının "iyi"den "mükemmel"e yükseldiği sonucuna ulaşılmıştır.
Nasiri ve ark., 2021	Randomize Kontrollü Çalışma	Kontrol listesi kullanan grupta bilgi eksikliği oranı steril ekipte %19,5'ten %12,1'e; sirküle ekipte %16,8'den %14,1'e düştü. Steril ekipte devir teslim süreci kalitesi uygulama sonrası ($7 \pm 1,5$), uygulama öncesine ($6,5 \pm 0,9$) göre anlamlı derecede yüksek bulunmuştur. Kontrol listesi kullanımı ile shiftler arası geçiş süresi hem steril ekipte hem de sirküle ekipte arttı. Ekibin kontrol listesi kullanımıyla devir teslimden memnuniyeti %67,5'tan %85,5'a yükselmiştir.

Leong ve ark. tarafından cerrahi ekip üyeleri arasında optimal bir iş birliğine odaklanan perioperatif brifing ve bilgilendirmenin getirilmesiyle ameliyathanede hasta güvenliğini artırmaya yönelik bir çalışma yapılmıştır. Bu çalışmanın başlamasından yaklaşık 2.5 yıl sonra

cerrahi ekibin ekip ikliminin anlamlı derecede arttığı; bilgilendirme ve brifinglerin olumlu etki yarattığı; ameliyat süresinin çalışma öncesinden daha kısa sürdüğü; hem cerrahi verimliliğinin hem de hasta güvenliğinin arttığı sonucuna ulaşılmıştır (Leong ve ark., 2017).

Defontes ve Surbida tarafından perioperatif dönemde hasta güvenliğini artırmak için cerrahi ekibin iletişimini, iş birliğini, durumsal farkındalığı ve ekip çalışmasını artırmak için brifing projesi uygulanmıştır. Çalışmanın sonunda yanlış alan cerrahisinin yılda 3'ten 0'a (%300) düştüğü; ekibin memnuniyetinin %19 arttığı, hemşirelerin değişim hızının %16 azaldığı ve ameliyathanedeki güvenlik iklimi algısının "iyi"den "mükemmel"e yükseldiği sonucuna ulaşılmıştır (Defontes ve Surbida, 2004).

Nasiri ve ark. tarafından ameliyathanede shift değişimlerinde yapılandırılmış bir devir teslim kontrol listesinin etkili iletişim, ameliyathane ekibi memnuniyeti ve hasta güvenliği üzerindeki etkisini incelemek amacıyla randomize kontrollü bir çalışma yapılmıştır. Kontrol listesi kullanan grupta bilgi eksikliği oranı steril ekipte %19,5'ten %12,1'e; sirküle ekipte %16,8'den %14,1'e düşerek istatistiksel olarak anlamlı bir düşüş bulunmuştur. Steril ekipte devir teslim süreci kalitesi uygulama sonrası ($7 \pm 1,5$, uygulama öncesine ($6,5 \pm 0,9$) göre anlamlı derecede yüksek bulunmuştur. Kontrol listesi kullanımı ile shiftler arası geçiş süresi hem steril ekipte hem de sirküle ekipte artmıştır. Ekibin kontrol listesi kullanımıyla devir teslimden memnuniyeti %67,5'ten %85,5'a yükselmiştir (Naziri ve ark., 2021).

SONUÇ

Birlikte çalışan ve iyi iletişim kuran ekip üyeleri, hataları hızla algılayabilir ve daha kolay önleyebilir. Cerrahi ekibin hasta güvenliğini bir öncelik olarak algılaması gerekmektedir. Ameliyathanede brifing ve devir teslim kontrol listelerinin kullanımı ile ekip iletişimi artabilir, bu da hasta güvenliğini doğrudan olumlu yönde etkileyebilir.

ÖZET

Otobiyografik bellek (OB) (kişisel olarak deneyimlenen geçmiş olayların anımsanmasıyla ilgili belleği yönü) günlük durumlarda uyumsal işleyişin önemli bir parçasıdır. Benlik duygusuna katkıda bulunur, sosyal davranışa ve problem çözmeye rehberlik eder ve gelecekteki etkinlikleri tasavvur etme ve bağlamsallaştırma becerisini kolaylaştırır. Belirli psikiyatrik tanıları olan bireyler en belirgin şekilde majör depresif bozukluk ve travma sonrası stres bozukluğu sağlıklı yetişkinlerin deneyimlediğinden farklı bir otobiyografik bellek kalitesi yaşarlar. Bu hastalarda otobiyografik anılar aşırı genel olma eğilimindedir; yani psikiyatrik hastaların otobiyografik anılarından daha az özel ayrıntı içerirler. Aşırı genel otobiyografik bellek, savaş gazileri, fiziksel ve cinsel saldırı mağdurları, kanser teşhisi konan hastalar ve doğal afetler yaşamış kişiler dahil olmak üzere birçok travma mağdurunun özelliğidir. Bu bilişsel işleme biçimi genel bir travmayla ilişkili yapısal anormallik ve işlevsel düzensizlik modeline uyar; özellikle, travmatik anı izlerinin geri alınması sırasında yukarıdan aşağıya bilişsel kontrolde yer alan beyin bölgelerinin (örn. Prefrontal korteks) azalmış aktivasyonu ile ilişki görünmektedir. Psikolojik travma, kortizolün bozulmuş salgılanmasıyla, özellikle glukokortikoid bozulmuş salınımı ile beyne zarar verebilir. Travmaya maruz kalan bireylerde otobiyografik bellek aşırı genel ve olumsuz önyargılı olma eğilimindedir. Çocukluk çağı travması, körelmiş bazal kortizol salgılanması, beyin değişiklikleri ve otobiyografik bellek eksiklikleri ile ilişkilidir. Çocukluk çağı travması, bazal kortizol sekresyonunu ve prefrontal-hipokampal-extrastriat bölgelerin bağlantısını değiştirerek otobiyografik bellekte görsel-algısal bağlamsal ayrıntıların yokluğuna yol açabilir. Bu nedenle mevcut bulgular, bir olayın belirli bağlamsal ayrıntılarının travma deneyimi olan bireylerde işlevsel kaçınma ve daha zayıf yürütme kontrolü nedeniyle kaybolabileceğini göstermektedir. Cromheeke ve ark. (2014) çocuklukta istismar öyküsü olan kadınlarda özellikle olumlu duygular için işleyen bellek kapasitelerinin bozulduğunu bildirmiştir; bu, çocukluk istismarının duygu işleme üzerinde kalıcı bir etkiye sahip olduğunu ve bunun da hafıza performansını etkilediğini göstermektedir. Hastalar ayrıca aşırı uyarılma, duygusal düzensizlik, aşırı uyanıklık ve uyku problemlerinden muzdariptir ve travmatik olayı

hatırlamayı tetikleyen her şeyden aşırı derecede kaçınma eğilimindedir. TSSB, amigdala ve insula gibi limbik bölgeler üzerindeki prefrontal kontrolün kaybı nedeni ile travmatik anılar zayıf bir şekilde bağlamsallaştırılır, parçalanmış anılara neden olur (Fenster ve diğerleri, 2018). Özellikle çocukluk çağı cinsel istismarlarına bağlı travmalarda otobiyografik hafıza kaybı yaşanır. Bu durum sıklıkla ihanet, disosiyasyon, istismar süresi ve dissosiyatif amnezi, istismarın başlangıç yaşı ile doğrudan ilişkili bulunmuştur. Travma geçirmiş birey, gerçek bir hatıra olarak kabul edilemeyecek fiziksel ve psişik, parçalı ve rahatsız edici izlerin sürekli dönüşünden dolayı bedeninde acı çeker. Travmatik bir deneyimin anısı ve bundan doğabilecek bellek çalışması, öznenin deneyimindeki radikal bir boşluğu dolduran bir anının ayrıntılandırılması sorununu ortaya koyar: doğrudan hatırlanamayan bir olay. Otobiyografik bellek eksikliklerinin altında yatan nörobiyolojik mekanizmaları anlamak, travmayla ilişkili ruhsal bozuklukların önlenmesi ve tedavisi için önemli sonuçlar sağlayacaktır.

Anahtar Kelimeler: travma, travmatik hafıza, istismar, cinsel, mental

GİRİŞ

Çocukluk çağındaki cinsel istismar (CÇCİ), uzun süreli olumsuz etkileri ve bununla ilişkili yüksek yıllık maliyetleri olan endemik bir halk sağlığı ve sosyal sorunudur. Dünya Sağlık Örgütü'ne (WHO) göre, CÇCİ, “çocuğun tam olarak anlamadığı, bilgilendirilmiş rıza veremeyeceği veya gelişimsel olarak hazır olmadığı ve rıza gösteremeyeceği, toplumun yasalarını veya sosyal tabularını aykırı cinsel aktiviteye dâhil edilmesi” olarak tanımlanmaktadır (WHO, 1999; Gewirtz-Meydan, Godbout, 2023). CÇCİ yaşayan bireyler, travma semptomları ve diğer olumsuz sonuçlar yaşama riski altındadır. Çocukluk döneminde travmaya maruz kalmak, yetişkinlikte kötü sağlık sonuçları riskinin artmasına neden olabilir. Psikolojik travmaya maruz kalmanın, glukokortikoid (insanlarda kortizol) salgılanmasını bozarak nöronal hücre ölümüne neden olduğu bilinmektedir. Aslında, travma sonrası stres bozukluğu (TSSB) olan hastalarda kortizol salgılanmasında bozulma ve beyinlerinde gri madde hacminde azalma görülmektedir. TSSB’de travmatik anılar, patolojik olmayan travmatik anılardan farklı olarak çok daha rahatsız edicidir ve travma hatırlatıcıları tarafından kolayca tetiklenir. Unutamama ve korku tepkisinin aşırı genelleştirilmesi, geçmişe dönüş, kabuslar, aşırı uyarılma ve travmayla ilişkili uyaranlardan kaçınma gibi çeşitli TSSB semptomlarının temelini oluşturur.

Psikolojik travma, kortizolün bozulmuş salgılanması yoluyla, özellikle glukokortikoid reseptörlerinin ifade edildiği alanlarda beyne zarar verebilir. Çocukluk çağı travması, körelmiş bazal kortizol salgılanması, beyin değişiklikleri ve aşırı genel otobiyografik bellek (OB) olarak adlandırılan otobiyografik bellek eksiklikleri ile ilişkilidir. Otobiyografik bellek (yani, "kişisel olarak deneyimlenen geçmiş olayların anımsanmasıyla ilgili belleğin yönü), günlük durumlarda uyumsal işleyişin önemli bir parçasıdır. Benlik duygusuna katkıda bulunur, sosyal davranışa ve problem çözmeye rehberlik eder ve gelecekteki faaliyetleri tasavvur etme ve bağlamsallaştırma becerisini kolaylaştırır. Travmatik bireylerde otobiyografik anılar aşırı genel olma eğilimindedir ve sağlıklı kontrollerin otobiyografik anılarından daha az spesifik ayrıntı içerirler. Çocukluk çağı travması, bazal kortizol sekresyonunu ve prefrontal-hipokampal-extrastriat bölgelerin bağlantısını değiştirerek otobiyografik bellekte görsel-algısal bağlamsal ayrıntıların yokluğuna yol açabilir.

Erken yaşam stresi, yaşamın ilerleyen dönemlerinde psikopatoloji ve bilişsel gerileme riskini artırır. Erken yaşam stresinden etkilenen nörobiyolojik substratlar (yani, biliş, nöroplastisite ve nöroinflamasyon) da yaşlanma süreci üzerinde olumsuz etkiye sahiptir. Yaşlanan beyin, hem temel hem de zorlu koşullar altında mikroglia proinflamatuvar bir duruma geçerken nöroimmün

düzensizliği ile karakterize edilir. Çocukluk travmasının hızlanan yaşlanma ile ilişkili olduğu, beyinde hızlandırılmış telomer kısalmasına yol açtığı belirlenmiştir. Bir çalışmada 5 ila 10 yaşları arasında çeşitli şiddet türlerine maruz kalan çocukların akranlarına göre önemli ölçüde daha fazla telomer erozyonu (yani 10 yaşına kadar) yaşadıkları belirlenmiştir (Drury et al., 2012). Özellikle hızlı yaşlanmayla birlikte nesne tanıma belleğinde bozulmalar görülür. Yoğunlaştırılmış prefrontal-extrastriate bağlantı, bellek alımındaki anlamsal içeriği güçlendirerek OGM oluşumuna katkıda bulunabilir. Bununla birlikte, yakın tarihli bir meta-analiz, travmaya maruz kalmanın, ancak depresif semptomalojinin değil, OB'nin büyüklüğünü tahmin ettiğini bulmuştur. Daha da önemlisi, OB aynı zamanda travmaya maruz kalan sağlıklı bireylerde ve çocukluk çağı travması ve depresyon öyküsü olanlarda da gözlemlenmiştir, ancak yalnızca depresyon öyküsü olanlarda görülmemektedir. Bu bulgular, travmatik deneyimin kendisinin, psikiyatrik semptomatolojiden bağımsız olarak beyin değişikliklerini olduğu kadar OB'yi de etkileyebileceğini göstermektedir. OB şu üç şekilde ortaya çıkabilir: 1) yakalama ve ruminasyon, 2) işlevsel kaçınma ve 3) daha zayıf yürütme kontrolü. Kendilik hakkındaki olumsuz düşüncelerin yakalanması ve ayrıntılı düşünülmesi, travmatik hafızadaki acı verici bir yönün sınırlı bir şekilde hatırlanmasını sağlayabilir ve diğer acı verici olmayan bağlamsal bilgileri göz ardı edebilir. Bununla birlikte, aynı zamanda, kişi travmayı anlamsal olarak onlarla ilişkilendirdiği için travmatik olmayan anıların kendisini hatırlamaktan da kaçınılabilir. Ayrıca, yürütücü kontrolden ödün verilmiş kişiler, travma ile semantik olarak ilişkili olan potansiyel tetikleyiciyi engelleyemedikleri için, belirli bağlamsal bilgileri almada genellikle zorluk gösterirler.

Teorik olarak, işlevsel kaçınma ve daha zayıf yürütme kontrolü, travma-OB ilişkisinin altında yatan temel bir faktör olabilecek anlamsal ilişkilendirmeyi içerir. Bu, depresyonu olmayan bu klinik olmayan popülasyonda semantik-ilişkili belleğin neden özel olarak travma ile ilişkili olduğunu açıklayabilir. Bu nedenle mevcut bulgular, bir olayın belirli bağlamsal ayrıntılarının, travma deneyimi olan bireylerde işlevsel kaçınma ve daha zayıf yürütme kontrolü nedeniyle (veya en azından bilişsel işlevlerinin bozulmamış olması koşuluyla işlevsel kaçınma nedeniyle) kaybolabileceğini göstermektedir.

Daha fazla olumsuz ve daha az olumlu bilgiyi hatırlama eğilimi sıklıkla depresyona genetik yakınlıkla ilişkilendirilmiştir. Bu bellek önyargısı, özellikle stresli çocukluk olayları yaşayan kişilerde depresyon aday genleri ile ilişkili olabilir. Depresif bireyler, olumlu bilgiler yerine olumsuz bilgileri tercihli olarak işleme eğilimindedirler. Bu yanlı işleme algı, dikkat ve hafızada mevcuttur ancak bellek yanlılığındaki bulgular özellikle sağlamdır. Olumsuz önyargılı bellek,

olumsuz bilginin hakim olmasına izin verecek ve farklı bilişsel alanlardaki önyargılar birbirleriyle ilişkili olduğundan, daha fazla olumsuz işlemeyi teşvik edecektir. Ayrıca, olumsuz önyargılı bellek, depresyon ve depresyon savunmasızlığının önemli bir özelliği olan ruminasyon ile ilişkilendirilmiştir. Önyargılı bellek işleme, depresyondan kurtulduktan sonra da devam eder ve istikrarlı bir depresyon özelliği olarak kabul edilir. Bu nedenle, tercihen olumsuz materyali hatırlama ve olumlu bilgiyi daha az hatırlama eğilimi, yalnızca depresyonun bir belirtisi değil, aynı zamanda önemli bir depresyon savunmasızlığı faktörü olarak kabul edilir. Travmatik olayların kişiler arası ilişkilerin doğasından kaynaklı olabilir, kasıtlı olarak çocuğa yönelik travmatik olaylar -özellikle de bir başkası tarafından uygulandığında güvenliği sağlama gereken bakıcı- olumsuz temel varsayımların oluşmasını teşvik edebilir ve dolayısıyla depresyonun seyri ve şiddeti üzerinde travmatik olmayan olumsuz olaylardan daha güçlü bir etkiye sahip olabilir.

Çocukluk ve ergenlik sıkıntıları, psikoz gelişimi için önemli risk faktörleridir. Fiziksel, cinsel ve duygusal istismar gibi çocukluk çağı travması; tümünün potansiyel risk faktörleri olduğu bulunmuştur. Bir failin dahil olduğu travma, yani çocukluk dönemindeki kişiler arası travmanın, ayrışmayı tetikleyebileceği nedeniyle özellikle zarar verici olduğu düşünülmektedir bu da daha sonraki psikozla bağlantılıdır. Travmatik anıların TSSB'nin gelişimi ve sürdürülmesinde merkezi olduğu iddia edilmektedir ve ayrıca bazı insanların psikoz deneyimlerinde rol oynadığı öne sürülmektedir. Bu hastalarda müdahaleci epizodik anılar, olumsuz geçmiş olaylarla ilgili duygusal olarak yoğun, istemsiz düşüncelere neden olur. Epizodik anıların kendine gönderme yapan, şimdiye odaklı anlamlara göre kategorize edildiği bilinmektedir. Günlük yaşam sırasında epizodik anıların geri çağrılmasını ve ardından belleğin bir kişinin işleyişi ve refahı üzerindeki etkisini etkiler. Örneğin, bir kişi "Ben kötüyüm" diye düşünürse, bu inançla tutarlı anıları hatırlaması muhtemeldir. Bu hafıza geri kazanımı daha sonra bilişsel süreçleri, duyguları ve davranışı etkileyerek kişinin kendisini 'kötü' bir insan olarak algılamasını güçlendirecek ve bu travmatik anının güçlenmesini ve psikotik süreci destekleyecektir (Clarke et al, 2022).

Çocukların duygusal ihmalinin, işlevsel olmayan veya bozulmuş duygu düzenlemesi ve ayrıca azalmış bilişsel kapasitelerle bağlantılı olduğunu gösteren kanıtlar vardır: örneğin, Gouid ve ark. çocuklara kötü muameleyle ilgili olarak nöropsikolojik işleyiş kalıplarını araştırmış ve duygusal işlemede ve çocuk ihmaliyle ilgili işleme hızında belirgin eksiklikler bulmuştur. (Frewen, et al, 2008; Gouid ve ark. 2012) İstismarın kendini ifşa etmesi, gizli ve isimsiz bir kişisel bildirim ortamında, yüzyüze görüşmeye göre daha kolay olabilir, çünkü çoğu kişi

genellikle utanır, kendini suçlar veya inanılmamaktan korkar (özellikle yakın kişiler arası travma durumlarında) Şiddetli yakın kişiler arası travma durumlarında, kişi çözülme nedeniyle travmatik olayları kısmen ya da tamamen unutmuş olabilir. Bununla birlikte, bu tür travmanın doğası, travmaya özgü amnezi nedeniyle eksik bildirim neden olabilir. Ayrıca, kişiler arası travmada faille yakın ilişkisi olanlar ifşayı daha çok geciktirme eğilimi gösterir.

Çocukluk çağı travması, çocuklarda (Macfie, Cicchetti ve Toth, 2001) ve yetişkinlerde çözülme (dissosiasyon) ile ilişkilidir. Dissosiasyonun olumsuz ve dayanılmaz duygulara karşı düzenleyici bir stratejiyi temsil ettiği kavramı göz önüne alındığında ve dissosiasyonu düşük hafıza performansı da dahil olmak üzere farklı bilişsel eksikliklerle ilişkilendirildiği belirlenmiştir (Terock ve diğerleri, 2016).

SONUÇ

Otobiyografik bellek, düzgün çalıştığında, insanların tutarlı bir benlik duygusunu sürdürmelerine, duygularını uygun şekilde düzenlemelerine ve sorunları verimli bir şekilde çözmelerine olanak tanır. Travmatik durumla karşılaşıldığında çalışması bozulur ve dikkate değer bilişsel ve duygusal olumsuz sonuçlar ortaya çıkar. Özellikle çocukluk çağı cinsel istismarları önemli ruhsal sorunlara yol açan travmalardır. Bu bireylerdir ruhsal sorunların ortaya çıkmasında etkin rol oynayabilen travmatik hafızasının değerlendirilmesi ve travmaya ilişkin hafıza sorunlarını hedefleyen psikoterapötik tekniklerden faydalanılabilmektedir.

İNSAN SAĞLIĞI VE SOSYAL HİZMETLER SEKTÖRÜNDE FAALİYET (DEVİR HIZI) RASYOLARININ ÖNEM DÜZEYİNİN BELİRLENMESİ: SD – CRITIC VE LOPCOW TABANLI COPELAND YÖNTEMİYLE AMPİRİK BİR ANALİZ

Doç. Dr. Haşim BAĞCI (Orcid ID: 0000-0002-5828-2050)

ÖZET

Günümüzde hizmet sektörü oldukça değer kazanmaya başlamaktadır. Hem gerçekleşen deprem, sel, salgın hastalıklar gibi öngörülemeyen olaylar hem de insanların hizmet gereksinimi sektörün önemini arttırmaktadır. Hizmet sektörü denildiğinde akla ilk gelen sağlık hizmetidir. Sağlık; insanların hayatta kalabilmeleri ve hayatını iyi geçirebilmeleri için temel göstergelerdendir. Sağlıkın ne derece önemli olduğu özellikle pandemi döneminde açıkça ortaya çıkmıştır. Bu çalışmada Türkiye Cumhuriyeti Merkez Bankası'na kayıtlı sektörlerden olan insan sağlığı ve sosyal hizmetler sektörü ele alınmıştır. Bu sektörün 2009-2021 yılları arası 13 yıllık verileri yardımıyla faaliyet oranları diğer bir ifadeyle devir hızı rasyolarının ağırlığı ölçülmüştür. Devir hızı rasyoları olarak; stok devir hızı, alacak devir hızı, çalışma sermayesi devir hızı, net çalışma sermayesi devir hızı, maddi duran varlık devir hızı, borç devir hızı ve aktif devir hızı kullanılmıştır. Bu rasyoların yüksek olması işletmenin alacak, borç vb. tahsillerini yapabildiğini göstermektedir. Dolayısıyla sağlık sektörü için devir hızlarının artması sektörün hizmet kalitesinin iyi olduğu konusunda da fikir vermektedir. Çalışmada faaliyet oranlarının ağırlığını bulabilmek için 3 farklı çok kriterli karar verme tekniği kullanılmıştır. Amaç; farklı yöntemler aracılığıyla faaliyet oranlarının önem düzeyini belirleyerek daha sağlıklı sonuçlara ulaşabilmektir. Ardından ise Copeland yöntemiyle bu sonuçlar tek bir sıralamaya dönüştürülmüş ve belirlenen zaman diliminde hangi devir hızı rasyosunun daha çok önem arz ettiği saptanmıştır.

Anahtar Kelimeler: Faaliyet (devir hızı) rasyoları, SD, Critic, LOPCOW ve Copeland yöntemi

DETERMINING THE SIGNIFICANCE LEVEL OF ACTIVITY (TURNOVER) RATIOS IN THE HUMAN HEALTH AND SOCIAL SERVICES INDUSTRY: AN EMPIRICAL ANALYSIS WITH THE COPELAND METHOD BASED ON SD – CRITIC AND LOPCOW

ABSTRACT

Today, the service sector is starting to gain a lot of value. Both unpredictable events such as earthquakes, floods, epidemics, and the need for service of people increase the importance of the sector. When the service sector is mentioned, the first thing that comes to mind is health service. Health is one of the basic indicators for people to survive and have a good life. The importance of health has been clearly revealed especially during the pandemic period. In this study, the human health and social services sector, which is one of the sectors registered with the Central Bank of the Republic of Turkey, is discussed. With the help of the 13-year data of this sector between the years 2009-2021, the activity rates, in other words, the weight of the turnover ratios were measured. As turnover ratios; inventory turnover, receivables turnover, working capital turnover, net working capital turnover, tangible asset turnover, debt turnover and asset turnover were used. If these ratios are high, the company's receivables, debts, etc. demonstrates that he is able to complete his studies. Therefore, the increase in turnover rates for the health sector also gives an idea that the service quality of the sector is good. In the study, 3 different multi-criteria decision making techniques were used to find the weight of the activity rates. The aim is to reach healthier results by determining the level of importance of activity rates through different methods. Then, with the Copeland method, these results were converted into a single order and it was determined which rotation rate ratio was more important in the specified time period.

Keywords: Turnover ratios, SD, Critic, LOPCOW and Copeland methods

1. GİRİŞ

Günümüzde gelişen teknolojik yapılarla birlikte hizmet sektörünün önemi giderek artmaya başlamıştır. Hizmet sektörüne verilen önem aynı zamanda verilen hizmetin kalitesini arttırmak için yapılan uygulamaların geçerli, uygulanabilir ve geleceğe yönelik iz bırakabilmesini sağlayacak düzeyde olmasını hedeflemektedir. Dolayısıyla hedeflerin gerçekleşmesiyle birlikte doğrudan hizmet sektörü daha kaliteli hâle gelmektedir.

Hizmet denildiğinde ise akla ilk gelen sağlık sektörüdür. Çünkü sağlık; insan hayatı için vazgeçilmez olan ve insanların toplumda huzur içinde yaşayabilmeleri için ilk önce değinilmesi gereken kavramlardandır.

Sağlık sektöründe dünyada birçok ülke, özel veya kamu olmak üzere birçok hastanenin yönetimi konusunda ekonomik ve finansal açıdan baskılar yaşayabilmektedir. Bu sorunu ortadan kaldırmak için ise sağlık yönetimindeki üst düzey yöneticilerin etkin, geçerli, doğru ve uygulanabilir politikalar belirmeleri oldukça önem arz etmektedir (Avcı, 2014). Bu politikaları belirleme kısmında ise finansal veya mali analizler devreye girmektedir. Hastaneler için uyguladıkları politikayla uyumlu bir finansal analiz yapmak; hem faydalı hem de finansal performansı arttıran kilit uygulamaların başında gelmektedir (Li vd., 2002).

Tüm işletmelerdeki gibi özel veya kamu olmak üzere hastanelerde finansal performans ölçümü; geleceğe yönelik tahminler yapmak ve hedef belirlemek açısından oldukça önem arz etmektedir. Ayrıca özel sektörün sağlıkta varlığı hastaneler arası rekabeti arttırdığı için performans ölçümü gitgide önem kazanmıştır. Hastanelerin türüne göre finansal performans ölçümünde amaç değişse de her işletmenin getiri sağlaması gerekmektedir (Doğru, 2010). Kamu hastanelerinde her ne kadar sosyal sorumluluk bilinci ağır bassa da varlıklarını sürdürebilmeleri için onların da kaynağa ihtiyaçları bulunmaktadır ve bu kaynakları özel hastanelerdekine benzer biçimde etkin ve verimli kullanılıp kullanılmadığını saptayabilmek için finansal performans ölçümlerinin yapılması gereklidir (Çil Koçyiğit, 2011).

Finansal performans ölçümleri yapıldıktan sonra başarılı bir performansı bulunan hastaneler, mevcut kaynaklarını doğru kullanıp finansal sürdürülebilirliği sağlamakta ayrıca borç-öz kaynak dengesini de kurabilmektedir (Özgülbaş, 2005).

Finansal performans ölçümü yapabilmek için ise sayısal verilerden oluşan finansal göstergeler kullanılmaktadır. Bu ölçüm hastaneler için; varlıklarını ve kaynaklarını ne derece etkin kullandıklarını, mevcut finansal durumlarını, risk durumunu ve yatırım kararlarını

değerlendiren bir dizi süreçten oluşmaktadır. Geçmiş ve şu anki durumu birlikte incelediği için hastanelerin gelecek planlamalarında yol gösterici nitelik taşımaktadır (Ekinci ve Bakır, 2021).

Mâli ya da finansal analiz; bir işletmenin finansal durumunun yeterliliğini belirleyen, finansal tablo kalemlerindeki değişiklikleri, kalemler arasındaki ilişkileri inceleyen ve sektördeki firmalarla sonuçları karşılaştıran bir kavramdır (Akgüç, 2013). Finansal analizde geleceğe yönelik tahminlerde bulunabilmek için mevcut ve geçmişteki veriler yardımıyla durum değerlendirmesi yapılmaktadır (Özer, 2012). Finansal analiz; yatay analiz, dikey analiz, trend analizi ve karşılaştırmalı tablolar analizi olmak üzere 4 şekilde yapılmaktadır (Palamutçu, 2013).

Bu çalışmada finansal analiz tekniklerinden oran analizi yardımıyla verilere erişim sağlanmıştır. Oran analizi türlerinden ise faaliyet oranları veya diğer bir deyişle devir hızı rasyoları hesaplanmıştır.

Faaliyet oranları; işletmelerin aktif kullanım etkinliğini ölçerek firmaların varlıklarını ne düzeyde verimli kullandığını tespit etmektedir. Bu nedenle faaliyet oranlarının yüksek olması varlıkların verimli kullanıldığına işaret etmektedir (Demir ve Tuncay, 2012).

Yapılan çalışmada kullanılan faaliyet oranları; stok devir hızı, alacak devir hızı, çalışma sermayesi devir hızı, net çalışma sermayesi devir hızı, maddi duran varlık devir hızı, borç devir hızı ve aktif devir hızıdır.

Stok devir hızı (SDH); firmanın stoklarını yılda kaç kere yenilediğini ve satışlara dönüştürdüğünü göstermekte olup, satılan malın maliyeti / ortalama stoklar formülüyle hesaplanmaktadır. SDH'nin düşük olması; işletmelerin satış politikalarındaki yanlışlardan, emniyet stoğu yüksekliğinden ve stok düzeyindeki dengesizliklerden kaynaklanmaktadır. Yüksek SDH ise doğru stok politikaları, üretim-stok dengesi ve siparişle üretim yapılması gibi gerekçelere bağlıdır (Warren, Reeve & Fess, 2002; Akdoğan ve Tenker, 1997; Akgüç, 1991).

Alacak devir hızı (ADH); alacakların yılda kaç kez tahsil edildiğini göstermekte ve net satışlar / ticari alacaklar formülüyle hesaplanmaktadır. ADH'nin yüksek olması istenmektedir. Yüksek ADH; firmanın alacak tahsil yeteneğinin yüksek olduğunu, alacak politikasının güçlü olduğunu, müşterilerinin risk profilinin düşük olduğunu, finansman ihtiyacının düşük ve çalışma sermayesinin alacaklara bağlı olduğunu göstermektedir (Tandoğan, 2002).

Çalışma sermayesi devir hızı (ÇSDH); işletme sermayesi devir hızı olarak da ifade edilen ÇSDH, net satışlar / işletme sermayesi formülüyle hesaplanmaktadır.

Net çalışma sermayesi devir hızı (NÇSDH); net işletme sermayesi devir hızı olarak da ifade edilen oran, net satışlar / net işletme sermayesi formülüyle bulunmaktadır. NÇSDH; 1 liralık net işletme sermayesinin işletme satışlarında ortaya çıkardığı satış kapasitesini göstermektedir (Ayboğa ve Erol, 2022).

Maddi duran varlık devir hızı (MDVDH); net satışlar / net maddi duran varlıklar formülüyle hesaplanan MDVDH, maddi yapıdaki varlıkların ne derece etkin kullanıldığını ölçmektedir (Aydoğdu, 2010).

Borç devir hızı (BDH); kredili alımlar tutarı / ortalama ticari borç formülüyle hesaplanan BDH, 1 yıl içinde borç ödeme kabiliyetini ortaya koymaktadır (Akgüç, 2010).

Aktif devir hızı (AKDH); varlıkların ne derece etkin kullanıldığını gösteren olup, net satışlar / toplam aktif formülüyle hesaplanmaktadır. AKDH'nin yüksek olması firmanın tam kapasite ile çalıştığını gösterirken, eğer firmada sabit varlıklar fazlaca bulunuyorsa AKDH genellikle düşüktür (Ceylan ve Korkmaz, 2013; Keown vd. 1998).

Yapılan çalışmada amaçlanan ise; Türkiye Cumhuriyeti Merkez Bankası'na (TCMB) kayıtlı insan sağlığı ve sosyal hizmetler sektörü için 2009-2021 yılları arası 13 yıllık dönemde hangi faaliyet oranının daha önemli olduğunu tespit ederek bu tespite yönelik değerlendirmelerde bulunmaktır. Çalışmada faaliyet oranlarının önem düzeyini tespit etmek için SD, Critic ve LOPCOW olmak üzere 3 çok kriterli karar verme tekniğinden yararlanılmıştır. Daha sonra bu sonuçları birleştirip tek bir sıralama elde etmek için Copeland yöntemi kullanılmış ve hangi faaliyet oranının insan sağlığı ve sosyal hizmetler sektöründe daha önemli olduğu saptanmıştır.

2. LİTERATÜR İNCELEMESİ

Araştırmanın konusuna ve amacına uygun literatürdeki çalışmalar hakkında kronolojik olarak bilgi verilmiştir.

Tutar ve Güngör Tanç (2022) araştırmalarında pandeminin yarattığı etkilerin hastanenin finansal performansındaki sonuçları ölçülmüştür. Örneklem; Mersin'de faaliyet gösteren bir devlet hastanesidir. Veriler; temel finansal tablolar yardımıyla elde edilmiş ve finansal performans analizi için ise karşılaştırmalı tablolar yöntemi tercih edilmiştir. Bulgulara göre; hastanenin dönen varlıkları, ticari alacakları, stokları, dönem net zararı ve faaliyet zararı 2020 yılında oldukça artmıştır. Bunun temel sebebi; Covid-19 salgınıdır. Fakat bu etkinin görülmesi adına devam eden yıllarda da analizlerin yapılması gerektiği önerilmektedir.

Işıkçelik ve Ağırbaş (2022) orta ve büyük ölçekli sağlık kurumlarının 2020 yılına ait finansal performansını Gri İlişkisel Analiz (GİA) tekniğiyle ölçmüşlerdir. Analiz sonucunda; orta ölçekli kurumların büyük ölçekli kurumlara kıyasla finansal performansının daha iyi olduğu tespit edilmiştir. Ayrıca oran bazlı bakıldığında; likidite ve devir hızı olarak büyük ölçekli, kârlılık açısından orta ölçekli ve finansal yapı açısından her iki grubun eşit düzeyde performans gösteren sağlık kurumları olduğu ortaya çıkarılmıştır.

Ekinci ve Bakır (2021) yeni kurulan kamuya bağlı bir özel dal hastanesinin finansal analizi ilk 5 yıla ait temel finansal tablolar aracılığıyla yapılmıştır. Yöntem olarak ise oran analizi kullanılmıştır. Sonuç olarak; hastanenin etkili bir finansal performans göstermesi için likidite durumunu koruması, maliyetlerini kontrol etmesi, alacak-borç yönetiminde etkinliği sağlaması ve finansal göstergelerini düzenli olarak kontrol etmesi gerektiği vurgulanmıştır.

Timurtaş (2021) kamu-özel ortaklığına dayalı hastanelerle sadece kamuya bağlı hastaneler arasındaki sağlık hizmetinin verimlilik ve performansını kıyaslamıştır. Araştırmada literatür taranmış ve çalışmanın amacına uygun 5 araştırma değerlendirilmiştir. Sonuç olarak; kamu-özel ortaklığına dayalı hastanelerin kamu hastanelerine göre performansı daha yüksek ve verimli olduğu görülmüştür. Ancak bu konunun daha net çıkarımlar yapabilmek adına derinlemesine incelenmesi gerektiği önerilmiştir.

Yiğit (2020) araştırmasında 2009-2019 yılları arasında Türkiye'deki hastane hizmetleri alt sektörünün finansal performansını ve risk durumunu analiz etmiştir. Oran analizi yardımıyla 11 finansal performans değerlendirme kriterini TOPSIS yöntemiyle analize tabi tutmuştur. Risk durumunu ise Altman Z Skorunu kullanarak ölçmüştür. TOPSIS skorlarına göre; en yüksek finansal performans 2010 yılında, en düşük finansal performans ise 2018 yılında gerçekleşmiştir. Altman Z Skoru ise en yüksek 2009 yılında en düşük ise 2018 yılında görülmektedir. Hastane sektörünün 2009 ve 2010 yıllarında finansal riski olmadığı; fakat 2017 ve 2018 yıllarında riski yüksek finansal olarak başarısız olduğu tespit edilmiştir.

Yiğit (2019) çalışmasında kamu hastanelerinin performansını TOPSIS yöntemi ile analiz etmiştir. Örneklem evrenin tamamından oluşmakta olup Sağlık Bakanlığı'na bağlı A1 grubunda yer alan tüm hastaneleri içermektedir. Performans değerlendirme kriterleri; hekim başına düşen günlük poliklinik sayısı, yatak başına düşen hekim oranı, yatak başına düşen hemşire oranı, hekim başına ağırlıklı ameliyat sayısı, yatak doluluk oranı, yatak devir hızı ve ortalama kalış gün sayısıdır. Analiz sonucunda; performansı en yüksek hastane Giresun Üniversitesi Prof. Dr. A. İlhan Özdemir Hastanesi, en düşük puana sahip hastane

ise Gülhane Eğitim ve Araştırma Hastanesi olarak tespit edilmiştir. İl bazlı en düşük performans ise sırasıyla İzmir, Ankara, İstanbul, Antalya ve diğer illere ait olarak bulunmuştur.

Çil Koçyiğit ve Kocakoç (2019) çalışmalarında Ankara ilindeki 13 kamu hastanesinin 2008-2017 yılları arası 10 yıllık mali tabloları yardımıyla oran analizi gerçekleştirmişlerdir. Elde edilen bulgulara göre; likidite oranlarında düşüşler olduğu, borçların hatta kısa vadeli borçların oldukça arttığı, özkaynakların azaldığı, riskin artış gösterdiği, maddi duran varlık ve duran varlıkların gereğinden fazla kullanıldığı ve kârlılığın istenilen düzeyde olmadığı görülmüştür.

Kar, Özer ve Avcı (2019) çalışmalarında Türkiye'deki kamu ağız ve diş sağlığı merkezlerinin tümüne ait finansal performans analizi yapmışlardır. Araştırmanın örneklemini aynı zamanda evreni olup Türkiye'deki 126 ağız ve diş sağlığı merkezini kapsamaktadır. Kullanılan yöntem, TOPSIS yöntemidir. Yıl olarak, 2016 yılı analiz edilmiştir. Değerlendirme kriterleri; toplam tahakkuk gelirleri / toplam gider, global bütçe dışı diğer tahsilat / global bütçe dışı diğer tahakkuk, tahakkukların muhasebeleştirilmesi süresi ve net borç / net hizmet tahakkuk tutarıdır. Elde edilen bulgulara göre; en iyi ya da en ideal finansal performans 1603530 ID numaralı ağız ve diş sağlığı merkezi olarak belirlenmiştir.

Alper ve Biçer (2017) oran analizi yardımıyla bir kamu hastanesinin 3 yıllık mali tablolarını kullanarak finansal analizini gerçekleştirmişlerdir. Sonuçları sektör oranlarıyla kıyaslamışlardır. Bulgulara göre; hastanenin likiditesinin yeterli, net çalışma sermayesinin iyi, alacak tahsilinde sorun yaşamadığı, stok devir hızının yüksek, finansal yapısının güçlü ve kârlılık durumunun ilk 2 yıldan sonra artmaya başladığı görülmüştür.

Özer (2012) kamu hastanesinin son 3 yıla ait mali tabloları yardımıyla retrospektif analizini yapmayı amaçlamıştır. Oran analizi ve karşılaştırmalı tablolar analizi yöntem olarak kullanılmıştır. Örneklem yılı; 2008, 2009 ve 2010'dur. Sonuçlar; alacak devir hızının düşük olduğu ve buna istinaden alacak tahsilinde sıkıntılar bulunduğunu göstermekte hatta özkaynak ağırlıklı finansal yapıya sahip hastanenin kârlılık düzeyinde 3 yılda oldukça dalgalanmalar yaşandığı görülmüştür.

Özgülbaş vd. (2008) araştırmalarında; Türkiye'deki 797 özel hastanenin 1994-2005 yılları arasında kapsayan 12 yıllık bir veri seti yardımıyla finansal analizini gerçekleştirmişlerdir. Analiz yapılırken oran ve trend analizi kullanılmıştır. Ayrıca araştırmada finansal performans etki eden faktörler Mann-Whitney U testi ile belirlenmiştir. Sonuç olarak; likidite durumu, net çalışma sermayesi, finansal yapıları, alacak yöntemi, tahsilat süresi ve kârlılık oranlarının finansal performansı etkileyen faktörler olduğu saptanmıştır.

3. ARAŞTIRMANIN YÖNTEMİ

Araştırmada faaliyet oranlarının önem derecesini bulabilmek için 3 farklı çok kriterli karar verme tekniği yardımıyla kriterler sıralanmış ve bu sıralama başka bir yöntem yardımıyla bütünleştirilmiştir. Kullanılan 3 yöntem; SD, Critic ve LOPCOW yöntemleridir. 3 yöntemin sonuçları ise Copeland yöntemiyle tek bir sıralama hâline dönüştürülmüştür.

3.1. SD Yöntemi

SD yöntemi; objektif çok kriterli değerlendirme kriterlerinden olan ve standart sapma yöntemi olarak da ifade edilen Entropi, Critic ve CILOS gibi nesnel çok kriterli karar verme teknikleri arasındadır. Bu yöntemde kriter ağırlıkları belirlenirken standart sapmadan yararlanılmaktadır (Bağcı ve Yüksel Yiğiter, 2019).

SD yöntemi 3 adımdan oluşmaktadır (Diakoulaki, Mavrotas & Papayannakis, 1995):

Adım 1: Araştırmanın veri setinden karar matrisi oluşturulması kısmıdır. Bu adım çok kriterli karar verme tekniklerinin birçoğunda bulunmaktadır.

Adım 2: Karar matrisi sonucu elde edilen verileri normalize etme işlemidir. Bu adımda pozitif nitelikli fayda kriterleri 1 numaralı formülle, negatif nitelikli maliyet kriterleri ise 2 numaralı formülle normalize edilmektedir.

$$r_{ij} = \frac{x_{ij} - x_j^{\min}}{x_j^{\max} - x_j^{\min}} \quad i = 1, 2, \dots, m; \quad j = 1, 2, \dots, n \text{ (fayda kriteri için)} \quad (1)$$

$$r_{ij} = \frac{x_j^{\max} - x_{ij}}{x_j^{\max} - x_j^{\min}} \quad i = 1, 2, \dots, m; \quad j = 1, 2, \dots, n \text{ (maliyet kriteri için)} \quad (2)$$

Adım 3: Yöntemin son adımı; kriterlerin ağırlıklarının bulunması ve hangi kriterin daha önemli olduğunun tespit edilmesidir. Bu tespit 3 numaralı formülle yapılmakta ve ağırlığı en çok olan kriter en önemli kriter olarak saptanmaktadır.

$$w_j = \frac{\sigma_j}{\sum_{k=1}^n \sigma_k} \quad (j = 1, 2, \dots, m) \quad (3)$$

3.2. Critic Yöntemi

Critic yöntemi; objektif çok kriterli karar verme tekniklerinden biri olan ve içerisinde diğer yöntemlerden farklı kriterler arası ilişkiyi gösteren korelasyon matrisi bulunan bir tekniktir. Bu teknik 4 aşamadan meydana gelmektedir (Jahan vd. 2012).

1. Aşama: Karar matrisini oluşturup verileri normalleştirme kısmıdır. Bu kısım 4 numaralı formülde olumlu kriterleri hesaplarken, 5 numaralı formülde olumsuz kriterleri tespit etmektedir.

$$R_{ij} = (X_{ij} - X_{jmin}) / (X_{jmax} - X_{jmin}) \text{ olumlu kriterler için;} \quad (4)$$

$$R_{ij} = (X_{jmax} - X_{ij}) / (X_{jmax} - X_{jmin}) \text{ olumsuz kriterler için;} \quad (5)$$

2. Aşama: Kriterler arası ilişkiyi gösteren korelasyon matrisi oluşturmaktır. Bu matrisi oluşturulurken 6 numaralı formül kullanılmaktadır.

$$\rho_{jk} = \frac{\sum_{i=1}^m (r_{ij} - \bar{r}_j)(r_{ik} - \bar{r}_k)}{\sqrt{\sum_{i=1}^m (r_{ij} - \bar{r}_j)^2 \sum_{i=1}^m (r_{ik} - \bar{r}_k)^2}} \quad (j, k = 1, 2, \dots, n) \quad (6)$$

3. Aşama: Belirlenen korelasyon matrisine göre her bir kriterin standart sapmaları 7 numaralı formülle bulunmakta ve ardından 8 numaralı formülle toplam bilgi düzeyi ölçülmektedir.

$$\sigma_j = \sqrt{\frac{\sum_{i=1}^m (r_{ij} - \bar{r}_j)^2}{m}} \quad (7)$$

$$C_j = \sigma_j \sum_{k=1}^n (1 - \rho_{jk}) \quad j = 1, 2, \dots, n \quad (8)$$

4. Aşama: Son adımda toplam bilgi düzeyi kullanılarak kriter ağırlıkları 9 numaralı formülle hesaplanmakta ve ağırlığı en çok olan kriter en önemli kriter olarak belirlenmektedir.

$$w_j = \frac{C_j}{\sum_{k=1}^n (C_k)} \quad (j = 1, 2, \dots, n) \quad (9)$$

3.3. LOPCOW Yöntemi

Güncel çok kriterli karar verme tekniklerinden olan LOPCOW yöntemi Ecer ve Pamucar (2022) tarafından geliştirilmiştir. Nesnel kriterlerden biri olarak literatürde yerini bulmuş ve 4 adımdan oluşmaktadır (Ecer ve Pamucar, 2022).

Adım 1: Araştırmanın veri setinden karar matrisi oluşturulması kısmıdır. Bu adım çok kriterli karar verme tekniklerinin genelinde bulunmaktadır.

Adım 2: Bu adımda veriler normalize edilerek standart hâle getirilir ve birçok yöntemde bu adım mevcuttur. 10 numaralı formülle fayda kriterleri, 11 numaralı formülle maliyet kriterleri normalize edilmektedir.

$$r_{ij} = \frac{x_{ij} - x_j^{\min}}{x_j^{\max} - x_j^{\min}} \quad i = 1, 2, \dots, m; \quad j = 1, 2, \dots, n \text{ (fayda kriteri için)} \quad (10)$$

$$r_{ij} = \frac{x_j^{\max} - x_{ij}}{x_j^{\max} - x_j^{\min}} \quad i = 1, 2, \dots, m; \quad j = 1, 2, \dots, n \text{ (maliyet kriteri için)} \quad (11)$$

Adım 3: Üçüncü adımda her kritere ait yüzde değeri 12 numaralı formülle bulunmaktadır.

$$PV_{ij} = \left| \ln \left(\frac{\sqrt{\frac{\sum_i^m r_{ij}^2}{m}}}{\sigma} \right) \cdot 100 \right| \quad (12)$$

Adım 4: Son adımda kriter ağırlıkları 13 numaralı formülle hesaplanmakta ve ağırlığı en yüksek olan kriter en önemli kriter olarak belirlenmektedir.

$$W_j = \frac{PV_{ij}}{\sum_{i=1}^n PV_{ij}} \quad (13)$$

3.4. Copeland Yöntemi

Copeland yöntemi, Saari ve Merlin (1996) tarafından geliştirilen ve birden çok tekniğin sıralamalarını tek bir sıra hâline dönüştüren yöntemlerden biridir. Literatürde “Borda Sayım” yöntemi gibi Copeland yöntemine benzeyen yöntemler de mevcuttur.

Copeland yöntemi; kıyaslama kullanarak sıralama gerçekleştirir ve galip ya da mağlup olma durumuna göre 1 veya 0 puanı vermektedir. Ardından yöntem bu puanları toplam skora dönüştürüp sıralamayı tamamlamaktadır (Çakır, 2017).

4. BULGULAR

International Conference on Global Practice of Multidisciplinary Scientific Studies-IV
Turkish Republic of Northern Cyprus, April 28-30, 2023

Araştırmada 2009-2021 yılları arasını kapsayan 13 yıllık veri seti yardımıyla TCMB'ye kayıtlı insan sağlığı ve sosyal hizmetler sektörünün faaliyet oranları önem düzeyi ölçülmüştür. Araştırmada kullanılan faaliyet oranları Tablo 1'de görülmektedir.

Tablo 1: Örneklem

Alternatifler	Kriterler
2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020 ve 2021 yılları	Stok devir hızı (SDH), Alacak devir hızı (ADH), Çalışma sermayesi devir hızı (ÇSDH), Net çalışma sermayesi devir hızı (NÇSDH), Maddi duran varlık devir hızı (MDVDH), Borç devir hızı (BDH), Aktif devir hızı (AKDH)

Tablo 1'de örneklem; 13 alternatif ve 7 kriterden oluşmaktadır. Hedeflenen, 7 kriter içerisinde hangisinin daha önemli olduğunu ölçmektir. Ölçüm yapılırken 3 farklı çok kriterli karar verme tekniğiyle önem düzeyleri tespit edilip ardından kullanılan Copeland yöntemiyle bu sıralamalar bütünleştirilmiştir. İlk kullanılan yöntem SD yöntemidir. SD yöntemi skorları Tablo 2'de görülmektedir.

Tablo 2: SD Skorları

Kriterler	Puanlar
NÇSDH	0,151654
ADH	0,149774
AKDH	0,149183
MDVDH	0,145799
ÇSDH	0,143867
SDH	0,130886
BDH	0,128837

SD skorlarına göre; belirlenen zaman diliminde insan sağlığı ve sosyal hizmetler sektörü için en önemli gösterge net çalışma sermayesi devir hızı iken, önem düzeyi en düşük gösterge ise borç devir hızı olarak saptanmıştır. SD yönteminin ardından önem düzeyini ölçmek için kullanılan ikinci yöntem Critic yöntemidir. Critic yöntemine ait sonuçlar Tablo 3'de verilmiştir.

Tablo 3: Critic Puanları

Sıralama	Puanlar
SDH	0,196731
ÇSDH	0,149618
BDH	0,142878
ADH	0,137939
MDVDH	0,131233
NÇSDH	0,130205
AKDH	0,111395

Critic puanlarına göre; aynı sektör için en önemli gösterge stok devir hızı iken, en önemsiz gösterge ise aktif devir hızı olarak belirlenmiştir. Critic yönteminden sonra ise üçüncü bir

yöntem olan LOPCOW yöntemiyle önem düzeyleri son kez hesaplanmış ve sonuçlar Tablo 4’de verilmiştir.

Tablo 4: LOPCOW Skorları

Sıralama	Puanlar
SDH	0,255205
NÇSDH	0,179352
MDVDH	0,161501
ÇSDH	0,155536
AKDH	0,153956
ADH	0,064196
BDH	0,030254

LOPCOW skorlarına göre; stok devir hızı insan sağlığı ve sosyal hizmetler sektörü için en önemli faaliyet oranı iken, borç devir hızı ise önemi en az olan faaliyet oranı olarak tespit edilmiştir.

3 farklı yöntemle elde edilen sıralama sonuçları ve skorlarını tek bir sıralama hâline getirip daha sağlıklı yorumlar yapabilmek için Copeland yöntemi kullanılmıştır. Copeland yöntemi sonucunda 3 farklı yöntem tek bir yöntem indirgenmiş ve sonuçlar Tablo 5’de görülmüştür.

Tablo 5: Copeland Skorları

Sıralama	Puanlar
SDH	8
NÇSDH	6
ADH	4
ÇSDH	2
MDVDH	0
AKDH	-6
BDH	-10

Copeland sonucuna göre; kullanılan 3 yöntemin ortak kararı olarak insan sağlığı ve sosyal hizmetler sektörü için en önemli faaliyet oranı stok devir hızı, ardından net çalışma sermayesi devir hızı onu takip ederken; önemi en düşük faaliyet oranı ise borç devir hızı olarak ortaya çıkarılmıştır.

5. SONUÇ

Özelleştirme uygulamalarının artmasıyla birlikte hizmet sektöründe de rekabet giderek artmış ve artık kamu işletmelerinde de performans ölçümünün önemi ortaya çıkmaya başlamıştır. Hizmet sektörüne verilen önemi arttırmak için, verilen hizmetin kalitesini müşteriler tarafından asgari kabul edilebilir düzeye çıkarmak hatta daha da geliştirmek gereklidir. Hizmet kelimesi kullanıldığında akla ilk gelen kavram ise insan hayatının vazgeçilmez unsuru olan sağlıktır.

Sağlık sektöründe özel veya kamu biçiminde sınıflandırılan hastanelerde, finansal performans ölçümü hastanelerin geleceğe yönelik hedef belirlemeleri açısından son derece önem taşımaktadır. Başarılı durumdaki hastaneler borç-özkaynak dengesini koruyabilmektedir. Yapılan çalışmada finansal analizin türlerinden olan oran analizi kullanılarak veri seti oluşturulmuştur. Oluşturulan veri seti, faaliyet oranlarını içermektedir. Faaliyet oranlarının seçilmesinin nedeni; örneklemdaki işletmelerin aktiflerini ne derece etkin kullandığını tespit ederek varlıklarının verimliliğini belirlemektir. Faaliyet oranları ne derece yüksek olursa varlıkların verimli kullanıldığı görülmektedir. Çalışmanın amacı; TCMB'ye kayıtlı insan sağlığı ve sosyal hizmetler sektöründe faaliyet oranlarının etkinliği ölçülmüştür. Etkinlik ölçümü için; SD, Critic ve LOPCOW yöntemleri kullanılmış ve ardından bulunan sonuçlar Copeland yöntemiyle tek bir sıralamaya dönüştürülmüştür. Çalışmada kullanılan faaliyet oranları; stok devir hızı, alacak devir hızı, çalışma sermayesi devir hızı, net çalışma sermayesi devir hızı, maddi duran varlık devir hızı, borç devir hızı ve aktif devir hızıdır. Kullanılan 3 yönteme göre elde edilen sonuçlar bağlamında SD yönteminde en önemli faaliyet oranı net çalışma sermayesi, önem düzeyi en düşük faaliyet oranı ise borç devir hızı iken; Critic yönteminde en önemli faaliyet oranı stok devir hızı, önemi en az olan ise aktif devir hızı; LOPCOW yönteminde ise yine stok devir hızı en önemli faaliyet oranı, borç devir hızı önemi en düşük faaliyet oranı olarak saptanmıştır. Elde edilen sonuçları bütünleştirip tek bir sıralama hâline getiren Copeland yönteminde insan sağlığı ve sosyal hizmetler sektöründe faaliyet oranlarından en önemlisi stok devir hızı, önem düzeyi en düşük olan ise borç devir hızı olarak tespit edilmiştir. Stok devir hızının, hastaneler için stoklarını ne kadar hızlı paraya çevirdiğini gösterdiğinden dolayı yüksek olması tercih edilmektedir. Hatta bu oranın yüksek olmasıyla birlikte hastanenin gereksinim duyduğu hasta sayısı, ilaç ve tıbbi malzeme hareketliliği de yüksek olacaktır. Dolayısıyla bu yükseliş; hastanedeki ameliyat, acil, yoğun bakım vb. servis hizmetlerinde yoğunluğun arttığını ve hastanenin işlevselliğini de ortaya koymaktadır.

ABSTRACT

Purpose: This review study was conducted to examine the intervention programs for frailty in the elderly and the role of the public health nurse.

Method: Literature search Google Academic through the keywords 'elderly, fragility, frailty syndrome, nursing, prevention, intervention' and using the PubMed database. English and Turkish articles published between 2015 and 2022 and whose full texts are available were reviewed.

Results: When the literature on the subject is examined, the health problems of elderly individuals, who constitute approximately 9.1% of the world population, are characterized by the emergence of several complex health conditions called geriatric syndromes. One of the important health problems of elderly people is fragility. The concept of fragility, which is defined as the state of weakness and the deterioration of adaptation to stress as a result of the decrease in physiological reserves with aging, is extremely important for elderly individuals. Studies in the literature direct us to prevention and intervention programs at this point. In a study, it was determined that the concept of vulnerability negatively affects functional independence and life activity. In another study, it was determined that the development of delirium in fragile individuals was higher than in non-fragile individuals.

Conclusion: It has been determined that trainings such as exercise and diet within the scope of the intervention programs implemented in line with the studies in the literature are factors that can have a healing effect on the course of the frailty level. In addition, it is seen that the interventions applied as a result of the early detection of vulnerability protect the independence of individuals. It is recommended that screening and follow-up of elderly individuals by public health nurses in primary health care services, early detection of frailty in line with the literature, and implementation of effective intervention programs that prevent and reduce frailty.

Anahtar Kelimeler: Elderly, frailty, nursing, intervention program

INTRODUCTION

With the improvement of living standards worldwide, medical and technological developments, controlling infectious diseases, vaccination programs, improvements in health policies, prolonging life expectancy, and providing treatment for many diseases, the human lifespan is getting longer, and the elderly population is gradually increasing (Santrock 2015, Top ve Dikmetaş 2015). According to the data of the World Health Organization, which states that the proportion of the elderly population is increasing in every country, by 2050, the population of people aged 60 and over in the world is expected to double (2.1 billion) (WHO 2021, Beard et al. 2016). In Turkey, it is seen that the elderly population has reached 8 million 245 thousand 124 according to the 2021 data published by the Turkish Statistical Institute (TUIK). It is stated that the proportion of the elderly population in the total population has increased to 9.7% (TUIK 2021). The accumulation of a wide variety of molecular and cellular damage over time causes aging at the biological level. Biological aging leads to a gradual decrease in physiological and mental capacity, an increase in disease risks and ultimately death. In addition, old age is characterized by the emergence of several complex health conditions called the geriatric syndrome. Geriatric syndromes are often the result of multiple underlying factors such as frailty, falls, urinary incontinence, delirium and pressure sores (WHO 2021). Among geriatric syndromes, frailty, which is frequently encountered with prolonged life expectancy, has become an issue that needs to be handled carefully in all health care providers.

The concept of fragility is defined in the literature as the state of weakness and deterioration of adaptation to stress, which occurs as a result of the decrease in physiological reserves in multiple organ systems with aging (Yoltay & Korkmaz 2021, Demiray et al. 2022). Although aging is not synonymous with the concept of fragility, age is an effective factor in the development of frailty (Yoltay & Korkmaz 2021). In a prevalence study, it was found that the prevalence of frailty is higher in people over the age of 80 than in other age groups (Büyüksülu 2020).

The ethology of frailty syndrome has not been fully explained, but advanced age, low education level, smoking and alcohol consumption, high body mass index, malnutrition, decreased immunity, genetic and environmental factors, being single, depression, antidepressant drug use, presence of mental disability, cardiovascular disease. There are studies showing that systemic diseases, sarcopenia and fragility are related. (Mello et al. 2014, Bandeen-Roche et al. 2015, Graham & Brown 2017, Şahin & Akçiçek 2019, Çakmak & Inkaya 2021, Kong 2021). In another study, it was concluded that the risk factors associated with frailty are female gender, sedentary life, presence of comorbidities, polypharmacy, malnutrition, staying at home, going

to the emergency department at least once in the last year, and a history of hospitalization (Büyükuslu 2020).

When the clinical features of fragile individuals are observed, it is stated that there are postural disorders, loss of muscle strength, decrease in appetite, weakness, unexplained anemia, amnesia, deterioration in cognitive processes, decrease in visual and hearing acuity, and decreased reflexes (Kapucu and Ünver 2017, Michel and Walston 2018, Şahin and Akçiçek 2019). Neurological diseases such as depression, cancer, kidney diseases, blood diseases, diabetes mellitus, Parkinson's and Alzheimer's are counted as the most common co-morbidities in fragile individuals (Şahin ve Akçiçek 2019). According to the analysis of meta-analysis studies in which many studies were included, it is stated that frail elderly individuals have more cognitive impairment than non-fragile elderly individuals (Büyükuslu 2020).

It is reported that with the control of the fragility process, the quality of life of elderly individuals will increase by preserving their independence (Kapucu & Ünver 2017). It is stated that it is possible to reverse the frailty state when appropriate exercise activities are performed for the frail individual who has been identified in the early period. It is stated that if it is not noticed, it can cause much more serious problems that progress to immobility or mortality (Akturan et al. 2020). For these reasons, this review study was conducted to examine intervention programs for frailty in elderly individuals.

METHOD

The literature search was conducted using the Google Scholar and PubMed database, using the keywords 'elderly, fragility, frailty syndrome, nursing, prevention, intervention, frailty assessment'. English and Turkish articles published between 2015 and 2022 and whose full texts are available were reviewed.

RESULTS

The intervention studies implemented for vulnerability are listed below.

In an intervention study by Nagai et al. (2018), due to the uncertainty of the effect of increased physical activity (PA) in addition to resistance exercise (RT) on frailty, in this study, in addition to resistance strength training, physical activity intervention with feedback was used in frail older adults physical and mental health. It is aimed to investigate the effect on the results. 41 elderly individuals living in Japan with an average age of 81.5 were included in this study. Randomly selected individuals received resistance training with either the PA (RPA group) or RT group for six months. Instrumental activities of daily life, state of movement, level of muscle strength and health-related quality of life, frailty status and frailty scores were evaluated. It was

stated that while a significant increase was observed in the number of daily steps taken and lower extremity muscle strength of the participants in the RPA group, a significant decrease was achieved in frailty scores. In this study, administration of a PA intervention in addition to RT reduced frailty scores in older adults with frailty symptoms. Also, it is reported to be applicable because it increases muscle strength and mobility in the lower extremities (Nagai et al. 2018).

In another intervention study by Hsieh et al. (2019), effective individualized home-based exercise and nutrition interventions were developed to reduce vulnerability. 319 pre-frail or frail older adults; randomly assigned to any of the four study groups (control, exercise, nutrition, and nutrition+exercise [combination]). An exercise intervention was created from a combination of training that included flexibility, strength, balance, and endurance. As a nutritional intervention, it was aimed to maintain the desired body weight by consuming a certain number of servings from all six food groups and ensuring adequate caloric intake (fruits, vegetables, foods high in protein, cereals, plant oils). Calorie needs of the participants were evaluated by considering age, gender, height, weight and physical activity levels. Participants were recommended about 3 to 7 exercise sessions per week. All participants in the combination and exercise groups were encouraged to complete 6 months of home-based exercise, and their daily exercise performance was recorded in an exercise diary. Evaluation of all participants at baseline, month 1, month 2, month 3 and month 6 was performed monthly by a trained case manager who did not know to which intervention group the participants belonged. When the results of this study are examined, it has been reported that individualized home-based exercise and diet interventions are effective in improving frailty and physical performance in pre-frail or frail older adults in the community. In addition, it is stated that nutritional intervention can play an active role in improving mental health in pre-frailty or older adults. As a result, it is recommended to identify pre-vulnerable or frail older adults in clinical and public health units, community-based hospitals. Implementation of individualized exercise and nutrition intervention programs is another recommendation to improve and manage frailty (Hsieh et al. 2019).

The effect of a Multisystem Physical Exercise Program (MPE) by Chittrakul et al. (2020) on fall prevention and health-related quality of life in older adults with pre-frailty was evaluated in the study. This research was carried out with 72 individuals aged 65 and over, 36 people in the multi-system physical exercise group and 36 people in the control group. This intervention was carried out 3 days a week for 12 weeks and consisted of proprioception (awareness of body

movement and position), muscle strengthening, reaction time and balance exercise. According to the results of the research; It has been reported that the MPE program significantly increases muscle strength by improving proprioception, reaction time and postural sway, in addition to reducing the risk of falls in older adults with anterior fragility. In line with these results, it is recommended that the that the MPE program be used in primary care practices in individuals with pre fragility (Chittrakul et al. 2020).

In another intervention study by Sadjapong et al. (2020), the aim of the Multi-component exercise program (MCEP) is to investigate its effectiveness on fragility, physical performance and blood biomarkers. This study included 64 elderly adults, 32 people in the MCEP group and 32 people in the control group. The combined center and home-based multi-component exercise program consists of chair aerobics, resistance and balance. This training was carried out 3 days a week for 24 weeks. It has been concluded that the combined center and home-based multi-component exercise program is effective in returning frailty to pre- frailty, improving balance and improving physical performance, especially in the elderly population. It has been reported that the Multi-Component Exercise Program has made significant progress on the frailty scores of the participants, the Berg Balance Scale (BBS) and the Timed Up and Go test (TUG) (Sadjapong et al. 2020).

CONCLUSION

In conclusion, in line with the research, early detection of frailty in elderly individuals and planning of intervention programs suitable for the individual are extremely important. At the same time, it has been determined that programs such as exercise and diet within the scope of intervention programs for frailty can improve the course of frailty level. Also, it is seen that the interventions applied as a result of the early detection of vulnerability protect the independence of individuals. In primary health care services, it is recommended to carry out screenings and follow-ups for elderly individuals by nurses, early detection of frailty, and implementation of effective intervention programs that prevent and reduce frailty.

Abstract

The System Marginal Price (SMP) is the purchase price derived by taking into account all bids received in the balancing energy market. An accurate SMP prediction is critical for electricity generators and suppliers. If generators and suppliers can precisely predict the SMP, they will be able to make more accurate market bids and limit potential losses. This study aims to compare machine learning-based eXtreme Gradient Boosting Regressor (XGBoostRegressor), Support Vector Regressor (SVR), Extreme Learning Machines (ELM), and Monte Carlo Simulation-based models for SMP prediction. Multiple parameters and time delay options have been tested for 7 different days. A dataset of 45790 rows consisting of 30 attributes obtained from Energy Exchange Istanbul (EXIST) has been created. The MAPE's obtained with XGBoostRegressor, SVR, ELM and Monte Carlo Simulation varied from 2.23% to 45.7% on different days. Examination of the results of the prediction models indicates that models based on machine learning and Monte Carlo Simulation can be effective in predicting SMP and that further research can be conducted to improve their performance.

Keywords: System Marginal Price, Forecasting, Machine Learning, Monte Carlo Simulation

Introduction

The electricity sector worldwide has undergone significant and transformative changes since the early 1980s in order to improve economic efficiency. Prior to these changes, the electricity sector was monopolized by state-owned, vertically integrated entities that controlled all aspects of generation, transmission, distribution, and retail activities. Consumers were obligated to purchase electricity at a price set by these monopolies. Governments have allowed investors to participate in the energy market as they cannot handle the huge demand for energy alone. This has led to a liberalization of the energy market, which involves a reduction in public spending and an increase in private sector investments (Wang and Ramsay 1997). Turkey has followed this pattern by creating an electricity market similar to a stock market, allowing for trade to be carried out through a pool system (Ünal et al. 2022, Arslan and Ertuğrul 2022). The electricity market in Turkey is divided into three markets, including the day-ahead market, intra-day market, and balancing market. The balancing market provides reserve capacity to ensure real-time balancing for system operators, and frequency control and demand control services are guaranteed through ancillary services. The balancing power market determines the price of the bid, which is associated with the net volume of orders issued in the market. (Sirin and Yilmaz 2021, Dursun et al. 2020).

Following the liberalization and restructuring of the electricity sector, activities such as unbundling and privatization became prevalent. The primary objective of these changes was to create a competitive market where utilities and consumers could compete to sell and purchase electricity at a price that is not government-regulated. As electricity markets have undergone restructuring and liberalization, accurate electricity price forecasting has become increasingly vital for various market participants, including utilities, generators, and consumers. The ability to accurately predict electricity prices enables utilities to develop effective supply strategies and optimize their bilateral contracts to maximize profits, while consumers can use the forecast to derive their electricity consumption and bidding strategies to minimize consumption costs (Ozgiiner 2012). With the growth of the competitive energy market, electricity price forecasts such as the System Marginal Price (SMP) have become even more important, as they provide essential information for electricity generators and other energy service providers to participate in the market and maximize profits.

The SMP, in particular, is a reference price used to settle transactions in the Day-Ahead Market (DAM) and is crucial for generators and other energy service providers to make informed decisions. However, predicting the SMP has become a more complex process due to the volatile nature of electricity as a commodity. The SMP can change rapidly, sometimes within an hour,

to balance supply and demand. Furthermore, the SMP is affected by several factors, such as long-term contracts between suppliers and consumers, the price of primary energy sources, and power grid expansion planning (Mount 2001).

In the past, the objective of power system planning and management was to reduce production and operating costs. However, the introduction of competition in the electricity market has changed the objective to maximizing profits or returns for market participants. Predicting the System Marginal Price (SMP) is significant for both consumers and producers of electrical power. However, the prediction of SMP is difficult because it is volatile and depends on various variables, such as the price of oil, load demand, and natural parameters. A good SMP prediction can assist both consumers and electric power companies in maximizing their profit. The price of primary energy sources also affects the SMP, making electricity more volatile and challenging to predict than other traded commodities.

To overcome these challenges, it is essential to develop a robust and adaptable SMP forecasting model that can account for both short-term and long-term variation (Jufri et al. 2019). This study compares different machine learning-based models for predicting the SMP, including the eXtreme Gradient Boosting Regressor (XGBoostRegressor), Support Vector Regressor (SVR), Extreme Learning Machines (ELM), and Monte Carlo Simulation-based models. By evaluating the performance of these models, we can determine which ones are most effective in forecasting the SMP and can be used by market participants to make informed decisions and maximize their profits.

Literature Review

In recent years, various methods have been proposed for the prediction of System Marginal Price (SMP) in electricity markets. These methods use a wide range of techniques from traditional time series analysis to machine learning and deep learning algorithms. This literature review focuses on the machine learning-based approaches, specifically the eXtreme Gradient Boosting Regressor (XGBoostRegressor), Support Vector Regressor (SVR), Extreme Learning Machines (ELM), and Monte Carlo Simulation-based models for SMP prediction. According to a recent study by (Shim et al. 2023), a 2-Step method was proposed for SMP forecasting after load forecasting using XGBoost, random forest, light gradient boosting machine, and linear regression models. The study performed feature selection using Shapley additional explanations and Pearson correlation coefficient, and the hyperparameters of the forecasting model were adjusted by Grid search. The ensemble model of LGBM and random forest showed the best performance in MAPE except for spring. The study concluded that the proposed method can be

useful for power generation companies or virtual transaction operators participating in the electricity market for SMP forecasting. In a recent study, (Zhao et al. 2022) proposed an ultra-short-term power load forecasting method based on the windowed XGBoost model and real-time electricity prices. The proposed method aims to reduce the complexity of the model and capture the autocorrelation effect of the predicted object. The model's forecast accuracy is significantly improved by introducing real-time electricity prices. The superiority and feasibility of the proposed method were verified by simulating actual data from the national electricity market of Singapore (NEMS) and comparing it with several deep learning algorithms. In a recent study, the authors proposed an adaptive long-term electricity price forecasting model using Monte Carlo simulation to reduce risks and maximize outcomes in the electricity market (Poullikkas 2018). The proposed method showed good performance in electricity and oil price prediction for various forecasting periods. A K-means, Support Vector Machine and Support Vector Regression (k-SVM-SVR) model was proposed by the authors to predict day-ahead electricity prices in the single electricity market (SEM) in Ireland. The model achieved approximately 20% improvement and reduced error variances over the existing predictions available to market participants in Ireland (Lynch et al. 2019). A comparative analysis of machine learning methods in the Turkish electricity market was conducted to analyze system marginal price (SMP), and the results showed that comparing with support vector machines (SVM)-based methods, k-nearest neighbors (KNN)-based methods, the ensemble-based method gives better results (İpek 2023). According to a comparative analysis of machine learning models for System Marginal Price (SMP) prediction in the Greek energy market, the use of artificial neural networks and neuro-fuzzy models can lead to increased profits and more efficient portfolio management for producers. The study found that ANFIS outperformed other models in terms of accuracy and is more suitable for the problem under study (Panapakidis and Moschakis 2019). According to a research study, comparing traditional time series forecasting algorithms, adaptive or self-adaptive approaches to forecasting short term system marginal prices (SMPs) would be more suitable in predicting energy demands in territories such as Ireland, considering factors such as meteorological forecasts, forecasted demand, and network topology constraints (Li et al. 2017). In conclusion, machine learning-based approaches, including XGBoostRegressor, SVM, ELM, and Monte Carlo Simulation-based models, have been proposed as effective methods for SMP prediction in electricity markets. These methods utilize historical SMP data, as well as other relevant information, such as weather forecast data, temperature, load, and wind speed, to forecast SMP for the next hour

or day. The results of these studies showed that the proposed machine learning-based models outperformed traditional time series methods in terms of accuracy and robustness.

Dataset Generation

We use a dataset obtained from the Energy Exchange Istanbul, which includes hourly SMP values from January 2017 to March 2022, along with several other attributes.

These attributes are: *Historical SMP (System Marginal Price)*, *Natural Gas (Amount of electricity production from natural gas source)*, *Dam (Amount of electricity production from dam source)*, *Lignite A (Amount of electricity production from lignite source)*, *Stream (Amount of electricity production from stream source)*, *Imported Coal (Amount of electricity production from imported coal source)*, *Wind (Amount of electricity production from wind source)*, *Solar (Amount of electricity production from solar energy source)*, *Fuel Oil (Amount of electricity production from fuel source)*, *Geothermal (Amount of electricity production from geothermal source)*, *Bituminous Coal (Amount of electricity production from bituminous coal source)*, *Asphaltite Coal (Amount of electricity production from asphaltite coal source)*, *Biomass (Amount of electricity production from biomass energy source)*, *Naphta (Amount of electricity production from the distillation of petroleum between 100 and 250 degrees Celsius)*, *SMP (TL/Mil) (Previous SMP in TL / Milli Watt Hour (MWh))*, *SMP (USD/Mil) (Previous SMP in USD / Milli Watt Hour (MWh))*, *SMP (EURO/Mil) (Previous SMP in EUR / Milli Watt Hour (MWh))*, *EURO_open (Opening value of EURO)*, *EURO_close (Closing value of EURO)*, *USD_open (Opening value of USD)*, *USD_close (Closing value of USD)*, *BIST30_open (Opening value of Exchange İstanbul-30)*, *BIST30_close (Closing value of Exchange İstanbul-30)*, *BIST100_open (Opening value of Exchange İstanbul-100)*, *BIST100_close (Closing value of Exchange İstanbul-100)*, *Wet_Istanbul (Temperature in Istanbul during the day (in °C))*, *Wet_Ankara (Temperature in Ankara during the day (in °C))*, *Wet_Izmir (Temperature in Izmir during the day (in °C))*, *Wet_Antalya (Temperature in Antalya during the day (in °C))*, *Wet_Bursa (Temperature in Bursa during the day (in °C))*.

Methodology

Developing accurate and effective prediction models in the energy sector requires careful selection of relevant attributes and features in the dataset. In this study, the Minimum Redundancy Maximum Relevance (mRMR) feature selection algorithm was employed to identify the most important features in the dataset for developing successful prediction models.

In this study, a total of four algorithms were utilized, among which three were machine learning algorithms namely Support Vector Regression (SVR), XGBoost Regressor, and Extreme Learning Machine (ELM), while the fourth algorithm was Monte Carlo simulation.

SVR is a type of supervised learning algorithm that is commonly used for regression analysis. The algorithm works by finding a hyperplane in a high-dimensional space that optimally separates the input data into different classes. The goal is to find the hyperplane that maximizes the margin between the two classes while minimizing the classification error (Drucker et al. 1996).

The XGBoost Regressor is a powerful gradient boosting algorithm that is widely used in the field of machine learning. It works by iteratively adding weak decision trees to the ensemble, with each new tree correcting the errors made by the previous trees (Chen and Guestrin 2016). The Extreme Learning Machine (ELM) is a type of artificial neural network that is known for its fast learning speed and good generalization performance. Unlike traditional neural networks, ELM only requires a single hidden layer and randomly assigns the weights between the input layer and the hidden layer. This simplifies the training process and reduces the risk of overfitting (Huang et al. 2011).

Monte Carlo simulation is a statistical method that uses random sampling to simulate real-world scenarios. In this study, Monte Carlo simulation was used to generate multiple scenarios of energy consumption and price fluctuations to test the robustness and accuracy of the developed prediction models (Mooney 1997).

The performance of each of the four machine learning algorithms was evaluated using Mean Absolute Percentage Error (MAPE) metric. The models were developed using Python programming language and its associated libraries (Scikitlearn, XGBoost, Tensorflow, Pandas, Numpy).

In this study, two techniques were used as pre-processing technique: Gaussian Filter (GF) and Exponential Smoothing (ES). The GF technique was used to remove the noise from the dataset. Noise in the dataset can lead to inaccurate predictions, so this technique was applied to ensure that the data was as clean as possible before analysis. The ES technique was used to give more weight to newer data when previous price changes were less important. This technique is useful when there are seasonal patterns in the data, as it allows for the identification of these patterns and their impact on future prices. These two techniques were applied at predefined time intervals for energy price prediction. The results of the predictions were then compared, so that

the success rates and accuracies of each technique could be compared. This comparison allowed for the identification of the most accurate and successful technique for energy price prediction. Our experiments showed that the GF, and ES smoothing techniques are both useful for energy price prediction. Each technique has its strengths and weaknesses. Comparing the results of these techniques, due to being slightly better, Gaussian Filter was used to derive final results to be presented.

Overall, the combination of mRMR feature selection algorithm and the four machine learning algorithms showed promising results for predicting energy consumption and prices in the energy sector. Accurate and reliable prediction models can help energy companies optimize their supply strategies, maximize profits, and reduce risks. Additionally, consumers can benefit from accurate price predictions to develop effective bidding and consumption strategies to minimize costs.

Results and Discussion

There are several relatively diverse and hard to be forecasted days selected to be test our models. The days selected for the SMP prediction are June 30/2021, July 21/2021, July 23/2021, October 29/2021, December 31/2021, March 19/2022 and March 20/2022.

The following conditions were considered in the selection of the test dates:

- Dates in the last three months,
- Random (June 30/2021),
- The effect of the holiday on the SMP (October 29/2021),
- The last day of the year (December 31/2021),
- The weekend (March 19/2022 and March 20/2022).

The hyperparameters and MAPE's of the developed models are given in Table 1 through Table 5. All the results are obtained from mRmR and Gaussian filter applied experiments which result better than alternative techniques.

Table 1. The hyperparameters and MAPE's of XGBoost Regressor-based models (Number of forecasts: 24)

6/30/21	6/30/20	mRMR	SmfDolar	4.3	4.7	4.9

- Based on results obtained, SVR has the lowest MAPE (2.23%) for the test day June 30, 2021 and the highest MAPE (5.02%) for the test day Mach 19, 2022.
- Based on results obtained, XGBoost-Regressor has the lowest MAPE (2.63%) for the test day June 30, 2021 and the highest MAPE (5.67%) for the test day Mach 19, 2022.
- Based on results obtained, ELM are examined, the lowest MAPE (4.9%) for the test day June 30, 2021 and the highest MAPE (22.6%) for the test day July 21, 2021.
- Based on results obtained, Monte Carlo Simulation has the lowest MAPE (7.8%) for the test day June 30, 2021 and the highest MAPE (45.7%) for the test day July 23, 2021.
- Based on results, it's clear that Machine learning-based methods are more successful than Monte Carlo Simulation method.

Conclusion

This research aimed to develop prediction models for electricity producers and suppliers operating in the Turkish market using both deep learning and statistics-based methods. The models were tested by generating 24-hour forecasts over 7 different days, and their performance was evaluated using the mean absolute percentage error (MAPE). The results of the study indicated that the SVR method had the lowest average MAPE of 2.30%, suggesting it was the most accurate model. Overall, machine learning-based models were found to be more effective at predicting SMP than Monte Carlo simulation models.

**YARI KURAK İKLİM KOŞULLARINDA KURU FASULYENİN (*Phaseolus Vulgaris*
L.) BITKİ SU TÜKETİMİNİN İKİ FARKLI YÖNTEMLE BELİRLENMESİ**

Doç. Dr. Ali Beyhan Uçak (ORCID: 0000000343442848)
Siirt Üniversitesi Ziraat Fakültesi Biyosistem Mühendisliği Bölümü, Siirt
E-mail: abucak@siirt.edu.tr

Özet

Bu çalışmanın amacı doğrudan bitki su tüketimini belirlemeye yarayan su dengesi eşitliği ve iklim parametrelerinden yararlanarak bitki su tüketimini tahmin etmeye yarayan Penman Monteith eşitliği (ET_o miktarına bağlı olarak çeşitli bitkilerin ET_a miktarlarının tahmin edilmesinde kullanılan yöntem) FAO 56 modifikasyonu tahmin yöntemini kullanarak kuru fasulye (*Phaseolus vulgaris L.*) bitkisinin Siirt ili iklim koşullarında bitki su tüketimini belirlemektir. Araştırmada bitki materyali olarak Nevşehir derin kuyu kuru fasulye türü kullanılmıştır. Çalışma 2017 yılı fasulye bitkisinin yetiştirme sezonu boyunca Siirt üniversitesi Ziraat Fakültesi deneme arazisinde tarla koşullarında yürütülmüştür. Erken vejetatif dönemde su dengesi eşitliğine göre günlük ET_a değeri 5.3 mm gün^{-1} arasında değişirken, çiçeklenme öncesinde ve çiçeklenme döneminde $9.5-10 \text{ mm gün}^{-1}$ olarak belirlenmiştir. Penman Monteith eşitliği ile saptanan referans bitki su tüketimi ise 9.0 mm gün^{-1} olarak hesaplanmıştır. Aylık olarak (Temmuz ayı) ise su dengesi eşitliğine göre 290.0 mm ay^{-1} , Penman Monteith eşitliğine göre $275.51 \text{ (Temmuz ayı) mm ay}^{-1}$ olarak hesaplanmıştır. Yetiştirme sezonu boyunca kuru fasulye bitkisine uygulanan sulama suyu miktarı 693.0 mm olup su dengesi eşitliği yöntemine göre mevsimlik bitki su tüketimi (ET_a) $748.0 \text{ mm mevsim}^{-1}$, Penman Monteith FAO 56 modifikasyonu eşitliğine göre ise ET_o miktarı $778.33 \text{ mm mevsim}^{-1}$ olarak tespit edilmiştir. Sonuç olarak çalışmada gerçek su tüketimi ile hesaplanan (kıyas) su tüketimi arasındaki farkın önemsiz olduğu ve daha fazla meteorolojik veri kullanarak bitki su tüketim tahmininde daha gerçekçi sonuçlara ulaşan Penman-Monteith eşitliği kullanılarak fasulye bitkisinin yarı kurak iklim koşullarında sulama programlarının hazırlanmasında kullanılabileceği önerilebilir.

Anahtar Kelimeler: Kuru fasulye, Bitki su tüketimi, Su dengesi denklemi, iklim

Teşekkür:

Bu çalışmanın bir kısmı 2023 yılında yurt dışı indeksli bir dergiye yayınlanmak amacıyla gönderilmiştir.

**DETERMINATION OF PLANT WATER CONSUMPTION OF DRY BEANS
IN SEMI-ARID CLIMATE CONDITIONS WITH TWO DIFFERENT
METHODS**

Abstract

The aim of this study is the water balance equation, which directly determines the plant water consumption, and the Penman Monteith equation, which is used to estimate the plant water consumption by utilizing the climate parameters (the method used to estimate the ET_a amount of various plants depending on the ET_o amount) FAO 56 modification using the estimation method of dry beans (*Phaseolus vulgaris*). L.) plant in Siirt province climatic conditions to determine the plant water consumption. Nevşehir deep well dry bean type was used as plant material in the research. The study was carried out in field conditions in the experimental field of the Faculty of Agriculture of Siirt University during the growing season of the bean plant in 2017. According to the water balance equation in the early vegetative period, while the daily ET_a value varied between 5.3 mm day⁻¹, it was determined as 9.5-10 mm day⁻¹ before and during flowering. The reference plant water consumption determined by the Penman Monteith equation was calculated as 9.0 mm day⁻¹. On a monthly basis (July), it was calculated as 290.0 mm ay⁻¹ according to the water balance equation, and 275.51 (July) mm month⁻¹ according to the Penman Monteith equation. The amount of irrigation water applied to the dry bean plant during the growing season was 693.0 mm, seasonal plant water consumption (ET_a) according to the water balance equation method was determined as 748.0 mm season⁻¹, and according to the Penman Monteith FAO 56 modification equation, the amount of ET_o was determined as 778.33 mm season⁻¹. As a result, it can be suggested that the difference between the actual water consumption and the calculated (comparative) water consumption in the study is insignificant and it can be used in the preparation of irrigation programs in semi-arid climatic conditions of the bean plant by using the Penman-Monteith equation, which achieves more realistic results in estimating plant water consumption by using more meteorological data.

Keywords: Dry beans, Plant water consumption, Water balance equation, climate

Giriş

Gıda ve Tarım Örgütü (FAO) 2020 yılı verilerine göre 34,80 milyon hektar alanda 790 kg/ha verim ortalaması ile 27,55 milyon ton kuru fasulye üretimi gerçekleşmiştir. Hindistan, Myanmar ve Brezilya dünya üretimin sıralamasında ilk üçte yer almaktadır. Türkiye, 2020 yılı dünya üretim sıralamasında 19'uncu, verim sıralamasında ise 12'inci sırada yer almaktadır (TÜİK, 2020). Şekil 1'de Nevşehir derin kuyu kuru fasulyesi görülmektedir.

2020 yılında kuru fasulye üretim alanlarında pandemi nedeni ile 2019 yılına göre 1,12 milyon ha artış yaşanmıştır. Üretimde ise bir önceki yıla göre 1,5 milyon tonluk artış gerçekleşmiştir. Dünya 2020 yılı üretiminin %20'si Hindistan, %11'i Myanmar, %11'i ise Brezilya tarafından gerçekleştirilmiştir. TÜİK tarafından açıklanan 2020 yılı verilerine göre yaklaşık 1 milyon dekar alanda 280 bin ton üretim gerçekleşmiştir. Son 10 yılda (2011-2020 yılları) ülke genelinde 79 bin tonluk üretim artışı sağlanırken, iller bazında en fazla üretim artışı Niğde'de gerçekleşmiştir. TÜİK 2019/2020 pazarlama yılı verilerine göre yeterlilik oranı %76, ülke tüketimi 276 bin ton, kişi başı tüketim ise 3,3 kg/yıl'dır (TÜİK, 2020).

Şekil 1.Nevşehir derin kuyu kuru fasulyesi

Türkiye sahip olduğu toprak ve su kaynakları ile çok değişik iklim koşulları yönünden dünyada tarımsal potansiyeli yüksek olan sayılı ülkeler arasında bulunmaktadır. Ülkemizde işlenen arazi 28.5 milyon hektardır. Yapılan etütlere göre, mevcut su potansiyeli ile teknik ve ekonomik olarak sulanabilecek arazi miktarı 8.5 milyon hektar olarak hesaplanmıştır. Sulanan alan ise 5.5 milyon ha'dır. Siirt ilinin yüzölçümü 598.700 ha.'dır. Bu alanın yaklaşık, teknik anlamda sulanabilecek arazi varlığı 24.115 ha'dır. Günümüzde bitkilerin sulanmasında yüzey sulama yöntemleri yetersiz kalmakta ve uygulanan sulama suyunun yalnızca 1/3'ü bitkiler tarafından terleme (transpirasyon) yoluyla kullanılmaktadır. Bu nedenle, bitkilerin her yöre ve her bitki

için bitki su tüketimlerinin geliştirilmesine yönelik çalışmaların yapılmasına gereksinim duyulmaktadır. Ulusal ve uluslararası kaynaklarda 'Evapotranspirasyon' olarak adlandırılan ve ETa simgesiyle gösterilen terimin Türkçe' deki karşılığı 'Bitki Su Tüketimi' olarak tanımlanmaktadır (Bayramoğlu, 2013; Uçak ve ar., 20216). Bitki su tüketiminin (Evapotranspirasyon, ETa) saptanması; su kaynaklarının işletilmesi, sulama sistemlerinin planlanması ve sulama programlarının yapılabilmesi için temel bir ihtiyaçtır. Bitkisel üretimde bitki su tüketiminin dikkate alınması ve suyun ölçülü kullanılması, hem verim hem de toprak-su kaynaklarının korunması açısından büyük önem taşımaktadır (Abtew ve Obeysekera, 1995; Güngör et al., 2004; Demir ve Meral, 2016). Günümüzde sulama programlarının oluşturulmasında dikkate alınan en önemli parametrelerden biriside bitki su tüketimidir. Bitki su tüketimi lizimetre sistemleri, tarla deneme parselleri ve bitki kök bölgesindeki nem azalmasının denetimi gibi metotlardan faydalanarak doğrudan hesaplanabilmektedir (Şarлак ve Bağçacı, 2020; Kırnak ve Gençoğlan, 2001). Sulama uygulamalarında bitki su tüketiminin dikkate alınmadığı ve homojen bir su dağılımının yapılamadığı, salma sulama yönteminin kullanılması durumunda, bitki gelişiminde büyük bir öneme sahip olan demir mineralinin topraktan yıkanarak etkili kök bölgesi altında sızmasına sebep olmaktadır (Fulton, 2013; Jarvis Shean et al., 2018). Uygulamada sulama programı, genellikle yetiştirici deneyimlerine veya toprak su dengesi (iklim temelli yöntem) belirlenmesine dayanmaktadır. Sulama programı oluşturulmasında ve bitki su tüketiminin saptanmasında alternatif metotlardan birisi de, toprak suyunun ölçülmesi (gravimetrik) yöntemidir (Pardossi et al., 2009). Bitki su tüketimi ve sulama suyu ihtiyacı bitki, toprak ve iklim özelliklerine bağlı olarak değişkenlik göstermektedir. Tarımsal sulamada su kaynaklarının optimum bir randımanla kullanımı, bitki su tüketimini esas alan sulama programları hazırlanarak, bitkinin suya ihtiyacı olduğu zamanlarda sulama yapılması ve her sulamada bitkiye ihtiyacı kadar su verilmesi ile sağlanabilmektedir (Jensen ve Allen, 2016). Bitki su tüketim yöntemleri direkt olarak veya indirekt olarak iklim parametrelerine bağlı olarak birçok yöntemle tespit edilebilmektedir. Direkt yöntemler uzun bir zaman dilimi ve fazla miktarda iş gücü gerektirirken, indirekt yöntemler daha basit ve daha hızlı uygulanabilmektedir (Kaya 2011). ETo'ı belirleyen etmenler iklim parametreleri ve hava verileridir. Örneğin FAO56 Penman-Monteith yöntemi değerlendirildiği bölgede çayır bitkileri ETo değeriyle oldukça sıkı şekilde benzerlik gösterdiği için, fiziksel olarak, fizyolojik ve aerodinamik parametrelerin her ikisini de açıkça birleştirmiş bir yöntem olması sebebiyle tek yöntem olarak tavsiye edilmektedir. Yöntemin ilk aşamasında birçok iklim verisi formüle dâhil olduğu için zorluklar yaşanmasına karşın araştırmadaki ilerlemeler ve bitkiler kıyas ürünlerini içeren geçerli tahminleri ile büyük çapta aşılmıştır (Allen et al., 1998). Bu çalışmanın amacı

doğrudan bitki su tüketimini belirlemeye yarayan su dengesi eşitliği ve iklim parametrelerinden yararlanarak bitki su tüketimini tahmin etmeye yarayan Penman Monteith eşitliği (ETo miktarına bağlı olarak çeşitli bitkilerin ET miktarlarının tahmin edilmesinde kullanılan yöntem) FAO 56 modifikasyonu yöntemini kullanarak fasulye bitkisinin Siirt iklim koşullarında bitki su tüketimini belirlemektir.

2. Gereç ve Yöntem

2.1. Deneysel Çalışmalar

Damlama sulama yönteminin kullanıldığı deneme parsellerinde su dağıtımı, 4 atm çalışma basıncı ve 16 mm dış çapa sahip yumuşak PE lateral boru hatları kullanılarak sağlanmıştır. Araştırma alanının toprakları ağırdır ve 6 mm h⁻¹ infiltrasyon oranına sahiptir. Her lateralde, sıralı tip basınç düzenleyicisi ve 1 atm çalışma basıncında 4 L h⁻¹ akış hızına sahip damlatıcılar kullanılmış ve aralarında 0.33 m boşluk bırakılmıştır. Bu nedenle, bitki damla sulama yöntemi ile sulama suyu sadece doğru miktarda uygulanmıştır. Herhangi bir sızma veya yüzey akışı meydana gelmesine izin verilmemiştir. Sırta ekilecek tohum yatağı hazırlanmıştır. Her parsel, sıra arasında 70 cm boşluk, sıra üzeri 35 cm boşluk, parsellerin boyutları 6 m uzunluğunda ve 2,8 m genişliğinde (parsel yüzeyi = 16,8 m²) olmak üzere 4 çizgiye sahip olacak şekilde tasarlanmıştır. Tohumun 4-5 cm derinlikte ekildiğinden emin olmak için 4 hatlı pnömatik tohum makinası kullanılmıştır. Sulama konuları ve tekrarlar arasındaki etkileşimleri önlemek için 2 m tampon bölge oluşturulmuştur. Çalışmada, etkili kök derinliğinin (90 cm) nem içeriği her sulamadan önce gravimetrik yöntem kullanılarak tespit edilmiştir. Her tür için tam sulama (I100) ile kontrol parselinde 90 cm toprak derinliğinde eksik nemi tarla kapasitesine getirmek için kullanılmıştır. Bu amaçla, sulama öncesi her sulama derinliği için 90 cm'lik toprak profilinin 0-30, 30-60 ve 60-90 cm'lik tabakalarından alınan toprak numuneleri toplanmış ve kuru toprak ağırlık yüzdesi (%Pw) olarak belirlenmiştir. Her katman için belirlenen nem içeriği, denklem 1 kullanılarak derinlemesine nem içeriğine dönüştürülmüştür.

$$d=(Pw-PwAW)*As*D/100..... (1)$$

Burada; d derinliğinde toprak nem içeriğidir (mm), Pw tarla kapasitesi (%), PwAW;her katmanın nem içeriği (%), As ,Toprak birim ağırlığı (g/cm³)

D katman derinliği (mm) olduğu gibi uygulanacak suyun hacmi aşağıdaki denklem kullanılarak hesaplanmıştır (Eq. (2));

Her tabaka için hesaplanan su içeriği nin eklenmesiyle, etkili kök derinliği için toplam su miktarı (dT) bulunmuştur (Eq. (2)).

$$dT=d(0-30)+ d(30-60) + d(60-90) (2)$$

Her sulama konusunun aylık ve mevsimsel evapotranspirasyon değerleri, büyüme mevsiminde hasadın başlangıcında ve sonunda ölçülen toprağın nem oranı (90 cm) su bütçe yöntemi ve nem içeriği değerleri kullanılarak hesaplanmıştır (Zelege ve Wade 2012).

Bitkinin su tüketiminin hesaplanmasında aşağıdaki su dengesi denklemi kullanılmıştır (Eq. (4)) (Zelege ve Wade 2012).

$$ETa = P + I - Rf - Dp \pm \Delta S \dots\dots\dots(Eq. (5)).$$

ETa: Evapotranspirasyon (mm),

P: yağış (mm),

I: sulama suyu miktarı (mm),

Rf: yüzey akışı (mm),

Dp: Derin infiltrasyon (mm) ve

ΔS (mm) kökündeki toprak nem değişimidir. Çalışmada tercih edilen damla akış hızı toprağın sızma hızından daha düşük olduğundan, yüzey akışı oluşmamıştır. Sulama suyu miktarı mevcut nemi saha kapasitesine getirmek için yeterli olduğu için derin bir sızma meydana gelmediği varsayılmıştır. Penman-Monteith yöntemine göre referans (kıyas) bitki su tüketiminin hesaplanması aşağıda formülde verilmiştir.

Bu yöntemde kıyas bitki su tüketimi;

Bu yöntemde kıyas bitki su tüketimi;

$$ET = \frac{\delta}{\delta + \gamma^*} (R_n - G) \frac{1}{\lambda} + \frac{\gamma}{\delta + \gamma^*} \frac{900}{T + 273} u_2 (e_a - e_d)$$

(1.3) eşitliği ile tahmin edilmektedir.

Bu eşitlikteki bazı terimlerin hesaplanmasında kullanılan eşitlikler ise aşağıda verilmiştir.

$$\delta = \frac{4098e_a}{(T+237.3)^2} \quad (1.4)$$

$$\lambda = 2.501 - 2.361 \times 10^{-3}T \quad (1.5)$$

$$\gamma = 0.0016286 \frac{P}{\lambda} \quad (1.6)$$

$$\gamma^* = \gamma(1 + 0.34u_2) \quad (1.7)$$

$$R_n = R_{n_s} - R_{n_l} \quad (1.8)$$

$$R_{n_s} = 0,75R_s \quad (1.9)$$

$$R_{n_l} = 2,451f(T)f(e_d)f\left(\frac{n}{N}\right) \quad (1.10)$$

$$R_s = \left(0.25 + 0.50\frac{n}{N}\right)R_a \quad (1.11)$$

$$e_d = e_a \frac{RH}{100} \quad (1.12)$$

$$u_2 = u_z \left(\frac{z}{z}\right)^{0.2} \quad (1.13)$$

Bu eşitliklerde;

ET = Referans bitki su tüketimi, mm/gün,

δ = Buhar basıncı eğrisinin eğimi, kPa/°C

γ^* = Modifiye psikrometrik sabite, kPa/°C

γ = Psikrometrik sabite, kPa/°C

P = Atmosfer basıncı, kPa

R_n = Bitki yüzeyindeki net radyasyon, $\frac{MJ}{M^2 \text{ gün}}$

R_a = Atmosferin dış yüzüne ulaşan radyasyon, $\frac{MJ}{M^2} / \text{gün}$

$$R_s = \text{Yeryüzüne ulaşan kısa dalgali radyasyon, } \frac{MJ}{M2} / \text{gün}$$

$$R_{ns} = \text{Kısa dalgali net radyasyon, } \frac{MJ}{M2} / \text{gün}$$

$$R_{nl} = \text{Uzun dalhalı net radyasyon, } \frac{MJ}{M2} / \text{gün}$$

$$f(T) = \text{Sıcaklık fonksiyonu}$$

$$T = \text{Sıcaklık, } ^\circ C$$

$$f(e_d) = \text{Buhar basıncı fonksiyonu}$$

$$e_d = \text{Ortalama hava sıcaklığındaki gerçek buhar basıncı, kPa}$$

$$e_a = \text{Ortalama hava sıcaklığındaki doymun buhar basıncı, kPa}$$

$$f(n/N): \text{Güneşlenme oranı fonksiyonu}$$

$$n = \text{Güneşlenme süresi, h}$$

$$N = \text{Olası maksimum güneşlenme süresi, h}$$

$$G = \text{Topraktaki ısı akımı, MJ/m2/gün}$$

(Ardışık periyotlarda toprağın ortalama sıcaklığı çok fazla değişmediğinden ihmal edilebilir.)

$$\lambda = \text{Buharlaşma gizli ısı, } \frac{MJ}{kg} \left(\text{ortalama bir değer olarak } 2.45 \frac{MJ}{kg} \text{ alınabilir} \right)$$

$$u_2 = \text{Rüzgar hızının 2 m yükseklikteki eşdeğeri, m/s}$$

$$u_z = z \text{ m yükseklikte ölçülmüş rüzgar hızı, } \frac{m}{s}$$

$$z = \text{Rüzgar hızının ölçüldüğü yükseklik, m}$$

(Türkiye’de meteoroloji bültenlerinde genellikle 10 m yükseklikte ölçülmüş rüzgar hızı değerleri verilmektedir) ve RH = Ortalama bağıl (nispi) nem, % değerlerini göstermektedir. Çizelge 1’de Siirt ilinin uzun yıllar iklim verileri görülmektedir.

Çizelge 1. Siirt iline ait uzun yıllık meteorolojik veriler (1938-2019).

3. Bulgular ve Tartışma

Kuru fasulye bitkisinin ekim tarihi 1.ürün olarak toprağın ısınma durumuna da bağlı olarak Mayıs ayının ilk haftasında yapılmıştır, hasat tarihi ise bitkinin yapraklarının kurduğu ve generatif gelişmenin tamamlandığı Eylül ayında gerçekleşmiştir. Erken vejetatif dönemde su dengesi eşitliğine göre günlük bitki su tüketimi (ETa) değeri 5.3 mm gün⁻¹ arasında değişirken, çiçeklenme öncesinde ve çiçeklenme döneminde 9.5 mm gün⁻¹ olarak belirlenmiş olup, Penman Monteith eşitliği ile saptanan referans bitki su tüketimi ise 9.0 mm gün⁻¹ olarak hesaplanmıştır. Aylık olarak ise su dengesi eşitliğine göre 290.0 mm ay⁻¹, Penman Monteith eşitliğine göre 275.51 mm ay⁻¹ olarak hesaplanmıştır. Araştırmanın yürütüldüğü yıl fasulye bitkisine uygulanan sulama suyu miktarı 693.0 mm olup su dengesi eşitliği yöntemine göre mevsimlik bitki su tüketimi (ETa) 748.0 mm mevsim⁻¹, Penman Monteith FAO 56 modifikasyonu eşitliğine göre ise ETo miktarı 778.33 mm mevsim⁻¹ olarak tespit edilmiştir.

4. Sonuç

Son zamanlarda küresel ısınmaya bağlı olarak ciddi bir tehdit olarak karşımıza çıkan ani iklimsel değişim, ülkemizdeki kısıtlı olan su kaynaklarının tükenmesine yol açmakta önemli bir oynamaktadır. Bunun yanında kuru fasulyenin yetiştiriciliği alanında daha fazla teşvik edilmesi için yapılan çalışmada gerçek su tüketimi ile hesaplanan referans su tüketimi arasında farkın önemsiz olduğu belirlenmiştir. Öte yandan su tüketiminin en yoğun olarak kullanıldığı alanların sulama amaçlı olduğu düşünüldüğünde sulama projelerinin gerçekçi olarak iklim verilerine bağlı, uzun ya da kısa dönemlere ilişkin bitkilerin kullanacakları su miktarının belirlenmesi gereklidir. Sonuç olarak bitki su tüketiminin saptanmasında daha fazla meteorolojik veri kullanarak bitki su tüketim tahminlerinde daha gerçekçi sonuçlara ulaşan bir yöntem olan Penman-Monteith eşitliği kullanılarak kuru fasulyenin sulama programı hazırlanmasında kullanılabilir olduğu önerilebilir.

ÖZET

Bu çalışmanın amacı doğrudan bitki su tüketimini belirlemeye yarayan su dengesi eşitliğinden yararlanarak kabak bitkisinin Siirt iklim koşullarında bitki su tüketimini belirlemektir. Araştırmada bitki materyali olarak Nevşehir çevresinde kabak popülasyonu (*Cucurbita pepo L.*) kullanılmıştır. Çalışma 2017 yılı kabak bitkisinin yetişme sezonu boyunca Siirt üniversitesi Ziraat Fakültesi deneme arazisinde bölünmüş parseller deneme deseninde tarla koşullarında yürütülmüştür. Erken vejetatif dönemde su dengesi eşitliğine göre günlük ETa değeri 4.9 mm gün⁻¹ arasında değişirken, çiçeklenme öncesinde ve çiçeklenme döneminde 9.4 mm gün⁻¹ olarak belirlenmiştir. Aylık olarak (Temmuz ayı) ise su dengesi eşitliğine göre 291.4 mm ay⁻¹ olarak hesaplanmıştır. Yetişme sezonu boyunca kabak bitkisine uygulanan sulama suyu miktarı 573.20 mm olup su dengesi eşitliği yöntemine göre mevsimlik bitki su tüketimi (ETa) 628.30 mm olarak tespit edilmiştir. Sonuç olarak çalışmada gerçek su tüketimi ile hesaplanan bitki su tüketimi değeri kullanarak kabak bitkisinin yarı kurak iklim koşullarında sulama programlarının hazırlanmasında çiftçilerin kullanılabileceği önerilebilir. Ayrıca bu konularda çalışan diğer araştırmacılarında bu ve benzeri çalışmalarda bu araştırmadan elde edilen çıktıları kullanabileceği söylenebilir.

Anahtar Kelimeler: Kabak, Bitki su tüketimi, Su dengesi eşitliği, İklim

**DIRECT DETERMINATION OF PLANT WATER CONSUMPTION OF SQUASH
(*Cucurbita Pepo L.*)**

ABSTRACT

The aim of this study is to determine the plant water consumption of zucchini in Siirt climatic conditions by using the water balance equation that directly determines the plant water consumption. Nevşehir framed pumpkin population (*Cucurbita pepo L.*) was used as plant material in the study. The study was carried out in field conditions in the experimental design of divided plots in the experimental land of the Faculty of Agriculture of Siirt University during the growing season of the zucchini plant in 2017. According to the water balance equation in the early vegetative period, while the daily ET_a value changed between 4.9 mm day⁻¹, it was determined as 9.4 mm day⁻¹ before and during the flowering period. On a monthly basis (July), it was calculated as 291.4 mm month⁻¹ according to the water balance equation. The amount of irrigation water applied to the zucchini plant during the growing season was 573.20 mm, and seasonal plant water consumption (ET_a) was determined as 628.30 mm according to the water balance equation method. As a result, it can be suggested that farmers can be used in the preparation of irrigation programs in semi-arid climatic conditions of zucchini by using the plant water consumption value calculated with the actual water consumption in the study. In addition, it can be said that other researchers working on these issues can use the outputs obtained from this research in this and similar studies.

Keywords: Pumpkin, Crop water consumption, water balance equation, Climate data

1. GİRİŞ

Kabak Çekirdeği üretimi ülkemizde uzun yıllardan beri yapılmakla birlikte 2004 yılından sonra üretim alanı ve miktarında daha hızlı bir artış olmuştur. Türkiye'nin kabak çekirdeği üretimi Orta Anadolu Bölgesi'ndeki illerde daha yüksek düzeydedir. Kabak çekirdeği kuruyemiş olarak kullanımı yanında bir sanayi ürünüdür. Gıda sektöründen ilaç ve kozmetik sektörüne kadar olan geniş bir yelpazede değerlendirilme şansına sahiptir. Kabak çekirdeği yetiştiriciliği son 20 yılda önemli bir sektör haline gelmiştir. Özellikle iç bölgelerde alternatif ürün olarak değerlendirilmekte, üretim alanları giderek artış göstermektedir. 2020 yılı itibarıyla ülkemizin kabak çekirdeği üretimi 57.184 ton'dur (TÜİK, 2020).

Türkiye sahip olduğu toprak ve su kaynakları ile çok değişik iklim koşulları yönünden dünyada tarımsal potansiyeli yüksek olan sayılı ülkeler arasında bulunmaktadır. Ülkemizde işlenen arazi 28.5 milyon hektardır. Yapılan etütlere göre, mevcut su potansiyeli ile teknik ve ekonomik olarak sulanabilecek arazi miktarı 8.5 milyon hektar olarak hesaplanmıştır. Sulanan alan ise 5.5 milyon ha'dır. Siirt ilinin yüzölçümü 598.700 ha'dır. Bu alanın yaklaşık, teknik anlamda sulanabilecek arazi varlığı 24.115 ha'dır. Günümüzde bitkilerin sulanmasında yüzey sulama yöntemleri yetersiz kalmakta ve uygulanan sulama suyunun yalnızca 1/3'ü bitkiler tarafından terleme (transpirasyon) yoluyla kullanılmaktadır. Bu nedenle, bitkilerin her yöre ve her bitki için bitki su tüketimlerinin geliştirilmesine yönelik çalışmaların yapılmasına gereksinim duyulmaktadır. Ulusal ve uluslararası kaynaklarda 'Evapotranspirasyon' olarak adlandırılan ve ETa simgesiyle gösterilen terimin Türkçe' deki karşılığı 'Bitki Su Tüketimi' olarak tanımlanmaktadır (Bayramoğlu, 2013; Uçak ve ar., 20216). Bitki su tüketiminin (Evapotranspirasyon, ETa) saptanması; su kaynaklarının işletilmesi, sulama sistemlerinin planlanması ve sulama programlarının yapılabilmesi için temel bir ihtiyaçtır. Bitkisel üretimde bitki su tüketiminin dikkate alınması ve suyun ölçülü kullanılması, hem verim hem de toprak-su kaynaklarının korunması açısından büyük önem taşımaktadır (Abtey ve Obeysekera, 1995; Güngör et al., 2004; Demir ve Meral, 2016). Günümüzde sulama programlarının oluşturulmasında dikkate alınan en önemli parametrelerden biriside bitki su tüketimidir. Bitki su tüketimi lizimetre sistemleri, tarla deneme parselleri ve bitki kök bölgesindeki nem azalmasının denetimi gibi metotlardan faydalanarak doğrudan hesaplanabilmektedir (Şarlak ve Bağcı, 2020; Kırnak ve Gençoğlu, 2001). Sulama uygulamalarında bitki su tüketiminin dikkate alınmadığı ve

homojen bir su dağılımının yapılamadığı, salma sulama yönteminin kullanılması durumunda, bitki gelişiminde büyük bir öneme sahip olan demir mineralinin topraktan yıkanarak etkili kök bölgesi altında sızmasına sebep olmaktadır (Fulton, 2013; Jarvis Shean et al., 2018). Uygulamada sulama programı, genellikle yetiştirici deneyimlerine veya toprak su dengesi (iklim temelli yöntem) belirlenmesine dayanmaktadır. Sulama programı oluşturulmasında ve bitki su tüketiminin saptanmasında alternatif metotlardan birisi de, toprak suyunun ölçülmesi (gravimetrik) yöntemidir (Pardossi et al., 2009). Bitki su tüketimi ve sulama suyu ihtiyacı bitki, toprak ve iklim özelliklerine bağlı olarak değişkenlik göstermektedir. Tarımsal sulamada su kaynaklarının optimum bir randımanla kullanımı, bitki su tüketimini esas alan sulama programları hazırlanarak, bitkinin suya ihtiyacı olduğu zamanlarda sulama yapılması ve her sulamada bitkiye ihtiyacı kadar su verilmesi ile sağlanabilmektedir (Jensen ve Allen, 2016). Bitki su tüketim yöntemleri direkt olarak veya indirekt olarak iklim parametrelerine bağlı olarak birçok yöntemle tespit edilebilmektedir. Direkt yöntemler uzun bir zaman dilimi ve fazla miktarda iş gücü gerektirirken, indirekt yöntemler daha basit ve daha hızlı uygulanabilmektedir (Kaya 2011). Bu çalışmanın amacı doğrudan bitki su tüketimini belirlemeye yarayan su dengesi eşitliğinden yararlanarak kabak bitkisinin Siirt iklim koşullarında bitki su tüketimini doğrudan (su dengesi eşitliği) belirlemektir.

2. Gereç ve Yöntem

2.1. Deneysel Çalışmalar

Damla sulama yönteminin kullanıldığı deneme parsellerinde su dağıtımı, 4 atm çalışma basıncı ve 16 mm dış çapa sahip yumuşak PE lateral boru hatları kullanılarak sağlanmıştır. Araştırma alanının toprakları ağırdır ve 6 mm h^{-1} infiltrasyon hızına sahiptir. Her lateralde, sıralı tip basınç düzenleyicisi ve 1 atm çalışma basıncında 4 L h^{-1} akış hızına sahip damlaticılar kullanılmış ve aralarında 0.33 m boşluk bırakılmıştır. Bu nedenle, bitki damla sulama yöntemi ile sulama suyu sadece doğru miktarda uygulanmıştır. Herhangi bir sızma veya yüzey akışı meydana gelmesine izin verilmemiştir. Sırta ekilecek tohum yatağı hazırlanmıştır. Her parsel, sıra arasında 70 cm boşluk, sıra üzeri 35 cm boşluk, parsellerin boyutları 6 m uzunluğunda ve 2,8 m genişliğinde (parsel yüzeyi = 16,8 m²) olmak üzere 4 çizgiye sahip olacak şekilde tasarlanmıştır. Tohumun 4-5 cm derinlikte ekildiğinden emin olmak için 4 hatlı pnömatik tohum makinası kullanılmıştır. Sulama konuları ve tekrarlar arasındaki etkileşimleri önlemek için 2 m tampon bölge oluşturulmuştur. Çalışmada, etkili kök derinliğinin (90 cm) nem içeriği her sulamadan önce gravimetrik yöntem kullanılarak

tespit edilmiştir. Her tür için tam sulama (I100) ile kontrol parselinde 90 cm toprak derinliğinde eksik nemi tarla kapasitesine getirmek için kullanılmıştır. Bu amaçla, sulama öncesi her sulama derinliği için 90 cm'lik toprak profilinin 0-30, 30-60 ve 60-90 cm'lik tabakalarından alınan toprak numuneleri toplanmış ve kuru toprak ağırlık yüzdesi (%Pw) olarak belirlenmiştir.

Her katman için belirlenen nem içeriği, denklem 1 kullanılarak derinlemesine nem içeriğine dönüştürülmüştür.

$$d=(Pw-PwAW)*As*D/100..... (1)$$

Burada; d derinliğinde toprak nem içeriğidir (mm), Pw tarla kapasitesi (%), PwAW;her katmanın nem içeriği (%), As ,Toprak birim ağırlığı (g/cm^3)

D katman derinliği (mm) olduğu gibi uygulanacak suyun hacmi aşağıdaki denklem kullanılarak hesaplanmıştır (Denklem. (2));

Her tabaka için hesaplanan su içeriği nin eklenmesiyle, etkili kök derinliği için toplam su miktarı (dT) bulunmuştur (Denklem. (2)).

$$dT=d(0-30)+ d(30-60) + d(60-90) (2)$$

Her sulama konusunun aylık ve mevsimsel evapotranspirasyon değerleri, büyüme mevsiminde hasadın başlangıcında ve sonunda ölçülen toprağın nem oranı (90 cm) su dengesi eşitliği denkelemi kullanılarak hesaplanmıştır (Zelege ve Wade 2012).

Bitkinin su tüketiminin hesaplanmasında aşağıdaki su dengesi denklemini kullanılmıştır (Eş. (4)) (Zelege ve Wade 2012).

$$ETa= P + I - Rf - Dp \pm \Delta S(Eş. (4)).$$

ETa: Evapotranspirasyon (mm),

P: yağış (mm),

I: sulama suyu miktarı (mm),

Rf: yüzey akışı (mm),

Dp: Derin infiltrasyon (mm) ve

ΔS (mm) kökündeki toprak nem değişimidir. Çalışmada tercih edilen damlatıcı akış hızı toprağın sızma hızından daha düşük olduğundan, yüzey akışı oluşmamıştır. Sulama suyu miktarı mevcut nemi saha kapasitesine getirmek için yeterli olduğu için derin bir sızma meydana gelmediği varsayılmıştır.

2. Bulgular ve Tartışma

Kabak bitkisinin ekim tarihi 1.ürün olarak toprağın ısınma durumuna da bağlı olarak Mayıs ayının ilk haftasında yapılmıştır, hasat tarihi ise bitkinin yapraklarının kurduğu ve genaratif gelişmenin tamamlandığı Eylül ayında gerçekleşmiştir. Erken vejetatif

dönemde su dengesi eşitliğine göre günlük bitki su tüketimi (ETa) değeri 4.9 mm gün^{-1} arasında değişirken, çiçeklenme öncesinde ve çiçeklenme döneminde 9.4 mm gün^{-1} olarak belirlenmiştir. Aylık olarak ise su dengesi eşitliğine göre 291.4 mm ay^{-1} , olarak hesaplanmıştır. Araştırmanın yürütüldüğü yıl kabak bitkisine uygulanan sulama suyu miktarı 573.20 mm olup su dengesi eşitliği yöntemine göre mevsimlik bitki su tüketimi (ETa) 628.30 mm olarak tespit edilmiştir.

4. Sonuç

Son zamanlarda küresel ısınmaya bağlı olarak ciddi bir tehdit olarak karşımıza çıkan ani iklimsel değişim, ülkemizdeki kısıtlı olan su kaynaklarının tükenmesine yol açmakta önemli bir oynamaktadır. Bunun yanında kabak bitkisi yetiştiriciliği alanında daha fazla teşvik edilmesi için yapılan çalışmada gerçek su tüketimi ile hesaplanan referans su tüketimi arasında farkın önemsiz olduğu belirlenmiştir. Öte yandan su tüketiminin en yoğun olarak kullanıldığı alanların sulama amaçlı olduğu düşünüldüğünde sulama projelerinin gerçekçi olarak iklim verilerine bağlı, uzun ya da kısa dönemlere ilişkin bitkilerin kullanacakları su miktarının belirlenmesi gereklidir. Sonuç olarak bitki su tüketiminin saptanmasında daha gerçekçi sonuçlara ulaşan bir yöntem olan su dengesi eşitliği yönteminin sulama programlarının hazırlanmasında kullanılması önerilebilir. Araştırmadan elde edilen sonuçlar diğer araştırmacılar tarafından da test edilebilir.

ABSTRACT

Since the discovery of antibiotics, the use of herbal antiseptics has declined significantly. The development of strains resistant to many antibiotics and the emergence of consumer insecurity due to "unnatural" food ingredients have led to an increased interest in natural antimicrobials in the food industry. This research was carried out to determine fruit extracts for use in traditional medicine and as food ingredients due to their antibacterial activities. In this study, antibacterial activity of extracts obtained from *Capsicum annuum* fruit against bacterial strains of *Staphylococcus aureus* ATCC 29213 and *Escherichia coli* ATCC 25922 were investigated in vitro. The fruits of the plant were dried and then were extracted by using different solvents (methanol, ethanol, ethyl acetate and acetone). The antibacterial activity of *Capsicum annuum* fruit extracts was evaluated by disc diffusion method. According to the results the highest antibacterial activity was observed against *Staphylococcus aureus* with ethanol extract an inhibition zone of 26 mm. The extracts showed limited inhibition effect (about 8-12 mm inhibition zone) against *Escherichia coli*.

Keywords: *Capsicum annuum* L., antibacterial activity, disc diffusion method

Introduction

Many developing countries use traditional medicine as their primary level of health care. Many drugs currently used are economically expensive and not readily available in rural areas. Inconsistent use of these drugs can lead to microbial drug resistance. Medicinal plants contain a wide variety of chemicals with important therapeutic properties that can be used in the treatment of human diseases. Approximately 80% of individuals in developed countries use traditional medicines based on medicinal plants (Akinpelu et al., 2008). Pepper (*Capsicum annuum* L.) is a member of the Solanaceae family and is believed to be originated from Central and South America. Peppers belong to the genus *Capsicum*. *C. annuum*, *C. frutescens*, *C. chinense*, *C. pubescens*, and *C. baccatum* are grown domestically or commercially. Peppers are excellent sources of phytochemicals, such as anthocyanins, vitamins, phenolic acids, flavonoids, carotenoids, and capsaicinoids. Capsaicinoids called capsaicin, homocapsaicin dihydrocapsaicin, nordihydrocapsaicin, and homodihydrocapsaicin are found in the structure of pepper. It has been reported that the capsaicinoid content of different pepper species is also different (Hülül, 2016). Numerous studies have demonstrated the antibacterial activity of capsaicin and dihydrocapsaicin bioactive compounds isolated from *Capsicum annuum*. Since the discovery of antibiotics, the use of herbal antiseptics has declined significantly. As a result of the studies, capsaicin in various pharmaceutical forms; it is also indicated in the symptomatic treatment of muscle, joint and arthritis pain, in the treatment of ulcers and obesity, in the relief of neuropathy pain, in the treatment of neurogenic pain such as Herpes zoster. It has been proven that capsaicin can be a P-gp inhibitor or substrate that plays an important role in drug-nutrient, drug-drug and drug absorption interactions. The development of strains resistant to many antibiotics and the emergence of consumer insecurity due to "unnatural" food ingredients have led to an increased interest in natural antimicrobials in the food industry (Thomas et al., 1998; Sener and Sahin, 2010; Hülül, 2016) This research was carried out to determine fruit extracts for use in traditional medicine and as food ingredients due to their antibacterial activities.

Materials and Methods

Chemicals

All of the chemicals used in this study were obtained from Sigma Aldrich (Germany).

Plant material

Capsicum annuum was collected in August 2021 in Uşak Province of Turkey. The plant samples were cleaned and dried via herbarium techniques of Davis (1972). After the plant material was dried, it was pulverized with the help of a grinder. Powder samples were weighed

(15 gr); Different solvents (acetone, methanol, ethyl acetate, chloroform) were used in the determined ratios (150 ml) in glass jars with lids for 2 days. A rotary evaporator was used to remove the solvents of the samples, which were filtered into glass balloons with the help of blotting paper. Solvents were evaporated under vacuum at 40-45 °C. The amount of the extract was determined by weighing the balloons used before and after the procedures, and thus the samples were prepared for the determination of antibacterial activity (Lin et.al., 1999).

Preparation of Test Microorganisms

Bacterial strains used in the determination of antibacterial activity were inoculated into Tryptic Soy Broth medium and activated by incubation at 37 °C for 24 hours. Activated bacteria were inoculated on Sheep Blood Agar by streaking and fresh cultures were prepared. Petri dishes in which bacteria were cultivated were incubated at 37 °C for 24 hours. After incubation, the bacterial density was adjusted to 0.5 Mc Farland (10^8 CFU/ml) and made ready for the study.

Experimental Procedure

The obtained extract was prepared to be absorbed into the discs at the desired concentration (3200 µg/10µl) by adding DMSO at the determined rate. Commercially available 6 mm diameter, antibiotic-free blank sterile discs were impregnated with 10 µl/disc of the prepared extracts and the discs were left to dry overnight. The discs on which the extracts were impregnated were placed at equal distances by pressing lightly on the medium with the help of sterile forceps. Discs impregnated with DMSO were used as negative control. Clindamycin (10 µg), Tetracycline (10 µg) and Amoxicillin-Clavulanic acid (30 µg) antibiotic discs were used as positive controls. The inhibition zone diameters formed after incubation were measured (Ferreira et. al., 2006).

Measurement of zone diameters

Inhibition zone diameters (mm) formed around the discs were measured to determine whether the plant material had antibacterial activity against microorganisms that were incubated for 24 hours at 37 °C. The results were recorded by taking the average of the zone diameters in the three replication experiments. By looking at the zone diameters formed around the discs, it was determined whether the plant material had antibacterial activity on the bacteria used in the study.

Results and Discussions

Disk diffusion method was used in this study. The effect of *Capsicum annuum* L. on *Staphylococcus aureus* is shown in Table 1.

Table 1. The effect of *Capsicum annuum* L. on *Staphylococcus aureus*

Extracts	Zone diameters (mm)				
	<i>Capsicum annuum</i>	Control	Clindamycin	Tetracycline	Amoxicillin-Clavulanic acid
Ethanol	26	0	31	18	30
Acetone	20				
Methanol	18				
Ethyl acetate	16				

A disk of 3200 µg of ethanol extract formed a 26 mm inhibition zone diameter. Inhibition zone diameter of 20 mm for acetone extract, 18 mm for methanol extract and 16 mm for ethyl acetate extract was observed. No effect was observed in DMSO-impregnated discs used as negative control.

Table 2. The effect of *Capsicum annuum* L. on *Escherichia coli*

Extracts	Zone diameters (mm)				
	<i>Capsicum annuum</i>	Control	Clindamycin	Tetracycline	Amoxicillin-Clavulanic acid
Ethanol	12	0	8	18	23
Acetone	8				
Methanol	8				
Ethyl acetate	8				

According to Table 2, a disk of 3200 µg of ethanol extract formed a 12 mm inhibition zone diameter. Inhibition zone diameter of 8 mm for acetone, methanol and ethyl acetate extracts were observed. No effect was observed in DMSO-impregnated discs used as negative control. The differences in inhibitory activity observed against the bacterial species would be due to the difference in genetic and structural composition of the isolates and strains. The presence of potential antimicrobial substances was identified by chemical analysis of *C. annuum* fruit extract which showed the presence of alkaloids, polyphenols, flavonoids, anthocyanins, anthraquinones, tannins, triterpenes, and saponins. This partially corroborates the results of previous reports (Samrot et.al., 2018).

It is reported that nearly nine thousand plant species grow naturally in our country and there are few studies on their chemical contents and medicinal effects. According to the research prepared by the World Health Organization (WHO) based on publications in many countries, it is reported that the total number of medicinal plants used for treatment is around 20 000. In the studies, the antimicrobial effects of the pepper plant were determined by some studies. Oussalah et al. (2007), conducted research to determine the effects of *Allium sativum* (garlic)

and *Capsicum annuum* var. *conoides* (red pepper) on fecal microflora and blood lipid levels. In this study, rats were fed 2% food containing red pepper and garlic and 19% fatty beef for 4 weeks (Oussalah et al., 2007). As a result, the ratio of bacteria belonging to the Enterobacteriaceae family, which is a fecal bacterial group; *Capsicum annuum* var. *conoides* in added foods; they report a reduction from 9.4 to 9.0 log cfu/g. They also reported that the rate of *Bifidobacterium* sp. and *Staphylococcus* sp. species decreased from 8.7 to 7.6 log cfu/g (Oussalah et al., 2007). It has been shown in different studies that the antibacterial activity in plants differs according to the plant variety. It is stated that this difference is due to factors such as the possible absence of the active substance in the content of the sample in the extracted medium or the different concentration of the active substance (Omidbeygi et. al., 2007; Hülül, 2016).

Conclusion

In this study, antibacterial activity of extracts obtained from *Capsicum annuum* fruit against bacterial strains of *Staphylococcus aureus* and *Escherichia coli* were investigated in vitro. The fruits of the plant were dried and then were extracted by using different solvents (methanol, ethanol, ethyl acetate and acetone). The antibacterial activity of *Capsicum annuum* fruit extracts were evaluated by disc diffusion method. According to the results the highest antibacterial activity was observed against *Staphylococcus aureus* with ethanol extract an inhibition zone of 26 mm. The extracts showed limited inhibition effect (about 8-12 mm inhibition zone) against *Escherichia coli*.

ABSTRACT

Especially during the storage of foods such as corn, oats and wheat, there may be major problems due to the presence of insects such as the yellow mealworm *Tenebrio molitor*. Insects in stored bran and grains contaminate food through their excrement and old cuticle fragments, as well as indirectly through saprophytic microorganisms. All these factors cause quality loss in warehouse products. Therefore, it is important to control the *T. molitor* pest. Pest insects can be controlled by chemical methods such as pesticides; however, these chemicals may cause undesirable effects on the environment and non-target organisms. Therefore, safer control methods such as natural extracts of plants are becoming important for pest control. The present study was undertaken to investigate the effects of essential oil *Capsicum annuum* fruit against larval stage of the important stored-product pest, *T. molitor*. The results indicated that mortality increased with the increasing concentration of essential oil. Also, increasing doses of essential oil caused decreasing in SOD, CAT, GPx activities and increasing in MDA level. But there were no statistically differences between control and treatment groups in AChE activities. These results indicate that *C. annuum* essential oil exerts its effectiveness at the applied doses by creating oxidative stress.

Keywords: pest control, pepper, mealworm

Introduction

Many plants, their essential oils and extracts, have potential in medical procedures and applications in the pharmaceutical, cosmetic and food industries (Tepe et al., 2005). *Capsicum annuum* L. is mostly used commercially.

The genus *Capsicum* is a member of the Solanaceae family and has five commonly cultivated species: *Capsicum annuum*, *Capsicum baccatum*, *Capsicum chinense*, *Capsicum frutescens* and *Capsicum pubescens*. However, there are 20 registered wild species (Heiser, 1973). The chemical composition of foods is quite complex and contains both volatile and non-volatile substances. Some of these substances contribute to the flavor of food. Since the aroma component (volatile taste) is generally responsible for the characteristic flavor of foods, the essential oil compounds have attracted the most attention. The fruits of the *Capsicum* species have a relatively low essential oil content, reported to range from about 0.1% to 2.6% in capsicum. The initial essential oil content of freshly picked fruit is highly dependent on the species/culture grown and the maturity stage at harvest. However, the final essential oil content of the dried product may be lower and depends on the drying procedure, time and storage condition (whole or ground). For example, paprika powder usually contains less than 0.5% essential oil (Nadeem et al., 2011). Especially during the storage of foods such as corn, oats and wheat, there may be major problems due to the presence of insects such as the yellow mealworm *Tenebrio molitor*. Adults are reddish brown, 1.25-1.8 cm long. The eggs are shaped like white beans. The larvae are similar to the wireworm, 2.5 cm in length, the larva that emerges from the egg first turns white and then cream. The female lays her eggs singly or in groups. Active at night, these insects cause significant damage to stored products. There are different control methods such as cultural precaution and physical control to control the pests in stored products, but other than these, control methods have started to be used with extracts obtained from plants (Chonwaski et.al., 2014).

Insects in stored bran and grains contaminate food through their excrement and old cuticle fragments, as well as indirectly through saprophytic microorganisms. All these factors cause quality loss in warehouse products. Therefore, it is important to control the *T. molitor* pest. Pest insects can be controlled by chemical methods such as pesticides; however, these chemicals may cause undesirable effects on the environment and non-target organisms. Therefore, safer control methods such as natural extracts of plants are becoming important for pest control (Costa et.al., 2020). The present study was undertaken to investigate the effects of essential oil *Capsicum annuum* fruit against larval stage of the important stored-product pest, *T. molitor*.

Materials and Methods

Chemicals

All of the chemicals used in this study to determine the AChE activity, MDA level and antioxidant enzyme activities were obtained from Sigma Aldrich (Germany).

***Tenebrio molitor* culture**

Insects were cultivated in plastic containers (30 x 25 x 15 cm). Corn flour (30%) and wheat flour (70%) were added as a food source and pasteboards were added for egg deposition. Thinly sliced potato or apple was added each week for water source and regulating for humidity of containers. Twenty individuals of the larvae were selected randomly from one population.

Plant material, isolation and analysis of the essential oil

Capsicum annuum was collected in August 2021 in Uşak Province of Turkey. The plant samples were cleaned and dried via herbarium techniques of Davis (1972). 200 g of *C. annuum* fruit essential oil was extracted from plant material by hydrodistillation using a modified Clevenger apparatus for 3 to 4 h at a laboratory scale. With this method, secondary plant metabolites (mainly terpenes and phenolic compounds) are obtained in a relatively pure fraction excluding most of primary metabolites. The essential oil obtained was kept at 4°C until beginning of the study.

Toxicity of essential oil to *Tenebrio molitor*

Capsicum annuum essential oil was tested for its fumigant effect against larvae stage of *Tenebrio molitor*. Larvae were placed into 1 L glass jars. 3 replicates were tested for each concentration of *Capsicum annuum* essential oil and each replicate consisted of 20 insects. We used 2.5 × 2.5 cm filter paper strips for application of essential oil then the filter paper was attached to the bottom of the cover of glass jars. Larvae were exposed to different concentrations of essential oil (0, 1, 2, 4, 8, 16 and 32 µL/L air) for 24 h. We determined the mortalities and values of LC₅₀ and LC₉₉. The control groups of larval stage involved the same conditions without essential oil. Larvae were cooled on ice then sterilized with ethanol. Then, the extracts of larvae were prepared with a homogenizer, centrifuged and the supernatants were taken for examination of MDA level and CAT, SOD, GPx, AChE activities. Measurement of these parameters were determined by a UV-VIS spectrophotometer (Biotech Engineering, Spectroscan 60 DV). Protein concentrations were estimated according to the method of Lowry et al. (1951).

Measurement of oxidative stress parameters and AChE activities

Activity of AChE was measured by the procedure of Ellman et al. (1961). The reaction was monitored at 412 nm wavelength and the activity was estimated as U/mg protein. The levels of

MDA were measured by thiobarbituric acid (TBA) test as described by Ohkawa et al. (1979). We measured the absorbance at 532 nm. We defined the MDA level as nmol/mg protein. We measured the enzyme activity of CAT based on procedure of Aebi (1984). This procedure is based on determining the hydrolysis of H₂O₂. The absorbance was determined at 240 nm and the activity was given as mmol/mg protein. The method of Marklund and Marklund (1974) was used for SOD activity assessment at 440 nm and the enzymatic activity was indicated as U/mg protein. The GPx activity was measured by the procedure which was identified by Paglia and Valentine (1987). The reaction was searched at 340 nm and the activity was indicated as nmol/mg protein.

Statistical analysis

The data were analyzed in IBM SPSS 26.0 program for Windows by one-way analysis of the variance and Tukey test for multiple comparisons at a significance level of 0.05. LC₅₀ and LC₉₉ values were estimated by probit analysis with IBM SPSS 26.0 (Abbott, 1925).

Results and Discussions

These results indicate that essential oil *Capsicum annuum* can be used against *Tenebrio molitor* in a pest control program. The LC₅₀ and LC₉₉ values (μL/L air) of *Capsicum annuum* essential oil against *Tenebrio molitor* larvae are given in Table 1.

Table 1. LC₅₀ and LC₉₉ values (μL/L air) of *Capsicum annuum* essential oil against *Tenebrio molitor* larvae.

Time (24 h)	n	LC ₅₀ μL/L air	LC ₉₉ μL/L air	df ^b	sig	Chi-Square
larvae	20	8,558	19,064	5	0,423 ^a	4,939

n: number of the tested insects

a: Since the significance level is greater than 0,150, no heterogeneity factor is used in the calculation of confidence limits.

b: Statistics based on individual cases differ from statistics based on aggregated cases.

32 μL/L was the most effective essential oil dose against *Tenebrio molitor* larvae. Increasing doses of essential oil caused decreasing in SOD, CAT, GPx and AChE activities and increasing in MDA level.

Figure 1. The mortality values of *Tenebrio molitor* larvae after exposure to *Capsicum annuum* essential oil for 24 h. Letters above bars indicate significant differences between concentrations. Bars with the same letter are not significantly different. Error bars indicate SD of means.

Figure 2. MDA levels of *Tenebrio molitor* larvae after exposure to *Capsicum annuum* essential oil for 24 h. Letters above bars indicate significant differences between concentrations. Bars with the same letter are not significantly different. Error bars indicate SD of means.

Table 2. Enzyme activities of *Tenebrio molitor* larvae after exposure to *Capsicum annuum* essential oil for 24 h.

Enzymes	control	1 μ L/L air	2 μ L/L air	4 μ L/L air	8 μ L/L air	16 μ L/L air	32 μ L/L air
AChE (U/mg protein)	0,038 \pm 0,0029 ^a	0,038 \pm 0,0031 ^a	0,037 \pm 0,0028 ^a	0,035 \pm 0,0024 ^a	0,034 \pm 0,0037 ^a	0,034 \pm 0,0033 ^a	0,034 \pm 0,0039 ^a
SOD (U/mg protein)	0,04 \pm 0,0015 ^a	0,039 \pm 0,0012 ^a	0,037 \pm 0,0011 ^a	0,034 \pm 0,0016 ^b	0,03 \pm 0,0013 ^c	0,026 \pm 0,0013 ^d	0,021 \pm 0,0017 ^e
CAT (mmol/mg protein)	64,3 \pm 3,74 ^a	62,7 \pm 4,11 ^a	61,2 \pm 4,80 ^a	59,3 \pm 3,62 ^a	50,2 \pm 4,10 ^b	39,9 \pm 5,26 ^c	30,1 \pm 4,42 ^d
GPx (nmol/mg protein)	0,365 \pm 0,012 ^a	0,363 \pm 0,017 ^a	0,33 \pm 0,014 ^b	0,305 \pm 0,016 ^b	0,267 \pm 0,020 ^c	0,231 \pm 0,013 ^d	0,205 \pm 0,011 ^e

Values are mean \pm standard deviation. Significance at $P < 0.05$. Within each row, means followed by the same letter are not significantly different.

Like our study, Adamski et al. (2016) stated that the repellent effect increased depending on time and concentration in their study with *S. tuberosum* extract against larvae and adults. In another study (Ignatowicz, 1998), they found that extracts obtained from the young leaves of *Artemisia vulgaris* L. and *Tanacetum vulgare* had a repellent effect on *Sitophilus granarius* and *S. oryzae*.

Conclusion

The results indicated that mortality increased with the increasing concentration of essential oil. Also, increasing doses of essential oil caused decreasing in SOD, CAT, GPx activities and increasing in MDA level. But there were no statistically differences between control and treatment groups in AChE activities. Today, there is a need for studies on herbal preparations within the framework of organic agriculture and good agricultural practices. Continuing research on this subject and studies on formulations are important. These results indicate that *C. annuum* essential oil exerts its effectiveness at the applied doses by creating oxidative stress.

Özet

Plevral boşluk seröz zarlarla kaplıdır ve normalde parietal dolaşım (esas olarak interkostal arterler) tarafından sürekli olarak üretilen ve sağlıklı hayvanlarda parietal ve visseral plevranın kılcal damarları ve lenfatik sistemi tarafından boşaltılan az miktarda seröz sıvı içerir. Hemotoraks, göğüs duvarı, plevra veya intratorasik yapıların herhangi bir dokusunun bozulmasını takiben plevral boşluğa kanamayı yansıtan özel bir plevral efüzyon vakasını temsil eder. Hastalığın patogenezi göre pet hekimliğinde acil durum kategorisinde değerlendirilmektedir. Bu araştırmada kedi ve köpeklerde hemotoraksın klinik bulguları, tanı yöntemleri ve tedavisi hakkında bilgi verilmiştir.

Anahtar Kelimeler: Kedi, köpek, semptom, hemotoraks

HEMOTHORAX IN CAT AND DOGS

Abstract

The pleural cavity is lined by serous membranes and normally contains a small amount of serous fluid that is constantly produced by the parietal circulation (mainly the intercostal arteries) and drained by the capillaries and lymphatic system of the parietal and visceral pleura in healthy animals. Hemothorax represents a specific case of pleural effusion reflecting bleeding into the pleural space following disruption of any tissue of the chest wall, pleura, or intrathoracic structures. According to the pathogenesis of the disease, it is evaluated in the category of emergency in pet medicine. In this study, information was given about the clinical findings, diagnostic methods and treatment of hemothorax in cats and dogs.

Keywords: Cat, dog, symptom, hemothorax

Giriş

Plevral membranlar, tek bir mezotelyal hücre tabakasından ve daha derin bir elastik lifler tabakasından ve seyrek düz kas hücrelerinden oluşur. Arterler, toplardamarlar, kılcal damarlar ve lenfatikler bu derin bağ dokusu tabakasından geçer. Plevral boşluk içindeki sıvı miktarı; net basınç gradyanına, plevral membranların yüzey alanına ve drenaj mekanizmalarına bağlıdır (Stillion ve Letendre, 2015). Haemotorax, plevral boşlukta kanlı bir efüzyonun birikmesi, intratorasik yapıların/damar sisteminin bozulmasından ortaya çıkar. Hemotoraks en sık travma, koagülopati ve neoplazi/inflamatuvar durumlara sekonder olarak ortaya çıkar.

Plevral Boşluğun Anatomisi

Plevral boşluk, göğüs duvarını, akciğerleri, diyaframı ve mediasteni ayıran potansiyel bir bölme olup, plevra pariyetal ve visseral ile kaplıdır. Normalde torasik radyografi veya ultrasonla saptanamayan az miktarda sıvı bulunur. Pariyetal plevral kılcal damarlardaki yüksek hidrostatik basınç ve plevral boşluktaki düşük onkotik basınç, sıvının plevral boşluğa hareketini destekleyen yaklaşık 9 cmH₂O net filtrasyon basıncı oluşturur. Normal plevral sıvının yaklaşık %75'i, düz kas kasılmaları ve lenfatik akışı artıran solunum hareketi ile lenfatikler yoluyla boşaltılır. Plevral boşlukta kalan herhangi bir sıvı daha sonra düşük hidrostatik basınçları nedeniyle visseral plevral venöz kılcal damarlara hareket eder. Visseral plevranın büyük vaskülaritesi, akış direncini daha da azaltır ve net sıvı emilimini artırır (Stillion and Letendre, 2015). Plevral sıvının fizyolojik hacimleri türler arasında değişir (0.04 ila 0.6 ml/kg aralığında), canlı ağırlık artışıyla birlikte plevral sıvı hacmi/kg miktarında da azalma olmaktadır. Genel olarak köpeklerde plevral boşluğundaki sıvı miktarı 0.1 ml/kg bulunurken, kedilerin plevral boşluğunda 1 ila 5 ml sıvı bulunur ve bu miktar ise 0.3 ml/kg'a eşdeğerdir.

Patofizyoloji

Patolojik plevral sıvı birikimi, sıvı üretimi ve çıkarılması arasındaki dengesizliği yansıtır. Plevral sıvı birikimi – yani plevral efüzyon – şu durumlarda oluşur: a) Sıvı üretimi artış b) sıvının lenfatik sistem yoluyla yeniden emilmesi/drenajı engellenmesi. Artmış plevral sıvı üretimi aşağıdakilere sekonder olarak ortaya çıkabilir: 1) Azalan onkotik basınç, 2) Artan hidrostatik basınç, 3) Artmış damar geçirgenliği ve plevral sıvı drenajında azalma olabilir: 1) artan lenfatik basınç sonucu, 2) artan lenf sızıntısına ikincil olarak lenf sistemi. Transplevral basınç dengesindeki değişiklikler (yani, artan hidrostatik basınç veya azalmış onkotik basınç), bozulmuş lenfatik drenaj veya artan kapiller endotelyal geçirgenliğin tümü, plevral efüzyon gelişimine katkıda bulunabilir (Murphy ve Papsouliotis, 2011). Hemotoraks, göğüs duvarı,

plevra veya intratorasik yapıların herhangi bir dokusunun bozulmasını takiben plevral boşluğa kanamayı yansıtan özel bir plevral efüzyon vakasını temsil etmektedir (Scott, 2003).

Hemotoraksın Tanımı

İnsanlarda hemotoraks, hematokritin periferik hematokritin % 50'sinden fazla olduğu kanlı bir eksüdatif efüzyon olarak tanımlanmıştır (Azfar Ali ve ark., 2008). Hematokrit içeren sıvılar periferik hematokritin yüzde 25 ila 50'si hemorajik efüzyon olarak adlandırılır ve alternatif ayırıcı tanılara sahiptir. Veteriner tıbbında standart bir uygulama yoktur. Genel olarak, periferik hematokritin % 25'inden daha büyük bir hematokrit, bir hemotoraks ile uyumlu kabul edilir, ancak bazı araştırmacılar % 20'den fazla paketlenmiş plevral sıvı hücre hacmi kullanır (Rozanski 2017).

Hemotoraks Nedenleri

Kedi ve köpeklerde hemotoraksın farklı nedenlerinin sıklıklarını karşılaştıran veteriner literatüründe herhangi bir yayın bulunmamaktadır. Burada sunulan etiyojilerin listesi bir çalışmadan türetilmiştir. Köpeklerde koagülopatik olmayan spontan hemotoraksın (Nakamura ve ark., 2008), hemotoraksın tanımlandığı olaylar/bozukluklarla ilgili çalışmalar, bireysel vaka çalışmaları ve insan literatüründen spekülatif çıkarımlardır. Genel olarak hemotoraksa künt veya penetran travma veya neoplazi, akciğer lobu torsiyonu, bulaşıcı hastalık ve çeşitli çeşitli durumlarla birlikte spontan olarak ortaya çıkabilir. Kısaca kedi ve köpeklerde hemotoraksın başlıca etiyojileri travma, koagülopati ve neoplazi olarakta özetlenebilir (Tablo 1).

Tablo 1.: Hemotoraksın Sebepleri	
Travma	<ul style="list-style-type: none">• Karayolu trafiği çarpışması.• Penetran yaralanma• Ezilme/basma yaralanması• Hızlanma veya yavaşlama yaralanması

Travma

Torasik travmalar, köpek ve kedilerde künt veya penetran durumların bir sonucu olarak ciddi ve potansiyel olarak yaşamı tehdit eden yaralanmalara neden olur (Hackner, 1995; Looney, 2001; de Laforcade, 2002; Fossum, 2002b; Kirpensteijn, 2002; Yay, 2003; Tello, 2006; Pelosi ve ark., 2008). Göğüs travması, şokun yanı sıra kardiyovasküler ve solunum sistemi yaralanmalarına da neden olur. Göğüs travmasına bağlı olarak sıklıkla karşılaşılan patolojik durumlar; trakeal travma, pnömotoraks, hemotoraks, pulmoner kontüzyon, kaburga kırığı, yelken göğüs, miyokardiyal kontüzyon veya perforasyondur (Salci, 2003a; Salci, 2003b; Salci, 2004).

Tanı

Künt veya penetran torasik veya torakoabdominal travmayı takiben herhangi bir hayvanda ve ayrıca hipovolemi ve eş zamanlı solunum sıkıntısı belirtileri gösteren hayvanlarda hemotorakstan şüphelenilmelidir. Kapsamlı bir öykü, hemotoraksın olası etiyojisine ilişkin değerli ipuçları verebilir (Tablo 1). Kusma ve diyare az sayıda hemotoraks vakasında rapor edilmiştir (Nakamura ve ark. 2008) ve pankreatit düşünülmesine yol açabilir. Az sayıda hemotoraks vakasında kusma ve ishal bildirilmiştir (Nakamura ve diğerleri 2008) ve pankreatit (karın ağrısı ve iştah kaybı ile ilişkiliyse) düşünülmesine yol açabilir. Uyuşukluk dahil belirsiz sistemik belirtiler ve iştahsızlık da zaman zaman rapor edilir, ancak farklılık listesini daraltmaz. Hemotoraksın doğrulanması, plevral sıvı örneğinin analizini gerektirir. Tanısal torakosentez, uygun şekilde aşamalı bir yaklaşımın parçası olarak yapılmalıdır. Bazı durumlarda, plevral sıvı toplanmasından önce/olmadan hemotoraksın varlığından kuvvetle şüphelenilebilir. Bazen torakosentez terapötik olarak gerekli olmayabilir. Tanısal ve terapötik müdahalelerin dengesi, klinik belirtilerin ciddiyetini yansıtmalıdır.

Tablo 1. : Hemotoraksın klinik bulguları

Soluk mukoz membranlar	Uzun süreli kapiler geri çekilme süresi
Değiştirilmiş düşünce	Taşipne
Hipotermi	Kötü/zayıf çevresel nabız kalitesi
Taşikardi (kedilerin kalp atış hızı artmayabilir hızı ve bradikardik olabilir)	Soğuk ekstremiteler
	Hipotansiyon

Semptomlar

Hemotoraksın altta yatan nedenini belirlemeye yardımcı olabilecek diğer fizik muayene bulguları arasında dış yaraların (aşınmış pençeler, kırık kaburgalar, dış sıyrıklar veya morarma), birincil (peteşi veya ekimozlar) veya ikincil (diğer bölgeler) belirtiler hemostatik kusurlar veya kitle lezyonları (vücut duvarında deformasyona neden olan kaburga veya viseral kitleler) dir. Akut kan kaybını takiben, organ perfüzyonunu korumak için plazma hacminin hızlı bir şekilde değiştirilmesi de dahil olmak üzere bir dizi telafi edici değişiklik meydana gelir. Bu, ekstrasvasküler protein havuzunun mobilizasyonu ve ardından kan hacminin genişlemesi ile sağlanır (Adamson ve Hillman 1968). Anekdöt olarak, köpeklerde ve kedilerde paketlenmiş hücre hacmi, önemli kanamadan sonraki altı saat içinde değişebilir, ancak maksimum denge 24 saate kadar sürebilir. Kritik bir durumda bulunan hayvanlarda ilk kan çalışmasını yorumlarken, hematokritin daha da aşağı doğru ayarlanması beklenmelidir. Bu nedenle, intravenöz sıvı

desteđi veya transfüzyon tedavisine devam etme kararları, hayvanın hemodinamik durumunun fiziksel deęerlendirmesine dayanmalıdır. İlk kan numuneleri alınırken periferik damarların (örneğin, sefalik veya safenöz) kullanılması iyi bir uygulama olarak kabul edilir, çünkü bu, bir hematoma oluşması durumunda (örneğin, altta yatan bir koagülopatinin varlığı) boyundaki hayati yapıları sıkıştırma ihtiyacını ortadan kaldırır. Tam bir kan sayımı, anemiyi ölçer ve rejeneratif durumun bir göstergesini sağlar. Retikülositoz köpeklerde sadece üç ila beş gün, kedilerde beş ila yedi gün sonra gelişir ve hemotoraks bağlamında, kronikliđin bir göstergesidir. Otomatik trombosit sayımı, trombositopeniyi dışlamak veya doğrulamak için yararlı olabilir. Bir kan yayması incelemesinde, yüksek güçlü alan başına (x 100 objektif) üç veya daha fazla trombositin varlığı, kanama nedeni olarak trombositopeniyi ekarte etmek için yeterlidir. Tüylü kenar trombosit kümelerinin varlığı açısından da kontrol edilmelidir. Spontan kanamaya neden olacak kadar düşük trombosit sayısı, büyük olasılıkla immün aracılı kökenlidir. Uygun görüntüleme yoluyla altta yatan bir tetikleyici aranmalıdır.

Plevral Efüzyon Varlığına İlişkin Fiziksel Muayene Bulguları

Taşipne	Kısıtlayıcı solunum modeli (sıđ/hızlı solunum)
Ortopne	Solunum sırasında artan karın hareketi
Dispne	Ağızdan nefes alma (kediler)
Öksürük (üretken olmayan ve atelektatik akciđerdeki reseptörlerin uyarılmasına bağlanabilir)	Oskültasyon/perküsyon indisleri
Düzgün bođuk kalp/akciđer sesleri	Akışkan hattının varlığı
Perküsyonda ventral donukluk	

Fiziksel Muayene

Fizik muayene bulguları, altta yatan nedeni ortaya çıkararak veya önemli komorbiditeleri vurgulayarak faydalı tanısal bilgiler sağlayabilir. Hemotorakslı küçük hayvanlarda ortaya çıkan belirtiler, önemli bir kan hacminin yeniden dağılımının hemodinamik sonuçlarını, azalmış toplam akciđer kapasitesinden kaynaklanan solunum yetmezliğini veya altta yatan etiyolojiyi yansıtabilir. Nefes zorluklar ve takipne sadece 20 ml/kg plevral sıvı birikimi. Öyleyse, kan hacminin yüzde 15 ila 20'sinin hızlı kaybı (örn. 20 kg'lık bir köpekte 250 ila 350 ml kan) neden olabilir ve önemli olmayan hipovolemi belirtileri hayvanın nefesi üzerindeki etkisi. Kapasite görece yerleştirmek için plevral boşluđun belirgin solunum yolu olmayan büyük miktarda kan uzlaşma, hemotorakslı hayvanların olmaksızın hipovolemik şok sunabilir.

Tanısal Görüntüleme

Göğüs radyografileri, insan ve veteriner hastalarda plevral efüzyon tanısı için sıklıkla tercih edilen ilk görüntüleme yöntemidir (Stillion and Letendre, 2015). Kısıtlayıcı bir solunum paterninin ve katı kalp/akciğer seslerinin varlığı, plevral boşluk hastalığını oldukça düşündürür. Çeşitli torasik görüntüleme modaliteleri varlığını doğrulayabilir. Plevral sıvı varlığını belirlemede kullanılan tekniğin seçimi, ekipmanın kullanılabilirliğini, uzmanın deneyimini ve hasta stabilitesini yansıtmalıdır. Eğer vakada ciddi solunum yetmezliği varsa torakosentez görüntülemeden önce yapılabilir ve vaka stabil hale getirildikten sonra tanısal görüntüleme yapılmalıdır (Fossum,1998 ; Boysen ve Lisciandro, 2013).

Torasik Ultrasonografi

İnsanlarda ve küçük hayvanlarda plevral boşlukta serbest sıvının saptanması için ultrasonun hem fizik muayene hem de radyografiye eşit veya üstün olduğu kabul edilir (Ma ve Mateer 1997, Lisciandro ve ark., 2008). Ultrason, plevral efüzyonun hızlı bir şekilde saptanmasına izin verir ve radyografi ve BT için gerekli olan aynı düzeyde fiziksel veya kimyasal kısıtlama gerektirmez. TFAST (travma, triyaj veya izleme için sonografi ile torasik odaklı değerlendirme) tekniği, sınırlı ultrasonografi deneyimine sahip bir veterinerin, önemli bir plevral efüzyon olup olmadığını hızla tespit etmek için kullanabileceği bir ultrason yaklaşımıdır (Lisciandro 2011 ; Parlak, K., Zamirbekova, N., Uzunlu, E. O., Ayol, E. T., & Yavru, 2021). TFAST ile amaç tüm göğüs boşluğunu değerlendirmek değil, belirlenmiş bölgelere odaklanmaktır (Boysen ve Lisciandro, 2013).

Göğüs Radyografisi

Plevral efüzyonun radyografik kanıtı, interlobar damarların genişlemesini (orta boy bir köpekte >100 ml sıvı ile görülür (Thrall, 2018), kostofrenik bölgede akciğer kenarlarında taraklaşmayı içerir. Altta yatan bir hastalık sürecinin göstergesi olan diğer anormallikler de tespit edilebilir. Ventrodorsal projeksiyonlar küçük (potansiyel olarak klinik olarak önemsiz) plevral sıvı hacimlerini saptayabilir ve kimyasal veya fiziksel kısıtlama olmaksızın elde edilebilir. Hasta stabilitesi, radyografik görüntülerin elde edilmesinde potansiyel bir sınırlayıcı faktördür (Boysen ve Lisciandro, 2013). Torasik ultrason veya kör torakosentez dispneik bir hastada daha güvenli alternatifler olabilir. Plevral sıvının çıkarılması, intratorasik yapıların radyografik incelemesini de kolaylaştırır (Boysen ve Lisciandro, 2013).

Bilgisayarlı Tomografi

Kesitsel BT, radyografi ve ultrasona göre çeşitli avantajlar sunar. BT, yapıların üst üste binmesi olmadığı için orta düzeyde bir plevral sıvı hacmi varken yapılabilir. BT ayrıca anatomik yapıların üstün çözünürlüğünü sağlayarak radyografide gözden kaçabilecek plevral ve kaburga kitlelerinin saptanmasını sağlar. BT, sıvı birikiminin mediastinal veya plevral kitlelerden ayırt edilmesini kolaylaştırabilir ve ayrıca cerrahi ve onkolojik planlamaya rehberlik edebilir (Walters ve ark., 2018).

Torakosentez

Plevral efüzyondan şüphelenilen dispneik hayvanlarda radyografiler alınmadan önce torakosentez yapılmalıdır. Küçük miktarlarda plevral efüzyonun çıkarılması bile hayvanın ventilasyonunu önemli ölçüde iyileştirerek radyografik prosedürler için daha güvenli manipülasyona izin verebilir (Fossum, 1998).

Torakosentez için ihtiyaç duyulan malzemeler :

- Kelebek iğne (16 - 21 gauge) veya 18 - 20 gauge intravenöz kanül (daha büyük köpekler için daha uzun iğne uzunluğu),
- Şırınga (20 ml),
- Üç yollu musluk veya merkezleme valfi,
- Uzatma seti,
- Steril tüpler (sitolojik analiz, protein/lipit seviyeleri ve kültür ölçümü için),
- Sıvı toplama kabı (sürahi).

Torakosentez sıklıkla bilinçli bir hastada düşük oksijen temini ile yapılır. Gerekirse hafif sedasyon sağlanabilir (örn. düşük doz butorfanol, 0.1 ila 0.2 mg/kg). Hasta konumlandırma, stresi ve dispneyi en aza indirecek şekilde uyarlanmıştır; sternal uzanma veya hayvanın ayakta durması genellikle iyi tolere edilen ve erişilebilir pozisyonlardır. Yerleştirme noktasının etrafına lokal anestetik (lidokain) alınır. Torakosentez, 7. ve 9. interkostal boşluklar arasında (kaudal yerleşimli sinirlere ve damarlara zarar vermemek için kranial kaburgaya kadar) veya uygun bir sıvı cebinin belirlenmesi üzerine ultrason rehberliği ile toraksın ventral üçte birinde olacak şekilde torakosentez yapılır. Sıvı alınana kadar iğne yavaşça aspire edilirken yavaşça ilerletilir. Torakosentezin son noktası genellikle solunum sıkıntısının hafifletilmesidir, ancak

bazı vakalarda yalnızca minimal bir artık hacim bırakmaktan tanınasal yarar (özellikle radyografi için) olabilir. Akciğerler torasik boşluğu hasta edecek şekilde yeniden genişleyemezse, iyatrojenik pnömotoraks riski vardır. Re-ekspansiyon yaralanması, kronik efüzyonlara sekonder plevral fibrozis ile tanımlanır ve radyografilerde akciğer kenarlarında yuvarlaklaşma olduğunda şüphelenilebilir. Bununla birlikte, torakosentezin tehlikeleri abartılmamalı ve özellikle dispneik hastaların, prosedürün komplikasyonlarından ziyade aşırı plevral sıvının zararlı etkilerinden ölme olasılığı daha yüksektir. Ancak hayvanda solunum sıkıntısı göstermiyorsa sıvının çıkarılması gereksiz olabilir, çünkü kan diyafragmatik lenfatikler yoluyla plevral boşluktan hızla geri emilir (Day, 2014).

Sıvı Analizi

Plevral sıvının kaba görünümü açık kan görünümü olsa bile bu yanıltıcı olabilir. Plevral sıvı, hematokrit yüzde 5'i aştığında kanla aynı renge sahiptir ve bu nedenle doğrulamadan önce dikkatli olunmalıdır. Hemotoraks. Plevral sıvının hematokrit/paketlenmiş hücre hacminin ölçülmesi ve periferik kan ile karşılaştırılması, hemotoraksın kesin tanımını tamamlamak için gereklidir. Periferik kana benzer bir hematokrit, yakın zamanda travma/aktif kanamayı düşündürür. Periferik hematokritin %50'sinden fazlasına sahip plevral sıvı hematokritleri en sık travmatik orijinli hemotoraksta görülür ve malignitelere olağandışı kabul edilir. Tüm plevral efüzyon türleri için, biyokimyasal ve sitolojik özelliklerin analizi ve olası kültür dahil olmak üzere daha ileri teşhisler için sıvı toplanmalıdır. Sıvı, bir EDTA tüpüne (sitolojik inceleme ve hücre sayımı), düz bir tüpe (toplam protein ölçümü, pıhtılaşma özellikleri, özel biyokimyasal testler) ve aerobik ve anaerobik kültür için uygun kaplara toplanmalıdır. Örneklemeye (veya aktif patolojik kanama) sırasında meydana gelen iyatrojenik kanama trombositler içerir ve pıhtılaşacaktır. Eritrofagositoz eksikliği de patolojik hemorajik efüzyondan ayırt edilmesine yardımcı olur. Sıvının sitolojik incelemesi, bu özelliklerin değerlendirilmesinde ve atipik hücre materyalinin aranmasında yardımcı olur. Hemanjiyosarkomlar gibi bazı tümörlerin sitoloji temelinde teşhis edilmesi zor olsa da, malign hücrelerin tanımlanması neoplastik bir etiyojeniyi doğrulayabilir. Bu gibi durumlarda histopatolojik örnekler gereklidir.

Tedavi

Hemotoraks yönetimi duruma ve nedene bağlıdır. Oksijen tedavisi ve dolaşım desteğini içeren önlemler, ilk hasta stabilizasyonu için kritik öneme sahiptir. Önemli kan kaybından sonra, bazı hastalar kan ürünleri transfüzyonu için aday olabilir (Allerton, 2019). Solunum sıkıntısı çeken hayvana ek oksijen, fizik muayeneye izin vermek ve vasküler erişim sağlamak için analjezi ve

solunum sıkıntısını hafifletmek için terapötik torakosentez yapılabilir. Bunlar ek olarak hayvan efor/stresten durumlarında uzak tutulmalıdır. Hemotoraks tedavisi, altta yatan bozukluğa göre uyarlanır ve yoğun bakım, ölçülen sıvı çıkarılması, kanamayı durdurmak için doğrudan önlemler ve potansiyel olarak kaybedilen kanın değiştirilmesini içerebilir. Hemotoraks yönetimi vaka ve nedene bağlıdır. Oksijen tedavisi ve dolaşım desteğini içeren önlemler, başlangıç için kritik öneme sahiptir. Önemli kan kaybından sonra, bazı hastalar kan ürünleri transfüzyonu için aday olabilir. Altta yatan bir koagülopatiden şüpheleniliyorsa, kaybedilen eritrositleri ve pıhtılaşma faktörlerini yenilemek için tam kan tercih edilebilir. Bir koagülopati yoksa, paketlenmiş kırmızı kan hücreleri yeterli olabilir. Otolog kan transfüzyonu (hastanın dolaşımına geri dönmek için plevral boşluktan kırmızı kan hücrelerinin toplanması), hemotorakslı bazı kedi ve köpeklerde etkili bir acil durum önlemi olabilir (Higgs ve ark., 2015). Sepsis veya antikoagülan intoksikasyonu durumlarında uygun değildir ve neoplastik bir kökenden şüpheleniliyorsa dikkatle değerlendirilmelidir. Uygulama için her zaman uygun bir filtre kullanılmalıdır.

İmmünsüpresif ilaçlar (\pm vinkristin) ve gerektiğinde kaybedilen kırmızı kan hücrelerinin yerine konması, birincil immün aracılı trombositopeni tedavisinin temel dayanağıdır. Doğrulanmış veya olası antikoagülan intoksikasyonları K1 vitamini \pm bir plazma transfüzyonu (taze dondurulmuş veya saklanmış) ile tedavi edilebilir. Taze donmuş plazma transfüzyonu veya kriyopresipitat, von Willebrand hastalığına sahip olduğundan şüphelenilen veya doğrulanmış köpekler için uygun transfüzyon ürünleridir (Higgs ve ark., 2015 ; Allerton, 2019). *Angiostrongylus vasorum* durumlardan ise Fenbendazol, milbemisin oksim veya imidakloprid/moksidektin uygulanmalıdır (Di Cesare ve Traversa, 2014).

Akciğer lobu torsiyonu veya torakal maligniteleri olan hastalar göğüs cerrahisi gerektiren bazı cerrahi işlem yapılmalıdır. Özellikle göğüs duvarı tümörlerinin prognozu histopatolojik sonuçlara bağlı olarak bazı vakalarda rezeksiyon küratif olabilir veya uzun süreli remisyonla sonuçlanabilir (Allerton, 2019).

Özet

Selenyum, insanların ve evcil hayvanların beslenmesinde önemli bir eser elementtir. Vücutta önemli bir rol oynayan 30'dan fazla selenoprotein bir bileşendir. Selenoproteinler, hücreleri birçok kronik hastalığın nedeni olan serbest radikallerin neden olduğu hasarlardan korur. Bunlara ek olarak tiroid hormonlarının metabolizmasına katılmakta, üreme fonksiyonlarını kontrol etmekte ve nöroprotektif etkiler göstermektedir. Ayrıca anti-proliferatif ve antiinflamatuar özelliklerinin yanı sıra bağışıklık sisteminde uyarmaktadır. Bu araştırmada selenyum iz elementinin evcil hayvanlardaki önemi hakkında bilgi verilecektir.

Anahtar kelimeler: Selenyum, hayvan, etki, önem

THE IMPORTANCE OF SELENIUM IN ANIMAL HEALTH

Abstract

Selenium is an essential trace element in the diet of humans and domesticated animals. It is a component of more than 30 selenoproteins that play an important role in the body. Selenoproteins protect cells from damage caused by free radicals, which are the cause of many chronic diseases. In addition to these, it participates in the metabolism of thyroid hormones, controls reproductive functions and shows neuroprotective effects. In addition to its anti-proliferative and anti-inflammatory properties, it also stimulates the immune system. In this study, information will be given about the importance of the trace element selenium in domesticated animals.

Keywords: Selenium, animal, effect, importance

GİRİŞ

Selenyum

Selenyum (Se), antioksidan aktivite, antiinflamatuvar, antimutajenik, antikanserojenik veya kemopreventif, antiviral, antibakteriyel, antifungal ve antiparaziter etkiler gösteren temel bir eser elementtir (Hosnedlova ve ark., 2017). Selenyum (Se), memeli biyolojisi için gereklidir; çünkü önemli enzimatik fonksiyonlu selenosistein gibi pek çok selenoproteinlerin bir bileşenidir (Kozat, 2006). Selenyum içeren peroksidazlar (Glutathion Peroksidaz (GPx)) sınırlandırıldığında (selenyum noksanlığına bağlı olarak) dokularda serbest radikallerin düzeyleri artar ve dokularda hasarlara neden olur (Tórtora-Pérez, 2010). Dokulardaki peroksidasyon reaksiyonlarını sonlandırmak ve dokuları peroksidasyona karşı korumak için vitamin E ve Bakır-Çinko superoksit Dismutaz (Cu-Zn SOD) ve Mangan superoksit Dismutaz (MnSOD), Katalaz, Glutathionsulfur- transferaz gibi enzimler tarafından paylaşılır (Tórtora-Pérez, 2010). Ayrıca selenyum selenoenzimeler tip I ve hormon 3,3',5 tri- iyodthironin (T₃) üretim için önemli iyodthironin deiodinaz tip II işlevleri için gereklidir (Hosnedlova ve ark., 2017).

Selenyumun Vücuttaki Rolü

Selenyum, antioksidan savunma, tiroid hormonlarının oluşumu, DNA sentezi, doğurganlık ve üreme gibi birçok biyolojik fonksiyonda önemli rol oynayan selenoproteinlerin temel bir bileşenidir. Selenyum organizmada çeşitli metabolitlere dönüştürülebilir. Metilselenol gibi bazıları kanserin önlenmesinde rol oynar. Selenyum, E vitamininin yanı sıra dayanıklılık ve iyileşmeyi iyileştirerek ve yaşlanma sürecini yavaşlatarak kas fonksiyonunda da rol oynar (Mehdi ve ark. 2013).

Gastrointestinal Sistemine Etkisi

Selenyum (Se), hayvanların çok çeşitli fizyolojik aktivitelerde rol oynadığı için hayvan yeminde daha küçük konsantrasyonlarda zorunlu olarak gerekli olan önemli bir mikro besin elementidir (Khan ve ark., 2006). Geviş getiren hayvanların gastrointesitnal sistemi, çok kompartmantlı midelerin (özellikle rumen) ardından ince ve kalın bağırsakların varlığıyla karakterize edilir. Rumen ve kalın bağırsak (özellikle kolon ve sekum) kısa zincirli yağ asitleri (SCFA) üretilir. Geviş getiren hayvanların vücut kondisyonu, büyüme ve üretim için ihtiyaç duyduğu enerji ihtiyacının yaklaşık % 90'ını üretilen kısa zincirli yağ asitlerinden karşılamaktadır (Malhi ve ark., 2013). Bir hayvanın büyüme ve üretim performansı, besinlerin sindirim sistemi boyunca etkili bir şekilde sindirilmesi, emilmesi ve uygun kullanım için emilen besinlerin verimli periferik akışı gerekir. Sindirim organlarının büyümesi, vücut büyümesinin

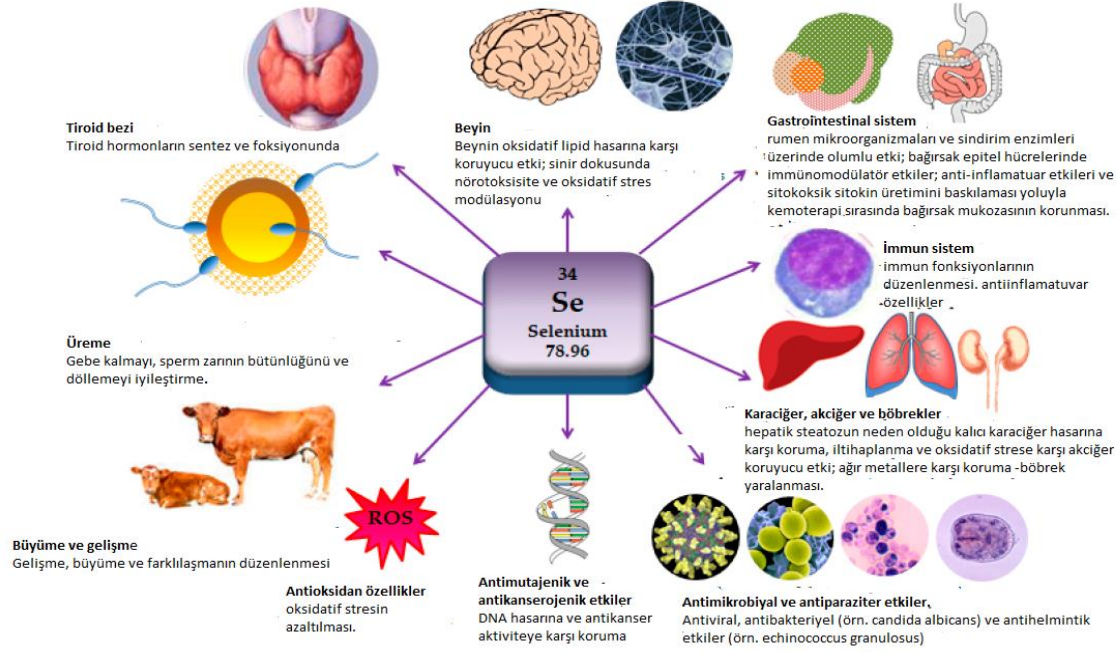

önemli bir göstergesi olup ve besin kullanım miktarını temsil etmektedir (Johnson ve ark., 1990). Hayvan rasyonlarına selenyum başka olmak üzere iz minerallerin rasyona eklenmesi gastrointestinal sistemin gelişimine ve besin sindirilebilirlik oranlarını etkilediği belirtilmektedir. Hayvan rasyonuna 0.2 – 0.6 mg/kg oranında eklenen inorganik Se, selenat veya selenit formları yüksek konsantrasyonla beslenen koyunlarda gastrointestinal sistemin sindirilebilirliğini artırırken (Del Razo-Rodriguez ve ark., 2013), düşük konsantrasyonla beslenen koyunlarda hiçbir etki gözlenmediği rapor edilmiştir.

Antioksidan Etkisi

Oksidasyon reaksiyonları, et ürünlerinin besleyici değerini ve tatlarını olumsuz etkiler ve glutatyon peroksidazın (GSHPx) antioksidan özelliği ile önlenir (DeVore ve ark., 1983; Gatellier ve ark., 2004). Oksidasyondaki azalma, ette bir antioksidanın mevcudiyetini gerektiren et kalitesini korur (Samo ve ark. 2018).

Glutatyon Peroksidaz (GPx)

Glutatyon peroksidazlar (GPx), antioksidan enzimlerin bir ailesidir. Başlıca işlevleri, hücre içi ve hücre dışı bölmelerdeki hidrojen peroksit ve organik hidroperoksitleri nötralize etmektir. Yakın tarihli bir derlemede, Brigelius ve ark. (2013), glutatyon peroksidazların çeşitli yönleriyle ilgili en son bilgileri özetledi. Benzer özelliklerle karakterize edilen sekiz GPx formu vardır. Farklı modları, etki yerleri ve farklı kimyasal formları vardır. E vitamini ile sinerji içinde hücreleri H₂O₂ veya organik hidroperoksitlerin birikmesinden korurlar ve hücre zarlarının sürekli bütünlüğünü sağlarlar. Enzimatik aktiviteleri, nötralizasyon gerçekleştirmek için özellikle selenyuma bağımlı olan 1 ila 4 formları için selenyum alımıyla doğru orantılıdır. Bu nedenle selenyum eksikliği ile oksidatif stres arasında güçlü bir bağlantı vardır (Ducros ve Favier, 2004).

Şekil 1.: Selenyumun fizyolojik etkileri (Hosnedlova ve ark., 2017). Selenyum, antioksidan, antitumör ve antikarsinojenik özellikleriyle bilinir, ayrıca parazitlerin yanı sıra mikroplara karşı da etki eder ve antiinflamatuar etkilere sahiptir, metabolizmayı, büyümeyi ve gelişmeyi sağlar, organları oksidatif stresten korur, bağışıklık fonksiyonunu etkiler ve doğurganlığı artırır.

Tiroid Bezi

İyodotironin deiyodinazlar ayrıca tiroksinin (T4) metabolik olarak aktif bir tiroid hormonu olan 3,5,3'-triyodotironine (T3) veya ters 3,5,3'-triyodotironine dönüşümünü düzenleyen önemli bir selenoenzim grubudur. Tip 1 5'-iyodotironin deiyodinaz, tiroid bezi gibi T3 hormonu üreten karaciğer ve böbreklerde bulunur. Geviş getiren hayvanlarda beyinde ve hipofiz bezlerinde de varlığı kaydedilmiştir (Zarczynska ve ark., 2013).

Selenyumun Bağışıklık Sistemi Üzerindeki Etkisi

Selenyum bağışıklık sistemini etkiler ve selenyum bileşikleri humoral bağışıklık mekanizmalarını etkileyerek tip M immünoglobulin düzeylerini artırır (Maggini ve ark., 2007). Hayvan yemine selenyum takviyesi, antikör düzeylerini artırır, nötrofil granüositleri ve makrofajların fagositik aktivitesini artırır ve miyojenlerle uyarıldığında T lenfosit sayısını artırır (Kamada ve ark., 2007).

Antiparaziter ve antimikrobiyal etki

Selenyum (Se), antioksidan aktiviteyi, antiinflamatuvar, antimitojenik, antikanserojenik veya kemopreventif özellikleri gösteren temel bir iz elementtir. Bunun yanı sıra antiviral, antibakteriyel, antifungal ve antiparazitik etkilere sahiptir

Noksanlık

Bütün dokular gelişimleri süresince oksidaz strese duyarlıdır. Çiftlik hayvanlarında antioksidan selenyum' un azalışına bağlı olarak çok çeşitli klinik belirtiler görülür. Selenyum noksanlığına bağlı olarak buzağılarda, kuzularda, oğlaklarda, taylarda ve eşeklerde beyaz kas hastalığı (WMD) veya beslenme kas distrofisidir (NMD) hastalıklar oluşmaktadır (Millar ve ark. 1986; Underwood, 1997; Tórtora-Pérez, 2010; Hosnedlova ve ark., 2017).

Selenyum Konsantrasyon Düzeyinin Ölçümü

Organizmadaki selenyum durumu, selenyum içeriğinin belirlenmesine dayalı olarak doğrudan veya selenyum bağımlı glutasyon peroksidaz aktivitesine dayalı dolaylı yöntem kullanılarak değerlendirilebilir (Hosnedlova ve ark., 2017).

Tablo1. Sığırlarda Selenyum düzeyleri (Kincaid, 1999).

	Selenyum		
	Tam kan ng/ml	Karaciğer µg/g DM (yetişkin)	Karaciğer µg/g DM (genç)

Özet

Perinatal mortalite, en az 260 günlük gebelik döneminden sonra, fetüsün veya buzağının doğumdan önce, buzağılama sırasında veya doğumdan sonraki 48 saat içinde görülen kayıpları (ölümleri) tanımlarken, neonatal ölümü ise doğumun başlangıcından doğum sonraki otuz ikinci güne kadar ki periyottaki buzağı ölümü tanımlamaktadır. Süt sığırcılığında buzağı verim kaybı ve ölümleri yaklaşık % 60'ı iki dönem içerisinde meydana gelmektedir Sütçü inek işletmelerinde hem biyolojik hem de ekonomik verimliliği etkileyen en önemli faktörler üreme performansı, ölüm oranının azalış ve yavrunun büyüme hızıdır. Bu araştırmada buzağılama dönemlerimde yaygın görülen ve buzağılarda verim ve ölüm neden olan durumlar hakkında bilgi verilmiştir.

Anahtar Kelimeler: Buzağı, perinatal, neonatal, periyot

PREVENTION STRATEGIES FOR CALF LOSS IN PERINATAL AND NEONATAL PERIOD

Abstract

Perinatal mortality defines losses (deaths) of the fetus or calf before birth, during calving or within 48 hours after birth, after a gestation period of at least 260 days, while neonatal death defines calf death in the period from the onset of birth to the thirty-second day after birth. Approximately 60% of calf yield loss and death in dairy cattle breeding occur in two periods. The most important factors affecting both biological and economic efficiency in dairy cow farms are reproductive performance, decrease in mortality rate and growth rate of offspring. In this study, information was given about the conditions that are common in my calving periods and that cause yield and death in calves.

Keywords: Calf, perinatal, neonatal, period

GİRİŞ

Sütçü inek işletmelerinde hem biyolojik hem de ekonomik verimliliği etkileyen en önemli faktörler üreme performansı, ölüm oranının azalış ve yavrunun büyüme hızıdır (Drennan ve Berry, 2006). Perinatal mortalite, en az 260 günlük gebelik döneminden sonra, fetüsün veya buzağının doğumdan önce, buzağılama sırasında veya doğumdan sonraki 48 saat içinde görülen kayıpları (ölümleri) tanımlarken (Jawor ve ark., 2021), neonatal ölümü ise doğumun başlangıcından doğum sonraki otuz ikinci güne kadar ki periyottaki buzağı ölümlerin tanımlamaktadır. Süt sığırcılığında buzağı verim kaybı ve ölümleri yaklaşık % 60'ı iki dönem içerisinde meydana gelmektedir. Doğum süreci bir buzağının hayatında travmatik ve tehlikeli bir olayların görüldüğü bir kaotik süreçtir. Bu sürecin etiklenmesi, fetal kortizolün yükselmesiyle başlar, ardından annede uterus kasılmalarına, serviksin genişlemesine, fetüsün doğumu ve son olarak plasentanın atılmasına yol açan endokrin olayları kapsamaktadır (Senger, 1999). Ancak bazen pek çok farklı faktör, doğumla ilgili fetal veya maternal sistemleri bozabilir ve distosi ile sonuçlanabilir (Breazile ve ark., 1988; Murray and Leslie, 2013). Yeni doğan memelilerin doğumdan sonra hayatta kalması, belirli bir davranış modelinin hızlı bir şekilde ifade edilmesine bağlıdır. Bu davranışlar; ayakta durma, yürüme, emzik arama ve kolostrum ve süt emmeyi içerir (Holdsworth ve ark. 2022). Büyük ölçekli, çoklu çiftlik çalışmalarında perinatal dönemde süt buzağılarının %2.4-9.7'sinin çok çeşitli nedene bağlı olarak öldüğü veya %6.2 oranında ise düşük canlı ağırlıklı oldukları rapor edilmektedir (Fourichon ve ark., 2001; Ghavi Hossein-Zadeh ve ark., 2008; Cuttance ve ark., 2019). Perinatal ölüm (PÖ) için önemli risk faktörleri arasında ilk buzağılama yaşı (Chassagne ve ark., 1999), annenin cinsi, üreme yöntemi, buzağılama yönetimi, fetomaternal sağlık durumu, gebelik süresi (López Helguera ve ark., 2016), gebelik beslenmesi, buzağı cinsiyeti ve tohumlamada kullanılan boğanın ırkı (Mee ve ark., 2014) yer alır. Perinatal ölüm (PÖ) için birçok risk faktörü yönetimin kontrolü altında olmasa da (doğum yılı, doğum ayı, ikiz doğum, primiparite, önceki perinatal mortalite ve fetal cinsiyet) değiştirilebilir (Mee ve ark. 2013). Eğer doğumdan hemen sonra bu hayatta kalmayla ilgili davranışların modellerinde herhangi bir bozulma saptanırsa yeni doğan buzağın canlılık değerlendirilmesi ise 'düşük (zayıf) canlılık' olarak nitelendirilir (Tuchscherer ve ark., 2000). Perinatal mortalite, genç süt hayvanlarının başarılı yönetiminde önemli bir sorun olup ve süt üretimini, üremeyi ve annenin sağlığını olumsuz etkiler (Mee, 2008; Mee ve ark. 2013; Mee, 2013; Mee, 2023). Yeni doğan buzağın canlılık değerlendirme kriterleri tablo 1'de özetlenmiştir.

Tablo 1. Yeni doğan buzağı canlılığının değerlendirilmesi

Kriter	İyi Canlılık	Zayıf Canlılık
Solunum	50-75 bpm ve göğüs solunumu	Nefes nefese kalma, primer apne, düzensiz, abdominal solunum, uğultu ve sekonder apne
Vücudu kaplayan kıl görünümü	Plasenta sıvısı kaplı	Mekonyum lekeleri mevcut
Periferik ödem	Yok	Baş, dil veya ayaklarda ödem
Mukoza membranları	Pembe ve normal kapiller dolun süresi	Siyanotik, soluk ve yavaş kapiller dolun süresinde uzama
Refleks stimülasyonuna yanıt	Güçlü kafa sallama, güçlü kornea, emme veya pedal çevirme refleksi	Zayıf veya yanıt yok
Kas tonusu	Birkaç dakika içinde kafayı doğrultarak aktif hale getirme	Hareketsizlik ve sarkık kas yapısı
Nabız	100-150 bpm ve düzenli	> 150 bpm'yi takiben bradikardi (<80 bpm) ve düzensiz, azalan bir hız
Rektal sıcaklık	Doğumda 39-39.5°C, doğumdan sonra 38.5-39°C düşer. 1 saat ve kararlı	Doğumda 39.5-40°C, buzağılama sonrası düşüş <38.5°C ve 1 saatte ve azalır
Sternal yaslanma	5 dakika içinde ulaşılır	Uzun süreli yan yatma
Ayağa kalkma girişimleri	15 dakika içinde ayağa kalkmaya çalışmak 1 saat içinde ayakta durmak	Gecikmeli veya ayağa kalkma girişimi yok
Emzirme refleksi	2 saat içinde başlar	Emzirme girişiminde gecikme veya hiç girişimde bulunmama

Perinatal Hipotermi

Buzağılar prekocal termoregülasyonla doğmasına rağmen, ılıman bir ortamda genç buzağuların dörtte birine kadarında birincil hipotermi (rektal sıcaklık 98.6°F, <37°C) meydana gelebilir. Perinatal hipotermi, ayağa kalkma süresinin uzaması, kolostral immünoglobulinlerin geç emilimi gibi durumlarda sıkça görülen klinik bir tablodur. Doğumda, buzağın rektal sıcaklığı anneninkinden daha yüksek olup ve beden sıcaklığı 38.5 ve 40.0°C arasında değişir. Distosiye maruz kalan buzağuların vücut ısıları doğumda ötosiyal buzağılara göre daha yüksekken, doğumdan sonra daha fazla vücut ısıyı kaybederler. Bu artan ısı kaybı ve azalan termojenez, distosiyal buzağılarda asidoz ve hipotiroksinemiden kaynaklanmaktadır. Neonatal hipotermiye katkıda bulunan diğer faktörler arasında rüzgarlı ortam, buzağı derisi üzerindeki plasental sıvıların kurutulmaması (temizlenmemesi veya ıslaklığın yaygın olması), ıslak yatak takımların kullanılması ve açlık çamur veya yağmur yer almaktadır. Termoregülasyon, başlangıçta doku

substratlarının katabolizması ile ayakta durmaya çalışmak gibi aktivite; anne tarafından yalama ve piloereksiyon titremeyen termojenez ile elde edilebilir. Buzağı rektal sıcaklığı doğumdan hemen sonra 37°C'nin altına düşerse, yalamayı teşvik etmek için buzağın kafasını ineğin kafasına doğru çevirmek, buzağıyı samanla kurutmak ve erken yeterli kolostrum alımını sağlamak gibi ısıtma prosedürleri uygulanmalıdır. Bu, ilk günden sonra ısı üretiminin devam etmesi için gereklidir. Şiddetli, uzun süreli soğuk stresli buzağuların önerilen tedavisi, kızılötesi lamba, saç kurutma makinesi, ısı yastığı veya ılık su ile yeniden ısıtma yanısıra glukoz solüsyonu (3-4 ml/kg %10'luk solüsyon IV) parenteral uygulamalıdır (Kozat, 2018).

Göbek Bakımı

Göbek kordonunun kendiliğinden yırtılması meydana gelir buzağılama sırasında veya hemen sonrasında, buna bağlı olarak buzağılamada inek ayakta mı yoksa yatıyor mu ve ne kadar canlı buzağı doğumdan hemen sonradır. Kordon koptuktan sonra, urakus ve damarlar normalde karın içine çekilir, böylece çevresel kirlenmeden korunurlar. Yardımlı buzağılamalarda, buzağıyı oturtmak için hemen kordon kopartılmalı ve annenin yalaması için buzağın kafası anneye doğru çevrilmelidir. Buzağularla ilgili araştırmalar sınırlı olmakla birlikte, bir çalışmada omfalit veya göbek hastalığı, 76'nın %5 ila %15'inde görüldüğü rapor edilmektedir. Genellikle tedavi edilmediği için büyümenin yavaşlamasına, eklem hastalıklarına ve diğer sekellere neden olmaktadır. Göbek hastalığının önlenmesinde buzağı bakımı, doğumhane hijyeni, kalma süresinin azaltılması ve sağlıklı olmayan analık bölmelerindeki buzağuların, kaliteli kolostrum ve göbek deliğinin yeterli erken alımını sağlaması ve antiseptik solüsyon uygulaması gibi önlemler önemli rol oynayan faktörlerdir. Göbek antisepsisine atfedilen faydalar arasında buzağı morbidite ve mortalitesinin azalması ve solunum yolu hastalıklarında azalma yer almaktadır.

Tablo 2. Yeni doğan buzağı bakımında yapılması ve yapılmaması gerekenler

Dönem	Yap	Yapma
Buzağılama öncesi	Buzağılama öncesi inekleri doğum ünitesine taşıyın.	Buzağılamanın birinci aşamasında inekleri hareket ettirilmesi
Buzağılama	<ul style="list-style-type: none">✓ Bireysel olarak gebe ineğe derin saman yatakları sağlayın✓ Buzağılamanın I. aşamasının başlamasından sonra her 3-6 saatte bir inekleri izleyin.✓ Buzağılamanın II. evresinin başlangıcından en az 2 saat sonra müdahale edin.	<ul style="list-style-type: none">• Gebe ineklerin kalabalık grup halinde doğum bölmelerine alınması• Buzağılamanın 1. veya 2. aşamasında inekleri gereksiz yere rahatsız edilmesi• Gebe düvenin buzağılama sırasında yardımcı olmamak
Buzağılama sonrası	<ol style="list-style-type: none">1. Buzağılamadan sonra buzağın hayati belirtilerini hemen değerlendirin2. Resüsitasyon yardımcılarını edinin ve personeli resüsitasyon tekniklerinin kullanımı konusunda eğitin.3. Göbek antisepsisi uygulayın.	<ul style="list-style-type: none">✓ Göbek kordonunu kesin veya zamanından önce yırtın.✓ Zayıf bir buzağının sonunda yeterince emeceğini düşüncesinde olmak✓ Paratüberkülozlu sürülerde buzağıyı anayla birlikte bırakın.

Günümüzde süt buzağularının yönetimi ve barındırılması ilgili olarak birçok ilerlemeye sağlanmasına rağmen, halen ABD’de süt emme döneminde 10 buzağıda 1 nin öldüğü bildirilmektedir. Morbidite ve mortalite riskini azaltmak için buzağuların stres faktörlerine karşı fizyolojik ve davranışsal tepkilerine katkıda bulunan iç ve dış uyaranların daha iyi anlaşılması gerekmektedir (Hulbert ve Moisés, 2016).

Fiziksel resüsitasyon

Perinatal döneminde işletme yöneticisi/ bakıcısı risk altındaki buzağularla uğraşırken fiziksel resüsitasyonun öncelik sırasını bilmelidir. Resüsitasyonun 'ABC'si olarak solunum yolunun açık olması, solunum stimülasyonu, Dolaşım desteğinin sağlanması olarak tanımlanır. Resüsitasyon, buzağı hala doğum kanalındayken başlayabilir ve yaşamsal belirtiler normale dönene kadar (örneğin duruş, aktivite, solunum fonksiyonu, rektal sıcaklık) veya kalp atışı mevcut olana kadar devam eder. Resüsitatif ilk yardım prosedürleri, buzağının göğüs kafesi inekten çıktıktan sonra kalça kilidi sayesinde buzağı yerinde kalsa bile nefes alabilir. Resüsitasyon problemlili bir buzağılama sırasında buzağının nazal reseptörlerinin saman veya

parmak (veya oksijen tedavisi mevcutsa burun içi tüp) ile uyarılmasıyla başlanmalıdır. Doğumdan hemen sonra, buzağı kısa bir süre baş aşağı asılmalıdır. Bu prosedür, pulmoner sıvıların postüral drenajını kolaylaştırır ve pulmoner gaz değişimi, mikst asidozun düzeltilmesi ve ardından kolostral immünoglobülinlerin emilimi üzerinde olumlu bir etkiye sahiptir. Buzağıdan drene olan sıvının çoğunun abomasal olmasına rağmen bu faydalar artar Hava yollarının temizlenmesi, bir aspiratör pompası kullanılarak faringeal ve nazal aspirasyon ile başlayabilir. Genellikle sadece küçük bir sıvı hacmi (<10ml) atılsa da, prosedür, pulmoner gaz değişimi ve asit-baz dengesine önemli ölçüde fayda sağlar.

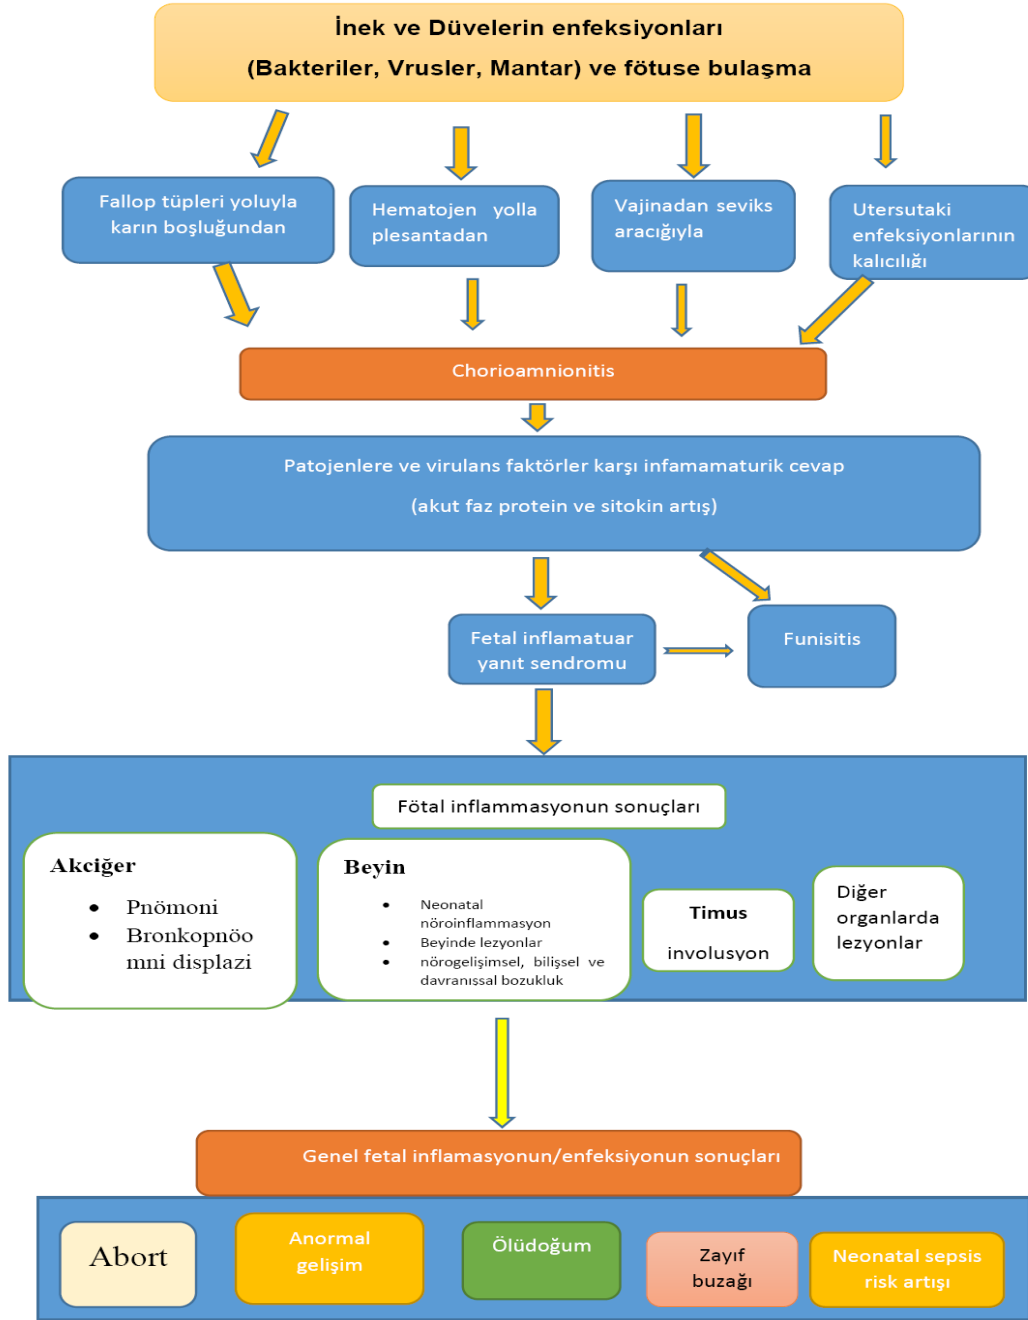

Kolostrum Alımı

İlk kolostrum, yenidoğan buzağıyı bulaşıcı hastalıklara karşı koruyan, annenin lökositlerini de içeren önemli bir besin kaynağı, immunoglobulinler ve diğer önemli bağışıklık faktörlerini de içeren bir özelliğe sahiptir (Kozat, 2019). İlk ağız sütünün (Kolostrum) buzağı verilmesi başarılı pasif transfer mortalite ve morbidite riskini azalttığı için çok önemlidir ((Hulbert ve Moisés, 2016). Buzağı ayağa kalkmama ve zayıf emme motivasyon mevcutsa zayıf canlılık olarak tanımlanır. Yeni doğmuş bir buzağıya, normal serum immunoglobulin G seviyesi 10 g/L olacak şekilde ilk iki saat içinde en az 2 litre (120 g immunoglobulin'e eşdeğer miktarda), ilk 12 saat içinde ise en az 6 litre olarak almalı ve bu miktarın alındığından emin olunmalıdır (Furman-Fratczak ve ark., 2011).

Ölüdoğuma neden olan Enfeksiyözlerin teşhisi

Amerika Birleşik Devletleri, Kanada ve Avustralya da dahil olmak üzere birçok ülkede süten kesim öncesi buzağı morbidite ve mortalite risklerinin yüksek olduğu (yaklaşık %23-35 morbidite ve %3,5 %10,5 mortalite) bildirilmiştir. İshal veya pnömoni gibi bulaşıcı hastalıklar, süten kesim öncesi buzağı ölümlerinin çoğundan sırasıyla %56,5 ve %22,5 oranında sorumlu olduğu rapor edilmiştir (Abuelo, 2020). Perinatal dönemdeki buzağı ölüm nedenlerinin teşhisi oldukça zordur. Ölü doğuma neden enfeksiyöz etkenlerin teşhisi uzman(lar)ının yeteneklerine ve deneyimine ve mevcut laboratuvar desteğine ve diğer birçok faktöre bağlı olarak ölüm nedenlerinin oranı değişir. Yapılan birçok araştırmalarda perinatal ölüm vakalarının yaklaşık üçte biri ile yarısında ölüm nedeni saptanmadığı rapor edilmektedir (Berglund ve ark., 2003; Jawor ve ark., 2021). Nedeni bilinmeden buzağuların ölüm nedenlerinin araştırılmasında tanı konulamayan vakalar ciddi bir sorundur. Çünkü nedeni bilinmeden gelecekteki kayıpların önlenmesi mümkün değildir (Khodakaram-Tafti ve ark., 2005; Sac 2009; Jawor ve ark., 2021). En basit haliyle, PÖ'de enfeksiyonun rolü veya fetüsün pronasyonu yavru ölümüne sebep

olabilir. Bununla birlikte, öldürücü olmayan enfeksiyon ve dolaylı olarak ölüm riskini artıran (örneğin, kısalmış gebelik veya intrauterin gelişme geriliği (Mee ve Szenci, 2012) ile canlı doğumla sonuçlanan durumların yanı sıra canlı ve yaşayabilir ancak geçici veya kalıcı olarak enfekte buzağılar (örn. BVDV veya *N. caninum* enfeksiyonu) ve cansız buzağılar (abort) (örn., adenovirüse bağlı zayıf buzağı sendromu) gibi durumlar özetlenebilir. Smyth ve ark. (1999), plasentasında leptospiral antijen bulunan ineklerin, plasentasında antijen olmayan ineklere göre ortalama 6 ila 10 kg kadar daha hafif fetüslere sahip olduğu ve gebeliğin 100. günde BVDV enfeksiyonundan kurtulan buzağuların intrauterin büyüme geriliği gebelik süresi de bildirilmiştir. Bu nedenle pre veya perinatal enfeksiyonun etkileri perinatal dönemin ötesine geçebilir. Anneden fetüse bulaşma yolları, karın boşluğundan fallop tüpleri yoluyla migrasyon, plasenta yoluyla hematogen yayılım ve vajinadan serviks yoluyla geçişi içerir. Ek olarak, bazı bakteriler için (*Trueperella pyogenes* ve *Campylobacter fetus*), gebelikten önce uterusda kalıcılık meydana gelebilir (Jawor ve ark., 2021). Anderson (2012), sığırlarda hematogen yolun en önemli gibi görüldüğünü öne sürmüştür. Gebeliğin erken döneminde maternal immünsüpresyon, sığırlarda başarılı bir gebeliğe yol açan Th1 sitokinlerinin (IFN- γ ve IL-2) aşağı ekspresyonu ve Th2 sitokinlerinin yukarı ekspresyonu yoluyla düzenlenebilir. Th1 sitokinleri genellikle gebeliğin sürdürülmesinde zararlıdır, oysa Th2 sitokinleri hümmoral yanıtı ve başarılı gebeliği desteklemektedir. Hücre aracılı immün yanıtın bu inhibisyonu, inekten fetüse enfeksiyon bulaşma riskinin artmasına neden olabilir. *N. caninum*'a karşı etkili immün yanıt, parazit çoğalmasını kontrol etmek için IFN- γ içeren bir Th1 sitokin yanıtı gerektirir, ancak plasentada aşırı IFN- γ , gebelik için zararlı etkilere sahip olabilir ve fetal canlılığı tehlikeye atabilir (Regidor-Cerrillo ve ark., 2014).

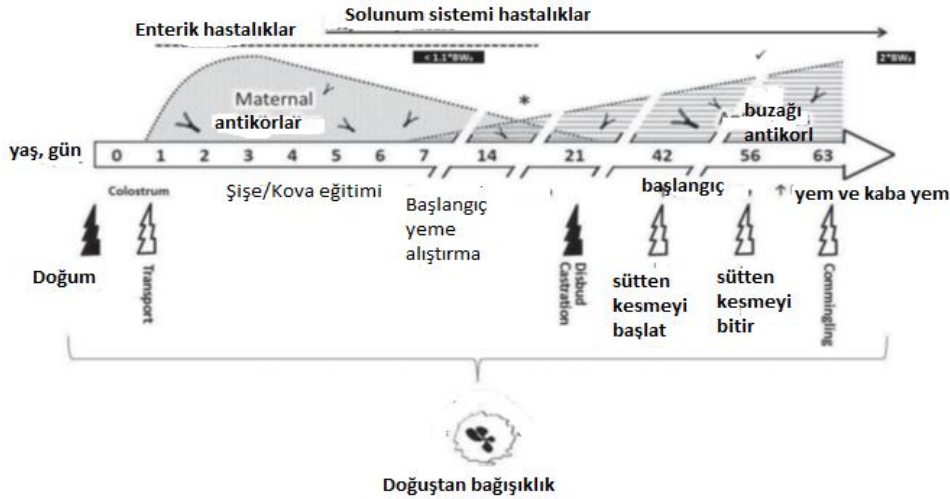

Şekil 3. İnsan ve hayvan çalışmalarına dayalı olarak sığırlarda intrauterin enfeksiyonun olası sekelleri (Jawor ve ark., 2021)

İmmunitenin Güçlendirilmesi

Bağışıklık, potansiyel olarak zararlı mikroplara ve parazitlere karşı kendini savunma yeteneği olarak tanımlanır. Zararlı etkeni; engelleme, gözetleme, savaş, kontrol ve dokümantasyon dahil olmak üzere çeşitli sistemler bağışıklık yeterliliği ile ilgilidir. Bariyerler arasında cilt ve mukozal bariyerler (örneğin, solunum yolu ve sindirim sistemi) bulunur. Bu bariyerler komensal mikrobiyota ile oluşturulur. Bağışıklık sisteminin gözetleme ve savaşma kanadı,

fagositik ve granülositik hücreler (örn. makrofajlar, nötrofiller, eozinofiller ve bazofiller) gibi yerleşik lökositleri içerir; bakteri kaynaklı mikrobiyal ilişkili moleküler modellere (MAMP) maruz kalmadan önce tamamen işlevseldirler (Kampen ve ark., 2006). Yenidoğan buzağlarda kısmi ve tam olarak şekillenen kolostral immünoglobulin yetersizliğine neonatal buzağlarda oldukça sık rastlanmakta ve yüksek mortaliteyle seyretmektedir. Bu tabloya mahruz kalan buzağı (ları) anadan temin edilemeyen pasif immüniteyi sağlamak, bağışıklık mekanizmasını uyarmak, belli bir etkene karşı spesifik antikor sağlamak, genel direnci artırmak ve antibiyotiklerin etkisini kuvvetlendirilmelidir. Bu amaçla; 1) Ana kanı nakli (150-300 ml, IV), 2) Buzağı septisemi serumu (koruyucu olarak 15 ml, sağaltıcı 30-40 ml, SC) ve 3) Kolostrum serumları (50-150 ml, SC) uygulanmaları buzağı sağlığı açısından ve buzağın hayatta kalma şansını artırmak açısından oldukça önemlidir

Şekil 4. Buzağı stresi, bağışıklığı ve yönetim zaman çizelgesi

Gelişmekte olan, elle beslenen süt buzağları için potansiyel inflamatuvar (siyah cıvata) ve psikolojik (beyaz cıvata) stresörler kaçınılmazdır. Doğum, bir buzağının hayatındaki ilk doğrudan stres etkenidir, ancak doğum öncesi ortam fetal stres eksenini etkileyebilir. Buzağılara maternal antikorların (Y) pasif transferini sağlamak için kolostrum sağlanmalıdır. Güç doğan buzağların pasif transfer yetmezliği (FPT) olma olasılığı daha yüksektir. İlk doğum (düve) yapandan doğan yavru yüksek bir FPT oranına sahiptir. Gebe hayvanın transportu bir stres etkenidir. Doğum ve taşıma stresi buzağların biberon eğitimini etkileyebilir.

Koruyucu Aşılamalar

Yenidoğan buzağuları viral ve bakteriyel hastalıklarda korumak için mutlak olarak koruyucu aşılama programları uygulanmalıdır. Amerikada üreticilerin %60'dan fazlası buzağularını süttten kesmeden önce bazı klostridiyal hastalıklara karşı aşılamaktadırlar. Büyük işletmelerde koruyucu aşılanma oran %91'e kadar çıkmaktadır. Dünya genelinde klostridiyal hastalıklara karşı kullanılan aşilar ruminant aşı grupları içerisinde ikinci sırada en fazla satılan aşı grubunu oluşturmaktadır. Gebe inekler genellikle doğuma 60 gün kala kuruya ayrılırlar. Gebe düveler ise henüz süt vermeye başlamadıklarından doğuma 45 gün kala mastitis aşısının tekrarı, pasteurella aşısı ile aşılanırken, buzağının korunması için ilk E. coli ve Klostridyum C aşısı da uygulanır. Doğumdan üç hafta önce ise ikinci E. coli, Klostridyum C aşısı, mastitis aşısının tekrarı, leptospirosis ve viral solunum yolu enfeksiyonlarına karşı aşıların tekrarı ile aşılama programına devam edilir (Kozat, 2021). Bu dönemde bir A, D, E vitamin karması enjeksiyonu yapılması da yararlı olacaktır. Gebe düve ve ineklerde doğuma 2-6 hafta kala septisemi aşısı yapılmalı. Koruyucu aşı uygulamaları yanısıra doğuma 1 hafta kala, (doğumdan; 2-8 gün önce) yüksek dozlu D3 vitamini enjeksiyonu yapılmalıdır (Sancak, Gülhan, 2021).

**Experimental Investigation Of The Behavior Of Modulated Kinetic Combustion
Strategy In A Diesel Engine At Different Engine Loads**

Abstract

Nowadays, the harmful atmospheric effect of exhaust gases pollutants have reached critical level that creates serious problems. This raises the issue of limitations or restrictions the use of internal combustion engines. Diesel engines emit high amounts of NO_x and soot emissions, and continuous use of diesel engines is only possible if these two emissions are taken under control. Modulated kinetic (MK) combustion strategy aims to control NO_x and soot emissions in diesel engines by retarding combustion than conventional timing, with compromising engines effective power. In this study, the change trends of these two emissions were examined with MK strategy. In this study, the start of injection timing was changed with certain steps in certain range and injected fuel quantity (IFQ) were manipulated. Indicated engine torque, effective engine torque, in-cylinder peak pressure and heat release rate values were investigated under constant engine speed and rail pressure condition. In addition, carbon monoxide, unburned hydrocarbon, nitrogen oxide and soot emissions were evaluated. Also, specific emissions were included the study. According to the results from the study, when combustion was delayed, an increase were observed in carbon nonoxide and hydrocarbon emissions, but significant decrease was observed in nitrogen oxide emissions. In the soot emissions, a decrease was observed in the first zones where the MK strategy dominates the combustion, and then, as a result of the late combustion, the soot emissions started to increase again due to the negative impact of the poor atomization regime. With the increase in the IFQ, the changing ratio of different start of injection timing became more complex, the reduction in NO_x emission at high IFQ values also decreased to a narrower band, and a same trend wasn't observed for soot emission.

Keywords: Modulated Kinetic Combustion, Retarded Injection, NO_x Emission, Particle Matter

Introduction

Diesel engines are in an advantageous position not only for heavy-duty vehicles but also for light-duty vehicles, thanks to their high thermal efficiency, but particulate matter and NO_x emissions need to be controlled [1]. These two emissions are the most fundamental problems to be overcome in diesel engines. There is a trade-off between these two emissions when the diesel engine is operating conventionally. It is therefore difficult to control these two emissions at the same time. A lot of study has been carried out on this subject. However, both emissions cannot be controlled in the conventional operating range by only manipulating the combustion. On the other hand, after-treatment systems do not give healthy results in every working conditions. This makes it necessary to control these emissions, even partially, during combustion. Except from conventional diesel combustion, low temperature combustion strategies applied at partial loads are the combustion strategy applied to control both NO_x and soot emissions at the same time. Purpose of low temperature combustion (LTC) strategies, applied in diesel engines is to create a better macro scale mixture formation by extending the time from the start of fuel injection to ignition. Thus, combustion starts with a more dilute mixture and combustion temperatures decrease. This strategy allows NO_x emissions to fall to more reasonable levels. In LTC applications such as HCCI, PCCI, MK, the peak temperature during combustion is taken to the levels of 1600-1800K and NO_x emissions are controlled [2]. MK combustion strategy is carried out in areas where the start of injection (SOI) is close to the top dead center (TDC). Thus, the combustion largely shifts to the expansion stroke and the combustion temperatures decrease. This also reduces the average pressure rise rate [3]. Both prolongation of the ignition delay and the decrease in combustion temperatures also reduce the soot emissions. However, there is a limitation with the increase of soot emission at high engine loads [3].

Although there is a decrease in NO_x and soot in the LTC strategy, carbon monoxide (CO) and total hydrocarbon (THC) emissions increase due to the nature of the mixture formation. In addition, thermal efficiency and performance parameters such as mean indicated pressure (IMEP), brake mean effective pressure (BMEP), effective engine torque are adversely affected as a result of combustion moving away from the optimum point in terms of performance. Fang and Lee [1] worked at 1500 rpm engine speed, 1000bar injection pressure, 12.7 mg/st injected fuel quantity (IFQ). Start of injection, advance is at 2 °CA, 6.5 °CA and 8 °CA after TDC (ATDC). Efficiency of thermal value decreased with the distance from the 2 °CA ATDC spray advance.

Information on some studies in the literature on the modulated kinetics combustion strategy is as follows. Liu et al. [4] investigated the effects of different injection timings on NO_x , soot, THC, CO under constant engine load and IFQ. In the study, injection timing was experienced in a wide range from 70°CA before TDC (BTDC) to 10°CA ATDC. In the study in which the injection was performed as a single phase, it was seen that the range that should be evaluated for the MK strategy was between 20°CA BTDC and 10°CA ATDC. NO_x emission, which was around 1750ppm at the 20°CA BTDC SOI, decreased to around 1500ppm at 15°CA BTDC. It decreased to around 1250 ppm at the 10°CA BTDC. It decreased to around 500 ppm with the injection starting at TDC and to around 400 ppm with the injection starting at 5°CA ATDC. Soot emission was 0.35 FSN at 20°CA BTDC SOI and to 0.2 FSN at 15°CA BTDC. Soot was observed at 0.1 FSN value at TDC and decreased to much smaller values at 5°CA ATDC SOI condition. Buyukkaya and Cerit [5] investigated the change in specific NO_x emissions at three different injection advance values, keeping the injected fuel quantity constant at three different engine speeds. At all three engine speeds, reductions in specific NO_x emissions occurred as the SOI was delayed. Kim et al. [6] conducted an experimental study by deactivating 5 cylinders of a six cylinder diesel engine and acquired data from just single cylinder. In the study, the engine speed was selected as 1400 rpm, the injection pressure was 160 MPa, and a constant IFQ was 44.5 mg/st as single-phase injection. Three operating conditions were evaluated in the study. These are early injection, conventional injection and late injection. Among these three studies, the highest in-cylinder pressure observed at conventional injection. The lowest peak in-cylinder pressure was in the late injection. It should be clearly stated that the pressure values that occur in the late LTC application are quite low compared to the other two alternatives. Peak in-cylinder heat release rate values increased as we moved from conventional combustion to LTC applications, but this forced excess lasted for a very short time. Heat release rate profile that emerged in conventional combustion has a fuller character. In the study, the injection advance at the starting point of combustion was changed and as the combustion initiation shifted to expansion in the range of specific NO_x values between 9°CA BTDC and 7°CA ATDC, serious decreases occurred in specific NO_x emissions. Specific NO_x emissions, which were around 0.22 g/kWh in the use of conventional diesel under 9°CA BTDC conditions, decreased to about half of this value at 5°CA BTDC points. It decreased to about 0.08 g/kWh at TDC and then below 0.02 g/kWh at 7°CA ATDC. Fang et al. [7] conducted an experimental study on a single-cylinder, 16.8 compression ratio engine at 1450 rpm. Engine load was chosen as 0.3, 0.6 and 0.9 MPa BMEP. Single phase SOI was changed between 7.5°CA BTDC and 5°CA ATDC. In the specified range, the specific fuel consumption values increased regularly as the injection

was delayed at all engine loads. Depending on the injection timing change, differences between the extreme values decreased slightly at the beginning with the increase of the engine load from 0.3 MPa BMEP, and then to increase again. Between the two-end SOI timing, the ignition delay time increased by about 50%. More than 50% increment of the ignition delay time obtained at 7.5 °CA BTDC was observed at 5 °CA ATDC points. While the decrease in brake thermal efficiency due to delayed injection was more reasonable at low engine loads, the difference increased at higher engine loads. In NO_x emissions, the injection advance of 7.5 °CA BTDC was changed between 5 °CA ATDC. NO_x emissions decreased approximately 7 times at 0.3 MPa BMEP, similar trends were seen at the 0.6 MPa BMEP condition and at the 0.9 MPa BMEP condition. Smoke opacity values are very sensitive to advance at 0.3 MPa BMEP condition. At higher engine loads, however, the trend of change was not so high. In addition, unlike NO_x emissions, soot emissions increased up to a certain delay in advance, and then a downward trend started. On the other hand, Hydrocarbon emissions showed a regular decrease with delayed injection. At high engine loads, the difference between the first and last advance values doubled. CO and THC showed same behavior.

Experimental Procedure

During the experimental study, engine was braked with a 400 kW capacity dynamometer of AVL “DynoRoad 504/5”. AVL ConsysLube 25/50 is used for the engine oil system, heating capacity of the oil conditioner is 90 kW and it can condition the oil temperature between 70-140 °C. AVL 753CH M100 device is used for the fuel conditioner system, it can condition the fuel temperature between 10-80 °C. The sensitivity of the conditioner unit is 1 °C. AVL 753CH M100 device is used for the fuel consumption measurement system, the measurement accuracy of the device is 0.12%. For air conditioning system, AVL brand Consysboost 3000 device with a heat output capacity of 135 kW was used. Kistler brand 6045BU48-3-1 model piezoelectric pressure sensor was used for in-cylinder pressure measurement. 365C ANGLE ENCODER SET speed reader was used to measure engine speed. In-cylinder pressure and engine speed measurements were performed integrated with the AVL Indicom device.

During the experimental studies, an S8000 type 4-cylinder engine with a stroke volume of 3.9 liters, supercharged, common-rail injection system, produced by TUMOSAN, was used. In the experimental studies, the turbocharger unit was deactivated in order to keep the intake air flow rate under control. Commercial diesel with EN590 standard was used as fuel.

Figure 1. Engine Test Room

Results and Discussion

Experimental studies were carried out at 1750 rpm engine speed, 99.5 kPa intake pressure and an ambient temperature of 25 °C. Injected fuel quantity was selected as 20 mg/st, 25mg/st and 30 mg/st. SOI is determined by 2 °CA steps between -4 °CA ATDC (4 °CA BTDC) and 10 °CA ATDC. The injection pressure was kept constant at 1000 bar. The diverge of start of combustion from the timing value that will provide the maximum torque, adversely affect the performance parameters as expected. MK strategy occurs with lately injection timing than the advance value, which will realize the maximum torque. As can be seen at Figure 2., IMEP values decreased while the SOI timing was retarded. With the retarded SOI, IMEP values decreased regularly. When the IFQ value increases, an increase in the IMEP value is expected situation. The point to be noted here is that the sensitivity to the SOI is higher at higher engine loads.

Figure 2. Mean indicated pressure values at different engine loads and injection timing

If SOI point occurs later, it reduces the combustion temperatures and causes a weaker flame propagation. At the same time, the increase in the ignition delay period also increases the actual combustion region volume, with a leaner mixture formation. Conclude of these two effects, an increase in CO emissions will occur under the conditions where the MK strategy dominates. Figure 3. shows the CO emissions according to the SOI timing values. At lower engine loads, higher CO emissions emitted due to the lower combustion temperature, and this trend was observed undisturbed for all SOI values. There were no significant change observed in CO emissions between -4°CA ATDC and 4°CA ATDC for all three different IFQ values. While the IFQ value was high, the difference remained within relatively predictable and acceptable limits, while at lower IFQ values, the difference reached unacceptable limits and dramatic increases were observed.

Figure 3. Carbon monoxide emissions at different engine loads and injection timing

THC emissions and CO emissions perform largely co-trend. Generally, an increase in one of these two emissions will result in an increase in the other. In this study, as can be seen from Figure 3., THC emissions showed a regular increase when the SOI timing retarded. In contrast to CO, remarkable differences emerged in all injection timing values and a relatively stable region could not be observed. Higher THC emissions emitted at lower engine loads, like CO.

Figure 4. Total hydrocarbon emissions at different engine loads and injection timing

One of the main focuses of this study is to reveal the NO_x emission behavior. The decrease in combustion temperatures in the MK strategy will reduce the formation of NO_x . At the same time, the cooling rate that will occur during the expansion stroke will decrease to a lower level

together with the combustion postponed to the expansion. Depending on these two factors in the MK strategy, NO_x emissions decreased as seen in Figure 5. As the SOI was delayed, there was a steady decrease in NO_x emissions. This decrease, which appeared at the beginning, was realized with a fairly large gradient, and then a softer change trend emerged. When the IFQ value increases, NO_x values are observed to be higher, because of the higher heat release rate. However, with the so delayed injection, the difference has decreased to more acceptable levels. Between the two extreme SOI values, NO_x emissions differed more than 4 to 6 times. This can be considered a fairly good result, provided that other performance parameters are not deteriorated.

Figure 5. Nitrogen oxides emissions at different engine loads and injection timing

Soot has very complex relationships in terms of formation mechanism and, it's mechanism has not been fully theorized. However, it is clearly known that high temperature and locally rich zones trigger soot formation. Figure 6. shows the soot values for different SOI and IFQ values. A constant trend could not be obtained in soot emissions in contrast to other evaluated emissions. For 20 mg/st IFQ, soot emission raised up to the 4 °CA ATDC, after that a strong downtrend occurred. For 25 mg/st, the downward trend emerged at 8 °CA ATDC. However, no downward trend was observed for 30 mg/st. This can be explained by the fact that the IFQ value remains high in this SOI range for the soot decrease. The restriction in soot control that will occur in the MK strategy due to the increase in engine load has also been noted by Tang et al [MK2].

Figure 6. Soot emissions at different engine loads and injection timing

Conclusion

In this study, the results were obtained according to the data taken at three different engine loads and eight different levels SOI timing, between -4°CA ATDC and 10°CA ATDC. As SOI is delayed, IMEP values decrease and this decrease remains relatively more reasonable at low IFQ values. Initially, significant differences in CO emissions did not emerge. Afterwards, the increase reached a dramatic level especially at low loads. It exhibited similar trends in THC emissions to that of CO. However, with the delay of SOI, there was a noticeable increase in THC at each interval. Regular decreases occurred as the SOI of NO_x emissions lagged. Larger values of the NO_x reduction gradient occurred at higher engine loads. It has been observed that the downward trend starts after a point at low IFQ values in soot emissions, and as IFQ increases, the starting point of the downward trend is postponed and even no downward trend can be observed in increasing IFQ values.

Özet

Bu araştırmada fen bilgisi öğretmen adaylarının çevresel davranış durumlarının belirlenmesi amaçlanmıştır. Araştırmada araştırma yöntemlerinden nicel araştırma, araştırma desenlerinden ise tarama modeli kullanılmıştır. Bir devlet üniversitesinin eğitim fakültesinde 2021-2022 eğitim-öğretim yılında lisans eğitimi almakta olan fen bilgisi öğretmen adayları araştırmanın örneklemini oluşturmaktadır. Araştırmaya 1., 2., 3. ve 4. sınıflardan 181 kadın ve 43 erkek öğretmen adayı katılmıştır. Araştırmada Timur ve Yılmaz tarafından uyarlanan 20 madde ve 6 alt boyuttan oluşmuş, cronbach alpha güvenirlik katsayısı 0,903 olan Çevre davranış ölçeği kullanılmıştır. Araştırmada elde edilen bulgular doğrultusunda fen bilgisi öğretmen adaylarının çevreye yönelik davranışları ve alt boyutlara göre değişimi incelenmiştir.

**ENVIRONMENTAL BEHAVIORAL STATUS OF PRE-SERVICE SCIENCE
TEACHERS**

Abstract

In this study, it was aimed to determine the environmental behavior status of science teacher candidates. Quantitative research, one of the research methods, and scanning model, which is one of the research designs, were used in the research. In the 2021-2022 academic year, science teacher candidates studying at the faculty of education of a state university constitute the sample of the research. 181 female and 43 male teacher candidates from 1st, 2nd, 3rd and 4th grades participated in the research. The Environmental Behavior Scale, which consists of 20 items and 6 sub-dimensions, adapted by Timur and Yılmaz, and has a cronbach alpha reliability coefficient of 0.903, was used in the study. In line with the findings obtained in the research, the behavior of the pre-service science teachers towards the environment and their changes according to the sub-dimensions were examined.

Keywords: Environmental Ethics, Pre-service Teachers, Science

GİRİŞ

Çevre sorunlarının yerel değil küresel olması en büyük özelliğidir. Çevre sorunları dil, din, ırk, cinsiyet, köylü-şehirli, zengin-fakir, genç-yaşlı, fen bilgisi veya okul öncesi öğretmeni, sınıf öğretmeni, biyoloji öğretmeni, matematik veya kimya öğretmeni gibi hiç bir ayırım olmaksızın herkesi etkiler. Bu sebepten çevreyi korumak yalnızca çevrecilerin görevi değildir. Aynı çevrenin korunması sadece bireyin değil de toplumunda görevi olduğu gibi çevre eğitimi de sadece çevre eğitimcilerinin vermesi gereken görev değildir. Verilen eğitimlerde çevrenin korunması arasında ilişki kurulmalıdır (Erten, 2004).

Çevre eğitimi, toplumu oluşturan bireylerin çevreye karşı davranış ve düşüncelerini belirleyerek bireylerde doğru bir çevre anlayışının oluşmasını sağlayabilecektir (Sancar, 2005). Çevrenin hızla kirlenmesi günümüzden çok gelecek kuşakları daha çok etkilemektedir. Çevre kirliliğini azaltılması, oluşacak çevre kirliliğini engellenmesi ve çevre tahribatlarının azaltılması için çevre gönüllüleri ve bilim adamları çevreci fikirler ortaya atmışlardır. Bu çevreci fikirler etik değerler çerçevesinde tartışılmaya başlanmıştır (Görmez, 2003).

Yapılan literatür incelemesi sonucunda çeşitli seviyelerde farklı branşlarda çevresel davranış durumu ile ilgili yapılan bir çok araştırma bulunduğu tespit edilmiştir (Duru, 2021; Güngör, 2019; Özgün, 2019; Temiz ve Karakuyu, 2019).

Bu araştırmanın amacı fen bilimleri öğretmen adaylarının çevresel davranış durumlarının belirlenmesidir.

YÖNTEM

Araştırma Modeli

Yapılan araştırma da, fen bilgisi öğretmenliğinde öğrenim görmekte olan farklı sınıf seviyelerindeki öğretmen adaylarının çevresel davranış durumlarını belirlemek için nicel araştırma yöntemlerinden tarama modeli kullanılmıştır. Genel bir yargıya varmada genel tarama modeli kullanılırken konunun derinlemesine incelemede ise örnek olay tarama modeli kullanılmaktadır (Karasar, 1984).

Çalışma Grubu

Araştırmanın çalışma grubunu 2021-2022 eğitim-öğretim yılında Ankara ilinde bir devlet üniversitesinin eğitim fakültesinde Fen Bilgisi Öğretmenliği programında 1., 2., 3. ve 4. Sınıfta öğrenim gören 224 Fen bilgisi öğretmen adayı (181 kadın ve 43 Erkek) oluşturmaktadır (Tablo 1).

Tablo 1. Sınıf seviyesine göre cinsiyet dağılımı.

Cinsiyet	Sınıf Seviyeleri									
	1.Sınıf		2.Sınıf		3.Sınıf		4.Sınıf		Toplam	
	N	%	N	%	N	%	N	%	N	%
Kadın	8	21,0	51	28,2	56	30,9	36	63,2	181	100
Erkek	9	20,9	10	23,3	3	7,0	21	36,8	43	100
Toplam	47	21	61	27,2	59	26,3	43	19,2	224	100

Veri Toplama Aracı

Yapılan bu araştırmada Timur ve Yılmaz (2013) tarafından yapılan uyarlama sonucundaki Çevre Davranış Ölçeği kullanılmıştır. Ölçek 20 maddeden ve 6 alt boyuttan oluşmaktadır. Ölçeğin alt boyutları; kişinin ekonomik yararına olan kaynak koruma aktiviteleri (KEYOKKA), çevreye duyarlı tüketici (ÇDT), doğa ile ilgili boş zaman aktiviteleri (DİİBZA), geri dönüşüm çabaları (GDÇ), sorumlu vatandaşlık (SV) ve çevre eylemciliği (ÇE)'dir. Çevre Davranış Ölçeği 5'li Likert tipi şeklindedir ve öğretmen adayları görüşlerini her bir madde için Hiçbir zaman(1), Nadiren(2), Bazen(3), Genellikle(4), Her zaman(5) olmak üzere 5 farklı dereceden biriyle değerlendirmesi gerekmektedir. Çevre davranış ölçeğinin Timur ve Yılmaz (2013)'ın uyarlama çalışmasında cronbach alpha güvenirlik katsayısı 0,903 olarak tespit edilmiştir.

Verilerin Analizi ve Kullanılacak İstatistiksel Teknikler

Veri analizi, verilerin toplanması, toplanan verilerin düzenlenmesi ve istatistiksel işlemler yapılarak anlamlı kararlara ulaşma ve geçerli sonuçlar çıkarabilmek amacıyla yapılan işlemler süreci olarak tanımlanabilir (Büyüköztürk, 2014). Yapılan bu araştırmada gerekli olan veriler katılımcılara uygulanan ilgili ölçek ile toplanmıştır. Toplanan veriler ise istatistiksel analiz programlarından SPSS programında analiz edilerek ve çözümlenerek tablolar haline getirilmiştir. Çevre Davranış Ölçeği Hiçbir zaman(1), Nadiren(2), Bazen(3), Genellikle(4), Her zaman(5) şeklinde 5'li Likert tipi ölçek şeklinde değerlendirilmesi gerekmektedir. Ölçeklerin puanlarının değerlendirilmesinde öğretmen adaylarının işaretlediği yanıtlara göre 1 ile 5 aralığında puanlanması sonucu aldıkları ortalama puanlar kullanılmıştır. Ayrıca yapılan araştırmada elde edilen veriler istatistiksel analiz sonuçları frekans (f) ve yüzde (%) analizi kullanılmıştır.

BULGULAR VE SONUÇ

Araştırmada yer alan fen bilimleri öğretmen adaylarının “Çevre Davranış Ölçeği” ne ilişkin Aldıkları Puanların Frekans, Yüzde Değerleri Tablo 2’de görülmektedir.

Tablo 2. Öğretmen Adaylarının Çevre Davranış Ölçeği’ne İlişkin Aldıkları Puanların Frekans, Yüzde Değerleri

Maddeler	Hiçbir Zaman		Nadiren		Bazen		Genellikle		Her Zaman	
	n	%	n	%	n	%	n	%	n	%
E1. Çevresel sorunları yetkililere bildiririm.	10	4,5	37	16,8	97	44,1	59	26,8	17	7,7
E2. Gazete ve plastik şişe gibi atıkları geri dönüşüm toplama noktalarına götürürüm.	4	1,8	19	8,6	73	33,2	87	39,5	37	16,8
E3. Medyaya çevresel sorunlar hakkında mektuplar gönderirim.	135	61,4	43	19,5	24	10,9	16	7,3	2	0,9
E4. Depozitosu olan meşrubat şişelerini geri veririm.	38	17,3	45	20,5	47	21,4	61	27,7	29	13,2
E5. Kullanılmış kâğıtları müsvedde kağıdı olarak yeniden kullanırım.	3	1,4	6	2,7	23	10,5	104	47,3	84	38,2
E6. Daha önceden alışveriş poşeti olarak kullanılmış naylon poşetleri tekrar kullanırım.	1	0,5	2	0,9	13	5,9	76	34,5	128	58,2
E7. “Çevre dostu” ürünleri satın alırım(ozon dostu spreyleyler, geri dönüşüm paketi olan ürünler ve ekonomik boy ürünler).	2	0,9	26	11,8	70	31,8	74	33,6	48	21,8
E8. Halka açık yerlerin korunması ve temizlenmesi için kampanyalara katılırım.	53	24,1	68	30,9	53	24,1	27	12,3	19	8,6
E9. Kullanılmayan elektrikli cihazları ve ışıkları kapatarak enerji tasarrufu sağlarım.	1	0,5	3	1,4	14	6,4	86	39,1	116	52,7
E10. Evde su tasarrufu yaparım (dişlerimi fırçalarken veya bulaşıkları yıkarken musluğu kapatırım vb.).	0	0,0	3	1,4	13	5,9	78	35,5	126	57,3
E11. Halka açık alanlara çöp atan veya zarar veren insanları uyarırım.	7	3,2	23	10,5	63	28,6	75	34,1	52	23,6
E12. İnsanların, halka açık yerlere attıkları çöpleri toplayıp çöp kutusuna atarım.	21	9,5	38	17,3	70	31,8	54	24,5	37	16,8
E13. Kullanılmış pilleri çöp kutusu yerine piller için uygun toplama kutularına koyarım.	9	4,1	27	12,3	46	20,9	74	33,6	64	29,1
E14. Odadan çıkarken klima vb. cihazları açık bırakırım.	16	7,3	10	4,5	17	7,7	56	25,5	121	55,0
E15. Dışarıdayken kuş seslerini, hayvanları ve çiçekleri fark ederim.	1	0,5	1	0,5	21	9,5	96	43,6	101	45,9
E16. Çevre kirliliğini önlemek için düzenlenen kampanyalarda görev alırım.	54	24,5	78	35,5	45	20,5	27	12,3	16	7,3
E17. Bir çevre organizasyonunda aktif olarak görev alırım.	73	33,2	76	34,5	36	16,4	22	10,0	13	5,9
E18. Günlük gazete veya dergilerdeki çevre konularıyla ilgili makaleleri okurum.	41	18,6	65	29,5	63	28,6	34	15,5	17	7,7
E19. Çevre ve doğa ile ilgili televizyon programlarını izlerim.	16	7,3	37	16,8	79	35,9	62	28,2	26	11,8
E20. Doğa yürüyüşü ve geziler yaparım.	11	5,0	30	13,6	60	27,3	69	31,4	50	22,7

Çevre Davranış Ölçeği’ne verilen cevaplar incelendiğinde elde edilen bulgulara göre;

- Fen Bilgisi öğretmen adaylarının çoğunluğunun kullanılmış pilleri pil toplama kutusuna genellikle koydukları, geri dönüşüm atıklarını geri dönüşüm toplama noktalarına götürdüğü ve deponosunu olan meşrubat şişelerini nadir olarak geri verdiği,
- Fen Bilgisi öğretmen adaylarının büyük bir çoğunluğunun kullanılmış kâğıtları müsvedde kâğıt olarak yeniden kullandıkları ve daha önceden alışveriş poşeti olarak kullanılmış naylon poşetlerin tekrar kullandıkları görülmektedir. Son zamanlarda alışveriş poşetlerinin ücretlendirilmesi bu davranışı olumlu yönde etkilediği,
- Fen Bilgisi öğretmen adaylarının Çevre Davranış Ölçeği'ne verdikleri cevaplara göre alışveriş yaparken çevre dostu ürünler almaya dikkat ettikleri,
- Fen Bilgisi öğretmen adaylarının büyük çoğunluğunun verdikleri cevaplara göre odadan çıkarken elektrikli cihazları açık bırakmadıkları, kullanılmayan cihazları ışıkları, kapatarak enerji ve su tasarrufu yaptıkları,
- Fen Bilgisi öğretmen adaylarının büyük çoğunluğunun halka açık alanlara çöp atmaları veya çevreye zarar verenleri genellikle uyardıkları ve çevredeki çöpleri toplayıp çöp kutusuna bazen attıkları,
- Fen Bilgisi öğretmen adaylarının büyük çoğunluğunun çevresel sorunları yetkililere bazen bildirdikleri, medyaya çevresel sorunlarla ilgili mektuplar göndermediği ve halka açık yerlerin korunması, temizlenmesi ve çevre kirliliğini önlemek için düzenlenen kampanyalara çok sık katılım sağlamadığı ayrıca Fen Bilgisi öğretmen adaylarının çevre organizasyonlarında çok sık aktif görev almadıkları,
- Fen Bilgisi öğretmen adaylarının büyük çoğunluğunun gazete ve dergideki çevre ile ilgili makaleleri çok fazla okumadıkları fakat çevre ile ilgili televizyon programlarını bazen izlediği,
- Fen Bilgisi öğretmen adaylarının büyük bir çoğunluğunun doğa yürüyüşü, geziler yaptığı ve dışarıdayken insan dışındaki canlıların farkında olduğu söylenebilir.

**ENVIRONMENTAL ETHICS AWARENESS OF PRE-SERVICE SCIENCE
TEACHERS**

Abstract

In this study, it was aimed to determine the environmental ethics awareness of science teacher candidates. In the research, one of the research methods and one of the quantitative research designs, the scanning model was used. The research was carried out with 224 science teacher candidates (181 Female and 43 Male) from the 1st, 2nd, 3rd and 4th grades of Science Teaching at the education faculty of a state university in the province of Ankara in the 2021-2022 academic year. In the study, the "Environmental Ethics Awareness Scale" of Özgür and Keleş was used to determine the environmental ethics awareness of teacher candidates. The percentage and frequency distributions of the answers given to the questions related to the sub-dimensions by the pre-service science teachers in the research were examined and the environmental ethics awareness of the pre-service science teachers was revealed.

Keywords: Environmental Ethics, Pre-service Teachers, Science

GİRİŞ

Canlıların birbirleriyle etkileşim halinde olduğu yaşam ortamına çevre olarak tanımlanır (Doğan, 2019). Çevrenin genel olarak tanımı yapılacak olursa “organizmanın içinde bulunduğu alan” denilebilir. İnsanların etkisinin olmadığı alanlara doğal çevre olarak adlandırılırken insan etkisiyle değiştirilmiş alanlara ise yapay çevre olarak adlandırılır (Doğan, 2019). Çevresel değerler kapsamında çevre etiği “iyi ve kötü çevrecilik” kavramlarının ne olduğuna dair cevap arar. Aynı zamanda çevre etiği insan davranışları ile direkt olarak ilişki içerisindedir (Frankena, 2007).

Yapılan literatür incelemesi sonucunda çeşitli seviyelerde farklı branşlarda çevre etiği ile ilgili yapılan bir çok araştırma bulunduğu tespit edilmiştir (Altın, 2022; Duru, 2021; Tekiroğlu, 2021; Güngör, 2019; Gürüçin, 2019; Deniz, 2019; Temiz ve Karakuyu, 2019; Sönmez, 2018; Karademir, 2017).

Bu çalışmanın amacı “Fen bilimleri öğretmen adaylarının çevre etiği farkındalıkları” nı belirlemektir.

YÖNTEM

Araştırma Modeli

Yapılan araştırma da, fen bilgisi öğretmenliğinde öğrenim görmekte olan farklı sınıf düzeyinde öğretmen adaylarının çevre etiği farkındalık durumlarını belirlemek amacıyla nicel araştırma yöntemlerinden tarama modeli kullanılmıştır. Mevcut veya geçmişteki bir durumu olduğu gibi tanımlayan araştırma yaklaşımına tarama modeli olarak tanımlanır. Bu modelde genel ve örnek olay tarama modeli olmak üzere iki yaklaşım bulunmaktadır (Karasar, 1984).

Çalışma Grubu

Yapılan araştırma 2021-2022 eğitim-öğretim yılında Ankara ilinde bir devlet üniversitesinin eğitim fakültesinde Fen Bilgisi Öğretmenliği programında 1., 2., 3. ve 4. Sınıfta öğrenim gören 224 Fen bilgisi öğretmen adayı (181 kadın ve 43 Erkek) ile yürütülmüştür (Tablo 1).

Tablo 2. Çalışma grubunun sınıf seviyesine göre cinsiyet dağılımı

Cinsiyet	Sınıf Seviyeleri									
	1.Sınıf		2.Sınıf		3.Sınıf		4.Sınıf		Toplam	
	N	%	N	%	N	%	N	%	N	%
Kadın	8	21,0	51	28,2	56	30,9	36	63,2	181	100
Erkek	9	20,9	10	23,3	3	7,0	21	36,8	43	100
Toplam	47	21	61	27,2	59	26,3	43	19,2	224	100

Veri Toplama Aracı

Araştırmada kullanılan veri toplama aracı “Çevre Etiği Farkındalık Ölçeği” Özer ve Keleş (2013) tarafından geliştirilmiştir. Öğretmenlerin çevre etiğine yönelik farkındalıklarının belirlenmesi amacıyla geliştirilmiş olan bu ölçek, 23 maddeden ve 4 boyuttan oluşmaktadır. Çevre etiği farkındalık ölçeğin boyutları; çevre etiğinin tanımı, çevre etiğinin ortaya çıkış nedeni, çevre etiğinin amacı ve çevre etiğine yönelik önlemler şeklindedir. Özer ve Keleş (2016) tarafından ölçeğin geneli için Cronbach Alpha güvenilirlik katsayısını 0,95 olarak tespit edilmiştir.

Verilerin Analizi ve Kullanılacak İstatistiksel Teknikler

Veri analizi, verilerin toplanması, toplanan verilerin düzenlenmesi ve istatistiksel işlemler yapılarak anlamlı kararlara ulaşma ve geçerli sonuçlar çıkarabilmek amacıyla yapılan işlemler süreci olarak tanımlanabilir (Büyüköztürk, 2014). Toplanan veriler istatistiki analiz programlarından SPSS programında analiz edilerek fen bilimleri öğretmen adaylarının sorulara verdikleri cevapların ortalama, sapma, frekans (f) ve yüzde (%) dağılımları verilmiştir.

BUGULAR VE SONUÇ

Araştırmada kullanılan 4 boyutu bulunan Çevre etiği farkındalık ölçeğin alt boyutları; çevre etiğinin tanımı, çevre etiğine yönelik alınacak önlemler, çevre etiğinin ortaya çıkış nedeni ve çevre etiğinin amacı şeklindedir. Araştırmaya katılan fen bilgisi öğretmen adaylarının çevre etiğinin tanımı alt boyut puanlarının frekans ve yüzde değerleri Tablo 2’de verilmiştir.

Araştırmada yer alan fen bilimleri öğretmen adaylarının çevre etiğinin tanımı alt boyutuna ilişkin aldıkları puanlar incelendiğinde en yüksek puan ortalamasına S1 in, en düşük ortalamaya ise S7’nin sahip olduğu belirlenmiştir (Tablo 2). Araştırmada yer alan öğretmen adaylarının çevre etiği tanımına ilişkin puan ortalamalarına bakıldığında iyi durumda oldukları söylenebilir

Tablo 2. Çevre etiğinin tanımı alt boyutuna ilişkin aldıkları puanların frekans, yüzde değerleri

Araştırmada kullanılan 4 boyutu bulunan Çevre Etiği Farkındalık ölçeğinin alt boyutları; çevre etiğinin tanımı, çevre etiğine yönelik alınacak önlemler, çevre etiğinin ortaya çıkış nedeni ve çevre etiğinin amacı şeklindedir. Araştırmada elde edilen veriler değerlendirildiğinde fen bilimleri öğretmen adaylarının Çevre Etiği Farkındalıklarının tüm alt boyutlarda yüksek olduğu belirlenmiştir (Tablo 2- 5).

Çevre Farkındalık Ölçeği'ne verilen cevaplar incelendiğinde elde edilen bulgulara göre;

- Fen bilgisi öğretmen adaylarının yaşadıkları dünyayı gelecek kuşaklarla paylaşmak zorunda olduklarını ve çevreye bıraktıkları izlerin sadece bugünkü kuşakları değil gelecek kuşakları da etkilediğinin farkında olduğu,
- Fen Bilgisi öğretmen adaylarının insan refahı ve mutlu bir hayat için çevreyi korumaları gerektiğinin farkında olduğu,

- Fen Bilgisi öğretmen adaylarının çevredeki her şeye ahlaki açıdan da değer verdiği ve çevreyi korudukları,
- Fen Bilgisi öğretmen adaylarının çoğunluğunun teknolojisiz bir hayatta canlı cansız varlıkların değerini daha fazla anlayacaklarının farkında olsalar da bu konuda kararsız olan ve bu görüşe katılmayan öğretmen adayları da çok fazla olduğu,
- Fen Bilgisi öğretmen adayları hukuk kurallarının insanlar üzerinde etkisinin çok olduğunu ve hukuk kuralları olursa çevre sorunlarının azalacağını veya ortadan kalkacağını düşündüğü ve bu nedenle hükümetlerin çevreye yönelik yasaklamaları ve tedbirleri olması gerektiğini düşündüğü,
- Fen Bilgisi öğretmen adaylarının doğal kaynakların tüketilmesinde adalet ve hukuk çerçevesinde olmasına önem verdiği, çevreyi korumanın ahlaki kural olduğunu ve bu kurala uyulması gerektiğini düşündüğü,
- Fen Bilgisi öğretmen adaylarının doğal dengenin bozulmasının tüm canlıları etkileyeceğinin farkındadırlar. Bu nedenle çevrede bulunan canlılara karşı sorumlu ve doğaya karşı ahlaki sorumluluklarının olduğunu farkında olduğu,
- Fen Bilgisi öğretmen adayları canlı-cansız varlıklara saygının yolu eğitim olduğunu ve ekoloji sorunlarının ortadan kaldırılması için eğitimin yapılandırılması gerektiğini düşündüğü belirlenmiştir.

ABSTRACT

The importance of turfgrass among ground cover crops has been increasing in recent years. Turfgrasses, sports fields, parks and gardens etc. It is an important cover plant in areas. Among these areas, especially sports fields have started to attract more attention as the competitions become more professional and their popularity increases. Nowadays, football is the most striking sport among sports competitions. Football fields are one of the important factors that indirectly affect the visual satisfaction in the competition, the performance of the athlete, the quality of the game and the injuries of the football players. For these factors to be in the desired order, the cutting height should be kept short, the turfgrass density should be minimum 80%, frequent monitoring of irrigation and sun control for plant health and many other parameters. These fields, the use of which varies in intensity on a weekly or monthly basis, are the fields that need to be followed up seriously considering all these uses and seasonal conditions, and maintenance must be done in the same discipline throughout the year to maintain the same order in every competition. However, surface care alone is not enough for a successful field. For this reason, the field infrastructure must be provided in order for the maintenance operations to be more efficient. Football field infrastructure; hybrid content, heating, cooling, drainage layer, etc. of factors. All this structure directly affects the entire maintenance process. Especially, while the hybrid turf system affects the cover plant and the plant root system, the under-site heating and cooling systems affect the plant growth in harsh climatic conditions that have intense summer or winter seasons. This study aimed to discuss in detail the selection and maintenance of turfgrasses used in the construction of football fields and the importance of field infrastructure.

Keywords: Turfgrass, football field, establishment, hybrid

INTRODUCTION

Turfgrasses; It is one of the most important species in the cover crops plant group. Due to the density cover, sports fields, parks, gardens, hotel gardens, road slopes, etc. It is preferred as a cover crops in areas. Football the most attention in this regard among sports fields. Football is in more and more demand in our country and in the world, and for this reason, new stadiums are being built. These built areas are organized according to the standards set by FIFA (Fédération Internationale de Football Association), which is responsible for football management around the world. Turfgrass football fields (pitch), which are the main areas of use for athletes and the basic visual of football, are the most basic part of the facilities within football (Icoz et al.,2009; Puhalla et al., 2020). All stadium fields are built within certain order and quality elements, and the following process proceeds accordingly. Football fields, where national or international matches are played, are one of the areas of the facility that should be given high priority both visually and in terms of condition. Football field; It directly affects factors such as visual, tactical application, athlete injuries and game quality. Football field according to Performance Quality Standards; It should have adequate drainage, none weeds, uniform, leveled and dense cover. In order to provide all of these, the necessary infrastructure, sufficient equipment, knowledgeable personnel for the equipment and the right irrigation system are required (Cockerham 2008, FIFA 2011).

Football fields are divided into two as natural and synthetic (artificial) turfgrass fields according to the characteristics of the ground. While synthetic pitches are generally preferred in local pitches, natural turfgrass pitches are preferred more than artificial ones in terms of the health and playing quality of football players in top league football clubs. Frequency of use of natural fields, excess of surface impact in a competition, etc. For these reasons, it is one of the most difficult areas to maintain. These fields are established in 4 different ways. These are roller grass, vegetative planting, sowing and hydroseeding methods. Although these areas contain surface maintenance differences within themselves, maintenance is generally carried out on the same foundation (Hocaoğlu and Bingöl, 2022). Turfgrass fields in football; It is evaluated in terms of surface hardness, tearing, drainage level, root strength and visual order. If all these details, which can be improved in a certain discipline with the right care, are not taken into account, athlete's injury etc. can cause serious problems. For this reason, all factors from the grass plant selected for the surface coating to the choice of the machine to be used in the care of the plant and the personnel to use the machine should be carefully selected and the applications should be done correctly.

Although the turfgrass types preferred in football fields differ in terms of care, the turfgrass types used basically in all are classified as cool season turfgrasses (C3) and warm climate turfgrasses (C4) according to the climatic conditions of the field. C3 cool climate turfgrasses such as *Lolium perenne* (Perennial ryegrass), *Festuca arundinacea* (Tall fescue), *Festuca rubra* (Red fescue), *Poa pratensis* (Kentucky bluegrass) and *Cynodon dactylon* (Bermudagrass), which is also preferred in sports fields. (Alkan et al. 2019). *Paspalum vaginatum* (Seashore paspalum). In addition, two other warm-season turfgrass species, *Buchloe dactyloides* (Buffalograss) and *Zoysia japonica* (Zoysiagrass), are sometimes used for sports turf but infrequently (Beard, 1973; Avcioglu, 2014; Puhalla et al., 2020)

These types, which are known as the strongest grass types in terms of root structure and plant growth characteristics, are preferred primarily in areas where surface pressure and surface injuries such as rupture and tearing are high, especially in football fields. Among these plants, the cool climate turfgrasses *Lolium perenne*, *Poa pratensis* and *Festuca* sp. The most preferred are known as turfgrass species. Especially *Lolium perenne* plays an important role in football fields due to its high germination and growth rate. Bermudagrass is the most widely used turfgrass type in warm climate turfgrasses. It is the most preferred hot climate plant due to its strong stolon structure, tillering speed and impact resistance. Inter-planting is done with *Lolium perenne* in the autumn months in football fields covered with Bermudagrass. This; It provides the support of *Lolium perenne*, which has high germination power and durability, to the Bermudagrass turfgrass, which weakens during the transition period, and to extend the use of the ground, and to quickly repair the damages that occur in the competitions (Beard, 1973; Avcioglu, 2014; Puhalla et al.,2020).

ESTABLISHMENT OF FOOTBALL FIELD

The football field contains layers that support the mechanical maintenance made from the surface on the underground foundation. These are from the top ground to the deepest layer; turf surface, root zone, drainage gravel, geotextile, drainage pipe, semi-permeable soil. Each of these layers consists of hybrid root strengthening system, drainage gravel, permeable sand layer etc. All of these ingredients are of great importance both for the care process of the plant and for the success of the game and the athlete.

Turfgrasses used in football fields are plants that must be maintained depending on the competition time. From time to time, this requires the cool climate plant to survive in hot weather conditions and the warm climate plant to survive in cool weather conditions. Since this is not possible with natural roads, football fields should have a full-capacity infrastructure in

order to achieve this.(Avcioğlu, 2014). This infrastructure, from the top to the deepest layer, respectively; Turf surface, root zone, drainage gravel, geotextile, drainage pipe, semi-permeable soil. All elements in this infrastructure are built to ensure that the football field floor is of the same visual and quality throughout the year, despite seasonal differences. One of the most important layers is the underfloor heating/cooling system, which ensures the survival of cool climate and hot climate turfgrasses in non-living seasons. Underground heating and ventilation systems are systems used to bring the underground temperature to the desired temperature according to the seasonal conditions of the plant. For example, in order to prolong the dormancy period in grass plants that show stolon spread rapidly when dormancy loses its temperature, such as Bermudagrass (*Cynodon dactylon*), at the same time, an under-field aeration system is used to extend the survival time of *Lolium perenne*. In addition, the same system can be used to minimize the surface freezing of heating systems in regions with a harsh winter climate and high risk of frost due to snow and cold. (Alkan et al., 2019)

The most intense period of the competitions is usually the rainy winter months, so another important element is the field drainage system. Subsurface drainage systems are composed of conventional drainage pipes and vertical discharge gravel-sand mixture. Field drainage provides surface water control by preventing ponding etc. On the surface. This affects both the water saturation level of the plant and the game quality and player health. In the fields where drainage cannot be provided, serious problems such as muddying of the soil structure, excessive water saturation of the turfgrasses, difficulty in ball control during the game, deterioration of the visual of the field, the player's slip and the increase in the risk of player injury due to falling. In order to support surface drainage in heavy rainy areas where the correct drainage system cannot be established in the field infrastructure or where the drainage is not sufficient, an average of 1.5% slope is given to the field along the long line passing from the midfield level. With this slope, the water going to the edge of the field flows into the basins located 4m-6m from the touch line.

One of the most important sources of providing surface water control in turf fields is field irrigation systems. These systems are provided with sprinklers placed on the field surface. Each sprinkler is placed on the field with a certain math (Esin, 2006). Sprinklers are placed in a geometry on the field by determining the rotation angle and maximum reaching point on its own axis, and the pressure settings are adjusted according to the field dimensions. Sprinklers, which are not arranged in a correct mathematics, will prevent the equal amount of watering of

every point of the field, thus causing regional plant losses and indirectly visual deterioration. (Puhalla et al. 2010).

Football players make moves that require resistance during the match or experience involuntary falls that require resistance. It can be soft, muddy, lost its turfgrass texture locally or widely, or excessively covered, etc. The fields directly affect the field resistance. For example, although the dense and dense appearance of the turfgrass texture on the surface is visually beautiful, it prevents drainage in the fields where stolon growing turfgrasses such as Bermudagrass are dense and indirectly prevents the resistance of the field by creating a spongy soft field. For this reason, surface care to be applied in the fields is also very important.

The density of the grass plant may decrease due to the season or due to the increase in the intensity of the competition, and field injuries due to the same reasons increase and are dragged into the negative in terms of affecting both visual and performance. In order to maintain these problems throughout the year with the least impact, the strength of the root zone of the plant is a priority in the year-round maintenance (Özdemir, 2017).

For this, turfgrass root strengthening systems (hybrid turfgrass) are used in football fields. Hybrid turfgrasses are classified as rololer hybrid, sowing (stitched) and fiber hybrid. Stitched (sowing) hybrids; Synthetic material called polypropylene, with the use of computer-directed electrical machines with laser precision control facility, on the previously established or newly built field, approximately 9-18 cm of the surface. Carried out by placing it in the up to part of it. (Hocaoğlu and Bingöl, 2022). Roller hybrids; It is placed by knitting or weaving on a special support material that is partially biodegradable in nature, developed to ensure the deep and rooted growth of natural grass. Finally, a fiber mixture is used in fiber-reinforced root hybrids. Fiber hybrids are a direct root zone consolidation system, unlike the other two hybrid systems.

MAINTENANCE ON FOOTBALL FIELD

Maintenance operations on turfgrass fields; The type of turfgrasses, the season of the region, the infrastructure conditions of the field are taken into consideration. The most important after the infrastructure establishment in the field facility is equal and correct insemination to the entire field. Seed sowing, which is applied with tractor type machines or manual tools, is carried out in a way to ensure homogeneity in the whole field (Hocaoğlu and Bingöl, 2022). After the turfgrasses growth process is completed on turfgrass fields that have been planted in a homogeneous way, the shaping process plays a very important role in creating a visual feast of the field. In addition to the turfgrass, the arrangement and arrangement of the existing machinery also creates an effect. For example, the sharpness of the blades of the machines used

during shaping creates a direct visual effect. If the machine blade has lost its sharpness, it causes the plant to tear the surface part of the plant instead of cutting it, which causes the remaining part to die and turn yellow and the field visual to deteriorate.

After the match played on the field, especially in the periods when the root strength of the plant decreases, the turfgrass breaks off from the field and accumulates on the field surface. This both accumulates plant residues on the field surface and creates open areas without grass texture in the ruptured areas. All residues on the surface are cleaned with vacuum mowers or rakes, etc., depending on their density. Cleaned with hand tools. The bare areas are filled with local sandblasting and if necessary, they are repaired by seeding from place to place (Cereti et al., 2004; Emmons and Rossi, 2015).

Turf height in football fields is made within certain standards. This standard; creating a visually measured pattern, the rate of effect of the speed of the ball on the field, the comfort of the football player on the field, etc. consists of factors (Demiroglu Topcu and Ozkan, 2018). One of the other factors affecting the comfort of the athletes is the hardness of the floor. Since very hard floors will directly affect the field resistance, it increases the risk of injury during the fall of the football player. In order to control this situation, it is the process of drilling the field evenly with machines with 8-10 cm iron bars, called ventilation (Beard, 1973). This process not only brings the hardness of the field to the desired level, but also helps to increase the root strength of the plant by aeration of the plant roots.

Although the grass plants, which are sustained by the underfloor heating/cooling system on the field surface outside the seasonal normal, seem to be a very useful and sustainable system, many problems arise along with it. The most important of these is that the plants require more or less water than usual, especially during the season transition or intermediate planting periods, and this causes problems that will affect the plant and soil health and field quality in the long run (Hocaoğlu and Bingöl, 2022). Due to the architecture of the grass field facilities, the fact that a certain facade of the turfgrass fields is always shaded and the water ratio is high causes the part of the irrigation water that cannot be absorbed by the soil and the plant to remain in the top soil layer without evaporation due to shadow. In line with all these factors, a moss layer is formed that creates a slippery ground in the fields and closes the soil surface at a dangerous level if it is not controlled. While the moss layers affect the living conditions negatively by covering the plant and the soil, they create a slippery ground in the field and may create risky situations such as the slipping of the football players. Considering the plant health as a priority, the struggle of moss layers can be achieved by machines or sandblasting (Özdemir, 2017). Depending on the density level of the algae layer, this layer can be destroyed by local shredding

from the surface with unirake machines, with dense rakes or hand-held harrows, or it can be combated with a local or general sandblasting.

Another problem caused by the shadow areas in the stadium architecture is the inability to provide the sunlight and temperature that the plant desires. Main problems such as visibly thinning of plant density, color differences, weak root development are seen especially in the areas that do not receive sunlight. In some stadium architectures, the parts of the roof that are reflected on the field are built using semi-permeable glasses and the field can benefit from sunlight, albeit minimally (Özdemir, 2017). However, artificial daylight is used in all shaded areas since sufficient benefit cannot be provided. These lights are used in the shadow areas of the grass field when the underfloor heating cannot be turned on or is insufficient.

CONCLUSION

Football; It is one of the most popular sports fields due to its popularity. For this reason, football turf fields attract direct attention. From the spectators who come to the stadium to watch the match to the spectators watching on the digital screen, the first area that attracts everyone's attention is the turfgrass fields. For this reason, its image should always be neat. However, more importantly, the health of the football players who are direct users of the field, their comfort on the field, and the quality of the game they play have a very high impact on the field. In order for these effects to remain in the desired order, football fields should be formed in a way that complements each other from the foundation to the surface.

ABSTRACT

This study was carried out to determine the effect of different foliar fertilizer application on cotton yield, yield components, plant development and fiber technological characteristics. The experiment was conducted as randomized complete block design with four replications in 2018. Stoneville 468 cotton variety was used as plant material. In the study 5 different organic fertilizer (Control, Fullexan, Cifamin BK, Cifoumic, Sinergon 2000, Macys BC 28) were used. All of the foliar fertilizers used are organic fertilizer and applied as foliar fertilization during flowering period of plants. In the study seed cotton yield ranged between 352,58 and 419,91 kg da⁻¹, plant height ranged between 76,86 and 83,81 cm, the number of monopodial branches ranged between 1,79 and 2,43 number/plant, number of sympodial branches ranged between 10,96 and 14,46 number/plant, the number of first vegetative branch's node 5,28 to 5,78 number/plant, number of nodes 16,74 to 19,06 number/plants, height/node ratio 4,29 and 4,75 number/plant, boll number 13,41 to 22,29 number/plant, boll weight 6,12 to 6,37 g, seed cotton boll weight 4,57 to 4,91 g, 100 seeds weight 9,00 to 9,44 g and first picking percentage ranged between 90,11 to 94,84%. It has been determined that the application of foliar fertilizers does not make a significant statistical difference on all agronomic and fiber technological properties examined. It was concluded that the use of foliar fertilizers may be beneficial in case of plant nutrient deficiency symptoms. It is thought that foliar fertilizer applications should be supported with different varieties and studies to be carried out for longer years and it would be more appropriate to repeat the applications more than once.

Keywords: Cotton, Foliar Fertilizer, Application, Yield, Fiber Quality Properties

Introduction

The cotton plant is a product of great economic importance for humanity with its widespread and compulsory use, and for the producing countries with the added value and employment opportunities it creates. Approximately 432 thousand hectares of cotton farming is done in Türkiye and a total 832 thousand tons of fiber cotton is produced from these areas (Anonymous, 2022). Cotton production of country is located in Aegean, Mediterranean and Southeastern Anatolia Region. The Southeastern Anatolia Region, where the GAP (Southeastern Anatolia Project) dam is located, meets 60% of the country's cotton production.

Türkiye has developed infrastructure and facilities in the textile industry and has a suitable ecology in cotton agriculture. However, because the local cotton lint production is not sufficient to meet the ever increasing demands of textile industry, Türkiye imports about 1.000.000 tons of cotton lint per year. The only way to meet the increasing consumption and prevent fiber imports is to increase productivity in cotton, to prevent stress conditions that cause yield loss and to produce more economically. The rapid increase in the world population has brought with it efforts to increase productivity in plants. To get the highest efficiency from the unit area in order to meet the increasing consumption and fiber imports, to minimize the biotic and abiotic stress factors that cause yield loss, and to be more sensitive to nature and the environment while doing this.

Timely and appropriate dosage of macro and micro plant nutrients during plant development is a way to increase productivity. Macro plant nutrients (N, P, K, Ca, Mg and S) and micronutrients (Fe, Zn, Mn, Cu, Mo, B and Cl) are important for plant growth and metabolism (Karaman, 2012). In the absence of sufficient amount of plant nutrients in the environment, plant development and metabolism are adversely affected and the plant cannot complete its normal development. In the case of plant nutrient deficiency, vegetative and generative development in plants cannot be fully completed, which leads to the deterioration of the balance between vegetative and generative development of plants. Fertilizers contain plant nutrients required to generate yield or higher biomass. Plant nutrients are found in fertilizers in the form of different chemical compounds and are taken up by plants either directly or after chemical change by roots or leaves after dissolving with water. Hodges and Constable, 1991 stated that any stress factor in the plant will affect the uptake of plant nutrients.

Fertilizers applied by spraying to plants in the form of foliar fertilizer are taken into the plant body by entering through the cuticle and pores of the leaves. Oosterhuis, 2007, reports that when foliar fertilizers are used for deficiency symptoms of plant nutrients, the plant responds quickly, deficiency symptoms are eliminated more quickly, the use of foliar fertilizers

in small quantities is advantageous and has a lower cost, leaves do not burn, yield and fiber quality parameters can be improved. It has been reported that the absorption rate of plant nutrients from the leaves of plants is lower than the roots, and the mechanisms of taking nutrients from the leaves of the plants are similar to those in the roots.

This study was carried out in Siirt University Faculty of Agriculture in 2018 in order to determine the effects of different organic foliar fertilizer applications on yield, yield components, plant growth and fiber quality characteristics in cotton.

Material and Methods

The experiment was carried out at the Siirt University, Faculty of Agriculture, Department of Field Crops's experimental area during 2018 cotton growing season in Siirt, Turkey. Stoneville 468 cotton varieties and 5 different leaf fertilizers (Sinergon 2000, Cifamin BK, Cifoumic, Macys BC 28 and Fullexan) were used as material in the study. The experiment was carried out according to the randomized completely blocks design with 4 replications and 6 different applications (Control, SINERGON 2000, CIFAMIN BK, CIFOUMIC, MACYS BC 28, FULLEXAN) were included in the experiment.

Each plot consisted of four rows of 12 m in length, between and within row spacing were 0.70 m and 0.15-0.20 m, respectively. Seeds were planted on 4 May, 2018 by planting machine. Plants were grown under recommended cultural practices for commercial production. Soil analyzes were made by taking soil samples from the experimental area and the amount of fertilizer needed by the plant was determined.

Table 1. Main properties of the soil

Specification	Value
Clay (%)	43.51
Sand (%)	47.99
Silt (%)	8.49
pH	6.89
Electrical conductivity (mS cm ⁻¹)	463
Lime (%)	0.50
Organic matter (%)	1.02
Available phosphorus, P ₂ O ₅ (kg ha ⁻¹)	22
Available potassium, K ₂ O (kg ha ⁻¹)	860

*: Siirt University, Science and Technology Application and Research Center, Siirt

Half of the nitrogen needed during planting and all of the phosphorus (8 kg da⁻¹ N, 8 kg da⁻¹ P₂O₅) were applied to the band in the form of 20-20-0 compound fertilizer, and the second half of the remaining nitrogen (6 kg da⁻¹ N) was applied before the first irrigation (about 45 days after sowing) as ammonium nitrate (33%). In addition, foliar fertilizers were applied to the experimental plots with a back sprayer. Foliar fertilizer applications were made by spraying

the leaves during the flowering period of the plant, and the prospectus in the fertilizers was taken into account in the applications.

Experimental plots were irrigated with drip irrigation method, which started to before flowering and given up at 10% boll opening stage. Harvesting was done by hand and completed twice. The first harvest was made when 60% of the bolls were opened, and the remaining product was collected at the second-hand harvest. The first-hand harvest was made on October 3, 2018, and the second-hand harvest was made on November 1, 2018. The crops collected at the first and second hand harvest were weighed separately and then converted into total yield. Observations and measurements were taken from 10 randomly selected plants. Fiber technological properties were determined by using HVI 1000 devices. Statistical analysis was performed using JMP 5.0.1 statistical software (<http://www.jmp.com>) and the means were grouped with LSD_(0.05) test.

Results and Discussion

The differences between investigated agronomic traits are given in Table 2-3. The statistical analysis indicated that the differences between treatments for seed cotton yield was non-significant. The seed cotton yield ranged from 352.58 to 419.91 kg da⁻¹. The highest yield was obtained from MACYS BC 28 (419.91 kg da⁻¹) and the lowest yield was obtained from FULLEXAN foliar fertilizer (352.58 kg da⁻¹). It was observed that foliar fertilizers did not have a significant effect on seed cotton yield. Similar findings are also reported by Heitholt 1994, Edmisten et al., 1994, Bednardz et al., 1998, Haliloğlu et al. (2006). The results of the research differ with those who reported that Foliar Fertilizer applications have a significant effect on the seed cotton yield (Howard et al., 1998, Temiz and Gençer, 1999, Brar and Brar, 2004, Rathika et al., 2013). This may be due to the differences in the cotton type used as material in the study, fertilizer form, application methods, application times, fertilizer level in the soil, and climate and maintenance conditions.

Table 2. Average values of the investigated traits

Treatment	Seed Cotton Yield (Kg da ⁻¹)	Plant Height (cm)	Monopodial Branches (number plant ⁻¹)	Sympodial Branches (number plant ⁻¹)	Node Number of First Fruiting Branches (number plant ⁻¹)	Number of Nodes (number plant ⁻¹)
1. Control	392,67	83,81	1,83	14,46	5,66	17,69
2. SINERGON 2000	386,01	80,51	1,79	11,11	5,36	17,36
3. CIFAMIN BK	396,69	78,84	2,10	11,06	5,78	16,74
4. CIFOUMIC	377,55	79,66	2,28	12,39	5,28	17,74
5. MACYS BC 28	419,91	83,08	2,43	13,22	5,78	19,06
6. FULLEXAN	352,58	76,86	1,84	10,96	5,30	17,93
Mean	387,57	80,46	2,05	11,70	5,53	17,75
CV (%)	14,92	6,08	30,24	14,47	10,31	7,32
LSD (0.05)	ns	ns	ns	ns	ns	ns

*, **; Significant at $p \leq 0.05$ and $p \leq 0.01$, respectively

Plant height ranged between 76.86 and 83.81 cm, but the differences between treatments were non-significant. The highest value was obtained from Control (83.81 cm) and the lowest value was obtained from Fullexan (76.86 cm). Research findings showed parallelism with those (Temiz and Gençer., 1999, Gençsoylu 2016), who stated that foliar fertilizer application did not have a significant effect on plant height. On the other hand, the findings differ with Haliloğlu et al., 2006 and Ogan 2019, who stated that foliar fertilizer application has a significant effect on plant height.

As shown in Table 2, number of monopodial branches ranged between 1.79 and 2.43 number/plant, but the differences between treatments were non-significant. The highest value was obtained from MACYS BC 28 (2.43) and the lowest value was obtained from SINERGON (1.79). Research findings are similar to those of (Temiz and Gençer., 1999) who stated that foliar fertilizer application did not have a significant effect on the number of monopodial branches.

Number of sympodial branches ranged between 10.96 and 14.46 number/plant, but the differences between treatments were non-significant. The highest value was obtained from Control (14.46) and the lowest value was obtained from FULLEXAN (10.96). Similar findings were also reported by Temiz and Gençer., 1999; Karademir et al., 2005 and Ogan 2019.

Depending on the applications, it can be observed that the average values of the node number of first fruiting branch vary between 5.28 and 5.78, and the general average of the

experiment is 5.53 units/plant. Although there is no significant difference between the applications in terms of the number of nodes on the first fruiting branch, the CIFOUMIC fertilizer gave the lowest value in the number of nodes on the first fruiting branch (5.28 units/plant), while the applications of CIFAMIN BK and MACYS BC 28 showed the highest value (5.78).

Number of nodes is an indicator of plant growth ranged between 16.74 and 19.06 number/plant, but the differences between treatments were non-significant. The highest value was obtained from MACYS BC 28 (19.06) and the lowest value was obtained from CIFAMIN BK (16.74).

Table 3. Average values of the investigated agronomic traits

Treatment	Height/ Node Ratio (num/plant)	Boll Number (num/plant)	Boll Weight (g)	Seed Cotton Weight Per Boll (g)	100 Seed Weight (g)	First Picking Percentage (%)
1. Control	4,75	15,87	6,24	4,75	9,00	93,03
2. SINERGON 2000	4,65	16,01	6,13	4,63	9,30	90,11
3. CIFAMIN BK	4,72	16,75	6,15	4,69	9,44	92,14
4. CIFOUMIC	4,49	16,31	6,12	4,57	9,30	94,40
5. MACYS BC 28	4,36	22,29	6,13	4,68	9,09	92,20
6. FULLEXAN	4,29	13,41	6,37	4,91	9,37	94,84
Mean	4.54	16,77	6,20	4.70	9,24	92,79
CV (%)	6,38	23,85	5,38	6,59	4,33	2,62
LSD (0.05)	ns	ns	ns	ns	ns	ns

*, **; Significant at $p \leq 0.05$ and $p \leq 0.01$, respectively

As shown in Table 3, Height/Node ratio ranged between 4.29 and 4.75 number/plant, but the differences between treatments were non-significant. The highest value was obtained from Control (4.75) and the lowest value was obtained from FULLEXAN (4.29).

Boll number ranged between 13.41 and 22.29 number/plant, but the differences between treatments were non-significant. The highest value was obtained from MACYS BC 28 (22.29) and the lowest value was obtained from FULLEXAN (13.41). Similar findings reported by Temiz and Gençer., 1999 who stated that foliar fertilizer application has no effect on the number of bolls. There are also research results indicating that it contributes positively to the number

of bolls (Brar and Brar, 2004, Dordas, 2006, Haliloğlu et al., 2006, Sawan et al., 2009, Yaseen et al., 2013).

Boll weight ranged between 6.12 and 6.37 g, but the differences between treatments were non-significant. The highest value was obtained from FULLEXAN (6.37) and the lowest value was obtained from CIFOUMIC (6.12). The results of Sawan et al., 2009 confirmed this findings.

Seed cotton weight per boll ranged between 4.57 and 4.91 g, but the differences between treatments were non-significant. The highest value was obtained from FULLEXAN (4.91 g) and the lowest value was obtained from CIFOUMIC (4.57). Research findings are similar to those (Temiz and Gençer, 1999; Ogan, 2019), who reported that foliar fertilizer applications did not have a significant effect on seed cotton weight per boll. Dordas, 2006, Rashidi and Gholami, 2011, Hosamani et al, 2013, Abdel-Aal, 2018 reported that the effect of foliar fertilizers on seed cotton weight per boll was significant. This may be due to the differences in the cotton type used as material in the study, the fertilizer form, application methods, the amount of nutrients in the soil, and the climate and maintenance conditions.

100 seed weight ranged between 9.00 and 9.44 g, but the differences between treatments were non-significant. The highest value was obtained from CIFAMIN BK (9.44 g) and the lowest value was obtained from Control (9.00). Similar findings were also reported by (Temiz and Gençer, 1999, Ogan, 2019) and showed parallelism with research findings. Research findings differ from those (Haliloğlu et al., 2006), who reported that foliar fertilizers contributed positively to the weight of 100 seeds.

The statistical analysis indicated that no significant differences between treatments for first picking percentage. Value ranged from 90.11 to 94.84%. The highest value was obtained from FULLEXAN (94.84%) and the lowest value was obtained from SINERGON (90.11%).

Table 4. Average values of the fiber quality traits

Treatment	Mic.	Fiber Length (mm)	Fiber Strength ⁻¹ (g tex)	Fiber Elong. (%)	Fiber Unif.	Short Fiber Index	Yellow (+b)	Reflec (Rd)	SCI
1. Kontrol	4,97	27,73	30,80	6,15	84,07	6,00	8,65	78,72	137,00
2. SINERGON 2000	4,70	28,59	32,17	6,15	84,65	5,67	8,85	79,30	139,00
3. CIFAMIN BK	4,45	28,62	29,22	6,37	84,52	5,67	8,60	78,92	138,75
4. CIFOUMIC	4,76	28,38	32,17	6,52	84,87	5,75	9,15	79,10	146,75
5. MACYS BC 28	4,61	28,55	30,00	6,77	84,82	5,45	8,60	78,75	140,75
6. FULLEXAN	4,87	27,95	30,17	6,35	84,10	5,77	8,77	79,52	137,50
Mean	4,72	28,30	30,36	6,39	84,67	5,72	8,77	79,05	139,96
CV (%)	5,35	2,61	7,81	5,25	1,44	14,99	4,92	1,54	8,15
LSD (0.05)	ns	ns	ns	ns	ns	ns	ns	ns	ns

*, **, Significant at $p \leq 0.05$ and $p \leq 0.01$, respectively

In the research, it is seen that foliar fertilization does not have a significant effect on fiber quality traits, but highest value was obtained from CIFOUMIC and MACYS BC 28. Temiz and Gencer (1999) stated that foliar fertilizer had no effect on fiber fineness, fiber length and fiber strength. However, Ogan, 2009 revealed that foliar fertilizer had a significant effect of fiber fineness. Sankaranarayanan et al. (2010) reported that foliar fertilizer had a positive effect on fiber uniformity.

Conclusion

The findings obtained from the study showed that no statistically significant difference could be obtained between foliar fertilizer applications in terms of all of the investigated properties. All of the foliar fertilizers used as material in the study were organic leaf fertilizers, and the green part was applied once during the blooming period of the plant. The instructions in the fertilizer leaflet were taken into account as the application amount. In the study, it was determined that the number of bolls increased slightly with the application of MACYS BC 28, but this did not lead to a significant difference in terms of both bolls count and seed cotton yield traits, but highest value was obtained from CIFOUMIC and MACYS BC 28.

Since only one variety was used in the study, foliar fertilizer applications were applied once, and the research findings were obtained from one-year field trials, it is thought that these results will not be sufficient to give advice and suggestions to the producers in cotton production areas. There is an impression that more reliable findings can be reached with studies to be carried out for two or three years with different varieties. It is understood from many literature reports that the effect of organic foliar fertilizers in the study is not significant and may be related to the amount of nutrients in the soil. It is known that foliar fertilization should be applied only when certain plant nutrient deficiency symptoms are observed in the cotton plant.

For this reason, foliar fertilization can be recommended against plant nutrient deficiency symptoms in production areas. In the study, seed cotton yield values varying between 352.58 kg/da and 419.91 kg/da were obtained. Although there is no significant statistical difference between foliar fertilizers, the highest value was obtained from MACYS BC 28 fertilizer. This fertilizer led to a slight increase in the seed cotton yield.

It was observed that there was an increase in yield of 27.24 kg/da when compared with the control application. Although it does not lead to a significant increase in yield, the low cost of using foliar fertilizers can be considered as an advantage. It was determined that foliar fertilizers did not have a significant effect on all fiber quality characteristics. It was determined that different organic foliar fertilizers in cotton did not have a significant effect on plant yield,

yield components, plant growth and fiber quality characteristics. In the study, foliar fertilizers were used in addition to normal fertilization.

It is thought that the nutrient deficiency in the plant is eliminated due to the base and top fertilizer used. It has been understood that the use of foliar fertilizers would be more appropriate in case of symptoms of plant nutrient deficiency. Before applying foliar fertilizers, it is thought that it will be useful to determine the deficiency of plant nutrients by making leaf analyzes. However, it is understood that there is a need for studies to be conducted for longer years, since the study includes the findings of a 1-year study.

Abstract

Stress is as an adverse reaction people have due to too much pressure or other types of demand placed on them. Several strategies have been proposed by researchers across the globe. However, the menace still persists in construction projects. Therefore, this study investigated the underlying strategies for effective management of Job-stress in Nigerian construction projects. The necessary data for the study was obtained through questionnaire survey. The questionnaire was designed using the information obtained in the literature on the subject matter. Findings of the study show that construction professionals experience work stress on a daily basis. It was also discovered that workload, job complexity, and personal trait are the main causes of job-stress in construction projects. Death is the major impact of stress on construction workers. The study concludes that workers in the construction industry need effective communication between them and the management for effective reduction of stress during construction activities. Premised on the conclusion, the study recommends that construction workers should embrace the use of software in project planning and management for effective stress reduction.

Keywords: Construction, Effective, Management, Strategies, Job-stress,

1.0 Background of the Study

Stress is neither a simple nervous tension that can result from damage, nor necessarily something to be avoided (Wahab, 2010). From the Health and Safety Executive (HSE, 2007), It is a neurotic human response to psychological, social, job and environmental pressures. This implies that stress is as an adverse reaction people have due to too much pressure or other types of demand placed on them. Some of the causes of stress encountered by professionals in the construction industry are handling of multiple construction projects at a time, poor planning, poor health condition of an individual, poor site condition, large volume of work, ambitious deadline (Leung *et al.*, 2005). Others are workload that employees' cannot cope with, lack of or inadequate consultation by managers with employees regarding their work, communication and negative relationship issues (Leung *et al.*, 2010). It is essential to note that the various causes of stress encountered by professionals in the construction industry can be categorized into physical work environment stressors, organizational related stressors, work demand stressors and job role stressors.

The consequence of stress to employees and organizations across the globe cannot be over emphasized. It could lead to inefficiency, low productivity, abandonment of project, delay in project delivery, depression, anxiety, health related issues such as high blood pressure; headache; body pains; slump or even death of an employee (Leung *et al.*, 2005; Wahab, 2010). The literature exists on stress and its causes in construction project. Also, there are previous studies on the effects of job-stress on employees' and organizations. However, as at when this study was conducted, there seems to be scarce literature on the underlying Strategies for Effective Management of Job-stress in Nigerian Construction Projects

Therefore, this study was conducted to assess the various forms of stress experienced by workers during construction activities. The causes of the various stresses, the impacts of the stress on employees' and organizations as well as the strategies that can be adapted to reduce or overcome the stress were investigated in this study.

2.0 Literature review

2.1 Over view of construction industry

The construction industry is known to be a complex industry in terms of the managerial skills needed and standards to be met, and it is also characterized by numerous elements that differentiate it from other known business sectors of the economy like the manufacturing, banking, oil & gas, services and the likes (Ozaki, 2003). Despite its complexity, the industry contributes about 10% of Gross Domestic Product in a country (Navon, 2005). The technology used in the construction industry has always been known to be flexible due to the fact that

construction processes take place at the location of consumption (Tukel & Rom, 2001). Therefore, high demand for labour mobility, low capital intensity and high entrepreneurial risks continue to affect the performance of construction industry across the globe (Vouzias, 2004). In Nigeria, the construction industry is known by small, medium and large scale local investors (contractors), which in most cases deals with commercial, industrial and residential projects (Dantata, 2008).

2.2 The concept of job-stress

The term stress is used to refer to hardship, strain, adversity or affliction. It was used in the eighteenth and nineteenth centuries to denote force, pressure, strain, or strong efforts relating to an object or person (Somerfield & McCrae 2000). A study by Aitken and Crawford (2007) revealed that the concept of job-stress originated with the research of Selye in 1978. Schuler, (2014) affirmed that stress as a pathological human response to psychological, social, occupational and/or environmental pressures. Melia and Becerril (2007) on the other hand pointed out that stress is an experience expressed in one's feeling of being strained while the Health and Safety Executive (HSE, 2007) defined stress as the adverse reaction people have due to too much pressure or other types of demand placed on them. Put differently, (Lath, 2010) was of the opinion that every person including a child, an adult, employed or unemployed faces stress in his/her everyday life.

2.3 Causes of stress in construction projects

The main cause of stress in construction projects is as a result of factors that negatively arise from the project, and hence makes desired goal unattainable (Kenneth, 2005). Hence, work overloads, working long hours and role ambiguity are known to be leading causes of stress amongst professionals in construction industry (Sutherland & Davidson, 2012). Srivastava, (2005) asserted that multilevel subcontracting, time pressure; constant worker rotation and unstable work due to temporary contracts can contribute to psychosocial stress among workers. Others are inadequate room for innovation, unsatisfactory remuneration, and ambiguity of job requirement, inadequate knowledge of project objectives, long working hours, tight schedules and unfavourable working conditions (Leiter, 2012; Campbell, 2006).

2.4 Impacts of stress on employees' and organizations

The consequences of stress could be divided into 3 categories: effect on health, effect on personal characteristics, and effect on employees' working efficiency. The most common appearing health problems caused by stress are high blood pressure, elevated cholesterol and blood fats, adult-onset diabetes or high blood sugar, obesity, poor fitness, and inflammatory illness (Buchan *et al.*, 2008). Therefore, it is imperative to prevent any stress at work and by

adapting any stress management program or tool rather than to spend money on workers' treatment or replacement (Ben, 2006).

2.5 Stress management strategies in construction projects

Akubue (2000) stated that stress management strategies are referred to as the methods organizations employed to deal with stressful or disturbing situations. These includes the use of advanced project management software's such as primavera, Microsoft project manager among others in projects execution, adequate time management, conducive site office, well ventilated environment, clarity of job role by creating a work schedule, maximization of break time, proper feeding, reduction of work load by employing the different professionals, building interpersonal relationship skills, adequate funding, adoption of appropriate job design practices and education of professionals in stress management. All these strategies will reduce the incidence of stress among professionals in the building industry.

3.0 Research methodology

3.1 Research Design

Research design is the overall design for obtaining answers to the questions being studied and for handling some difficulties encountered during the course of the research (Jeanne, 2011). Field survey research proposed by Griffith (2014) was adopted in this study. Questionnaire was the instrument used for data collection in the survey research design.

3.2 Questionnaire survey

The questionnaire was designed using the information obtained in the literature on the subject matter. It was distributed directly to the study respondents (professionals in construction firms in the study context). The professionals are Architects, Civil engineer, Builder, Quantity Surveyor, Project Manager and Site Supervisor, which were randomly selected from randomly selected firms. The academic qualifications of the professionals range from PhD to Higher National Diploma (HND). The professionals have been working in construction industry for more than 5 years, and have executed different projects ranging from small to large. Before the distribution of questionnaires, a formal approval was obtained from the management of all the selected construction firms in Federal Capital Territory, Abuja. The question in the questionnaire was based on a 5 point likert scale. These enabled respondents express their level of agreement or disagreement with the information in the questionnaire form strongly agrees (5), to strongly disagree (1). A total of 150 questionnaires were distributed out of which only 119 (88%) were returned back and were used for the study. The data obtained through the questionnaire was analysed using descriptive statistics such as mean item score (MIS) and standard deviation (SD) (Digital Bridge Institute, 2018).

4.0 Results and discussion

4.1 Demographical information of the respondents

Table 1 presents the general information on the qualification, years of experience and job position on site of participants of the study. As earlier stated, total of 150 questionnaires were randomly administered to construction professionals in the construction firms in Abuja. Out of the total distributed, 119 responses were obtained, which represents 88.1% of the total distributed.

Table 1: Questionnaires administered /returned

Questionnaire	Number	Percentage (%)
Number distributed	150	100
Number received	119	79.3
No response	31	20.7

Table 2: Demographical information of the respondents

Qualification	Frequency	Percentage (%)
PhD	6	5.0
M.Tech / MSc	18	15.1
B.sc	68	57.1
HND	24	20.2
Total	119	100
Experience		
1-5 Years	59	49.6
6-10 Years	31	26.1
11- 15 Years	21	17.6
16-20 Years	2	1.7
> 20 years	6	5.0
Total	119	100
Designation		
Project managers	31	26.1
Resident builders	28	23.5
Architects	13	10.9
Quantity surveyors	15	12.6
Civil engineers	17	14.3
Contractor	8	6.7
Others	7	5.9
Total	119	100

4.2 Causes of stress in construction projects

Table 3: Main causes of job-stress in construction projects

Causes of stress	SD	MIS	Rank
Bullying by senior colleagues	0.66	1.45	25
Handling more than one project at a time	0.91	1.94	24
Conflict co-worker or labourer	1.03	3.42	19
Ambiguous deadline	0.96	3.21	23
Role ambiguity	1.22	3.25	22
Job complexity	1.15	3.81	2
Poor ventilation in site office	1.03	3.68	9
Too much noise on site	1.04	3.68	9
Poor lighting	1.22	3.76	5
Lack of safety outfit	1.10	3.74	7
Poorly design office space	1.11	3.67	11
Lack of privacy	1.24	3.71	8
Inadequate machinery and equipment	1.19	3.60	13
Resources constraint	1.09	3.37	21
Changes in organization level	1.06	3.76	5
Poor organizational structure	1.26	3.50	17
Inadequate staffing	1.01	3.38	20
Conflict with artesian	4.78	3.52	16
Poor relationship with superior	1.15	3.56	15
Lack of communication skill	1.12	3.58	14
Conflict with co-workers on site	1.16	3.77	3
Work over load	1.04	3.97	1
Unfortunate life event	1.07	3.63	12
Heath condition	1.18	3.43	18
Personal trait	1.13	3.77	3

In order to ascertain the causes of stress encounter by professionals in construction site, not less than 25 causes of stress were identified from literature. Respondents were asked to indicate the one mostly encounter during construction activities. The results obtained revealed that work overload with MIS of 3.97 is the most cause of job-stress in construction projects, followed by job complexity. To be precise, with the exception of bullying by senior colleagues and handling more than a project at a time, all other causes of stress identified in the literature were rated to be very significant by the participants of the study. This implies that 23 of the 25 causes of stress identified in the existing literature in the subject matter are the main causes of stress in construction projects. This is similar to findings of Aryal *et al.* (2017), Xing, *et al.* (2020) on the causes of fatigue among employees' during daily activities.

4.3 Impacts of stress in construction projects

In order to evaluate the impacts of stress on construction workers, nine parameters (impacts of stress) were identified from the literature. Respondents were then requested to indicate their agreement on the identified parameters. The outcomes of this section of the questionnaire study are presented in Table 4.

Table 4: Impacts of job-stress on construction workers

Stress impacts	SD	MIS	Rank
Abandonment of project	1.01	3.30	3
Delay in project delivery	0.77	2.68	7
Low productivity of workers	0.87	2.58	8
Negative impact on health of workers	0.96	2.94	6
Building failure due to bad design	0.95	3.39	2
Cost overrun	1.01	3.22	4
Death	1.05	3.42	1
Poor projects performance	0.85	3.02	5

It is obvious from the results presented in Table 4 that the greatest impact of stress on construction workers is death with a mean score of 3.42 followed by building failure due to bad design (MIS=2.39). This is synonymous to the opinion of Okafor and Okafor (2006) on the impact of stress on employees' in construction projects. In a nutshell, the results presented in

Table 4 show that virtually all the impacts of stress identified in the literature are highly significant factors. Hence, strategies that can be used to overcome stress in projects need to be continuously investigated by researchers across the globe.

4.4 Strategies for stress minimization in construction projects

Table 5 presents possible organizational strategies for stress minimization in construction projects.

Table 5: Stress minimization strategies

Possible stress minimization strategies	SD	MIS	RANK
Proper project management plans	0.86	2.83	10
Adequate funding	0.79	2.97	9
Encouraging decentralized organizational structure	0.83	2.98	8
Provision of machineries and equipment	0.90	3.02	7
Provision of conducive site office (well ventilated and adequate lighting)	0.90	3.24	5
Effective time management schedule	0.88	3.11	6
Employing enough staff to reduce workload	1.17	3.29	4
Provision of necessary safety gadgets	0.97	3.35	3
Encouraging effective interpersonal relationships / communication between the management and employees	1.18	3.40	1
Providing seminars and workshops for employees to expose them to new technologies in the construction industry	0.94	3.40	1

In order to establish the various organizational strategies that can be adopted to reduce workers stress in construction projects, 10 strategies were identified from the existing literature. Respondents were then requested to indicate the extent of their agreement on each strategy based on their experience. Encouraging effective interpersonal relationships/ communication between the management and employees and providing seminars and workshops for employees to expose them to new technologies in the construction industry were ranked first by the participants of the study, followed by provision of necessary safety gadgets. To be precise, the MIS of all the identified strategies are above 2.5 and can be adopted for stress reduction in construction projects (Digital Bridge Institute, 2018).

5.0 Conclusion and recommendations

Based on the findings of this study, it is clear that construction professionals experience work stress on a daily basis. It can also be concluded that workload, job complexity, and personal trait are the main causes of job-stress in construction projects. Death is the major impact of stress on construction workers. Other organizations impacts are projects delay/poor projects delivery, low productivity of workers, and abandonment of projects. For effective reduction of stress in construction projects, employees need for effective communication between management and workers. Construction firms also need to introduce workplace wellness schemes. Allow flexible time for workers and encourage effective interpersonal relationships between the management and employees.

Premised on the above conclusion, the study recommends that construction workers should embrace the use of software in project planning and management such as MS project planner, primavera project planner, Orion, and the use of Microsoft spreadsheet. Management should also ensure that workers are not overworked / overloaded with work and their roles in daily activities should be clearly stated. It is also advisable that site offices should be made comfortable and properly ventilated for effective flow of work. The study further recommends that further research should be conducted to determine the level of effectiveness of the identified strategies on stress reduction in construction projects.

ÖZET

Bu araştırma farklı kalsiyum (Ca) uygulamalarının pamukta verim, verim bileşenleri ve lif kalite özelliklerine etkisini belirlemek amacıyla 2021 yılında yürütülmüştür. Deneme tesadüf blokları deneme desenine göre 4 tekrarlamalı olarak yürütülmüş ve denemede 7 farklı kalsiyum uygulaması (Kontrol, Taraklanma Dönemi 100 cc/da, Taraklanma Dönemi 200 cc/da, Taraklanma Dönemi 400 cc/da, Çiçeklenme Dönemi 100 cc/da, Çiçeklenme Dönemi 200 cc/da, Çiçeklenme Dönemi 400 cc/da) yer almıştır. Denemede materyal olarak MAY 455 pamuk çeşidi ile kalsiyum kaynağı olarak Kalsiyum Nitrat çözeltisi kullanılmıştır. Araştırmada kalsiyum uygulamalarının incelenen özelliklerden koza ağırlığı ve koza kütlü ağırlığı üzerine önemli etkisinin olduğu ve uygulamalar arasında önemli istatistikî farklılıkların bulunduğu belirlenmiştir. İncelenen diğer özelliklerden kütlü pamuk verimi, lif verimi, bitki boyu, odun dalı sayısı, meyve dalı sayısı, ilk meyve dalı boğum sayısı, boğum sayısı, koza sayısı, kozada tohum sayısı, çırcır randımanı, ilk el kütlü oranı, yaprakta klorofil içeriği (SPAD), normalize edilmiş vejetasyon farklılık indeksi (NDVI değeri), lif inceliği, lif uzunluğu, lif kopma dayanıklılığı, lif kopma uzaması, lif üniformite oranı, kısa lif oranı, lif sarılık değeri, lif parlaklık değeri ve iplik olabirlik indeksi değerlerinin kalsiyum uygulamalarından etkilenmediği belirlenmiştir. Araştırmada en yüksek koza ağırlığı ve kütlü koza ağırlığı değerleri çiçeklenme döneminde 400 cc/da dozunda uygulanan Ca ile elde edilmiştir. Pamukta çiçeklenme döneminde 400 cc/da dozunda Ca uygulaması ile koza ağırlığı ve koza kütlü ağırlığının artırılabilceği sonucuna varılmıştır.

Anahtar Kelimeler: Kalsiyum, Kalsiyum Nitrat, Lif Kalitesi, NDVI, Pamuk, Verim

**THE EFFECT OF DIFFERENT APPLICATIONS OF CALCIUM ON YIELD AND
FIBER QUALITY CHARACTERISTICS IN COTTON**

ABSTRACT

This research was carried out to determine the effects of different calcium (Ca) applications on yield, yield components and fiber quality characteristics in cotton. The research was conducted in 2021 according to the randomized complete blocks design with 4 replications. In the experiment 7 different calcium treatment (Control, Squaring Period 100 cc/da, Squaring Period 200 cc/da, Squaring Period 400 cc/da, Flowering Period 100 cc/da, Flowering Period 200 cc/da, Flowering Period 400 cc/da) were applied. In the experiment, MAY 455 cotton variety was used as plant material and Calcium Nitrate solution was used as calcium source. In the study, it was determined that calcium applications had a significant effect on the boll weight and seed cotton boll weight, and it was determined that there were significant statistical differences between the applications. Among the other characteristics examined it was determined that seed cotton yield, fiber yield, plant height, number of monopodial branches, number of sympodial branches, number of first fruiting branches, number of nodes, number of bolls, number of seeds per boll, ginning percentage, first picking percentage, chlorophyll content in leaves (SPAD), normalized difference vegetative index (NDVI value), fiber fineness, fiber length, fiber strength, fiber elongation, fiber uniformity, short fiber index, fiber yellowness value, fiber reflectance value and spinning consistency index (SCI) were not affected by calcium applications. In the study, the highest boll weight and seed cotton boll weight values were obtained with Ca applied at a dose of 400 cc/da during the flowering period. It has been concluded that the boll weight and seed cotton boll weight can be increased with the application of 400 cc/da Ca application during the flowering period in cotton.

Keywords: Calcium, Calcium Nitrate, Fiber Quality, NDVI, Cotton, Yield

Giriş

Pamuk, dünya genelinde yaklaşık 33.7 milyon hektar alanda tarımı yapılan ve bu alandan yaklaşık 26 milyon ton lif üretimi sağlanan (UPK, 2020), dünyanın en önemli endüstri bitkilerinden biridir. Lifi ile tekstil, çiğidi ile yağ sanayine hammadde olması, küspesi ile hayvancılığın gelişmesine katkıda bulunması gibi asıl ve yan ürünleri ile birçok farklı sanayi kollarına ham madde sağlamakta, bu nedenle hem ekonomik hem de sosyal açıdan birçok ülkenin kalkınmasında önemli rol oynamaktadır.

Pamuk, dünyada pamuk kuşağı (Cottonbelt) olarak isimlendirilen ve kuzey yarımkürede 45°, güney yarımkürede 32° enlemleri arasında kalan bölgede yetişmektedir. Ülkemizde ise pamuk; Ege, Çukurova ve Güneydoğu Anadolu Bölgelerinde yaygın şekilde üretilmektedir. Ülkemizde 2021 yılında 432.279 ha alanda pamuk ekimi yapılmış, bu alanlardan 2.250.000 ton kütlü pamuk, 832.500 ton lif pamuk üretimi gerçekleştirilmiştir. Güneydoğu Anadolu Bölgesinde ise, 2021 yılında 261.989,7 ha alanda pamuk ekimi yapılmış, 1.324.004 ton kütlü pamuk 489.880 ton lif pamuk üretimi gerçekleştirilmiştir (TÜİK, 2022).

Dünya pamuk üretiminin neredeyse tamamı (% 99,5) ülkemizin 7. sırada yer aldığı 10 büyük pamuk üreticisi ülke tarafından gerçekleştirilmektedir; bunlar Hindistan, Çin, ABD, Brezilya, Özbekistan, Pakistan, Türkiye, Avustralya, Meksika ve Yunanistan olarak sıralanmaktadır. Dünya pamuk kullanımının da yine, % 85 gibi önemli bir kısmı ülkemizin 5. sırada yer aldığı 8 büyük pamuk tüketicisi ülke tarafından gerçekleştirilmekte ve bu ülkeler Çin, Hindistan, Pakistan, Bangladeş, Türkiye, Vietnam, Brezilya ve ABD şeklinde sıralanmaktadır (UPK, 2022). Ulusal Pamuk Konseyi verilerine göre, 2021 yılında, yaklaşık değerlerle tekstil sanayi 1 milyon 617 bin ton lif pamuk tüketmiştir. Bu ihtiyacın yüzde 40 kadarı yerli pamuktan, yüzde 60'ı ithal pamuktan sağlanmıştır. Türkiye bu dönemde 1 milyon 170 bin ton pamuk ithal etmiştir (UPK, 2022). Artan talebi ve iç tüketimi karşılamanın ve lif ithalatını azaltmanın tek yolu, pamukta verimi ve lif kalitesini arttırmak, verim kaybına neden olan çevresel stres koşullarını önlemektir. Öte yandan, sahip olduğumuz agro-ekolojik potansiyel yurt içi pamuk talebinin miktar ve kalite olarak daha büyük oranlarda yerli üretimle karşılanmasına olanak sağlamaktadır.

Bitki büyümesi ve gelişimi için gerekli makro besin maddelerinden olan kalsiyum, bitki hücre duvarının tamamlayıcı bir parçası olduğu için hücre duvarı yapısını düzenleyen bitki besin elementi olarak bilinmektedir (Bolat ve Kara, 2017). Kalsiyum iyonları, granülasyonu artırarak toprak strüktürünü geliştirir. Strüktürü iyi olan topraklardan daha çok ürün sağlanır. Toprak pH'sını ayarlar. Kalsiyum bitki besin maddelerinin alınmasında; bitki ve toprakta bulunan toksik maddelerin çökmesinde rol oynar. Kalsiyum bitkilerde kök salgısı üzerinde

etkilidir. Bitki dokularını donma-çözünme stresine karşı korur (Güneş ve ark., 2000). Bitkilerde protein oluşumunda ve karbonhidratların taşınmasında önemli rol oynar (Bolat ve Kara, 2017). Sürgün ucu ve kök ucu gibi büyüme noktalarının gelişimi için son derece önemli olan kalsiyum, bitki besin elementlerinin alınımında oluşan metabolik süreçlerde görev alan, hücrelerdeki anyon-katyon dengesini sağlamada etkili bir besin elementidir (Tucker, 1999; Karaman ve ark., 2012). Bitkinin büyümesi ve gelişmesi için mutlak gerekli besin elementlerinden kalsiyumun eksikliğinde, büyüme yerleri çoğunlukla öldüğünden bitkilerde yeni sürgünler meydana gelememekte ve bitkinin kök sistemi de zarar görmektedir (Kacar, 1984).

Kalsiyum bakımından fakir olan topraklarda az ürün elde edilir ve üründeki protein oranı çok azalır. Kalsiyum hücre duvarlarının yapı taşı olduğundan, noksanlığı durumunda hücre duvarları zayıflar ve dokular zarar görür. Ksilemden daha çok, floemden beslenen bitki dokuları etkilenir. Kalsiyum bitkilerde immobil olduğu için noksanlık belirtileri ilk önce genç yapraklarda başlar. Genç yaprakların kenarlarında ve uçlarında sararmalar meydana gelir, yaprak kenarları kıvrılır, iç damarlarda klorozlar meydana gelir. Yaprak uç yanıklığı adı verilen yaprak uçlarının kahverengiye dönmesi kalsiyumun noksanlığında görülmektedir. Fazla dallanmış, kısa ve kahverengi kökler oluşur. Ayrıca kök ve sürgün uçları gelişiminde azalma görülür. Bitki gövdesi zayıflar, sürgün uçlarında bükülme ve kırılmalar, büyümede bodurlaşma, iç dokularda lekeler ve çürümeler meydana gelir. Anormal meyve ve tomurcuk oluşumu, çiçek ve tomurcuklarda dökülmeler görülür. Meyvelerde çatlamalar oluşur ve dolayısıyla meyve raf ömrü kısalmıştır (Karaman ve ark., 2012).

Pamukta kalsiyum noksanlığında büyüme ucu ölür, yan dallanmalar meydana gelir. Bu yan dalların yaprakları küçük ve kepe benzeri kıvrımlıdır. Genç yapraklarda nekrotik lekeler ortaya çıkar (Güneş ve ark., 2000). Son yıllarda yapılan çalışmalarda kalsiyumun bitki dokularını donma-çözünme stresine karşı koruduğu, yeterli kalsiyumun olması durumunda bitkilerin hastalıklara karşı daha dayanıklı olduğu, hücre duvarındaki kalsiyum pektatların bitkileri mantari ve bakteriyel enfeksiyonlara karşı korumada önemli olduğu bildirilmiştir (Güneş ve ark., 2000).

Stomaların açılma ve kapanmasında rol aldığı için kuraklık ve susuzluk etkisine karşı bitkileri koruduğu bildirilmektedir (Karaman ve ark., 2012). Kalsiyum, tuz stresinde bitki açısından olumlu etkiye sahip bir elementtir. Yapılan çalışmalarda yüksek dozda dışsal kalsiyum uygulamasının, hücre zarının Na⁺ iyonuna karşı geçirgenliğini azalttığı ve bu şekilde sodyumun pasif alınımıyla hücre içinde ve bitkide birikmesinin önlendiği bildirilmiştir (Hoffmann ve ark., 1989; Whittington ve Smith, 1992). Bu koşullar altında Ca²⁺ birçok fizyolojik ve hücresel olayı düzenleyerek stresten korunma sağladığı için önem kazanmaktadır

(Hirschi, 2004; Tang ve ark., 2006). Kalsiyumun Na⁺ alımını engellediği ve böylece tohumun çimlenmesi üzerindeki olumsuz etkisini azalttığı rapor edilmiştir (Zehra ve ark., 2012).

Yapılan bazı çalışmalar Ca eksikliğinin pamuk liflerinin uzamasını engellediği, pamuk liflerinin uzamasında kalsiyumun önemli rol oynadığını açığa çıkarmıştır (Guo ve ark., 2017). Bitkilerin çeşitli kısımlarında kalsiyum konsantrasyonu değişmektedir. Pamuk bitkisindeki kalsiyum konsantrasyonunun, olgun pamuk bitkilerinde 90 ile 160 kg ha⁻¹ arasında değiştiği, ancak tohum ve liflerde daha düşük olduğu belirtilmiştir (Ahmed ve ark., 2020).

Bu çalışma kalsiyumun farklı uygulamalarının pamukta verim, verim bileşenleri ve lif kalite özelliklerine etkisini belirlemek amacıyla yürütülmüştür.

Materyal ve Metod

Siirt Üniversitesi Ziraat Fakültesi deneme alanında 2021 yılında tesadüf blokları deneme desenine göre 4 tekrarlamalı olarak yürütülen bu çalışmada bitkisel materyal olarak özel sektörden temin edilen MAY 455 pamuk çeşidi ile kalsiyum kaynağı olarak sıvı formda Kalsiyum Nitrat Çözeltisi kullanılmıştır. Kalsiyum nitrat çözeltisi içeriğinde Suda Çözünür Kalsiyum Oksit (CaO) % 15, Toplam Azot (N) % 8, Nitrat Azotu (NO₃ - N) ise % 8' dir.

MAY 455 Pamuk Çeşidi

Erkenci bir çeşittir. Yaprakları az tüylüdür. Çepel oranı çok düşüktür. Konik bitki yapısına sahip olup kozalar ana gövdeye yakındır. 5 çenetli koza oranı % 60-70'tir. Adaptasyon kabiliyeti çok yüksektir. Çorak arazilerde çimlenme ve boylanma kabiliyeti oldukça iyidir. Yüksek verim kapasitesine sahiptir. Kuraklığa dayanımı yüksek, Verticillium wilt ve Fusarium wilt hastalıklarına karşı toleranslıdır. Güçlü bitki yapısı ile makineli hasada uygundur. Çırcır randımanı % 44- 46, lif inceliği 4,4 - 4,8 mic, lif uzunluğu 31-32 mm, lif mukavemeti 32-35 g/tex arasında değişmektedir (Anonim, 2014).

Şekil 1. Deneme yılı olan 2021 yılı ile uzun yıllara ait ortalama sıcaklık, minimum ve maksimum sıcaklık değerleri

Şekil 2. Deneme yılı olan 2021 yılı ile uzun yıllara ait ortalama yağış ve nispi nem miktarı

Denemenin yürütüldüğü alan sonbaharda pullukla derin olarak sürülmüş, ilkbaharda ise kültivatörle yüzlek olarak işlenmiş, ekim öncesi 2 kez tapan çekilerek ekime hazır hale getirilmiştir. Ekim işlemleri 13 Nisan 2021 tarihinde mibzer ile yapılmıştır. Her parsel 6 m uzunluğunda 4 sıradan oluşturulmuştur. Sıra arası 70 cm sabit tutulmuş, sıra üzeri mesafe ise 15-20 cm olacak şekilde seyreltme yapılmıştır. Her bir parsel genişliği 2,8 m olup, bloklar arasında 2 m boşluk bırakılmıştır. Deneme alanının toprak analizleri yapılmış ve bitkinin ihtiyaç duyduğu gübre miktarı belirlenmiştir. Belirlenen toprak özellikleri Çizelge 1’de verilmiştir.

Çizelge 1. Deneme arazisinin toprak özellikleri

Analiz Adı	Birim	Analiz Sonucu	Değerlendirme
pH		7,90	Orta derecede alkali
EC	dS/m	0,37	Tuzsuz
Kireç	%	1,58	Kireçsiz
Bünye	%	59,4	Killi-Tımlı
Organik Madde	%	0,92	Çok az
Alınabilir Fosfor	kg/da	5,59	Az
Alınabilir Potasyum	kg/da	27,28	Orta

**** Siirt Üniversitesi, Bilim ve Teknoloji Uygulama ve Araştırma Merkezi Laboratuvarı, Siirt**

Denemeye toplam 14 kg da⁻¹ saf N ile 8 kg da⁻¹ saf P₂O₅ verilmiş, ekim esnasında 8 kg⁻¹ da N ile 8 kg da⁻¹ P₂O₅ 20-20-0 kompoze gübre formunda banda, geriye kalan azot (6 kg da⁻¹ N) ise ilk sulama öncesinde üre formunda uygulanmıştır. Kalsiyum uygulamaları motorlu sırt pülverizatörü yardımı ile yaprağa püskürtme şeklinde uygulanmıştır. Kalsiyum uygulamaları, bitki gelişiminin taraklanma döneminde ve çiçeklenme döneminde olmak üzere 100 cc, 200 cc ve 400 cc dozlarında uygulanarak, kontrol ile kıyaslanmıştır. Denemede 7 farklı uygulama (Kontrol, Taraklanma Döneminde, 100 cc/da, Taraklanma Döneminde, 200 cc/da, Taraklanma Döneminde, 400 cc/da, Çiçeklenme Döneminde, 100 cc/da, Çiçeklenme Döneminde, 200 cc/da, Çiçeklenme Döneminde, 400 cc/da) yer almıştır.

Denemede tüm bakım işlemleri gerektiği dönemde yapılmıştır. Denemede 4 kez el, 3 kez makine çapası yapılmıştır. Deneme alanı karık usulü sulama yöntemine göre 8 kez sulanmıştır. Sulamalarda bitkinin su ihtiyacı göz önünde bulundurularak, sulama işlemi çiçeklenme öncesi dönemde başlamış ve % 10 koza açma döneminde son verilmiştir. Bitki gelişim dönemi boyunca zararlı kontrolü periyodik olarak yapılmış, taraklanma dönemi öncesi ve taraklanma döneminde thrips zararlısı görülmüştür. Thrips zararlısına karşı SP 20 (%20 Acetamiprid) suda çözünen toz insektisit yapraklara püskürtülerek uygulanmıştır. Hasat elle yapılarak iki defada tamamlanmıştır. Birinci el hasat 14 Eylül 2021 tarihinde, ikinci el hasat ise 2 Ekim 2021 tarihinde yapılmış, birinci ve ikinci elde toplanan ürünler ayrı ayrı tartılarak, toplam verime dönüştürülmüştür. Lif kalite analizleri GAP Uluslararası Tarımsal Araştırma ve Eğitim Merkezi Laboratuvarında HVI aleti yardımı ile belirlenmiş, denemeden elde edilen tüm veriler, JUMP istatistik program yardımı ile analiz edilmiş ve gruplamalar LSD (0.05)' e göre yapılmıştır.

Bulgular ve Tartışma

Araştırmada incelenen tarımsal özelliklere ilişkin elde edilen ortalama değerler Çizelge 2 ve Çizelge 3'de, lif teknolojik özelliklere ilişkin ortalama değerler ise Çizelge 4'de verilmiştir.

Çizelge 2. İncelenen özelliklerden kütlü pamuk verimi, lif verimi, bitki boyu, odun dalı sayısı, meyve dalı sayısı, ilk meyve dalı boğum sayısı ve boğum sayısı bakımından elde edilen ortalama değerler

Uygulama	Kütlü Pamuk Verimi (kg /da)	Lif Verimi (kg /da)	Bitki Boyu (cm)	Odun Dalı Sayısı (ad/bitki)	Meyve Dalı Sayısı (ad/bitki)	İlk Meyve Dalı Boğ. Sayısı (ad/bitki)	Boğum Sayısı (ad/bitki)
1. Kontrol	369,14	170,67	66,55	2,30	11,35	6,35	17,70
2.Taraklanma Dönemi 100 cc/da	348,20	157,73	68,20	2,75	11,75	7,10	18,85
3.Taraklanma Dönemi 200 cc/da	360,24	162,65	69,35	2,45	12,10	7,15	19,25
4.Taraklanma Dönemi 400 cc/da	379,80	176,62	66,35	2,70	10,45	7,25	17,70
5.Çiçeklenme Dönemi 100 cc/da	340,27	157,76	66,35	2,40	11,45	7,50	18,95
6.Çiçeklenme Dönemi 200 cc/da	401,96	185,20	65,95	2,40	11,05	7,45	18,50

**Aynı harfle gösterilen ortalamalar arasındaki farklar 0.05 düzeyinde önemli değildir.

Kütlü Pamuk Verimi: Kütlü pamuk verimi değerlerinin 340,27 ile 403,07 kg/da arasında değiştiği ve denemenin genel ortalamasının 371,80 kg/da olduğu Çizelge 2’de görülmektedir. En yüksek kütlü pamuk veriminin 7. uygulamadan (Çiçeklenme Dönemi 400 cc/da) elde edildiği (403,07 kg/da) ve bunu 6. uygulamanın (Çiçeklenme Dönemi 200 cc/da) takip ettiği (401,96 kg/da), en düşük kütlü pamuk veriminin ise 5. uygulama olan (Çiçeklenme Dönemi 100 cc/da) kalsiyum uygulamasından (340,27 kg/da) elde edildiği izlenebilmektedir. Kalsiyum uygulamalarının kütlü pamuk verimine önemli bir etkisinin olmadığı görülmektedir. Kalsiyum uygulamaları ile elde edilen en yüksek kütlü pamuk verimi ile kontrol kıyaslandığında 33,93 kg/da bir artışın görüldüğü, ancak bu farklılığın istatistiki olarak önemli olmadığı belirlenmiştir.

Zeng ve ark. (2022) kalsiyumun kütlü pamuk verimini % 9.3 ile 19.4 oranında arttırdığını, Tsialtas ve ark. (2016), yaprak Ca konsantrasyonunun, hem kütlü pamuk verimi hem de lif verimi ile güçlü korelasyon gösterdiğini belirtmişlerdir. Mısır pamuklarına yapraktan 60 ppm dozunda uygulanan Ca ile pamuk veriminin arttığı belirtilmiştir (Sawan ve ark., 2001; Sawan, 2014). Kalsiyumun kütlü pamuk verimini arttırdığını bildiren Sawan ve ark. (2001), Elms ve ark. (2001) ile topraklardaki kalsiyum içeriğinin kütlü pamuk verimini olumlu yönde etkilediği Aydın ve ark. (2012) tarafından bildirilmekte ve çalışmada elde edilen bulgular ile

paralellik göstermemektedir. Bu durum denemede kullanılan materyal, kullanılan pamuk çeşidi, uygulama zamanı ve yöntemleri ile iklim koşulları gibi farklılıklardan kaynaklanabilmektedir.

Lif Verimi: Lif verimi değerlerinin 157,73 ile 185,20 kg/da arasında değiştiği görülmektedir (Çizelge 2). En yüksek lif pamuk veriminin 185,20 kg/da ile 6. uygulamadan (Çiçeklenme Dönemi 200 cc/da) elde edildiği ve bunu 7. uygulamanın (Çiçeklenme Dönemi 400 cc/da) takip ettiği (183,84 kg/da), en düşük lif veriminin ise (157,73 kg/da) 2. uygulamadan (Taraklanma Dönemi 100 cc/da) elde edildiği izlenebilmektedir. Kalsiyum uygulamalarının lif pamuk verimi üzerine önemli bir etki yaratmadığı görülmüştür. Harris (2002) kalsiyum uygulaması ile lif veriminde önemli bir istatistiki farklılık belirlemediğini bildirmiş, elde edilen bulgular ile araştırma sonuçları paralellik göstermiştir. Heidari ve ark. (2022) Ca seviyesinin 1,5 g/L düzeyine kadar lif verimini arttırdığını, 3,0 g/L düzeyinde ise lif veriminin azaldığını bildirmişlerdir.

Bitki Boyu: Bitki boyuna ilişkin değerlerin, 65,95 ile 69,35 cm arasında değiştiği; denemenin genel ortalamasının 67,22 cm olduğu izlenmektedir. En yüksek bitki boyu değerinin 3. uygulama olan Taraklanma Döneminde 200 cc/da dozunda kalsiyum uygulamasından elde edildiği (69,35 cm), en düşük bitki boyu değerinin ise 6. uygulama olan Çiçeklenme Döneminde 200 cc/da kalsiyum uygulamasından elde edildiği (65,95 cm); uygulamalar arasındaki farklılıkların ise istatistiki olarak önemli olmadığı izlenebilmektedir. Kalsiyum uygulaması ile bitki boyu değerlerinde önemli bir farklılığın elde edilemediği belirlenmiştir. Heidari ve ark. (2022)'nin kalsiyumun bitki boyu üzerine önemli bir etkisinin olmadığını bildiren bulguları ile araştırma sonuçları paralellik göstermiştir. Rethwisch ve ark. (2007), DPL449BR pamuk çeşidinde kalsiyumun bitki boyu üzerine önemli etkisinin olduğunu bildirmişlerdir. Benzer bulgular Ahmad ve ark. (2003) ile Goud ve Kumar (2021) tarafından da bildirilmiştir.

Odun Dalı Sayısı: Çizelge 2'den odun dalı sayısı değerlerinin, 2,15 ile 2,75 adet/bitki arasında değiştiği ve denemenin genel ortalamasının 2,45 adet/bitki olduğu izlenebilmektedir. Aynı tablodan, en yüksek odun dalı sayısının 2. uygulama olan Taraklanma Döneminde 100 cc/da kalsiyum uygulamasından elde edildiği (2,75 adet/bitki), en düşük değer ise 7. uygulama olan Çiçeklenme Döneminde 400 cc/da kalsiyum uygulamasından elde edildiği (2,15 adet/bitki); ancak uygulamalar arasındaki farklılıkların istatistiki olarak önemli olmadığı izlenebilmektedir. Ahmad ve ark. (2003)'nin Ca uygulaması ile pamukta çimlenmeden 2 hafta sonra maksimum yan dal sayısına ulaşıldığını belirten bulguları ve Güneş ve ark. (2000)'nin pamukta kalsiyum noksanlığında yan dallanmaların meydana geldiğini belirten bulguları ile araştırma bulgularının farklılık gösterdiği görülmektedir.

Meyve Dalı Sayısı: Meyve dalı sayısı değerlerinin, 10,45 ile 12,10 adet/bitki arasında değiştiği ve denemenin genel ortalama değerinin 11,31 adet/bitki olduğu, ancak uygulamalar arasındaki farklılıkların önemli olmadığı görülmektedir. Meyve dalı sayısı bakımından taraklanma döneminde 400 cc/da dozunda uygulanan kalsiyum uygulamasından (4. uygulama) en düşük değer (10,45 adet/bitki) elde edildiği, en yüksek değer ise taraklanma döneminde 200 cc/da dozunda uygulanan kalsiyum uygulamasından (3. uygulama) elde edildiği (12,10 adet/bitki) izlenebilmektedir. Ananthkrishnan ve Backiyavathy (2020), kalsiyumu diğer besin elementleri ile karışım halinde uyguladıkları çalışmada en yüksek meyve dalı sayısını 12,9 adet/ bitki ile elde ettiklerini bildirmişlerdir.

İlk Meyve Dalı Boğum Sayısı: İlk meyve dalı boğum sayısı değerlerinin, 6,35 ile 7,50 adet/bitki arasında değiştiği; denemenin genel ortalamasının 7,16 adet/bitki olduğu izlenebilmektedir. İlk meyve dalı boğum sayısı bakımından en düşük değer (6,35 adet/bitki) kontrol uygulamasından (1. uygulama) elde edildiği, Çiçeklenme Döneminde 100 cc/da dozunda uygulanan kalsiyum uygulamasından (5. uygulama) ise en yüksek değer elde edildiği (7,50 adet/bitki); ancak uygulamalar arasındaki farklılıkların istatistiki olarak önemli olmadığı izlenebilmektedir. Rethwisch ve ark. (2007)'nin, kalsiyum içeren 7 farklı uygulama ile yürüttükleri çalışmada bu özellik bakımından önemli farklılıklar elde ettiklerini bildiren bulguları ile araştırma sonuçları farklılık göstermektedir. Bu durum çalışmadaki materyal ve yöntem farklılığından kaynaklanabilmektedir.

Boğum Sayısı: Boğum sayısı değerlerinin, 17,70 ile 19,25 adet/bitki arasında değiştiği ve denemenin genel ortalamasının 18,47 adet/bitki olduğu izlenebilmektedir. Boğum sayısı bakımından en düşük değer (17,70 adet/bitki) kontrol uygulaması (1. uygulama) ile Taraklanma Döneminde 400 cc/da dozunda uygulanan kalsiyum uygulamasından (4. uygulama) elde edildiği, Taraklanma Döneminde 200 cc/da dozunda uygulanan kalsiyum uygulamasından (3. uygulama) ise en yüksek değer elde edildiği (19,25 adet/bitki); fakat uygulamalar arasındaki farklılıkların istatistiki olarak önemli olmadığı görülmektedir. Boğum sayısı yönünden elde edilen bulgular Rethwisch ve ark. (2007)'nin bulguları ile farklılık göstermiştir.

Çizelge 3. İncelenen özelliklerden koza sayısı, kozada tohum sayısı, koza ağırlığı, koza kütlü ağırlığı, çırçır randımanı, ilk el kütlü oranı, SPAD değeri ve NDVI değeri bakımından elde edilen ortalama değerler ve oluşan gruplamalar

Uygulama	Koza Sayısı (ad/bitki)	Kozada Tohum Say (ad.)	Koza Ağırlığı (gr)	Koza Kütlü Ağırlığı (gr)	Çırçır Rand. (%)	İlk El Kütlü Oranı (%)	SPAD değeri (%)	NDVI Değeri

LSD (0.05)	Ö.D	Ö.D	0,46*	0,42*	Ö.D	Ö.D	Ö.D	Ö.D

**Aynı harfle gösterilen ortalamalar arasındaki farklar 0.05 düzeyinde önemli değildir.

Koza Sayısı: Çizelge 3’den koza sayısı değerlerinin, 8,60 ile 9,75 adet/bitki arasında değiştiği görülmektedir. En önemli verim komponenti olarak bilinen koza sayısı bakımından en düşük değer (8,60 adet/bitki), Taraklanma Döneminde 200 cc/da dozunda uygulanan kalsiyum uygulamasından (3. uygulama) elde edildiği, Çiçeklenme Döneminde 100 cc/da dozunda uygulanan kalsiyum uygulamasından (5. uygulama) ise en yüksek değer (9,75 adet/bitki); ancak uygulamalar arasındaki farklılıkların istatistiki olarak önemli olmadığı izlenebilmektedir. Goud ve Kumar (2021), yapraktan uygulanan kalsiyumun verim ve verim parametrelerinde artışa yol açtığını bildirmişlerdir. Ananthakrishnan ve Backiyavathy (2020), farklı makro besin elementlerini karışım halinde bitkilere uyguladıkları çalışmada en yüksek koza sayısını kalsiyumun yer aldığı uygulamadan elde ettiklerini; Ahmad ve ark. (2003) en yüksek koza sayısı değerini kalsiyum uygulamasından 8 hafta sonra elde ettiklerini bildirmişlerdir.

Kozada Tohum Sayısı: Kozada tohum sayısı 26,38 ile 30,08 adet arasında değişmiştir. Taraklanma döneminde 100 cc/da kalsiyum uygulaması (2. uygulama) ile en düşük değer (26,38 adet) elde edildiği, çiçeklenme döneminde 400 cc/da kalsiyum uygulaması (7. uygulama) ile en yüksek değer (30,08 adet); ancak uygulamalar arasındaki farklılıkların istatistiki olarak önemli olmadığı izlenebilmektedir.

Koza Ağırlığı: Koza ağırlığı değerlerinin, 5,87 ile 6,82 gr arasında değiştiği; uygulamalar arasında % 5 önem düzeyinde istatistiki farklılıkların bulunduğu ve denemenin genel

ortalamasının 6,42 gr olduğu görülmektedir. Çiçeklenme Döneminde 400 cc/da dozunda kalsiyum uygulaması (7. uygulama) ile en yüksek değerin (6,82 gr) elde edildiği; Taraklanma Döneminde 100 cc/da kalsiyum uygulaması (2. uygulama) ile en düşük koza ağırlığı değerinin (5,87 gr) elde edildiği izlenebilmektedir. Çalışmada kalsiyum uygulamaları ile pamukta koza ağırlığının etkilendiği belirlenmiştir. Kalsiyum konsantrasyonlarının koza ağırlığının artmasında önemli rol oynadığını bildiren Sawan ve ark. (1997) ile araştırma bulguları benzerlik göstermektedir. Ananthakrishnan ve Backiyavathy (2020), koza ağırlığının kalsiyum uygulaması ile en yüksek düzeye ulaştığını bildirmişlerdir.

Koza Kütlü Ağırlığı: Koza kütlü ağırlığı değerlerinin, 4,50 ile 5,25 gr arasında değiştiği; uygulamalar arasında % 5 önem düzeyinde istatistiki farklılıkların bulunduğu ve denemenin genel ortalamasının 4,92 gr olduğu görülmektedir. Çiçeklenme Döneminde 400 cc/da kalsiyum uygulaması (7. uygulama) ile en yüksek değerin elde edildiği (5,25 gr); Taraklanma Döneminde 100 cc/da kalsiyum uygulaması (2. uygulama) ile en düşük değerin (4,50 gr) elde edildiği izlenebilmektedir. Çalışmada incelenen koza kütlü ağırlığı değerlerinin kalsiyum uygulamalarından önemli derecede etkilendiği görülmektedir.

Çırcır Randımanı: Çırcır randımanı değerlerinin, % 45,20 ile 46,50 arasında değiştiği ve denemenin genel ortalamasının % 45,90 olduğu görülmektedir. Taraklanma Döneminde 200 cc/da kalsiyum uygulaması ile (3. uygulama) çırcır randımanı bakımından en düşük değer (% 45,20) elde edilmiştir. Taraklanma Döneminde 400 cc/da kalsiyum uygulaması (4. Uygulama) ile en yüksek değerin elde edildiği (% 46,50); ancak uygulamalar arasındaki farklılıkların istatistiki olarak önemli olmadığı izlenebilmektedir.

İlk El Kütlü Oranı: İlk el kütlü oranı değerlerinin, % 91,49 ile 93,62 arasında değiştiği, denemenin genel ortalamasının % 92,87 olduğu görülmektedir. Taraklanma Döneminde 200 cc/da kalsiyum uygulaması (3. uygulama) ile en düşük ilk el kütlü oranı değerinin (%91,49) elde edildiği, Taraklanma döneminde 400 cc/da kalsiyum uygulaması ile (4. uygulama) en yüksek değerin elde edildiği (% 93,62); ancak uygulamalar arasındaki farklılıkların istatistiki olarak önemli olmadığı izlenebilmektedir. Kalsiyumun bitkide açan koza sayısını artırarak erkenciliği arttırdığını bildiren Sawan ve ark. (1997) ile farklı sonuçların elde edildiği görülmektedir.

Klorofil İçeriği (SPAD değeri): Yaprakta klorofil içeriğine ilişkin ortalama değerlerin, % 46,68 ile 52,35 arasında değiştiği ve denemenin genel ortalamasının % 49,31 olduğu belirlenmiştir. Çiçeklenme Döneminde 200 cc/da dozunda uygulanan kalsiyum uygulaması (6. uygulama) ile yaprakta klorofil içeriği bakımından en düşük değerin (% 46,68) elde edildiği, taraklanma döneminde 100 cc/da dozunda uygulanan kalsiyum uygulaması (2. uygulama) ile

en yüksek değerin (% 93,62) elde edildiği; ancak uygulamalar arasındaki farklılıkların istatistiksel olarak önemli olmadığı izlenebilmektedir.

Heidari ve ark. (2022), kalsiyum uygulaması ile pamukta klorofil içeriği değerinin arttığını, ancak bu farklılığın istatistiksel olarak önemli olmadığını belirtmişlerdir. Yao ve ark. (2022), kalsiyum uygulaması ile klorofil içeriğinin arttığını saptamışlardır. Rethwisch ve ark. (2007), pamukta kalsiyum içeren yedi yaprak gübresi uyguladıkları çalışmada kontrole kıyasla yaprak klorofil seviyesinin en az %7,4 oranında arttığını ve en yüksek klorofil içeriği değerinin (%21,3) artışla Kalsiyum Metalosate®'de kaydedildiğini bildirmişlerdir. Klorofil içeriği üzerine Ca'un önemli olduğu ve yüksek kalsiyumun (300 mg L^{-1}) yaprakta klorozu arttırdığı, bununla birlikte Mg alınımı için rekabete yol açtığı, Ca ve Mg arasında antagonistik bir etkileşimin olduğu bazı araştırmacılar tarafından bildirilmiştir (Ho ve ark., 1999; Paiva ve ark., 2008, Hao ve Papadopoulos, 2004).

Normalize Edilmiş Vegetasyon Farklılık İndeksi (NDVI değeri): Normalize edilmiş vegetasyon farklılık indeksi olan NDVI değerinin 0,70 ile 0,75 arasında değiştiği; denemenin genel ortalama değerinin ise 0,72 olduğu görülmektedir. NDVI değeri bakımından en yüksek değerin (0,75) ile taraklanma döneminde 200 cc/da kalsiyum uygulamasından (3. uygulama) elde edildiği belirlenirken, en düşük değerin (0,70) kontrol uygulamasından elde edildiği; ancak uygulamalar arasındaki farklılıkların istatistiksel olarak önemli olmadığı görülmektedir.

Çizelge 4. İncelenen lif kalite özelliklerine ilişkin ortalama değerler

Uygulama	Lif İncel. (mic)	Lif Uzun. (mm)	Lif Kopma Dayan. (g/tex)	Lif Kopma Uzaması (%)	Lif Ünlümler Oranı (%)	Kısa Lif Oranı (%)	Lif Sarılık Değeri (+b)	Lif Parlaklık Değeri (Rd)	İplik Olab. İndeksi (SCI)

** Aynı harfle gösterilen ortalamalar arasındaki farklar 0.05 düzeyinde önemli değildir.

Lif Teknolojik Özellikler: Lif kalite özelliklerinden lif inceliği, lif uzunluğu, lif kopma dayanıklılığı, lif kopma uzaması, lif üniformite oranı, kısa lif oranı, lif parlaklık değeri, lif sarılık değeri ve iplik olabilirlik indeksi bakımından kalsiyum uygulamaları arasında önemli bir istatistiksel farklılığın bulunmadığı Çizelge 4'den izlenmektedir. Kalsiyumun liflerde en düşük seviyede bulunan makro element olduğu, ancak lif gelişimi için önemli bir element olduğu, Ca eksikliğinin pamuk liflerinin uzamasını engellediği, pamuk liflerinin uzamasında kalsiyumun önemli rol oynadığı, ancak kalsiyumun yüksek dozlarının lif kopma uzamasını olumsuz yönde etkilediği, K ve Ca arasında lif kopma uzaması açısından bir bağlantının bulunduğu Guo ve ark., 2017 tarafından bildirilmiştir. Taliercio ve Haigler (2011), önceki araştırmalarda liflerin anthesis'ten yaklaşık 1 gün sonra Ca biriktirdiğini, bunda lif gelişiminde kalsiyumun önemli bir rol oynadığının göstergesi olduğunu, kalsiyum konsantrasyonunun azalması ile lif kopma uzamasının arttığını belirtmişlerdir.

Sonuç ve Öneriler

Çalışmada kalsiyum uygulamalarının koza ağırlığı ve koza kütlü ağırlığı üzerine önemli etkisinin olduğu ve uygulamalar arasında önemli istatistiksel farklılıkların bulunduğu, incelenen diğer özelliklerden kütlü pamuk verimi, lif verimi, bitki boyu, odun dalı sayısı, meyve dalı sayısı, ilk meyve dalı boğum sayısı, boğum sayısı, koza sayısı, çırçır randımanı, ilk el kütlü oranı, kozada tohum sayısı, yaprakta klorofil içeriği (SPAD değeri) ve NDVI değerinin (normalize edilmiş vejetasyon farklılık indeksi) kalsiyum uygulamalarından etkilenmediği saptanmıştır. Lif kalite kriterlerinin kalsiyum uygulamalarından etkilenmediği ve uygulamalar arasında önemli bir farklılığın bulunmadığı belirlenmiştir.

Araştırmada çiçeklenme döneminde 400 cc/da kalsiyum uygulaması ile en yüksek koza ağırlığı ile en yüksek koza kütlü ağırlığı değerleri elde edilmiştir. Çalışmada pamukta çiçeklenme döneminde 400 cc/da kalsiyum uygulaması ile en yüksek koza ağırlığı ve koza kütlü ağırlığı değerlerinin elde edilmesi bu uygulamanın önerilebileceğini göstermektedir.

Ancak çalışmada kalsiyumun verim üzerine istatistiksel anlamda bir etkisinin görülmemiş olması kalsiyumun etkisini belirlemek için daha fazla araştırmaya ihtiyaç duyulduğu anlaşılmaktadır. Yapılacak çalışmaların farklı çeşitler ile yürütülmesi, bitki gelişiminin farklı dönemlerinde ve dozlarda kalsiyumun uygulanması ve diğer besin elementleri ile interaksiyonlarında araştırılmasının uygun olacağı anlaşılmaktadır.

Gaziantep University, Faculty of Economics and Administration, Gaziantep

E-mail: arslan@gantep.edu.tr

ÖZET

Yeşil ekonomi, çevresel kaygılar ile sürdürülebilir kalkınmayı odağına alan, ekonomik büyüme ve kalkınmada doğanın korunmasının önemini vurgulayan iktisadi bir bakış açısıdır. Ekonomik faaliyetlerin olumsuz çevresel ve ekolojik etkilerini dikkate alan, 21.yüzyılda kalkınma anlayışına getirilmiş çevreci bir perspektif olarak ifade edilebilir. 6 Şubat 2023 tarihinde Kahramanmaraş'ın Pazarcık ilçesinde 7,7 şiddetindeki ve aynı tarihte Ekinözü ilçesinde 7,6 şiddetindeki depremler yaklaşık 350.000km²'lik alanda hasara yol açmıştır. Türkiye nüfusunun %16'sını oluşturan yaklaşık 14 milyon kişiyi doğrudan etkilenmiştir. Nisan 2023 itibariyle resmi verilere göre 50binden fazla kişi vefat etmiş, 107binden fazla kişi bu olay neticesinde yaralanmıştır. Depremi oluş biçimi ve yıkıcı etkisinin multidisipliner bakış açısı ile çok sayıda bilimsel araştırmayı gerekli kıldığı düşünülmektedir. Bu çalışmada amaç, yeşil ekonomi bakış açısıyla ilgili olayın ön değerlendirmesine ilişkin bir perspektif oluşturmaktır. Depremden doğrudan 11 il etkilenmiştir. Yaklaşık 387bin binadan 51bini yıkılmış veya acil yıkılacak olarak ilgili bakanlıkça tespit edilmiştir. 618bin kişi bölgeden tahliye uçuşları ile tahliye edilmiştir. Diğer ulaşım yolları da dikkate alındığında bölgeden yaklaşık 2milyon kişi geçici veya kalıcı olarak ayrılmıştır. Bölgede kalan kişilerin büyük kısmı geçici konaklama alanlarında (çadır ve konteynırlarda) konaklamaktadır. Bu geçici konaklama alanlarında ısınma şekli çoğunlukla kömür sobası olup bunun CO₂ salınımının hesaplanması için yakın gelecekte açıklanacak verilere ihtiyaç duyulmaktadır. 2021 GSYİH hesaplamalarından gelirler yöntemine göre bölge Türkiye'nin tarım, orman ve balıkçılık gelirine %15 oranında katkı sağlamaktadır. Bölgenin tarım ürünlerinin ihracattaki payı ise aynı yıl için yaklaşık 4,8milyar dolardır. Bölgede artan CO₂ salınımı, yıkılan ve yıkılacak binalardan doğaya karışan zararlı kimyasallar ve dolayısıyla bölgenin tarım alanlarının göreceği olası zarar dikkate alındığında, bölgenin yeşil ekonomi bakış açısıyla yaşadığı tehlikenin oldukça büyük olduğu düşünülmektedir. Bölgenin karşı karşıya olduğu durum yalnızca ulusal değil, aynı zamanda küreseldir. Olası risklerin bütüncül bakış açısıyla değerlendirilmesi, gerekli önlemlerin alınması gerektiği düşünülmektedir.

Anahtar Kelimeler: Kahramanmaraş, Deprem, Yeşil Ekonomi, Tarım

**AN ASSESSMENT FROM A GREEN ECONOMY PERSPECTIVE;
KAHRAMANMARAŞ-CENTERED EARTHQUAKES**

ABSTRACT

Green economy is an economic perspective that focuses on environmental concerns and sustainable development and emphasizes the importance of protecting nature in economic growth and development. It can be expressed as an environmentalist perspective brought to the understanding of development in the 21st century, taking into account the negative environmental and ecological impacts of economic activities. On February 6, 2023, a 7.7 magnitude earthquake in Pazarcık district of Kahramanmaraş and a 7.6 magnitude earthquake in Ekinözü district on the same date caused damage in an area of approximately 350,000 km². Approximately 14 million people, 16% of Turkey's population, were directly affected. According to official data as of April 2023, more than 50,000 people have died and more than 107,000 people have been injured as a result of this event. It is thought that the way the earthquake occurred and its devastating impact necessitates a multidisciplinary perspective and numerous scientific researches. The aim of this study is to create a perspective on the preliminary assessment of the event from a green economy perspective. 11 provinces were directly affected by the earthquake. Out of approximately 387,000 buildings, 51,000 have been identified by the relevant ministry as collapsed or in urgent need of demolition. 618 thousand people were evacuated from the region by evacuation flights. Considering other transportation routes, approximately 2 million people have left the region temporarily or permanently. Most of the people staying in the region are staying in temporary accommodation areas (tents and containers). Heating in these temporary accommodation areas is mostly coal stoves, for which CO₂ emissions need to be calculated based on data to be released in the near future. According to 2021 GDP calculations using the incomes method, the region contributes 15% to Turkey's agriculture, forestry and fisheries income. The share of the region's agricultural products in exports is approximately 4.8 billion dollars for the same year. Considering the increasing CO₂ emissions in the region, the harmful chemicals released into nature from the buildings that have been and will be demolished, and the potential damage to the region's agricultural lands, the danger that the region faces from a green economy perspective is considered to be quite great. The situation facing the region is not only national but also global. It is thought that possible risks should be evaluated from a holistic perspective and necessary measures should be taken.

Keywords: Kahramanmaraş, Earthquake, Green Economy, Agriculture

GİRİŞ

İktisadın bilim haline gelişinin temelini hazırlayan Adam Smith'in Ulusların Zenginliği eserinden bu zamana, sermaye daha çok kazanma, emek daha insani koşullarda çalışarak geçimlik ücretten daha fazlasını hak edebilme gayesini sürdürmüştür. Ancak iktisat yazınında sıkça vurgulanan, dört üretim faktöründen emek ve sermaye faktörleri bu derece öne çıkarken, doğal kaynak faktörünün göz ardı edilmiş olması yahut yeterince dikkate alınmamış olması günümüzde, gelecek yıllara ilişkin yoğun ekolojik kaygılara sahip olmamıza neden olmuştur.

Yeşil ekonomi kavramı bu noktada ortaya çıkmış olup ekonomilerin büyüme gayelerinin yanına, sürdürülebilir büyüme gayesini eklemiştir. Zira ekonomik zenginliklerden de doğal zenginliklerden de yararlanmak sadece bugünkü neslin değil aynı zamanda gelecek nesillerin de en doğal hakkı olacaktır.

Bu çalışmada, 6 Şubat 2023 tarihinde Türkiye'de yaşanan ve aynı anda oldukça büyük bir coğrafyayı etkileyerek tarihi bir doğal afete dönüşen Kahramanmaraş merkezli depremlerin, erken görünüm sonuçlarından yola çıkarak, bölgenin yeniden inşasında yeşil ekonomi perspektifine ilişkin bir bakış açısı sunulacaktır.

Bu amaçla öncelikle yeşil ekonomi kavramsal çerçevede incelenecek, ardından genel kabul görmüş yeşil ekonomi prensipleri ve endeksinden bahsedilecek, Kahramanmaraş merkezli depremlerin demografik, ekonomik ve ekolojik sonuçlarına yer verilerek bu sonuçların telafisi sürecinde yeşil ekonomi perspektifinden nasıl politikalar geliştirilebilir konusunda öneriler sıralanacaktır.

KAVRAMSAL ÇERÇEVE

Yeşil Ekonomi Kavramı ve Tarihi

Çalışmanın bu kısmında yeşil ekonomi kavramının ifade ettiği anlam ve kısa tarihçesi incelenecektir. Ekonomi kavramının anlamına ilişkin kullanılan en yaygın tanım olan “kıt kaynaklar ile sonsuz ihtiyaçların giderilmesi” ifadesi esasen özünde yeşil ekonomi kavramının manasını da barındırmaktadır. Yeşil ekonomi, kaynakların kıtlığının göz önüne alınarak sürdürülebilir kaynak kullanımını ile ekonomide kalkınmaya ulaşılmasını ifade etmektedir (Kuşat, 2013: 4897). Sürdürülebilirliği, bir başka ifade ile mevcut tüm kaynakların mümkün olduğunca korunarak geleceğe aktarılmasını ve bu aktarımda aynı zamanda kalkınmayı odağına alan yeşil ekonomi, sıklıkla ekolojik denge, üretimin pozitif dışsallığı, küresel dejenerasyon ve aşırı kaynak kullanımı ifadelerinden yararlanır. Ekonomik kalkınmayı doğa odaklı bir yaklaşım ile ele alan bu kavram için, sanayileşmeden bu yana yalnızca üretimi ve büyümeyi hedefleyen

görüşlerden ayrılarak, ekonomik kalkınmada ekolojik bir soluk ifadesini kullanmak yanlış olmayacaktır.

Yeşil düşünce, farklı bir ifade ile doğayı merkezine alan düşünce temeline dayanan yeşil ekonomi kavramının ortaya çıkışını hazırlayan olaylar dizisini kronolojik olarak; 1972 yılı Roma Kulübü “Büyümenin Sınırları” raporu, 1987 yılı World Commission on Environment and Development (Dünya Çevre ve Kalkınma Komisyonu) tarafından hazırlanan Brundtland Report (Ortak Geleceğimiz Raporu), 1992 yılı Rio Dünya Çevre ve Kalkınma Konferansı’nda katılımcı ülkelerce imzalanan “Gündem 21” isimli anlaşma, 2012 yılı Rio+20 Zirvesi “İstedığımız Gelecek” raporları olarak sıralamak mümkündür (Özçağ ve Hotunluoğlu, 2015: 307 ; Kuşat, 2013: 4899). Yeşil ekonomi kavramının evraksal kronolojik sıralamasının yanında, kavramın ortaya çıkışını hazırlayan olaylar dizisini ise, azalan doğal kaynaklar, nesli tükenen canlılar, kirlenen temiz su kaynakları, çoğalan doğal afetler, artan gelir dağılımı adaletsizliği, derinleşen bölgesel yoksulluk gibi negatif sosyo-ekonomik sonuçlar olarak ifade etmek mümkündür (Kılıç, 2012: 202). Kavram, salt bir söylem olmaktan öte durumdadır. Ülkelerin, “yenilenebilir enerji, düşük karbonlu ulaşım, enerji verimli binalar, gelişmiş atık yönetimi, iyileştirilmiş tatlı su temini, sürdürülebilir tarım, ormancılık ve balıkçılık” sektörlerine yoğunlaşmasını ve sermaye gelişimini bu sektörler üzerinden elde edilmesini vurgulamaktadır (Ağcakaya ve Kaya: 2022: 514).

Yeşil Ekonomi Prensipleri

Rio+20 zirvesi ile, daha önce kavramsallaştırılan ancak içerik tanımlaması daha yüzeysel kalan yeşil ekonomi kavramı, somut temellere oturtulmuştur. Bu prensipler 12 tane olup şu şekilde sıralanmaktadır;

Adil refah dağılımı,

Ekonomik eşitlik ve adalet,

Nesiller arası eşitlik,

İhtiyati (tedbir) yaklaşımı,

Gelişim hakkı,

Dışsallıkların içselleştirilmesi,

Uluslararası işbirliği,

Uluslararası sorumluluk,

Bilgi, katılım ve hesap verebilir sorumluluk,

Sürdürülebilir tüketim ve üretim,

Sürdürülebilir kalkınma, yeşil ekonomi ve yoksulluğun azaltılması için stratejik, koordineli ve entegre planlama,

Geçiş süreci (Stakeholder Forum, 2012).

Sıralanan prensipler, konunun uluslar üstü bağlamda, hem bugünü hem de geleceği dikkate alarak sosyo-ekonomik düzlemde ele alındığını göstermektedir. Elbette prensiplerin ilan edilmiş olması, tümünün eş zamanlı ve eksiksiz uygulandığı anlamını taşımaktan uzaktır. Bu noktada sorumluluğun politika yapıcılarda, uygulayıcılarda ve geleceğin arzın devamlılığında mı yoksa ekolojik sistemin devamlılığında mı mevcut olduğu ayrımını yapabilen bireylerde olduğu da açıktır.

LİTERATÜR ARAŞTIRMASI

Literatür araştırması önce yeşil ekonomi ardından Kahramanmaraş merkezli depremler olarak iki bölümde ele alınmıştır.

Yeşil Ekonomi Kavramı Literatür Araştırması

Yeşil ekonomi kavramını odağına alan çalışmaların her geçen yıl arttığı görülmektedir. Konu hakkında öne çıkan bazı çalışmalara, önce uluslararası ardından ulusal bazda, aşağıdaki tabloda yer vermeye çalışılmıştır.

Tablo 1. Yeşil Ekonomi Literatür Taraması

Yazar, Yıl	Araştırma Konusu
Tienhara, K. (2014).	Yeşil ekonomiye, yeşil kapitalizm rolü atfindan yola çıkarak, ekolojik modernleşmeyi irdelemektedir.
Teixeira, vd. (2015).	Amerika ve Çin ekonomilerini dikkate alarak “kişi başına düşen karbondioksit salınımı, içme suyuna erişim ve halk sağlığı, insani gelişmişlik endeksi ve yenilenebilir enerjinin toplam enerji tüketimindeki oranı” değişkenlerinden yeşil ekonomi endeksi oluşturmuşlardır.
Nahman, vd. (2016).	Yeşil ekonomi endeksi oluşturma gayesi ile 196 ülkeyi kapsayan bir araştırma hazırlamışlardır.
Vilasboas ve Teixeira (2017)	Brezilya'nın yeşil ekonomi endeksini oluşturma üzerine çalışmışlardır.
Schlör, vd. (2017).	Almanya için hazırlanan çalışmada su, enerji ve gıda sektörleri aracılığıyla yeşil endeks araştırması yapılmıştır.
Kararach, vd. (2018).	Afrika ülkelerini baz aldıkları çalışmada alt kategorili ve çok değişkenli bir yeşil büyüme endeksi oluşturmuşlardır.
M. Battaglia, E. Cerrini, N. Annesi, (2018)	“Yeşil ekonomi” ve “yeşil işler” arasındaki ilişkiye odaklanan çalışmada yeşil işler ve yeni yeşil iş modelleri ile endüstriyel dönüşüm arasındaki bağlantı araştırılmıştır.
D'Amato, D. ve Korhonen, J. (2021)	Sürdürülebilir kalkınmada yalnızca yeşil ekonomiyi değil, aynı zamanda döngüsel ekonomiyi ve biyo-ekonomiyi birbirine entegre ederek, kavramların içerik eksikliklerinin birbirilerini tamamlayacağı görüşünü öne sürmektedir.
Hao, X., vd. (2023)	Yeşil ekonomi kavramını güncel gelişmelerin gerisinde bırakmayarak, dijitalleşmenin kavrama etkilerine çalışmalarında yer vermişlerdir.
Kaypak, Ş. (2011).	Çalışmasında yeşil ekonomi kavramına giden yolda, sürdürülebilir bir çevre için çözüm arayışı gayesini vurgulamaktadır.
Kılıç, S., (2012).	Kalkınmanın sürdürülebilirliğinde ekolojik değişkenleri vurgulayan çalışması ile ulusal literatüre kavramsal anlamda önemli katkılar vermiştir.
Kuşat, N. (2013)	Yeşil ekonominin Türkiye için avantaj ve dezavantajları çalışmada değerlendirilmiştir.
Pekizoğlu, F. (2016).	Yeşil ekonominin tüm tabanlara yayılması için “yeşil pazarlama sistematığı, yeşil tüketici, yeşil üretim ve bu ikisini birbirine tanıttacak bir yeşil etiket” uygulamasının Türkiye’de ihtiyacını ortaya koymaktadır.
Demirtaş, I. (2017).	Çalışmada “yeşil ekonomi politikalarının durgunluk ve iklim değişikliği gibi çevresel ve ekonomik sorunları çözmedeki rolü” incelenmektedir.
Bilgili, M. Y. (2017).	Ekonominin yanında ekolojik ve sosyal boyutlarıyla sürdürülebilir kalkınmanın ifade ettiği anlamları incelemiştir.
Al, İ. (2019).	Türkiye için yeşil ekonomi endekslerini incelediği çalışmasında, “çevresel performansta son yıllarda olumlu gelişmeler olmakla birlikte, çevresel göstergelerin yeşil ekonomi performansına katkısı nispeten sınırlı” olduğu görüşünü vurgulamıştır.
Acci, Y. , Akarsu, G. & Cefri, R. (2023).	Yeşil büyüme ve ekonomik büyüme ilişkisini AB ülkelerini baz alarak ampirik bir analiz ile değerlendirmişlerdir.

Kahramanmaraş Merkezli Depremler Literatür Araştırması

Tablo 2’de ise Kahramanmaraş merkezli depremlerin çoğunlukla ekonomik etkilerine ve hatta tespiti daha hızlı olabilen finansal etkilerine odaklanan ulusal çalışmalara yer verilmiştir. Bu çalışma hazırlanırken, depremin üzerinden henüz yaklaşık iki buçuk ay geçmiş olmasına karşın, ulusal literatürde konu hakkındaki çalışmaların sayısında hızlı artış ivmesi dikkat çekicidir. Zira literatürde sadece ekonomi bakış açısıyla değil, başta mühendislik alt dallarından tıp bilimine, eğitimden sosyolojiye çok sayıda alanda konu hakkındaki çalışmaların hızla yayımlanışı

dikkate değerdir. Buna karşın henüz uluslararası yazında konu hakkında çalışmanın olmayışı da tespit edilmiştir.

Tablo 2. Kahramanmaraş Merkezli Depremler-Ekonomik Etkileri Literatür Taraması

Yazar, Yıl	Araştırma Konusu
Say, S. ve Doğan, M. (2023)	Depremin hisse senedi piyasasına etkisini inceledikleri ampirik çalışmalarında “analiz sonucunda olay günü [0] ve olay sonrası birinci [+1] ve ikinci [+2] gün ortalama anormal getiri elde edildiği” sonucuna ulaşmışlardır.
Gürsoy, S., vd. (2023)	Depremin finansal piyasalar üzerindeki etkilerinin incelendiği çalışmada “BIST Gıda, İçecek, BIST GMYO, BIST Madencilik, BIST Bankalar, BIST Aracı Kurumlar, BIST Enf. Teknoloji, BIST KOBİ Sanayi, BIST Tekstil, Deri” incelenmiş ve depremin sektör etkilerinin farklı oluşuna dikkat çekilmiştir.
Ozbilgin, M., vd. (2023)	Depremin sosyal etkilerini dikkate aldıkları çalışmada, “delil temelli, etik ve kapsayıcı afet yönetimine yönelik sosyal politikaların oluşumuna yardım edecek bir analiz” ortaya çıkardıklarını ifade etmişlerdir.
Kanat, E., & Tetik, N., (2023)	Borsa İstanbul’un deprem sürecinde kapanması ve ilgili dönemdeki işlem hacimlerini incelemişlerdir.
Tetik, N. ve Öner, A. (2023)	Depremin bölgedeki KOBİ’lere olası ekonomik ve finansal etkilerini incelemiş, covid döneminde alınan önlemleri baz alarak KOBİ’lerin devamlılığı için politika önerilerini sıralamışlardır.
Tetik, N. ve Akbulut, İ. İ. (2023)	İhracat üzerine deprem etkilerini araştırmış, ihracat yapan firmalara yönelik uygulanabilecek spesifik politika önerilerini vurgulamışlardır.
Koç, A. (2023)	Sosyo-ekonomik açıdan ele aldığı deprem olayının ardından kısa, orta ve uzun vadede alınacak kararlarına ilişkin önerilerini belirtmiştir.
Doker, A. C. ve Yiğit, A. G. (2023)	Sürdürülebilir kalkınma için deprem bölgesinin alt yapısından yeniden refahın inşasına çeşitli alt başlıklarda politika önerilerinde bulunmuşlardır.
Yiğit, M. (2023)	Davranışsal iktisat perspektifinden depremi değerlendirdiği çalışmasında, davranışsal iktisadın argümanlarını kullanarak politika önerilerini ortaya koymaktadır.
Gül, K. & Akyol, H. (2023).	Kırsal kalkınmaya depremin etkisini inceledikleri çalışmalarında afetlerin ulusal ve kırsal kalkınmadaki rolünün göz ardı edilmeyecek derecede önemli olduğunu vurgulamışlardır.
Özüdoğru Aydın, B., (2023)	Depremi geniş bir bakış açısıyla ele almış, ekonomi biliminin enflasyondan kamu maliyesine çok sayıda alt başlığını dikkate alarak konuya ilişkin değerlendirmelerini sunmuştur.
Şen, S. (2023)	Çalışmasında depremin ekonomiye etkisini makro göstergeler dahilinde değerlendirmiştir.

TÜRKİYE’NİN YEŞİL EKONOMİDE MEVCUT DURUMU

Yeşil ekonomi, salt ekonomik büyüme elde etmeyi değil aynı zamanda çevresel sürdürülebilirliği tahsis edebilme olgusunu ortaya çıkarmaktadır (Yıldız, 2021:2). Bunu tahsis ederken yeşil ekonomi ilkelerinin uygulanma düzeyleri global bazda ülkelere bir yeşil ekonomi karnesi sahibi olma imkanı sağlamaktadır. Dual Citizen isimli kurum tarafından oluşturulan “Global Green Economy Index (GGEI)” (küresel yeşil ekonomi endeksi) küresel ölçekte kabul görmüş bir yeşil ekonomi puanlaması sunmaktadır. “160 ülkenin yeşil ekonomi performansını 18 gösterge üzerinden” ölçen endeks ülkeleri hem 2005’ten günümüze ilerleme performansları hem de küresel anlamda sürdürülebilirlik hedefine ulaşmak için katetmeleri gereken yol ölçeğinde değerlendirmektedir (Dual Citizen, 2023a).

2022 yılında 2005-2020 yılları arasını kapsayacak sonuçlar yayınlanmış olup yayınlanan sonuçlara ilişkin özet Tablo 3’de yer almaktadır.

Tablo 3. Küresel Yeşil Ekonomi Endeks Sonuçları (2005-2020)

Ülke Bazlı İlerleme			Küresel Hedefe Mesafe			Toplam (Genel Değerlendirme Sonucu)		
Ülke	Puan	Sıralama	Ülke	Puan	Sıralama	Ülke	Puan	Sıralama
Ürdün	0,780	1	İsveç	0,888	1	İsveç	0,799	1
Uruguay	0,698	2	Norveç	0,863	2	İsviçre	0,781	2
İsrail	0,686	3	Danimarka	0,829	3	Norveç	0,747	3

Puanlama (yüzdeler hesaplaması) 0 ile 1 arası olup ideal olan tüm ülkelerin 1 tam puana ulaşmasıdır. Tablo 3’te yer alan ilk kısım ülkelerin bir önceki dönemlere göre yeşil ekonomi prensipleri üzerinden ilerleme durumlarını ifade etmektedir. 160 ülke arasında mevcut durumundan daha iyi koşullara erişme bazında Ürdün birinci, Uruguay ikinci, İsrail ise üçüncü

sırada yer alırken Türkiye 130.sırada yer almaktadır. Bir başka ifade ile bir önceki rapor dönemi ile yayınlanan son rapor arasındaki süreçte Türkiye ilerleme bazında 0,426 puan almıştır.

Tablo 3'ün ikinci kısmında küresel hedefe ulaşma bazında bir sıralama yapılmış olup, global ölçekte ilk sırada İsveç, ardından Norveç ve Danimarka yer alarak küresel hedefe en yakın ülkeleri oluşturmuşlardır. Küresel hedefe uzaklıkta Türkiye 136.sırada yer alırken, küresel yeşil ekonomi hedefine en uzak ülkeler Arabistan, Türkmenistan ve Umman olarak görülmektedir.

Tablonun son kısmında ise hem ilerleme hem de küresel hedefe mesafe bazında yapılan değerlendirmelerin genel toplamını ifade eden bir sıralama verilmiş olup, İsveç, İsviçre ve Norveç dünyanın yeşil ekonomi puanı en yüksek ülkeleri olarak görülmektedir. Türkiye burada ise 140.sırada yer alırken liste sonunu 158.sırada Türkmenistan, 159.sırada Arabistan ve 160.sırada Umman oluşturmaktadır.

İlgili raporda burada tabloda yer verilen sıralamaların dışında Türkiye'nin OECD ülkeleri arasında 38. (son) sırasında yer aldığı, G20 ülkeleri arasında 15.sırada yer aldığı, 14 MENA ülkesi arasında ise 7.sırada olduğu görülmektedir (Dual Citizen, 2023b).

Bu rapor küresel bir prestijden çok daha öte, Türkiye'nin hem insani, hem ekolojik hem ekonomik olarak gelecek nesillerinin karşı karşıya kalacağı olası sorunların bir ön raporu olarak değerlendirilmelidir. Elde edilen rapor sonuçları, Türkiye'ye gelecek için bugünden alınması gereken ekolojik önlemlerin elzemliğini ifade eder niteliktedir.

KAHRAMANMARAŞ MERKEZLİ DEPREMLER VE ETKİLERİ

Tarih boyunca yer kabuğu çeşitli ölçeklerde depremler yaşamıştır. Yer kabuğu sarsıntısı olarak tanımlanan deprem, doğal afet statüsünde tanımlanan, büyüklük ve şiddetine göre yıkıcı etkiye sahip olabilen doğal bir olaydır (TDK, 2023).

Resmi verilere göre, 06.02.2023 tarihinde "Türkiye saati ile 04:17'de ve 13:24'te merkez üssü Kahramanmaraş'ın Pazarcık ve Elbistan ilçeleri olan Mw7.7 (odak derinlik=8,6km) ve Mw7.6 (odak derinlik=7km) büyüklüklerinde iki deprem meydana gelmiştir" (SBB, 2023).

Kahramanmaraş Merkezli Depremlerin Demografik Etki Alanı

Depremden etkilenen iller, resmi açıklamalara göre alfabetik olarak, Adana, Adıyaman, Diyarbakır, Elazığ, Gaziantep, Hatay, Malatya, Kahramanmaraş, Şanlıurfa, Kilis ve Osmaniye'dir. Esasen depremin etkisi ülke sınırlarını da aşmış, Türkiye'nin sınır komşusu Suriye'de de yıkıcı bir etki bırakmıştır.

Türkiye’de depremde etkilenen illerin toplam nüfusu, yaklaşık 14milyon olup bu sayı ülke nüfusunun %16,4’üne tekabül etmektedir. Eklemek gerekir ki bölgede buna ek olarak 1.7milyon “geçici koruma kapsamında ikamet eden göçmen” yaşamakta, bu Türkiye’de kayıtlı yabancıların %36,48’sine denk gelmekte olup toplamda yaklaşık 15.7milyon insan depremde doğrudan etkilenmiş durumdadır (Sağiroğlu, vd., 2023: 3).

Bu çalışma hazırlanırken bölgede deprem nedeniyle vefat edenlerin sayısının 50binden fazla olduğu, yaralananların sayısının ise 107bini geçtiği açıklanmıştır.

Bölgenin Türkiye geneli istihdam oranı içerisindeki payı %13,3 olup depremde önce ilgili illerde toplam 3.8milyon kişi kayıtlı istihdam nüfusu içerisinde yer almaktaydı (SBB, 2023).

Bölgede yaşam çoğunlukla çadır ve konteynır gibi geçici konaklama merkezlerinde sürmektedir. Yine bu çalışma hazırlanırken Nisan 2023 itibariyle açıklanan son bilgilere göre, “deprem bölgesinde 345 çadırkent ve 305 konteyner kent” kurulmuş olup “2.6 milyon kişinin çadır kentlerde, 79 bine yakın kişinin ise konteyner kentlerde yaşadığı” açıklanmıştır (OCHA, 2023).

Kahramanmaraş Merkezli Depremlerin Ekonomik Etki Alanı

Literatürde afetlerin ekonomik etkileri kısa, orta ve uzun olmak üzere üç grupta incelenmektedir. Kısa vadeli ekonomik etkiler, yaşanan can ve mal kayıpları ile, ilk aşamada yapılan sağlık, ulaşım, alt yapı ve iletişim harcamalarını, orta vadeli etkiler deprem bölgesindeki iş gücü ve kira gibi muhtelif gelir kayıplarını, uzun vadeli etkiler ise dış ticaret, enflasyon, kur gibi değişkenleri kapsamaktadır (Karancı, vd., 2011: 36 & Şahin ve Kılınç, 2016: 34).
