Afetlerin ekonomik etkilerine ilişkin bir diğer sınıflandırma, birincil etki, ikincil etki ve üçüncü etki şeklindedir. Birincil etki depremin (afetin) hemen ardından “kamu malvarlığı, ürün stoğu, sermaye stoğu, alt yapı ve nüfus üzerindeki ekonomik etki” başta olmak üzere her türlü kamu hizmetinin olumsuz etkilenmesinin yanında sanayi sektöründe ilk etapta meydana gelen kayıplar ile konutlarda meydana gelen hasarları içermektedir (Altun, 2018: 11). İkincil etkiler, depremin üzerinden ortalama bir süre geçmesinin ardından makro ekonomik değişkenler üzerinde meydana gelen olumsuz etkiler ile sosyal ve psikolojik yıkıma uğrayanları içeren etki grubudur (Altun, 2018: 13).

Bu kısım ve devamında Türkiye Cumhuriyeti Cumhurbaşkanlığı Strateji ve Bütçe Başkanlığı (SBB) tarafından Mart 2023'te "SBB Deprem Sonrası Değerlendirme Raporu" ismiyle yayınlanan ve bu süreçteki en detaylı sayısal verileri içerdiği düşünülen rapordan yararlanılacaktır. Bölge ekonomisinin gidişatına yön verecek birincil etken, bir başka ifade ile kısa vadede ilk harcama yapılması gerekli alan konut sektörüdür. İlgili rapora göre;

"Bölgedeki toplam bina sayısı yaklaşık 2,6 milyondur. Söz konusu bina stokunun yaklaşık yüzde 90'ını mesken, yüzde 6'sını işyerleri ve yüzde 3'ünü kamu binaları oluşturmaktadır. Depremden etkilenen 11 ildeki konut sayısı 2022 yılı itibarıyla 5,6 milyon düzeyinde olup Türkiye genelindeki toplam konut stoku içindeki payı yüzde 14,05 düzeyindedir."

Türkiye Cumhuriyeti Çevre ve Şehircilik Bakanlığı'nın Mart 2023'te yaptığı açıklamaya göre, bahsi geçen 2.6milyon binadan 1.7milyonuna hasar tespit çalışması yapılmıştır. Bunlardan yaklaşık 860bin bina hasarsız raporu almıştır. Yine yaklaşık olarak 431bin bina az hasarlı, 40bin bina orta, 180bin bina ağır hasarlı, 35bin bina yıkık, 17bin bina acil yıkılacak olarak tespit edilmiştir (ÇŞİDB, 2023). İlgili bakanlığın orta hasarlı binaların da yıkılacağını açıklamasının ardından deprem bölgesinde kullanılamayacak durumda olan toplam bina sayısının yaklaşık 272bin olduğu görülmektedir. Aynı açıklamada 272bin binanın yaklaşık 818bin bağımsız bölüme (daireye/bireysel konuta) tekabül ettiği belirtilmektedir. Vurgulamak gerekir ki bu sayılar, ilgili tarihte henüz durum tespiti yapılamamış olan yaklaşık 900bin binayı (297bin bağımsız bölümü) içermemektedir.

İnşaat Mühendisleri Odası (İMO) ve ÇŞİDB ortak çalışmasıyla her yıl resmi gazetede yayımlanarak ilan edilen inşaatlarda minimum metrekare maliyeti tarifesine göre, 2023 yılında apartman tipi konutlarda (IV.Sınıf-A Grubu ve yapı yüksekliği 30,5m'den az) metrekare maliyeti 6.825TL olarak ilan edilmiştir (İMO, 2023). Yeniden inşası gerekli olan 818bin bağımsız bölümün her birinin ortalama 100metrekare yapılacağı varsayılırsa, toplam maliyetin yaklaşık 558.3milyar TL olacağı anlamını taşımaktadır. Bu tutar Türkiye'nin 2022 GSYİH'nın yaklaşık %3,72'sine eş değerdir. Yeniden vurgulamak gerekir ki bu maliyete az hasarlı binaların onarım maliyetleri ile henüz tespiti yapılamamış binaların olası yeniden inşa veya onarım maliyetleri dahil değildir. Bu nedenle, bölgenin yeniden inşası için ortaya çıkacak maliyetin 2022 GSYİH'sının %3,72'sinden daha fazla olacağı düşünülmektedir.

Bu hesaplamanın yanında SBB'nin deprem raporu dahilinde yaptığı maliyet çalışmasına da yer vermekte fayda olduğu düşünülmektedir. Tablo 4'te ilgili maliyet kalemleri yer almaktadır.

Tablo 4. Deprem Bina Hasar Maliyetleri

Hasar	Milyar TL	Milyar Dolar
Kullanılamaz Hale Gelen Konutları Yeniden İnşa Maliyeti	1.032	54,7
Kullanılamaz Hale Gelen Ahırları Yeniden İnşa Maliyeti1	3	0,2
Kullanılamaz Hale Gelen Ticarethaneleri Yeniden İnşa Maliyeti	39	2
Az Hasarlı Konutlar için Onarım Yardım	12,8	0,7
Kullanılamaz Hale Gelen Konutlardaki Eşya Maliyeti	58,5	3,1
Toplam Hasar	1.145,3	60,7
Enkaz Kaldırma ve Temizleme Maliyeti	29,8	1,6
Ağır Hasarlı, Acil Yıkılacak, Yıkık, Orta Hasarlı Konutlar için	6,5	0,3
Hane Halklarına Ödeme	25	1,3
Geçici Barınma	40,5	2,1
Konaklama ve İaşe	40,5	2,1
Genel Toplam	1.247,1	66

Kaynak: SBB, 2023.

Az hasarlı konutlar için tabloda yer alan maliyet hane başına verilen 10binTL'yi ifade etmekte olup enkaz kaldırma maliyeti ise yalnızca konut statüsündeki yapıların enkaz kaldırma maliyetlerini içermektedir. Tablodaki veriler dikkate alındığında 1.247,1 milyar TL'nin 2022 GSYİH'nın yaklaşık %8,3'üne tekabül etmektedir. 350bin kilometrekarelik bir alanın yeniden inşasının söz konusu olduğu bu doğal afet sonucunda, ekonomik kayıp da göz önüne alınırsa, ekolojik kaygılara düşmemek olanaksız görünmektedir.

Bölgede alt yapının aldığı zararlar sonucu oluşan tahmini maliyetler ise SBB'nin ilgili raporundan doğrudan alıntılanmış olup Tablo 5'te yer almaktadır.

Tablo 5. Bölgenin Tahmini Alt Yapı Onarım Maliyetleri

Alt Kalem	Birim	Miktar	Maliyet* (TL)	Veri Kaynağı
İçme Suyu İsale Hattı	km	169	1.595.000.000	DSİ
İçme Suyu Arıtma Tesisi	m ³ /gün	135.000	25.000.000	DSİ
Su Deposu	m ³	10.000	50.000.000	DSİ
İçme Suyu İshale Hattı	Km	185	2.118.000.000	DSİ
İçme Suyu Arıtma Tesisi	Adet	2	1.765.000.000	İlbank
Su Deposu	Adet	23	112.900.000	İlbank
İçme Suyu Şebekesi	Km	488	1.405.000.000	İlbank
Kanalizasyon Şebekesi	Km	1.842	6.262.000.000	İlbank
Atıksu Arıtma Tesisi	Adet	7	1.595.000.000	İlbank
Pompa İstasyonu	Adet	5	51.000.000	İlbank
İçme Suyu Şebekesi	Km	241	29.000.000	İl Özel İdaresi
Kaptaj Yapımı	Adet	5	800.000	İl Özel İdaresi
Su Deposu	Adet	22	71.000.000	İl Özel İdaresi
Toplam			15.080.700.000TL	

Kaynak: SBB, 2023.

Tablo 5, bölgenin içme suyu, atık su, kanalizasyon şebekesi gibi temel ve insani alt yapı hizmet ihtiyaçlarının aldığı zararı ortaya koymaktadır. “İçme suyu ve kanalizasyon altyapısını sağlayan tesisler çoğunlukla yerin altında gömülü olduğundan bu yapılarda hasar tespitinin yapılması oldukça zor” olup hasarlar yalnızca ilgili veri kaynağı kurum tarafından ihbar edilen durumların toplamını oluşturmakta ve 2022 ihale tutarları ile maliyetlendirilmiştir (SBB, 2023: 63). Bu hali ile alt yapının yeniden onarım maliyeti 15.1milyar TL olarak görülmektedir.

Bunlara ek olarak,

Şehir içi yol ve kaldırım niteliğindeki ulaşım altyapısının 1.188km’inde hasar olduğu ve yeniden yapım maliyetinin 3.350.628.582TL olduğu,

Belediye hizmet binaları ile araçlarının aldığı çeşitli hasar düzeyleri sonucu toplamda yaklaşık 75.335.000TL,

Belediye sosyal tesislerinin çeşitli hasar düzeylerine göre yeniden onarım maliyetlerinin yaklaşık 1.244.706.695TL,

Belediyelerin kent mobilyaları, istinat duvarları, köy yolu, bağlantı ve grup yolu hasar maliyetinin yaklaşık 179.319.070TL,

Belediye sınırlarındaki altyapı ve üretim tesislerinin onarım maliyetinin yaklaşık 303.919.024TL

Demiryollarında meydana gelen hasarların tahmini maliyetinin 17,4milyar TL, demiryolu araçlarında 19,6milyon TL, bölgede depremden önce inşası başlayan ancak depremle orta düzeyde hasar alan yüksek hızlı tren hattının ise 260milyonTL onarım maliyeti olduğu, böylece toplamda demiryolu hasarlarının yaklaşık 17.679.600.000TL,

Bölgede yer alan Kahramanmaraş, Adıyaman, Malatya ve Hatay havalimanlarında yaklaşık 3.300.000.000TL,

Denizyolu ulaşımına ilişkin tesislerde ise yaklaşık 38.000.000TL'lik hasar olduğu raporlanmıştır (SBB, 2023: 71-79).

Bu başlıkta sıralanan konut, alt yapı, ulaşım ve belediye sorumluluk alanlarındaki hasarların toplam maliyetinin; 1.288.352.208.371TL, bir başka ifade ile 1.29trilyon TL'dir. Bu genel toplam 2022 GSYİH'nin %8,59'üne tekabül etmektedir.

Bu çalışmanın kapsamı gereği yer verilemeyen ancak depremin ekonomik etki alanı içerisinde yer alan bölgedeki gıda ve sağlık hizmetleri ihtiyacı sonucu ortaya çıkan maliyetler hesaplamalara dahil edilmemiştir.

Kahramanmaraş Merkezli Depremlerin Ekolojik Etki Alanı

Bölgenin tarım, hayvancılık ve ormancılık sektöründeki son durumu bu başlık altında değerlendirilecektir. 2021 GSYİH hesaplamalarından gelirler yöntemine göre bölge Türkiye'nin tarım, orman ve balıkçılık gelirine yaklaşık %15,3 oranında katkı sağlamaktadır (TÜİK, 2022). Bölgenin tarım ürünlerinin ihracattaki payı ise aynı yıl için yaklaşık 4,8milyar dolardır (TİM, 2023).

Deprem bölgesi Türkiye'nin orman varlığının yaklaşık %11'ini, ağaç servetinin %6'sını ve ağaç büyüme oranı olan yıllık artımın %7'sine, ayrıca su ürünleri üretiminin yaklaşık %12'sine sahiptir (TOB, 2023).

Deprem nedeniyle bölgede;

8.241 büyükbaş, 64.260 küçükbaş, 42.000 baş kanatlı hayvanın öldüğü, 701.000 civcivin telef olduğu, 5.756 arı kovanının zarar gördüğü ve bunların toplam maliyetinin yaklaşık; 611.100.000TL,

Bölgedeki tahıl ürün depolarında meydana gelen zararların tahmini 81.600.000TL,

Tarım İşletmeleri Genel Müdürlüğü'ne bağlı tarım işletmelerinde ortalama 134.100.000TL hasar,

Bölgedeki özel sektör su ürünleri yetiştiriciliği işletmelerinde 101 ton balık ve 37.4 milyon yavru balığın öldüğü, bunların maliyetinin 63.200.000TL olduğu,

Gıda laboratuvar ve tesislerinde 51.300.000TL maliyetli hasar olduğu,

Orman Genel Müdürlüğü'ne bağlı alanlarda hasarların 3.000.000.000TL,

Devlet Su İşleri tesislerinde 19.500.000.000TL, baraj ve gölet havzalarındaki hasarın ise yaklaşık 2.700.000.000TL olduğu tespit olunmuştur (SBB, 2023: 100-123).

Tarım, hayvancılık, ormancılık ve balıkçılığın aldığı tahmini zararın şimdilik maliyeti 26.141.300.000TL olarak görülmektedir. Elbette buna, bölgeden zaruri göçler nedeniyle yapılamayacak tarım, hayvancılık, ormancılık ve balıkçılık maliyetlerini şuanda eklemek olası değildir. Ancak tutarı yakın gelecekte, muhtemelen artan gıda fiyatlarıyla ortaya çıkacak, bu maliyet kalemlerinin de göz önünde tutulması gereklidir.

Bölgede ekolojik sisteme katkıda bulunan çok sayıda alan mevcuttur. Bunlar “Nemrut Dağı Milli Parkı (Adıyaman), Gölbaşı Tabiat Parkı (Adıyaman), Kapıçam Tabiat Parkı (Kahramanmaraş), Beydağları Milli Parkı (Malatya), Belen Tabiat Parkı (Hatay) Yaban Hayvanı Üretme İstasyonu (Malatya), Kapıçam Keklik Üretme İstasyonu (Kahramanmaraş)” şeklinde sıralanabilir. Ancak bu alanlar için muhtelif hasarların olduğu bilinmekle birlikte henüz net bir hasar tespit ve maliyet çalışması yayınlanmamıştır.

Deprem bölgesinden 1 Mart 2023 tarihi itibarıyla 3.3milyon kişinin geçici veya kalıcı kararlar ayrıldığı, bu kişilerden 811bininin resmi tahliye yöntemleriyle bölgeyi terk ettiği görülmektedir (Sağiroğlu, vd., 2023: 2-6). Bu kişilerin başta Ankara, Antalya ve Mersin olmak üzere neredeyse Türkiye'deki bütün illere dağıldığı ancak dağılımın homojen olmadığı gözlemlenmektedir (Sağiroğlu, vd., 2023: 8). Bu göç hareketliliği esnasında kullanılan muhtelif ulaşım biçimlerinin atmosfere salınan gazlarda ne miktarda bir artışa neden olduğunun ilgili araştırmacılar tarafından araştırılması oldukça elzemdir.

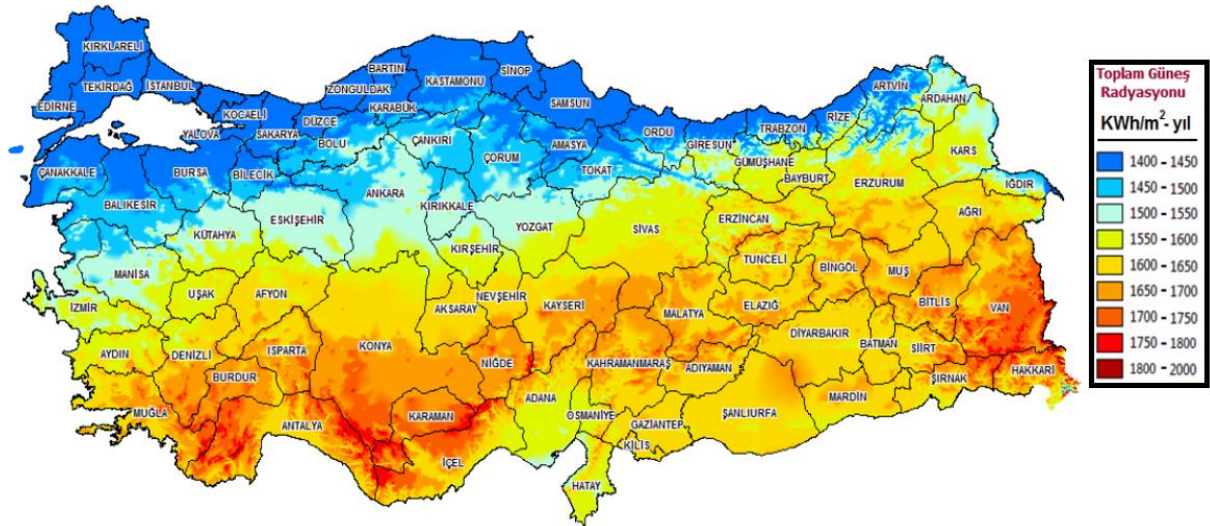

Buna ek olarak yukarıda bahsi geçen (orta hasarlı binalarla birlikte) 272bin binanın enkazından havaya karışan ve moloz dökülme alanlarından toprağa, su kaynaklarına ulaşan zehirli kimyasalların mutlak suretle kontrol altına alınması ve bu işlemlere ilişkin bilgilerin kamuoyuyla şeffaf biçimde paylaşılması gereklidir.

Deprem Etkilerine Yeşil Ekonomi Perspektifinde Politika Önerileri

Deprem yıkıcı etkisinin yalnızca insanların yaşam alanlarında değil, alt yapıdan ulaşıma, tarımdan balıkçılığa, su havzalarından kültürel yapılara çok sayıda alanda etkili olduğu, deprem sonrası erken görünüm raporları ile tespit edilmiştir.

Yeşil ekonomi özünde doğaya duyarlı olmayı öğütleyen felsefi bir yaklaşım barındırmaktadır (Ağcakaya ve Kaya, 2022: 514). Yaşanan olayın telafisi meşakkatli sonuçları ortadadır. Bu bir doğal afet krizi görünümündedir ve bu krizin mimarı ne yazık ki yeterli denetleme mekanizmasına tabi olmadan yapılaşmayı normalleştiren insanoğludur. Bu noktada, krizi bölge doğası için, bölge insanı için ve uzun vadede küresel anlamda insanlık için fırsata dönüştürmek de yine insanoğlunun elindedir. Krizin fırsata dönüşmesi, bir başka ifade ile depremin etkilerinin yeşil ekonomi perspektifinde politikalar ile çözümlenmesi olasıdır.

İlk olarak belirtmelidir ki, bölgenin iklim koşullarının hem güneş hem de rüzgar enerjisi ile enerji üretimine uygunluğu bilinmekte ancak bu alanlardan enerji elde ediminin oldukça sınırlı olduğu da görülmektedir. Şekil 1’de Türkiye Cumhuriyeti Enerji ve Tabii Kaynaklar Bakanlığı tarafından 2022 yılında hazırlanan “Türkiye Güneş Enerjisi Potansiyeli Atlası (GEPA)” yer almaktadır.

Şekil 1. Türkiye Güneş Enerjisi Potansiyeli Atlası-2022 (Kaynak: ETKB, 2023).

Harita, bölgenin yeniden inşa sürecinde güneşten enerji üretimine yönelik yapılacak yatırımların uygunluğunu ortaya koymaktadır. Eklemek gerekir ki, güneş enerjisi, enerji üretiminde zararlı atık oluşturmayan, yeşil ekonomi prensiplerini doğrudan taşıyan, kurulum ve kullanımı, görece olarak, diğer enerji üretim tesislerine göre daha kolay olan bir enerji üretim

türüdür. Bölgenin hali hazırda atık yönetiminde enkaz, asbest, pestisit gibi uzun vadeli zarar vericiler ile mücadele ettiği bir dönemde, güneş enerjisi üretiminin ve kullanımının uzun vadeli olarak yaygınlaşması, bir nebze olsa yaşanan ekolojik dejenerasyonu telafi edebilecek bir yöntem olabilir.

Ulaşım yollarının yeniden inşasında, karbon ayak izi daha düşük ulaştırma seçeneklerine öncelik verilmesi, buna yönelik imkanların artırılması ve bölge halkının konu hakkında teşvik edilmesi yerinde olacaktır. Bölgede hali hazırda yapıyı depremden önce başlayan yüksek hızlı tren hattı projesi mevcuttur. Bu proje Mersin-Adana-Gaziantep illerini kapsamaktadır (TCDD, 2023). Projenin bu aşamada yeniden değerlendirilmesi ve projede yer almayan Kahramanmaraş ilinin projeye eklenmesi, kısa vadede ise mevcut tren hattının lojistik sektöründe özendirilmesi yerinde olacaktır.

Yapılacak zemin etütleri neticesinde, bilhassa il ve ilçe merkezlerinde yer alan ve yeniden konut inşası olası olmayan alanların, bölge yapısına uygun olarak ağaçlandırılması gerek bu alanlara yeniden inşanın önlenmesi gerekse de yaşanan afet sonucunda bölgede artan zararlı gazların salınımının telafisinde etkili olabilecektir.

Yeniden inşa sürecinde çevreye duyarlı yapı malzemelerinin tercih edilmesi, bu tercihlerin devletçe desteklenmesi, yeniden yapılaşmada yeşil alanlara bilhassa önem verilmesi de oldukça elzemdir.

Bu çalışmada sıklıkla içeriğine yer verilen 142 sayfalık SBB Deprem Sonrası Değerlendirme Raporu'nda depremin ekolojik etkilerine ilişkin aşağıdaki üç madde, sürece ekolojik açıdan bakabilmek adına, oldukça önemlidir;

“Yıkılan ve yıkılması planlanan binalara ait inşaat ve yıkıntı atıklarındaki ilgili asbest, pestisitler vb. ile ilgili tehlikeli maddelere ilişkin önlemler alınmalıdır.

Atık yönetim sistemindeki tesis ya da toplama ve taşıma araçları ile ilgili aksaklıkların giderilerek işler hale getirilmesi sağlanmalıdır.

İnşaat ve yıkıntı atıklarından geri dönüştürülebilecek malzemelerle ilgili çalışmalar yapılmalıdır”(SBB, 2023: 72).

Bu gibi raporlar kamuoyu tarafından takip edilmekte, haber sitelerinde ve kanallarında veri olarak baz alınmakta ve farklı kesimlerden çok sayıda insana ulaşabilmektedir. Bu gibi raporlarda, bölgenin yeniden inşasında yeşil ekonomi perspektifinin vurgulanması, ekolojik dengeye verilen zarara ve bunları düzeltme yollarına dikkat çekilmesi yerinde olacaktır.

SONUÇ

Yeşil ekonomi, çevreye duyarlı bir büyüme modeli öngörmektedir. Sermayenin “acımasız” büyüme modellerinden uzaklaşması zor olsa da, krizi bir fırsata çevirme açısından, Kahramanmaraş merkezli depremlerin etki alanındaki illerde geleneksel ekonomik büyüme alışkanlarının kırılması, şehirlerinden yeniden inşasında topluma yeşil ekonomi bakış açısı kazandırılması olası olabilir. Elbette bu olasılığın artışı sağlayacak olan, etkin kalkınma politikalarından ileri gelecektir. Bu bağlamda çalışmada depremin demografik, ekonomik ve ekolojik etkilere, ulaşılabilen veriler ışığında, yer verilmiştir.

Doğal afetlerin ekonomik etkilerinin tasnif biçimleri göz önüne alındığında, yeşil ekonomi perspektifinde ekolojik dengede sürdürülebilirliği engelleyici etkilerin hem orta ve uzun vadede hem de ikincil etki grubunda yer alabileceği ifade edilebilir.

Alınacak politika önlemlerinin arzın devamlılığı veya güvenliği için mi yoksa doğanın sürdürülebilirliği ve güvenliği için mi alındığının ayırımına varılması oldukça önemlidir. Zira yaşanan depremler, bilhassa inşaat sektöründe, arz hızını arttırma, kar maksimizasyonunu sağlama güdüsü sonucu yaşanan bir felaketler dizisine dönüşmüş durumdayken, geleceği güvenle inşa etmenin fırsat maliyetinin dikkate değer olduğunu düşünmekteyiz.

Çalışmada depremin yıkıcı etkisinin sonuçlarını ortadan kaldırma sürecine yeşil ekonomi bağlamında bazı politika önerileri getirilmiştir. Bu öneriler, enerji, ulaşım, yeniden inşa, yeşil alanların korunması gibi temel başlıkları içermektedir. Ancak öneriler sınırlı sayıda rapor verisine dayanmaktadır. Gelecek aylarda açıklanacak yeni raporlar, bölgenin son durumunun değerlendirilmesinde ve bu alanlarda yeni çalışmalar yapılmasında önem arz edecektir.

Son olarak, yaşanan olaylar neticesinde, gelecek dönemlerde açıklanacak yeşil ekonomi endekslerinde Türkiye'nin sıralamasının negatif etkilenmesi olasıdır. Ne yazık ki Türkiye halihazırda çok da kabul edilebilir bir sırada yer alamamakta, ortalamada 160 ülke içerisinde 130 ile 140. sıralama arasında kendisine yer bulmaktadır. Öncelikle mevcut sıralamamamın korunması, ardından yaşanan sürecin ekolojik denge gözetilerek yönetilmesi halinde sıralamanın pozitif yönde artması konuyu gündemde tutacak akademik çalışmaların, politika yapımcıların, politika uygulayıcıların ve bu süreci doğrudan yaşayan bölge halkının elindedir.

**RETAIL CASH CONVERSION CYCLE AND PROFITABILITY NEW EVIDENCE
FROM A COINTEGRATION TEST WITH MULTIPLE STRUCTURAL BREAKS
FOR TURKISH RETAIL INDUSTRY**

Assoc. Prof. Dr. Kartal DEMİRGÜNEŞ (Orcid ID: 0000-0002-6305-0967)

ABSTRACT

The cash conversion cycle (CCC) is a metric of time that it takes for a firm to convert its investments in current assets into cash flows generated from sales. It is a vital quantitative measure used to evaluate the efficiency and effectiveness of a firm's operations, and therefore management quality. Understanding cash conversion cycle and implementing a proper plan to shorten it is a must to increase financial performance and profitability, especially for specific industries such as retailing, trading, healthcare, software development, etc. that have tendency to have best working capital and cash conversion cycles. This study aims to analyze the relationship between cash conversion cycle and firm profitability on a sample consisting of quarterly data of Turkish retailing industry consisting of Borsa Istanbul (BIST) listed retailing firms covering 1997.q1-2022.q4. In the study, the stationarity of series is tested by unit root test of Carrioni-i-Silvestre et. al. (2009). Following, co-integration test of Maki (2012) is employed whether there exists a cointegration relationship among series or not. Finally, cointegration coefficients are estimated by the dynamic ordinary least squares (DOLS) method of Stock and Watson (1993). Estimated break dates refer to some turning points in Turkish retailing industry. The empirical findings indicate that there does not exist any significant relationship between cash conversion cycle and profitability, while there exists a statistically significant and a negative relationship between profitability and leverage.

Keywords: Cash conversion cycle, profitability, retailing industry, cointegration test with multiple structural breaks.

INTRODUCTION

According to a McKinsey&Company report by Dobbs et al. (2015), over the last couple of decades, the world is being transformed through the four global forces breaking all the trends. These forces can be summarized as (i) the shifting of the locus of economic activity and dynamism to emerging countries and to cities within those countries; (ii) the acceleration in the scope, scale, and economic impact of technology; (iii) graying of the world due to sharp decline in fertility rates in recent years and (iv) the degree to which the world is much more connected through trade and through movements in capital, people, and information. Nowadays, multiple health challenges such as pandemic influenzas like COVID-19, vaccine-preventable diseases like diphtheria, growing rates of obesity, and etc. may be referred as the fifth global force accelerating the transformation.

Besides, it is obvious that these forces also result in a highly intense and global, national and - even- local competition environment. In such an environment, firms struggle to provide sustainable profit by proper investment decisions to enhance an optimum capital structure that will maximize the firm value. As term *capital structure* generally refers to the mix of a firm's long-term capital as a combination of debt and equity; short-term investments in working capital are mostly ignored in optimal capital structure appraisals. However, working capital management (WCM) is closely related to entire asset composition and short-term liabilities of any firm and directly affects financial performance both in terms of profitability and firm value (Jose et al., 1996; Appuhami, 2008; Banos-Caballero et al., 2011; Habib and Mourad, 2022). Besides, the mediating role of profitability on the relationship between WCM and sustainable growth has been supported by several studies of Churchill and Mullins (2001), Amouzesh et al. (2011), and Mukherjee and Sen, (2018). On the contrary, inefficient working capital practices are regarded as significant reasons for many distressed and demised firms (Alshubiri, 2011; Habib and Kayani, 2022), and small and medium-sized enterprise (SME) failures (Cielen et al., 2004). Increasing awareness of the vitality of proper working capital investments has caused to draw greater attention to reconsideration of firms' short-term investments (Shin and Soenen, 1998; Ajilore and Falope, 2009). This attention has risen to prominence following the massive shocks created by the COVID-19 pandemic and these shocks have changed the ongoing stereotype attitude towards working capital practices (Gadelius and Larsson, 2019).

Ernst and Young's 2019 Working Capital Report shows that the 2,000 leading companies in the United States and Europe have failed to manage their working capital due to challenges caused

by the COVID-19 pandemic. Another report by PricewaterhouseCoopers indicates that due to social distancing to prevent the spread of COVID-19 pandemic, firms have faced serious problems related to access to cash and working capital. These cash related issues have also been confirmed by Barclays' report concluding that COVID-19 pandemic has intensely affected cash conversion cycle (CCC) in most industries¹. Besides, lockdowns and interruptions to economic activities due to COVID-19 pandemic have lowered the value of firms' assets (Almaghrabi, 2022; Hassan et al., 2022) and highly affected firms' working capital requirements.

However, from both macroeconomic and microeconomic perspectives, the recovery didn't last long. GDP in most developed countries returned to or exceeded pre-COVID-19 pandemic levels by April 2022. J.P. Morgan working capital index which peaked in 2020, sharply reserved and improved by 11.2 points in 2021. Average overall sales of S&P 1,500 companies increased by 20% in 2021 and this increase reduced days inventory outstanding and improved days sales outstanding figures. Besides, in 2021, the cash index improved by 6.0 points and companies began to deploy cash on capital expenditures, increased their payouts to shareholders as share buybacks and dividends, and M&A activities across the globe again gained popularity².

This study concentrates specifically on (Turkish) retail industry for a number of reasons. First of all, differing from other industries, retail industry must attribute more attention to working capital, as it connects manufacturers to end-customers (Shailaja, 2017). Therefore, effective management of working capital should be a priority for such firms to ensure customer satisfaction and long-term sustainability. Secondly, working capital requirement of any firm depends heavily on its operating cycle, i.e., the days required to receive inventory, sell it, and collect cash from the sale of the inventory. The retail firms with relatively long operating cycles should invest more in inventories for meeting customer demand on time and these inventory investments make them working capital intensive. Thirdly, throughout the growth of Turkey's economy, the Turkish retail industry has been one of the most appealing sectors for both investors and consumers. The value of Turkish retail industry reached at 1,751 billion Turkish liras in 2021 and is forecast to grow at a CAGR of 25.4% over the period of 2021-2026, reaching to 5,439 billion Turkish liras. Among the sub-sectors, food and grocery is the dominating one

with a value of 874 billion Turkish liras in 2021. Besides, the industry is dominated by mass-market players using hypermarkets, supermarkets and discounters as leading channels³. These figures point out the importance of retail industry in overall Turkish economy.

The aim of this study is to analyze the possible relationship between cash conversion cycle (CCC) and firm profitability on a sample consisting of quarterly data of Turkish retail industry consisting of Borsa Istanbul (BIST) listed retail firms covering 1997.q1-2022.q4. Besides, the study refers advanced econometric methodologies including Carrioni-i-Silvestre et al. (2009) unit root test; Maki (2012) cointegration test and the dynamic ordinary least squares method of Stock and Watson (1993).

The remainder of the study is as follows: After discussing the *Conceptual Framework*, a brief *Literature Review* is presented regarding previous studies concentrating mainly on the relationship between cash conversion cycle and profitability. Then, sample and data, variable selection, the research model specification and empirical findings are given in *Methodology*. Finally, the empirical findings and their implications are discussed in the *Conclusion*.

CONCEPTUAL FRAMEWORK

The roots of WCM theory may be dated back to the study of Sagan (1955), firstly emphasizing the importance of working capital management policies on financial health of companies. Following, the researches of Modigliani (1957) on inventory investments; Walker (1964) on risk-return trade-off of WCM; Chakraborty (1973) on the role of working capital as a fund covering all the operating expenses of a company on-going and Smith (1973) on the business failures arising from inefficient management of current assets and liabilities are among other pioneering studies.

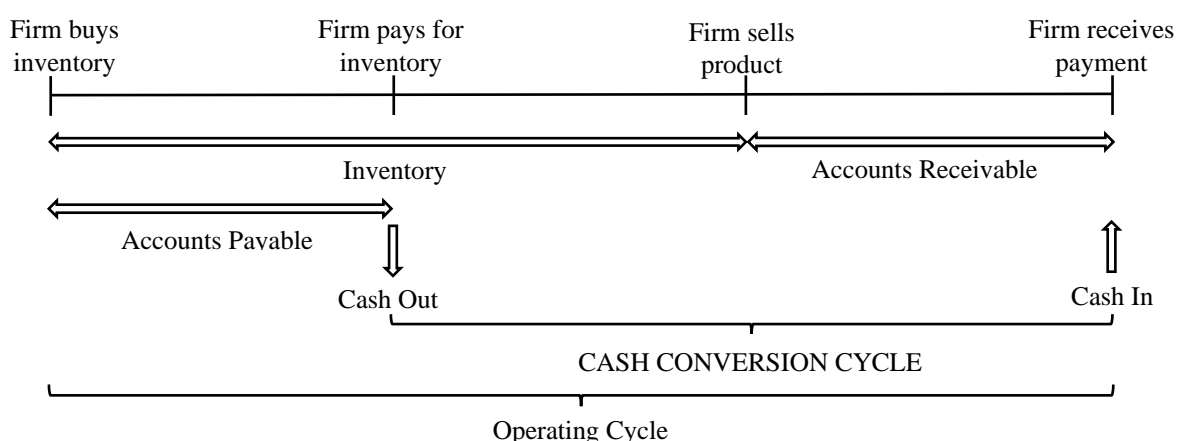

Efficiency and effectiveness of WCM practices are considered as strong predictors of profitability (Shin and Soenen, 1998; Deloof, 2003; Raheman and Nasr, 2007). The trade-off between the dual goals of WCM, that is liquidity and profitability, has been first highlighted by Smith (1980). He stated that profit maximization tendency is highly related to maintaining optimal liquidity; and focusing on only liquidity may tend to reduce potential profitability. However, how to measure liquidity arises as an empirical question. Though liquidity measures such as current, acid-test and cash ratios are the most common static measures of liquidity that focus on static balance sheet values; Shulman and Cox (1985), and Kamath (1989) question the

³ Available at: https://www.globaldata.com/store/report/turkey-retail-market-analysis/?view_report

validity of these measures depending that liquidity of an ongoing firm is more closely linked to the operating cash flow generated by its assets rather than the liquidation value of its assets. Therefore, evaluating efficiency and effectiveness of WCM practices requires an appropriate measure of liquidity that can provide dynamic insights.

Cash -conversion- cycle, initially introduced by Gitman (1974) and Hager (1976), and later operationalized by Richards and Laughlin (1980), is an extension of operating cycle. Operating cycle fails to consider liquidity requirements as affected by the time pattern of cash outflow requirements (Moss and Stine, 1993: 26). Cash conversion cycle (CCC) overcomes this failure by measuring liquidity with a time pattern (Wang, 2002; Afrifa and Padachi, 2016). CCC involves management of inventory, accounts receivable and accounts payable in optimal balance. This balance can be ensured by reducing accounts receivable period combined with lower inventory and extended supplier (trade) credit terms. A working capital policy based on relatively short CCC and low capital level mostly improves profitability, as such a policy reduces financing cost of operations (Ebben and Johnson, 2011).

As stated before, CCC is a derivation of operating cycle. Operating cycle is calculated by adding the average number of days necessary to purchase a product on credit and sell it (days inventory outstanding) to the average number of days required to collect sales (days sales outstanding). CCC takes the operating cycle analysis one step further by subtracting the length of the accounts payable period (days payable outstanding) from operating cycle. From this point of view, CCC is the actual time between cash outflows and cash inflows (Figure 1).

Source: Berk and DeMarzo, 2017: 951.

Figure 1: Cash Conversion Cycle

CCC and its three components, i.e., days inventory outstanding (DIO), days sales outstanding (DSO) and days payable outstanding (DPO) are calculated by using the following formulas:

$$CCC = [DIO + DSO] - DPO \quad (1)$$

where

$$DIO = \text{Inventory} / \text{Average Daily Cost of Goods Sold} \quad (2)$$

$$DSO = \text{Accounts Receivable} / \text{Average Daily Sales} \quad (3)$$

$$DPO = \text{Accounts Payable} / \text{Average Daily Cost of Goods Sold} \quad (4)$$

LITERATURE REVIEW

The earlier studies on cash -conversion- cycle are mostly established on models as extensions of operating cycle and/or theoretical frameworks to analyze working capital requirements. For instance; the theoretical framework developed by Gitman and Sachdeva (1982) was about the combination of value added and working capital. Investigating a possible relationship between CCC and firm size, Cheatham (1989) proposed a theoretical suggestion of shortening cash conversion cycle, while Cheatham et al. (1989) illustrated how the cash conversion cycle can be a value-driver for small firms. These theoretical suggestions were firstly tested by Ulrich and Reinhart (1991) for a sample of large and small firms, obtaining mixed empirical findings. Then, Moss and Stine (1993)'s research for a sample of building materials, hardware and garden to retail stores proved that firm size is a determinant of length of the CCC. Accordingly, cash conversion cycles of relatively large retail firms are found to be shorter and the length of the cash conversion cycle is inversely related to cash flows to the firm. Another earlier proposed model is the weighted cash conversion cycle of Gentry et al. (1990). This model calculates the weightings as the proportion of sales tied up to each component of the cash conversion cycle enabling better evaluation of firm's short-term financial performance.

Following these models, since especially the early 1990s, empirical studies on the effect working capital management practices on firm profitability have begun to draw greater attention. The main feature of these empirical studies is that they are concentrated on generally specific industries such as construction service, agriculture, mining, wholesale, oil and gas, transportation or manufacturing. Besides, a great majority of these studies is about US companies (Soenen, 1993; Jose et al., 1996; Shin and Soenen, 1998; Farris et al. 2005; Ebben and Johnson, 2011; Yazdanfar and Ohman, 2014); while several ones examine different European countries (Deloof, 2003; Lazaridis and Tryfonidis, 2006; Garcia-Teruel and Martinez-

Solano, 2007; Muscettola 2014; or emerging economies (Şamiloğlu and Demirgüneş, 2008; Ramachandran and Janakiraman, 2009; Coşkun and Kök, 2011; Sharma and Kumar, 2011; Tekin and Gör, 2022). Another feature is that while the early empirical studies on the subject refer to common static measures such as current ratio and acid-test ratio, etc. to evaluate firm's liquidity proficiency level; the contemporary ones suggest better liquidity measures such as cash conversion cycle, working capital requirement, the net trade cycle, the comprehensive liquidity index, and net liquid balance, tied up in firm's operations that include main components of net working capital cycle (Smith and Fletcher, 2009; Erasmus, 2010; Louw et al., 2016).

Focusing on US firms, studies of Soenen (1993), Jose et al. (1996), Shin and Soenen (1998), and Ebben and Johnson (2011) on various samples of US manufacturing firms over the periods 1974-1993, 1974-1993, 1975-1994 and 2002-2003, and respectively, conclude that working capital management policies shortening cash conversions cycles lead higher firm profitability due to tendency to minimize the cost of holding excess working capital. Deloof (2003)'s study on 1,009 Belgium firms throughout a wide range of sectors of the economy over the period of 1992-1996 claims that efficiency of working capital management practices affects both firm profitability and shareholder value. Empirical findings from the works of Lazaridis and Tryfonidis (2006) for 131 Athens Stock Exchange listed firms over the period of 2001-2004, Garcia-Teruel and Martinez-Solano (2007) for 8,872 Spanish SMEs over the period of 1996-2002 and Fernandez-Lopez et al. (2020) for 444 Spanish cheese-manufacturing firms over the period of 2010-2016 confirm Deloof (2003)'s findings.

Apart from findings on US and European firms, the empirical findings of Ramachandran and Janakiraman (2009) for India, Dong and Su (2010) for Vietnam, Mohamad and Saad (2010) for Malaysia, Nobanee et al. (2011) for Japan, Attari and Raza (2012) for Pakistan, Anser and Malik (2013) for Pakistan, Garanina and Petrova (2015) for Russia, Al-Mohareb (2019) for Jordan and Wang (2019) for both Japan and Taiwan, referring samples on different industries except retail also posit that there exists a significantly negative relationship between cash conversion cycle and profitability.

As stated before, one main feature of the related studies is that they are concentrated on a wide range of industries including construction service, agriculture, mining, wholesale, oil and gas, transportation and manufacturing, etc. From this point of view, it can be deduced that empirical studies on retail industry are comparatively rare and there is a research gap in this

field. Gosman and Kelly (2003), analyzing working capital management practices in US retail industry, focuses on inventory management and payment policies. In a similar study of Choudhary and Tripathi (2012) on a sample of three Indian retail firms, no evidence on the effect of inventory management on firm profitability is found. As seen, the existing studies on the relationship between working capital management practices and firm profitability in retail industry deals with the subject referring to static liquidity measures rather than a liquidity measure with a time pattern such as cash conversion cycle.

However, several studies of Lyrودي and Lazaridis (2000) on Athens Stock Exchange listed food firms; Gill et al. (2010) on US manufacturing firms, Sharma and Kumar (2011) and Abuzayed (2012) on non-financial firms in India and Jordan, respectively, point out a positive relationship between cash conversion cycle and working capital practices. These authors explain their findings indicating that firm profitability may be increased by keeping accounts receivable at an optimal level and relatively profitable firms may be less motivated to manage working capital efficiently. Moreover, while Panigrahi (2013) and Mathuva (2014) provide evidence for these claims by their studies on India and Kenya, respectively; Muscettola (2014) observes no significant relationship between cash conversion cycle and firm profitability.

It is obvious that previous empirical studies provide mixed and ambiguous findings concerning the form of the relationship between cash conversion cycle and firm profitability. These findings may be associated with sample selection procedures and the variables regarding cash conversion cycle included in research models.

METHODOLOGY

Sample and Data

This study analyzes the possible relationship between cash conversion cycle and firm profitability on a sample consisting of quarterly data of Turkish retail industry consisting of Borsa Istanbul (BIST) listed retail firms covering 1997.q1-2022.q4. The data is derived from the official website of Financial Information News Network (FINNET) by using Financial Analysis software.

Variable Selection

The dependent variable of the research model is firm profitability referred as return on assets (ROA), and is calculated as the book value of net profit (loss) after taxes divided by the book value of total assets.

The independent variable of interest is cash conversion cycle (CCC) and the formula to calculate it sums up the days inventory outstanding (DIO) and days sales outstanding (DSO) and then subtracts the days payable outstanding (DPO).

The control variable included in the research model is leverage (LEV) and is calculated by dividing the book value of total debt to the book value of total assets.

The Research Model Specification

The regression equations to test possible relationships between firm profitability and cash conversion cycle (Model 1), and between firm profitability and leverage (Model 2) are given in Equations 5-6:

$$ROA_t = \beta_0 + \beta_1 CCC_t + \varepsilon_t \quad (5)$$

$$ROA_t = \beta_0 + \beta_1 LEV_t + \varepsilon_t \quad (6)$$

Empirical Findings

This study tests relationship between ROA and CCC, and ROA and LEV using various methodologies including (i) multiple structural breaks unit root test of Carrioni-i-Silvestre et al. (2009), (ii) multiple structural breaks cointegration test of Maki (2012) and (iii) dynamic ordinary least squares (DOLS) method developed by Stock and Watson (1993).

The classical unit root tests may sometimes fail due to the effects of some events like economic and financial crises, wars, pandemics, etc. on the data, as such events may tend to cause structural breaks in the series. Therefore, it is recommended to employ multiple structural breaks unit root tests. Carrioni-i-Silvestre et al. (2009)'s unit root test as an extension of Kim and Perron (2009)'s work is one of these tests, allowing maximum up to five multiple breaks.

Totally five test statistics have been developed by Carrioni-i-Silvestre et al. (2009). Their first test statistics is based on the analyses of Elliot et al. (1996) and Perron and Rodriguez (2003) as given in Equation 7:

$$P_T^{GLS}(\lambda^0) = \{S(\bar{\alpha}, \lambda^0) - \bar{\alpha}S(1, \lambda^0)\} / s^2(\lambda^0) \quad (7)$$

where $s^2(\lambda^2)$ is an estimate of the spectral density at frequency zero of v_t .

Following Perron and Ng (1998), and Ng and Perron (2001), Carrioni-i-Silvestre et al. (2009) use an autoregressive estimate as defined in Equation 8:

$$s(\lambda^0)^2 = s_{ek}^2 / (1 - \sum_{j=1}^k \hat{b}_j)^2 \quad (8)$$

where $s_{ek}^2 = (T - k)^{-1} \sum_{t=k+1}^T \hat{e}_{t,k}^2$ and $\{\hat{b}_j, \hat{e}_{t,k}\}$ are obtained from the ordinary least squares (OLS) regression in Equation 9:

$$\Delta \tilde{y}_t = b_0 \tilde{y}_{t-1} + \sum_{j=1}^k b_j \Delta \tilde{y}_{t-j} + e_{t,k} \quad (9)$$

with $\tilde{y}_t = y_t - \hat{\Psi}' z_t(\lambda^0)$ where $\hat{\Psi}$ minimizes the objective function.

The order of autoregression k is selected using the modified information criteria suggested by Ng and Perron (2001) with the modification proposed by Perron and Qu (2007).

Carrioni-i-Silvestre et al. (2009)'s three M -class of test statistics that allow for multiple structural breaks are defined by Equations 10-12:

$$MZ_{\alpha}^{GLS}(\lambda^0) = (T^{-1} - s(\lambda^0)^2)(2T^{-2} \sum_{t=1}^T \tilde{y}_{t-1}^2)^{-1} \quad (10)$$

$$MSB^{GLS}(\lambda^0) = (s(\lambda^0)^{-2} T^{-2} \sum_{t=1}^T \tilde{y}_{t-1}^2)^{\frac{1}{2}} \quad (11)$$

$$MZ_t^{GLS}(\lambda^0) = (T^{-1} \tilde{y}_T^2 - s(\lambda^0)^2) \left(4s(\lambda^0)^2 T^{-2} \sum_{t=1}^T \tilde{y}_{t-1}^2 \right)^{-\frac{1}{2}} \quad (12)$$

with $\tilde{y}_t = y_t - \hat{\Psi}' z_t(\lambda^0)$, where $\hat{\Psi}$ minimizes the objective function.

The fifth test statistics of Carrioni-i-Silvestre et al. (2009) is a modified feasible point optimal test defined by Equation 13:

$$MP_T^{GLS}(\lambda^0) = \frac{[c^{-2} T^{-2} \sum_{t=1}^T \tilde{y}_{t-1}^2 + (1-c) T^{-1} \tilde{y}_T^2]}{s(\lambda^0)^2} \quad (13)$$

Carrioni-i-Silvestre et al. (2009) obtains asymptotic critical values by using the bootstrap. The null hypothesis of a unit root is rejected in case of calculated test statistics being smaller than critical values referring that series is stationary under the presence of structural break. Results of unit root test of Carrioni-i-Silvestre et al. (2009) are presented in Table 1.

Table 1: Results of Unit Root Test of Carrion-i-Silvestre et al. (2009)

Variable	Critical Values					Break Dates
	P_T^{GLS}	MZ_{α}^{GLS}	MSB^{GLS}	MZ_t^{GLS}	MP_T^{GLS}

Note: Critical values obtained by using the bootstrap at significance level of 5% are given in parenthesis. ** and Δ denote stationarity at significance level of 5%, and the first difference, respectively.

The null hypotheses of a unit root test is accepted as calculated test statistics at level are bigger than critical values. Therefore, test results indicate that series are stationary at their first differences and integrated of order one, $I(1)$. Structural break dates estimated by the unit root test of Carrion-i-Silvestre et al. (2009) point out dramatic turning points for not only Turkish retail industry, but also the entire Turkish economy.

Gregory and Hansen (1996) criticize cointegration tests of Zivot and Andrews (1992), and Westerlund and Edgerton (2007) which allow only one structural break. They recommend processing multiple (that is, at least more than one) structural breaks in cointegration tests, as structural breaks may cause spurious unit root behavior in the cointegrating relationship. Tests developed by Carrion-i-Silvestre and Sanso (2006) and Hatemi-J (2008) allow two structural breaks. However, Maki (2012) proposes a test that performs better, when the cointegration relationship has more than three (maximum up to five) structural breaks. Therefore, this study employs Maki (2012) cointegration test.

Maki (2012) identifies the long-run relationships between series with four different regression models in as given in Equation 14-17.

$$y_t = \mu + \sum_{i=1}^k \mu_i D_{i,t} + \beta' x_t + \mu_t \quad (14)$$

$$y_t = \mu + \sum_{i=1}^k \mu_i D_{i,t} + \beta' x_t + \sum_{i=1}^k \beta_i x_t D_{i,t} + \mu_t \quad (15)$$

$$y_t = \mu + \sum_{i=1}^k \mu_i D_{i,t} + \gamma t + \beta' x_t + \sum_{i=1}^k \beta_i x_t D_{i,t} + \mu_t \quad (16)$$

$$y_t = \mu + \sum_{i=1}^k \mu_i D_{i,t} + \gamma t + \sum_{i=1}^k \gamma_i t D_{i,t} + \beta_i x_t + \sum_{i=1}^k \beta_i x_t D_{i,t} + u_t \quad (17)$$

where $t = 1, 2, \dots, T$. y_t and $x_t = (x_{1t} \dots x_{mt})'$ denote observable I(1) variables, and u_t is the equilibrium error. y_t is a scalar and $x_t = (x_{1t}, \dots, x_{mt})'$ is an $(m \times 1)$ vector. It is assumed that an $(n \times 1)$ vector z_t is generated by $z_t = (y_t, x_t) = z_{t-1} + \varepsilon_t$, where ε_t are independent identically distributed with mean zero, definite variance-covariance matrix Σ , and $E|\varepsilon_t|^s < \infty$ for some $s > 4$. $\mu, \mu_i, \gamma, \gamma_i, \beta' = (\beta_{i1}, \dots, \beta_{im})$ are true parameters. $D_{i,t}$ takes a value of 1 if $t > T_{Bi}$ ($i = 1, \dots, k$) and of 0 otherwise, where k is the maximum number of breaks and T_{Bi} denotes the time period of the break.

The first model with level shifts and without trend in which there is a break in the constant term, and the second regime-shifts model without trend in which there are breaks in both constant term and slope are formulated in Equations (14) and (15), respectively. The third model (Equation 16) is the second model with a trend. The fourth model is the comprehensive one with breaks in constant term, slope and trend (Equation 17).

The approximation of asymptotic critical values of the tests for the maximum number of breaks (from 1 to 5) are calculated by Monte Carlo simulations as given in Maki (2012). The null hypothesis of non-existence of cointegration between series is rejected in case of calculated test statistics being smaller than these critical values. In the study, null hypothesis is accepted for the first model, while it is rejected for the second one. This indicates the existence of a cointegration relationship between firm profitability and leverage (Table 2).

Calculated test statistics being smaller than critical values point out that alternative hypothesis of existence of cointegration between the series under multiple structural breaks is accepted. Maki (2012) test results show that the series are cointegrated in the long-run. This study estimates long-run parameters by the dynamic ordinary least squares (DOLS) method developed by Stock and Watson (1993). Break dates obtained from cointegration test are also included in the model.

The DOLS estimator is obtained from the Equation 18:

$$y_t = \alpha_0 + \alpha_1 t + \alpha_2 x_t + \sum_{i=-q}^q \delta_i \Delta x_{t-i} + \varepsilon_t \quad (18)$$

where q and ε_t represent optimum leads and lags, and error term, respectively.

		Model 3	-6.421	-8.004	-7.414	-7.110	1998.q4; 2000.q2; 2012.q3 2018.q4; 2021.q4	-
<i>ROA</i> → <i>LEV</i>	Null hypothesis is rejected	Model 0	-4.879	-5.959	-5.426	-5.131	1998.q4; 2000.q4; 2009.q4 2012.q1; 2020.q2	-
		Model 1	-5.712**	-6.195	-5.699	-5.449	2000.q4; 2004.q2; 2009.q4 2012.q1; 2020.q2	+
		Model 2	-4.879	-6.915	-6.357	-6.057	1999.q1; 2002.q4; 2018.q4 2020.q1; 2022.q2	-
		Model 3	-6.759	-8.004	-7.414	-7.110	1999.q4; 2003.q3; 2008.q1 2017.q3; 2022.q2	-

Note: Critical values are obtained from Maki (2012). ** denotes significance level of 5%.

The long-run parameters estimated by DOLS method indicate that leverage has statistically negative effect on firm profitability. The other independent variable, cash conversion cycle has no significant effect on firm profitability.

CONCLUSION

The aim of this study is to test the relationship between cash conversion cycle and firm profitability in Turkish retail industry. Through this aim, multiple structural breaks unit root test of Carrioni-i-Silvestre et al. (2009), multiple structural breaks cointegration test of Maki (2012) and dynamic ordinary least squares (DOLS) method developed by Stock and Watson (1993) are employed on a sample consisting of quarterly data of Turkish retailing industry consisting of Borsa Istanbul (BIST) listed retailing firms covering 1997.q1-2022.q4.

Unit root test results indicate that series are stationary at their first differences and the structural break dates estimated point out dramatic events for not only Turkish retail industry, but also the

entire Turkish economy. On 17 August 1999, a moment magnitude 7.6 earthquake struck the Marmara, causing high casualties and significant material damage on property. Following this earthquake, on 12 November 1999 another one occurred in Düzce with a moment magnitude of 7.2, again causing high damage and casualties. Then, on 19 February 2001 a crisis in the form of a virtual raid on foreign currencies emerged. After a recovery period following 2001 crises, Turkish economy faced with 2008 Financial Crisis. This crisis is considered by many economists as the worst financial crisis since the Great Depression. On 15 July 2016, a coup d'état was attempted against state institutions, including the government. This attempt failed after forces loyal to the state defeated the coup plotters. Beginning from 2018, Turkish currency and debt crisis is an ongoing financial and economic crisis in Turkey. The main characteristics of this crisis is the value decrease in the Turkish Lira high inflation, rising borrowing costs, and correspondingly rising loan defaults. These earthquakes and crises cause severe effects on retail industry and entire Turkish economy.

This study tests cointegration relationship and coefficients between firm profitability, cash conversion cycle and leverage by employing cointegration test of Maki (2012) and Stock and Watson (1993)'s dynamic ordinary least squares method, respectively. The results of Maki (2012) test indicate a cointegration relationship between firm profitability and leverage. The long-run parameters estimated by dynamic ordinary least squares method show that the only statistically significant relationship is between firm profitability and leverage. Accordingly, leverage has negative effect on profitability indicating that firm profitability decreases due to increase in leverage. The relationship between firm profitability and cash conversion cycle is not statistically significant. This finding is similar to Muscettola (2014).

ABSTRACT

Garlic (*Allium sativum*) is a food that mainly contains organosulfur compounds such as alliin, allicin, S-allyl cysteine, diallyl sulfide, diallyl disulfide and diallyl trisulfide. Garlic contains antibacterial, antioxidant, antifungal, anti-atherosclerotic, hypoglycemic, and antitumoral properties due to these bioactive components, which play significant roles in cellular metabolism. Despite these positive benefits, its characteristic smell and aroma greatly limit its consumption as a raw form. It is known that the substance causing the smell originates from the allicin, which is released as a result of the degradation of the raw garlic heads and the decomposition of alliin by the alliinase enzyme. Various methods are used to prevent this reaction. Special fermentation devices without using any additives have been developed for the fermentation of raw garlic heads. In this fermentation the color of raw garlic turns black as a result of the non-enzymatic Maillard reaction. The obtained product is called as black garlic due to its color. There are differences in physical and chemical properties between raw and black garlic due to fermentation processes. Since the alliinase enzyme becomes inactive during fermentation, the smell of raw garlic can be eliminated by converting alliin into S-allyl cysteine rather than the odor-causing allicin. S-allyl cysteine produced during fermentation has strong antioxidant properties. Many studies have reported that black garlic contains higher levels of phenolic compounds, methionine and arginine than raw garlic. Although the consumption of raw garlic above a certain level causes a toxic effect, the black garlic consumption is more reliable. There were many studies investigating the effects of the use of different forms of garlic in diets on performance, egg and meat quality, oxidative stress and cholesterol content in poultry. However, there are limited number of studies on the use of black garlic. In this review, the chemical and physical properties of raw and black garlic and the studies about the usage of these different forms of garlic in poultry nutrition were summarized.

Keywords: Poultry nutrition, black garlic, raw garlic, bioactive compounds, fermentation

INTRODUCTION

The ban on the use of antibiotics at sub-therapeutic levels to promote growth in animal nutrition due to bacterial resistance and residues in products has increased interest in phytobiotics as an alternative natural additive (Diaz-Sanchez et al., 2015). Phytobiotics include a wide range of herbs, spices, and botanical products such as medicinal and aromatic plants and their extracts (Mohammadi-Gheisar and Kim, 2018). They show antioxidant, antibacterial, antiviral, antifungal, and anti-inflammatory properties due to their bioactive components (Bagno et al., 2018). One of the important phytobiotics is the garlic (*Allium sativum*). Garlic is a member of the Alliaceae family (Najman et al., 2021) and the genus *Allium* (Stavělíková, 2008). Garlic, one of the oldest known plants, has great importance in production in Turkey. According to Turkish Statistical Institute (TUIK) data, 47.487 tons of fresh (green) and 140.464 tons of dry garlic were produced in 2022 (TUIK, 2023).

Garlic can be consumed fresh and raw as well as in different forms such as dried, powdered, pureed, juice, and essential oil (Evren et al., 2006). It has important activities due to having organosulfur compounds, saponins, and phenolic substances (Shang et al., 2019). When the integrity of the garlic heads is disrupted through crushing, shredding or cutting, the odorless alliin is converted to allicin by the action of the enzyme alinase (Kovarovič et al., 2019). Allicin gives garlic a characteristic odor and aroma (Borlinghaus et al., 2021). This limits the raw consumption of garlic (Zhang et al., 2016; Daliri et al., 2019; Qiu et al., 2020). Various methods are used to prevent this situation. One of them is the fermentation of garlic (Daliri et al., 2019; Qiu et al., 2020). Black garlic is obtained after the fermentation process carried out at a certain temperature, and humidity at an appropriate time (Kimura et al., 2017; Zhang et al., 2016). The appearance of raw garlic and black garlic is given in Figure 1 (Afzaal et al., 2021). In this review, the composition of raw and black garlic, the effect of the fermentation process on garlic composition, and studies in poultry are summarized.

Figure 1. The appearance of raw garlic (a) and black garlic (b) (Afzaal et al., 2021)

Effect of Fermentation Process on Garlic Composition (Black Garlic)

Garlic, one of the oldest known medicinal aromatic plants, has antioxidant (Santhosha et al., 2013; Jang et al., 2018), antibacterial (Srinivasan et al., 2004), anti-inflammatory (Çiçek, 2022), anticancer (Srinivasan et al., 2004; Santhosha et al., 2013), hypocholesterolemic (Yeh and Liu, 2001), hypolipidemic (Zeng et al., 2013), hepatoprotective (Santhosha et al., 2013) and cardioprotective properties (Çiçek, 2022) due to having various bioactive components (Santhosha et al., 2013). The main organosulfur compounds found in *Allium* species are given in Figure 2 (Poojary et al., 2017).

Black garlic is produced by keeping garlic heads under high temperatures (60-90°C) with controlled humidity (80-90%) for a certain period of time (Kimura et al., 2017). High temperature causes the loss of alliinase enzyme activity (Ríos-Ríos et al., 2016). In this case, alliin is converted to S-allyl cysteine instead of allicin which causes odor (Karakaya et al., 2020). S-allyl cysteine is known to be a powerful antioxidant (Geddo et al., 2023). Therefore, black garlic has higher antioxidant activity than raw garlic (Akan, 2014; Afzaal et al., 2021). Color changes in garlic according to the fermentation time are given in Figure 3 (Choi et al., 2014). Total phenolic substances, flavonoid content and antioxidant activity of raw and black garlic for the extracts of ethanol and water were given in Table 1 (Atun et al., 2021). Differences in the total phenolic substances and flavonoid levels were observed between raw and black garlic. The antioxidant activity of black garlic extract was higher than that of the raw form (Atun et al., 2021).

Tahir et al. (2022) showed that moisture of garlic was reduced whereas the contents of crude protein, crude fiber, crude ash and soluble carbohydrates were increased after fermentation of different varieties (*desi* and *farmi*) of garlic in Pakistan.

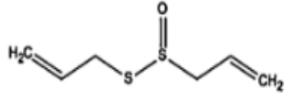

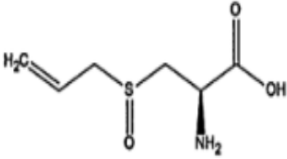

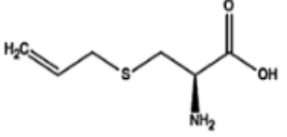

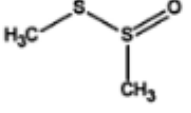

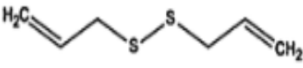

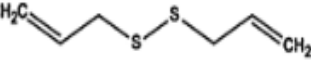

Allicin	Alliin	S-Allyl cysteine
		
S-Methylthiomethanesulfinate	Di-allyl disulphide	Di-allyl tri-sulphide

Studies on the Use of Raw Garlic in Poultry Nutrition

There are many studies investigating the usage of raw garlic in poultry nutrition. Some of these are summarized in Table 2.

Garlic usage in the diets of laying hens in different doses has increased egg production (Canogullari et al., 2009) and egg weight (Yalçın et al., 2006). In contrast to these studies, there are studies showing that garlic in different forms and doses in laying hen diets had no significant effect on body weight gain (Chowdhury et al., 2002; Yalçın et al., 2006; Mousa et al., 2019), egg weight (Chowdhury et al., 2002; Khan et al., 2008), egg mass (Chowdhury et al., 2002; Khan et al., 2008; Omri et al., 2019), egg production (Yalçın et al., 2006; Hossain et al., 2015), feed intake (Chowdhury et al., 2002; Yalçın et al., 2006; Khan et al., 2008; Canogullari et al.,

2009; Hossain et al., 2015) and feed conversion ratio (Chowdhury et al., 2002; Yalçın et al., 2006; Khan et al., 2008; Canogullari et al., 2009; Kolawole and Folake, 2019; Omri et al., 2019). It has been indicated that garlic had no significant effect on shape index (Yalçın et al., 2006), yolk index (Yalçın et al., 2006; Kolawole and Folake, 2019), yolk weight (Canogullari et al., 2009; Kolawole and Folake, 2019) albumen index (Yalçın et al., 2006), Haugh unit (Yalçın et al., 2006), shell thickness (Omri et al., 2019) and breaking strength (Yalçın et al., 2006). In contrast to these studies, Omri et al. (2019) determined that garlic increased albumen and yolk weight; while Hossain et al. (2015) observed that garlic increased yolk height and shell thickness. In some studies the levels of egg cholesterol (Yalçın et al., 2006; Kolawole and Folake, 2019; Omri et al., 2019) and serum cholesterol (Yalçın et al., 2006; Hossain et al., 2015; Omri et al., 2019), triglyceride (Yalçın et al., 2006) and LDL (Canogullari et al., 2009) were decreased by dietary garlic supplementation. Hossain et al. (2015) found that aged garlic extract increased the serum lymphocyte and IgG values and decreased the number of *Escherichia coli* in excreta of laying hens. Mousa et al. (2019) reported that garlic supplementation decreased the total aerobic bacteria in the cecum, but did not significantly affect duodenum and jejunum morphology (villus height, crypt depth, villus width) and internal organ (liver, heart, spleen, gizzard) weights.

Different levels and forms of garlic in broiler diets had no significant effect on body weight (Khaidem et al., 2019), body weight gain (Onibi et al., 2009; Khaidem et al., 2019), feed intake (Onibi et al., 2009; Toghyani et al., 2011; Khaidem et al., 2019), feed efficiency (Onibi et al., 2009; Toghyani et al., 2011; Khaidem et al., 2019), and weights of gizzard, liver, heart, thigh, breast, abdominal fat (Onibi et al., 2009). Garlic supplementation improved meat shelf life by reducing MDA level (Onibi et al., 2009).

Garlic supplementation decreased serum LDL (Toghyani et al., 2011; Elbaz et al., 2021), triglyceride (Elbaz et al., 2021), and cholesterol (Elbaz et al., 2021), and increased HDL (Toghyani et al., 2011; Elbaz et al., 2021), hemoglobin (Toghyani et al., 2011) and hematocrit (Toghyani et al., 2011) levels in blood in broilers. In the study of Sangilimadan et al. (2019), dietary garlic improved body weight and feed efficiency but did not affect carcass characteristics in broilers. *Lactobacillus* counts were increased and *E. coli* and total coliform counts were decreased in the ileum with the usage of garlic in broilers (Elbaz et al., 2021).

In a study conducted on quails (Yalçın et al., 2007), garlic did not affect live weight, egg production, feed intake, feed efficiency, and egg quality characteristics (albumen index, yolk

index, Haugh unit) but increased egg weight. Yalçın et al. (2007) also determined that garlic significantly decreased serum cholesterol levels. In the study of Sobhani et al. (2023), garlic decreased the *E. coli* level and increased the number of *Lactobacillus* in the intestine of male quails. Sobhani et al. (2023) also stated that garlic improved some sperm parameters (viability, acrosome integrity, sperm production).

Studies on the Use of Black Garlic in Poultry Nutrition

According to the literature review, it is seen that there are a limited number of studies investigating the possibilities of using black garlic, which is obtained by fermentation, in poultry nutrition. Some of these studies are summarized in Table 3.

Table 3. Some studies on black garlic in poultry nutrition

Garlic form	Garlic dose	References
Broiler		
Powder	%0, 3	Tanti et al. (2022a)
Powder	%0, 1, 2, 3	Tanti et al. (2022b)
Powder	%0, 3	Tanti et al. (2023)
Powder	%0, 3	Zulfikar et al. (2022)
Quail		
Garlic meal	%0, 1, 2, 3	Nurhayati et al. (2023)

Nurhayati et al. (2023) added different levels (0, 1, 2, 3%) of raw and black garlic to quail diets and observed no significant effect on egg weight, egg mass, feed efficiency, serum total cholesterol, LDL, and HDL levels. Egg production, feed intake, and meat protein percentages were increased and the percentage of meat fat decreased with black garlic supplementation in the diet of quails. Nurhayati et al. (2023) concluded that black garlic can be used instead of raw garlic to improve performance in quails.

Zulfikar et al. (2022) reported that black garlic at 3% level in the diet affected feed intake and abdominal fat weight, but did not affect carcass percentages in broilers. In a study conducted by Tanti et al. (2023), 3% black garlic powder had no significant effect on final body weight, body weight gain, feed intake, feed efficiency, and intestinal length in broilers. Tanti et al. (2023) also stated that black garlic increased the width and height of intestinal villi.

CONCLUSION

Various additives are used to increase the quantity and quality of animal products and to protect animal health. Since some of these additives are controversial and limited in use due to their

properties. Garlic contains organosulfur compounds and phenolic substances. However, its characteristic odor and aroma limit its consumption as raw. When raw garlic is fermented, its odor and aroma disappear and the antioxidant content increases due to the release of S-allyl cysteine in significant amounts. There are many studies on the use of raw garlic in poultry nutrition. However, studies about the usage of black garlic in poultry feeding are very limited. Therefore, there is a need for a comprehensive investigation of the use of black garlic as a feed additive in poultry.

ÖZET

Türkiye'nin bulunduğu coğrafi konum birçok bitkinin kültüre alınmasına, birçok bitkinin de doğal olarak yetişmesine imkan tanımaktadır. Bu özellik, tıbbi ve aromatik bitkilerin ülke ekonomisinde önemli bir yer almasına neden olmuştur. Sağlıklı yaşam düşüncesi ve ilaçların muhtemel yan etkileri tıbbi ve aromatik bitkilere olan küresel talebi artırmasına rağmen, küresel iklim değişikliği, doğal afetler ve tıbbi ve aromatik bitkilerin doğadan bilinçsizce toplanması, bu ürünlerin sürdürülebilirliğini tehdit etmektedir. Bu çalışmada son 15 yıllık verilerin ışığında dünya ve Türkiye'de tıbbi ve aromatik bitkilerin dış ticaretindeki gelişmeler incelenmiştir. Veriler Uluslararası Ticaret Merkezi ve Birleşmiş Milletler Gıda ve Tarım Örgütü internet sitelerinden derlenmiştir. Sonuçlar Türkiye'nin tıbbi aromatik bitkiler konusunda net ithalatçı bir ülke olduğunu, ihracatın ithalatı karşılama oranının her geçen gün arttığını, 2021 yılına gelindiğinde ihracatın ithalatı karşılama oranının %83 olduğunu göstermiştir. Dünyada tıbbi ve aromatik bitkilerin dış ticaret hacmi 2007 yılında yaklaşık 108 milyar \$ iken, 2021 yılında 236 milyar \$'ı geçmiştir. Türkiye dünya pazarından %0.60'lık bir pay almaktadır. Bu oran Türkiye'nin sahip olduğu potansiyelden çok uzaktır. En önemli ihracatçı ülkeler Fransa, Almanya, ABD, Çin ve Singapur olurken, ithalatta da Çin, ABD ve Almanya başı çekmektedir. Yetiştiriciliği yapılan ürünlerde çeşit ıslahı çalışmalarının hızlandırılması verimlilik ve kaliteli tohumluk temini açısından önemli görülmektedir. Ayrıca doğal olarak yetişen bitkilerin sürekliliğinin sağlanması açısından toplayıcıların eğitimi en önemli konularından biridir.

Anahtar Kelimeler: İthalat, ihracat, sağlıklı yaşam, endemik bitki, Tarım Ekonomisi

**DEVELOPMENT OF FOREIGN TRADE IN MEDICINAL AND AROMATIC
PLANTS IN TÜRKİYE**

ABSTRACT

The geographical location of Türkiye allows for the cultivation of many plants and the natural growth of many others. This feature has led to the country's economy's significant presence of medicinal and aromatic plants. Despite the global demand for medicinal and aromatic plants increasing due to the desire for a healthy lifestyle and the potential side effects of drugs, global climate change, natural disasters, and the unconscious collection of medicinal and aromatic plants from nature threaten the sustainability of these products. This study examined developments in the international trade of medicinal and aromatic plants in Türkiye and the world in light of data from the last 15 years. Data were compiled from the websites of the International Trade Centre and the Food and Agriculture Organization of the United Nations. The results showed that Türkiye is a net importer of medicinal and aromatic plants. The ratio of exports to imports increased yearly, reaching 83% in 2021. While the foreign trade volume of medicinal and aromatic plants in the world was approximately \$108 billion in 2007, it exceeded \$236 billion in 2021. Türkiye has a share of 0.60% of the world market, which is far from the country's potential. France, Germany, the USA, China, and Singapore are the major countries in world trade. The acceleration of variety breeding studies in cultivated crops is considered important in terms of productivity and quality of seed supply. In addition, the training of collectors is one of the most important issues in terms of ensuring the continuity of naturally growing plants.

Keywords: Import, export, healthy living, endemic plants, Agricultural Economics

Giriş

Yapılan bir çalışmada dünya üzerinde 422.000 bitki türünün olduğu ve bunların 52.885'inin tıbbi ve aromatik bitkilerden oluştuğu bildirilmiştir (Schippmann vd., 2002). Türkiye, zengin bitki çeşitliliği ile birçok tıbbi ve aromatik bitkiyi kendi coğrafyasında barındırmaktadır (Temel vd., 2018). Tıbbi ve aromatik bitkiler, insanlık tarihi boyunca tedavi amacıyla kullanılmıştır. Bu bitkilerin tüketiminin dejeneratif hastalıklarla ilgili riskleri azaltma potansiyellerinin, sahip oldukları antioksidan özellik gösteren biyoaktif bileşikler, özellikle fenolik maddelerle ilgili olduğu son yıllarda yapılan çalışmalarla ortaya koyulmuştur (Karadağ, 2019). Tıbbi bitkilerin kullanımı sadece geleneksel tıpla sınırlı olmayıp gıda ve ilaç endüstrilerini de kapsamaktadır. Ancak, kontrolsüz bir şekilde yapılan toplama ve aşırı faydalanmalar sonucunda tıbbi bitki türlerinin önemli bir bölümünün geleceği tehlike altına girmiştir (Güneri vd., 2023).

Tıbbi ve aromatik bitkiler besin değeri bakımından oldukça zengindir. Örneğin, dut (*Morus alba* L.), fenolik asitler, flavonoidler, flavonoller, antosiyaninler, makro besinler, vitaminler, mineraller ve uçucu aromatik bileşikler dahil olmak üzere bol miktarda fitokimyasal içeren ve mükemmel farmakolojik yeteneklerini gösteren bir bitkidir (Chen vd., 2021). *Satureja hortensis*, gıda ve ilaç endüstrilerinde özel uygulamaları olan iyi bilinen bir tıbbi, aromatik ve baharat bitkisidir. Yüksek besin değerlerine ek olarak, yaygın olarak kullanılan ikincil metabolitler içerir (Mohtashami vd., 2021). Zencefil (*Zingiber Officinale*), baharat ve tıbbi bileşen olarak çok popüler olan rizomlu bir bitkidir. Zencefilin antiartritik, antitrombotik ve anti-inflamatuar etkiye sahip olduğu tespit edilmiştir (Therkleson, 2013). Ayrıca, tıbbi ve aromatik bitkilerden elde edilen uçucu yağlar, gıda endüstrisi için sentetik katkı maddelerine alternatif olarak kullanılan uçucu bileşiklerin karışımlarıdır. En hayati eser elementlerden biri olan selenyum, insan beslenmesinde önemli bir role sahiptir ve faydalı eser elementleri elde etmek için baharatlar, otlar ve şifalı bitkiler tüketilmelidir (Ozkutlu vd., 2011). Tıbbi ve aromatik bitkiler önemli besin değerine sahiptir ve faydalı eser elementlerin, vitaminlerin ve minerallerin kaynağı olarak kullanılabilir.

Tıbbi ve aromatik bitkilerin ticareti birçok ülkede önemli bir ekonomik faaliyettir. Örneğin, Güney Afrika'da tıbbi ve aromatik bitki ticareti ülke ekonomisinde önemli yer kaplamaktadır. Malavi'de bitki tüccarları hane gelirlerinin %50'sinden fazlasını tıbbi bitki satışından elde etmektedir. Fas'ta tıbbi bitkilerin ihracatından elde edilen yıllık gelir 2015 yılında 55,9 milyon dolardır (Andel vd., 2012). Ayrıca bu bitkilerin kullanımı aynı zamanda kırsal topluluklar için önemli bir gelir kaynağıdır (Bhat vd., 2013). Tıbbi bitkilerin küresel ticareti, aşırı sömürüye yol açabilen ve önemli tıbbi bitki türlerinin hayatta kalmasını tehdit edebilen, doğadan kapsamlı bir

şekilde toplanmasına bağlıdır (Kuniyal vd., 2005). Tıbbi ve aromatik bitkilerin ticareti, önemli tıbbi bitki türlerinin hayatta kalmasını sağlamak için sürdürülebilir yönetim gerektiren önemli bir ekonomik faaliyettir. Tıbbi ve aromatik bitkiler ve ürünlerine yönelik artan talep, bu bitkilerin kültüre alınmasını teşvik etmiştir (Zeng vd., 2013). Tıbbi ve aromatik bitkilerin kültüre alınmasının, yabancı popülasyonlar üzerindeki baskının azaltılmasına ve sürdürülebilir bir bitki materyali tedarikinin sağlanmasına yardımcı olacaktır. Sonuç olarak, tıbbi ve aromatik bitkiler yüzyıllardır tedavi edici özelliklerinden ve gıda kaynağı olmalarından dolayı kullanılan ve günümüzde çeşitli endüstrilerde hala geçerli olan önemli kaynaklardır. Ancak, bunların korunması ve sürdürülebilir yönetimi, hayatta kalmaları ve sürekli kullanımlarını sağlamak için çok önemlidir.

Materyal ve Metot

Çalışmada materyal olarak ikincil veriler kullanılmıştır. Veriler Uluslararası Ticaret Merkezi (ITC-Trade Map) ve Birleşmiş Milletler Gıda ve Tarım Örgütü (FAO) internet sitelerinden elde edilmiştir. Elde edilen verilerle basit indeksler hesaplanmış, artış ve azalışlar yorumlanmıştır.

Araştırma Bulguları ve Tartışma

Tıbbi ve aromatik bitkiler doğadan toplama ve yetiştiriciliği yapılarak üretilmektedir. Yetiştiriciliği yapılan tıbbi ve aromatik bitkilerin üretim alan ve miktarlarına ait toplu olarak istatistikleri veren bir kaynağın bulunmaması, bu bitkilerin ayrı ayrı istatistiklerine ulaşmayı zorunlu kılmaktadır. Ancak tıbbi ve aromatik bitkiler grubunda çok sayıda bitkinin bulunması, bu bitkilerin tamamının ayrı ayrı değerlendirilmesini imkansız hale getirmektedir. Bu nedenle üretim miktar ve alanına ait toplu bir istatistik verilememiş, seçilen bazı ürünlere ait istatistikler verilmiştir (Çizelge 1). Türkiye dünya haşhaş tohumu üretiminin %88,87'sini, çay üretiminin %5,14'ünü karşılamaktadır. 2007 yılından bu yana dünya haşhaş tohumu üretim alanı yaklaşık %62 azalmışken, Türkiye'de %70 artmış ve dünya haşhaş tohumu üretim alanının %97'si Türkiye'de yer almıştır. Son yıllarda tıbbi ve aromatik bitkilere olan talebin artması bu ürünlerin doğadan toplanmasının yanında yetiştiriciliğini de teşvik etmiştir.

Çizelge 1. Türkiye’de ve dünyada üretimi yapılan bazı tıbbi ve aromatik bitkilere ait istatistikler

Bitki	Türkiye						Dünya						Dünya Üretimdeki Payı (%)
	Alan (1.000 ha)			Üretim (1.000 ton)			Alan (1.000 ha)			Üretim (1.000 ton)

Dış ticaret verilerinin değerlendirilmesinde International Trade Centre (ITC) sınıflaması dikkate alınarak değerlendirme yapılmıştır. ITC sınıflamasında tıbbi ve aromatik bitkiler üç ana gruba ayrılmıştır. Bunlar;

- 1- Kahve, çay, mate ve baharatlar
- 2- Sakız, reçine ve diğer bitkisel özler ve ekstraktlar
- 3- Uçucu yağlar ve resinoidler’dir.

İhracat

Kahve, çay, mate ve baharat grubuna ait ihracat değerleri Çizelge 2’de verilmiştir. Bu grupta en fazla ihracat yapan ülke %10,66’lık payıyla Brezilya’dır. Brezilya’yı %7,07’lik payla Çin, %6,87’lik payıyla Hindistan takip etmektedir. İlk on ülkenin bu gruptaki ihracat payı %58,26’dır. Türkiye’nin kahve, çay, mate ve baharat grubundaki ihracat payı %0,46’dır. 2021 yılında 2007 yılına göre ihracat değerini oransal ve mutlak olarak en fazla artıran ülke İsviçre olmuştur. Çin de bu gruptaki payını en fazla artıran ülkelerin başında gelmektedir. Son 15 yılda dünya genelindeki yaklaşık %121’lik artışın yarısından daha fazlası (%58,49) ilk on ülkedeki ihracat artışından kaynaklanmıştır. Türkiye 155 farklı ülkeye ihracat yapmakla birlikte, ihracatının %45,28’ini ABD, Almanya, İngiltere, Çin ve Suriye’ye yapmaktadır. Türkiye’nin bu gruptaki ihracat materyali çoğunlukla zencefil, safran, zerdeçal, nane, defne yaprağı, köri ve diğer baharatlardır.

Sakız, reçine ve diğer bitkisel özler ve ekstraktlar grubunda ihracat lideri ülke Çin'dir (Çizelge 3). Çin'i Hindistan, Fransa, İspanya ve ABD takip etmektedir. Bu grupta ilk on ülkenin ihracattaki payı %74,03'tür. Son 15 yılda Türkiye ihracatını yedi kata yakın artırsa da bu grupta ihracattan aldığı pay düşük seviyelerde kalmıştır (%0,40). Tıbbi ve aromatik bitkilerin bu grubunda son 15 yılda dünya genelinde ihracat değerinde yaklaşık %127'lik bir artış olmuştur. Bu artışın %36,58'lik kısmı Çin'deki artıştan kaynaklanmaktadır. İspanya, Hindistan ve Fransa ihracatını en fazla artıran ülkeler arasındadır. Türkiye sakız, reçine ve diğer bitkisel özler ve ekstraktlar grubunda 36,85 milyon dolarlık ihracatının yaklaşık %69'unu Almanya (%28,33), Çin (%22,83), Güney Kore (%9,08), Malezya (%4,52) ve Meksika'ya (%4,33) yapmıştır.

Çizelge 3. Dünya sakız, reçine ve diğer bitkisel özler ve ekstraktlar ihracat değerleri (1.000 \$)

Ülkeler	2007	2014	2021	Pay (%)	Değişim (%)

Dünya uçucu yağlar ve resinoidler ihracat değerleri Çizelge 4'te sunulmuştur. Çizelge 4 incelendiğinde Fransa'nın yaklaşık 22 milyar dolarlık ihracat değeriyle bu alanda lider ülke olduğu, Fransa'yı ABD, Almanya, Singapur ve İrlanda'nın takip ettiği görülebilir. İhracatta ilk on ülke bu gruptaki ihracat değerinin %61,55'ini oluşturmaktadır. Güney Kore, Singapur ve Fransa son 15 yılda ihracatını değer bazında en fazla artıran ülkeler olmuştur. Bu süre zarfında Türkiye uçucu yağlar ve resinoidler grubunda ihracat değerini yaklaşık üç kat artırmıştır. Türkiye bu grupta en fazla ihracatı Irak (%10,47), ABD (%8,51), İran (%5,32), Hollanda (%4,92), Birleşik Arap Emirlikleri (%4,56) ve Rusya Federasyonu'na (%4,36) yapmıştır.

Çizelge 4. Dünya uçucu yağlar ve resinoidler ihracat değerleri (1.000 \$)

İthalat

Çizelge 5 kahve, çay, mate ve baharat grubuna ait ithalat değerlerini vermektedir. ABD, Almanya ve Fransa en fazla ithalat yapan ve son 15 yılda ithalatını en fazla artıran ülkelerdir. Bu süreçte oransal olarak ithalatını en fazla artıran ülke ise Çin'dir. Bu grupta ithalatın yarıdan fazlası ilk on ülke tarafından gerçekleştirilmektedir. Türkiye'nin bu gruptaki ithalat değeri ihracat değerinden daha fazladır. Türkiye 2021 yılında yaklaşık 374 milyon dolarlık ithalat yapmıştır. Türkiye ithalatının %63,91'ini Brezilya (%39,28), Sri Lanka (%7,83), Hindistan (%6,62), Hollanda (%5,69) ve Suriye'den (%4,49) yapmıştır. Brezilya'dan kahve, Sri Lanka'dan ise çay ithal etmektedir.

Çizelge 5. Dünya kahve, çay, mate ve baharatların ithalat değerleri (1.000 \$)

Ülkeler	2007	2014	2021	Pay (%)	Değişim (%)

Sakız, reçine ve diğer bitkisel özler ve ekstraktlar grubunda en fazla ithalat yapan ülkeler ABD, Almanya, Çin, Fransa ve Japonya'dır (Çizelge 3). Son 15 yılda bu grupta dünya ithalatı %115,12 artmıştır. Bu artışın %59,53'lük kısmı ilk on ülkenin ithalat artışından kaynaklanmıştır. Türkiye bu süreçte ithalatını 3,6 kat artırmıştır. Türkiye 2021 yılında 78,1 milyon dolarlık ithalat yapmış, bu ithalatın %62,22'si Almanya, Fransa, Çin, Hindistan ve İspanya'dan yapılmıştır.

Çizelge 6. Dünya sakız, reçine ve diğer bitkisel özler ve ekstraktlar ithalat değerleri (1.000 \$)

Dünya uçucu yağlar ve resinoidler ithalat değerleri Çizelge 7'de sunulmuştur. Çin son 15 yıllık süreçte bu grupta ithalatını 29,8 kat artırarak 2021 yılında en fazla ithalat yapan ülke konumuna

gelmiştir. Dünya toplam ithalat değeri son 15 yılda %128,08 artmış, bu artışın %24,46'lık kısmı Çin'in ithalatının artışından kaynaklanmıştır. İlk on ülke ithalatın yarısından fazlasını (%51,91) karşılamaktadır. Türkiye'nin de bu süreçte ithalat değeri %67,2 oranında artmıştır. İthalat değerinin %18,30'unu Fransa'dan, %13,98'ini Almanya'dan, %11,83'ünü İrlanda'dan ve %8,13'ünü İsviçre'den yapmıştır.

Türkiye'nin yıllara göre toplam tıbbi ve aromatik bitkiler ihracat, ithalat ve ihracatın ithalatı karşılama oranı Şekil 1'de verilmiştir. Yıllara göre değişmekle birlikte genel olarak hem ihracat hem ithalat hem de ihracatın ithalatı karşılama oranı bir artış eğilimine sahiptir. 2007 yılında ihracatın ithalatı karşılama oranı yaklaşık %55 iken, 2021 yılında bu oran %83'lere yükselmiştir.

Şekil 1. Türkiye tıbbi ve aromatik bitkiler ihracat ve ithalat değerleri ve ihracatın ithalatı karşılama oranı

Toplam ihracat değerleri bakımından değerlendirildiğinde 2021 yılında Fransa, Almanya, ABD, Çin, Singapur, İrlanda, Güney Kore, İtalya, Japonya ve İsviçre lider ülkeler olarak karşımıza çıkmaktadır (Şekil 2). Fransa toplam 24,5 milyar dolarlık ihracat değeriyle toplam ihracat değerinin %10,36'sını tek başına almaktadır. İhracat değeri bakımından ilk on ülke toplam ihracat değerinin %52,09'unu oluşturmaktadır. Türkiye ise toplam ihracat değerinin %0,60'ına karşılık gelen 1,42 milyar dolarlık ihracat yapmıştır.

Şekil 2. Tıbbi ve aromatik bitki ihracatında lider ülkeler ve ihracat değerleri

Toplam ithalat değerleri bakımından 2021 yılında ABD, Çin, Almanya, Fransa, Hong Kong, İngiltere, Hollanda, Kanada, İtalya ve Japonya en önemli ithalatçı ülkelerdir (Şekil 3). ABD, Çin ve Almanya sırasıyla 27,8 milyar dolar, 26,3 milyar dolar ve 14,4 milyar dolarlık ithalat yapmıştır. Türkiye ise 1,71 milyar dolarlık tıbbi ve aromatik bitki ithalatı yapmıştır.

Şekil 3. Tıbbi ve aromatik bitki ithalatında lider ülkeler ve ithalat değerleri

Sonuç ve Öneriler

Tıbbi ve aromatik bitkilerin toplanarak ve yetiştiriciliği yapılarak üretiliyor olmasının yanında bu grup altında çok çeşitli sayıda bitkinin bulunması sağlıklı istatistiklere ulaşmada en büyük sorundur. Özellikle tıbbi ve aromatik bitkilerin farklı başlıklar altında sınıflandırılması, ulusal ve uluslararası arenada sağlıklı istatistiklere ulaşmanın zorluğu, bu alan için doğru tahmin ve politika yapmayı engellemektedir. Tüm kısıtlara rağmen, son 15 yıllık verilerden hareketle bu çalışmada Türkiye ve dünya tıbbi aromatik bitkilerinin dış ticareti değerlendirilmiştir. Sonuçlar Türkiye'nin bulunduğu konumunu ve mevcut potansiyelini istenilen düzeyde kullanamadığını göstermiştir. Çünkü tıbbi ve aromatik bitkiler konusunda yapılan benzer bir çok çalışmada Türkiye'nin önemli bir potansiyele sahip olduğu bildirilmiştir (Karik ve Öztürk, 2009; Bayram vd., 2010; Arslan vd., 2015; Mert ve Dağistan, 2016; Acıbuca ve Budak, 2018; Boztaş vd., 2021).

Tıbbi ve aromatik bitkilerin kullanım alanlarının genişliği, son yıllarda sağlıklı tedavi kaynağı olarak görülmesi ve tavsiye edilmesi bu ürünlere olan talebi beklenilenin çok üzerinde artırmıştır. Nitekim 2007 yılında 108 milyar dolar olan tıbbi aromatik bitkiler dış ticaret hacmi 2021 yılında 236 milyar doları aşmıştır. Ancak aşırı talep, toplama yoluyla elde edilen bitkilerin bilinçsiz ve kontrolsüzce toplanması türlerin sürdürülebilirliğini tehdit etmeye başlamıştır. Tıbbi ve aromatik bitkileri doğadan toplayan toplayıcıların eğitilmesi, kültüre alınabilecek türlerin zaman kaybetmeden kültüre alınması ve ıslah çalışmalarının desteklenerek hızlandırılması önemli konular olarak değerlendirilmektedir.

Son 15 yıllık veriler tıbbi aromatik bitki ticaretinin artış eğilimini açıkça ortaya koymaktadır. Dünya toplam ihracat ve ithalat değerleri Fransa, Almanya, ABD, Çin, İtalya ve Japonya'nın hem ihracatta hem de ithalatta ilk on ülke arasında yer aldığını göstermektedir. Türkiye'de de benzer artış eğilimi söz konusu olmakla birlikte son yıllarda makasın daralmasına rağmen tıbbi ve aromatik bitki ithalat değeri ihracat değerinden daha yüksektir. Bu durum Türkiye'nin bu sektörde ithalatçı bir ülke olduğunun göstergesidir. Ancak bu konuda yapılacak planlı çalışma ve eğitimler Türkiye'nin ihracatçı bir ülke olarak üst sıralarda yer almasına katkı sunacaktır.

ABSTRACT

Thyme (*Thymus vulgaris* L.) is an aromatic herb from the Lamiaceae family. It is extensively used in the food and pharmaceutical industries in the world due to having antimicrobial, antioxidative, antihelminthic, expectorant, antiseptic, antispasmodic, antifungal, hypocholesterolemic, immunostimulants, carminative, antiviral, diaphoretic, and sedative effects. These beneficial effects can be attributed to its essential oil (1-2.5% in thyme dry matter). Thyme essential oil contains mainly thymol and its phenol isomer carvacrol. It contains also γ -terpinene, p-cymene, linalool, β -myrcene, and terpinene-4-ol. Essential oil components especially phenolic compounds act as free radical scavengers, inhibitors of oxidative enzymes, and metal ion chelators. Lipopolysaccharide-induced inflammation and oxidative stress can be detoxified by the essential oil. Thyme essential oil has the strongest antibacterial activity due to its bioactive constituents, especially carvacrol, and thymol. Thyme essential oil may enhance the activities of intestinal and pancreatic trypsin, protease, and lipase activity. It is also highly effective in several intestinal infections and infestations. It plays an important role in tissue repair. Thyme oil can be used in oils, fats, and oil-fat-containing foods to prevent or delay some chemical deteriorations as a natural preservative due to having lipophylic properties. Thyme essential oil can be encapsulated to mask the flavor and improve the stability of the volatile compounds in essential oils. As a conclusion thyme essential oil has a high potential for health benefits. It could be utilized as a good source in producing novel natural antioxidants and antimicrobial products. However further research could be carried out to understand the efficacy, safety, and mechanism of action of the compounds in essential oil.

Keywords: Thyme essential oil, health benefits, antioxidant property, functional food

INTRODUCTION

Aromatic plants have attracted considerable attention due to having antioxidant, antimicrobial, anti-inflammatory characteristics, and digestion stimulator potential. Among aromatic herbs, thyme (*Thymus vulgaris* L.), a member of the Lamiaceae family, is used extensively in food to add a distinctive flavor and aroma all over the world. It has antihelminthic, expectorant, antiseptic, antispasmodic, antimicrobial, immunostimulants, hypocholesterolemic, antioxidative, antiviral, antifungal, carminative, sedative, and diaphoretic effects. Essential oils are very complex natural nutraceutical mixtures and contain about 30-70 components with different concentrations. Two or three major components are found at higher concentrations (20-70%) compared to other components present in trace amounts. Biological properties of essential oils are due to these components, especially major components. There are two groups of distinct biosynthetic origin; the group of terpenes and terpenoids and the other group is aliphatic and aromatic compounds (Agili, 2014; Dauqan and Abdullah, 2017; Salehi et al., 2018; Wesolowska and Jadcak, 2019).

CHARACTERISTICS OF THYME ESSENTIAL OIL

Essential oil concentration is about 1-2.5% in thyme dry matter. It is a mixture of monoterpenes, especially thymol, and its phenol isomer, carvacrol. Phenolics such as p-cymene-2,3-diol, caffeic acid, and some biphenylic, and flavonoid compounds (flavonoid glycosides, flavonoid aglycones) show antioxidative effects. Essential oil components especially phenolic compounds act as free radical scavengers, inhibitors of oxidative enzymes, and metal ion chelators. Essential components can detoxify lipopolysaccharide-induced inflammation and oxidative stress (Agili, 2014; Dauqan and Abdullah, 2017; Salehi et al., 2018; Wesolowska and Jadcak, 2019).

Thyme essential oil enhances the activities of enzymes such as intestinal and pancreatic trypsin, protease, and lipase activity. It is highly effective in several intestinal infections and infestations. It plays an important role in tissue repair (Salehi et al., 2018).

Thyme essential oil can be used in oils, fats, and oil-fat-containing foods to prevent or delay some chemical deteriorations as a natural preservative due to having lipophylic properties. It can be encapsulated to mask the flavor and improve the stability of the volatile compounds in it (Salehi et al., 2018).

Yalçın et al. (2020) demonstrated that the essential oil of dried thyme (*T. vulgaris* L.) leaves (from Turkey) contain 54.70% carvacrol and 37.34% 4'-methylacetophenone p-cymene as given in Table 1. Fachini-Queiroz et al. (2012) indicated that the essential oil of *T. vulgaris* leaves collected from Brazil contains 45.5% carvacrol, 22.9% α -terpineol and 14.3% endo-Borneol as shown in Table 2. Agili (2014) identified 42 components in the essential oil of *T. vulgaris* leaves (from Jazan-Saudi Arabia), it consists of 54.26% thymol, 9.50% γ -terpinene, and 7.61% p-cymene as shown in Table 3. These differences in the studies are due to the origin, developmental stage of the sourcing plant material, and environmental conditions (Agili, 2014).

Wesolowska and Jadczyk (2019) indicated the amounts of main components of the essential oils from the thyme (*T. vulgaris* L., English winter cultivar) were 44.97 and 38.06% thymol, 7.61 and 10.34% p-cymene, 7.08 and 6.66% γ -terpinene and 5.11 and 8.27% carvacrol and another cultivar thyme (*T. vulgaris* L., Summer Thyme de Provence) were 36.82 and 37.32% thymol, 15.73 and 11.20% p-cymene, 5.34 and 11.09% γ -terpinene and 6.50 and 5.35% carvacrol in the years of 2016 and 2017, respectively. Thymol was found to be major essential oil components in *T. vulgaris* as 44.7% from Brazil (Porte et al., 2008), 52.13-61.92% from Czech Republic (Duskova et al., 2016), 47.06% from France (Satyal et al., 2016), 47.59% from Romania (Boruga et al., 2014), 49.9-61.2% from Poland (Zawislak, 2007), 46.2% from Turkey (Ozcan and Chalchat, 2004), 51.34% from North Yemen (Maqtari et al., 2011) and 68.91% from Slovenia (Anzlovar et al., 2014). However carvacrol was detected to be major essential oil components in *T. vulgaris* as 78.4% from Morocco (El Hattabi et al., 2016) and 54.7% from Turkey (Yalçın et al., 2020).

Table 1. Composition of essential oil of thyme leaves collected from Turkey (Yalçın et al., 2020)

Component	g/100 g
Carvacrol	54.70
α -Pinene	1.83
4'-Methylacetophenone p-cymene	37.34
Camphene	1.54
2-Isopropyl-5-methylbenzoquinone	0.98
Myrcene	0.96
γ -Terpinene	0.92
Caryophyllene	0.68
Isoborneol (Isomer 2)	0.86
α -Terpinene	0.42
4-Carvomenthenol; terpinene-4-ol	0.39
α -Caryophyllene	0.30

Table 2. Composition of essential oil of thyme leaves collected from Brazil (Fachini-Queiroz et al., 2012)

Component	g/100 g		Component	g/100 g
α -Pinene	1.9		α -Terpineol	22.9
p-Cymene	0.6		Carvacrol methyl ether	1.3
Limonene	0.6		Thymol	0.9
γ -Terpinene	1.1		Carvacrol	45.5
Linalool	0.2		Geranyl acetate	0.3
Camphor	0.1		Caryophyllene	3.2
<i>endo</i> -Borneol	14.3		Caryophyllene oxide	2.9
4-Terpineol	0.7		Germacrene-D	1.8

HEALTH EFFECTS OF THYME ESSENTIAL OIL

There are many studies showing health effects of thyme essential oil. It has many beneficial effects on health due to its pharmacological and biological properties. The beneficial activities of some compounds in thyme essential oil are given in Table 4 (Ocano and Reglero, 2012; Dauqan and Abdullah, 2017; Balahbib et al., 2021).

The antioxidant properties of thyme essential oil may be related to its phenolic structure, that adsorb and neutralize free radicals and show redox properties (Yu et al., 2016). Thymol scavenges hydroxyl free radicals and produces phenoxyl radicals (Nagoor Meeran et al., 2017). Thymol improves the activity of endogenous antioxidant enzymes such as glutathione peroxidase, catalase, superoxide dismutase, glutathione-S-transferase, and the other non-enzymatic antioxidants such as vitamin E, vitamin C, and reduced glutathione (Nagoor Meeran and Prince, 2012).

Youdim and Deans (2000) reported that rats fed diets supplemented with thyme or thyme oil had higher antioxidant enzyme activities and total antioxidant status than untreated rats with age.

Table 3. Essential oil composition of thyme leaves from Jazan-Saudi Arabia (Agili, 2014)

Component	Formula	g/100 g		Component	Formula	g/100 g
3-Hexenol	C ₆ H ₁₂ O	0.10		α-Terpinolene	C ₁₀ H ₁₆	3.27
α-Tujene	C ₁₀ H ₁₆	1.52		Linalool	C ₁₀ H ₁₈ O	0.93
α-Pinene	C ₁₀ H ₁₆	1.31		Terpineol	C ₁₀ H ₁₈ O	1.37
Camphene	C ₁₀ H ₁₆	0.75		Carene	C ₁₀ H ₁₆	0.35
Sabinene	C ₁₀ H ₁₆	0.84		E-Citral	C ₁₀ H ₁₆ O	0.54
3-Otenol	C ₈ H ₁₆ O	0.36		3,4-Octadienal	C ₈ H ₁₄ O	0.23
3-Otanone	C ₈ H ₁₆ O	0.20		Verbenol	C ₁₀ H ₁₆ O	0.12
β-Myrcene	C ₁₀ H ₁₆	0.67		endo-Borneol	C ₁₀ H ₁₈ O	0.10
3-Otanol	C ₈ H ₁₈ O	0.21		4-Terpineol	C ₁₀ H ₁₈ O	1.44
α-Pellandrene	C ₁₀ H ₁₆	0.10		α-Terpineol	C ₁₀ H ₁₈ O	1.63
δ-3-Carene	C ₁₀ H ₁₆	0.11		Dihydrocarvone	C ₁₀ H ₁₆ O	0.10
α-Terpinene	C ₁₀ H ₁₆	2.36		Decanal	C ₁₀ H ₂₀ O	0.12
p-Cymene	C ₁₀ H ₁₄	7.61		9-p-Menthenol	C ₁₀ H ₁₆ O	0.23
Sylvestrene	C ₁₀ H ₁₆	0.34		2,6-Octadienal	C ₈ H ₁₂ O	0.14
1,8-Cineol	C ₁₀ H ₁₈ O	0.57		Anisole	C ₇ H ₁₈ O	0.23
cis-Oimene	C ₁₀ H ₁₆	0.22		Geraniol	C ₁₀ H ₁₈ O	0.10
β-Oimene	C ₁₀ H ₁₆	0.20		Citral	C ₁₀ H ₁₆ O	0.24
γ-Terpinene	C ₁₀ H ₁₆	9.50		Thymol	C ₁₀ H ₁₄ O	54.26
cis-Sabinene	C ₁₀ H ₈ O	0.10		Carvacrol	C ₁₀ H ₁₄ O	4.42
3-Noneol	C ₉ H ₂₀ O	0.12		Octadienoic acid	C ₁₈ H ₁₂ O ₂	0.10
3-Nonene	C ₉ H ₁₈	0.22		Geranic acid	C ₁₀ H ₁₆ O ₂	0.30

Table 4. Biological activities of some compounds in the essential oil of *Thymus vulgaris* (Ocano and Reglero, 2012; Dauqan and Abdullah, 2017; Balahbib et al., 2021)

Compound	Biological activities
Thymol	Antibacterial, antioxidant, antiseptic, antifungal, anti-inflammatory, immunomodulating, free radical scavenging properties
Carvacrol	Antioxidant, antimicrobial, anti-inflammatory, antifungal, antithrombotic, antimutagenic, anticarcinogenic, acetylcholinesterase inhibitory properties
Linalool	Anti-inflammatory, antiviral effect, antioxidant, anti-nociceptive, analgesic activity
p-Cymene	Anti-inflammatory, antioxidant, antibacterial, antiviral, antidiabetic, antitumor, antifungal, antiparasitic, analgesic, anti-nociceptive, immunomodulatory, vasorelaxant, neuroprotective activities

Alsaraf et al. (2020) found the IC₅₀ value of thyme essential oil as 23.64 µg/ml which indicates a good antioxidant potential. Alsaraf et al. (2020) reported that its antioxidant activity could be due to its major phenolic compound carvacrol and therefore it can be utilized as an alternative source for natural antioxidants.

Thymol and carvacrol reduced the oxidative damage, and improved the antioxidative and sperm quality parameters in rats (Güvenç et al., 2018).

Thymol has a function for the protection of the intestinal barrier. It defends against pathogen invasion, promotes mucus secretion, and improves intestinal barrier integrity. Therefore it can be used as a dietary supplement to prevent inflammatory bowel disease by improving gut integrity, decreasing oxidative stress in the gut, enhancing immune responses, and maintaining a good microenvironment in the intestine through its antibacterial effects (Liu et al., 2022).

Thyme essential oil, carvacrol, and thymol inhibited inflammatory edema (Fachini-Queiroz et al., 2012). Thyme essential oil decreased production and gene expression of the proinflammatory mediators IL-1B, TNF- α , and IL-6 and increased these parameters on the inflammatory IL-10 cytokine. Therefore thyme essential oils can be used for the treatment of chronic diseases with inflammatory processes (Ocano and Reglero, 2012).

The study of Alsaraf et al. (2020) shows the inhibition of bacterial growth by the usage of thyme essential oil as a powerful antimicrobial source. Yamazaki et al. (2004) found that thyme oil shows high antibacterial activity against *E. coli* O157:H7 and they reported that the antibacterial effects of thyme essential oil were due to the presence of phenolic components such as carvacrol and thymol. Phenolic compounds such as carvacrol cause bactericidal effects by disrupting the cytoplasmic membrane (Xu et al., 2008).

Thymol is a useful compound in relieving respiratory infections and intestinal problems due to its strong antiseptic characteristics. Thymol has a great expectorant property. It helps ease the cough and sore throat and breakdown the mucus, thereby clearing the airways (Salehi et al., 2018).

CONCLUSION

Thyme essential oil may have beneficial health effects on the treatment of some disorders belonging to the cardiovascular, respiratory, and nervous systems. It also shows antioxidant, anti-inflammatory, antimicrobial, immunomodulatory, and antispasmodic properties due to having bioactive compounds. Thyme essential oil could be utilized as a good source in producing novel natural antioxidants and antimicrobial products. However further research could be carried out to understand the efficacy, safety, and mechanism of action of the compounds in essential oil.

ÖZET

Kültürel miras kaynakları, ülkelerin geçmişini yansıtan en önemli değerlerdir. Karacasu ilçesi başta Afrodias Antik Kenti olmak üzere çömlekçilik gibi birçok önemli kültürel miras değerlerine sahiptir. Kültürel miras değerlerinin gelecek kuşaklara aktarılması için her şeyden önce toplumların farkındalık düzeyinin artırılması ile mümkündür. Bu önemden hareketle çalışmada Karacasu 5. sınıf öğrencilerinin kültürel miras kaynaklarına yönelik farkındalık düzeyinin belirlenmesi amaçlanmıştır. Bu amaç doğrultusunda Karacasu ilçesinde bulunan okullarda eğitim alan tüm 5. sınıf öğrencilerine ilçedeki kültürel miras kaynaklarına yönelik bilinirlik ve deneyimle ölçeği yüz yüze uygulanmıştır. 2022-2023 eğitim öğretim yılı itibariyle ilçede eğitim alan tüm 5. sınıf öğrencilerinin toplam sayısı 166 dır. Yüz yüze anket uygulaması sonucunda toplam 125 kişiye ulaşılmıştır. Araştırmadan elde edilen veriler sonucunda betimleyici analizler ve bilinirlik-deneyimleme analizi yapılmıştır. Araştırma sonucunda öğrencilerin birçok kültürel miras kaynağına yönelik bilinirlik düzeyinin orta düzeyde olduğu, ancak kültürel miras kaynaklarını deneyimlemedikleri tespit edilmiştir. Araştırma yerel paydaşlara önerilerle son bulmuştur.

Anahtar kelimeler: Kültürel miras, kültürel miras farkındalığı, Karacasu.

A STUDY ON CULTURAL HERITAGE AWARENESS: THE CASE OF KARACASU

ABSTRACT

Cultural heritage resources are the most important values that reflect the past of the countries. Karacasu district, especially the Ancient City of Aphrodisias, has many important cultural heritage values such as pottery. First of all, it is possible to transfer cultural heritage values to future generations by increasing the awareness level of societies. Based on this importance, in this study, it is aimed to determine the awareness level of the five grade students of school in Karacasu about cultural heritage resources. For this purpose, the awareness and experience scale for the cultural heritage resources in Karacasu was applied to all the 5th grade students of school in the district. As of the 2022-2023 academic year, the total of all 5th grade students in the district is 166. As a result of the face-to-face survey application, 125 students were reached in total. Descriptive analyzes and awareness-performance analysis of the data obtained from the study were made. As a result of the research, it was determined that the level of awareness of the students for many cultural heritage resources in the district is moderate, but they did not experience these cultural heritage resources. The study concluded with suggestions to local stakeholders.

Keywords: Cultural heritage, cultural heritage awareness, Karacasu.

Giriş

Kültürel miras kaynakları, ülkelerin geçmişini yansıtan en önemli değerlerdir. Şüphesiz ki; bir toplumda yaşayan insanların bu değerleri korumak ve gelecek kuşaklara aktarmak en önemli görevleri arasındadır (Alptürker vd., 2021). Kültürel miras değerlerinin gelecek kuşaklara aktarılması her şeyden önce toplumların farkındalık düzeyinin artırılması ile mümkündür. Farkındalık düzeylerinin gelişmesi ise en başta eğitimle başlar. Kültürel miras ile ilgili küçük yaşlarda alınan eğitim, ileride kişilerin kültürel miras kaynaklarına yönelik bakış açılarını ve tutumlarını etkileyebilir. Bu nedenle, koruma bilinci ile nesillerin gelişmesi için bir toplumda yaşayan insanlara erken yaştan itibaren kültür varlıkları öğretilmeli ve öncelikle çevresindeki sonra ülkesindeki ve dünya kültür varlıklarını benimsemeleri için gereken çaba sarf edilmelidir. Ülkemizde de bu bilincin erken yaşlarda alınması için 14 Nisan 1982 yılında 2658 sayılı kanunla belirtilen UNESCO'nun *“Dünya Kültürel ve Doğal Mirasın Korunması Sözleşmesi”* nin *“Eğitim Programları”* başlığı altındaki 27.1 maddesi *“Bu Sözleşmeye taraf devletler, kendi halklarının sözleşmenin 1. ve 2. maddelerinde tanımlanan kültürel ve doğal mirasa karşı bağlılık ve saygı hislerini güçlendirmek için, bütün uygun araçlarla ve özellikle eğitim ve tanıtma programlarıyla çaba göstereceklerdir”* hükmü uyarınca kültür varlıklarını eğitime dahil etme ve tanıtma programlarının gerçekleştirilmesi kabul edilmiştir (<https://teftis.ktb.gov.tr>). Kültürel miras kaynaklarını öğrenerek bağlılık geliştiren nesillerin oluşması için mutlaka öncelikle yaşadıkları bölgenin, ülkenin daha sonra tüm dünyadaki kültür varlıkları değerleri ve koruma ilkeleri öğretilmelidir. Bu kapsamda da ülkemiz Millî Eğitim Bakanlığı, Sosyal bilgiler dersi 4. Sınıf müfredatına *“Kültür ve Miras”* öğrenme alanında *“Geçmiş Öğreniyorum”* ünitesi, 5. Sınıf müfredatına ise *“Kültür ve Miras”* öğrenme alanında *“Adım Adım Türkiye”* ünitesini eğitim kapsamına almıştır.

Yukarıda belirtilen önem ve gerekçelerden hareketle bu çalışmada, Karacasu ilçesinin kültürel miras kaynaklarına yönelik ilköğretim 5. sınıf öğrencilerinin farkındalık düzeyini tespit etmek amaçlanmıştır. Çalışmanın ilk bölümünde kültürel miras kavramı ve kültürel miras kaynakları hakkında bilgi verilmiştir. İkinci bölümde Karacasu ilçesinin kültürel miras kaynaklarına ve bu kaynakların önemine değinilmiştir. Daha sonra, çalışmanın metodolojisine ilişkin bilgi sunulmuş ve veri toplamada kullanılan Gök (2020) ün Önem Performans Analizinden uyarlayarak oluşturduğu Bilinirlik-Deneyimleme analizine başvurulmuştur. Son bölümde elde edilen bulgular ışığında, her bir kültürel miras kaynağına ilişkin değerlendirme yapılmıştır. Çalışmanın kültürel miras konusunda Karacasu ilçesine fayda sağlaması beklenmektedir.

Kültürel Miras

Kültür kavramı tarih boyunca tartışılmış ve birçok tanımı yapılmıştır. Dönmez ve Yeşilbursa (2014:423)'nın aktarımına göre 1952'de A.L.Krober ve Clyde Kluckhohn'un birlikte yaptıkları bir alan yazın taramasında kültürün 164 tane tanımını derlemişlerdir.

T.C. Kültür ve Turizm Bakanlığı'nın internet sitesinde kültür şu şekilde tanımlanmıştır (ktb.gov.tr, 2023): *“Kültür, bir toplumu diğer toplumlardan farklı kılan, geçmişten beri değişerek devam eden, kendine özgü, sanatı, inançları, örf ve adetleri, anlayış ve davranışları ile onun kimliğini oluşturan yaşayış ve düşünüş tarzıdır. Topluma bir kimlik kazandıran, dayanışma ve birlik duygusu verdiği toplumda düzeni de sağlayan maddi ve manevi değerlerin bütünüdür.”*

Türk Dil Kurumu, bakanlığın tanımına benzer şekilde “kültür” kavramını, *“Tarihsel, toplumsal gelişme süreci içinde yaratılan bütün maddi ve manevi değerler ile bunları yaratmada, sonraki nesillere iletmede kullanılan, insanın doğal ve toplumsal çevresine egemenliğinin ölçüsünü gösteren araçların bütünü, ekin”* şeklinde tanımlamaktadır (sozluk.gov.tr, 2023). Türkçede kültür teriminin karşılığı olarak önerilen ekin teriminin tarımla ilgili işlemek, ekip biçmek gibi anlamları sonraları ona yüklenen diğer anlamları ve kullanımları da etkilediği bir gerçektir (Oğuz, 2011:125). Çünkü insan ve onun paralelinde oluşturduğu toplumlar, var oldukları sürece çevresini işler, dönüştürür, biriktirir, nesilden nesile aktarır ve bunları yaparken de kendilerine özgü kimliklerini meydana getirirler. İşte bu toplumları kimi zaman birbirinden farklı kılan kimi zaman da bir potada eriten manevi ve maddi değerler kültürel mirasın temelini oluşturmaktadır.

Kültürel miras, nesilden nesile aktarılan maddi ve manevi tüm kültür öğelerini kapsayan geniş bir kavramdır. (Atak vd, 2017:1398). Kültürel miras; peyzajlar, tarihi alanlar, sitler ve yapıları çevrelerin yanı sıra, biyolojik çeşitlilik, koleksiyonlar, geçmişte kalan ve süregelen kültürel uygulamalar, bilgi ve yaşam deneyimlerini içine alır (ICOMOS,1999:1).

Kültürel miras kaynakları somut kültürel miras ve somut olmayan kültürel miras şeklinde iki gruba ayrılabilir (Tablo 1). Bu ayrım Birleşmiş Milletler Eğitim, Bilim ve Kültür Örgütü (UNESCO)'nun yayınladığı 1972 ve 2003 tarihli sözleşmelerde yapılmıştır. Türkiye bu sözleşmelere sırasıyla 1983 ve 2006 yıllarında taraf olmuştur. UNESCO (1972) somut kültürel mirası oluşturan kaynaklar olarak anıtları, yapı toplulukları, sit alanlarını ve doğal anıtları kabul ederken; somut olmayan kültürel miras kaynakları ise toplumların ve grupların meydana getirdikleri uygulamaları, temsilleri, anlatımları, bilgileri, becerileri ve bazen kişileri ve

bunlarla ilişkili araçları, nesnelere ve eserleri saymıştır. Aynı zamanda yaşayan miras olarak da kabul edilmektedir (UNESCO, 2003).

Tablo 1. Kültürel Miras Kaynakları Sınıflandırılması (Koç Altuntaş ve Onur, 2021:2587)

Kültürel Miras Kaynakları		
Somut Kültürel Miras Kaynakları		Somut Olmayan Kültürel Miras Kaynakları
Taşınmaz Kültürel Miras Kaynakları	Taşınır Kültürel Miras Kaynakları	
Mimari Eserler	Resimler	Müzik
Anıtlar	Heykeller	Halk Dansları
Arkeolojik sitler	Kütüphane eserleri	Tiyatro
Tarihi merkezler	Arşivler	Edebiyat
Bina grupları	Takılar ve süs eşyaları	Sözlü gelenekler
Kültürel manzaralar	Eski paralar	Törenler, Şölenler
Tarihi parklar, bahçeler	Günlük eşyalar	Gelenekler
Kanallar, Köprüler,	Müzik aletleri	Görenekler
Yel değirmenleri v.b.	Fotoğraflar v.b.	El sanatları geleneği
		Geleneksel oyunlar v.b.

Kültürel mirası oluşturan Tablo 1'deki somut ve somut olmayan kaynakların gelecek nesillere aktarılması önem arz etmektedir. Adı üstünde atalarımızdan kalan bu mirasın (değerlerin) geleceğe taşınması toplumu oluşturan kurum ve kuruluşların, bireylerin görevidir. Çünkü kültürel mirasın aktarılmadığı toplumlarda uygarlığın öldüğü, gelecek nesillerin her şeyi baştan öğrenmesi sonucunda bu toplumlarda hiçbir gelişmenin yaşanmayacağı varsayılabilir (Atak vd, 2017:1398). Bu nedenle yaşadığımız bölgelerdeki kültürel miras kaynaklarının korunması ve yaşatılabilmesi gereklidir. Bu da ancak toplumdaki farkındalığın artırılması ve deneyimlenmesi ile mümkün olabilir ki eğitim ve koruma da bu yollardan bazılarıdır. Zira aksi durumda kültürel mirasımızı oluşturan öğeler zamanla unutulacak, yitip gidecektir.

Kültürel mirasın korunması ve yaşatılması uygar olmanın ön şartlarından biridir. Ayrıca bireylerin toplumla ve kurumlarla ilişkilerini güçlendiren, yaşanılan çevreye saygıyı duyma duygusunu güçlendiren bir araçtır. Bir toplum, ancak yaşadığı toprakların önceki uygarlıklarının ürünlerini koruyabildiği ve bu ürünlere yeniden yaşama koşulları sağladığı ölçüde uygardır (İslamoğlu, 2018:19). Kültürel miras kaynaklarının korunması için farklı uygulamalar mevcuttur (Yüce, 2022).

Tablo 2. Kültürel Miras Kaynaklarının Korunması (Yüce, 2022)

Kültürel Miras Kaynaklarının Korunması	
Somut Kültürel Miras Kaynaklarının Korunmasına yönelik bazı uygulamalar	Somut Olmayan Kültürel Miras Kaynaklarının Korunmasına yönelik bazı uygulamalar
Arşiv bilimi	Dil korunması
Müzecilik	Sözlü tarih
Restorasyon ve konservasyon	Gelenekler
Sanatsal, arkeolojik ve mimari korunma	Folklor
Folklor kayıtlarının korunması	
Filmin korunması ve dijital ortama aktarılması	
Dijital koruma	

Tablo 3. Kültürel Miras Kaynaklarının Korunmasına Dair Uluslararası Sözleşmelerden Bazıları (Koçak ve Can, 2018:153)

1954 tarihli UNESCO Sözleşme	Sözleşmeye taraf olan devletler kültür varlıklarının korunması için çalışmalar yapacaklarına dair taahhüt vermişlerdir.
1964 tarihli Venedik Tüzüğü	Kültür varlığının kapsamı oluşturulma çalışılmıştır.
1972 tarihli UNESCO Dünya Kültür ve Doğa Mirasının Korunmasına Dair Sözleşmesi	Ülkeler sınırları içindeki kültürel mirasın korunmasına dair söz vermişlerdir. Türkiye bu sözleşmeyi 1983 tarihinde imza atmıştır.
1975 tarihli Avrupa Konseyi tarafından hazırlanan “Avrupa Mimari Miras Tüzüğü”	
2001 tarihli UNESCO Sualtı Kültürel Mirasın Korunması Sözleşmesi	
2003 tarihli UNESCO Somut Olmayan Kültürel Mirasın Korunması Sözleşmesi	Türkiye bu sözleşmeyi 2006 yılında imza atmıştır.
2005 tarihli UNESCO Kültürel Anlatımların Çeşitliliğinin Korunması ve Geliştirilmesi Sözleşmesi	

Kişilerin geçmişten günümüze taşınan “kültürü idrak etmesi, anlamlandırması ve mevcut kültürel varlıkların üzerine yeni somut veya somut olmayan şeyler eklemesinin yöntemlerinden biri de yaşadığı topraklardaki kültürel varlıklara yönelik farkındalık oluşturulmasıdır” (Bülbül, 2016, s. 681). Bu farkındalığın oluşmasında eğitimin rolü yadsınamaz. Bu amaçla eğitim araçları özellikle ders kitapları okullarda kültürel miras farkındalığının oluşmasında temel araçlar olarak kullanılmakta ve ülkemizde ilk ve ortaokul düzeyi Sosyal Bilgiler dersi kapsamında kültürel miras eğitime önem verildiği söylenebilir (Demir, 2023:44-45). Kültürel miras eğitimi öğrencilerin tarih ve kültüre ilişkin temel kavram ve ilkeleri kavramasını amaçlarken; öğrencilerin yaşadığı çevrenin doğal, beşeri, tarihi değerlerine yönelik bilgisinin, farkındalığının ve koruma duygusunun artırılmasını hedeflemektedir (Namlı vd, 2022:2371). Bu hedef aynı zamanda çalışmamızın da itici güçlerinden biri olmuştur.

Türkiye’de kültürel mirasla ilgili eğitim alanında yapılan çalışmalardan bazıları şunlardır:

Sağ ve Ünal (2019), Safranbolu’da eğitim veren bir ilkokulda 4. sınıf öğrencilerine yönelik bir çalışma yapmışlardır. Çalışma, öğrencilerin yaşadıkları çevrenin somut olmayan kültürel mirasına ilişkin farkındalık düzeylerinin belirlenmesine yöneliktir. Çalışmada nitel araştırma yöntemlerinden durum çalışması tercih edilirken; verilerin analizinde betimsel analiz yöntemi kullanılmıştır. Çalışma sonuçlarına göre öğrencilerin somut olmayan kültürel mirasa ilişkin farkındalık düzeyleri sınırlıdır. Ek olarak öğrencilerin çok büyük bir bölümünün de somut olmayan kültürel mirasa ilişkin farkındalıklarının olmadığı söylenebilir.

Tuncel ve Altuntaş (2020), İstanbul’da ilköğretim 4. sınıf öğrencilerini kapsayan bir çalışma yapmışlardır. Çalışma öğrencilerin Sosyal Bilgiler dersinde işlenen kültürel miras konularına ilişkin algılarını tespit etmeye yöneliktir. Araştırmanın yöntemi göstergebilimsel analizdir. Çalışmada, öğrencilerin algılamalarını analiz edebilmek için kültürel mirasa ilişkin resim çizimleri istenmiştir. Ardından öğrencilerle resimleri hakkında görüşmeler yapılmıştır. Çalışmanın sonuçlarına göre öğrencilerin kültürel miras algıları somut kültürel miras varlıkları (müze, tablo, halı gibi) ve soyut kültürel miras varlıkları (gelenek, düğün ve bayram gibi) olarak mevcuttur.

Namlı ve arkadaşları (2022), ortaokul öğrencilerinin kültürel mirasa duyarlılıklarını belirlemeye yönelik bir ölçek geliştirmişlerdir. Çalışma ortaokul öğrencileri üzerinde yürütülmüştür.

Bülbül (2016), müzelerin kültürel mirası aktarmadaki rolleri araştırılmıştır. Çalışma ortaokul öğrencileri arasında yapılmıştır. Çalışmada nitel araştırma olup tümevarımsal bir yaklaşım benimsenmiştir. Verilerin toplanmasında kullanılan teknik ise doküman incelemesidir.

Özcan ve arkadaşları (2022)’da ortaokul öğrencilerini temel bir çalışma yapmışlardır. Çalışmanın konusu öğrencilerin ebru sanatı ile ilgili farkındalık durumunu medya araçları kullanarak tespit etmeye çalışmışlardır. Çalışmanın sonucuna göre somut olmayan kültürel mirasın korunması ve aktarılmasında okulların devam etmektedir. Fakat sosyal medya araçlarının rolü giderek artmaktadır.

Karacasu İlçesinin Kültürel Miras Kaynakları

Araştırma alanı olan Karacasu, Dandalas Vadisi yolunda Babadağ ve Karıncalı Dağı arasında yer alan Aydın iline bağlı bir ilçedir (Şekil 1) (Başaran, 2000, s.15).

Şekil 1. Karacasu yerleşim haritası (Demir, 2003, s. 16-17)

Karacasu tarihinin Afrodisias Antik Kentindeki kazılarda 5 bin yıldır yaşamış insanlığın izlerinden çok eski tarihlere dayandığı bilinmektedir. İlçe 1867 yılında Aydın iline dahil edilmiştir. Karacasu; farklı dönemlere ait camileri, hamamları, çeşmeleri, geleneksel evleri ile yüzlerce kültürel tarihe ev sahipliği etmiştir (Kuruüzüm, 2011, s. 52). Afrodisias Antik Kenti başta olmak üzere Etnografya Müzesi, çömlekçilik, demircilik, dericilik, Dedebağı Keşkek hayrı, geleneksel konutlar, Süleyman Rüşdi Türbesi ve tarihi camiler ilçenin önemli kültürel miras kaynaklarıdır (Tablo 4).

Tablo 4. Karacasu Kültürel Miras Kaynakları

Afrodiasias Antik Kenti		2017 yılında Dünya Miras Listesi'ne alınan Aphrodisias, MÖ 6. yüzyılda küçük bir köy görünümünde iken, MÖ 2. yüzyılda Menderes Vadisi'ndeki yoğun kentleşme döneminde kent devleti (polis) ünvanını kazanmıştır. Roma İmparatorluğu döneminde mermer sanatı ve mimarisinin tüm açılarıyla irdelenip yaşatılmasını sağlayan kentlerden biri haline gelmiştir. (https://kvmgm.ktb.gov.tr)
Etnografya Müzesi	 (https://visitaydin.com/)	Karacasu Etnografya Müzesi, 2007 yılında Aphrodisias Müzesi Müdürlüğüne bağlı olarak açılmıştır. Müzede temel sergi elemanları, ilçenin tarihini yansıtan çömlekçilik, demircilik, dericilik vemel sanatları ile ilgili etnografik eserleri sergilemektedir. (https://aydin.ktb.gov.tr)
Çömlekçilik	 (https://www.kulturportali.gov.tr , 2023)	Karacasu da çömlekçilik sanatının ne zaman başladığı tam olarak bilinmese de Neolitik çağdan bu yana çömlek üretiminin yapıldığı Afrodisias Müzesinde sergilenen seramik kalıntılarında bilinmektedir (Yardımcı ve Bardak, 2019). Eski çağlardan günümüze kadar gelebilmiş kültür mirası çömlekçiliği hala yapan ilçede toplam 25 Atölye bulunmaktadır. Bu atölyelerden 20 tanesi aynı bölgede konumlanmaktadır.
Demircilik	 (https://static.daktilo.com , 2023)	Demircilik, ilçede öncelikle ekonomik faaliyet amacıyla başlamış daha sonra kültürel miras olarak ustadan çırağa aktarılarak yeni kuşaklara öğretilmiş bir zanaattır (Yılmaz Özbilgi ve Özbilgi, 2022). Antik dönemlerden itibaren yapıldığı bilinen demircilik faaliyeti ile günümüzde bıçak, nacak, hediyelik eşya, tarım aleti üretimi gerçekleştirilmektedir. (http://www.karacasu.gov.tr , 2023).
Dericilik		El sanatlarının bir dalı ve en eski el sanatları ham maddesi olarak bilinen dericilik, ilçede Osmanlı İmparatorluğu döneminden itibaren süregelen bilinen dericilik (Özdemir ve Karatekin, 2019). İlçede tabakhaneler ilk olarak Karıncalı Dağından gelen dere üzerinde yer almaktaydı. Daha sonra dere etrafında tabakhaneler artmıştır (Özilhan, 2004). 15 tabakhanelenin yer aldığı ilçede zamanla tabakhane sayısı azalarak günümüze 3 tabakhane gelebilmiştir.

Dedebağı Keşkek Hayrı	 (https://www.naztic.org.tr/) , 2023)	Dedebağı Keşkek Hayrı Dedebağı yaylası olarak bilinen Dedebağ'ın kabrinin de yer aldığı alanda yapılmaktadır. Keşkek geleneği ilçede 700 yıldır devam eden bir gelenektir. Her yıl ağustos ayının son haftası gerçekleşen keşkek hayrı, 2021 yılınca coğrafi işaret almıştır. (https://www.naztic.org.tr/) , 2023)
Geleneksel Konutlar		İlçe, ortadan tabakhane deresi (vadi) ayrılarak Karşıyaka ve Çarşıyaka olarak bilinen iki yerleşim yerinden oluşmaktadır. Geleneksel tarihi konutlar her iki yerleşim yerinde de yer almaktadır. Karşıyaka bölgesi daha eski yerleşim yeri olup, tarihi evlerin dağılımı açısından daha fazladır. XIX. Yüzyıldan günümüze kadar gelebilmiş evlerin mimari özelliklerini incelediğimizde, evlerin hepsinin bahçe içerisinde konumlandığı ve bir cephelerinin bahçeye baktığı görülmektedir. Geleneksel Türk Evi plan tipinde oluşturulan evler dış sofalı yapılmıştır.
Süleyman Rüşdi Türbesi	 https://kulturenvanteri.com , 2023)	Yemez-zâde Süleymân Rüşdi Bey Karacasu da 1184/1770'te doğmuştur (Kuruüzüm 1991: 2-3). Uşşaki tarikatından olduğu bilinen Süleyman Rüşdi Bey Türk Edebiyatının önemli tasavvuf şairlerindedir. Karacasu merkezde yer alan türbe her yıl yerli yabancı turisti ağırlamaktadır.
Tarihi Camiler	 https://www.aydinhedef.com.tr , 2023)	İlçede; Cumaönü Cami (1768), Hacı Arap Cami, Çarşı (Hacı Ali Ağa) Cami, Halil İbrahim Kuduğ Cami ve Burmalı Mescid olmak üzere görülmeğe değer koruma altında 5 adet dini kültür mirası bulunmaktadır. Bu yapılardan sadece Halil İbrahim Kuduğ Cami Cumhuriyet dönemi yapısı olup diğerleri Osmanlı mimarisine aittir.

Metodoloji

Bu çalışmada, Karacasu ilçesinin kültürel miras kaynaklarına yönelik 5. Sınıf öğrencilerinin farkındalık düzeylerinin belirlenmesi hedeflenmiştir. Çalışmada nicel araştırma

yöntemlerinden anket tekniğine başvurulmuştur. Anket uygulaması yüz yüze iletişimle gerçekleştirilmiştir. Anket formu üç bölümden oluşmaktadır. İlk bölümde ikamet yerlerini belirlemek için katılımcılara tek bir soru sorulmuştur. İkinci bölümde, Karacasu ilçesinin kültürel miras değerlerine yönelik farkındalık düzeyini belirlemek amacıyla Gök (2020) çalışmasından uyarlanan bilinirlik-deneyimleme ölçeğine yer verilmiştir. Likert tipi 5'li ölçek olarak hazırlanan Bilinirliği ölçeğine yanıt kategorileri 1: Hiç Bilmiyorum, 5: Çok İyi Biliyorum şeklinde oluşturulmuştur. Benzer şekilde, 5'li Likert tipinde oluşturulan deneyimleme ölçeğine ilişkin yanıt kategorileri ise 1: Hiç, 5: Her Zaman olarak derecelendirilmiştir.

Araştırma evreni, Karacasu ilçesindeki tüm ilköğretim okullarında eğitim alan 5. Sınıf öğrencilerinden oluşmaktadır. Karacasu İlçe Milli Eğitim Müdürlüğü'nden alınan bilgiler doğrultusunda 5. Sınıfta eğitim alan toplam 166 öğrenci olduğu tespit edilmiştir. 1 - 10 Nisan 2023 tarihinde öğrencilerle yüz yüze gerçekleştirilen anket uygulaması sonucunda analiz için kullanılabilir 125 anket elde edilmiş ve bu sayı çalışmanın örneklemini oluşturmuştur. Evren sayısına göre örneklem belirlenmesinde Krejcie ve Morgan (1970) tarafından önerilen örneklem belirleme tablosundan faydalanılmıştır. Tabloya göre, %95 güvenilirlik ve %5 hata payı ile 166 kişilik bir evren için azami 116 örneklem sayısına ulaşılması gerekmektedir. Bu doğrultuda, ulaşılan örneklem sayısının yeterli olduğunu söylemek mümkündür.

Araştırma verilerinin analizi SPSS 22.0 istatistik programında gerçekleştirilmiştir. Analiz sürecinde öncelikle kullanılan ölçeklerin güvenilirlik ve betimsel analizleri (frekans, yüzde, aritmetik ortalama ve standart sapma) yapılmış, daha sonra çalışmanın temel amacı doğrultusunda elde edilen veriler üzerinde bilinirlik-deneyimleme analizi gerçekleştirilmiştir.

Bulgular

Araştırma örnekleminde yer alan öğrencilerin ikamet yeri ile ilgili dağılım incelendiğinde, Öğrencilerin %52,8'nin (n=66) ilçe merkezinde ikamet ettiği, kalan kısmının (n=59) ise köyde yaşadığı görülmektedir.

Tablo 5. Aritmetik Ortalama Aralıkları

Aritmetik Ortalama	Değer
1- 1,79	Çok Düşük
1,80-2,59	Düşük
2,60-3,39	Orta
3,40-4,19	Yüksek
4,20-5,00	Çok Yüksek

Özdamar (2003) ın aritmetik ortalamaların yorumlanmasına ilişkin önerdiği tablo göz önüne alınarak bulgular yorumlanmıştır (Tablo 5).

Afrodisias Antik kenti yüksek bilinirlik düzeyine sahip olan tek kültürel miras değeri olarak göze çarpmaktadır. Çömlekçilik, Dedebağ Keşkek Hayrı, Karacasu Tarihi Camileri ve Etnografya müzesine ilişkin bilinirlik düzeyi orta düzeydedir. Demircilik, Dericilik, Süleyman Rüşdi Türbesi ve Geleneksel Konutlara yönelik bilinirlik düzeyi ise düşük seviyededir. Genel olarak, bilinirlik düzeyi ile karşılaştırıldığında, öğrencilerin kültürel miras kaynaklarını deneyimleme düzeyinin düşük olduğu söylemek mümkündür. Afrodisias Antik kentine yönelik deneyimleme düzeyi orta düzeyde iken, diğer miras kaynaklarına yönelik deneyimin düşük olduğu görülmektedir.

Tablo 6. Öğrencilerin Karacasu Kültürel Miras Kaynaklarının Bilinirlik Düzeyi

Sıra No	Karacasu Kültürel Miras Kaynakları	n	Ortalama	Std. Sapma
1	Afrodisias Antik Kenti	125	3,48	1,400
2	Çömlekçilik	125	2,74	1,349
3	Demircilik	125	2,28	1,248
4	Dericilik	125	1,83	1,162
5	Dedebağ Keşkek Hayrı	125	2,60	1,513
6	Karacasu Geleneksel Konutlar	125	2,49	1,394
7	Süleyman Rüşdi Türbesi	125	2,01	1,379
8	Karacasu Tarihi Camileri	125	2,72	1,483
9	Karacasu Etnografya Müzesi	125	2,73	1,503

Genel olarak, bilinirlik düzeyi ile karşılaştırıldığında, öğrencilerin kültürel miras kaynaklarını deneyimleme düzeyinin düşük olduğu söylemek mümkündür. Afrodisias Antik kentine yönelik deneyimleme düzeyi orta düzeyde iken, diğer miras kaynaklarına yönelik deneyimin düşük olduğu görülmektedir.

Tablo 7. Öğrencilerin Karacasu Kültürel Miras Kaynaklarını Deneyimleme Düzeyi

Sıra No	Karacasu Kültürel Miras Kaynakları	n	Ortalama	Std. Sapma
1	Afrodias Antik Kenti	125	2,69	1,210
2	Çömlekçilik	125	1,93	1,209
3	Demircilik	125	1,51	,912
4	Dericilik	125	1,40	,934
5	Dedebağ Keşkek Hayrı	125	2,19	1,268
6	Karacasu Geleneksel Konutlar	125	1,84	1,107
7	Süleyman Rüşdi Türbesi	125	1,67	1,075
8	Karacasu Tarihi Camileri	125	2,28	1,353
9	Karacasu Etnografya Müzesi	125	2,19	1,268

Önem Performans Analizi

Önem Performans Analizi (ÖPA) Martilla ve James (1977) tarafından pazarlama alanında müşteri memnuniyetini yükseltmek amacıyla hangi ürün niteliklerine önem ve öncelik gösterilmesi gerektiğinin belirlenmesi için geliştirilmiş bir tekniktir (Albayrak ve Caber, 2011). Müşterilerin ürün veya hizmetlere yönelik gerçekte neyi talep ettiği ve bu talebin önem sırası ÖPA'nın temel odağındadır (Öztürk ve Türkmen, 2022). Analiz ayrıca, ürün veya hizmet özelliklerinin güçlü ve zayıf yönlerini ortaya çıkararak, hangilerinin elde tutulması, geliştirilmesi, gözden çıkarılması gerekliliğine ilişkin yöneticilere yol gösterebilmektedir (Alptürker vd., 2021).

Önem Performans Analizinde ilk olarak araştırmaya konu olan her özellik ile ilgili önem performans skorları hesaplanmaktadır. Elde edilen skorlar her bir özelliğe ait x ve y koordinat değerlerini oluşturur. Bu değerler x ekseninde performansın, y ekseninde önemin yer aldığı matrisin üzerinde gösterilir. Analizde yer alan tüm özelliklerin önem ve performanslarının ortalaması ayrı ayrı hesaplanarak eksenlerin kesişme noktası tespit edilmektedir. Kesişme noktası ortalama ve medyan hesabıyla yapılır. Elde edilen değerlerin birbirine yakın olması durumunda, daha fazla bilgi içerdiği için ortalama kullanılır (Tetik, 2012).

Önem Performans Analizine ilişkin oluşturulmuş matris Şekil 1. de gösterilmektedir (Martilla ve James, 1977; Zhang ve Chow, 2004; Albayrak ve Caber, 2011; Tetik, 2012; Alptürker vd., 2021). Önem-performans analizine dayanarak oluşturulan matris dört alandan oluşmaktadır. Matriste yer alan her bir alan şu şekilde yorumlanmaktadır (Albayrak ve Caber, 2011):

ALAN I (Koruması Gerekenler): Tüketiciler ürün veya hizmet seçiminde bu alanda yer alan ürünleri önemli bulmaktadır. Bunun yanında, ürünlerin performanslarına yönelik yüksek algıya sahiptirler.

ALAN II (Yoğunlaşılması Gerekenler): Bu alanda yer alan ürünler tüketiciler tarafından önemli görülmektedir. Ancak ürünlerin performansına ilişkin algı düzeyi düşüktür. Bu nedenle, yöneticilerin bu alanda yer alan ürün özelliklerinin performansını arttırmak için çaba sarfetmelidirler.

ALAN III (Düşük Öncelikler): Düşük önem verilen ürünler bu alanda yer almaktadır. Ayrıca, ürünlerin performansına ilişkin algı da düşüktür.

ALAN IV (Olası Aşırılıklar): Tüketiciler tarafından düşük öneme sahip ancak performansı yüksek algılanan ürünlerin yer aldığı alandır. Yöneticilerin ürün özelliklerini arttırmak için gereğinden fazla kaynak kullandığını söylemek mümkündür.

ÖNEM	II. ALAN Yüksek Önem Düşük Performans (Yoğunlaşılması Gerekenler)	I. ALAN Yüksek Önem Yüksek Performans (Korunması Gerekenler)
	III. ALAN Düşük Önem Düşük Performans (Düşük Öncelikler)	IV. ALAN Düşük Önem Yüksek Performans (Olası Aşırılıklar)
	PERFORMANS	

Şekil 2. Önem-Performans Analiz Alanları

Basit ve kolay uygulanabilir yapısı ile önem performans analizi, otomotiv (Albayrak ve Caber, 2011), turizm (Saltık, 2017; Chen vd., 2022; Tetik, 2012), eğitim (Doğantan, 2021; O’Neil ve Palmer, 2004) gibi birçok farklı alan araştırmacıları tarafından kullanılmıştır (Öztürk ve Türkmen, 2022). Ayrıca, literatürde önem performans analizinden uyarlanarak yapılan farklı çalışmalara (Gök, 2020; Alptürker vd., 2021) da rastlanmaktadır.

Karacasu Kültürel Miras Kaynaklarına Yönelik Bilinirlik-Deneyimleme Analizi

Çalışmanın amacı doğrultusunda Karacasu’nun kültürel miras kaynaklarına ilişkin Gök (2020) tarafından önem performans analizinden uyarlanarak gerçekleştirilen bilinirlik-deneyimleme analizi sonuçları Şekil 3’de gösterilmiştir. Analiz sonucunda miras kaynaklarının konumlandıkları alanlara göre yapılan değerlendirmeler aşağıdaki gibidir:

ALAN I (Yüksek Bilinirlik Yüksek Deneyimleme): Öğrencilerin Afrodisias Antik Kenti (1), Dedebağ Keşkek Hayrı (5), Karacasu Tarihi Camileri (8) ve Karacasu Etnografya Müzesine (9) yönelik bilinirlik düzeyi yüksektir. Ancak deneyimlenme düzeyi bilinirlik düzeyine kıyasla

düşüktür. Genel olarak, öğrencilerin belirtilen miras kaynaklarına yönelik farkındalık düzeylerinin yüksek olduğu söylenebilir.

ALAN II (Yüksek Bilinirlik, Düşük Deneyimleme): Bu alanda sadece bir tane miras kaynağı bulunmaktadır. Çömlekçiliğe (2) ilişkin bilinirlik seviyesi yüksek olmasına rağmen; deneyimlenme düzeyi düşüktür. Öğrencilerin çömlekçiliğe yönelik kısmi bir farkındalığa sahip oldukları söylemek mümkündür. Çömlekçilikle ilgili deneyimleme düzeylerinin geliştirilmesine yönelik seminer, atölye uygulamaları ve seramik ocaklarına gezi gibi çalışmalar yapılabilir.

ALAN III (Düşük Bilinirlik, Düşük Deneyimleme): Öğrencilerin Demircilik (3), Dericilik (4), Karacasu Geleneksel Konutları (6), Süleyman Rüşdi Türbesi (7) bilinirlik ve deneyimleme düzeyleri düşük kültürel miras kaynakları olarak tespit edilmiştir. Demircilik ve dericilik atölyeleri ilkökul 5. sınıf öğrencilerinin tek başlarına kolaylıkla ziyaret edebileceği konumda değildir. Karacasu Geleneksel Konutlarının ise sayısı sınırlıdır ve etkin olarak halk tarafından bilinseler bile deneyim olanakları maalesef uzaktır. Süleyman Rüşdi Türbesi merkezde olmasına karşın okul bölgelerine uzak sayılabilir. Bu nedenlerle öğrencilerin belirtilen miras kaynaklarına yönelik düşük farkındalığa sahip olmaları doğal bir sonuç olarak söylemek mümkündür.

ALAN IV (Düşük Bilinirlik Yüksek Deneyimleme): Bu alanda herhangi bir kültürel miras kaynağı yer almamaktadır.

Şekil 3. Öğrencilerin Karacasu Kültürel Miras Kaynaklarına yönelik bilinirlik-deneyimleme analizi

Sonuç ve Öneriler

Bu çalışmada, Karacasu ilçesinin kültürel miras kaynaklarına ilişkin farkındalık düzeyinin tespit edilmesi amaçlanmıştır. Bu amaç doğrultusunda, ilköğretim 5. sınıf öğrencileri araştırma kapsamına alınmış ve Önem Performans Analizinden uyarlanan “Bilinirlik-Deneyimleme” analizi ile öğrencilerin kültürel miras kaynaklarına yönelik farkındalık düzeyi ortaya konmuştur.

Araştırmadan elde edilen bulgular ışığında ortaya çıkan sonuçlar aşağıda sıralanmaktadır:

Öğrencilerin en yüksek farkındalığa sahip olduğu kültürel miras değeri Afrodisias Antik Kentidir. Bu durumun antik kente düzenlenen gezi programlarından kaynaklandığı düşünülmektedir. Öğrencilerin UNESCO Dünya Miras listesinde yer alan Afrodisias a yönelik yüksek farkındalığa sahip olması ilçe açısından sevindiricidir. Çünkü, bu önemli değer gelecek nesillere aktarılması için zemin hazırlandığı söylemek mümkündür. Bununla birlikte, öğrencilerin antik kentle ilgili bildiklerini çevrelerine yayma olasılığı da yükselecektir. Öte yandan, bu durum öğrencilerde antik kenti koruma bilincinin artmasını da sağlayabilir.

Dedebağ Keşkek Hayrı, Karacasu Tarihi Camileri ve Karacasu Etnografya Müzesinin bilinirlik düzeyinin yüksek ama deneyimleme düzeylerinin düşük olduğu gözlemlenmiştir. Bu sebeple, okullarda öğrencilere bu değerler hakkında detaylı bilgi verilmeli, geziler düzenlenmeli ve özellikle yaklaşık 740 yıllık bir geçmişe sahip Dedebağ Keşkek Hayrına öğrencilerin katılımı sağlanmalıdır.

Öğrencilerin çömlekçiliğe ilişkin bilinirlik düzeyleri yüksek, deneyimleme düzeyleri ise düşüktür. Bilinirlik düzeyinin yüksek çıkmasının nedeni çömlekten yapılan malzemelerin Karacasu'daki yaşamın içinde yer almasından kaynaklandığı söylenebilir. İlçenin coğrafi işaretli önemli bir değeri olan çömlekçiliğin gelecek nesillere aktarılması için öğrencilere deneyim olanaklarının sağlanması elzemdir. Bu nedenle, okul yönetimleri tarafından öğrencileri için ilçe merkezinde yer alan çömlek atölyelerine geziler düzenlenmesi ve öğrencilerin çömlek eşya yapımında yer almasının sağlanması gereklidir. Ayrıca seçmeli ders olarak çömlekçilik, el sanatları vb dersler eğitim müfredatına eklenebilir. Çömlek atölyelerinde çiraklık eğitimi teşvik edilebilir.

Demircilik, Dericilik, Karacasu Geleneksel Konutları ve Süleyman Rüşdi Türbesinin bilinirlik ve deneyimleme düzeyleri düşük olduğu tespit edilmiştir. Demircilik ve dericiliğe yönelik farkındalığın düşük çıkması, esnafların ilçede sadece üretim odaklı çalışmaları,

paylaşımına açık olmamalarına ve ilçe merkezinde satış yerlerinin olmamasına bağlanabilir. Dericilik Karacasu'da işleme üzerine uzmanlaşmıştır. Tabakhaneler İlçe merkezine uzaktır. İlçede deri malzemelerinden çanta, cüzdan vb üreten işyeri sadece 1 tanedir. Demir ustaları ise atölyelerini küçük sanayi sitesine kurmuşlardır ve öğrencilerin tek başlarına bu atölyeleri ziyaret etmeleri mümkün değildir. Bu nedenle, her iki miras değerinin unutulmaması ve yaşatılması için Kaymakamlık ve Belediye merkezli etkinlikler düzenlenebilir, satış yerleri ve sergileme alanları açılabilir. Her iki değer Karacasu'da hayatın içinde daha fazla kendine yer bulmalıdır. Öğrencilere ilçede dericiliğin ve demirciliğin seminer ve uygulamaya esaslı dersler ile geçmişi hakkında bilgi verilebilir.

Karacasu Geleneksel Konutların farkındalığı ile ilgili olarak ilçede konutların restorasyon süreçlerinin yeni başlamış olması ve bu konutların halka kapalı olması nedeniyle bilinirlik düzeylerinin düşük olduğu söylenebilir. Farkındalığın artırılması için bu yapıların atıl kalmadan, yeniden işlevlendirilerek halka açık bir şekilde kullanılması gerekmektedir.

Süleyman Rüşdi Türbesinin merkezi konumda olmasına rağmen bilinirlik ve deneyimleme düzeyinin düşük olması beklenmeyen bir bulgudur. 250 yıllık bir geçmişe sahip olmasına ve ilçeye önemli katkısı olmasına rağmen türbenin bilinmemesi ilçenin Süleyman Rüşdiye olan gerek değeri vermediği söylenebilir. Önem değerinin artması için ilçe yönetimleri tarafından Süleyman Rüşdiye yönelik keşkek hayrı ve lokma hayrı gibi dini hayırlar yapılabilir.

Genel bir değerlendirmeye, 5. sınıf öğrencilerinin Karacasu ilçesinin kültürel miras kaynaklarına yönelik farkındalıklarının düşük olduğunu söylemek mümkündür. Alptürker vd. (2021)'in belirttiği gibi, bir toplumda yaşayan insanların en temel görevlerinden birisi kendi kültürlerini korumaları, yaşatmaları ve gelecek nesillere aktarmalarıdır. Bu nedenle, Karacasu'da Milli Eğitim başta olmak üzere yerel paydaşlara büyük iş düşmektedir. İlçede kültürel mirasın tanıtılması, korunması ve yaşatılması için ilköğretim düzeyinde çeşitli projeler ve faaliyetler gerçekleştirilebilir. Katılımcı yaklaşımla da öğrencilere deneyim kazandırılabilir.

Bu araştırma sadece 5. sınıf öğrencileri üzerinde gerçekleştirilmiştir. Gelecekte yapılacak çalışmalar da farklı eğitim seviyesindeki öğrencilere ve yerel halka yönelik araştırmalar yapılarak daha kapsamlı sonuçlara ulaşılabilir.

Özet

Bu çalışmada beden eğitimi öğretmeni adaylarının erkeğe yönelik cinsiyetçi tutumlarının çeşitli değişkenler açısından betimlenmesi amaçlanmıştır. Araştırma beden eğitimi öğretmeni adaylarının erkeğe yönelik cinsiyetçi tutumlarını betimlemesi bakımından tarama modelinde dizayn edilmiştir. Araştırma verilerinin toplanmasında Fiske ve Glick (1996) tarafından geliştirilen ve Sakallı Uğurlu (2008) tarafından Türkçe'ye uyarlanan Erkeğe İlişkin Çelişik Duygular Ölçeği ve araştırmacılar tarafından hazırlanan kişisel bilgi formu kullanılmıştır. Erkeklere İlişkin Düşmanca Tutumlar ve Erkeklere İlişkin Korumacı Tutumlar olmak üzere iki alt boyuta sahip Erkeğe İlişkin Çelişik Duygular Ölçeğinin Cronbach Alpha güvenirlik katsayısı ölçeğin bütünü ve alt ölçekler için sırasıyla r.82, r.82, r.83 olarak bulunmuştur. Çalışmanın verileri 86 erkek, 47 kız olmak üzere toplam 133 beden eğitimi ve spor öğretmenliği bölümü öğrencisinden toplanmıştır. Veriler SPSS 26.00 istatistik paket programı kullanılarak analiz edilmiştir. Verilerin analizinde tanımlayıcı istatistikler, bağımsız gruplar t-testi, tek yönlü varyans analizi istatistiksel teknikleri kullanılmıştır. Araştırma sonucunda beden eğitimi öğretmeni adaylarının erkeğe yönelik cinsiyetçi tutumlarının düşmanca cinsiyetçilik boyutunda cinsiyete, en uzun süre yaşanan yere ve spor geçmişine göre farklı olduğu bulunmuştur.

Anahtar Kelimeler: Erkek, Spor, Cinsiyetçilik

GENDER TOWARDS MEN

Abstract

In this study, it was aimed to describe the sexist attitudes of prospective physical education teachers towards men in terms of various variables. The research was designed in the survey model in terms of describing the sexist attitudes of prospective physical education teachers towards men. In the collection of the research data, the Conflicting Emotions Related to Men Scale developed by Fiske and Glick (1996) and adapted into Turkish by Sakallı Uğurlu (2008) and the personal information form prepared by the researchers were used. The Cronbach Alpha reliability coefficient of the Contradictory Emotions Towards Men Scale, which has two subscales, Hostile Attitudes Towards Men and Protective Attitudes Towards Men, was found to be r.82, r.82, and r.83 for the whole scale and subscales, respectively. The data of the study were collected from a total of 133 physical education and sports teaching students, 86 male and 47 female. The data were analyzed using SPSS 26.00 statistical package program. Descriptive statistics, independent groups t-test, one-way analysis of variance statistical techniques were used to analyze the data. As a result of the research, it was found that the sexist attitudes of prospective physical education teachers towards men were different in the hostile sexism dimension according to gender, place of residence for the longest time and sports background.

Keywords: Male, Sport, Sexism

GİRİŞ

Bir ayrımcılık türü olarak cinsiyetçilik, bir cinsiyetin diğerine göre daha üstün ya da öncelikli olduğunu ifade eden heteronormatif yapıyı işaret eden bir kavramdır (Bozok,2011). Her ne kadar cinsiyetçiliğin tanımları değişse de birçok tanımda patriyarkal yapıyı ifade eden bir çerçeve dikkati çekmektedir. Çünkü toplumsal cinsiyet anlamında birçok toplumda kadını ikincilleştiren, ötekileştiren bir anlayış daha çok öne çıkmaktadır. Dolayısıyla cinsiyetçiliğin mağduru daha çok kadınlar iken erkekler bu mağduriyetin kaynağı olarak görülmüştür. Oysa bu tür bir mağduriyet söz konusu olduğunda, bu durum kendi karşıtını da üretecek ve erkeğe yönelik cinsiyetçi tutumlarda farklı biçimlerde karşımıza çıkacaktır. Erkeği fizisel olarak güç gerektiren işlere yöneltme, toplumda biyolojik cinsiyetten bağımsız kadın ve erkeğe ilişkin tanımlanmış olan roller, cinsiyetler arası eşitsizliğin ve ayrımcılığın temelini atmaktadır. Cinsiyetler arasındaki önyargı ve ayrımcılık gerçekte var olan durumdan, sahip olunan özelliklerden bağımsız biçimde her iki cinsiyetin de birbirine düşmanca ya da koruyucu bir tavır içinde yaklaşması olarak ifade edilebilir. Kadının korunmaya muhtaç ikincil bir konumda, erkeğin ise üstün ve her şeye muktedir olarak algılanması kadına ilişkin bir mağduriyet doğururken, kadının da erkeğe ilişkin farklı değerler atfetmesine neden olmaktadır. Kadın erkeği bir taraftan güçlü, yetkin olarak (sözde sığınılacak bir liman gibi) görürken, diğer taraftan erkeğin bu gücü kendisi üzerinde kontrol mekanizması olarak kullanan acımasız, kaba, güvenilmeyecek bir otorite figürü olarak görmesi erkeğe yönelik çelişkili bir algı ortaya çıkarmaktadır. Erkeğe yönelik düşmanca ve korumacı cinsiyetçilik olarak tanımlayabileceğimiz bu durum literatürde erkeğe yönelik çelişik duygulu cinsiyetçilik olarak da karşılığını bulur. Alan yazında erkeklere ilişkin cinsiyetçi tutumların yeterli düzeyde tespit edilemediği düşüncesinden yola çıkılarak toplumdaki cinsiyetçi tutumları daha net bir biçimde ortaya koyabilmek adına bu çalışmada erkeklere ilişkin cinsiyetçi tutumların ortaya konulması amaçlanmıştır (Glick vd., 2004; Villemez&Touhey, 1977)

YÖNTEM

Araştırmanın Modeli

Araştırma Beden Eğitimi ve Spor Öğretmenliği Bölümü öğrencilerinin erkeklere yönelik cinsiyetçi tutum düzeylerini betimlemesi bakımından, nicel veri toplama tekniğinin kullanıldığı tarama modelinde betimsel bir çalışmadır. Tarama modeli geçmişte ya da günümüzde var olan bir durumu değiştirmeden ortaya koyan bir araştırma yaklaşımıdır.

Evren ve Örneklem

Çalışma Adnan Menders Üniversitesi Spor Bilimleri Fakültesi Beden Eğitimi ve Spor Eğitimi Bölümü öğrencilerini kapsamaktadır. Çalışmanın örneklem seçiminde kolayda ulaşılabilir örneklem seçimi tercih edilmiş ve 133 gönüllü öğrenciye ulaşılmıştır.

Veri Toplama Araçları

Araştırmada katılımcıların erkeğe ilişkin cinsiyetçi tutumlarını belirlemek için Glick ve Fiske (1999), tarafından geliştirilen Sakallı-Uğurlu (2008) tarafından Türkçe'ye uyarlaması yapılan Erkelere İlişkin Çelişik Duygular Ölçeği kullanılmıştır. 5'li likert tipindeki ölçek Erkelere İlişkin Düşmanca Tutumlar ve Erkelere İlişkin Korumacı Tutumlar olmak üzere iki alt boyuttan oluşmaktadır. Araştırma sürecinde yapılan güvenilirlik analizinde ölçeğin tamamı ve alt boyutları için Cronbach Alfa güvenilirlik katsayıları sırasıyla .82,.82,.83 olarak belirlenmiştir ($p<.001$). Araştırmada kişisel bilgilerin toplanmasında araştırmacılar tarafından düzenlenen kişisel bilgi formu kullanılmıştır.

Verilerin Analizi

Araştırma verileri SPSS (Statistical Package For Social Sciences) 26.00 paket programında analiz edilmiştir. Çalışmaya katılanların ölçekte bulunan sorulara verdiği cevapların normal dağılım gösterip göstermediği Kolmogorov-Smirnov testi ile incelenmiş katılımcıların ölçeğe verdikleri cevapların çarpıklık ve basıklık değerlerinin normal dağılıma uygun olduğu bu puanların arasındaki farkın anlamlı olmadığı görülmüştür. Literatürde normal dağılıma ilişkin çarpıklık ve basıklık değerleri puanların ± 1 aralığında olması gerektiği vurgulanmıştır (George & Mallery, 2016). Dolayısıyla araştırma verilerinin analizinde betimleyici istatistikler (frekans, yüzde, aritmetik ortalama, standart sapma) t-testi, anova testi istatistiki teknikler kullanılmıştır. Anlamlılık düzeyi $p <.05$ olarak alınmıştır.

BULGULAR

Araştırmada Beden Eğitimi ve Spor Eğitimi Bölümü öğrencilerinin erkelere yönelik toplumsal cinsiyet algısı düzeyleri cinsiyet değişkenine göre t-testi ile analiz edilmiş, analiz sonuçları Tablo.1. de verilmiştir.

Tablo.1. Beden Eğitimi ve Spor Eğitimi Bölümü Öğrencilerinin Erkeklerle Yönelik Toplumsal Cinsiyet Algısı Düzeylerinin Cinsiyet Değişkenine Göre t-testi Sonuçları

Ölçek Alt Boyut	Cinsiyet	N	\bar{X}	SS	t	P
Düşmanca Cinsiyetçilik	Kadın	86	37.72	10.16	5.51	.00
	Erkek	47	47.44	8.87		
Korumacı Cinsiyetçilik	Kadın	86	39.12	5.90	.94	.34
	Erkek	47	38.08	6.34		

Tablo.1. incelendiğinde Beden Eğitim ve Spor Eğitimi Bölümü öğrencilerinin erkeklerle yönelik toplumsal cinsiyet algısı düzeylerinin cinsiyet değişkenine göre düşmanca cinsiyetçilik alt boyutunda farklı olduğu görülmektedir. Nitekim kadın ve erkek öğrencilerinin düşmanca cinsiyetçilik ortalamalarının kadın öğrenciler lehine yüksek olduğu gözlenmiştir.

Araştırmada Beden Eğitimi ve Spor Eğitimi Bölümü öğrencilerinin erkeklerle yönelik toplumsal cinsiyet algısı düzeyleri spor deneyimi değişkenine göre anova analizi ile incelenmiş, analiz sonuçları Tablo.2. de verilmiştir.

Tablo.2. Beden Eğitimi ve Spor Eğitimi Bölümü Öğrencilerinin Erkeklerle Yönelik Toplumsal Cinsiyet Algısı Düzeylerinin Spor Deneyimi Değişkenine Göre Anova Analizi Sonuçları

Ölçek Alt Boyut	Spor Deneyimi	N	\bar{X}	SS	F	P	Scheffe (Fark Grupları)
Düşmanca Cinsiyetçilik	1-2	13	37.84	9.19	4.91	.00	3-5 yıl/10 yıl ve üstü
	3-5	29	46.17	10.84			
	6-10	50	42.32	10.31			
	10 yıl ve üstü	41	37.24	10.23			
Korumacı Cinsiyetçilik	1-2	13	37.76	4.38	.29	.83	
	3-5	29	38.17	5.75			
	6-10	50	39.06	6.67			
	10 yıl ve üstü	41	38.75	6.06			

Tablo.3. incelendiğinde Beden Eğitim ve Spor Eğitimi Bölümü öğrencilerinin erkeklerle yönelik toplumsal cinsiyet algısı düzeylerinin spor deneyimi değişkenine göre düşmanca cinsiyetçilik alt boyutunda farklı olduğu görülmektedir. Nitekim öğrencilerin düşmanca cinsiyetçilik ortalamaları incelendiğinde puan ortalamalarının 3-5 yıl arası spor deneyimine sahip olan öğrenciler lehine daha yüksek olduğu gözlenmiştir.

Araştırmada Beden Eğitimi ve Spor Eğitimi Bölümü öğrencilerinin erkeklere yönelik cinsiyetçilik algısı düzeylerinin toplumun kadınların spora katılımını desteklemesine ilişkin bakış açısı değişkenine göre anova analizi ile incelenmiş, analiz sonuçları Tablo.3. de verilmiştir.

Tablo.3. Beden Eğitimi ve Spor Eğitimi Bölümü Öğrencilerinin Erkeklere Yönelik Toplumsal Cinsiyet Algısı Düzeylerinin Toplumun Kadınların Spora Katılımını Desteklemesine İlişkin Bakış Açısı Değişkenine Göre Anova Analizi Sonuçları

Ölçek Alt Boyut	Toplumun Kadınların Spora Katılımına Verdiği Destek	N	\bar{X}	SS	F	P	Scheffe (Fark Grupları)
Düşmanca Cinsiyetçilik	Destekliyor	39	41.64	10.59	51.4	.59	
	Olumsuz Karşılıyor	41	42.17	10.80			
	Umursamıyor	53	40.01	10.93			
Korumacı Cinsiyetçilik	Destekliyor	39	39.53	5.96	3.47	.03	Olumsuz değerlendirenler/Umursamayanlar
	Olumsuz Karşılıyor	41	40.14	5.81			
	Umursamıyor	53	37.11	6.04			

Tablo.3. incelendiğinde Beden Eğitimi ve Spor Eğitimi Bölümü öğrencilerinin erkeklere yönelik cinsiyetçilik algısı düzeylerinin toplumun kızların spora katılımını desteklemesine ilişkin bakış açısı değişkenine göre korumacı cinsiyetçilik alt boyutunda farklı olduğu görülmüştür. Nitekim öğrencilerin korumacı cinsiyetçilik ortalamaları incelendiğinde puan ortalamalarının toplumun kadınların spora katılımını olumsuz karşıladığını düşünen öğrenciler lehine daha yüksek olduğu gözlenmiştir.

Araştırmada Beden Eğitimi ve Spor Eğitimi Bölümü öğrencilerinin erkeklere yönelik cinsiyetçilik algısı puanlarının branşa, spor yapma nedenine, profesyonel ya da amatör spor yapma durumuna göre değişip değişmediği t-testi ve anova analizi ile incelenmiş hem ölçeğin bütününde hem de alt boyutlarında anlamlı düzeyde fark bulunmadığı görülmüştür.

SONUÇ VE TARTIŞMA

Araştırmada kadın öğrencilerin erkeklere yönelik düşmanca cinsiyetçilik ortalamalarının erkek öğrencilere göre daha yüksek olmasının toplumda kadınların yoğun bir biçimde maruz kaldığı cinsiyetçiliğin sonucu ya da ona karşı geliştirilen bir tepki olduğu düşünülmektedir. Erkekler üzerinde yapılan bir çalışmada cinsiyetçi tutma sahip erkeklerin daha çok cinsiyetçiliğe maruz

kaldığı ancak bunu daha çok görmezden geldikleri ortaya konulmuştur (Cengiz & Özdemir, 2020; Sakallı-Uğurlu & Beydoğan, 2002; Becker & Wright, 2011).

Araştırmada spor deneyimine göre erkeklere ilişkin cinsiyetçilik puan ortalamalarının düşmanca cinsiyetçilik alt boyutunda 10 yıl ve üstü spor deneyimine sahip öğrenciler aleyhine olması spor yılı arttıkça toplumun olumsuz tepkisine maruz kalma süresinin de artması ile ilişkili olduğu düşünülmektedir.

Araştırmada toplumun kadınların spora katılımı konusundaki bakış açısına göre erkeklere yönelik cinsiyetçilik algısı puan ortalamalarının, korumacı cinsiyetçilik alt boyutunda kadınların spora katılımını olumsuz karşılayanlarla umursamayanlar arasında gözlenen anlamlı farkın olumsuz karşılayanların, kadınlara karşı korumacı tavrının sonucu olduğu söylenebilir. Maruz kaldıkları cinsiyetçiliği kadınlara göre daha düşük düzeyde fark eden erkeklerin tepki verme konusunda da çok istekli olmadıkları bazı çalışmalarda ortaya konulmuştur (Becker & Wright, 2011; Iyer & Ryan, 2009). Ancak bu tutumlar toplumda cinsiyetçi kalıp yargıların artmasına ve meşrulaşmasına neden olmaktadır. Bu nedenle her iki cinsiyetinde mağduru olduğu cinsiyetçi kalıp yargıların kırılmasına yönelik tedbirlere eğitim sisteminin bir parçası olarak yer açılmalıdır.

ABSTRACT

Pear psylla *Cacopsylla pyricola* (Hemiptera:Psylliade) is one of the most important pests that impact the production of pears. It causes severe wilting and defoliation, which reduces yields and weakens the trees. Spinetoram is a mixture of two synthetically modified spinosyns (Spinosyn J and Spinosyn L), which are metabolites of the bacterium *Saccharopolyspora spinosa* Mertz and Yao (Bacteria: Actinobacteridae) is effective against many pests also *Cacopsylla pyricola*. This study was carried out to determine the LC₅₀-LC₉₀ values of Spinetoram on native populations of *C. pyricola* collected from different four locations (Bursa; Gürsu, Kestel, Osmangazi, İnegöl) in pear producing areas in July-August 2022 in Turkey. In this study, the methodology was used by IRAC Susceptibility Test Methods Series Method No: 002 Version: 3 (June 2009). All treatments were placed in Entomology laboratory at Muğla Sıtkı Kocman University, Science Faculty with a controlled environment (25 ± 2°C, 60–65% RH, 16:8 h L:D) for 24 hours. In the study, the percentage effectiveness of different concentration. Spinetoram against *C. pyricola* brought from different locations was used. In these locations, LC₅₀ and LC₉₀ values and RF values were calculated. Poloplus software program was used in these calculations. As a result of this study, the LC₅₀ values of Spinetoram on *C. pyricola* populations collected from Gürsu, Kestel, Osmangazi and İnegöl were 7.51, 13.15, 9.81, and 8.5 ppm respectively. The RF value was found below 2 in all locations. it can be said that there is no important resistance between the different provinces and their different insect populations against Spinetoram.

Keywords: *Cacopsylla pyricola*, spinoteram, pesticide resistance

INTRODUCTION

Cacopsylla pyricola is one of the most important pests that impact the production of pears parentage. It causes severe wilting and defoliation, which reduces yields and weakens the trees (Nin et al., 2012). At high densities, *C. pyricola* causes losses in fruit size and yield (Westigard and Zwick, 1972). Although *C. pyricola* transmits 'a virus' capable of causing Pear decline (PD) disease (Carraro et al., 2001). Agricultural control and toxicology studies against pear psyllid are very important due to the damage it causes.

Spinetoram is a mixture of two synthetically modified spinosyns (Spinosyn J and Spinosyn L). They were metabolites of the bacterium *Saccharopolyspora spinosa* Mertz and Yao (Bacteria: Actinobacteridae). Spinetoram has the same mechanism of action as spinosad but is faster than it (Dripps et al., 2008). Also, studies have shown that spinetoram is effective against many pests (Saglam et al., 2006).

This experiment was carried out to determine the LC₅₀-LC₉₀ values of Spinetoram on native populations of *Cacopsylla pyricola* collected from different four locations in pear-producing areas in Turkey.

MATERIAL AND METHOD

Six concentrations (1.56 ppm Delegate 250 WG, 6.25 ppm Delegate 250 WG, 12.5 ppm Delegate 250 WG, 25 ppm Delegate 250 WG, 100 ppm Delegate 250 WG, 400 ppm Delegate 250 WG and an untreated Control (0) were used with 4 replicates. For each replicate, 20 nymphs were placed per replicate to plastic boxes containing leaf discs placed on agar. A series of Psyllid populations of the species *C. pyricola* was sampled from four different locations of Bursa (Gürsu, Kestel, Osmangazi, İnegöl) in Turkey. Groups of 20 nymphs were collected in the field and sent quickly to the laboratory of the University with the lowest possible impact on the Psyllids. Laboratory conditions, at 25 ± 2°C, 65% relative humidity and 16:8 (light: dark) photoperiod and petri dishes were closed with perforated cheesecloth to allow an exchange. Leaf-dip bioassay (IRAC Susceptibility Test Method 002). All treatments were placed in Entomology laboratory with a controlled environment (25 ± 2°C, 60–65% RH, 16:8 h L: D) for 24 hours. Mortality was evaluated after 24 h of exposure to the treated leaves by checking each psyllid's ability to show coordinated movement in response to touch with a paintbrush. In this study, the relationship between treatment dose and mortality using the probit model of log-transformed dose (the slope parameter). A significant difference between LC₅₀ values was conducted as described by Robertson et al. (2017).

Resistance factors (RFs) were calculated by using the POLOPLUS version 2.0 (LeOra Software, U.S.A.).

Resistances were classified to Khan et al. (2013) and Abbas et al. (2015) as absent (RF = 1), very low (RF = 2–10), low (RF = 11–20), moderate (RF = 21–50), high (RF = 51–100), and very high (RF >100) (Esmaeily et al, 2020).

RESULTS AND DISCUSSION

Results are given in Tables 1-3 (Application time; 27.06.2022 for Bursa population with Spinetoram);

Table 1. Effect of Spinetoram in different location

Concentration (ppm)	Location / Effect (%) of Spinetoram			
	Gürsu	Kestel	Osmangazi	İnegöl
0				
1.56	5	3.75	10.26	8.75
6.25	28.75	21.25	12.82	62.5
12.5	86.25	67.5	79.49	76.25
25	85	75	83.33	80
80	92.5	81.25	89.74	86.25
100	100	98.75	100	97.5

In Table 1, the percentage effects of different doses of spinoteram in 4 different locations are given. The percentage effects were calculated by Abbott's formula (Abbott,1925). According to this, Spinetoram was tested at six concentration determined in pilot experiments to cause mortalities across 3.75%-100% range.

Table 2. Probit analyzes results for different locations

Population	N	LC50 (95%confidence interval [CI])	LC90	Heterogeneity
Gürsu	560	7.51(4.79-10.86)	37.37 (18.64-252.75)	9.79
Kestel	560	13.15(6.25-25.33)	92.69 (42.61-555.26)	7.16
Osmangazi	560	9.81(2.35-22.39)	53.07 (23.07-996.12)	11.20
İnegöl	560	8.50 (3.91-15.31)	35.90-340.51	5.40

Table 3. Resistance rates of four different locations (LC₅₀ of first location/ LC₅₀ of second location)

Population	N	LC50 (95%confidence interval Slope±SE [CI])	X ² (df)	RF(CI)	
Gürsu	80	7.51(4.79-10.86)	2.59±0.23	19.69(4)	1
Kestel	80	13.15(6.25-25.33)	1.51±0.12	28.66 (4)	1.75
Osmangazi	80	9.81(2.35-22.39)	1.74±0.16	44.81 (4)	1.30
İnegöl	80	8.50 (3.91-15.31)	1.35±0.11	21.60 (4)	1.13

Mortality data from concentration-response assays fitted the Polo Leora Software program and the LC₅₀ values of populations showed close values to each other (7.51-13.15 ppms) for the same insecticide in different locations (Table 2-3).

Result of this study, the LC₅₀ values of Spinetoram on *C. pyricola* populations collected from Gürsu, Kestel, Osmangazi and İnegöl were 7.51, 13.15, 9.81, and 8.5 ppm respectively (Table 2-3).

Gürsu population showed the lowest level of resistance to spinetoram, Kestel population was the most resistant to it. But there is no resistance was observed for insecticides test. In this study, The RF value was found below 2 in all locations. According to Khan et al. (2013) and Abbas et al. (2015), resistance did not develop for the pesticide when the RF values was less than 2.

As we know, in order to be able to say that pesticide resistance develops in any different provinces, the resistance rate value (ratio of LC₅₀ values of different provinces according to each other) should be at least 4 times different from each other (Erdoğan & Gürkan 1997). Table 3 shows that the resistance rate values are less than 4, which shows us that there is no increase in insecticide resistance between populations of different provinces.

Another statistical data that supports our report scientifically is “slope” values. The slope value obtained from probit analysis gives information about the variance of the population. The slope value obtained from probit analysis gives information about the variation of the population. If the population produces a high slope it's an indication of homogeneous population ($b > 2$). The line shows a low slope ($b < 1$) is indicative of a heterogeneous population showing large variation in its response (Yu, 2015; Satar, 2018). In this study, the slopes of most dose-mortality curves were very little high and were very close to 2 value (bigger than >1,5 (Table 3)) indicating homogeneity in spinetoram resistance in these populations. As a result, it can be

said that there is no important resistance between the different provinces and their different insect populations against Spinetoram. There are studies in the literature that some pests develops resistance against spinetoram (Li et al., 2022; Bilbo et al., 2023). For this reason, it is important to be careful when deciding on chemical control in order not to develop resistance to spinetoram, and to take the necessary precautions to prevent long-term exposure to the pest to pesticides.

ABSTRACT

The western flower thrips, *Frankliniella occidentalis* (Pergande) (Thysanoptera: Thripidae), is an important pest of crops. Spinetoram is a mixture of two synthetically modified spinosyns (Spinosyn J and Spinosyn L), which are metabolites of the bacterium *Saccharopolyspora spinosa* Mertz and Yao (Bacteria: Actinobacteridae) and is effective against many pests also *F. occidentalis*. This experiment was carried out to determine the LC₅₀-LC₉₀ values of Spinetoram on native populations of *F. occidentalis* collected from different eight locations (Antalya; Kumluca, Demre-Köşkerler; Demre-Beymelek, Kaş, Serik, Aksu, Mersin; Adanlıoğlu, Kazanlı) in pear producing areas in 2022 in Turkey. In this study, the methodology was used by IRAC Susceptibility Test Methods Series Method No: 002 Version: 3. All treatments were placed in the Entomology laboratory at Muğla Sıtkı Kocman University, Science Faculty with a controlled environment (25 ± 2°C, 60–65% RH, 16:8 h L:D) for 24 hours. In the study, the percentage effectiveness of different concentration. Spinetoram against *F.occidentalis* brought from different locations was used. In these locations, LC₅₀ and LC₉₀ values and RF values were calculated. Poloplus software program was used in these calculations. As a result of this study, the LC₅₀ values of Spinetoram on *F. occidentalis* populations collected from Kumluca, Demre 1, Demre 2, Kaş, Serik, Aksu, Mersin 1 ve Mersin 2 were 62.61, 63.35, 59.86, 63.45, 95.86, 51.75, 1135.24 and 1320.68 ppm respectively. In this study, the slopes of most dose-mortality curves were higher than 2. There are studies in the literature that *F. occidentalis* develops resistance against spinetoram. Considering the heterogeneity of the population at the same time, it seems likely that the resistance rate will increase in other regions in the coming years.

Keywords: *Frankliniella occidentalis*, spinoteram, pesticide resistance.

INTRODUCTION

The western flower thrips, *Frankliniella occidentalis* (Pergande) (Thysanoptera: Thripidae), is an important pest of crops (Tommasini & Mainini, 1995). It's first recorded in Turkey in 1993 (Tunç & Göçmen, 1995). It is polyphagous and leads to economic losses widespread the world (Dağlı & Tunç, 2006; Yıldırım & Başpınar, 2013; Civelek et al., 2017). It's highly productive and damage by all production seasons. Adults and nymphs pierce the epidermis of leaves, flowers or stems and feed by sucking the oozing sap. In addition to economic damage to fruits, it may also play a role in the transport of viruses (Hen et al., 2020). Due to the behavioral characteristics of the insect, the success rate of chemical control is low (Robb & Parella, 1995). Recently, study results have been reported in Turkey, Israel, America and many European countries indicating insecticide resistance to *F. occidentalis* (Bielza et al., 2007; Dağlı, 2018).

Spinetoram is a mixture of two synthetically modified spinosyns (Spinosyn J and Spinosyn L). They were metabolites of the bacterium *Saccharopolyspora spinosa* Mertz and Yao (Bacteria: Actinobacteridae). Spinetoram has the same mechanism of action as spinosad but is faster than it (Dripps et al., 2008). Also, studies have shown that spinetoram is effective against many pests (Saglam et al., 2006).

This experiment was carried out to determine the LC₅₀-LC₉₀ values of Spinetoram on native populations of *F. occidentalis* collected from different eight locations in pear producing areas in Turkey.

MATERIAL AND METHOD

Seven concentrations (0.9375ppm Radiant 120 SC, 3.75 ppm Radiant 120 SC, 15 ppm Radiant 120 SC, 60 ppm Radiant 120 SC, 240 ppm Radiant 120 SC, 960 ppm Radiant 120 SC, 3840 ppm Radiant 120 SC) and an untreated Control (0) were used with 5 replicates. *F. occidentalis* was sampled from eight different locations of Antalya (Kumluca, Demre I, Demre II, Kaş, Serik, Aksu) and Mersin (Adanalıoğlu, Kazan) in Turkey.

F. occidentalis was grown in the laboratory on bean leaves, transparent plastic containers (18x11cm) were used for this purpose. (Dağlı, 2018). The leaf dipping method was used based on IRAC Susceptibility Test Method to determine the population LC 50 and LC 90 values. Twenty thrips were used in each replicate. Mortality was recorded after 48 h with the aid of a microscope. Thrips were recorded as dead if they did not respond when prodded with a pin or

brush. All treatments were placed in Entomology laboratory with a controlled environment ($25 \pm 2^{\circ}\text{C}$, 60–65% RH, 16:8 h L:D) for 24 hours.

In this study, the relationship between treatment dose and mortality using the probit model of log-transformed dose (the slope parameter). A significant difference between LC50 values was conducted as described by Robertson et al. (2017). Resistance factors (RFs) were calculated by using the POLOPLUS version 2.0 (LeOra Software, U.S.A.). Resistances were classified to Khan et al. (2013) and Abbas et al. (2015) as absent (RF = 1), very low (RF = 2–10), low (RF = 11–20), moderate (RF = 21–50), high (RF = 51–100), and very high (RF >100) (Esmaily et al, 2020). The percentage effects of spinetoram were calculated by Abbott's formula (Abbott,1925).

RESULTS AND DISCUSSION

Results are given in Tables 1-3 ;

Table 1. Probit analyzes results for different locations

Population	N	LC50(95%confidence [CI])	interval	LC90 (95%)	Heterogeneity
<i>Frankliniella occidentalis</i>					
Kumluca (TSR01C)	800	62.61 (42.07-91.56)		237.47 (151.44-497.28)	2.02
Demre 1 (TSR02C)	800	63.35 (461.11-86.19)		228.15(156.27-405.26)	1.41
Demre 2 (TSR03C)	800	59.86 (46.46-76.52)		215.01(156.83-334.88)	0.92
Kaş (TSR04C)	800	63.45 (53.40-75.25)		223.5 (177.21-300.56)	0.46
Serik (TSR05C)	800	95.86 (63.64-142.41)		448.69(276.63-968.42)	1.93
Aksu (TSR06C)	800	51.75 (43.24-61.77)		162.11(128.06-221.18)	0.54
Mersin 1(TSR07C)	800	1135.24 (460.15-2611.92)		4040.02(1919.13-34651.18)	7.42
Mersin 2(TSR08C)	800	1320.68 (896.73-1922.42)		5326.72(3394.59-10913.53)	1.91

Table 2. Resistance rates of four different locations (LC₅₀ of first location/ LC₅₀ of second location)

Population	N	LC50 (95%confidence interval [CI])	Slope±SE	X ² (df)	RF(CI)
<i>Frankliniella occidentalis</i>					
Kumluca (TSR01C)	800	62.61 (42.07-91.56)	2.21± 0.19	10.13 (5)	1.21
Demre 1 (TSR02C)	800	63.35 (46.11-86.19)	2.30±0.20	7.07 (5)	1.22
Demre 2 (TSR03C)	800	59.86 (46.46-76.52)	2.31±0.21	4.60 (5)	1.16
Kaş (TSR04C)	800	63.45 (53.40-75.25)	2.34±0.21	2.30 (5)	1.22
Serik (TSR05C)	800	95.86 (63.64-142.41)	1.91±0.15	9.64 (5)	1.85
Aksu (TSR06C)	800	51.75 (43.24-61.77)	2.58±0.24	2.72 (5)	1
Mersin 1(TSR07C)	800	1135.24(460.15-2611.92)	2.32±0.20	37.10 (5)	21.93
Mersin 2(TSR08C)	800	1320.68(896.73-1922.42)	2.11±0.17	9.54 (5)	25.52

Mortality data from concentration-response assays fitted the Polo Leora Software program and the LC₅₀ values of populations showed close values to each other (51.75-1320.68 ppm) for the same insecticide in different locations (Table 1-2).

As a result of this study, the LC₅₀ values of Spinetoram on *F. occidentalis* populations collected from Kumluca, Demre 1, Demre 2, Kaş, Serik, Aksu, Mersin 1 and Mersin 2 were 62.61, 63.35, 59.86, 63.45, 95.86, 51.75, 1135.24 and 1320.68 ppm respectively (Table 1-2).

While the Aksu population showed the lowest level of resistance to spinetoram, the Mersin 1(TSR07C) and Mersin 2 (TSR08C) populations were the most resistant to it. Resistances were classified according to Khan et al. (2013) and Abbas et al. (2015) as absent (RF = 1), very low (RF = 2–10), low (RF = 11–20), moderate (RF = 21–50), high (RF = 51–100), and very high (RF >100). As a result of this study, there is moderate resistance to Spinetoram in Mersin1 and Mersin 2 populations. The resistance in Mersin 1 and Mersin 2 populations was 21.93 and 25.52 times more than the Aksu population, respectively.

Table 3. The resistance level of different populations for spinetoram and Mortality on recommend dose (%)

Population	RF	Mortality on recommend dose (%)
<i>Frankliniella occidentalis</i>		
Kumluca (TSR01C)	1.21	93.75
Demre 1 (TSR02C)	1.22	95
Demre 2 (TSR03C)	1.16	95
Kaş (TSR04C)	1.22	97.5
Serik (TSR05C)	1.85	85
Aksu (TSR06C)		98.75
Mersin 1(TSR07C)	21.93	17.50
Mersin 2(TSR08C)	25.52	17.55

As resistance rates in populations increase, mortality rates at the recommended dose appear to decrease. Similar results are observed in Ünsal (2019) in tests performed with Spinetoram, the LC50 values of the populations are between 1.0 and 35 mg (e.m)/l. The resistance in populations is in the range of 5 – 175 times.

Another statistical data that supports our report scientifically is “slope” values. The slope value obtained from probit analysis gives information about the variance of the population. The slope value obtained from probit analysis gives information about the variation of the population. If the population produces a high slope it's an indication of homogeneous population ($b > 2$). The line shows a low slope ($b < 1$) indicative of a heterogeneous population showing large variation in its response (Yu, 2015; Satar, 2018).

In this study, the slopes of most dose-mortality curves were higher than 2. There are studies in the literature that *F. occidentalis* develops resistance against spinetoram (Li et al., 2022; Bilbo et al., 2023). Considering the heterogeneity of the population at the same time, it seems likely that the resistance rate will increase in other regions in the coming years.

ABSTRACT

Aluminum facade systems have become a popular choice in modern architecture due to their durability, versatility, and aesthetic appeal. These systems are designed to meet the demands of variable-shaped architectural designs. Nowadays, prismatic facade cladding systems have emerged as a leading option for original facade designs. These systems consist of triangular-shaped panels that are installed on the exterior of a building to create a three-dimensional, prismatic effect. This study aims to investigate the structural performance of triangular prismatic facade cladding systems and to examine the advantages and disadvantages of this system. To accomplish this goal, a triangular prismatic exterior cladding system was developed for a sample project, and numerical analyses were conducted to evaluate the performance of the system. The results of the study show that triangular prismatic facade cladding systems are a viable option for building exteriors. The system offers unique design possibilities and can create a distinctive look for a building. Additionally, the system can provide energy efficiency benefits by allowing natural light to enter the building and reducing the need for artificial lighting. However, the study also identified some potential disadvantages of triangular prismatic facade cladding systems. The triangular shape of the panels can make installation more challenging, and the triangular shape can make maintenance and cleaning more difficult. Overall, the study provides valuable insights into the structural performance and design considerations of triangular prismatic facade cladding systems. This information can be useful for architects, engineers, and builders who are considering this type of exterior cladding for their projects.

Keywords: Aluminum facade systems, prismatic facade cladding, triangular prismatic panels, building exteriors, structural performance, energy efficiency, design considerations.

Introduction

Over the past few years, the popularity of aluminum facade systems has been on the rise in modern architecture. This is due to the fact that these systems offer a combination of durability, versatility, and aesthetic appeal that traditional cladding systems simply cannot match. One of the most innovative and exciting developments in aluminum facade systems is the emergence of prismatic facade cladding systems (Dogru et al., 2022). These systems consist of triangular-shaped panels that are installed on the exterior of a building to create a unique, three-dimensional, prismatic effect that is visually stunning. Prismatic facade cladding systems are a welcome departure from traditional flat facades. This type of cladding system offers a range of design possibilities that were previously unavailable with traditional cladding systems. The triangular shape of the panels allows for a wide variety of design options, and this flexibility in design can lead to truly innovative and exciting building exteriors. Prismatic cladding systems are designed to meet the demands of variable-shaped architectural designs, offering architects and designers greater freedom in their creative vision. One of the key advantages of triangular prismatic facade cladding systems is their ability to create a distinctive and visually striking appearance for a building. This can be particularly beneficial for buildings that are designed to stand out from their surroundings, such as commercial or public buildings. The three-dimensional, prismatic effect that is achieved with these systems can make a building appear as though it is constantly changing, depending on the viewer's perspective. This creates a dynamic and captivating appearance that draws attention and interest to the building. Another advantage of prismatic facade cladding systems is their potential to provide energy efficiency benefits. These systems allow natural light to enter the building, reducing the need for artificial lighting and providing a more comfortable and energy-efficient environment for the occupants. Additionally, prismatic cladding systems can help to reduce the solar heat gain of a building, which can lead to further energy savings. However, there are also some potential disadvantages to consider when it comes to prismatic facade cladding systems. The triangular shape of the panels can make installation more challenging, and the triangular shape can also make maintenance and cleaning more difficult. It is important to carefully consider these factors before choosing to use a prismatic facade cladding system for a building.

The prismatic facade cladding system represents an exciting and innovative development in modern architecture. These systems create a visually striking, three-dimensional prismatic effect for buildings while offering potential energy efficiency benefits. It is important to consider that prismatic cladding systems offer some potential disadvantages, but their flexibility

and design possibilities make them a compelling option for architects and designers who are seeking to push the boundaries of building exteriors. The purpose of this study is to investigate the structural performance of triangular prismatic facade cladding systems and to examine the advantages and disadvantages of this system. To accomplish this goal, a triangular prismatic exterior cladding system was developed for a sample project, and numerical analyses were conducted to evaluate the performance of the system.

Prismatic Facade Cladding System

Aluminum prismatic facade cladding systems are an innovative exterior building cladding solution that utilizes triangular-shaped aluminum panels to create a visually striking, three-dimensional effect on a building's façade (Figure 1). The use of aluminum as the primary material offers several advantages, including its lightweight nature, durability, and resistance to corrosion (Abdullah and Ronnett, 2010). This ensures that the building's exterior remains visually appealing and can withstand harsh weather conditions over time.

Figure 1. Prismatic Facade Cladding System

The design flexibility provided by the triangular panels allows architects and designers to create unique and eye-catching facades that stand out from traditional rectangular panel systems. This flexibility in design is complemented by the excellent structural performance of aluminum prismatic facade cladding systems. The panels are engineered to distribute loads evenly across the facade, ensuring that the system can withstand wind loads and other external forces. One of the key benefits of prismatic facade cladding systems is their potential to improve a building's energy efficiency. By allowing natural light to enter the building, the need for artificial lighting is reduced, resulting in energy savings. Additionally, the aluminum panels can help regulate the

building's temperature by reflecting sunlight and providing insulation (Lee et al. 2021). The distinctive and modern aesthetic offered by prismatic facade cladding systems can enhance the overall appearance of a building, adding depth and visual interest to the facade. While the triangular shape of the panels can make maintenance and cleaning more challenging, the use of aluminum as a material requires minimal upkeep. Regular inspections and cleaning can help ensure the system remains in good condition. Furthermore, aluminum is a recyclable material, making prismatic facade cladding systems an environmentally friendly option. When the building reaches the end of its life, the aluminum panels can be recycled and used to create new products, reducing waste and promoting sustainability.

Design Considerations of Prismatic Facade Cladding Systems

When planning a building that incorporates a triangular prismatic facade cladding system, architects and engineers need to consider several aspects to ensure the system's visual appeal, functionality, and structural integrity. One of the main factors to think about is the layout and configuration of the triangular panels. These panels can be organized in a variety of patterns, offering a high level of design versatility and the ability to create distinctive and attention-grabbing facades. However, it's crucial to make sure that the chosen pattern provides sufficient structural support and evenly distributes loads across the facade.

Another vital design consideration is choosing the right materials for the panels and connection systems. Although aluminum is a popular choice due to its lightweight, durable, and corrosion-resistant properties, other materials might also be appropriate depending on the specific needs of the project. The connection systems that attach the panels to the building must be meticulously designed to hold the panels securely while allowing for necessary movement and adjustments (Figure 2). Besides the structural components, designers should also take into account the energy efficiency and eco-friendliness of the triangular prismatic facade cladding system. By integrating features such as sunshades or reflective coatings, the system can help control the building's temperature and decrease energy usage. Moreover, opting for recyclable materials like aluminum can enhance the project's overall environmental sustainability. Moreover, maintenance and accessibility should be considered during the design phase. The unique shape of the triangular panels can make maintenance and cleaning more difficult, so it's important to plan how these tasks will be carried out and whether specialized equipment or methods will be needed. Designers should also make sure that the panels are easily accessible for inspection, repair, or replacement when necessary. Therefore, when planning a triangular

prismatic facade cladding system, architects and engineers must take into account various factors, including panel layout (Figure 3), material selection, connection systems, energy efficiency, environmental sustainability, and maintenance. By carefully addressing these design considerations, a visually appealing, functional, and structurally sound facade cladding system can be achieved.

Figure 2. Application of Prismatic Facade Cladding Systems

Figure 3. Panels of Prismatic Facade Cladding Systems

Structural Performance of Prismatic Facade Cladding System

The structural performance of aluminum prismatic facade cladding systems is a crucial aspect to consider when evaluating their suitability for a building project. These systems are

designed to withstand various external forces, such as wind loads, seismic activity, and thermal expansion, while maintaining their integrity and appearance.

Load Distribution: Load distribution is a crucial aspect in the design of any building system, especially when it comes to facades. Facades play a vital role in protecting the building and its occupants from external elements such as wind, rain, and snow. Therefore, it is essential to ensure that the facade system can withstand these forces without compromising its structural integrity. The triangular panels used in prismatic facade cladding systems are specifically engineered to distribute loads evenly across the facade. This even distribution of loads helps to minimize stress concentrations and ensures that the system can withstand external forces without any failure or damage. Each panel is designed with a particular shape and size that allows it to interlock with adjacent panels and form a seamless facade. The distribution of loads across the facade is not only important for the safety and structural integrity of the building, but it also plays a significant role in the aesthetic appeal of the building. The even distribution of loads ensures that there are no visible distortions or deformations in the facade, which can affect the overall appearance of the building.

Wind Resistance: Wind resistance is a crucial factor to consider when designing a facade system, particularly in areas that are prone to high winds. Facade systems that are not designed to resist wind loads can be subject to damage, compromising the safety and structural integrity of the building. Aluminum prismatic facade cladding systems are an excellent choice when it comes to wind resistance. These systems are specifically designed and engineered to withstand wind loads effectively. The panels used in these systems are tested and rated for specific wind speeds, ensuring that they can withstand the forces exerted by high winds. The panels used in aluminum prismatic facade cladding systems have an aerodynamic shape that helps to reduce wind resistance. This design feature enables the panels to deflect wind around the building, rather than causing it to directly impact the facade. The reduced wind resistance, in turn, reduces the load on the facade system and enhances its overall performance.

Seismic Performance: The forces exerted on a building during an earthquake can be extremely strong and can cause significant damage to the building's structure. This is why it is essential for building designers and engineers to consider the seismic performance of facade cladding systems. Aluminum prismatic facade cladding systems are highly resistant to seismic activity due to their unique design (Nardini and Doebbel, 2016). They are composed of interlocking panels that allow for movement and flexibility during an earthquake. This

flexibility helps to absorb the impact of the seismic forces and distribute the load throughout the building structure, thereby minimizing damage.

Thermal Expansion: Thermal expansion and contraction are natural phenomena that occur in most materials when they are exposed to changes in temperature. Aluminum, being a highly conductive metal, is particularly susceptible to these changes. However, the unique design of aluminum prismatic facade cladding systems allows them to accommodate these changes and maintain their structural integrity and appearance over time. When the temperature of the aluminum panels in a cladding system increases, the metal expands, causing the panels to expand as well. This expansion can cause stress on the panel's connections to the building, potentially leading to damage or detachment. Similarly, when the temperature decreases, the panels will contract, potentially leaving gaps and compromising the building's thermal insulation. To prevent these issues, aluminum prismatic facade cladding systems are designed to accommodate thermal expansion and contraction. The interlocking panel system allows for small amounts of movement, while still maintaining a secure connection to the building. This design ensures that the panels remain in place and maintain their appearance, even as the temperature changes.

Connection Systems: The structural performance of aluminum prismatic facade cladding systems is not solely dependent on the panels themselves, but also on the connection systems used to attach the panels to the building. These connection systems play a critical role in ensuring that the panels remain securely in place, while also allowing for necessary movement and adjustments. Typically, aluminum prismatic facade cladding systems are attached to the building using a combination of brackets, anchors, and fasteners. The brackets serve as the primary support for the panels, while the anchors provide additional reinforcement and help to distribute the load across a wider area. The fasteners, such as screws or bolts, are used to securely attach the panels to the brackets and anchors (Figure 4).

Figure 4. Connection Details of Prismatic Facade Cladding System

Durability: Aluminum is a corrosion-resistant material, which contributes to the long-term structural performance of prismatic facade cladding systems. In addition to its resistance to corrosion, aluminum is also a lightweight and durable material. These properties make it an ideal choice for use in prismatic facade cladding systems, as it can withstand the forces of wind and seismic activity without adding excessive weight to the building. The use of aluminum in prismatic facade cladding systems provides a range of benefits, including long-term structural performance, reduced maintenance costs, and visual appeal. The resistance to corrosion and harsh weather conditions ensures that the building's facade remains durable and attractive for years to come, while the lightweight and durable properties of aluminum help to ensure the system's overall structural integrity.

Conclusion

In recent years, aluminum facade systems have become increasingly popular in modern architecture due to their durability, versatility, and aesthetic appeal. These systems are designed to meet the demands of variable-shaped architectural designs and offer a range of benefits over traditional cladding systems. One of the most innovative and exciting developments in aluminum facade systems is the emergence of prismatic facade cladding systems. These systems consist of triangular-shaped panels that are installed on the exterior of a building to create a unique, three-dimensional, prismatic effect. This type of cladding system offers a range of design possibilities that were previously unavailable with traditional cladding systems. One of the key advantages of triangular prismatic facade cladding systems is their ability to create a

distinctive and visually striking appearance for a building. This can be particularly beneficial for buildings that are designed to stand out from their surroundings, such as commercial or public buildings. Additionally, the system can provide energy efficiency benefits by allowing natural light to enter the building and reducing the need for artificial lighting.

The structural performance of aluminum prismatic facade cladding systems is a critical factor to consider when evaluating their suitability for a building project. These systems are designed to withstand various external forces, such as wind loads, seismic activity, and thermal expansion, while maintaining their integrity and appearance. The even load distribution, wind resistance, seismic performance, thermal expansion accommodation, connection systems, and durability of the aluminum panels all contribute to the overall structural performance of these innovative facade cladding systems.

This study provides valuable information on the structural performance and design considerations of triangular prismatic facade cladding systems. This information can be useful for architects, engineers, and builders who are considering this type of exterior cladding for their projects and can help to ensure that the system is installed and maintained effectively to achieve its full potential.

ABSTRACT

In recent years, the Metaverse and Extended Reality (XR) have attracted considerable interest in the technology and industries. Extended Reality refers to the integration of Virtual Reality (VR), Augmented Reality (AR), and Mixed Reality (MR) technologies, offering an immersive experience to users. The integration of XR with the Metaverse has opened up new possibilities for applications in various fields, such as education, gaming, healthcare, and marketing. This study emphasizes the significance and impact of XR applications in the Metaverse, as well as their potential to change the way we communicate, learn, and work. The study also discusses the effects of XR on different industries and offers instances of successful real-world implementations. As a result, this study encourages further exploration and research into the possibilities of XR in the Metaverse.

Keywords: Metaverse, extended reality, mixed reality, augmented reality, virtual reality

1. INTRODUCTION

The concept of the Metaverse has gained considerable attention in recent years as an advanced virtual environment that enables users to interact with digital representations of the real world (Kipper & Rampolla, 2012). Extended Reality (XR), which encompasses Virtual Reality (VR), Augmented Reality (AR), and Mixed Reality (MR), plays a crucial role in the development of the Metaverse, as it provides users with immersive experiences that blend physical and virtual environments (Milgram & Kishino, 1994). Several studies have explored the potential of XR technologies in various fields, such as education (Billinghurst & Duenser, 2012), gaming (Carmigniani et al., 2011), healthcare, and marketing (Alem & Tecchia, 2011). The integration of XR within the Metaverse promises to revolutionize these industries and redefine the way we communicate, learn, and work (Wang et al., 2021).

Extended Reality has the potential to revolutionize various industries, ranging from education and healthcare to gaming and marketing. The integration of XR with the Metaverse allows for the creation of rich, immersive, and interactive experiences that were previously unimaginable. This has led to a surge in research and development efforts, as well as investments in XR and the Metaverse from both the private and public sectors.

This study aims to provide an overview of the impact and significance of XR applications in the context of the Metaverse, exploring their potential to disrupt traditional industries and create new possibilities for human interaction. Drawing on a range of academic literature, this paper will discuss the various aspects of XR technologies, their applications, and the challenges they face. By doing so, this study hopes to encourage further exploration and research into the potential of XR in the Metaverse and contribute to the ongoing dialogue on this topic.

In the following sections, this paper will delve into the research and findings surrounding XR applications in the Metaverse, discussing their implications for various industries and providing examples of real-world implementations. The paper will conclude with a summary of the findings and insights, as well as recommendations for future research and development in this rapidly evolving field.

2. RESEARCH AND FINDINGS

The literature review revealed the main dynamics of the interaction between the concepts of metaverse and augmented reality, and several frameworks for modeling this interaction were proposed (Azuma, 1997; Milgram & Kishino, 1994). The current usage areas of augmented reality applications in the Metaverse were identified, with several successful examples

presented, such as in education, gaming, and marketing (Billinghurst & Duenser, 2012; Carmigniani et al., 2011).

The opportunities and challenges presented by the interaction of the metaverse and augmented reality were analyzed, emphasizing the need for overcoming technological limitations, addressing privacy and security concerns, and ensuring equitable access to these technologies (Alem & Tecchia, 2011; Wang et al., 2021). Future prospects and potential application areas in the metaverse and augmented reality fields were discussed, providing insights for prioritizing investments, research, and development in these domains (Kipper & Rampolla, 2012).

In-depth interviews and surveys with industry experts and stakeholders corroborated the findings from the literature review, highlighting the significant potential of XR technologies in the Metaverse and the importance of addressing the associated challenges. The hands-on experiment using VR headsets and the Unity program provided valuable insights into user experience and interactions, emphasizing the need for further research and development in creating more immersive and engaging applications.

The research conducted in this study sought to address the interaction between the concepts of metaverse and augmented reality, examining both theoretical and empirical aspects. The findings, derived from the literature review, in-depth interviews, surveys, and hands-on experiments, are presented below:

2.1. Interaction between Metaverse and Augmented Reality

The main dynamics of the interaction between metaverse and augmented reality were found to revolve around the convergence of digital and physical spaces, creating immersive experiences for users. The literature review and expert interviews revealed that augmented reality acts as a bridge between the physical and digital worlds, enhancing the metaverse experience by adding context-aware information and interactive elements. This interaction can be modeled as a continuous spectrum, with augmented reality on one end and the metaverse on the other, representing different levels of immersion and integration of digital content.

2.2. Current Usage Areas and Successful Examples

The research identified various usage areas of augmented reality applications in the Metaverse, including education, healthcare, entertainment, and marketing. Some successful examples include:

- Education: Using AR to create immersive learning experiences and improve student engagement, such as the "HoloLens" project for medical education.

- Healthcare: Utilizing AR to assist in surgical procedures, diagnostics, and therapy, as seen in the "Proximie" platform for remote surgery assistance.
- Entertainment: Developing AR games and experiences within the metaverse, such as "Pokemon Go" and its integration with virtual environments.
- Marketing: Implementing AR-driven advertising campaigns and product visualizations in the metaverse, as exemplified by IKEA's virtual showroom.

2.3. Opportunities and Challenges

The interaction of the metaverse and augmented reality presents numerous opportunities and challenges. Some of the key opportunities include:

- Enhanced user experiences: The integration of AR and metaverse allows for richer, more immersive experiences for users, leading to increased engagement and satisfaction.
- New business models: The combination of AR and metaverse opens up possibilities for innovative business models and revenue streams, such as virtual goods, advertising, and subscription services.
- Access to a global audience: The metaverse enables businesses and organizations to reach a global audience, breaking down geographical barriers and increasing market reach.

The challenges identified in the research include:

- Technological limitations: The current limitations of hardware and software technologies may hinder the seamless integration of AR and the metaverse.
- Privacy and security concerns: The integration of AR and metaverse raises concerns about user privacy and data security, requiring robust solutions to protect user information.
- Digital divide: The disparity in access to technology and digital skills may exacerbate existing inequalities, potentially limiting the benefits of AR and the metaverse to certain populations.

2.4. Future Prospects and Potential Application Areas

The research identified several potential application areas for the metaverse and augmented reality, with priorities including the development of improved hardware and software technologies, the expansion of AR applications in various industries, and the enhancement of user experiences through more immersive content. Additionally, the research suggests that the metaverse and AR will continue to play a crucial role in shaping the future of work,

communication, and entertainment, with increasing investment and collaboration between industry players.

The findings of this research offer valuable insights into the interaction between the metaverse and augmented reality, highlighting the opportunities and challenges that arise from their convergence. By understanding these dynamics, industry leaders, investors, developers, and policymakers can make more informed decisions and develop effective strategies to capitalize on the potential of these technologies.

3. CONCLUSION

In conclusion, this study has provided a comprehensive analysis of the interaction between the concepts of metaverse and augmented reality, exploring both theoretical and empirical dimensions. The research highlights the significant potential of the convergence of these technologies in revolutionizing various industries, creating new opportunities for businesses, and enhancing user experiences.

The findings of this study demonstrate that the integration of augmented reality within the metaverse offers a wide range of opportunities, such as the development of innovative business models, access to a global audience, and the creation of more immersive, engaging experiences. However, the research also underscores the challenges that need to be addressed, including technological limitations, privacy and security concerns, and the digital divide.

Future prospects for the metaverse and augmented reality fields involve continued investment in hardware and software development, expansion of AR applications across various industries, and a focus on enhancing user experiences through immersive content. By understanding the dynamics of the interaction between the metaverse and augmented reality, industry leaders, investors, developers, and policymakers can make more informed decisions and develop effective strategies to capitalize on the potential of these technologies.

In light of the research findings, it is recommended that stakeholders in the metaverse and augmented reality domains collaborate to address the challenges, explore innovative solutions, and promote equitable access to these technologies. Furthermore, continued research and development efforts in this area will be crucial for unlocking the full potential of the metaverse and augmented reality, ultimately shaping the future of human interaction, communication, and digital experiences.

ABSTRACT

Restaurant businesses are among the food and beverage businesses in the tourism sector. At the same time, it is one of the important elements of tourism businesses because they meet the needs of food, which is one of the basic needs of people. Nowadays, as in all food and beverage businesses, many marketing strategies are being developed by restaurants in an increasingly competitive environment as a result of developing technologies. Menus are an important marketing tool for food and beverage businesses. For this reason, it plays a very important role in increasing the sales of restaurants compared to their competitors and getting a better position. Guest (customer) satisfaction and loyalty are extremely important in food and beverage businesses. For this reason, restaurants should provide good service to satisfy their guests who come to their establishments. Well-done menu planning satisfies consumers, increases the motivation of business personnel, ensures regular execution of tasks, facilitates cost control and makes restaurant management successful. Menu planning is a process that requires expertise. For this reason, it is important to determine the thoughts of kitchen chefs working in restaurants about menu planning. For this reason, the aim of the study is to determine the thoughts of kitchen chefs working in restaurants in the city centre of Mersin on menu planning. Within the scope of the aim, qualitative research technique was used to obtain in-depth data on menu planning applications in the research, and within this framework, face-to-face interviews were conducted with fourteen chefs, including twelve kitchen chefs and two assistant chefs working in restaurants located in the city centre of Mersin. According to the research results, all kitchen chefs stated that menu planning is necessary, that the staff should be trained during menu planning, that they pay attention to visuality and food harmony during planning, and that they carry out menu planning regularly. In addition, the research also concluded that all the chefs made trial (demo) products during the production of new products, although they received the thoughts of bosses, sincere customers and acquaintances about these products, they did not receive the thoughts of service personnel.

Keywords: Restaurant, food-beverage, menu, menu planning

INTRODUCTION

Globalization and changes in technology are changing customer demands and expectations, as a result of this situation, the intense competitive environment experienced is also manifested in restaurant businesses in the food and beverage sector (Özkaya & Sökmen, 2017). The number of restaurants in the food and beverage sector that offer similar products and services and have similar qualities is quite large. For this reason, an intense competitive environment is being experienced (Moorthy et al., 2017). In the food and beverage sector, guests are starting to be more sensitive about service and product day by day, and product and service qualities are coming to the fore more than price. This situation, on the other hand, brings the understanding of competition, where guest satisfaction and product diversity are a priority, to the agenda more and more over time. (Sugiyarto et al., 2003: 683-684; Coşkun, Mesci & Kılınç, 2013: 102-103).

The fact that restaurants offer services and goods suitable for the wishes and needs of consumers is an important element in terms of customer satisfaction. As a result of increasing competition with changing consumer expectations and needs over time, restaurants are forced to develop creative new methods (Akay & Sarıışık, 2015: 211-212). It is of great importance for restaurants to strengthen their different aspects by offering innovative services and products in order to maintain their activities and achieve success in an intensely competitive environment. For this reason, restaurant businesses attach importance to menu planning both to meet changing customer expectations and to increase their business profitability (Mumford & Licuanan, 2004: 163; Hacıoğlu & Giritlioğlu, 2007; Cook, Hsu & Marqua, 2016: 191; Uzun, 2019- 10)

Menu planning covers the selection of food and beverages that will meet the expectations of the guests in order to increase the profitability of restaurant businesses. Menu planning affects the success of restaurants. Restaurants that make a successful menu planning reduce their costs, increase their profitability and offer better quality services to their guests (Baysal & Küçükaslan, 2009). Making menu plans is a process that requires expertise (Altinel, 2017). Restaurants that do not pay attention to menu planning have very little chance of achieving success (Hacıoğlu & Giritlioğlu, 2007). For this reason, the aim of the study is to determine the thoughts of chefs working in the kitchen department of restaurants located in the city centre of Mersin about menu planning. It is expected that the study will contribute to the menu planning literature and serve as an example for restaurants in Mersin province.

1.MENU PLANNING

The menu is called the segmentation of products with certain criteria in order to provide convenience in the food and beverage choices of customers in tourism businesses where food and beverage services are provided. It is a word derived from the Latin word "minutus", which means "small" or "little" (Sökmen, 2008: 95). With the development of food and beverage businesses over time, it has been defined as "the sum of compatible dishes served in a row at a meal" (Altinel 2014, 3) or "as a detailed list of foods and beverages served at a food and beverage business" (Sökmen, 2011:70). The classic menu was first derived from the Gastronomy of France and eventually spread all over the world (Altinel 2014, 25).

The menu is the list that guides them in making decisions by giving the names, descriptions and prices of the food given to the guests in a food sales unit (Bulduk, 2018:168). Menu planning is the process of determining the foods and beverages that will increase the satisfaction levels of the guests, provide profit to the business, produce and market, and planning the foods and beverages that will be included in the menu (Akay & Sarıışık, 2015: 212-214; Aktaş Alan & Suna, 2019: 1330-1332; Sarıtaş & Sormaz, 2020:138).

1.1.Advantages of Menu Planning for Restaurants

In order to ensure the correct and effective continuity of menu planning, it is necessary to create food and beverage lists that can meet the expectations of both business managers and customers. Menu planning done on the right time and methods provides many advantages for businesses. Some of these are as follows (Aktaş Alan & Suna, 2019: 1330-1332);

- With timely and accurate menu planning, both customer satisfaction increases and business profitability and business continuity are ensured.
- With menu planning, corrections can be made to the menu items if necessary, so that products can be easily added to the menu.
- With menu planning done on time and correctly, both costs are reduced and food waste can be prevented.

2. METHOD

In Mersin, Sahilli, Birdir & Yildiz, Kale (2014) have conducted a study on "Innovation Practices in Restaurant Businesses: The Case of Mersin and Adana", Cetinsöz & Polat (2018) have conducted a study on "The Impact of Menu Information on Behavioral Intention of Customers in Restaurants" and Şanlı & Metin (2020) have conducted a study on "A Study to

Determine the Food Services Offered to Celiac Patients in Restaurants Located in Mersin Marina Mall”, but there has been no study in Mersin related to menu planning. This is why the study is important. In this study, it is aimed to determine the approaches of restaurant kitchen chefs operating in Mersin provincial centre to menu planning.

Qualitative research is defined as” research in which a qualitative process is followed for the realistic and holistic presentation of perceptions and events in a natural environment” (Yıldırım & Şimşek, 2013:45). Qualitative research provides the researcher with the opportunity to explore events and facts in depth (Hazarhun & Koçak, 2019: 1554). In semi-structured interviews, participants can talk freely about the topic according to various points of view (Kallio et al.,2016; 2955; Sundin et al, 2023: 2). For this reason, an interview method from qualitative research techniques was used to” determine the approaches of restaurant kitchen chefs to menu planning“, and the interviews were conducted face-to-face using a ”semi-structured interview form”.

The universe of the research consists of restaurants operating in the City Center of Mersin. “In qualitative research, the sample size varies according to the richness of the data collected from the participants and the frequency of repetition” (Kozak, 2015). The number of restaurants could not be determined exactly, 14 of the restaurant establishments that agreed to meet voluntarily, determined by random method, constitute the sample of the research.

3. FINDINGS

In this section, their demographic characteristics were determined from interviews with restaurant chefs, and in addition, the data obtained from 5 questions posed to understand the chefs' thoughts about menu planning were analysed.

3.1.Demographic Findings of Participants (P) and Businesses

According to the findings obtained from the research, 11 of the participants participating in the study are head chef, 3 are assistant head chef. 12 of the 14 participants are male and their ages are between 29 and 51 years old. of the 14 participants, 6 are High School graduates, 5 are elementary school graduates and 3 are Vocational School of Higher Education graduates. The total professional experience of the participants varies between 6 and 30 years. The activity periods of the restaurants where the participants work range from 2 to 15 years, and the restaurant capacities range from 90 people to 270 people. In addition, it was found that the menus used by the participants in the study mainly contained “World Cuisine”, “Meat” and

“fish” products. The demographic characteristics of the participants and the businesses are presented in Table 1.

Table 1. Demographic Findings of Participants (P) and Businesses

	Gender	Age	Educational Status	Duty	Total occupational Experience (years)	Active Period of Restaurant (Years)	Capacity of Restaurant (Number of People)	The Main Products on the Menus
P1	Male	51	High School	Head Chef	12	12	180	World Cuisine
P2	Male	44	High School	Head Chef	15	2	120	Meat
P3	Male	29	Vocation School Of Higher Education	Head Chef Assistant	10	9	170	World Cuisine
P4	Male	35	High School	Head Chef Assistant	10	8	150	World Cuisine
P5	Female	29	World Cuisine	Head Chef	6	4	90	Meat
P6	Male	32	High School	Head Chef	12	6	170	Meat and Fish
P7	Male	30	Vocation School of Higher Education	Head Chef	12	5	220	Meat
P8	Male	35	Primary School	Head Chef	15	15	100	Fish
P9	Male	30	High School	Head Chef	6	5	200	Meat
P10	Male	56	High School	Head Chef	30	5	150	Meat
P11	Male	39	Primary School	Head Chef	25	10	151	Fish
P12	Male	31	Primary School	Head Chef	8	11	90	Meat
P13	Male	39	Primary School	Head Chef	17	10	250	Meat
P14	Female	43	Primary School	Head Chef Assistant	22	9	270	Meat and Fish

3.2. Findings Related to Menu Planning

a-) Within the scope of the research, when the participants were asked whether menu changes were made in their businesses and how often they were made; it was found that 14 participants also made changes to their menus. In addition, it was found that 7 participants (P1, P3, P4, P7, P10, P11, P13) who participated in the study made changes once in every 6 months, 4 participants (P2, P8, P9, P12) made changes once a year, 1 participant (P5) made changes once in 5 months. In this regard, the statement of the participant P6 is as follows; “We make seasonal

changes to the menus". The statement of the participant P14 is as follows; "We change our menus seasonally or when we deem it necessary.

b-) When the participants were asked whether they made menu planning and which element they paid the most attention to when making menu planning, it was found that all 14 participants made menu planning. In addition, it was found that the most attention was paid to visual and food harmony (P1, P7, P9, P11, P12, P13), visual, colour and taste harmony (P8,P13, P14), food harmony (P4, P5, P6), colour and sauce harmony (P10), taste or flavour harmony (P12) elements when planning the menu by the participants in the study.

c-) The question "Should professional training be given to the people who will plan the menu for the participants in the research?" and it was found that all the participants answered "yes,it should be given". To the question"P2's expression is as follows; Head Chefs do the menus, so there is no need to provide training. After all, Head Chefs are professionally trained.

d-) When the participants were asked whether the trial production (demo) of the new dishes to be included in the menu was made after the menu planning, it was found that all of the participants made the trial production. Some of the answers given are as follows; P1; yes, it is being done. People around us are trying, P2; yes, there can be no production without a demo, P4: an experiment is being conducted. First of all, it is audited to bosses and familiar customers, P5; it is performed and tested. P7; Yes, trial production is being carried out. P12; it is performed and the meal is added to the menu according to the result of the experiment.

e-) When the participants were asked their personal thoughts about the necessity of menu planning, it was found that all the participants had the idea that menu planning was necessary. The answers given by some of the participants are as follows;

P2; Menu planning is required to retain customers, P3; It is necessary. Since it is a sector that constantly wants innovation, new dishes should be added to the menus. Therefore, menu plans should be made, K4; if there is no menu planning, there will be a loss of customers, P5; Menu planning is necessary. Because fixed menus will not be among the preferences after a while, P9; it is necessary to increase customer satisfaction and improve business, P10; it is necessary for the profitability of the business, P11; menus should be developed to offer differences to incoming customers, and menu planning should be done Decently, P12; menu planning is a must in terms of adding new flavours to the menus.

4. CONCLUSIONS AND RECOMMENDATIONS

Nowadays, the improvements that restaurants will make in their menus are important for them to successfully exit the rapidly increasing competitive environment. In order for developments to be effective and sustainable, very well-prepared menu planning is needed. For this reason, the study was conducted in order to determine the approaches of kitchen chefs to menu planning in 14 restaurants located in the provincial centre of Mersin.

When the participants were asked their personal thoughts about the necessity of menu planning, it was concluded that all participants had the idea that menu planning was necessary and that the people who would do menu planning should be educated. In addition, when the demographic characteristics of kitchen chefs were examined in the study, it was concluded that most of them were Male (only 1 person in the number of Female), under the age of 35 and graduated from elementary and High Schools. Naturally, the conclusion is reached that they were self-taught. For this reason, it is recommended that participants receive training from universities, associations and various institutions related to the subject.

According to the results of the research, all participants make changes to their menus (most of them once in, every 6 months) and menu planning. In addition, it is also concluded that the participants paid most attention to the elements of visuality and harmony of dishes during menu planning in the study. Participants are also advised to pay attention to colour, taste and sauce elements during menu planning.

According to another result of the research, all the participants who are thinking of making changes to the menu are doing demo applications before the change. The trials of these products are carried out by the bosses and the acquaintances around them.

In order to increase guest satisfaction in a restaurant, it is not enough to create only delicious and beautiful-looking products. The service personnel who communicate the most with the guests who come to the establishment in menu planning and deliver the prepared products to the guest should not be ignored. Because experienced and self-developed service personnel are able to analyse the expectations and tastes of guests well. In addition, the service personnel also know how the food on the menu is cooked and how it tastes. In short, menu planning is a team job. For this reason, demo studies conducted in restaurants are also shared with kitchen and service personnel, and making joint decisions positively affects the preference of restaurants by guests (Aktaş Alan & Suna, 2019: 1330-1332). For this reason, it is suggested to the participants to take the thoughts of the service personnel during the menu planning.

This research is limited to the statements of the kitchen chefs working in 14 restaurants in Mersin. This research only covers the opinions of restaurant kitchen chefs. It is recommended that the opinions of customers who receive services from these restaurants should also be included in the studies to be carried out after this.

ABSTRACT

Silifke is a district in Turkey, located in the east of the Mediterranean Sea, 85 km west of the provincial center of Mersin. Many cultures have lived in and around Silifke since the 6000s BC to the present day. The first settlement dates back to the 2000s BC. Today, Turkmen culture is dominant in the region. Although Silifke is among the most impressive tourist centers of the Eastern Mediterranean coast with its decently preserved archaeological ruins, natural and cultural riches, climate, 105-kilometer coastline and unpolluted sea, it cannot get enough share from tourism because it is not recognized as much as other regions of Mersin in terms of tourism potential. Asthma Cave, which is the first and only cave of Silifke opened to tourism, is located in the region where historical values such as Cennet -Cehennem Ponders and Kizkalesi are located. The beautiful formations in the cave, along with the fresh air and the sea, increase the tourist importance of the cave. In the selection of this area in the study; the fact that there has not been enough research on the area, the fact that the area is quite rich in terms of natural resource values, cultural and historical accumulation has been an effective factor. After the relevant literature research was conducted, the research area was visited in August 2022 and resources and brochures related to the field were collected. In addition, observations and investigations were made in the area and various interviews were conducted with local people and visitors. In the study, the current tourism potential of the "Asthma Cave" has been determined and an assessment was made about the contributions that this potential would provide to Silifke, which is very rich in terms of natural and cultural resource values. In the study, it was tried to determine the strengths and weaknesses of the area in terms of cave tourism potential, as well as the opportunities and threats that may arise in the future by conducting a SWOT Analysis. In the study, results such as "The fact that the study area has a generally pristine nature is an advantage for tourism (strengths)", "insufficient advertising and promotion of the cave (weaknesses)", "applying the right marketing and promotion strategies can positively affect local tourism (opportunities)", "tourists coming to the region may disrupt the lifestyle and traditional structure of local people (threats)" were reached.

Keywords: Asthma Cave, cave, tourism, tourism potential

INTRODUCTION

Since prehistoric times, underground cavities that form an indispensable environment for people's socio-cultural development and activities, have surface openings and have a width and height that can allow at least one person to crawl in, are called caves. Caves, typical examples of karstic erosion patterns, are natural cavities opened by water seeping underground from water-soluble rocks such as limestone, usually as a result of geomorphological and geophysical processes under natural conditions, melting and eroding the rocks (Doğanay and Zaman, 2013, 105; Bolechova et al., 2022: 196-198). In other words, caves are underground cavities of karstic origin, usually developed in a horizontal or vertical direction, complex in plan, which can have a length or depth of up to hundreds of kilometers in size that can be entered. (Erinç, 1971). Caves create a large ecosystem with their living and inanimate assets. These underground formations, which can be found at different elevations and positions in almost every region of the Earth, have been forming the habitat of living things since ancient times with their different lengths and depths, which develop depending on the geological, hydrological-hydrogeological, geomorphological, vegetation, climate and time factors of the natural environment in which they are located. (Akpınar & Sezen, 2018).

Caves have been helping people to survive by resisting all kinds of harsh living conditions since prehistoric times. In addition, they create indispensable environments for people's social and cultural development and activities. Thanks to the natural features they have, caves have been used by people for various purposes since ancient times of history and have been the subject of various researches. (Doğaner, 2001: 86; Arpacı et al., 2012: 62; Uzun et al., 2015: 245, Nazik & Bayari, 2018, Maksoud et al., 2021: 110). Human beings have used caves in past periods for purposes such as shelter – protection, places of worship, dungeons against future dangers from outside. Today and in recent periods; they are used as a place of worship, cold storage, animal and agricultural products protection, military logistics area and cave tourism, etc. In addition, due to the fact that the caves contain many data (geological and climatic) from past periods, it has a natural laboratory feature for sciences Geology, Geography, Geomorphology, Biology, Archeology, Speleology and Ecology, etc. In addition, caves are becoming important tourist attraction centres for reasons such as the mysterious images they create, internal waters, air and animal beings (Doğanay and Zaman, 2013: 121; Şengün et al., 2022: 2020).

The change in the understanding of tourism in the world and in Turkey over time directs people participating in tourism activities to different tourism areas, and the understanding of

tourism, which has been realized within the scope of beach tourism for many years, is gradually diversifying (Ceylan, 2007, 225). In this context, caves, which are the first natural habitats of humanity, have been attracting people's interest with their natural formations in recent years and are gradually taking their place in the concept of tourism. In the researches carried out, it is found that there are about 40 thousand caves in Turkey (Sever, 2008: 254). However, very few of them can be evaluated in economic terms. Caves in Turkey have a significant economic potential with their cold storage for food storage, fungiculture, speleotherapy (cave therapy), shelters for military purposes and various tourist attractions in recent years. Efforts are being made to bring these caves to tourism in Turkey. The number of these studies is increasing every day, which reveals the richness of the cave potential in Turkey. However, the studies carried out are mainly focused on the inclusion of caves as names and places in the literature on a local basis (Kopar, 2010: 33). However, the exploration of caves whose characteristics have not been explained in detail is of importance for local and regional tourism activities (Karadeniz, 2018; Zeybek vd., 2019:364-365).

The main material of the study is the “Asthma Cave” located in Silifke District of Mersin Province. Domestic and foreign sources related to the subject, on-site observations and field inspection reports were used. The research was carried out in three main stages within the framework of a plan and program: the “Planning”, “Realization” and “Reporting” stages. At the planning stage, the research subject was determined first and the boundaries of the study area were finalized. After that, the purpose of the study was determined and then the necessary literature researches were carried out. As a result of literature research, many domestic and foreign sources were identified, the revealed sources were classified and the realization stage was started. At this stage, the sources that were obtained were examined first. After that, the work site was observed on site in August, 2022 and the necessary examinations were made. These collected data were evaluated.

It is thought that the results obtained with this study would contribute to the process of making the necessary plans for the tourist infrastructure of the Asthma Cave, the acquisition of tourism value of the cave and similar studies to be carried out.

1.THE LOCATION, FEATURES AND IMPORTANCE OF THE CAVE

Asthma Cave is located in the Silifke District of Mersin. The distance to Silifke is 23 km The distance to Mersin is 85 km. Transportation is carried out by private vehicles and tour organizations. The cave, located in the Hasanaliler Neighborhood of Narlikuyu Town of Silifke, is located 600 meters northwest of the Heaven – Hell Caves. It is one of the places that best

reflects the geographical conditions of the region. Asthma cave is also known as one of the important natural wonders of the region (www.kulturportali.gov.tr, 2022). Because of its basin, which is believed to be good for asthma patients and is the subject of legends, it is visited especially by those who want to relieve their breathing. The cave is reached by a spiral iron staircase with 78 steps. The formation of the cave, which has a depth of about 15 meters and consists of three parts, dates back to the third geological period. there are giant stalactites and stalagmites with interesting shapes formed by the accumulation of silica minerals in the cave with 200-meter galleries. The humidity rate in the cave reaches to 85 percent in the summer season and reaches to 95 percent in the winter. The interior lighting of the cave especially allows photography enthusiasts to capture stunning images. Asthma Cave is also called “Wish Cave” by the public because pieces of cloth are tied to the trees and bushes around it by visitors for wishes (www.muze.gov.tr, 2022; www.essizmersin.com, 2022).

2. MATERIAL AND METHOD

2.1. Material

The main material of the study is the “Asthma Cave” located in the Silifke District of Mersin Province. Asthma cave is located in Narlikuyu Town, Hasanaliler Neighborhood. In addition to bearing interesting features with its geological structure and geomorphological elements, the area creates a rich potential for ecotourism with the values of natural and cultural resources found in the immediate vicinity. There are also “Heaven-Hell Ponders and the historical “Three Beauties Mosaic” in the region where the cave is located, where tourist visits are intensive. In the study, domestic and foreign resources related to the subject, observations and investigations conducted on site in the field, information obtained after conversations with local residents, visitors and managers were used as auxiliary materials.

2.2. Method

The method of this study was carried out in three stages. The first stage of the study was the selection of the research area and the determination of the purpose of the study. In the selection of this area, the fact that a sufficiently comprehensive research had not been conducted on the field of study, as well as the fact that the area was quite rich in terms of natural resource values and the cultural and historical accumulation, was an effective factor. In the second stage, after the place and purpose of the study were determined and the necessary literature researches were conducted, research area was visited in August 2022 and resources and brochures related to the field were collected. In addition, various interviews were conducted

with local residents, visitors and public employees of all professions by making observations and investigations in the field.

The SWOT analysis method was applied in the study, it was tried to determine the current tourism potential of the Asthma Cave and the strengths and weaknesses of this potential in terms of cave tourism, as well as what opportunities and threats may arise in the future. This study is important in terms of providing an idea about the cave tourism potential in the area, making contributions to the development of ecotourism in Mersin province through the development of this potential and putting forward solutions for this.

3.. FINDINGS AND CONCLUSION

Evaluation of Asthma Cave Tourism Values by SWOT Analysis

Strengths;

- The fact that the area where the Asthma cave is located is in the Eastern Mediterranean Region, the richness in biodiversity, flora and fauna can positively affect visits
- The climatic conditions in the region where the cave is located may allow to visit the cave for 12 months
- The fact that the study area has a generally unspoiled nature is an advantage for tourism.
- The hospitable nature of the local people can contribute to a positive image
- Availability of parking service at the cave entrance
- The presence of a facility providing cafe service at the cave entrance
- Being close to settlements such as Mersin, Silifke and tourism centers such as Kizkalesi and Atakent increases the rate of visits.

Weaknesses;

- Lack of tourism awareness of local people
- Insufficient advertising and promotion of the cave
- Insufficient infrastructure and superstructure investments of the region
- Lack of public transportation for transportation to the cave
- Insufficient explanation of the importance of the cave in terms of health

Opportunities;

- The increasing domestic tourism demand for Cave Tourism can positively affect the tourism of the region.
- The development of cave tourism in the region can positively affect the socio-cultural development of the village and its immediate surroundings.

- The development of cave tourism can also positively affect the development of other sectors.
- The implementation of the right marketing and promotion strategies can positively affect local tourism.
- The activities carried out within the scope of cave tourism can contribute to the balance of using protection without destroying the environment in the region.
- The fact that the local people are eager and willing to take part in the cave tourism-oriented service sector is an important opportunity for the success of tourism studies to be carried out in the district.

Threats;

- The arrival of tourists in the district and its immediate vicinity may cause damage to natural life, deterioration of vegetation
- Increasing construction and concretion in food and beverage establishments in the immediate vicinity may lead to a decrease in the aesthetic values of the region.
- Tourists who will come to the region may disrupt the lifestyle and traditional structure of the local people.
- The fact that the business owners working in the region are uneducated may be perceived as a threat element.
- The lack of a sufficient number of tourist guides in the region may negatively affect the development of tourism.

3.1. Conclusions and Recommendations

Diversification of tourism, except for the sand- sun – sea trio, and to be done in every region of the country for twelve months and the people of the region's providing income from tourism (Oriaku, 2021: 18-19) can only be possible with ecotourism (nature-based tourism). Natural and cultural assets that have entered a rapid extinction process despite having an important potential in the current century and cannot be properly evaluated can be evaluated through tourism in accordance with the principles of conservation, use and preservation. It should be realized that the natural values, the formation of which took millions of years, cannot be fulfilled in a short time and we must protect them first of all, and it should be aimed not to disturb the ecological balance while opening the region to tourism. In this context, cave tourism, which is a type of ecotourism, is also important in terms of bringing our natural and cultural values to tourism in the balance of conservation and use.

As a result, the development of activities such as plateau, mountain, culture and ecotourism in rural residential areas in Turkey, which have an important potential in terms of tourism, can play an active role in solving the problems of the region and developing the region in the long term. In short, ecotourism should be carried out with a sustainable planning and understanding in an environmental and ecological sense. It is recommended to provide tourism training to people in the region where the research was conducted, to create and implement advertising and promotion strategies aimed at increasing the awareness of the region and the Asthma Cave, to prevent concretion and degradation of the natural environment by conducting the necessary inspections by the authorities, to make the necessary investments to ensure easy access to the cave.

Özet

Bu araştırmada, okul öncesi dönemde yer alan çocukların, duyu düzenleme becerilerinin motor yaratıcılık etkinlikleri ile desteklenebilirliğini gösteren literatür (derleme) çalışmasını yapmak amaçlanmıştır. Yaratıcılığın bir boyutu olan motor yaratıcılık, çocukların bedenleri ile kendilerini ifade etme becerilerini desteklemede önemli yer tutmaktadır. Özellikle okul öncesi dönem çocuklarının kendilerini sözel olarak ifade etmekten daha çok bedenleri ile ifade etmeyi tercih ettikleri bilinmektedir. Bu anlamda, çocuklar kendilerini ifadede bedeni kullanılırken bir yandan da ön plana çıkmaktadır. Aynı zamanda duyu düzenleme becerilerinde de duygular ön planda yer almaktadır. Çünkü hissettiği duyguların bireyin kendi tarafından anlaşılması ve ifade edilebilmesi konusunda, bireyin kendisine ve çevresine olan farkındalığının yüksek düzeyde olması gerekmektedir. Duygu boyutunda ise bireyde farkındalığın artabilmesi için bedensel farkındalık ve hareket yadsınamaz iki etkeni oluşturmaktadır. Bu bağlamda duygular ve hareketlerin birbirinden ayrılamaz unsurlar olduğu düşünülmektedir. Buradan hareketle bu duygularımız ve duygularımızı düzenleme becerimizi motor yaratıcılık ile ilgili etkinliklerin büyük oranda etkileyeceği öngörülmektedir. Buradan yola çıkarak bu derlemede, okul öncesi dönemde motor yaratıcılık ve önemi, duyu ve duyu düzenlemenin gelişimi, motor yaratıcılığın duyu düzenlemede etkisi sunulmaktadır.

Anahtar kelimeler: yaratıcılık, motor yaratıcılık, duyu, duyu düzenleme

**CAN EMOTION REGULATION SKILLS IN PRESCHOOL PERIOD BE
SUPPORTED WITH MOTOR CREATIVITY ACTIVITIES?**

Abstract

In this review, it was aimed to show that emotion regulation skills of preschool children can be supported by motor creativity activities. Motor creativity, which is a dimension of creativity, has an important place in supporting children's ability to express themselves with their bodies. Especially preschool children are known to exhibit communication with their bodies more than verbal communication. In this sense, emotions come to the fore while expressing themselves. At the same time, emotions are also at the forefront in emotion regulation skills. Because the individual's awareness of himself/herself and his/her environment should be at a high level in order to understand and express the emotions felt by the individual. In the emotion dimension, physical awareness and movement constitute two undeniable factors in order to increase awareness in the individual. In this context, emotions and movements are thought to be inseparable elements. Therefore, it is predicted that activities related to motor creativity will greatly affect our emotions and our ability to regulate our emotions. Based on this, in this review, motor creativity and its importance in preschool period, the development of emotion and emotion regulation, the effect of motor creativity on emotion regulation are presented.

Keywords: creativity, motor creativity, emotion, emotion regulation

GİRİŞ

Duygu ile ilgili yaygın olarak bilinen doğrular ya da çoğu kişinin bir fikri olsa da tam olarak yapılmış bir tanım bulunmamaktadır (Izard, 2009). Izard (2009), duygular tanımsal açıdan açıklığa kavuşturulmasa bile zihnimizde var olduğunun ve duyguların dış etkenler vasıtası ile edinilemeyeceğini öne sürmektedir. Duyguların var olması ve hissedilebilirliği duygularla ilgili kavramların tanımı ve dilden önce ortaya çıkmıştır. Ancak dilin kazanımı, duygusal ifadeleri ve duyguyu ifade edebilmeyi kesinleştirmemektedir. Özellikle büyük yaş grubunda olan insanlar yaşadıkları duygunun ne olduğu, nasıl ifade edileceği konusunda zorluklar yaşamaktadır. Diğer bir deyişle, duygular zihinsel aktiviteler sonucunda kontrol edilmektedir (Izard, 2002). Duygu, açık bir tanım yapılmaya ya da hissedildikten sonra ifade edilemese bile zihinde hissedilmekte ve deneyimlenmektedir. Duyguların ifade edilişi bireyden bireye, farklı şiddet aralığında, farklı süre aralığında, farklı tepki aralığında, değişmektedir. Duygu düzenleme, bireyin duygular hakkında deneyim sahibi olması, bu deneyimleri ile cevap vermesini içermekte ve duygu düzenleme becerisi bu deneyimlerden beslenmektedir (Cole & Deater-Deckard, 2009). Duygu düzenleme, kişinin ruh halinde hissettiği duygusal deneyimleri, uyarılmayı, tepkileri, duygu dinamiklerindeki değişimleri, yıkıcı dürtüleri, olumlu ve olumsuz duyguları izleme, kontrol etme, değerlendirme, yönlendirme ve değiştirmeyi içeren içsel ve dışsal süreçler bütünü olarak tanımlanmaktadır (Koca, 2020).

Okul Öncesi Dönemde Duygu Düzenlemenin Gelişimi

Duygu düzenleme becerisi doğuştan gelmemekte, yaşamın ilk yıllarından itibaren büyük bir ivme ile geliştiği bilinmektedir (Eisenberg, Spinrad ve Eggum, 2010; Dodge ve Garber, 1991). Erken çocukluk döneminde edinilmesi gereken gelişimsel özelliklerden biri olan duygu düzenleme becerisi, bir kişinin amaçları doğrultusunda duygulara yönelik tepkilerin takip edilmesini, değerlendirilmesinden ve farklılaştırılmasını içeren çevresel ve iç görüsel süreçlerden oluşmaktadır (Thompson, 1994). Bu süreç mutluluk, mutsuzluk, öfke, şaşkınlık, korku gibi tüm duyguların bedende meydana gelen olası etkileri ile baş etmeyle ilgili özellikleri de kapsamaktadır (Kopp, 1989). Bu süreçte çocukların öncelikle duyguları anlaması gerekmektedir. Duyguları anlama becerisi ise bebeklik döneminden itibaren gelişmektedir. Çocuklar, bebeklikten itibaren konuşmadan önce duyguların karakteristik özelliklerini tanımlamaktadırlar (Thompson ve Lagattuta, 2006). Bu süreçte duyguları anlamlandırırken duyguları sembolik olarak zihinlerinde kodlamakta ve sosyal etkileşimleri ile deneyimle kazanmaktadırlar (Denham ve Burton, 2003). Deneyimleri ile duygu düzenleme becerilerini geliştirmekte ve bu süreçte bu becerilere sahip olan çocuklar çevreleri ile pozitif ilişkiler

kurabilmektedirler (Cassidy, Parke, Butkovsky ve Braungart, 1992; Webster-Stratton ve Reid, 2004). Ayrıca bilimsel niteliği olan konularda, sınıf içerisinde farklı fikirler ortaya koymada, erken okuryazarlık becerilerinde başarılı oldukları bilinmektedir (Graziano, Reavis, Keane ve Calkins, 2007). Buna karşın duygu düzenleme becerisi konusunda belirli bir yeterliliğe ulaşamamış olan çocuklar davranışlarında zorlanmalar yaşayabilmektedirler (Arı ve Yaban, 2016; Batum ve Yağmurlu, 2007; Eisenberg vd., 1996). Aksi durumda, Eisenberg ve Fabes (1992), erken çocuk döneminde duygu düzenleme becerisindeki herhangi bir kusur ya da eksikliğin, yaşamın ilerleyen yıllarında davranış problemlerine neden olabileceğini vurgulamaktadırlar.

Çocukların duyguları anlayışının gelişiminde, çocuğun ilk sosyal çevresi ve duygusal deneyimleri edindiği aile, önemli bir yere sahiptir (Laible ve Thompson, 1998). Çocukların duyguları tanımaları aile içerisinde oluşan bir durumdur. Duyguları tanıma sürecinde, bazı aileler çocuklarıyla konu ile ilgili etkileşimde kalarak çocuğa olumlu bir duygu iklimi sunarken, bazı aileler çocukların duygusal olarak zorlanmalarını destekleyecek, çocukların gelişimlerini olumsuz etkileyen duygusal görevleri çocuklara yüklemektedirler (Thompson ve Lagattuta, 2006). Duyguları anlama ebeveynlerin-çocukları ile karşılıklı etkileşiminden beslenen bir süreçtir (LaBounty, Wellman, Olson, Lagattuta ve Liu, 2008). Bu sebeple çocukların duygularını tanıma ve ifade etme konusunda çocuklarına destek olan ebeveynlerin çocuklarının bu yetiyi kazanmada daha başarılı oldukları bilinmektedir. (Denham, Mitchell-Copeland, Strandberg, Auerbach ve Blair, 1997). Bireyin dünyaya geldiği andan itibaren etkili olan ve sosyal duygusal gelişimde büyük önem taşıyan duygu düzenleme becerisinin gelişiminde en büyük etkenin aile olduğu ve ailenin karakterinden, çocuğa ve diğer aile üyelerine karşı tutum ve davranışlarının etkilediği görülmektedir. Eisenberg'e göre farklı bir ifade ile duygu düzenleme becerisinin genetik ve dışsal faktörler ile yakından ilişkili olduğu, ancak genetik etmenler yaşamın ilk yıllarından sonra çok fazla değişime uğramadığı vurgulanmaktadır (Eisenberg vd., 2010). Buradan hareketle duygu düzenleme sürecinde dışsal yani çevresel etmenlerin daha çok etkili olduğu ve çocukların duygusal durumlarının belirleyicisi olan sosyal etkileşim sonucunda ortaya çıktığı belirtilmektedir (Thompson, 1994).

Okul Öncesi Eğitim Ortamları ve Motor Yaratıcılık

Bebeklikte ve ilk çocukluk döneminde duygular ebeveyn ve çocuğun yakınındaki kişiler tarafından düzenlenip yönetiliyorken, okul çağı ve ergenlik dönemi ile birlikte duygu düzenlemeyi, geçmişte içselleştirdiği süreçler sayesinde, birey kendisi yapmaktadır. Bu süreçte özellikle ilk çocukluk dediğimiz dönemde okul öncesi eğitimin önemi ve gerekliliği ortaya

çıkılmaktadır. Çocukluktan yetişkinliğe izleri görülen sosyal-duygusal gelişimin, okul öncesi eğitim açısından istenilen yönde, olumlu özelliklere sahip olarak evrilmesi için birçok becerinin gelişmesi gerekmektedir.

Okul öncesi dönem, çocukların gelişimlerinin en hızlı olduğu dönemlerden birisidir. Bu dönemde çocuklara zengin deneyim fırsatları sunan okul öncesi eğitim onların tüm gelişim alanlarını etkilemektedir. Ayrıca çocukların doğuştan getirdikleri potansiyellerini en üst düzeye taşıyabilmesi de ancak erken yaşlarda verilecek eğitim ile mümkün olabilmektedir (Oktay, 2002). Çocuğun tüm gelişim alanları açısından desteklenmesi, temel becerilerin kazandırılması ve çocuğun yaşama iyi bir şekilde hazırlanması ise nitelikli okul öncesi eğitimi programı ve zengin uyarıcılarla desteklenmiş bir eğitim ortamı ile sağlanabilir (Özdemir Beceren, 2012; Koçyiğit, 2012). Young ve arkadaşlarına göre, bu becerilerden duygu düzenleme becerisinin gelişiminde kişinin bulunduğu ortamda duyguların ifade ediliş şekli, süresi ve yoğunluğunun önemli etmenler olduğunu vurgulamışlardır. Bu etmenlere göre çocukların geliştirecekleri duygularının ve duygu yaşantılarının şekil alacağı ifade edilmektedir (Young, Klosko ve Weishaar, 2003). Bu konuda çocuklara sunulan ortamlar ve hazırlanan nitelikli programların çocukların duyguları anlama ve kendilerini rahatça ifade etmelerini dolayısı ile duygu düzenleme sürecini kolaylaştıracağı söylenebilir. Okul öncesi eğitimde çocuklarda doğuştan var olan ve geliştirilmesi gereken diğer bir beceri alanı da yaratıcılıktır. Yaratıcılık; bireyler için farklı yararlı olması için düşüncelerin, içsel ürünlerin ve birtakım çözümlerin ortaya konma süreci olarak tanımlanmaktadır (Sternberg&Lubart, 1999). Bunun yanı sıra yaratıcılık, daha önce olmayan bir şeyi oluşturmada kullanılan zihinsel bir faaliyettir, olmayanı ortaya koymak ise yaratıcılığın çevresel ve gözle görülebilir bir sonucudur. Yaratıcılık ile ilgili çalışmaların en önemli isimlerinden biri olan Torrance (1981) yaratıcılığı bir fiil olarak tanımlamaktadır. Torrance yaratıcılığı, "problemlere, yolunda gitmeyen şeylere, eksikliklere, uyumsuzluğa karşı farkındalığı yüksek olma, problemi tanımlayabilme, çözüm arayışı içerisine girme, bulduğu çözümlerle ilgili denemeler yapabilme, başarısız olduğu denemelerini değiştirip geliştirebilme ve tüm bu sürecin sonucunda bir olgu ya da bir nesne oluşturabilme" olarak tanımlamıştır (Torrance,1981). Burada bahsetmek istediğimiz esas konu yaratıcılığın önemli bir boyutu olan motor yaratıcılıktır. Ve okul öncesi dönemde çocukların yaratıcılık, motor gelişim, bedeni tanıma, bedeni ile kendini ifade etme, kendine güven gibi birçok becerinin kazanılmasında etkili olduğu söylenebilir. Motor yaratıcılık ile ilgili çalışmalara ve tanımlara yaratıcılık kadar sık rastlanmamaktadır (Alston 1971). Ruiz, motor yaratıcılık ile yaratıcılığın birbirileri ile ilintili alanlar olduğunu belirtmiş ve birey karşılaştığı durum ya da problem durumlarına birbirinden

farklı ve kendine has yanıtlar üretiyorsa o bireyin motor yaratıcılık becerisine sahip olduğunun düşünülmesi gerektiğini vurgulamıştır (Ruiz,1995). Motor yaratıcılık, daha önce olmayan ve olandan farklı ürünleri ve durumları algılama yetisi olarak tanımlanmakta ve daha önce karşılaşılmayan bir problemin çözümü bir düşüncenin oluşumu ve bir duygunun bedeni farklı şekillerde kullanarak ifade edilmesi şeklinde belirtilmektedir (Bournelli ve Mountakis 2008) Var olan bir sorunu çözmek, bir duyguyu, bir fikri, bedenimizin farklı yerlerini farklı şekillerde kullanarak,çözmek ya da karşıdaki kişiye ,gruba aktarmak motor yaratıcılık (MC) olarak tanımlanmaktadır (Bournelli, Makri ve Mylonas, 2009; Wyrick, 1968). Aynı zamanda motor yaratıcılık, Kamaraj ve Aktan'a göre, duyguların eğitimine öncelik vermek bu yeteneği geliştirmek için büyük bir öncü olmaktadır (Kamaraj ve Aktan, 1998).

Çocukların Duygu Düzenleme Becerilerinde Motor Yaratıcılık Etkinlikleri İle Desteklenebilir mi?

Motor yaratıcılık, Olivares'e göre "bedeni kullanarak olası bir etkiye olabildiğince çok alternatif yol üretmek ve bu yolları kullanarak tepki üretme yeteneği" olarak tanımlanmaktadır. Fakat motor yaratıcılık yalnızca hareket ve hareketin niteliği ile ilgili somut etkenlerle bağlantılı değildir bunların yanı sıra hayal gücü biriciklik ve devamlılık gibi bireyin içgörüsü ile faktörleri de içinde barındırmaktadır (Akt.Justo 2008). Buradan hareketle motor yaratıcılığın sadece somut ve çevresel faktörlerle değil iç görü ve iç motivasyonla ilgili olduğu anlaşılmaktadır. Buradan hareketle duygularımız ve duygularımızı düzenleme becerimiz motor yaratıcılığı büyük oranda etkileyen iç görüsel faktörler arasında olduğu öngörülmektedir. Duygular ve duygu düzenleme becerimiz yaşamımızda önemli bir yere sahiptir. Kendimizle ve sosyal ortamdaki ilişkilerimizde etkilere karşı olumlu ve uyumlu duygusal tepkiler vermeye çalışırız. Öfkelendiğimizde öfkemizin kaynağına zarar vermek isteyebiliriz ama her zaman bunu yapmayı tercih etmeyiz; Bizi güldüren, absürt bir durumda gülmek isteriz ama bazen kendimizi tutarız. Duygularımızı genellikle kontrol altında tutmaya çalışırız. Yani duygu düzenleme eğilimimiz genellikle hep vardır. Duygu düzenleme kavramı, amacımıza ulaşmamız için duygusal tepkilerimizi farkında olma , tepkilerimizi analiz etme ve yeniden düzenlemeyi içeren iç görü ve çevresel süreçleri kapsamaktadır. Bu süreçte, duygularımızı tanımamız ve göstermemiz gerektiği zamanı, onları nasıl deneyimleyip, nasıl ifade ettiğimizi içermektedir. Duygularının bilincinde olma, sosyal ortama uygun şekilde duyguları dışa vurabilme duygu düzenlemenin gelişimi için en önemli becerilerdir (Macklem, 2008). Motor gelişim ve motor yaratıcılık burada kendini göstermektedir. Çünkü okul öncesi dönemde çocukların hem

duygularını ortaya çıkarma becerilerinde hem de yaratıcılık becerilerini göstermelerinde motor yaratıcılık önemli yer tutmaktadır.

Okul öncesi dönem çocuklarının sağlıklı büyümesi ve gelişebilmesi için hareket gereklidir (Grammatikopoulos, Gregoriadis ve Zachapoulou,2012). Çünkü hareket, çocukların öz farkındalıklarının ve sosyal farkındalıklarının oluşması ve artması için vazgeçilmez gereksinimler arasında yer almaktadır. Okul öncesi dönemde çocukların sensorimotor dönemdedirler ve yaratıcılığı hareket yolu ile daha kolay ifade etmektedirler (Bournelli,Makri ve Mylonas,2009). Dolayısı ile doğum öncesi dönemden itibaren hareket halinde olan çocuğun yaşamında önemli bir yer tutan motor yaratıcılık hem hareketlerden hem de yaratıcılıktan beslenmektedir (Pica, 2000). Aynı zamanda Greer-Paglia'ya göre (2006) motor yaratıcılık, çocukların öykü anlatma, dans etme gibi yollar kullanarak; kendi duygu ve düşüncelerini ifade etmesini, ilişki kurmasını sağlayan, spontane gelişen vücut hareketleridir. Duyguları konusunda farkındalığı oluşmuş ve duygularını dışa vurma konusunda da başarılı olan bireylerin öz farkındalık ve sosyal alan farkındalığının yüksek düzeyde olması çok önemlidir. Çünkü çocuklarda sosyal farkındalık arttığında bedenlerine dair olan farkındalıkta paralel olarak artmakta, bu da motor yaratıcılığın gelişmesine katkı sağlamaktadır (Wang, 2003). Bireyde duygu farkındalığının daha üst düzeye taşınması bedensel farkındalık ve hareket göz ardı edilemeyecek etkenleri oluşturmaktadır. Buradan hareketle hareket ve duyguların iç içe geçmiş olgular olduğu düşünülmektedir. Çünkü çocukların hissettikleri duyguları dışa vurabildikleri ve konuşmadan kendilerini ifade edebildikleri ilk ve temel yol harekettir (Hinitz,1980; Akt. Pica,2000). Yaratıcılık ve hareketi harmanlayarak kullanmakta duyguların dışa vurum şeklini değiştirecek ve zenginleştirecektir. Yaratıcılık her bireyde olan farklılaştırılmayı ve zenginleştirilmeyi bekler, farklı yaklaşımlar, farklı eğitim ortamları ve farklı eğitim yöntemleri ile belirgin hale gelebilir (Makero, 2012). Yapılan çalışmalarda, yaratıcılığı ortaya çıkarma, zenginleştirme ve yaratıcı hareketler sergileyebilmede okul öncesi eğitimin önemli dönemler arasında yer aldığı ortaya konmuştur. Bu dönemdeki çocukların temel ihtiyaçlarından birinin hareket olması ve çocukların hareketle rahatlama sağlamaları nedeni ile eğitim programında hareket etkinliklerine bolca yer verilmesi çocukların iç dünyalarını daha rahat dışa vurabildiklerini göstermiştir. (Cheung, 2010; Erbay, 2009; Felker &Treffinger, 1971; Justo, 2008; Torrance, 1981). Yaratıcı hareketin gelişmesi için çocuğun yaptıklarının kabul edilmesi, çocuğa kendini ifade edecek fırsatlar yaratılması, gelişim alanları göz önünde bulundurularak yol alınması gerekmektedir. Çocuk, kendini kabul görmüş ve saygı duyulmuş hissettiğinde; duygularını ve düşüncelerini ifade etme becerisini kademe kademe ilerleterek, serbest, esnek

ve açık fikirler yaratıp geliştirecek ve bu durum çocuğu bilgiye, deneye, keşfe yönlendirecektir. Bunun sonucunda çocuk kendini özgür ve güvende hissederek duygularını ifade etme ve duygularını düzenleyebilme becerisini geliştirebilecektir. Çocuklarda bu becerilerin kazandırılması ve geliştirilmesi için erken yaşlardan itibaren farklı destek programlarıyla desteklenmesi gerekmektedir. Bu noktada çocuklarla yapılan motor yaratıcılık ve duyu düzenleme çalışmalarının çocukların gelişimlerini desteklediği, duyu farkındalığı ve duygularını bedeni ile ifade edebilme becerisini arttıracığı düşünülmektedir. Okul öncesi dönemde yapılabilecek bu çalışmalar çocuğun kendisiyle ve çevredekilerle daha açık ve olumlu bir iletişim kurma fırsatı sunmaktadır. Motor yaratıcılık çalışmalarında amaç, çocukların dikkatlerini bedenlerine yoğunlaştırmalarına, bedenlerinin farkına varmalarına ve kendilerine güvenmelerine, yaratıcılıklarını geliştirmelerine, duygularını daha net ifade edebilmelerine yardımcı olabilecektir. Bu ön görüler doğrultusunda alan yazın incelendiğinde, okul öncesi dönemde yer alan çocukların duyu düzenleme becerilerinin motor yaratıcılık etkinlikleri desteklenebilirliğini gösteren çalışmaların olmadığı saptanmış ve bu çalışmanın alanda çalışan eğitimcilere ve ebeveynlere katkı sağlayacağı düşünülmüştür.

SONUÇ VE ÖNERİLER

Bebeklikten itibaren öncelikle ilk eğitim kurumları olan ebeveynlerin, daha sonraki süreçte okul öncesi eğitim kurumlarında duyu düzenleme becerisinin ve motor yaratıcılıklarının desteklenmesi önemli yer tutmaktadır. Bu süreçte çocuklar zorlu durumlarla karşılaşabilmekte, problemleri kendileri çözmek için uğraşmakta ve sonucunda başarı ya da başarısızlık durumları ile yüz yüze gelebilmektedirler. Önemli olan bu durumlarda duygularını düzenleyerek olumlu bir şekilde yönetebilmeleri ve pes etmeden yaratıcılık becerilerini ortaya koyarak devam etmeleri gerekliliğidir. Bu becerilerin kazanılması için okul ve eğitim süreçleri ile mümkün olabilmektedir. Okul ortamlarında duyu düzenleme ve motor yaratıcılık becerilerini geliştirecek süreç ve durumlar için fırsatların sunulması gerekmektedir. Akbaba'ya göre, aksi durumda olumsuz duygular yaşayan çocuklar hırçın ve saldırgan davranışlarda bulunabilirler. Duygu düzenleme becerisi düşük olan çocukların stres yaşama durumlarının artması, stresle baş etme becerisinin yetersiz olması kaçınılmazdır. Duygularının düzenleyebilen bir çocuğun davranışlarının olumlu bir biçimde şekillenmesi sonucunda sosyal uyumunun sağlanması, toplum tarafından kabulün kolaylaşması, duygularını ifade edebildiği için rahatlayarak daha mutlu bir birey haline gelmesi ise olası bir sonuçtur (Akbaba, 2017). Bu araştırmada duyu düzenleme becerilerinin gelişmesini motor yaratıcılık etkinlikleri ile desteklenip

desteklenemeyeceđi konusu ele alınmıřtır. Alan yazın incelendiđinde; duyguların, yaratıcı süreçte önemli bir rol oynadıđını (Ivcevic ve Hoffmann, 2017), duygu düzenleme ile yaratıcılık ilişkisine ve birbirini olumlu yönde etkilediđini (Ivcevic ve Brackett, 2015; Yeh ve Li, 2008; de Rooij, ve Jones, 2015; Baas vd., 2008) saptamıřlardır. Yeh ve Li, (2008)'e göre okul öncesi çocukların duygularını düzenleme becerileri ile yaratıcılıkları arasındaki ilişkiyi belirlemek için çok az sayıda çalışmanın olduđunu belirtmiřtir. Ancak yapılan çalışmalarda yaratıcılıđın önemli bir boyutu olan motor yaratıcılık ve duygu düzenleme ile ilgili çalışmanın olmadığı saptanarak, bu çalışmanın okul öncesi eğitimcilere ve ebeveynlere yol göstereceđi ve alana katkı sağlayacağı düşünülerek planlanmıřtır. Buradan hareketle bundan sonra yapılacak çalışmalarda duygu düzenleme ve motor yaratıcılık ilişkisinin araştırılması önerilebilir.

Özet

Lojistik, terim olarak ilk kez 19. Yüzyılın başlarında askeri birliklerde kullanılmıştır. II. Dünya Savaşından sonra sivil hayatta da kullanılmaya başlanmış, 1963 yılında işletme literatürüne girmiştir. Günümüze kadar hem tedarik zincirinin çeşitlenmesi hem de teknolojik gelişmelerin artmasıyla birlikte lojistik faaliyetlerin entegre edilmesi kolaylaşmıştır. Lojistik ilgili ürünün ilk üreticiden son tüketiciye kadar olan nakliye, ambalajlama, gümrükleme, depolama, dağıtım gibi bütün süreçlerini ifade etmektedir. Müşterinin ihtiyaçları hususunda tüm ürünlerin çıkış noktasından varış noktasına kadar etkili ve verimli bir şekilde taşınması ile depolanması için gerekli metotları uygulama, planlama ve denetleme sürecidir. Bu çalışmanın amacı, lojistik maliyetler, lojistik maliyetlerin muhasebe açısından sınıflandırılması, lojistik maliyetlerin unsurları ve lojistik maliyetlerin muhasebeleştirilmesine ilişkin örnek uygulamalar ile açıklamaktadır.

Anahtar Kelimeler: Lojistik, Lojistik Maliyetler, Lojistik Maliyetler Muhasebesi

LOGISTICS COSTS AND ACCOUNTING TRANSACTIONS

Abstract

Logistics, for the first time as a term, 19. It was used in military units at the beginning of the century. II. After the World War II, it started to be used in civilian life and entered the business literature in 1963. Until today, it has become easier to integrate logistics activities with both the diversification of the supply chain and the increase in technological developments. Logistics refers to all the processes of the related product from the first manufacturer to the last consumer, such as transportation, packaging, customs clearance, storage, distribution. It is the process of applying, planning and supervising the necessary methods for the effective and efficient transportation and storage of all products from the point of departure to the destination in accordance with the needs of the customer. The aim of this study is to explain logistics costs, classification of logistics costs in terms of accounting, elements of logistics costs and sample applications related to accounting for logistics costs.

Keywords: : Logistics, Logistics Costs, Logistics Cost Accounting.

Giriş

Küreselleşmenin etkisiyle sosyal ve iktisadi dinamikler hızla değişim göstermektedir. Bir ülkenin değişimi ve gelişimi için en önemli şart, o ülkenin yatırım, ticaret ve tedarik zincirinin sağlıklı bir şekilde yürütülmesidir. Ülkelerin gelişmişlik ve kalkınmışlık düzeylerini ekonomik göstergeler sayesinde incelemek mümkündür. Uluslararası ticaretin yaygınlaşmasına bağlı olarak uluslararası ticarete konu mal ve hizmetlerin satıcıdan alıcıya ulaştırılması ihtiyacı lojistik sektörüne olan talebi artırmıştır.

Lojistik tarihsel gelişimi itibarıyla de İkinci Dünya Savaşı'nda savunma sektörüyle başlamıştır. Günümüze kadar hem tedarik zincirinin çeşitlenmesi hem de teknolojik gelişmelerin artmasıyla birlikte lojistik faaliyetlerin entegre edilmesi kolaylaşmıştır.

İşletmelerin rekabet edebilmesinde maliyet avantajı en önemli stratejilerden biridir. Son yıllardaki teknoloji ile birlikte lojistik sektöründe yaşanan gelişmeler ve sunulan hizmetlerin entegre edilmeye başlanması, işletmelere maliyet avantajı sağlama imkanı vermekte ve birçok işletmenin uluslararası pazarlardan daha fazla pay almalarında itici güç olmaktadır. İşletmelerde lojistik ile maliyet yönetiminde etkinlik artarken, zaman yönetimi de ilave önem kazanır, planlamada etkin bir stratejik yaklaşım oluşur.

Gelişen zamanın değişen koşullarına uyum sağlayacak çözüm yolları ve alternatifler üretilmek suretiyle tepki oluşur ve bununla birlikte teknolojik yatırımlar süratli gelişim sağlar (Hacırüstemoğlu ve Şakrak, 2002).

Lojistik Maliyetlerinin Muhasebe Sistematiği Açısından Sınıflandırılması

Küresel rekabet ortamında, maliyet kalemlerinin belirlenmesi, sınıflandırılması ve bu maliyet kalemlerinin tespitinden sonra maliyetlerin düşürülmesi işletmeler açısından avantaj sağlamakta ve sağladığı bu avantajı koruması etkin bir lojistik maliyet yöntemi ile mümkün olmaktadır (Ceran ve Alagöz, 2007). Lojistik maliyetlerini muhasebe sistematiği açısından beş grupta sınıflandırabiliriz (Ceran ve Alagöz, 2007).

1-Lojistik Maliyetlerinin Çeşitlerine Göre Sınıflandırılması

İşletmelerde maliyetlerin büyük bir kısmını ürünlerin satın alınması, taşınması, depolanması, talep tahmini, müşteri hizmetleri, üretim planlaması, stok yönetimi, sipariş yönetimi, dağıtım, ambalajlanması, yer seçimi ve depo faaliyetlerinin planlanması kontrol edilebilmesi maliyet kalemleri oluşturmaktadır. İşte bu faaliyetlerin bütününe lojistik, bu faaliyetlerin maliyet toplamda lojistik maliyetleridir.

2-Lojistik Maliyetlerinin Fonksiyon Esasına Göre Sınıflandırılması

Maliyet kalemlerinin, işletmenin işlevlerine göre sınıflandırılmasının en önemli faydası; maliyetlerin üretim maliyetleri ile bunun dışında kalan maliyetler olarak ayrılmasına olanak vermesidir. Bu ayırım kar analizlerini kolaylaştırmaktadır (Savcı, 2010). İşletme içerisinde lojistik verileri çoğunlukla hazır ve kullanılabilir formda olmadığından birçok lojistik bilgisi belgelerde veya üretim, tedarik, pazarlama, araştırma geliştirme, finansman, yönetim gibi diğer departmanlardaki verilerin içinde gizlenmektedir (Demir, 2008).

3-Lojistik Maliyetlerinin Kontrol Edilebilirlik Esasına Göre Sınıflandırılması

Giderler, belli bir örgüt birimi açısından kontrol edilebilme özelliklerine göre; kontrol edilebilen ve kontrol edilemeyen giderler olarak ikiye ayrılmaktadır (Akoğan, 2009).

a-Kontrol Edilebilir Giderler: Yöneticilerin, sorumluluk merkezi sınırları içerisinde müdahale edebileceği faaliyetlere ilişkin giderler, kontrol edilebilen giderlerdir (Kaygusuz ve Dokur, 2009). İşletmelerde belirgin lojistik maliyetleri, görünebilir ve kontrol edilebilir niteliktedir. Maliyetin sorumluluk merkezinin sınırları içerisinde kontrol edilebilme özelliğinin olması maliyet yönetimi açısından önem taşır.

b-Kontrol Edilemeyen Giderler: İşletmeler kontrol edilemeyen lojistik maliyetlere ise başka maliyetlerden ayırt edilmeleri ve ölçülmeleri zor olduğundan bu tür lojistik maliyetlerin belirlenmesine yönelik çaba gösterilmez. Bu sebeple, çoğu zaman işletme yöneticileri hangi maliyet kaleminin lojistik maliyetleri arttırdığını ya da diğer maliyetler kalemleriyle olan ilişkilerini tam olarak bilemez.

4-Lojistik Maliyetlerinin Ürünlere Yüklenmesi Açısından Sınıflandırılması

Maliyet hesaplama yöntemleri birbirlerinin seçeneği olmakla birlikte aynı zamanda birbirlerinin tamamlayıcısıdır. İşletmeler hangi yöntemi seçerse seçsin, maliyet kalemleri incelendiğinde direkt ve endirekt maliyetle karşılaşılır.

a-Direkt Giderler: Belirli bir mal veya hizmetin üretim maliyetine doğrudan doğruya yüklenebilen giderlerdir. Direkt giderlerin en önemli özelliği, bunların belirli bir üretim birimi için ne kadar harcandığının doğrudan doğruya hesaplanabilmesidir.

b-Endirekt Giderler: Lojistikte endirekt maliyetler taşımacılık hizmetinin gerçekleşmesi için mutlaka gerekli olan fakat yapılan sefer ile doğrudan ilişki kurulamayan maliyetlerdir.

5-Lojistik Maliyetlerinin Faaliyet Hacmi Açısından Sınıflandırılması

Faaliyet hacmine göre sınıflandırma, faaliyet hacmindeki olası değişmelere karşı giderlerin davranışlarını ifade etmektedir. Mamul maliyetinin hesaplanması, planlama, kontrol ve karar verme aşamalarında kullanılan önemli bir sınıflandırmadır. Faaliyet hacmine göre giderler; değişken, sabit ve karma giderler olmak üzere üçe ayrılmaktadır (Kaygusuz ve Dokur, 2009):

a-Değişken Giderler: Faaliyet hacmine bağlı olarak artan ya da azalan giderlerdir. Diğer bir deyişle iş hacmiyle aynı yönde ve aynı oranda değişme gösteren giderdir. Taşıma faaliyetinde değişken maliyetlerin yüksek olmasına karşın, stok maliyeti ayrı tutulmak kaydıyla depolama faaliyetinde değişken maliyet düşük kalabilmektedir.

b-Sabit Giderler: Belirli bir zaman diliminde ve faaliyet hacminde, faaliyet hacmindeki artışlardan veya azalışlardan etkilenmeyerek aynı kalan giderlerdir.

c-Karma Giderler: Belirli bir faaliyet hacmine kadar sabit gider özelliği gösteren ve faaliyet hacmi arttıkça değişken gider özelliği gösteren giderlerdir. Yarı değişken gider olarak da ifade edilmektedir.

Lojistik Maliyetlerin Muhasebeleştirilmesi

Lojistik maliyetlerin analiz edilebilmesi ve birtakım kararlarda kullanabilmesi için, öncelikle bu maliyetlerin uygun hesaplar kullanılarak tasnif edilmesi ve izlenmesi gerekmektedir (Kıymetli Şen, 2014).

1-X Lojistik işletmesi, nakliye faaliyetlerinde kullanılan taşıtlar için 200.000 TL (%18 KDV hariç) nakit karşılığı mazot satın almıştır.

---	---	--------	--------

Sonuç

Lojistik faaliyetler ile üretim ve tüketim noktaları arasında ürünlerin müşterilerine ekonomik, güvenli ve hızlı bir biçimde ulaştırılması sağlanmakta işletmelerin farklı pazarlara girmesi ve pazar payının artırılması gibi avantajlar yakalanmaktadır. Lojistik faaliyetler, işletmelerin rekabet gücünü doğrudan etkilemektedir. Lojistik işletmeleri, minimum taşıma süreleri ve maliyet avantajla kaliteli hizmet vermek, teknolojiyi en üst düzeyde kullanmak ve maliyetleri en az seviyeye indirerek sektörde rekabet gücünü arttırmaya yönelmek zorundadır.

Çalışmada lojistik işletmelerinde tedarik sürecinden başlayarak depolama ve ulaştırma sürecini kapsayan lojistik faaliyetleri incelenmiştir. İşletmeler, lojistik maliyetlerini belirlemek için kesin ve net bilgilere ihtiyaç duymaktadırlar.

Özet

İşletmelerin küreselleşen ekonomide yer alması ile farklı ülkelerin bir arada faaliyet göstermesiyle birlikte farklı muhasebe uygulamalarıyla karşı karşıya kalınmıştır. Bunun sonucunda işletmeler faaliyet gösterdiği her yabancı piyasa için farklı finansal tablo ve muhasebe kaydı tutmak zorunda kalmıştır. Uluslararası ticaretin gelişmesiyle birlikte yabancı piyasalarda faaliyet gösteren işletmeler için ortak bir finansal raporun değerlendirilip, yorumlanma gereksinimi doğmuştur. Uluslararası piyasalarda faaliyet gösteren işletmelerin muhasebe işlemlerindeki farklılıkları ortadan kaldırmak ve ortak bir muhasebe sisteminin kullanılmasını sağlamaktır. Bunun içinde uluslararası muhasebe standartları yayınlanmıştır. Standartlarla bir uyum içinde sağlamak amacıyla Uluslararası Muhasebe Standartları (UMS) ve Uluslararası Finansal Raporlama Standartları (UFRS) daha iyi anlaşılıp yorumlanabilmesi için Türkçe'ye çevrilmiştir. Türkiye Muhasebe Standartları (TMS) ve Türkiye Finansal Raporlama Standartları (TFRS) hazırlanarak 2005 yılında Resmi Gazete de yayınlanmıştır. Nakit akış tablosu işletmenin yapmış olduğu faaliyet hareketlerinden ve işletme faaliyetlerinden doğan nakit akışlarındaki, artış ve azalışı gösterir. Bu çalışmada, nakit akış tablosu hazırlanırken dikkat edilmesi gereken hususlar, kullanılan yöntemler ve nakit akış tablosu ile ilgili açıklamalar ve kavramlara yer verilmiştir.

**ACCORDING TO TURKISH ACCOUNTING STANDARDS, THE CASH FLOW
STATEMENT AND THE METHODS USED IN THE ANALYSIS OF THE CASH
FLOW STATEMENT**

Abstract

As businesses take part in the globalizing economy and different countries operate together, different accounting practices have been encountered. As a result, businesses have had to keep different financial statements and accounting records for each foreign market in which they operate. With the development of international trade, there has been a need to evaluate and interpret a common financial report for enterprises operating in foreign markets. To eliminate the differences in the accounting transactions of enterprises operating in international markets and to ensure the use of a common accounting system. In this context, international accounting standards have been published. In order to ensure compliance with the standards, International Accounting Standards (IAS) and International Financial Reporting Standards (IFRS) have been translated into Turkish so that they can be better understood and interpreted. Turkish Accounting Standards (TAS) and Turkish Financial Reporting Standards (TFRS) were prepared and published in the Official Gazette in 2005. The cash flow statement shows the increase and decrease in cash flows arising from the operating movements made by the entity and the operating activities. In this study, the issues that should be considered when preparing the cash flow statement, the methods used and the explanations and concepts related to the cash flow statement are included.

Keywords: Turkish Accounting Standards, The Cash Flow Statement, TAS 7

Giriş

Küreselleşmenin etkisi sanat, toplum, politika ve teknolojik alanda olduğu gibi ekonomide de görülmüştür. Ekonomide küreselleşmeyle birlikte Uluslararası Pazarlarda, yatırımların önemi artmış, artık işletmeler kendi pazarlarıyla yetinmeyip farklı pazarlarda da faaliyet göstermek istemelerinden dolayı, finansal bilgilerin herkes tarafından aynı anlamı, aynı sadeliği ifade eden ve karşılaştırma yapabileceği ortak bir muhasebe diline ihtiyaç duymuşlardır (Tunçez, vd. 2019). Yaşanan bu gelişmeler ve ihtiyaçlardan dolayı dünya çapında Muhasebe Standartlarının oluşumuna ortam hazırlamış, uyum ve uyumlaştırma çabaları hız kazanmıştır.

Uluslararası Muhasebe Standartları (UMS) finansal tabloların doğruluğu ve güvenilirliği açısından oluşturulmuştur, bu standartlar sayesinde finansal tablo okuyucularına daha açık daha güvenilir bilgiler verilmesi amaçlanmaktadır. Uluslararası muhasebe standartları ile nakit akış tablosunun düzenlenmesi ve sunulması zorunlu olmuş, bu tablonun hazırlanmasına ilişkin hususlar TMS 7 Nakit Akış Tablosu standardında düzenlenmiştir.

Nakit Yönetimi

Nakit yönetimi, işletmenin elindeki nakit fazlasına ve nakit açıklarına olanak göstermeden işletmenin elinde bulundurması gereken optimum para tutarına denir. Nakit yönetiminin amacı işletmenin belirli bir dönemdeki ödemeleri ve yapması gereken tahsilatları arasındaki nakit tutarını değil de işletmenin ödeme yapacağı para tutarının önemini artırmaktır. Ayrıca nakit yönetimi ödeme ve tahsilattan kaynaklanan nakit fazlası ve noksanlığının şirket ve şirketin finansal faaliyetleri için en uygun bir biçimde sağlamaktadır (Apak, Tunalı, 2004).

İşletmenin gereğinden az ya da fazla nakit bulundurması, bazı olumsuz etkilere neden olmaktadır. Bu nedenle iyi bir nakit yönetimi yapan işletme bu olumsuzlukları ortadan kaldırıp, işletmenin karını arttıracak şekilde nakit yönetimini düzenlemelidir. İşletmenin nakit yönetimi, işletmenin finansal başarısı için büyük bir önem taşımaktadır. İşletmenin nakit giriş çıkışlarının kayıtlarının iyi bir şekilde tutulamaması durumunda birçok problemle karşı karşıya kalınacaktır. Tahsilatların gecikmesi, ürün veya hizmet üretimindeki gecikmeler gibi problemler işletmenin hem itibarının zedelenmesine hem de maddi yönden kayıplarına neden olacaktır.

Nakit Akış Tablosunun Bölümleri

Nakit akım tablosu, işletme faaliyetleri, yatırım faaliyetleri ve finansman faaliyetleri olarak sınıflandırılır (Gürbüz, Çakıcı, Akgül, 2006).

İşletme Faaliyetleri

İşletme faaliyetleri işletmenin ana faaliyet konusuyla ilgili hasılatı elde etmek amacıyla gerçekleştirmiş olduğu edimi ifade etmektedir. İşletmeler yapmış olduğu amaçlar doğrultusunda farklı edimlerde bulunurlar ve bu edimlerin gerçekleştirilmesinde her farklı işletme için ortak bir fonksiyon vardır. Bu farklı edimler tedarik üretim gibi çeşitli fonksiyonlar olarak değerlendirilmektedir.

Yatırım Faaliyetleri

İşletmenin yapmış olduğu çeşitli faaliyetler sonucunda gerçekleşen nakit akışları işletmenin uzun vadede ki fonların temel dayanağını temsil ettiğinden nakit akış tablosunun en önemli bölümünü oluşturmaktadır. İşletme kimseye ihtiyaç duymadan kendi borçlarını ödeyebilmesi sürekliliğin devam ettirebilmesi dönem sonunda kar payını dağıtabilmesi ve yeni farklı yatırımlar yapabilmemesinin imkanının olup olmadığı hususunda yol gösteren faaliyettir. İşletmenin yapmış olduğu faaliyet sonucunda kaynaklanan çeşitli nakit akışları zararların tespitinde yer alan işlem ve olaylardan kaynaklanır.

Finansman Faaliyeti

Finansman faaliyetleri ile işletmeye ait özkaynak ve yabancı kaynakların içinde ve bedellerinde birtakım farklılıklar ortaya çıkaran faaliyetlerin bütünü olarak açıklanabilir. İşletmenin çeşitli Finansman faaliyetleri işletmenin öz kaynak ile yabancı kaynaklarının yapısında ve tutarında değişiklik meydana getiren faaliyetler olarak tanımlanabilir (TMS 7, m., 6). Finansman faaliyet nakit akışları, borçların geri ödenmesi, yeni borçlanmalar, hisse senedi ihracı kar payı gibi birçok finansman işletme faaliyetini içermektedir. Bu faaliyetler sonucunda elde edilen nakit akışları işletmeni mevcut ve gelecekteki finansmanında meydana gelen nakit akışları, farklı ve yeni borçların ortaya çıkması hisse senedi alımları gibi birden fazla çeşitli işletme finansmanını içermektedir.

Nakit Akış Tablosu Analizinde Kullanılan Yöntemler

Finansal tablo analizinin amacı bir veya birden fazla döneme ait varlık ve kaynakları birbiriyle ilişkilerini çeşitli teknik ve yöntemler aracılığı ile analiz edilmesi, yorumlanması ve işletmenin içinde bulunduğu imkan ve koşullarda göz önüne alınarak değerlendirilme işlemidir. İşletme hakkında karar verenlere, doğru ve eksiksiz bilgi vermek finansal tabloların analiz edilmesi bakımından önem taşımaktadır.

Nakit akış tablosu farklı teknik ve yöntemler yardımıyla analiz edilip yorumlanabilir. Nakit akış tablosunun analizinde kullanılan kullanılan teknikler; Karşılaştırılmalı tablolar analizi, eğilim yüzdeleri analizi ve rasyo (oran) analizidir.

Karşılaştırılmalı Tablolar Analizi

Bir işletme ait iki ya da daha fazla döneme ait mali tablolar birbirini izleyen dönemlerde karşılaştırılmalı olarak analiz yapılmak istenirse karşılaştırılmalı mali tablolar analizinden faydalanılır. İşletmenin birden fazla döneme ait tabloları bu yöntem kullanılarak hazırlanılır. Bu tablolar sayesinde işletmenin hem geçmiş hem bugünkü mali durumunu ile geçmiş yıllara ait mali durumu arasındaki farkı görmemize imkan sağlamaktadır. Ayrıca karşılaştırılmalı tablolar analizi yardımıyla işletmenin gelecekteki mali durumu hakkında çıkarımlarda bulunulabilir.

Eğilim Yüzdeleri (Trend Analizi)

Trend analizi şirketin finansal yöneticileri ve analistlerinin mevcut hali durumu hakkında bilgi sahibi olmasına yardımcı olur. Bu tekniği işletmeler kendi bünyesinde uzun bir sürede analizin yapılması durumunda kullanılır. Trend analizi yönteminde amaç birbirini takip eden yıllara ait mali tablolarda bulunan kalemlerin örnek alınan mali tablo kalemlerine göre gösterdiği artış veya azalışlar yüzde olarak hesaplanmasıdır. Trend analiz yöntemi finansal tabloda yer alan kalemlerin zamanla açığa çıkardıkları seyrini incelenmesi esasına dayanmaktadır.

Rasyo (Oran) Analizi

Orana kavramsal olarak baktığımızda iki miktar arasındaki mantığa yatkın olan ilişkisidir. Bu iki miktar arasında kurulan ilişki kesir veya yüzde olarak kabul edilmektedir. Farklı bir deyişle işletmenin finansal işlevi veya bünyesindeki anlamlı sayılar arasında bulunan ilişkiye denir. İşletmelerin finansal performanslarını ölçüp yorumlamada en fazla kullanılan finansal analiz yöntemi oran analiz yöntemidir. Oran analiz yöntemlerinin bir diğer adı rasyo analiz yöntemidir. Bu analiz yöntemi sayesinde nakit akış tablosundaki varlık ve kalemlerin birbirlerinin kaç katı olduğu konusunda kanaatte bulunmaktadır. Nakit akış tablosu temel alınarak hesaplanan oranlar cari dönemdeki veya bir önceki döneme ait nakit akış tabloları üzerinden hesaplandığı gibi gerek aynı işletmelerde gerekse farklı işletmelerde aynı dönem veya farklı dönemler ile ilgili karşılaştırmalar yapılmasına dayanan yöntemdir (Karğın ve Aktaş, 2011):

Sonuç

Nakit akış tablosu yöneticilerin ve işletme sahiplerinin yatırım yapmak amacıyla yatırımcıların ve ilgili kuruluşlarının işletmeye sağlamış olduğu fayda neticesinde önemlilik arz eden bir tablo olarak sunulmaktadır. Nakit akış tablosu işletmenin her hangi bir sorunla karşı karşıya kalmaması olası bir olumsuz duruma gidilmeden gerekli önlemlerin alınmasına yardımcı olmaktadır. Nakit akış tablosu işletmenin olası faaliyetlerine ilişkin verimliliği artırılması ve nakdin yetersiz olması durumunda faaliyetlerin eksiksiz yürütülebilmesi için gerekli önlemlerin alınabilmesi açısından önemlilik arz etmektedir.

Günümüzde var olan işletmelerin yapmış olduğu çeşitli çalışmaları herhangi bir sekteye uğratmadan devam ettirebilmeleri kar elde edebilmek kadar önemli olan nakdin yaratabilmelerine bağlıdır. Kar elde etmiş olup fakat işletme için gerekli olan nakdi yaratamayan işletmeler borçlarını ödeyemeceği için elinde bulundurmuş olduğu varlıkları değerlerinin çok altında satarak borçlarını kapatırlar. İşletmenin yapmış olduğu bu hareket işletmenin bir çok faaliyetinin durdurulmasının yanı sıra kapatılmasına kadar gitmektedir. TMS 7'de düzenlenen nakit akış tablosu işletmelerin nakit akış yapılarını inceleyerek, işletmenin çeşitli faaliyetler sonucunda yaratmış olduğu nakit hakkında gerekli bilgiyi sağlamış olur.

Sonuç olarak işletme sahibi veya yöneticileri işletmenin sürekliliğini devam ettirebilmesi için ellerinde bulundurdukları nakdin yeterli olup olmadığının belirlenmesi ve nakit miktarının yetersiz olması durumunda yeni nakit yaratma imkanlarının nasıl değerlendirileceği işletmenin sürekliliğini sağlayabilmesine yardımcı olmaktadır.

ÖZET

Bu araştırmanın amacı, uzaktan eğitim sürecinde ilkokul dördüncü sınıf sosyal bilgiler dersinde gerçekleştirilen uygulamalara yönelik öğrenci görüşlerini incelemektir. Araştırma nitel araştırma yöntemlerinden biri olan fenomenoloji deseni ile gerçekleştirilmiştir. Araştırmanın katılımcıları Afyonkarahisar iline ait resmi ilkokullarda öğrenim gören 16 sınıf dördüncü sınıf düzeyindeki öğrencilerdir. Araştırmada veri toplama aracı olarak yarı yapılandırılmış görüşme formu kullanılmıştır. Görüşmelerden elde edilen veriler beş tema altında ele alınmış ve yorumlanmıştır. Araştırmada öğrencilerin uzaktan eğitimin yüz yüze eğitim gibi olmadığını ve öğrenemediklerini düşündükleri, çeşitli sorunlar yaşadıkları sonuçlarına ulaşılmıştır. Öğrencilerin uzaktan eğitimde Sosyal Bilgiler dersi kapsamında en fazla araştırma en az ise proje ödevleri yaptıkları sonucuna ulaşılmıştır.

Anahtar sözcükler: İlkokul, 4. Sınıf, Sosyal bilgiler, Öğrenci Görüşleri Uzaktan eğitim, Covid 19

**SOCIAL STUDIES COURSE IN DISTANCE EDUCATION ACCORDING TO
PRIMARY SCHOOL STUDENTS**

ABSTRACT

The aim of this study is to examine the students' views on the applications in the fourth grade social studies course in primary school during the distance education process. The research was conducted with phenomenology design, which is one of the qualitative research methods. The participants of the study were 16 fourth grade students, eight girls and eight boys, who were studying in various public primary schools in the central districts of Afyonkarahisar province. Semi-structured interview forms were used as data collection tools. The data obtained from the interviews were discussed and interpreted under five themes. In the study, it was concluded that students thought that distance education was not like face-to-face education and that they could not learn, that they had various problems. It was concluded that students did the most research and the least project assignments within the scope of Social Studies course in distance education.

Keywords: Primary school, 4th grade, social studies, student opinions, distance education,

GİRİŞ

Dünya genelinde yaşanan Covid 19 salgını nedeniyle karantina döneminde çevrimiçi öğrenme dünya çapında oldukça popüler hale gelmiştir (Radha, Mahalakshmi, Kumar & Saravanakumar, 2020). Ülkemizde bu süreçte ilkokulda Fatih Projesi kapsamında olan EBA platformunda yararlanılmakla birlikte EBA TV kanalı kurulmuş ve eğitimde yeni bir dönem başlamıştır. EBA sistemi üzerinden öğrenciler ile sanal sınıflar üzerinden canlı dersler yapılmaya başlanmış, hem öğretmenler hem de öğrenciler için süreç farklı bir şekilde ilerlemiştir. Salgın boyunca uzaktan eğitim uygulaması hastalığın seyrinde olumlu sonuçlar alınması açısından tercih edilmiş ve uzmanlar tarafından doğru bulunmuştur. Bu süreçte ilkokul öğrencileri ilk defa uzaktan eğitim kavramı ve sistemi ile tanışmış olup derslerini televizyon ve teknolojik araçlar üzerinden sanal sınıf aracılığıyla ekranlardan takip etmeye çalışmışlardır. Süreçte diğer derslerde olduğu gibi Sosyal Bilgiler dersi de uzaktan eğitim şekliyle işlenmeye başlamıştır. Sosyal bilgiler dersi bilgi temelini sosyal bilimlerin oluşturduğu, öğrencilerin eleştirel düşünme, problem çözme becerilerini geliştiren, bilgi, beceri, değer ve tutum gelişimini destekleyerek onları etkin bir vatandaş olarak hayata hazırlayan ilkokul programındaki en önemli derslerden biridir (Dündar, 2018).

Alanyazın incelendiğinde uzaktan eğitime ilişkin çeşitli çalışmaların yapıldığı görülmektedir (Kıyıcı, 2003; Can, 2005; Ağır, 2007; Usta, 2007; Çamlımfidan, 2007; Akyüz, 2008; Bahçekapılı, 2010; Daban, 2012; Salar, 2013; Berge, 2013; Kavrat, 2013; Arat & Bakan, 2014; Ersoy, 2014; Çengel, 2014; Şirin, 2015; Yalavaç, 2015; Özgül, 2016; Yıldız, 2016; Uslusoy, 2017; Yıldızhan, 2017; Demirci, 2018; Assante ve Candel, 2019; He & Xiao, 2020; Kurtdede Fidan, & Yıldırım, 2022). Fakat günümüzde bütün dünyayı etkileyen koronavirüs salgını nedeniyle uzaktan eğitim konusu daha çok çalışılır hale gelmiştir. Türkiye’de de uzaktan eğitim çalışmalarında son yıllarda artış yaşanmıştır (Aras, 2019; Enfiyeci, 2019; Can, 2020; Bulut, 2020; Akyürek, 2020; Doğan, 2020; Kaysi, 2020; Burak, 2020; Keskin & Kaya, 2020; Doğru, 2020; Sığın, 2020; Yolcu, 2020; Akaydın & Aktaş, 2020; Karadağ ve diğ. 2021; Avcı & Akdeniz, 2021; Koç, 2021). Yurt içinde ve yurt dışında geçmişten günümüze kadar Sosyal Bilgiler ve uzaktan eğitim araştırmaları yapılmıştır. Alanyazın incelendiğinde Sosyal Bilgiler dersi ile ilgili yapılan çalışmaların ortaokul kademesinde yoğunlaştığı görülmüştür. İncelemeler neticesinde uzaktan eğitimde ilkokul dördüncü sınıf Sosyal Bilgiler dersi ile ilgili çok fazla çalışma yapılmadığı görülmüş olup, yapılan çalışmanın alanyazına katkı sağlayacağı düşünülmüştür. Bu araştırmanın amacı, uzaktan eğitim sürecinde ilkokul dördüncü sınıf sosyal

bilgiler dersinde gerçekleştirilen uygulamalara yönelik öğrenci görüşlerini incelemektir. Bu amaç doğrultusunda şu sorulara cevap aranmıştır:

- İlkokul öğrencileri uzaktan eğitim denilince ne anlıyor?
- Uzaktan eğitimde sosyal bilgiler dersinde ne gibi etkinlikler gerçekleştirilmektedir?
- Öğrenciler sosyal bilgiler dersinde ne tür etkinliklerin olmasını istiyor ve istemiyor?
- Öğretmenler uzaktan eğitimde sosyal bilgiler dersinde ne tür ödevler veriyorlar?

YÖNTEM

Araştırmanın deseni

Bu çalışmada ilkökul dördüncü sınıf öğrencilerinin sosyal bilgiler dersinin uzaktan eğitim şeklinde gerçekleştirilmesine ilişkin görüşlerinden elde edilen veriler belirlenmeye çalışılmıştır. Araştırmanın amacına uygun olarak nitel araştırma deseni olan olgubilim (fenomenoloji) deseni tercih edilmiştir.

Katılımcılar

Araştırmanın katılımcıları, 2020-2021 eğitim-öğretim yılında Afyonkarahisar iline bağlı merkez ilçelerdeki çeşitli resmi ilkökullarda öğrenim görmekte olan sekizi kız sekizi erkek 16 dördüncü sınıf öğrencisidir.

Veri Toplama Aracı ve süreci

Veri toplama aracı olarak da beş sorudan oluşan yarı yapılandırılmış görüşme formu kullanılmıştır. Görüşme formundaki sorular için uzman görüşüne başvurulmuştur. İki ilkökul dördüncü sınıf öğrencisi ile pilot uygulama yapılmıştır. Öğrencilerin uzaktan eğitim süreci içerisinde evlerinde olmasından dolayı görüşmeler yüz yüze yapılamamış olup, 26-30 Mayıs 2021 tarihleri arasında katılımcıların izni ile ZOOM uygulaması üzerinden canlı bağlantılar kurularak gerçekleştirilmiştir. Ayrıca görüşmeler öncesinde ailelere ZOOM uygulaması ile kayıt edileceği bildirilmiş olup veli izni ve Yayın Etiği Kurulu'ndan yazılı izin (24.05.2021, sayı 246, no:07) alınmıştır.

Verilerin Analizi

Bu çalışmada veriler tematik analiz yöntemi analiz edilmiştir. Bir dizi bireysel veya odak grup görüşmesi ya da çeşitli metinlerden oluşan veri seti içerisinde tekrar eden anlam örüntülerini bulmak için yapılan bir inceleme tematik analiz denir. (Braun & Clarke, 2019). Görüşme kayıtları yazıya geçirilmiş ardından sorular tek tek analiz edilerek kodlanmıştır. Ayrıca ikinci bir kodlayıcı da eş zamanlı olarak verileri kodlamıştır. Kodlar sınıflandırılmış ve elde edilen bulgular ana temalar altında sunulmuştur. Bulguların sunumunda doğrudan alıntılara da yer

verilmiştir. Çalışma grubunda yer alan öğrenciler ise katılımcı gizliliği sağlaması açısından farklı kod adlar ve numaralar kullanılarak isimlendirilmiştir.

BULGULAR

Bu bölümde elde edilen verilere ilişkin olarak yapılmış olan bulgulara ve yorumlara yer verilmiştir.

Öğrencilerin Uzaktan Eğitim İle İlgili Düşüncelerine Yönelik Elde Edilen Bulgular

Görüşmelerden elde edilen bulgular doğrultusunda öğrenciler, “uzaktan eğitimi, evde telefonla ve ekrandan görüntülü olarak yapılan ders” olarak tanımlamışlardır. Uzaktan eğitimin yüz yüze eğitim gibi olmadığını ve öğrenemediklerini düşünmektedirler. Yüz yüze eğitime göre daha zor olduğunu bu durumun da sebebinin ekran karşısında olma olduğunu belirtmektedirler. Ayrıca öğrencilerin uzaktan eğitim ile ilgili olumlu ve olumsuz düşüncelere sahip olduğu ve bazı öğrencilerin uzaktan eğitimi sevdiği, birçok öğrencinin ise uzaktan eğitimi sevmediği görülmüştür. Uzaktan eğitim tanımı ile ilgili olarak Resul (Ö4) *“Uzaktan eğitim okullar kapanınca öğretmenin görüntülü ders vermesi.”* şeklinde görüşünü söylerken Bilal (Ö2), *“Yani uzaktan eğitim, eğitimin uzaktan, telefonla olması diyebilirim.”* demiş Kübra (Ö12) ise okuldaki eğitim gibi önemli olduğunu ifade edip *“Ben uzaktan eğitimi evlerde olan bir ders olarak görüyorum. Tahtaya çıkıp soru yanıtlayamıyoruz ama. Okuldaki eğitim gibi önemli olduğunu düşünüyorum.”* şeklinde düşüncelerini açıklamıştır. Uzaktan eğitimin yüz yüze eğitim gibi ve eğlenceli olmadığını ve sevmediğini söyleyen Arif (Ö5), *“Mesela tahtaya çıkıp bir şeyler yapamıyoruz. Öğretmenimiz tahtaya yansıtıyor ama okuldaki gibi eğlenceli olmuyor. Okuldaki gibi anlayamıyoruz. Biraz sıkıntılı oluyor ilk günlerde herkesi sistem atıyordu ama diğer günlerde iyiydi. Yüz yüze eğitimin yerini almıyor.”* şeklinde düşüncelerini belirtmiştir. Uzaktan eğitimi sevdiğini söyleyen öğrencilerden Kübra (Ö12), *“Yüz yüze gibi olmuyor ama seviyorum. Evlerde olduğumuzda derslerimi eksik olacaktı eksik konularımızı tekrar etmek daha kolay oluyor. Daha az yazı yazıyoruz.”* şeklinde sevme sebeplerini açıklamış Ezgi ve Tuğçe ise sağlığımız için iyi olduğunu *“Seviyorum çünkü bizim sağlığımız için uzaktan eğitime geçildi. Bizi korumak için hastalığı önlemek için iyi oldu.”* (Ezgi Ö7), *“Seviyorum, virüs çıktığı için okula gidersek hasta olabiliriz. Virüsten korunmak için uzaktan eğitim olması iyi oldu.”* (Tuğçe Ö16) cümleleriyle ifade etmiştir.

Uzaktan Eğitimde Sosyal Bilgiler Dersinde Yapılan Uygulamalara İlişkin Bulgular

Görüşmelerden elde edilen bulgular doğrultusunda uzaktan eğitimde Sosyal Bilgiler derslerinde en fazla “video izleme ve ders kitabından okuma” uygulamalarının yapıldığı sonucu ortaya çıkmıştır. Ayrıca soru çözme, yazı yazma, oyun oynama ve proje, çalışmaları yaptıklarını

söyleyen birer öğrenci de bulunmaktadır. Öğrencilerin görüşleri doğrultusunda Sosyal Bilgiler dersi işlenişinde birçok öğrenci ders kitabından okumalar yapıldığını ifade etmiştir. Daha iyi anlamak için okumalar yaptıklarını belirten Ebru (Ö3), “*Öğretmenimiz bir kere okutuyor sonra yine okuyoruz iyi anlamak için. Başka kitabımız da var. Öğretmenimiz bilgisayardan etkinlik çıkartıyor.*” şeklinde görüşlerini açıklamıştır. Öğrencilerin tamamı videolar izlediklerini belirtmiş “Tüm konular, Atatürk’ün Hayatı, Işık Kaynakları, Tarihi Konular” ile ilgili videolar izledikleri verileri elde edilmiştir. Tüm konulardan videolar izlediklerini belirten öğrencilerden Tuğba (Ö9) videolardan dersin hangi aşamasında yararlandığını “*Tüm konulardan izliyoruz. Öğretmenimiz anlatım olarak açıyor sonra sorular çözüyoruz. Öğretmenimiz önceden hangi dersi yapacağımız söylüyor. Sonra konuyla ilgili bir şeyler anlatıyor ve sonra video açıyor.*” cümleleriyle de ifade etmiştir.

Bazı öğrenciler soru çözme çalışmaları yaptıklarını ifade ederken oyun oynama, yazı yazma, proje çalışmaları yapma, anlatım yapma, çalışmalarını ise birkaç öğrenci belirtmiştir. Öğrencilerden Sarp (Ö6), “*Bu derste eğleniyorum çünkü öğretmenimiz hem eğlendirerek anlatıyor. Sitelerden sorular paylaşıyor ekranda bizde sırayla o soruları çözüyoruz..*” şeklinde yapılan çalışmaları örneklendirmiştir. Ezgi (Ö7) ise “*Bizim öğretmenimiz bizi eğlendirerek öğrenmemizi sağlıyor. Mesela dersle konuyla alakalı komik şeyler anlatıyor. Biz de sosyal bilgiler dersine kolay alıştık. Kitaptan okuma yapıyoruz ders sırasında. Etkinliklerini yapıyoruz sonra öğretmenimizle cevaplıyoruz.*” ifadelerinde bulunmuş ve eğlenceli anlatım sayesinde derse daha kolay alıştığını belirtmiştir.

Diğer öğrencilerden farklı olarak proje çalışmaları yaptıklarını ifade eden Kübra (Ö12), “*Öncelikle kitaptan yapıyoruz. Bazen etkinlik yapıyoruz ve konuyu zihnimize canlandırarak yapmaya çalışıyoruz. Konuyu anlamayan çok olursa projeler yapıyoruz. Sorular çözüyoruz.*” ifadelerinde bulunarak diğer çalışmaları da örneklendirmiştir.

Uzaktan Eğitimde Sosyal Bilgiler Dersi Kapsamında Gerçekleştirilen Sanal Müze Gezilerine İlişkin Bulgular

Görüşmeler sonrasında katılımcılardan sadece birkaç öğrenci sanal müze gezilerini yaptıklarını söylemiş olup bu öğrenciler dışındaki bazı öğrencilerin ise sanal müzelerin ne olduğuna dair fikirlerinin dahi olmadığı görülmüştür. Sosyal Bilgiler dersinde sanal müze gezisinde Etnografya ve Doğa Tarihi Müzelerinin gezildiği görülmektedir. Sanal müze gezisi yaptıklarını belirten öğrencilerden Sefa (Ö1), “*Nereleri gezdiğimizi isim olarak hatırlamıyorum şimdi. İçinde eski tarihi eşyalar vardı. Eski vazolar, heykeller vardı. Heykelleri görünce şaşırđım, gerçek insan gibiydiler.*” Çiğdem (Ö11), *Evet, yapmıştık ama nereye gittiğimizi*

hatırlamıyorum. Dinozor kemikleri vardı, vazo vardı. Ordaymış gibi oldum ama onları daha yakından görmek isterdim.” şeklindeki ifadeleri ile sanal müze gezi durumları hakkında hatırladıklarını ifade etmiştir. Birçoğu ise “ Hayır, sanal müze gezisi yapmadık.” ifadesinde bulunmuştur.

Uzaktan Eğitim Sürecinde Sosyal Bilgiler Dersinde Hoşa Giden ve Gitmeyen Uygulamalara Yönelik Elde Edilen Bulgular

Öğrencilerin çoğunluğu yapılan tüm çalışmaların hoşuna gittiğini söylemiş olup Resul (Ö4) dışındaki öğrencilerden örnek uygulama yanıtları da alınmıştır. Görüşmeler doğrultusunda en çok hoş giden çalışmanın “*ekran paylaşımı*” olduğu ortaya çıkmıştır. Hoşlarına giden diğer uygulamalar “*soru çözme, video izleme, EBA’ daki çalışmalar, etkinlik yapma, farklı sitelerden yararlanma, ders kitabında yer alan çalışmalar, ders kitabında olmayan çalışmalar, okuma yapma, bizim yaptığımız anlatımlar*” biçimlerinde ifade edilmiştir. “*Zor soruların olması, yazı yazma, videoların geç açılması, sistemin atması, ekranın gitmesi*” durumlarının ise öğrenciler tarafından hoş karşılanmadığı sonucuna ulaşılmıştır. Yapılan uygulamaların eğlenceli olduğunu düşünen öğrencilerden Çiğdem (Ö11), “*Genellikle etkinlikler yapma, video izleme hoşuma gidiyor.*” ifadelerinde bulunurken Ali (Ö14), “*En çok video izlemek hoşuma gidiyor, eğlenceli geliyor.*” Emine (Ö8) ise “*Hepsi hoşuma gidiyor benim. Konularımızdaki etkinlikler eğlenceli oluyor.*” demiştir. Kendileri çalışıp arkadaşlarına özetledikleri zaman daha eğlenceli şekilde olduğunu ifade eden Sarp (Ö6), “*Mesela haklarımız konusunu işlerken çok eğlenmişim. Hepimiz haklarımızı özetledik, öğretmenimiz ekran paylaşarak farklı sorular çözmüştük.*” şeklinde düşüncesini söylemiştir.

Ekran paylaşımı durumunu Arif (Ö5), “*Kitabımızda olmayan şeyleri tahtaya yansıtması hoşuma gidiyor.*” şeklinde kitaplarında olmayan yerlerin yansıtılmasından duyduğu memnuniyeti ifade ederken, Ezgi (Ö7) ise Google Earth üzerinden yaptıkları geziyi “*Mesela biz canlı derste haritalardan gezmiştik. Çok hoşuma gitmişti.*” şeklinde belirtmiştir.

Hoşa gitmeyen uygulamalara yönelik olarak “*Zor sorular olması, yazı yazma, videoların geç açılması, sistemin atması, ekranın gitmesi*” durumları belirtilmiştir.

Uzaktan Eğitim Sürecinde Sosyal Bilgiler Dersinde Yapılması İstenilen Çalışmalara Yönelik Bulgular

Öğrencilerin birçoğu yapılan uygulamalardan memnun olduğunu belirtmiştir. Öğrencilerden bazıları ise farklı önerilerde bulunmuştur. Bu öneriler; “*proje çalışmaları yapılabilir, değişik kostüm giyilebilir, hikayeler anlatılabilir, ilginç etkinlikler yapılabilir, farklı kaynaklardan uygulamalar yapılabilir, daha fazla oyun olabilir, daha fazla soru çözüm olabilir*” şeklindedir.

Proje çalışmaları yapılabileceğini belirten Ali (Ö14), “*Fen bilimleri dersinde yapıyoruz sosyal bilgiler dersinde de olsa güzel olabilir.*” diyerek önerisini açıklamıştır. Değişik kostüm giyilebileceğini söyleyen Sefa (Ö1), “*Öğretmenimin anlattığı konular güzel geliyor. Tarih konularını anlatırken değişik kıyafetler giyse daha güzel olabilirdi.*” şeklinde tarihi konuların bu şekilde daha güzel olabileceğini belirtmiştir.

Hikayeleri sevdiğinden dolayı Sarp (Ö6), “*Türkçe dersinde öğretmenimiz bize hikayeler falan anlatıyordu. Ona benzer şeyler anlatsa hoşuma giderdi.*” şeklindeki açıklamasıyla derslerde hikayelerden yararlanılsa hoşuna gideceğini belirtmiştir.

Tam bilmediği yerleri anlayabilmek düşüncesinden dolayı Kübra (Ö12), “*İlginç etkinlikler olsun isterdim. Kurtuluş Savaşı’nı işlerken çok fazla tarih vardı. Defterimize çok yazı yazdık o konuları işlerken. O konularla ilgili tarihleri unutamayacağımız farklı bir şeyler olabilirdi...*” ifadeleri ile tarihi konular ile ilgili yaşadığı eksikliğin giderilebileceğini belirtmiştir.

“*Bazen kitaptan işliyoruz. Bazen öğretmenimiz kendisi paylaşım yapıyor. Sorular çözüyor, dersle ilgili etkinlikler yapıyoruz.*” açıklamalarında bulunan Emine (Ö8), “*...başka sitelerden giriş yapabiliydik, farklı kitap uygulamalarından kullanabiliydik.*” önerilerinde bulunmuştur.

Türkçe dersinde daha çok oyun oynadıklarını belirten Çiğdem (Ö11), “*...Sosyal Bilgiler dersinde de daha çok oyun oynasak güzel olabilir.*” önerisinde bulunurken Enes (Ö13), “*Ben daha çok soru çözmek isterdim.*” şeklinde isteğini belirtmiştir.

Sosyal Bilgiler Dersinde Verilen Ödevlere Yönelik Elde Edilen Bulgular

Öğrencilerin görüşleri incelendiğinde Sosyal Bilgiler dersinde en fazla “*araştırma ödevi*” yaptıkları sonucuna ulaşılmıştır. Ayrıca bazı öğrenciler öğretmenlerin ödev olarak “*kaynak kitaplardan çalışmalar*” istediğini belirtirken, bazıları “*yazı yazma ödevleri*” olduğunu bazıları ise “*soru çözme*” ve “*etkinlik çalışması*” ödevleri yaptıklarını ifade etmiştir. Onları “*okuma ödevleri*” takip ederken birkaç öğrenci “*ders kitabından çalışmalar*” yaptıklarını ifade etmiş birkaç öğrenci ise “*proje çalışmaları*” yaptıklarını söylemiştir.

Araştırma ödevlerinin bazen olduğunu söyleyen Sefa (Ö1), “*Yeni konuya geçince ödevler veriyor. Ders kitabından oluyor, bazen araştırma ödevi veriyor.*” ifadelerinde bulunurken, Ezgi (Ö7) ise “*Mesela soru soruyor araştırmamızı istiyor. Arkadaşlarımızla birlikte bulmaya çalışıyoruz...*” ifadelerine okumalar yaptığını da eklemiştir. Resul (Ö4), “*... Araştırma ödevi vermişti. Uçağı, arabayı, lambayı kim buldu diye araştırmıştık. Ateşi kim bulduğunu kimse bilmiyormuş. Thomas Edison hangi işi yapıyor. Nuri Demirağ nerede çalışmış ne yapmış onları araştırın defterinize yazın demişti.*” ifadeleriyle araştırma yaptıkları belirtmiştir.

Yazı yazma, soru çözüme okuma ve etkinlik ödevleri yaptıklarını belirten öğrencilerden Tuğba (Ö9) örneklerini “*Kitaplarımızdan ödevler veriyor, okuma ödevleri oluyor. Mesela bugün yazma ödevi verdi. Konularla ilgili sorular çözüyoruz. Etkinlikler yapmamızı istiyor.*” biçiminde açıklarken Rıza (Ö10), “*Etkinlik yapmamızı istiyor, eşleştirme soruları falan oluyor, link gönderiyor oradan yapıyoruz. Bazen araştırma ödevi oluyor. Okuma, yazı yazma ödevlerimiz oluyor.*” açıklamalarında bulunmuş, Ali (Ö14) ise “*Genellikle yazı ödevi oluyor. Derste yarım kalan yazımız olduğunda onları tamamlıyoruz. Test veriyor...*” ifadelerini söylemiştir.

Ödev olarak proje çalışmaları yaptıklarını da söyleyen öğrencilerden Kübra (Ö12), “*Proje ödevlerimiz oluyor. Araştırmalar yapıyoruz. Konu sonrasında etkinlikler oluyor evde yapılabilecek etkinlikler olduğunda. Kaynak kitaplarımızdan soru ödevimiz oluyor.*” ifadelerinde bulunurken, Tılsım (Ö15), “*Proje etkinlikleri yaptırıyor.*” şeklinde ifade etmiştir. Ödevler çalışmaları ile ilgili olarak Arif (Ö5), “*Bazen bulmacalar veriyor. Ders kitaplarımızdan yapıyoruz. Kaynak kitabımızdan yapıyoruz. Bazen araştırma ödevleri oluyor. Bir kere resim araştırmamızı istemişti öğretmenimiz, kimlik konusuyla ilgili.*” ifade ederken, Bilal (Ö2), “*Mesela yön bulmayla ilgili ödev vermişti, benim size söylediğim yön bulma araçlarından başka var mı araştırın demişti. Araştırma ödevleri, yazı ödevi veriyor..*” şeklinde açıklama yapmıştır.

SONUÇ

İlkokul dördüncü sınıf öğrencilerinin gözünden uzaktan eğitimde Sosyal Bilgiler dersi ile ilgili neler yapıldığı, öğrencilerin bu süreç ile ilgili neler düşündüklerinin belirlenmesi amacıyla yapılan bu çalışmada; öğrencilerin uzaktan eğitimi evde telefonla ve ekrandan görüntülü olarak yapılan ders olarak tanımladıkları görülmüştür. Uzaktan eğitimin yüz yüze eğitim gibi olmadığını ve öğrenemediklerini düşündükleri sonucuna ulaşılmıştır. Ayrıca öğrencilerin uzaktan eğitimi sevmedikleri sevdiğini söyleyen öğrencilerin ise sağlığını korumak için böyle olması gerektiği ve daha az yazı yazdıkları için sevdikleri sonucuna ulaşılmıştır. En çok yaşanan sorunun ZOOM veya EBA sisteminin dersten öğretmeni veya öğrenciyi atması olduğu görülmüş olup bazı öğrenciler bu durumun hoşlarına gitmediği hatta bu durumdan dolayı uzaktan eğitimi de sevmediklerini belirtmişlerdir. Uzaktan eğitimden okuldaki verimi alamadıklarını, eğlenceli olmadığını, anlayamadıklarını, sıkıntılı olduğunu belirten öğrenciler olduğu sonucuna ulaşılmıştır. Şen ve Kızılcıoğlu (2020) da yapmış oldukları çalışmada öğrencilerin uzaktan eğitim ile işlenen dersleri sıkıcı bulması, uzaktan eğitimin sosyalleşmeye engel olması gibi nedenlerle uzaktan öğretim sürecinden memnun olmadıkları sonuçlarını elde

etmiştir. Görüşmelerden elde edilen veriler doğrultusunda öğrenciler Sosyal Bilgiler dersinde diğer derslerde olduğu gibi çeşitli problemler yaşadıklarını belirtmişlerdir. En çok bağlantı kaynaklı problem yaşandığı belirlenmiş olup bu problemler içinde en sık karşılaşılan problemin sistemin öğrenciyi atması olduğu görülmüştür. Bu probleme bağlı olarak iletişim ve anlama sorunlarının da beraberinde geldiği sonucuna ulaşılmıştır. Keskin ve Kaya (2020) da yapmış oldukları çalışmada öğrenciler eğitimler sırasında teknik sorunlar yaşadığını bildirdiklerini belirtmişlerdir.

Derslerde yapılan çalışmalar ile ilgili görüşler incelendiğinde ise en fazla “video izleme ve ders kitabından okuma” çalışmalarının yapıldığı sonucuna ulaşılmış olup “oyun oynama, yazı yazma, proje çalışmaları yapma” çalışmalarına ise çok az yer verildiği bu çalışmaların öğrenciler tarafından da daha fazla yapılması istendiği görülmüştür. Görüşmeler sonrasında katılımcılardan sadece birkaç öğrenci sanal müze gezilerini yaptıklarını söylemiş olup bu öğrenciler dışındaki bazı öğrencilerin ise sanal müzelerin ne olduğuna dair fikirlerinin dahi olmadığı görülmüştür. Akaydın ve Aktaş (2020)’ in yapmış oldukları çalışmada da uzaktan eğitimle gerçekleştirilen sosyal bilgiler dersinin öğrenci merkezli yöntem ve tekniklerin uygulanmasını sınırlandırmakla birlikte ders sırasında gerçekleştirilen sanal müze gezilerinin, eğitici video ve görsel paylaşımının öğrencilerin ilgisini çektiği tespit edilmiştir. Ayrıca öğrencilerin uzaktan eğitim ile gerçekleştirilen sosyal bilgiler derslerinin farklı dijital içeriklerin kullanılmasıyla birlikte eğlenceli geçtiğini, yüz yüze eğitim kadar etkili olmasa da konuları anlama, tekrar etme ve pekiştirmede etkili olduğunu sonucuna ulaşılmıştır. Öğrencilerin çoğunluğu yapılan tüm çalışmaların hoşuna gittiğini söylemiş olup görüşmeler doğrultusunda en çok hoş giden çalışmanın “ekran paylaşımı” olduğu ortaya çıkmıştır. Hoşlarına giden diğer uygulamalar “soru çözme, video izleme, EBA’ daki çalışmalar, etkinlik yapma” biçimlerinde ifade edilmiştir. “Zor soruların olması, yazı yazma, videoların geç açılması, sistemin atması, ekranın gitmesi” durumlarının ise öğrenciler tarafından hoş karşılanmadığı sonucuna ulaşılmıştır. Ayrıca öğrencilerden bazıları farklı uygulama önerilerinde bulunmuştur. Bu öneriler; “proje çalışmaları yapılabilir, değişik kostüm giyilebilir, hikayeler anlatılabilir, ilginç etkinlikler yapılabilir, farklı kaynaklardan uygulamalar yapılabilir, daha fazla oyun olabilir, daha fazla soru çözüm olabilir” şeklindedir. Öğrencilerin görüşleri incelendiğinde Sosyal Bilgiler dersinde en fazla “araştırma ödevi” yaptıkları sonucuna ulaşılmıştır. Ayrıca bazı öğrenciler öğretmenlerin ödev olarak “kaynak kitaplardan çalışmalar” istediğini belirtirken, bazıları “yazı yazma ödevleri” olduğunu bazıları ise “soru çözme” ve “etkinlik çalışması” ödevleri yaptıklarını ifade etmiştir. Onları “okuma

ödevleri” takip ederken birkaç öğrenci “*ders kitabından çalışmalar*” yaptıklarını ifade etmiş birkaç öğrenci ise “*proje çalışmaları*” yaptıklarını söylemiştir. Duru ve Çöğmen (2017)’ in, ilkokul ve ortaokul öğrencileri ile velilerin ev ödevlerine yönelik görüşlerini incelediği araştırmada da öğrencilerin hoşlandıkları ve hoşlanmadıkları ödevleri belirlemiş ve proje, tasarım ve araştırma ödevleri yaptıkları görülmüştür. Bu araştırmadan da anlaşılacağı üzere uzaktan eğitimde de yüz yüze eğitimde de öğretmenlerin aynı tür ödevlerden yararlandıkları sonucuna ulaşılabilir.

Özet

Gastronomide yeni trendler son yıllarda popüler bir şekilde artan birçok akımla genişlemektedir. Slow Food yani, 'iyi, temiz ve adil gıda' felsefesi son yıllarda popülerliğini arttıran özellikle Cittaslow (üye bölge ve ülkelerle) üyelikleri ile ortaya çıkan çevreyi doğayı koruyan ve yerel üretimi artırarak, üreticilerin gelir düzeyini önemseyen bir akımdır. Sürdürülebilirlik ve sosyo-kültürel ve tarihi değerleri korumak ve bu yeni akımla ziyaretçilere aktarma konusunda farkındalığı ve bilinç düzeyini artırmayı amaçlayan Slow Food'un, geleneksel gıdaları koruma altına almayı, bölge insanları tarafından üretimini artırmayı, biyolojik çeşitliliği korumayı, yemek eğitimi ve yerel ekonomiyi desteklemeyi amaç edindiği görülmektedir. Bu çalışma Slow Food akımı adına Kuzey Kıbrıs'ta yapılan akademik çalışmaların ve turizm ve gastronomi alanında yer alan işletmelerin akımla ilgili uygulama şekillerini içermektedir. Çalışmada konaklama tesisleri ve yiyecek içecek işletmelerinin gelir ve istihdam gibi ziyaretçi çekecek gelen yerli ve yabancı ziyaretçi sayısını artıracak turistik ve gastronomik ürünler üretmek adına bölge turizminin gelişmesi açısından değerlendirilerek bölge turizminde slow food akımının önemini paylaşmaya çalışmıştır. Çalışma 20 kişilik bir katılımcı ile görüşülüp geliştirilecek olup, katılımcılar sektörde gastronomi ile uğraşan ve akademik bir kariyere sahip kişilerden seçilecektir. Araştırma yöntemi olarak sözlü mülakat (açık uçlu sorular) yöntemi kullanılıp, elde edilen bulgularla çalışma desteklenecektir. Bu bulgular sonuç kısmında öneriler başlığı altında da paylaşılacaktır.

Anahtar Kelimeler: Slow food akımı, Gastronomi, Kuzey Kıbrıs.

**NEW TRENDS IN GASTRONOMY; NORTH CYPRUS SLOW FOOD TREND
EXAMPLE**

Abstract

New trends in gastronomy have been expanding with many popular trends in recent years. Slow Food, that is, the philosophy of 'good, clean and fair food' is a trend that has increased its popularity in recent years, especially with its memberships in Cittaslow (member regions and countries), protecting the environment and increasing local production, giving importance to the income level of the producers. Aiming to increase awareness and awareness about preserving sustainability and socio-cultural and historical values and conveying them to visitors with this new trend. Slow Food aims to protect traditional foods, increase production by the people of the region, protect biodiversity, food education and support the local economy. Appears to have acquired. This study includes the practices of the academic studies conducted in Northern Cyprus on behalf of the Slow Food movement and the businesses in the field of tourism and gastronomy. In the study, accommodation facilities and food and beverage businesses are evaluated in terms of regional tourism and gastronomic diversity, transportation, promotion, infrastructure and touristic and gastronomic products that will attract visitors and increase the number of visitors, especially income and employment, in terms of the development of regional tourism. It has been tried to show the importance of the slow food movement. The study will be developed by interviewing a participant of 20 people, and the participants will be selected from people who are engaged in gastronomy in the sector and have an academic career. The interview method will be used as a research method (with open ended questions) and the study will be supported with the findings obtained. These findings will also be shared under the heading of recommendations in the conclusion part.

Keywords: Slow food trend, Gastronomy, North Cyprus.

1. Giriş

İlk bakışta, Yavaş Turizm, 80'lerde ortaya çıkan (Broggi, 1985; Krippendorf, 1987) ve daha çevresel ve sosyal olarak algılanan alternatif turizm türlerini ayırt etmenin bir yolu olarak kullanılan soft turizm ile eşanlamlı gibi görünebilir. Slow food ile ilgili pek çok terim vardır ve bunlar, kitle turizmi türüne zıt olarak veya Bruntland Raporunda (Dünya Çevre ve Kalkınma Komisyonu – World Commission on Environment and Development, 1987) önerilen daha sürdürülebilir kalkınma ihtiyacının bir sonucu olarak ortaya çıkan alternatif turizm biçimlerini karakterize etmek için kullanılır. Alternatif turizmin çeşitli biçimleri, sosyal, kültürel ve fiziksel çevre kaygısıyla benzer ideolojiyi paylaşırsa da, farklı sosyal/politik hareketlerden kaynaklanabilir, farklı gelişme yolları izleyebilir ve farklı pazar segmentlerini çekebilir. Bu çalışmada Yavaş Turizm, kendine özgü kökeni, özellikleri ve pratiği ile benzersiz bir fenomen olarak ele alınmaktadır. Otuz yılı aşkın bir süre önce İtalya'nın Bra kentinde başlayan Slow Food Hareketi tarafından ortaya çıkan CittaSlow (Cittaslow International, 2010), yeni trend gastronomi ve turizm şekillerinin yaratılmasında lider bir rol oynadı. Tüm yeni turizm biçimleri gibi, evrensel olarak üzerinde anlaşmaya varılmış bir tanımın yanı sıra gelişimi için açıkça tanımlanabilir bir pazar segmenti veya modeli yoktur. Bu çalışma Slow Food akımı adına Kuzey Kıbrıs'ta yapılan akademik çalışmaların, turizm ve gastronomi alanında yer alan işletmelerin akımla ilgili uygulama şekillerini paylaşmayı amaçlamaktadır. Çalışmada konaklama tesisleri ve yiyecek içecek işletmelerinin gelir ve istihdam gibi ziyaretçi çekecek gelen yerli ve yabancı ziyaretçi sayısını artıracak turistik ve gastronomik ürünler üretmek adına bölge turizminin gelişmesi açısından değerlendirilerek bölge turizminde slow food akımının önemini paylaşmaya çalışmıştır.

1.1. Slow Food Akımı

1990'lı yılların başında bireyler, hızlı (hazır) yeme alışkanlıklarının olumsuz hayatlarını etkiledi. Fast food (abur cubur) dünya pazarına hızla hakim oldu ve bireylerin sosyal kültürü, yaşam standartları ve sağlıkları üzerinde birçok olumsuz etkiye neden olmuştur. Şeffaf bilgiye olan ihtiyaç da önemli ölçüde artmıştır. Fast food tüketimleri. Bununla ilgili olarak yerel, geleneksel ve organik gıdaların tüketilmesi çok zorlaştı ve obezite gibi pek çok sağlık sorunu baş göstermeye başladı (İnce, 2020). İtalyan bir yazar olan Carlo Petrini önderliğinde bir grup aktivist 1986 senesinde, İtalya'da bulunan Roma şehrine açılacak olan McDonalds restoranına hamur atarak tepki göstermiştir. Globalleşmenin ve süratin metaforu olan bu zincir restorana (McDonalds) gösterilen tepkinin sonucunda yavaşlık hareketi ortaya çıkmıştır. Bu hareketin

metaforu ise salyangoz olmuştur (Jackson, 2007). 9 Kasım 1989 yılında İsveç, İtalya, Fransa'nında içinde bulunduğu 14 ülkenin, Pariste bulunan Opera Comique' de attıkları imza ile Slow Food (Yavaş Yemek) resmileşmiştir (Güven, 2011). Yöresel besinlerin teşviği, yöresel tohum işlenişi, özgünlüğün güvenliğinin sağlanması, bölge insanının maddi kazanç sağlaması ve bölgesel kalkınmanın oluşturulmasıyla küreselleşmeye karşı bir tepkidir (Kinley, 2012). Slow Food Hareketi, iyi, temiz, adil gıda prensipleri ile ilerlemektedir. (Walter, 2009).

Yalnızca hızlı yemeğe karşı bir eylem değildir. Fast food ile birlikte oluşan alışkanlığa, standartlaşmaya, bölgesel bozulmalara da karşıda bir harekettir. Slow Food yalnızca gıda sınırlarında kalmayarak yavaş yolculuk, yavaş tıp, yavaş turizm gibi yaşamının pek çok noktasında var olmaya başlamıştır. Yavaş Yemek prensiplerini; yöresel ürün ve işlenişlerinin devamlılığı, yöresel besin pişirme ve tüketim anelerinin devamlılığı, yavaş yemek (slow food) fikrinin yaygınlaşması diye başlıklandırabiliriz (Keskin, 2010). Yavaş yemek hareketi zamanla birçok başarıya imza attı. Farklı coğrafyalarda hızla gelişmişti. Bireylerin ihtiyaçları ile farklı kültürlerdeki gıdaların kökenleri arasındaki güçlü bir ilişki kuruldu. Üstelik bu felsefesi sadece yemek tarzı ve şehir hayatı ile ilgili değildir, aynı zamanda turizm, seyahat, eğitim ve ticaret konularında geliştirme ve iyileştirme yöntemleri de içerir (İnce, 2020).

1.2. Cittaslow

'Sakin Şehir' olarak tanımlanan Cittaslow, İtalyanca 'citta' (şehir), İngilizce 'slow' (yavaş) sözcüklerinden türemiştir. Yavaş yemek (Slow Food) önderlerinden olan dört belediye başkanının çabaları ile başladı. Simgesi sırtında şehir taşıyan salyangozdur (Ergüven, 2011). Başarılı turizm hedefleri olan bu dört belediye yine de çabuklaşan dünya düzeninde başarısız olma ihtimalleri vardı. Olumlu geçen turizm faaliyetlerinin neticesinde kent merkezlerindeki trafik sorunu ortaya çıkmış, artan hızlı yemek (Fast food) mekanları turist sayısını fazlalaştırmış ve tanıtım-reklam levhalarından ki artış ise ışık kirliliğini ortaya çıkarmıştır. Hedef bu şehirleri yavaşlatmaktır. Özetle globalleşmenin kentlerin özgünlüğünü, bölge halkını ve yaşam stilleri arasındaki farklılıkların ortadan kalkmasını önlemek amacı ile slow food eyleminden doğmuş bir kentler birliğidir (Knox ve Mayer 2009).

Cittaslow, sürdürülebilir kalkınma için çabalayan ufak şehirleri; geçmişten gelen geleneğini muhafaza ederken, yaşamı yavaşlatarak, yaşamı makul düzeye getirerek, bu şehirlerin farklılıklarına zarar vermeyerek, sürdürülebilir kalkınmaya yardım etmektedir. Bir şehir yalnızca bugünün koşullarına göre hareket etmemelidir. Cittaslow ileriki dönemlerde de o bölgede yaşayacakları da düşünerekten, hayat standartlarını muhafaza edilmesini savunan bir harekettir.

Cittaslow'un ilk başlardaki asıl uğraşı bölge insanının genel refah ve erişim düzeyiydi. Zaman içinde bölge ziyaretçileri için de cazip gelmeye başlamıştır. Cittaslow bu durumdan sonra, bölge ziyaretçilerindeki devamlılığı ve devamlılık için seyahat arzı, hayat standartlarıyla seyahat talebinde mühim bir vasıta gücüne erişmiştir (Öztürk, 2019). 2020 yılı itibariyle sendikada 100.000'den fazla üye var. İlk günden, Şubat 2020'e kadar Cittaslow'a katılan 30 ülkeden 264 şehir var. Kuzey Kıbrıs, uluslararası Cittaslow hareketinin resmi bir üyesidir. 2013'ten itibaren. Resmi olarak belirtilen yedi merkezi politika Enerji ve çevre gibi yavaş şehir statüsünü elde etmek için Cittaslow tüzüğü politikaları, altyapı politikaları, kentsel yaşam kalitesi politikaları, tarım, turizm ve esnaf politikaları, misafirperverlik, farkındalık ve eğitim politikaları, sosyal uyum ve ortaklıklar. Ayrıca şehir nüfusu 50.000'den az olmalıdır (İnce, 2020).

1.3. Sürdürülebilir Şehir

Sürdürülebilir şehirler, kuşkusuz insanoglunun yarınları için ehemmiyeti çoktur. Sürdürülebilir şehir eski bir kavramdır. Farklı bölgelerdeki, uzun zamandır ayakta kalan tarihi noktaların sırrı; kendi yaşam ve maddi faaliyetleri arasındaki bağlantı ile bölgeden içinde olmayan doğa ve toprak alan arasındaki bağlantıları ölçülü kurup, bu balansın sürekliliğini sağlamaktır. Farklı bir anlatımla sosyal ve maddi menfaatlerin, çevre ve enerji problemleriyle ılımlı bir şekilde bağdaştırılıp yenilikte sürekliliğin oluştuğu bir bünyedir (Coşkun, 2018).

1.4. Slow food ve Cittaslow Ortaklığı

Sakin şehir, yavaş yemek faaliyetlerindeki gibi yavaş yaşamda devamlılığı müdafaada etmektedir, bu düşüncüyü şehirlerde gerçekleştirmek için yapılanmıştır. İki eylemin ortaklığı buradan başlamaktadır. Sakin Şehir ve Yavaş Yemek akımlarının ortaklığı bu hususta belli olmaktadır. Yavaş Yemek akımı 'TerraMadre' (Toprak Ana) tasarısında besinler ile ilgili olarak bir araya gelmiş dernek, vakıf, cemiyet ve birlikler gibi örgütler desteklenerek yok olma ihtimali olan malzemelerin önlem çalışmalarını tasarısını sağlamaktadır. Korumaya alınmış olan yöresel gıdalar ile geleneksel beslenme alışkanlıklarının okullar ve kantinlerinde eğitim programlarında ve restoranlarda kullanılarak korunmasını sağlanması, okul bahçelerinde tarımsal gelişimi destekleyecek çalışmaların uygulanması gibi görevlerini yerine getirmesi için CittaSlow hareketi ile ortaklığından olacak ve bu iki eylem birbirinden aldığı destekle güçlenecektir (Şahin ve Kutlu, 2014).

2. Kuzey Kıbrıs'ta Slowfood-Cittaslow Üyesi Bölgeler

2.1. Lefke (Cittaslow Üyesi)

Bol ceviz ve hurma ağaçlarıyla çevrili Lefke'de yetişen Yafa portakalları Kıbrıs'ın en lezzetli portakalları olarak kabul edilmektedir. Ayrıca Lefke, Kıbrıs'ın tarım merkezi olarak bilinir.

Lefke Belediyesi ve yerel derneklerin öncülüğünde her yıl çeşitli etkinlikler düzenlenmektedir: Ceviz Festivali, Hurma Festivali, Yafa Portakal Festivali, Çilek Festivali, Bağlıköy Eko Günü, Doğancı Kültür Günü ve Yedidalga Verigo Üzüm Festivali.

7 Kasım 2015 tarihinde İsveç'in Falköping şehrinde düzenlenen toplantıda Lefke Belediyesi'ne Cittaslow üyelik belgesi ve bayrağı takdim edildi.

Kültür çeşitliliği, geleneksel köyleri, mimari karakteri, yerel ürünleri, tarihi mirasları, geleneksel el sanatları, alternatif turizm potansiyeli, organik tarımı, doğal güzellikleri, verimli toprakları, doğal su kaynakları ve sakinliği ile Lefke, Lefke'nin çok önemli avantajlarıdır (İnce, 2020; Cittaslow.org, 2023).

2.2. Mehmetçik (Cittaslow/Slow food Üyesi))

Mehmetçik Belediyesi (mehmetcikbelediyesi.com), 2015 yılında yapılan Genel Kurul'da Cittaslow unvanını aldı. Resmi olarak bölgenin üçüncü Cittaslow üyesi oldu. Belediyenin düzenlediği birçok etkinlik var. İlk Cittaslow pazarı Mehmetçik ilçesine bağlı Çayırova köyünde kurulan ve bu pazarda organik olarak yetiştirilen sebze ve meyveler satılır (Cittaslow.org, 2023). Büyükkonukla birleşen bir belediye olarak Mehmetçik-Büyükkonut belediyesinin cittaslow üyeliği bulunmaktadır.

2.3. Tatlısu (Cittaslow Üyesi)

Tarihi yerler: Çiftlikdüzü Kazı Alanı, Molulos Antik Kenti, Minia Kıbrıs Açık Hava Müzesi, Panaghia Pergaminiotissa Kilisesi, Tarihi Harnup Depoları, Eski Un Değirmeni ve Osmanlı Çeşmesi'ni içerir.

Festivaller: Mart – Tatlısu Yeşil Festivali, Eylül – Tatlısu Harnup Festivali, Aralık - Nisan - Geleneksel Yürüyüş Etkinlikleri (Cittaslow.org, 2023).

2.4. Geçitkale (Cittaslow Üyesi)

Geçitkale Belediyesi, Kuzey Kıbrıs'ta dördüncü Cittaslow şampiyonluğunu kazandı. Geçitkale Belediye, Fransa'da yapılan Genel Kurul'da Cittaslow unvanını aldı. Geçitkale Belediyesi yaşam standartlarını yükseltmeyi hedefliyor. Yerel halkı ve bölgedeki yerel tarımı korumak. Geleneksel olarak, bu belediye Geçitkale Kültür Sanat Festivali gibi her yıl farklı festivaller düzenlemiştir (İnce, 2020; Cittaslow.org, 2023).

2.5. Yeniboğaziçi (Cittaslow/Slowfood Üyesi)

Bölge daha çok enginar yetiştiriciliği ve üretimi ile tarım ve hayvancılıkla tanınmaktadır ve bunlar bölge ekonomisine katkı sağlamaktadır. Turizm ayrıca, geleneksel restoranların (hem köylerin içinde hem de deniz kıyısı boyunca) bolluğu, Bizans ve Roma dönemlerine ait antik kalıntılara rehberli turlar ve diğer turistik cazibe merkezleriyle bölgenin mali kapasitesine katkıda bulunur.

Festivaller: 9 Mart- Kıbrıs Bahar Şenliği Pikniği, Ağustos-Yeniboğaziçi Pulya Festivali, 10 Aralık- Dünya günü kutlamaları (Cittaslow.org, 2023).

3. Sonuç

Yavaş yemek, isminden de anlaşıldığı üzere, sanayi devrimiyle hızlanan yaşamımıza entegre olan fast food'un karşıtıdır. Slow food'un göze çarpan en mühim başlıklarından biri tüketilen gıdanın içeriğinin aynı coğrafyanın ürünü olmasıdır. Slow food özünde, geçmişten gelen, atalarımızdan miras kalan yeme alışkanlarımız ve her coğrafyanın kendine has ürününü muhafaza etmek, gelecek nesillerin de yararlına bilmesi için onları koruma altına almak vardır. Slow food kurucularının destekleriyle başlayan Cittaslow ise; yöresel başlığını genişleterek şehir yapısı, alt yapı gelenek görenek gibi geçmişten gelen kültürü barındırmaktadır. Bu iki hareket standartlaşma ile mücadele vermektedir. Hızlanan dünyada küçük yerleşim yerlerinin hem ayakta kalıp, hem kalkınıp hem de özlüklerini gelecek nesillere aktarmaları için iki akımda desteklemektedir. Kuzey Kıbrıs'ta birçok bölge gibi kendine has yöresel gastronomiye sahiptir. Günümüzde Kuzey Kıbrıs'tan beş bölge Cittaslow ve/veya Slow food üyeliğine sahiptir. Her yıl düzenli olarak her bölge kendilerine ait yöresel ürünlerini sergileyebileceği festivaller düzenlemektedir.

Orjinal ve literatürde az işlenmiş bir konu olan çalışma ilerleyen aşamada 20 kişilik bir araştırma katılımcısı ile görüşülüp geliştirilecek olup, katılımcılar sektörde gastronomi ile uğraşan ve akademik bir kariyere sahip kişilerden seçilecektir. Araştırma yöntemi olarak sözlü mülakat (açık uçlu sorular) yöntemi kullanılıp, elde edilen bulgularla çalışma desteklenecektir. Bu bulgular sonuç kısmında öneriler başlığı altında da paylaşılacaktır.

Özet

Günümüzde gastronomi ve turizm alanındaki farklılıklar, bireysellik ve kimlik kavramlarını ön plana çıkarmış ve piyasalardaki arz ve talebi etkilemiştir. Ciddi bir rekabet ortamında bulunan restoranlar markette bulunan rekabet ortamı, sürekli değişen ziyaretçi talepleri ve değişen menülerle farklı konseptler üretmek zorunda kalmaktadır. Bu gelişmelerin bir sonucu olarak son yıllarda gastronomide yeni bir akım ortaya çıkmıştır 'konsept restoranlar' belirli bir temayı menüleri, hizmetleri ve iç mekanlarıyla ziyaretçilerine farklı bir deneyim ve konsept yansıtan bir akım ortaya çıkmıştır. Konsept restoranlar gastronomi sektöründe hem yeni bir hizmet tarzı hem de kimlik oluşturmaktadır. Literatürde restoranların hizmet kalitesi, müşteri memnuniyeti ve ziyaretçilerin tercih etme faktörleri sıklıkla araştırılrsa da konsept restoranlara yönelik çalışmaların özellikle Kuzey Kıbrıs gibi gelişmekte olan ülkelerde son derece sınırlı olduğu görülmektedir. Araştırmanın amacı, restoran kavramını tanımlamak, dünyadaki örnekleri incelemek ve konsept restoranları temalarına göre restoran türleri arasında sınıflandırmaktır. İlerleyen dönemlerde Kuzey Kıbrıs'ta bu tip restoranların gastronomi ve turizm alanlarında örneklerinin ve uygulamadaki farkındalığın artmasında çalışmanın amaçlarındandır. Bu bağlamda araştırmada, dünyadaki restoran literatürü ve uygulama örnekleri incelenmiş ve konsept restoranların farklı türleri açıklanarak farklı bölgelerde uygulanabilirlikleri değerlendirilmiştir. Çalışma 20 kişilik bir katılımcı ile görüşülüp geliştirilecek olup, katılımcılar sektörde gastronomi ile uğraşan ve akademik bir kariyere sahip kişilerden seçilecektir. Araştırma yöntemi olarak açık uçlu soruların kullanıldığı bir sözlü mülakat yöntemini kullanılıp, elde edilen bulgularla çalışma ileriki aşamalarda desteklenecektir. Bu bulgular sonuç kısmında öneriler başlığı altında da paylaşılacaktır.

Anahtar Kelimeler: Konsept Restoranlar, Gastronomi, Kuzey Kıbrıs.

NEW TRENDS IN GASTRONOMY: A LITERATURE REVIEW ABOUT CONCEPT RESTAURANTS

Abstract

Today, the differences in gastronomy and tourism have brought the concepts of individuality and identity to the fore and have affected the supply and demand in the markets. Restaurants in a serious competitive environment have to produce different concepts with the competitive environment in the market, constantly changing visitor demands and changing menus. As a result of these developments, a new trend has emerged in gastronomy in recent years. 'Concept restaurants', a trend that reflects a different experience and concept to its visitors with a specific theme, menus, services and interiors. Concept restaurants create both a new service style and identity in the gastronomy sector. Although the service quality of restaurants, customer satisfaction and the factors of preference of visitors are frequently investigated in the literature, it is seen that studies on concept restaurants are extremely limited, especially in developing countries such as Northern Cyprus. The aim of the research is to define the concept of restaurant, to examine examples in the world and to classify concept restaurants among restaurant types according to their themes. In the future, it is one of the aims of the study to increase the examples of this type of restaurants in the fields of gastronomy and tourism in Northern Cyprus and the awareness of the application. In this context, the restaurant literature and application examples in the world were examined and the applicability of concept restaurants in different regions was evaluated by explaining different types of concept restaurants. The study will be discussed and developed with a participant of 20 people, and the participants will be selected from people who are engaged in gastronomy in the sector and have an academic career. The interview method using open-ended questions will be used as a research method, and the study will be supported in the next stages with the findings obtained. These findings will also be shared under the heading of recommendations in the conclusion part.

Keywords: Concept Restaurants, Gastronomy, North Cyprus

1. Giriş

Gastronomi uçsuz bucaksız bir dünyadır. Yemekte yapmış olduğunuz değişimler ve sunumlar ilgi çekmekte ve bu değişimlerin sınırı yoktur. Her gün yeni trendler yeni sunumlar karsımıza çıkıyor. Bu durumda müşteriyi o mekan çekmek önemli bir konu haline gelmekte. Bu yüzden tarihi çok eski zamanlara dayanmış olsa da konsept restoranlar bayağı popüler hale geldiği gözlemlenmektedir. Bu değişen dünyada mekanların ayakta kalabilmeleri için gelişime ayak uydurmaları ve konsept uygulamalarına yönelmeleri gözlemlenmektedir. .Konsept restoranlar her yerde bir anda popüler olmuş ve uygulanmışlardır. Konsept restoranlar tarz ve gündelik akımlarda ilgili, o bireyin kendini sergilediği yerdir. Normalde bir sembol gibi dursada, o deneyimi yaşayanlara yereken anlık bir tiyatro sergilemek gibi bir durumdur (Hsu, 2009). Örnek vermek gerekirse:

- Cafe De Bagne (Hapishane),
- Proud Bird (Uçak)
- Hard Rock Cafe (Müzik)

Bu denemeler başlangıçta garip gelse de ilerde ciddi bir ilgi odağı olmaya devam etti. Yapılan bütün yatırımlar bir diğeri için merak konusu olmaya başladı. Proud bird yatırımla Tallichet bu alanda kendini öncü olmaktan çok dahada geliştirerek ilham kaynağı olmayı başarmıştır. Bu konseptler yıllar içinde yemek gibi kendini güncelleyerek farklı boyutlara ulaşmıştır. Bunlar tuvalet konseptli restoranla boyutun nereye gittiğini gösteriyor. Klozet şeklinde oturaklar ve tabaklar, dışkı şeklinde yemekler ile ilk duyduğunuzda iğreneceğiniz olaylar bir süre sonra ilginizi fazlasıyla oraya çekiyor.

2. Literatür Taraması

İnsanlığın temel ihtiyacından olan beslenme daha kaliteli zahmetsiz ve mekan tasarımı ile birleşince restoranlar ortaya çıktı. Bu restoranların öncüsü Boulanger Fransa da kuruldu. Bu atılım ilerde mega bir sektöre dönüşecek ve öncüsü hep bilinecekti. Türkiye de ve Kuzey Kıbrıs ta ise bu sektör Avrupa dan, orta doğudan ve asya dan çokça etkilenerek daha farklı bir alana taşınmıştır. Bu yapılar ticaret uygulamalarından insani ilişkilerden etkilenerek bir çok kültürün bir birine karışmasına neden olmuştur.

Ticari işletmeler: Kar amaçlı kurulan bu işletmedeki ana tema müşteri tatmini ve sürekliliği. Ticari işletme olarak geçen bu işletmelerin en birinci hedefi kar etmektir (Erdek, 2011). Yapılan bir araştırmada bu işletmeler sınıflandırılmıştır (Doğan vd., 2010).

- Lüks Restoranlar
- Kafeler

- Çabuk Yemek Yerleri
- Sıradan Yerler
- Kültürel Restoranlar
- Özellikli Restoranlar
- Ulaşım Merkezli

Ticari olmayan işletmeler: Kar amacı güdemeyen bu işletmelerin sunduğu yiyecek içecek hizmetleri destekleyicidir (Erdek, 2011). Bunlar ;

- Kurumssal işletmeler
- Personel yeme içme hizmeti

Kültürel tema, restoran temasının tartışmasız en yaygın biçimidir, çünkü birçok restoran kökleri restoranın bulunduğu yerden farklı bir kültüre sahip olan kişilere aittir ve sonuç olarak bu ülkenin mutfağından yemekler sunar. 1997 Ekonomik Sayımına göre, Amerika Birleşik Devletleri'ndeki 191.000 tam hizmet veren restoranın %33'ü etnik lokantalardır ve 29.7 milyar dolarlık satış yapmıştır (U.S. Census Bureau, 2000). Bu restoranlarda tema, sahibinin mirasıyla bağlantılı doğal bir sonuç olarak kabul edilebilir. Ancak etnik tema, küçük etnik restoranlarla sınırlı değildir. Ayrıca Almanya'da Güney Amerika mutfağı sunan Maredo, Benihana Japanese Steakhouse ve Bir Amerikalının seyahat etmeden tadını çıkarabileceği en otantik İtalyan yemek deneyimini sunmayı vaat eden Olive Garden gibi restoran zincirleri tarafından da kullanılıyor (Ebster and Guist, 2005).

Konsept restoranların en bilindik örneklerine baktığımızda yenilecek yemeğin ve edinilecek deneyimin oluşturduğu merak misafirleri bu alana yönlendirmiştir (Bekar, 2004). Yemek sektöründe rekabetin artması bu tip restoranların ortaya çıkmasına sebebiyet vermiştir. Diğer sektörlerde göre maliyet bakımından az olarak görülmektedir. İnsanların gerekli para ve zamanı oluştuğunda potansiyel müşteri konumuna gelmektedir. Girişimci insanlar bu sektöre girdiklerinde birbirlerine benzer birçok işletme ortaya çıkar. Bu durumdan mütevellit farklılık arama çabasına giren girişimciler Konsept restoranlara yönelmişlerdir (Heung, 2002). 1990'lı yıllar bu tip restoranların patlama yaptığı dönemdir fakat pazar payının kaybedilmesi saman alevi misali bu akımı düşüşe geçirmiştir. Bunun sebebi ise memnuniyetin olmaması ve müşteri çekme potansiyelinin düşmesidir (Weiss vd., 2004; Kim ve Moon, 2009).

2.1. Konsept ve Kültürel Ayrımı

Konsept restoran işletmelerinde işlenecek konu sonsuz nitelikte bir şeye bağlı kalmadan kurduğunuz absürt hayalleri bile yaşatabileceğiniz işletmelerdir. Kültürel restoranlar ise

seyahat etme zorunluluğunuz olmadan başka bir ülkenin kültürüne ait olan yemekleri tadıp deneyimliye bilirsiniz. Konsept restoranlar da mekan kültürel restoranlarda ise yemek göze çarpmaktadır. Kültürel restoran tipli işletmeler bilinen kültürel yapı ile kültürel sanat, dekor, müzik, mimari, ad ve farklı biçimlerde materyaller kullanılmaktadır (Jang vd., 2010). Yani bu restoranlarda belirli bir kültür ögesi işlenmektedir (Kılınç, 2014). Temaik işletmelerde ise belirli bir bağlam olmaksızın uçuk ve yapılabılır bir tecrübe sunarken, kültürel işletmelerde ise kültürel bağlamda yabancı kültür ve mutfak ile harmanlanmış bir tecrübe sunar (Wood ve Munoz, 2007).

2.2. Konsept Restoran Örnekleri

Konsept restoranların dünyada Kuzey Kıbrıs'ta ve Türkiye'de birçok örneği bulunmakta ve çok fantastik restoranlar vardır. Bunlar Avustralya'da bulunan Witches in Britches (Cadılar Bayramı konseptli), Maldiver'deki Ithaa Undersea (Akvaryum konseptli), Yeni Zelanda'ki Redwoods Treehouse (doğa konseptli), Dubai'deki Chillout Ice Lounge (Buzul Çağı konsepti), New York'taki Ninja Konseptli, Tayvan'daki Airbus A-380 restoranı (uçak konseptli), Chicago'daki Safe House (izli ajan konseptli), Paris'teki O'natural gibi konsept restoranları işletmek zordur. Bir masa rezerve ettikten sonra restorana girdiğinizde tüm kıyafetlerinizi ana salonun dışında bırakmanız gerekiyor. 40 masalık bu işletmede aşçı ve garson dışında hiç kimse giyinik değil. Parisin ortasındakai bu yerde yemek yemenin tek kuralı çırılçıplak olmak. Çin'in Pekin kentinde bulunan 'Dining in The Dark Restaurant' restoranda gece görüşü dürbünü olan garsonlar eşliğinde masaya kadar götürülüyorsunuz. Fener mum gibi hiç bir materyal olmadan yemekleri tadabilir veya koklayabilirsiniz sadece. Müşterilere ilginç bir deneyim sunan bu restoran çok moda. Walter's Coffee Roastery ise İstanbul Moda'da açılan ilk kahve laboratuvarı. Dünyanın ilk Breaking Bad Konsept restoran unvanına sahiptir. Restoranda bardak yerine deney tüpü kullanılmıştır. Duvarda dev bir periyodik cetvel bulunmaktadır ayrıca menüsü de periyodik cetvele benzemektedir (Turizm Günlüğü, 2020).

2.2.1. Rainforest Cafe

1994 yılında Amerika'da açılıp, Türkiye de dahil tüm dünyada 36 şubesi olan bu cafe ağaçların ve yeşilliklerin içinde, rutubetin ve sıcaklığın da hissedildiği bir orman havasına sahiptir. Ayrıca içerisinde tüm orman canlılarını temsil eden ve çok çeşitli robotik hayvanlar bulunmaktadır. Cafenin tavan mimarisi de bu güzel ortamı yansıtmaktadır. Rengarenk lazer ışıkları, dekorasyon ve 30 dakikalık aralıklarla yapılan fırtına ve şimşekler senkronize edilmiştir (Aksoy ve Akbulut, 2017).

2.2.2. Hard Rock Cafe

1971 yılında İngiltere Londra’da başlayan bu devasa işletme Konsept restoranların en başarılı örneklerinden biri. Günümüzde bu işi üst seviyeye taşıyan bu işletme 59 ülkede 145 cafe, 21 otel ve 10 kumarhane ile çıtayı en tepeye taşımıştır. Bu işletmedeki tema rock müzik ve enstrümanları ile poster teması işlenmiştir. (Çekal ve Memiş, 2020).

2.2.3. Hospitalist Restoran

Endonezya’nın Depok şehrinde kurulan Hospitalist Restoran, hastane gibi tasarlanan ilk restorandır. Farklı stili ve ilginç sunumları ile müşterilerine ilginç bir hizmet sunmaktadır. İç kısmında hastanede kullanılan ekipmanlar kullanılırken, müşterilerin oturduğu masalar ameliyat ışığı ile ışıklandırılmıştır ve oturdukları yerler ise tekerlikli sandalyelerdir. Bu değişik konseptteki restoranda masalara servisi hemşir ve hemşire gibi giyinmiş garsonlar yapmaktadır, mutfaktaki şefler ise doktor önlükleri giymektedir. İçecekler şurup şişeleri ve serum poşetinde, tatlandırıcılar da şırıngalarda sunulmaktadır. Dikkat çeken bir başka özellik ise yemek ve tatlıları insan organları ve hasta figürleri şeklindedir (Turizm Günlüğü, 2020).

2.2.4. Planet Hollywood

1991 Hollywood konseptiyle kurulan, Hollywood ünlülerinin de desteklediği bir restorandır (planethollywood.com). Bu restoran canlı performansları, alışveriş imkanı ve özel kutlama yemekleri ile her yaş grubundan misafire dünya standartlarının üzerinde bir hizmet ile unutulmaz bir eğlence sunmaktadır. Bu Hollywood konseptli restoran birçok casino, otel ve restoran olarak hizmet vermektedir.

2.2.5. RedSea Star

1998 yılında İsrail menşeli bu işletme su altı teması kullanmıştır. Denizin 6 metre içine inşa edilen camlardan su altı manzarası ile hafif ve dalga yaratan ışıklarla gece de manzaraya doyumsuz bir ambiyans yaratıyor. KKTC’de birçok balık restoranı bulunmakta ve girişten itibaren bir balıkçı teknesi gibi bu vb. işletmeler dizayn edilebilir.

2.2.6. Modern Toilet Restoran

260 mertekare alana inşa edilen modern toilet restoran (moderntoiletrestoran.com) restoran, müşteriye tuvalet algısını hissettirir. İçeceklerin kapları, oturulan sandalyeler, servis edilen yiyecek, yemek tabaklarına kadar her şey klozet şeklinde sunulmaktadır.

2.2.7. Leman Kültür

İlk olarak karikatür dergisi ile sevenlerinin karşısına çıkan Leman Kültür (lmc.com), daha sonraları fikir paylaşımlarının yapıldığı, yazarların-çizerlerin bulunduğu, günümüzde birçok sanatçının da ünlenmesine yardımcı olan ve yeme-içme imkânlarının da bulunduğu bir restoran

şeklini almıştır. Şu an Türkiye’de ve yurtdışında şubeleri bulunan ve “Yatıya Hariç Her Zaman Bekleriz” sloganıyla müşterilerine hitap eden Leman Kültür’ün teması duvarlarının, tuvaletlerinin, yemek masalarının, menü kartlarının ve personel kıyafetlerinin karikatürler ile süslenmesi ve bir bütünlük oluşturmasıdır. Ayrıca menüde yer alan yiyeceklerin de isimleri karikatürlere ait özel isimlerle müşterilerini beklemektedir.

2.2.8. Garavolli (KKTC)

Salyangozun ara sıcak ve turşu (soğuk meze) olarak sevril edildiği bu eşsiz hem yöresel hem modern restoranda misafirler farklı deneyimler kazanabilir. Ayrıca bu restoranın girişten itibaren salyangoz şeklinde olduğu düşünülürse tam bir konsept restoran olacaktır.

3. Sonuç

Araştırmanın amacı, restoran kavramını tanımlamak, dünyadaki örnekleri incelemek ve konsept restoranları temalarına göre restoran türleri arasında sınıflandırmaktır. İlerleyen dönemlerde Kuzey Kıbrıs'ta bu tip restoranların gastronomi ve turizm alanlarında örneklerinin ve uygulamadaki farkındalığın artmasında çalışmanın amaçlarındandır. Bu bağlamda araştırmada, dünyadaki restoran literatürü ve uygulama örnekleri incelenmiş ve konsept restoranların farklı türleri açıklanarak farklı bölgelerde uygulanabilirlikleri değerlendirilmiştir. Çalışma 20 kişilik bir katılımcı ile görüşülüp geliştirilecek olup, katılımcılar sektörde gastronomi ile uğraşan ve akademik bir kariyere sahip kişilerden seçilecektir. Araştırma yöntemi olarak açık uçlu soruların kullanıldığı bir sözlü mülakat yöntemini kullanılıp, elde edilen bulgularla çalışma ileriki aşamalarda desteklenecektir. Bu bulgular sonuç kısmında öneriler başlığı altında da paylaşılacaktır. Gastronomi alanında konsept restoranlara bakıldığında çeşitlilik ve özellikle Kuzey Kıbrıs'ta sayıca çok az oldukları görülmekte fakat zengin kültür, tarih, birçok zenginliğe sahip ve birçok tema uygulanabilecek yapıya sahiptir. Bu tip işletmelerinin müşteri odaklı olup mekan tasarımı ve menü olayını farklı bir boyuta taşıyarak gastronomi alanında farklılıklar yaratabileceği düşünülmektedir.

ÖZET

Bu çalışmanın amacı, takım kaptanlarının takım uyumuna etkisi ve bazı demografik değişkenlere göre farklılıklarını ve ilişkilerini ortaya koymaktır. Bu amaç kapsamında çalışmanın örneklemini Türkiye Futbol Federasyonu (TFF) 2. Ligde faal olarak futbol oynayan ve gönüllü olarak araştırmaya katılan 324 futbolcu oluşturmaktadır. Verilerin değerlendirilmesinde Kurtosis (basıklık) ve Skewnes (çarpıklık) normallik testi, Anova testi, Pearson korelasyon ve regresyon analizlerinden yararlanılmıştır. Analiz sonuçları incelendiğinde sporcuların algıladıkları liderlik davranışları ile takım uyumu arasında pozitif yönde doğrusal bir ilişki olduğu görülmüştür. Demografik değişkenlerden yaş değişkeni ile sporda liderlik algılamaları alt boyutlarından eğitim-öğretim, demokratik davranış, otokratik davranış ve ödüllendirici davranış arasında anlamlı farklılık görünmektedir ($p < .05$). Yaş değişkeni ile takım birlikteliği alt boyutlarından grup çekiliği-sosyal, grup çekiciliği-görev, grup bütünlüğü-sosyal ve grup bütünlüğü-görev arasında anlamlı farklılık bulunmaktadır. Futbolcuların oynadıkları mevki değişkeni ile demokratik davranış arasında da anlamlı farklılık görülmektedir. Eğitim düzeyleri dikkate alındığında sporda liderlik alt boyutlarından eğitim ve öğretim, demokratik davranış ve sosyal destek arasında anlamlı farklılık tespit edilmiştir. Futbolcuların eğitim düzeyi ve takım birlikteliği alt boyutları arasında (grup çekiliği-sosyal, grup çekiciliği-görev, grup bütünlüğü-sosyal ve grup bütünlüğü-görev) anlamlı bir farklılık görünmektedir. Son olarak sporda liderlik alt boyutlarından beş yordayıcı değişken, takım birlikteliği puanlarındaki toplam varyansın yaklaşık %19'unu anlamlı bir şekilde açıklamaktadır. Sonuç olarak sporcuların takım kaptanlarının eğitim-öğretim, demokratik, sosyal ve ödüllendirici davranışlarının pozitif yönde takım birlikteliğini veya takım uyumunu arttırdığı, ancak otokratik davranışın ise negatif yönlü bir ilişki oluşturduğu sonucuna ulaşılabılır.

Anahtar Kelimeler: Liderlik, Sporda liderlik, Takım uyumu, Takım Kaptanı, Takım sporu

**THE EFFECT OF ATHLETE LEADERSHIP ON TEAM COHESION IN TEAM
SPORTS**

ABSTRACT

The aim of this study is to reveal the effect of team captains on team cohesion and their differences and relationships according to some demographic variables. Within the scope of this purpose, the sample of the study consists of 324 football players who actively play football in the 2nd League of the Turkish Football Federation (TFF) and voluntarily participated in the study. Kurtosis and Skewness normality test, Anova test, Pearson correlation and regression analysis were used in the evaluation of the data. When the results of the analysis were examined, it was seen that there was a positive linear relationship between the leadership behaviors perceived by the athletes and team cohesion. Among the demographic variables, there is a significant difference between the age variable and the sub-dimensions of the perceptions of leadership in sport such as education-teaching, democratic behavior, autocratic behavior and rewarding behavior ($p < .05$). There is a significant difference between age variable and group attraction-social, group attraction-task, group cohesion-social and group cohesion-task sub-dimensions of team cohesion. There is also a significant difference between the position played by football players and democratic behavior. Considering the level of education, a significant difference was found between education and training, democratic behavior and social support among the sub-dimensions of leadership in sport. There is a significant difference between the level of education of football players and team cohesion sub-dimensions (group attraction-social, group attraction-task, group cohesion-social and group cohesion-task). Finally, five predictor variables from the sub-dimensions of leadership in sport significantly explain about 19% of the total variance in team cohesion scores. As a result, it can be concluded that education-teaching, democratic and autocratic behaviors of team captains of athletes increase team cohesion or team cohesion.

Keywords: Leadership, Leadership in sport, Team cohesion, Team captain, Team sport

1.Giriş

Futbolun her kademesinde performans ve başarı birbiriyle ilişkili önemli kavramlar olarak kabul edilmektedir. Bu kavramlara bir de takım kaptanlığının eklendiği ileri sürülebilmektedir. Profesyonel futbolun önemli bir ögesi olarak kaptanlık, takım başarısı, performans ve etkili iletişim ile olan doğrudan ilişkisi sebebiyle, takım içerisinde sözü geçer konumdadır. Bu bağlamda takım kaptanlarının, etkili iletişim becerilerine sahip olması, takım başarısı noktasında önemli bir rolü olduğu söylenmektedir.

Liderlik ve lider kavramları birçok araştırmaya konu olmuş ve bu terimler çok farklı şekillerde tanımlanmıştır. İnsanlık tarihi kadar eski olan lider ve liderlik kavramları özellikle son dönemlerde bilimsel araştırmalarda yer almaya başlamıştır (Kaplan ve diğ., 2016). Liderlik, özellikle takım sporu alanlarında spor performansının temel bir özelliği olarak anılmaktadır. Son 25 yılda antrenör ve yöneticinin bu konudaki rolünü araştıran önemli araştırmalar yapılmıştır. Ancak bu, spor alanındaki liderliğin sadece bir yönünü temsil etmektedir. Aynı derecede önemli, daha az incelenmesine rağmen, sporcu liderliği kavramıdır.

Son yıllarda özellikle ilgi çekici olan, ekip üyeleri arasında var olan liderlik hükmü ve sağlanan liderliğin ekibin liderlik ihtiyaçlarını karşılama derecesi olmuştur. Bu liderlik türü 'sporcu liderliği' olarak tanımlanmıştır ve operasyonel olarak "bir takım içinde resmi veya gayri resmi bir rol üstlenen ve ortak bir hedefe ulaşmak için bir grup takım üyesini etkileyen bir sporcu" olarak tanımlanmıştır (Loughead ve diğ., 2006.).

Hem resmi (ör. kaptan) hem de gayri resmi (liderlerin motivasyonları ve kültürel mimarlar gibi) sporcu liderlerinin rolü, memnuniyet, uyum ve takım dinamikleri gibi takımla ilgili çeşitli değişkenler üzerinde kayda değer bir etkiye sahiptir (Loughead, 2017). Takım kaptanlarını resmi liderler olarak ele aldığımızda takım kaptanları sporda liderlik sağlamak için donatılmıştır ve liderlik becerilerini diğer yaşam alanlarına aktarma olasılıkları daha yüksektir (Newman, Lower ve Brgoch, 2019).

Takım kaptanı olarak adlandırılan sporcu liderliği, takım arkadaşlarıyla iletişim kurmak, takım ve antrenör arasında bağlantı kurmak, rol model olmak ve takım dışındaki kişilerle (hakem vs.) olumlu etkileşimler kurmak ve takımın işleyişine yardımcı olmak gibi sorumluluklara sahip olmaktadır. Futbolda, çoğunlukla liderlik özellikleri gösteren, daha düzenli, diğer takım arkadaşlarına oranla daha fazla takımda bulunan, deneyimli olan ve istikrarlı bir performans ortaya koyan futbolculara, kaptanlık rolü verildiği söylenmektedir (Konter, 2004). Takım kaptanları lider olarak öğrenme eğilimi gösterirler (Eratlı Şirin ve Şahin,

2020). Bir lider olarak öğrenme eğilimi, takım kaptanlarının diğer oyuncularından ayrılan özelliklerinden birisidir.

Uyum, takım sporlarında en önemli grup değişkeni olarak tanımlanmıştır (Lott & Lott, 1965; Spink, 2016). Başlangıçta uyum, düşünce ve davranışta tekdüzelik olarak tanımlanırken (Festinger, 1950), daha sonra üyeleri bir grup içinde tutan güç olarak tanımlanmıştır (Festinger, Schachter ve Back, 1963). Ancak bu tanımlar, uyumu yalnızca bireylerin gruplarına çekildiği tek boyutlu bir yapı olarak ele almıştır. Uyumu çok boyutlu bir yapı olarak gören ilk tanımlardan biri, uyumu "bir grubun amaç ve hedefleri doğrultusunda bir arada kalma ve birlik olma eğilimini yansıtan dinamik bir süreç" olarak tanımlamıştır (Carron, 1982). Bu tanım daha sonra Carron, Brawley ve Widmeyer (1998) tarafından geliştirilerek uyumu "bir grubun araçsal hedefleri ve/veya üyelerin duygusal ihtiyaçlarının tatmini için bir arada kalma ve birlik olma eğilimini yansıtan dinamik bir süreç" olarak tanımlamıştır.

Takım uyumu, ortak hedeflere ulaşmak ve üyelerin memnuniyetini sağlamak için takımın birliğini desteklemeyi amaçlayan dinamik bir süreci ifade etmektedir (Carron, ve Brawley, 2012). Bu bağlamda, takım üyeleri arasındaki iyi ilişkiler daha iyi bir performansa ve sportif başarıya katkıda bulunduğundan, sporcu liderler takımlarında uyum oluşturmak için gerekli köprü görevi üstlenmektedir (Nascimento-Júnior ve diğ., 2018, Nascimento-Júnior ve diğ., 2019). Buna ek olarak, takım arkadaşlarıyla olumlu ikili ilişkiler gösteren sporcu liderler hem saha içi hem de saha dışında uyumlu ortamlar oluşturabilir, kurulan bu ilişkilerin yanı sıra ortak hedeflere ulaşılmasını desteklemektedirler [Jowett, 2017, Jowett S ve diğ., 2017).

Türkiye'deki spor takımlarda oynayan takım kaptanlarının sergiledikleri liderlik stili takımın uyumunu olumlu ve olumsuz yönde etkilemesi takımların başarılı ve başarısız olmasıyla beraber elbette sporun gelişimine katkı sağlayabileceğinden bu çalışma önemli görülmektedir. Bu çalışma, TFF 2. Ligde faal olarak futbol oynayan 324 futbolcu üzerinde uygulanmıştır. Çalışmanın amacı, takım kaptanlarının takım uyumuna etkisi ve bazı demografik değişkenler açısından değerlendirilmesini incelemektir. Bu bağlamda takım kaptanlarının liderlik davranışlarıyla takım uyumu arasındaki ilişkisinin takım performansı noktasında önemli bir rolü olduğunu göstermek çalışmanın konusunu oluşturmaktadır. Benzer sorgulamayı çeşitli spor örgüt yapıları içerisinde ele alan çalışmalar olmasına rağmen, takım kaptanlarının liderlik tarzları ve takım uyumu (birlikteliği) algılamalarını inceleyen çalışma sayısı oldukça azdır. Bu nedenle bu konunun araştırılması gereken bir problem olduğunu göstermiş ve üzerinde araştırma yapılmasını gerekli kılmıştır.

2. Materyal ve Metot

2.1. Araştırmanın Örneklemi

Bu çalışma, takım kaptanlarının sergiledikleri liderlik tarzının takım uyumuna etkisinin incelenmesi amacıyla yapılmıştır. Elverişli örneklemin kullanıldığı çalışma, 2022 yılında TFF 2.Lig'de faal futbol oynayan toplam 324 futbolcu ile yürütülmüştür.

2.2. Araştırma Ölçekleri

2.2.1 Sporda Liderlik Ölçeği (SLÖ)

Araştırmada kullanılan ölçeklerden, “Sporda Liderlik Ölçeği (Leadership for sports cale-LSS) Chelladurai ve Saleh (1980)” tarafından geliştirilmiştir. Ölçeğin orijinali 40 madde ve 5 faktörden oluşmaktadır. Ölçek Unutmaz ve Gencer (2012) tarafından Türkçeye uyarlanarak kendi çalışmalarında kullanılmıştır. Unutmaz ve Genç (2012) tarafından ölçeğin alt boyutlarına ilişkin iç tutarlık katsayıları .58 ve .91 arasında değişkenlik göstermekte olup, ölçeğin toplam iç tutarlık katsayısının .94 olduğu belirlenmiştir. Araştırma verileri 5'li likert tipi derecelendirme ile puanlanmıştır. Analiz sonucunda Sporda Liderlik Ölçeği- Sporcunun Antrenörünü Algılaması Versiyonunun profesyonel sporcular üzerinde kullanılabilir geçerli ve güvenilir bir ölçüm aracı olduğu belirlenmiştir. Ölçeğin güvenilirliğinin testine yönelik yapılan analizde Cronbach's Alfa değeri 0.925 olarak tespit edilmiştir.

2.2.2. Takım Birlikteliği (Uyumu) Ölçeği (TBÖ)

“Carron, Widmeyer ve Brawley” (1985) tarafından geliştirilen takım uyumunu ölçmeye yönelik "Takım Birlikteliği Envanteri"ni 4 ifadeden oluşan ölçek ile belirlenmiştir. Ölçek Unutmaz, Kiremitçi ve Genç (2011) tarafından Türkçeye uyarlanarak kendi çalışmalarında kullanılmıştır. Unutmaz ve ark. (2011) tarafından Croanbach Alfa iç tutarlılık katsayısı 0.82 olarak tespit edilmiştir. Araştırma verileri 9'lu likert tipi derecelendirme ile puanlanmıştır. Ölçeğin orijinali 4 faktör ve 18 maddeden oluşmaktadır. Analiz sonucunda Takım Birlikteliği Envanterinin profesyonel sporcular üzerinde kullanılabilir geçerli ve güvenilir bir ölçüm aracı olduğu belirlenmiştir. Ölçeğin güvenilirliğinin testine yönelik yapılan analizde Cronbach's Alfa değeri 0.88 olarak tespit edilmiştir.

2.3. Verilerin Analizi

Araştırmada uygulanan ölçekler sonucunda ulaşılan verilerin analizinde, $p \leq .05$ anlamlılık düzeyi olarak alınmış ve paket program olarak ise SPSS 26.0 kullanılmıştır. Kullanılan program ile veriler problemlere uygun farklı analiz teknikleriyle test edilmiştir. Araştırma verilerinin normal dağılım gösterip göstermediğini belirlemek amacıyla Kurtosis (basıklık) ve Skewnes (çarpıklık) normallik testi yapılmıştır. Çoklu karşılaştırmalarda tek yönlü varyans analizi (ANOVA) testi uygulanmıştır. Sporcu liderlik, takım uyumu ve etkili iletişim

arasındaki ilişki düzeyinin sorgulanmasında, Pearson korelasyon analizi, değişkenlerin birbirini etkileme düzeylerinin belirlenmesinde ise Linear Regression analizi kullanılmıştır.

3. BULGULAR

Tablo 1. Normallik Test Sonuçları

Değişkenler	Çarpıklık	Basıklık	Cronbach Alpha
Sporda Liderlik Ölçeği	-,264	-,479	0.925
Takım Birlikteliği Ölçeği	,045	-1,001	0.886

Araştırmamızda kullanılan ölçekler için yapılan normallik test sonuçları Tablo.1’de yer almaktadır. Çıkan analiz sonuçlarına göre veri setinin çarpıklık ve basıklık açısından normal dağıldığı görülmektedir ve analizlerde parametrik testler kullanılmıştır. Kurtosis (basıklık) ve Skewnes (çarpıklık) değerlerine bakarak verinin normal dağılımına ilişkin yorum yapılabilmektedir. Bu çarpıklık ve basıklık değerlerinin (+1,5) ile (-1,5) arasında bir değer alması halinde, veri setinin normal dağılım gösterdiği söylenebilmektedir (Tabachnick and Fidell, 2013).

Tablo 2. Yaş Değişkenine Göre Sporda Liderlik Ölçeğinin Alt Boyut Düzeyleri Puanlarında Anlamlı Bir Farkın Olup-Olmadığını Belirlemek için Yapılan Anova Testi Analiz Sonuçları

Sporda Liderlik	Yaş	N	\bar{X}	ss	df	F	p
Eğitim ve Öğretim	15-19 yaş	66	56,65	6,410	3	6,421	0,00
	20-24 yaş	87	51,41	8,337

	30 yaş ve üstü	73	20,36	3,963			
Sporda Liderlik Toplam Puanı	15-19 yaş	66	161,34	18,00	3	2,805	0,04
	20-24 yaş	87	151,98	21,00			
	25-29 yaş	98	155,24	20,62			
	30 yaş ve üstü	73	153,56	22,41			

Tablo 2 incelendiğinde, futbolcuların yaş değişkenine göre sporda liderlik algılamaları alt boyutlarından “eğitim ve öğretim, demokratik davranış, otokratik davranış ve ödüllendirici davranış” puan ortalamaları arasında anlamlı bir farklılık bulunmuştur. Farklılığın “eğitim ve öğretim, demokratik davranış ve ödüllendirici davranış” boyutlarında 15-19 yaş aralığı lehine, “otokratik davranış” boyutunda ise 25-29 yaş lehine gerçekleştiği belirlenmiştir. Sporda liderlik toplam puanı ile yaş değişkeni arasında da anlamlı farklılık bulunmuştur. Bu farklılığında 15-19 yaş grubundaki sporcuların lehine olduğu görülmektedir.

Tablo 3. Yaş Değişkenine Göre Takım Birlikteliği Ölçeğinin Alt Boyut Düzeyleri Puanlarında Anlamlı Bir Farkın Olup-Olmadığını Belirlemek için Yapılan Anova Testi Analiz Sonuçları

Takım Birlikteliği	Yaş	N	\bar{X}	ss	df	F	p
Grup Çekiciliği-Sosyal	15-19 yaş	66	35,44	6,769	3	9,339	0,000

Tablo 6'ya göre futbolcuların eğitim düzeyi değişkeni ile sporda liderlik alt boyutlarından “eğitim ve öğretim, demokratik davranış ve sosyal destek” algılamaları arasında anlamlı farklılık bulunmaktadır. Meydana gelen farklılığın ise lisans mezunu futbolcular lehine gerçekleştiği görülmektedir. Sporda liderlik toplam puanı ile eğitim düzeyi değişkeni arasında da anlamlı farklılık tespit edilmiştir. Farklılığın ise lisans mezunu futbolcular lehine olduğu görülmektedir.

Tablo 7. Futbolcuların Eğitim Durumu Değişkenine Göre Takım Birlikteliği Ölçeğinin Alt Boyut Düzeyleri Puanlarında Anlamlı Bir Farkın Olup-Olmadığını Belirlemek İçin Yapılan Anova Testi Analiz Sonuçları

Katılımcıların, Sporda Liderlik ve Takım Birlikteliği ve alt boyutları arasında anlamlı bir ilişki olup olmadığını belirlemek için Pearson korelasyon analizi yapılmıştır. Yapılan analiz sonucunda liderlik davranışları ile takım uyumu arasında düşük düzeyde ve pozitif yönde doğrusal bir ilişki olduğu görülmektedir (Pearson $R=0.180$; $p = 0,000 < 0,01$). Aynı şekilde “demokratik, eğitim-öğretim, sosyal destek ve ödüllendirici davranışları” arasında da pozitif yönde bir ilişki bulunmaktadır. Ancak otokratik davranış ile takım uyumu arasında negatif yönlü bir ilişki tespit edilmiştir.

Son olarak araştırmada futbolcuların sporda liderlik algılamalarının takım birlikteliği algılamalarını yordayıp yordamadığı araştırılmak istenmiştir. Bu amaçla sporda liderlik algılamaları ile takım birlikteliği algılamaları arasında korelasyonel ilişki olduğundan Regresyon analizi yapılmış ve elde edilen bulgular Tablo 9’da verilmiştir.

Tablo 9. Sporda Liderlik Alt Boyutları ve Takım Uyumu Arasındaki Regresyon Analiz Sonuçları
Yordanan Değişken: Takım Uyumu

Sporda liderlik algılamalarının takım birlikteliği algılamalarını yordayıcısı olup olmadığına ilişkin Tablo9 incelendiğinde ($p = 0,000 < 0,05$) “eğitim ve öğretim, demokratik ve otokratik davranış” boyutları, futbolcuların takım uyumu puanları ile anlamlılık düzeyinde yordayıcısı olduğu anlaşılmaktadır ($R^2 = 0,189$). Ancak “sosyal destek ve ödüllendirici davranış” boyutlarıyla futbolcuların takım uyumu puanları arasından anlamlı bir ilişkiye rastlanmamıştır. Buna göre adı geçen beş yordayıcı değişken açıklanan varyansın % ~19’unu anlamlı bir şekilde açıklamaktadır.

TARTIŞMA VE SONUÇ

Analiz sonucunda futbolcuların yaş grupları ortalamaları ile takım kaptanlarının “eğitim ve öğretim, demokratik davranış, otokratik davranış ve ödüllendirici davranış” algılamaları boyutu arasında anlamlı bir farklılık görülmektedir. Sporda liderlik toplam puanı ile yaş değişkeni arasında da anlamlı farklılık bulunmuştur. Farklılaşma bulgularına göre, 15-19 yaş grubundaki sporcuların, takım kaptanlarının “eğitici-öğretici davranışlarına, demokratik davranışlarına ve ödüllendirici davranışlarına” ilişkin algıları diğer yaş gruplarındaki sporculara göre daha olumludur. Bunun altında takım kaptanlarının takım içerisinde daha çok genç

sporculara yönelmesi, onlarla ilgilenmesi ve gelişimlerine katkıda bulunduğu düşüncesi yatmaktadır. Ancak otokratik davranışa ilişkin algıları 25-29 yaş grubundaki sporcularda daha yüksek olduğu tespit edilmiştir. Futbolcuların yaş artıkça başkalarına olan güvenin azaldığı ve kendi kararlarının daha doğru olduğuna inandıkları düşüncesi, takım kaptanlarının otokratik davranışlarını benimsedikleri düşünülebilir.

Futbolcuların yaş değişkenine göre takım birlikteliği algılamaları alt boyutları incelendiğinde “grup çekiciliği-sosyal, grup çekiciliği-görev, grup bütünlüğü-sosyal ve grup bütünlüğü-görev” puan ortalamaları arasında anlamlı bir farklılık bulunmuştur. Farklılığın 15-19 yaş aralığı lehine gerçekleştiği belirlenmiştir. Genç yaştaki sporcuların kendilerini kanıtlamak adına ve takım içi görev ve sosyal eğilimlerde aktif olduğu düşünüldüğünde sonucun anlamlı çıkması beklenen bir sonuç olmaktadır.

Futbolcuların mevkii değişkenine göre sporda liderlik algılamaları alt boyutları incelendiğinde demokratik davranış puan ortalamaları arasında anlamlı bir farklılık bulunmuştur. Farklılığın orta saha mevkinde oynayan futbolcular lehine gerçekleştiği belirlenmiştir. Orta saha mevkisinde yer alan futbolcuların takımdaki hem defansif hem de ofansif alanda bir köprü görevi görmesinden dolayı ve iki alanla da sürekli iletişim halinde olması düşüncesi, takım kaptanından daha çok demokratik davranışı beklediği söylenebilir.

Futbolcuların mevkii değişkenine göre takım birlikteliği algılamaları alt boyutları incelendiğinde “grup çekiciliği-sosyal, grup çekiciliği-görev, grup bütünlüğü-sosyal ve grup bütünlüğü-görev” puan ortalamaları arasında anlamlı bir farklılık bulunmamıştır. Hangi mevkide oynarsa oynasın oyuncu galibiyet için elinden geleni yapmaktadır. Başarı için ise takım olmak beraber olmak şartı yer almaktadır. Bu bağlamda bulgular sonucu da ortalamaların aynı düzeyde olduğunu göstermektedir.

Futbolcuların eğitim düzeyi değişkeni ile takım kaptanlarının sporda liderlik davranışlarından “eğitim ve öğretim, demokratik davranış ve sosyal destek” algılamaları arasında anlamlı farklılık bulunmaktadır. Farklılığın lisans mezunu futbolcular lehine olduğu tespit edilmiştir. Eğitim düzeyi artan bireyler daha sosyal, insan ilişkilerine ve iletişimine daha açık bir hale gelmektedir. Bu sonuçla kaptanlarından gördükleri ve benimsedikleri davranış şekilleriyle örtüşmektedir.

Futbolcuların eğitim düzeyi değişkenine göre takım birlikteliği alt boyutları incelendiğinde “grup çekiciliği-sosyal, grup çekiciliği-görev, grup bütünlüğü-sosyal ve grup

bütünlüğü-görev” puan ortalamaları arasında anlamlı bir farklılık bulunmuştur. Farklılığın lise mezunu futbolcular lehine gerçekleştiği belirlenmiştir. Bu anlamda sporcuların eğitim düzeyi arttıkça takıma olan bağlılıkları ve uyumları azalmaktadır. Bu duruma sporcuların bilgi düzeyinin yükselmesi ile sorumluluk alma, bağımsız karar verme, uygulama ve kişisel inisiyatif alma özelliklerinin artmasına neden olmaktadır.

Takım kaptanlarının sporda liderlik ve takım birlikteliği (uyumu) davranışlarının farklı açıdan incelendiği sporcuların dahil olduğu bu çalışmada; takım kaptanlarının liderlik davranışları ile futbolcuların takım birlikteliği algılamaları arasında düşük düzeyde ve pozitif yönde doğrusal bir ilişki olduğu görülmüştür. Cotterill ve Fransen (2016) de sporcu liderliğinin takım uyumu ve performansı üzerinde olumlu bir etkisi olduğunu tespit etmiş ve sporcu liderliğinin oyuncular arasında birlik ve anlayışı geliştirdiğini öne sürmüştür. Ayrıca başka bir çalışmada eğitim ve öğretim ile sosyal desteğin sporcu liderliği davranışları görev ve sosyal uyum ile pozitif yönde ilişkili bulunurken, demokratik davranış görev uyumu ile pozitif yönde, otokratik davranış ise görev ve sosyal uyum ile negatif yönde ilişkili olduğu tespit edilmiştir (Vincer ve Loughhead, 2010). Elde edilen sonuçlar ile çalışmamızın sonucu benzerlik göstermektedir.

Yapılan regresyon analizi sonucunda ise sporda liderlik algılamaları takım birlikteliği algılamalarının yordayıcısı olduğu ve takım birlikteliği için açıklanan varyansın %19’unun sporda liderlik alt boyutlarından olan “eğitim ve öğretim, demokratik davranış, otokratik davranış, sosyal destek ve ödüllendirici davranış” boyutlarından kaynaklandığı tespit edilmiştir.

Sonuç olarak sporcuların takım kaptanlarının “eğitim-öğretim, demokratik, sosyal ve ödüllendirici davranışlarının” pozitif yönde takım birlikteliğini veya takım uyumunu arttırdığı, ancak otokratik davranışın ise negatif yönlü bir ilişki oluşturduğu sonucuna ulaşılabilir. Çalışmamız sonucundaki bilgiler ışığında bazı önerilerde bulunulabilir. Spor kaptanlığı rolü sporcuya iyice anlatılmalı ve kendisinden ne beklendiği açıklanmalıdır. TFF’nin antrenörlere yönelik açmış olduğu kurslar ve seminerlerdeki eğitimlerin takım kaptanlarını kapsayacak şekilde yapılması ve sayılarının artırılması takım kaptanlarının takım uyumuna yönelik becerilerini, motive edici ve performans artırıcı yönlerinin gelişmesine katkı sağlayacaktır. Araştırmanın Türkiye geneline uyarlanması ve daha kapsamlı bir inceleme yapılması araştırmacılara tavsiye edilmektedir.

ABSTRACT

Chromium is one of the important metals used in industry such as iron, aluminium and copper. Chromite, found in the earth's crust as iron chromium oxide (FeCr_2O_4), is one of the 25 minerals containing the most chromium element. The beneficiation methods applied in chromite ores are determined according to the degree of liberation of the chromite and the properties of the ore. However, fine-grained chromites (0.1mm) are directly added to the waste. In this study, fine-grained chromite in Eti Krom INC./Elazığ was enriched with a multi-gravity separator (MGS). In addition, yield analyses were calculated. The most important and sensitive variable affecting the performance in MGS systems is the drum rotation speed. In the experimental studies, the drum rotation speed was adjusted as 105, 120 and 135 rpm. Sieve analysis and grain size analysis of fine grained chromites were performed. Microscopic images of the feed, product and waste used in the studies were examined. Then, chemical analyses were made using XRF in Eti Krom Analysis Laboratory. Enrichment with optimum operating parameters was also obtained from the feed material containing 15.39% Cr_2O_3 and a concentrate with 43.7% Cr_2O_3 grade with 60% yield. In enrichment studies with MGS, it was observed that drum rotation speed and tilt angle were the most effective operating parameters, while other variables (wash water amount, feed solid ratio, vibration amplitude and frequency) were less effective.

Keywords: Chromium; Chromite; Multi Gravity Separator; Drum Rotation Speed; Yield.

İNCE TANELİ KROM CEVHERİNİN MULTİ GRAVİTY SEPARATÖR İLE
ZENGİNLEŞTİRİLMESİ, PİLOT ÖLÇEKLİ VERİM ANALİZLERİ

ABSTRACT

Krom, demir, alüminyum ve bakır ile birlikte endüstride en çok kullanılan önemli metallere biridir. Yerkabuğunda demir krom oksit halinde $FeCr_2O_4$ olarak bulunan bir spinel grubu olan kromit, en fazla krom elementi içeren 25 mineralden biridir. Kromit cevherlerinde uygulanan zenginleştirme yöntemleri, kromitin serbestleşme derecesine ve cevherin özelliklerine göre belirlenmektedir. Fakat ince taneli (0.1mm) olan kromitler doğrudan atığa katılmaktadır. Bu çalışmada Elazığ Eti Krom firmasında bulunan ince taneli kromitin multi gravity separatör (MGS) ile zenginleştirilmiştir. Ayrıca verim analizleri hesaplanmıştır. MGS sistemlerde performansı etkileyen en önemli ve hassas değişken tambur dönüş hızıdır. Deneysel çalışmalarda tambur dönüş hızı 105, 120 ve 135 devir/dakika olarak ayarlanarak yapılmıştır. İnce taneli kromitlerin elek analizi ve tane boyutu analizleri yapılmıştır. Çalışmalarda kullanılan besleme, ürün ve atığın mikroskop görüntüleri irdelenmiştir. Daha sonra Eti Krom Analiz Laboratuvarında XRF kullanılarak kimyasal analizleri yapılmıştır. Optimum çalışma parametreleriyle yapılan zenginleştirmede %15,39 Cr_2O_3 içerikli besleme malzemesinden %43,7 Cr_2O_3 tenörlü konsantre %60 verimle elde edilmiştir. MGS ile yapılan zenginleştirme çalışmalarında tambur dönüş hızı ve eğim açısının en etkin işletme parametreleri olduğu, diğer değişkenlerin (yıkama suyu miktarı, besleme katı oranı, titreşim genliği ve frekansı) ise daha az etkili olduğu gözlenmiştir.

Anahtar Kelimeler: Krom; Kromit; Multi Gravity Separatör; Tambur Dönüş Hızı; Verim

INTRODUCTION

Chromium; it is one of the most important metals used in industry along with iron, aluminium and copper. There are significant reserves in the world and in our country, and large amounts of chromium are produced every year. Metallurgy, refractory and chemistry are the main industries where chromium is used. However, chromium ores extracted from the quarry often do not provide the product properties desired by these industries. Therefore, bringing the chrome ores extracted from the quarry to the properties desired by the industry, in other words, becoming a saleable product is only possible with effective enrichment processes [1]. Gravity methods (shaking tables, jigs, troughs, spirals, etc.), which is to separate the valuable mineral from the worthless parts in a fluid environment (usually water) by making use of the difference between the densities of the precious mineral and gangue minerals, are frequently used in the enrichment of chromite ores today. However, grain size is the limiting factor in classical gravity methods together with triage (hand sorting), and these methods can only be applied in fragmented ores and ores that can be released in large sizes. With the decrease of this type of ores today, the application areas of classical gravity methods are getting narrower [1, 2]. For this reason, enrichment of fine-grained chromite wastes is increasing its importance day by day. In general, enrichment methods based on specific gravity difference are used in the enrichment of chrome ores. Separation methods such as heavy media and jigs are used in large sizes. If it is less than 1 mm, shaking table, spiral, magnetic separation and flotation are used. During this process, fine-grained chromites below 0.1 mm are seen as direct waste, and waste containing 10-15% Cr_2O_3 reduces plant efficiency. Flotation, high field intensity wet magnetic separation and slime table are used for the enrichment of these fine chromites (0.1 mm). Although the best results in terms of efficiency are obtained in flotation, both the cost of this process is high and it affects the environment negatively [3]. For these reasons, the use of multi gravity separator (MGS) is much more advantageous in the enrichment of fine-grained chrome ores.

The multi-gravity separator (MGS) is one of the fine particle mineral concentration machines based on gravity separation. The parameters that affect the performance of MGS are the drum speed, tilt angle, shake amplitude, shake frequency, wash water flow rate and feed solids [4]. Successful concentration with MGS depends on the selection of suitable operating conditions and minerals [5]. Therefore, it is important to determine the operating parameters at which the response reaches its optimum [6]. MGS optimization requires many tests. However, the total number of experiments required can be reduced depending on the experimental design technique [5]. It is essential that an experimental design methodology is very economical for

extracting the maximum amount of complex information while saving significant experimental time, material used for analyses and personnel costs [7]. Experimental design methods and response surface methodologies have been applied for modelling process parameters to mineral processing systems. Central composite design has been successfully used to design an experimental program to provide data to model the effects of inlet pressure, feed density, and length and diameter of the inner vortex finder on the operational performance of a 150 mm three product cyclone [8]. Box–Behnken experimental design method has been employed for modelling and optimization of a multi-gravity separator to produce celestite concentrate by Aslan [9]. Response surface methodology and Box–Behnken design has been discussed for modelling of some Turkish coals by Aslan and Cebeci [10]. Gülcan et al. have worked on the enrichment of manganese ore by creating a gravity enrichment flow chart [11]. Aslan and Canbazoğlu investigated the enrichment of fine chrome ores with MGS. In their study, they emphasized that grain size is very important in enrichment with MGS. They observed that the separation was good in fine sizes, and the sensitivity of separation decreased in large sizes [3]. MGS offers the possibility to change the operating parameters as a reference. In addition, several literatures were found on the detail of operational mechanism of MGS [12-15].

In this study, the effect of drum rotation speed on production and yield in the enrichment process with MGS used in process conditions in Eti Krom INC./Elazığ was examined. Sieve analysis and particle size analysis were performed. Sample releases were examined with a microscope. Chemical analysis of feed, product and waste were performed with X-Ray Fluorescence (XRF) spectrometer. At the last stage, the efficiency calculation was made and the necessary parameters for the use of MGS in process conditions were determined.

METHODOLOGY

In the enrichment of fine chromite wastes (-0.1 mm); Technologies such as jet flotation, column flotation, high field intensity wet magnetic separators and multi gravity separator (MGS) are used. The multi gravity separator is a unique enhanced gravity separator for the separation of fine and ultra-fine minerals. The schematic diagrams of multi-gravity separator and its separation mechanism has shown in Figure 1.

Figure 1. Schematic representation of MGS internal mechanism and working principle.

The parameters affecting the efficiency of separation on the MGS are reported as the drum speed (100 to 300 rpm), tilt angle (0° to 9°), shake amplitude (10 to 20 mm), shake frequency (4.0-5.7 cps), wash water (0 to 10 l/min) and pulp density of the feed slurry (10% to 50% by mass) [6]. In the experimental studies, MGS located in the Eti Krom INC./KEF region was used. MGS tests were carried out with the Salter Cyclones SCMG2 model double drum industrial scale device. In the KEF Concentrate Facility, MGS device connections were made to the hydrosizer 1st chamber outlet that feeds the slurry tables. Particle size analysis was performed by taking samples from the hydrosizer outlets before the connection was made. The operational parameters of the MGS device are given in Table 1.

Table 1. Operational Parameters of Industrial Scale MGS Device

Capacity	2 t/h per drum (on dry basis)
Feed particle size	2-100 μm
Pulp density of the feed slurry	%25-45
Drum rotation speed	85-150 rpm (max: 150 rpm-65 Hz-% 100 Ort: 140 rpm-60 Hz-%92,3 min: 85 rpm-36,3 Hz-%55,8)
Shake frequency	4-6,4 cps
Shake amplitude	15 mm
Shake speed	Max: 384 rpm-60 Hz-%100 Ort: 348 rpm-54,2 Hz-%90,3 Min: 240 rpm-37,4 Hz-%62,3
Drum tilt angle	$7,5^{\circ}$ (5° - 10° adjustable)
Wash Water	per drum Max. 0-40 l/s Ort. 12-25 l/s

According to the device parameters, the particle size of the feed material should be below 100 μm . Pulp density of the feed slurry should be between 25-45%. In MGS experiments, the feed particle size and some of the operational parameters (drum tilt angle, shake amplitude, etc.) were kept constant, drum rotation speed and shake speed were determined as variable. Then, sieve analysis and grain size analyses of fine-grained chromite were carried out. Microscopic

images of the feed, product and waste used in the studies were examined. Chemical analyses were performed using XRF in Eti Krom INC. Analysis Laboratory. The study was concluded by calculating the enrichment yield with the optimum working parameters.

RESULTS AND DISCUSSION

Before the experimental study, a sample was taken from the hydrosizer outlets and particle size analysis was performed. In order to determine the particle size distribution of the samples used in the experiments, sieve analyses were performed using sieves with dimensions of 600, 425, 300, 150, 106, 75, 53 and 38 microns. Sieve analysis results are given in Table 2. In addition, the grain size analysis is given in the graph in Figure 2.

According to the sieve analysis, 80% of the hydrosizer 1 and hydrosizer 2 mesh samples contain particles of 90 µm size, while 80% of the sample taken from the hydrosizer 3 mesh contain particles of 125 µm size.

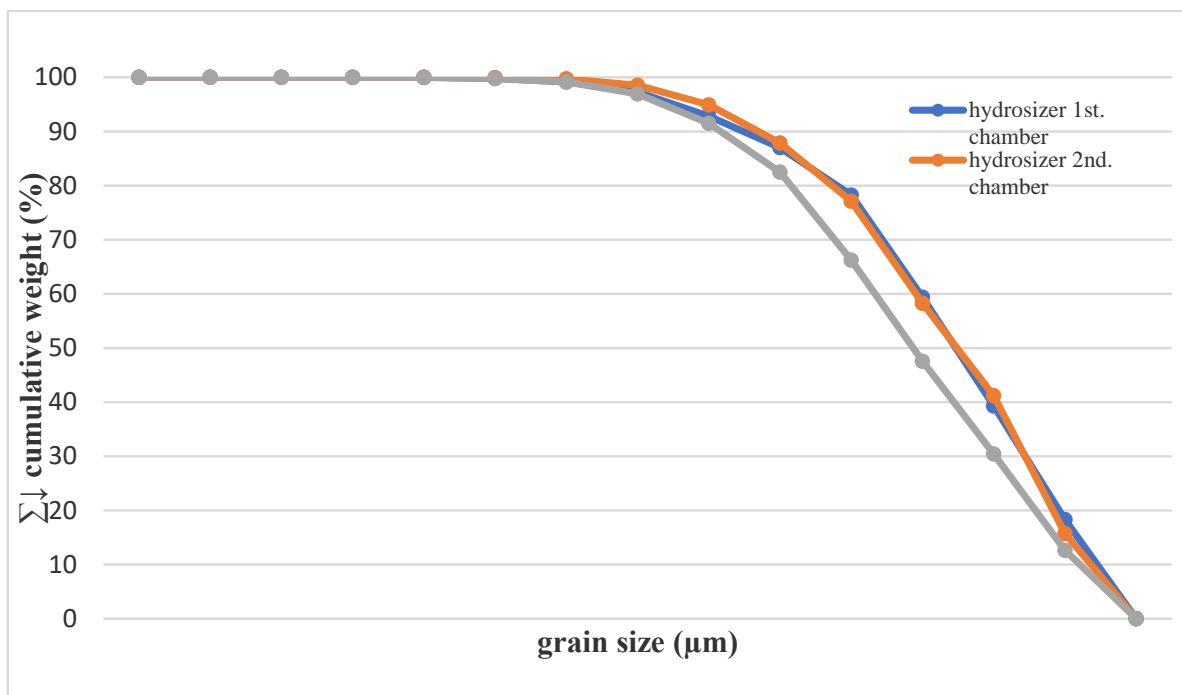

Figure 2. The grain sizes of the sieve analysis before MGS studies.

Aslan and Canbazoğlu mentioned the reduction of the liberalization grain size to increase the high grade and yield in MGS. The purpose of grinding the ore below 150-micron grain size is to achieve a further degree of liberation [3, 4]. According to MGS device parameters, the particle size of the feed material should be below 100 µm. Solid density should be between 25-45%. Due to the low solid density in the hydrosizer 3rd chamber, the hydrosizer 1st.chamber was used as eye feeding. In addition, slime tables were closed during the experiment. Then the working parameters were determined (Table 1). Sieve analysis was performed on the first concentrate, which was taken at a vibration rate of 60%. Sieve analysis results are given in Table 3. The size through which 80% of the concentrate passes was determined as 80 µm. The proportion of chromite grains released with decreasing grain size is linear. Studies have shown that yield increases with decreasing grain size [14-18].

The images of the product and waste obtained as a result of MGS experiments are given in Figure 3. In addition, the microscope images of the product are given in Figure 4.

Figure 3. Images of feed, product and waste used in experimental studies

Figure 4. Microscope images of the product

Figure 3 shows that most of the product is separated from the waste. In addition, it is seen in Figure 4 that most of the product is chromite and free chromite grains. The importance of the size of the free chromium grains has been demonstrated in the applications made with MGS. It has been shown that the grain size should be larger than 40 μm for an ideal enrichment in these applications. In the studies, it was observed that the performance decreased in the grain size range from -40 μm to +20 μm . It was also observed that this decrease increased more in fine grains than 20 μm [19]. Gravity enrichment yield decreases with decreasing grain size (for -20 μm). However, this problem can be eliminated by increasing the centrifugal force and the fluid medium. Decreasing the grain size (below 20 μm) causes an increase in engine power and cost [19-21]. In the study, it is seen that the grain size varies between 100 μm and 20 μm (Fig. 2). For this reason, MGS study parameters affected the result more than grain size.

In experimental studies, drum rotation speed and frequency parameters were changed. The product, waste amounts and tenor obtained in the experimental studies are given in Table 4. Then, feed, product and waste were sent to Eti Krom Analysis Laboratory for XRF analysis. The XRF analyses are given in Table 5.

Experimental studies were carried out in Eti Krom INC./KEF under process conditions. In Table 4, it is seen that the yield decreases with the increase of the drum rotation speed. This may be due to the fact that the fine particles move away from the structure due to the centrifugal force. Optimum operating parameters (for yield and tenor) determined in the enrichment of chrome ore with MGS; drum rotation speed was 105 rpm, amplitude was 15 mm, drum tilt angle was 7.5°, frequency was 4.48 cps, wash water 4 l/s and feed grain size were -100 μm . With the optimum operating parameter, a concentrate with 43.7% Cr_2O_3 tenor was obtained from the feed material containing 15.39% Cr_2O_3 with 60% metal recovery efficiency.

The results were balanced as a result of the obtained data and the yield percentages obtained according to the results are given in Table 6. In Table 6, it is seen that the balanced yield is 60% and the yield is 71.33% according to the results. Özgen studied on enrichment of Fethiye/Üç Köprü chromite plant wastes with knelson and Falcon Concentrator. As a result, Falcon Concentrator obtained 67.25% yield and 43.89% Cr₂O₃ tenor from chromite waste containing 13.27% Cr₂O₃. In addition, Knelson Concentrator obtained 72.51% yield and 47.32% Cr₂O₃ tenor [22]. In the study, 60% yield and 43.7% Cr₂O₃ tenor were obtained with MGS from fine chromite concentrate containing 15.39% Cr₂O₃. This study is important in that it was carried

out under process conditions, fine chromite ore was used and only two parameters were changed in MGS. This study has shown that with an MGS system to be added to classical gravity enrichment plants such as Eti Krom/KEF Concentrate Plant INC., the overall plant efficiency can be increased by evaluating very fine waste.

Table 6. The highest yield values obtained according to the results.

CONCLUSIONS

In this study, fine-grained chromite in Elazig Eti Krom was enriched with a multi-gravity separator (MGS). In addition, yield analyses were calculated.

Enrichment with optimum operating parameters was also obtained from the feed material containing 15.39% Cr₂O₃ and a concentrate with 43.7% Cr₂O₃ grade with 60% yield. In enrichment studies with MGS, it was observed that drum rotation speed and tilt angle were the most effective operating parameters, while other variables (wash water amount, feed solid ratio, vibration amplitude and frequency) were less effective.

According to the results obtained, it has been shown that the overall plant efficiency can be increased by evaluating very fine wastes with an MGS system to be added to classical gravity enrichment plants such as Eti Krom/KEF Concentrate Plant.

Acknowledgment

We would like to thank the employees of Eti Krom /KEF Concentrate Facility INC. for their support in this study.

ÖZET

Hashimotolu annelerin çocuklarında erken ultrasonografi (USG) ve Renkli Doppler (RDUSG) bulguları tesbit edilmiştir. Çalışmamızda 34 Hashimoto tanısı konulmuş annelere ve bunların toplam 42 çocuğuna USG ve RDUSG incelemeleri yapılmış, elde edilen bulgular retrospektif olarak araştırılmıştır. 42 çocuktan 11'inde (%26.2) normal USG bulguları izlenmiştir. 16 (%38.1) çocukta milimetrik boyutu aşmayan, sayıca az TI-RADS 1 nodüller saptanmıştır. Bu çocuklarda gland normal boyut ve ekopattern özelliği göstermekteydi. 9 (%21.4) çocukta erken evre Hashimoto bulguları tesbit edilmiştir. Bu bulgular glandda diffüz heterojen pattern, yamalı hipoeoik sahalar, psödonodüler infiltrasyon sahaları ve hiperekojen fibröz septal yapılar olarak özetlenebilir. Bu vakaların hiçbirinde glandda ekspansiyon veya hipervasülarizasyon saptanmamıştır. 6 (%14.3) çocukta ise erken evre Hashimoto bulguları yanında TI-RADS 1 mikronodüller saptanmıştır. Hashimoto tiroiditi etiyolojik olarak genetik yatkınlığı olan bireylerde çevresel faktörlerin etkisiyle ortaya çıktığı düşünülmektedir. Tanı konulmamış hipotiroid çocuklarda büyüme hızında yavaşlama görülebilir. Tedavi edilmezse bu durumda fiziksel büyüme geriliği ve zeka geriliği gibi yıkıcı sonuçları olabilir. Bu da erken tanının önemini daha da artırmaktadır. Hashimoto tanısı almış annelerin çocuklarında, noninvaziv bir yöntem olan USG + RDUSG tetkiki tarama amaçlı kullanılarak erken evre bulgular tesbit edilebilmektedir. Böylelikle olguların erken dönemde tedavi ve takip olanağı şansı olmaktadır.

GİRİŞ

Hashimoto tiroiditinde erken tanı, tedavi ve takip önemlidir. Hashimotolu annelerin çocuklarında erken ultrasonografi (USG) ve Renkli Doppler (RDUSG) bulgularını tesbit etmek erken tanı ile tedavi ve takip olanağı sağlamaktır.

MATERYAL VE METOD

USG ve RDUSG incelemeleri GE Logiq 730 pro, GE Logiq 9, GE Logiq S7 expert cihazları ile 4-15MHz, 5-13MHz lineer transducerler kullanılarak gerçekleştirildi. Her iki tiroid lobu ve isthmus farklı düzlemlerde incelendi.

Vaskülarizasyon özellikleri değerlendirildi.

Nodül varlığında TI-RADS skorlaması yapıldı.

Çalışmamızda 34 Hashimoto tanısı konulmuş annelere ve bunların toplam 42 çocuğuna USG ve RDUSG incelemeleri yapılmış, elde edilen bulgular retrospektif olarak araştırılmıştır.

BULGULAR

Çocukların yaş aralıkları 4-13, ortalaması 7.5 dur. 22'si kız, 20 tanesi erkektir.

42 çocuktan 11'inde (%26.2) normal USG bulguları izlenmiştir.

16 (%38.1) çocukta milimetrik boyutu aşmayan, sayıca az TI-RADS 1 nodüller saptanmıştır.

Bu çocuklarda gland normal boyut ve ekopattern özelliği göstermekteydi.

9 (%21.4) çocukta erken evre Hashimoto bulguları tesbit edilmiştir. Bu bulgular glandda diffüz heterojen pattern, yamalı hipoekoik sahalar, psödonodüler infiltrasyon sahaları ve hiperekojen fibröz septal yapılar olarak özetlenebilir. Bu vakaların hiçbirinde glandda ekspansiyon veya hipervasülarizasyon saptanmamıştır.

6 (%14.3) çocukta ise erken evre Hashimoto bulguları yanında TI-RADS 1 mikronodüller saptanmıştır.

TARTIŞMA

Kronik otoimmün tiroidit ya da kronik lenfositik tiroidit olarak bilinen Hashimoto tiroiditi en sık orta yaşlı kadınlarda görülmekle birlikte çocukluk yaş grubunda en sık görülen tiroidittir ve edinsel hipotiroidizmin ana nedenidir. Hashimoto hastalığı çocukların yaklaşık %1'ini etkilemektedir. Çeşitli hücre ve antikor aracılı immün sürece ve lenfositik infiltrasyona bağlı gelişen tiroid foliküllerinin harabiyeti ile karakterizedir.

Etiyolojik olarak genetik yatkınlığı olan bireylerde çevresel faktörlerin etkisiyle ortaya çıktığı düşünülmektedir.

Tanı konulmamış hipotiroid çocuklarda büyüme hızında yavaşlama görülebilir.

Ek semptomlar arasında halsizlik, solgunluk, kuru ve kaşıntılı kafa derisi, soğuğa karşı artan hassasiyet ve kabızlık yer alır. Tedavi edilmezse bu durumda fiziksel büyüme geriliği ve zeka geriliği gibi yıkıcı sonuçları olabilir.

Hipotiroidizm çocuklarda her yaşta, hatta infantlarda bile tiroid problemi ile doğabilir.

Ayrıca okul çağındaki çocuklar arasında en yaygın endokrin bozukluk tiroid kaynaklıdır. Hashimoto hastalığının yıllarca asemptomatik olarak seyredildiği bilinmektedir.

Bu da erken tanının önemini daha da artırmaktadır.

SONUÇ

Hashimoto tanısı almış annelerin çocuklarında, noninvaziv bir yöntem olan USG + RDUSG tetkiki tarama amaçlı kullanılarak erken evre bulgular tesbit edilebilmektedir.

Böylelikle olguların erken dönemde tedavi ve takip olanağı şansı olmaktadır.

OLGU 1

Klinik olarak sadece terleme şikayeti olan, 39 yaşında takipteki annede; glandda ekspansiyon, diffüz heterojen pattern, psödonodüler hipoekoik infiltrasyonlar ve infratiroidal lenf nodları varlığı ile karakterize Hashimoto bulguları

Bu annenin 4 yaşında klinik şikayeti bulunmayan kız çocuğunda; normal boyuttaki glandda diffüz heterojen yamalı hipoekoik pattern, infratiroidal birkaç adet lenf nodlarının varlığıyla karakterize erken evre Hashimoto bulguları ve sağ lobda 1, sol lobda 2 adet olmak üzere toplam 3 adet, 2-3mm çaplı TI-RADS 1 nodüller

OLGU 2

Klinik olarak seyrek çarpıntı ve avuç içi yanma şikayeti olan, 38 yaşında takipteki anne; normal boyuttaki glandda diffüz heterojen pattern, alt pollerde hiperekojen karakterde septal yapılar ve infratiroidal lenf nodları varlığı ile karakterize Hashimoto bulguları

Bu annenin 12.5 yaşında klinik şikayeti bulunmayan erkek çocuğunda; normal boyuttaki glandda diffüz heterojen yamalı hipoekoik pattern, yer yer psödonodüler alanlar ve infratiroidal birkaç adet lenf nodlarının varlığıyla karakterize erken evre Hashimoto bulguları. Nodül gelişimi saptanmadı.

OLGU 3

Klinik olarak kilo kaybı ve ellerde titreme şikayeti olan, 31 yaşında annede; normal boyuttaki glandda diffüz heterojen pattern, psödonodüler hipoekoik infiltrasyonlar ve peritiroidal lenf nodları varlığı ile karakterize Hashimoto bulguları

Bu annenin klinik şikayetleri bulunmayan 6 yaşındaki kız ve 7 yaşındaki erkek çocuklarında; normal boyut ve ekopatterndeki glandlarda 2.0-2.5mm çaplı birer adet TI-RADS 1 soliter nodüller

ANALYSIS AND DESIGN OF RESIDENTIAL BUILDING ON WIND LOAD
ANALYSIS BY USING STAAD PRO

ABSTRACT

On demand of growing population construction of high-rise building is being made compulsory for avoiding land scarcity in future. As these high rise buildings are difficult to design manually so many computerized commercial software's are available for analysing a structure. The structural elements are designed manually using IS 456 and IS 875. Here STAAD PRO is used to analyse the residential building. STAAD PRO is also one of the software used to structural analysis and design. Analysing structures, maximum shear force, bending moments and maximum displacements are compared by using STAAD PRO. A general structure of 7 storeys is considered for analysis and design considering wind loads in according with Indian codal provision.

Keywords: Wind load, Displacement, Shear force, Bending moment.

1. INTRODUCTION

A Building is a structure with a roof and walls standing more or less permanently in one place, such as a House or Factory. Buildings constructed in a variety of sizes, shapes and functions from building materials available. Buildings serve several societal needs primarily as shelter from weather, security, living space, privacy, to store belongings, and to comfortably live and work).

Residential Buildings

These building include any building in which sleeping accommodation provides for normal residential purposes, with or without cooking and dining facilities. It includes single or multi-family dwellings, apartment houses, lodgings or rooming houses, restaurants, hostels, dormitories and residential hostels.

Educational Buildings

These include any building used for school, college or day-care purposes involving assembly for instruction, education or recreation and which is not covered by assembly buildings.

Institutional Buildings

These buildings are used for different purposes, such as medical or other treatment or care of persons suffering from physical or mental illness, diseases or infirmity, care of infants, convalescents or aged persons and for penal detention in which the liberty of the inmates is restricted. Institutional buildings ordinarily provide sleeping accommodation

Assembly Buildings

These are the buildings where groups of people meet or gather for amusement, recreation, social, religious, assembly halls, city halls, marriage halls, exhibition halls, museum places of work ship, etc.

Business Buildings

These buildings are used for transaction of business, for keeping of accounts and records and for similar purposes, offices, banks, professional establishments, courts houses, libraries. The principal function of these buildings is transaction of public business and keeping of books and records.

Mercantile Buildings

These buildings are used as shops, stores, market, for display a sale of merchandise either wholesale or retail, office, shops, storage service facilities incidental to the sale of merchandise and located in the same building.

Industrial Buildings

These are buildings where products or materials of all kinds and properties are fabrication, assembled, manufactured or processed, as assembly plant, laboratories, dry cleaning plants, power plants, pumping stations, smoke houses, laundries etc.

Storage Buildings

These are used primarily for the storage or sheltering of goods, wares or merchandise vehicles and animals, as ware houses, cold storage, garages, trucks. In this Project a Residential building is designed. Residential Buildings are can be constructed based on the size of the site and Economy of the people such as High class, Middle class and Low-class people. In this project a residential building facilitated with all required rooms such as living room, Kitchen etc., with required plot size is designed.

2. SOFTWARES USED

The following software are used for the analysis and design of residential building in this project:

AUTOCAD Software

STAAD PRO Software

AUTOCAD

AUTOCAD is a commercial computer-aided design (CAD) and drafting software application. Developed and marketed by AutoCAD was first released in December 1982 as a desktop app running on microcomputers with internal graphics controllers. Before AutoCAD was introduced, most commercial CAD programs ran on mainframe computers or minicomputers, with each CAD operator (user) working at a separate graphics terminal AUTO CAD is used across a wide range of industries, by architects, project managers, engineers, graphic designers, and many other professionals. The main use of AUTOCAD software is to draw or drafting the plan, elevation and sections of structures in 2D or 3D view For the present project AUTOCAD is used for representing the plan of considered Residential Building.

STAAD PRO

STAAD (STAAD Pro) is a structural analysis and design computer program originally developed by Research Engineers International at Yorba Linda, CA in 1997. In late 2005, Research Engineers International was bought by Bentley Systems. The commercial version, STAAD.PRO, is one of the most widely used structural analysis and design soft ware products worldwide. It supports several steels, concrete and timber design codes. The design of considered Residential Building design is done with the help of STAAD PRO software.

3. OBJECTIVES

1. To analyze the residential building for dead load , live load wind load using STAAD PRO.
2. To design RCC Residential building using STAAD PRO.
3. To validate the manual calculation with analytical results.

4. LITERATURE REVIEW

1.ROHITH KUMAR “ANALYSIS AND DESIGN OF MULTI STOREY STRUCTURE USING ETABS”:

This project investigates that most buildings are of straight forward geometry with horizontal beams and vertical columns. Although any building configuration is possible with ETABS in most cases, a simple rigid system defined by horizontal floors and vertical columns lines can establish building geometry with minimum effort, most of the floor’s level in buildings are similar. This can reduce the modelling and design time. The main aim of this project is to complete a multi storey building and to ensure that the structure is safe against gravity loading conditions and to fulfil the function for which the structures have been built for the design of structure dead loads and live loads have been considered. The analysis and design of the structure is done by using Etabs Software and also with the confirmation of IS 456-2000.

2. SHIVHAR ’STUDY ON ANALYSIS AND DESIGN OF A COMMERCIAL BUILDING’.

This paper investigates about the Analysis and Design of a Commercial Building by using ETABS software and also gain sufficient knowledge in complete Analysis and Design Procedure. In this research they checked on G+4 Commercial Building frame made up of Reinforced Concrete. Providing with all necessary specifications. This project mostly stressed on Indian Standard Code Books and National Building Code (NBC) because planning and design of any building will be recognized as per the standards by these design aids. This paper provides information about the design procedure Analysis Results i.e. Shear Force, Bending Moment, Deflections etc. and various IS Code books. 9

3. MADHURIMA DUTTA “WIND ANALYSIS AND DESIGN OF A MULTI STORIED STRUCTURAL FRAME CONSIDERING USING STAAD PRO”:

This study was carried out for a few load cases and only wind load was taken as dynamic load. Different combination of load cases can be considered further with different kinds of dynamic loads as for a multi storied building dynamic loads play a major role.

4. S. RAMANARAYAN “SEISMIC ANALYSIS AND DESIGN OF RESIDENTIAL BUILDING (G+4) USING STAADPRO (2018)”:

From this journal we are understood the analysis and design part of residential building using Staid pro. And they analyzed structure is safe against seismic load.

5. SUPRAJA DUPPATI “Earthquake resistant design of G + 5 multi-storey residential building using STAAD.pro (2021)”:

In this journal they have done analysis on earth quake resistance in various zones (3,4,5) of residential building and they have taken shear force, bending moments, and deflection values.

5. PLANNING OF A BUILDING

Planning is a projected course of action and through planning we can achieve goal. Planning is deciding in advance what to do, how to do it, when to do it and who to do it

Stages in structural planning

Once the type of structure is finalized and planned, design of structure involves the corresponding stages in the planning. This is the main stage which decides the total

- a) Column positioning
- b) Orientation of columns
- c) Beam location
- d) Spanning of slabs
- e) Layout and planning of stairs and
- f) Type of footing

Plan from 1st to 7th floor

Wind load calculation.

Assigning of wind loads

LOADS AND COMBINATION:

The structures should be analyzed for combination of loads as in practice. we have number of loads in various directions act

Some of the combinations checked are:

- 1.2(DL+LL)
- 1.2(DL+WL)
- 1.2(DL+LL+WL)

7. ANALYSIS AND DESIGN OF RESIDENTIAL BUILDING USING STAAD PRO SOFTWARE.

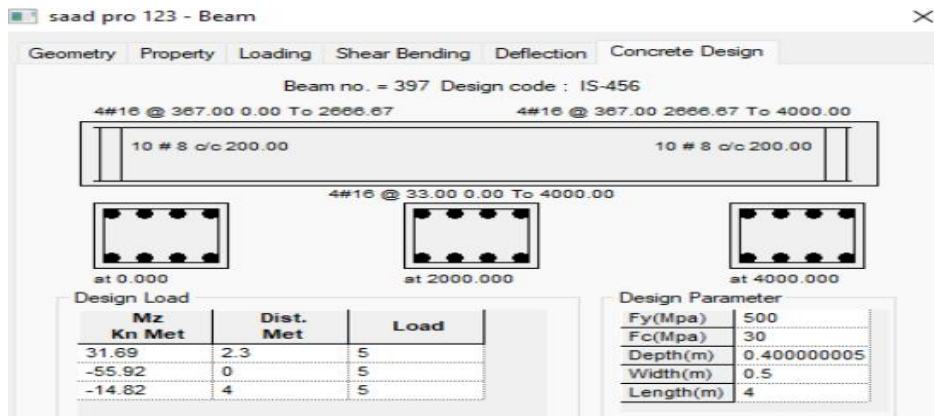

Procedure for Analyzing the Residential Building using STAAD PRO software:

- Double click on STAAD PRO software select new project select space and change the file name and location and give units Meters kilo Newton next add beam finish
- Click on geometry run structural wizard
- select frame models bay frame.
- Length 16M - Height 3M - Width 8M
- Number of bays along length and edit distances in dialog box as required apply transfer models- yes -ok.
- Select on column - click on geometry - translational repeat select required direction with distances and number click on link steps - ok - Repeat the translational repeat option (Y = 24M) and project the entire structure.
- Click on general property define rectangle Yd 0.4m, Zd 0:3m add close.
- Select the rectangle 0.3x0.3 assign to view assign - yes. -Click on support -fixed - add select support- use cursor to sign - place supports on required positions. - Click on the load and deflection - load case details - add change title as dead load - loading type as dead add - title as live load type as live add close.
- Click on dead load option add differ types of loads and assign them on required positions. Click on live load option add differ types of loads and assign them on required positions. Analyze run analyze ave go to post processing done. Click on results view value beam results select maximum and mid points, annotate.
- Click on SFD BMD options to view SFD BMD.
- Click on SFD (Fx Max value =76.762Kn) @beam no 442) BMD (Moment (Mz max 51.604knm) Beam no 14) options to view SFD BMD.

Procedure for Design of the Residential Building using STAAD PRO.

- Click on Design - concrete current code IS456- click on the design define parameters
- Select fck, fymin, Fymin, Maxmain, Maxsec, Minmain, Minsec, ok-select define parameters values - add -close- select each of them-assign to view -assign - yes.
- Select commands select design beam - add - select design slab element-add select take off - add - close. Select design beam - select beams parallel to X directions - beams parallel to Z direction - assign to selected beams - assign - yes.

- Select design column - select beams parallel to Y direction - assign to selected beams - assign - yes - Select design column - select beams parallel to Y direction- assign to selected beams assign - yes. -Select design slab element - assign to view - yes. - Go to analysis print - add - close. - Go to analyze - run analysis - save.
- Check concrete design information of each beam and find the critical section.

Design of beam

Design of column

8. CONCLUSIONS

From the above analysis we conclude the following points:

1. Tough our building is in Kurnool region is not much effecting due to wind loads.
2. There is less displacement after applying wind loads so it is negligible.

ÖZET

Tarımsal üretim, bitkisel üretim ve hayvansal üretim olmak üzere iki gruba ayrılmaktadır. Bahçe bitkileri ve tarla bitkileri bitkisel üretim kaynaklarını oluşturmaktadır. İnsanların beslenme, giyinme, barınma ve tedavi gibi temel ihtiyaçlarını büyük ölçüde karşılayan en önemli ürünler tarla bitkileridir. Tarla bitkileri üretimi bu bakımdan büyük önem arz etmektedir. Tarla bitkileri; tahıllar, yemelik tane baklagiller, endüstri bitkileri, çayır mera ve yem bitkileri olmak üzere 4 gruba ayrılmaktadır. İlk kültüre alınan tarla bitkileri tahıllardır. Ayrıca tahıllar, en fazla yetiştiriciliği yapılan tarla bitkileridir. Bunu yemelik tane baklagiller takip etmektedir.

Anahtar Kelimeler: Tarla bitkileri, tahıllar, baklagiller, yem bitkileri

IMPORTANCE OF HARVEST TIME IN FIELD CROPS

ABSTRACT

Agricultural production is divided into two groups as crop production and animal production. Horticultural crops and field crops constitute the plant production resources. The most important products that meet the basic needs of people such as nutrition, clothing, shelter and treatment are field crops. The production of field crops is of great importance in this regard. Farm plants; It is divided into 4 groups as cereals, legumes, industrial crops, meadow pasture and forage crops. The first cultivated field crops are cereals. In addition, cereals are the most cultivated field crops. This is followed by edible legumes.

Keywords: Field crops, cereals, legumes, forage crops

GİRİŞ

Tarım; bitki yetiştirme (fitotekni) ve hayvan yetiştirme (zootekni), bitkisel ve hayvansal ürünler elde etme, bitkisel ve hayvansal ürünlerin nitelik ve niceliklerini iyileştirme, bitkisel ve hayvansal ürünleri pazara hazırlama (marketing ve standardizasyon) ve saklama (depolama), bitkisel ve hayvansal ürünleri işleyip, değerlendirme (teknoloji) bilim ve sanattır. Bitkisel üretim ise bahçe tarımı ve tarla tarımı olarak ikiye ayrılmaktadır (Çiftçi, 2002). Tarla tarımı; güneş, toprak, hava ve su gibi doğal kaynakları kullanarak insan ve hayvan beslenmesi için elzem olan protein, karbonhidrat ve yağ gibi birincil; alkaloid, terpenoid ve fenolik maddeler gibi ikincil temel organik metabolitlerin üretimini gerçekleştirme bilimi ve sanattır (Baydar, 2012).

Tarla bitkileri; tarlada yetiştirilen, genellikle otsu yapılı, tek yıllık ve bazen çalimsı veya odunsu çok yıllık kültür bitkileridir. Tarla bitkileri; tahıllar, yemeklik tane baklagiller, endüstri bitkileri, çayır mera ve yem bitkileri olmak üzere 4 gruba ayrılmaktadır. Tahıllar; serin iklim ve sıcak iklim tahılları olarak ikiye ayrılmaktadır. Buğday, arpa, çavdar, yulaf ve tritikale serin iklim tahılları alt grubunu oluştururken, mısır, çeltik, koca darı, kum darı, cin darı, kuşyemi ise sıcak iklim tahıllarındandır. Yemeklik tane baklagiller; serim mevsim ve sıcak mevsim baklagilleri olarak iki alt grubu oluşturmaktadır. Nohut, mercimek, bakla ve bezelye serin mevsim baklagili iken, kuru fasulye ve börülce sıcak mevsim baklagilidir (Baltacıoğlu, 2013).

Endüstri bitkileri; lif bitkileri, yağ bitkileri, nişasta-şeker bitkileri, tıbbi ve aromatik bitkiler, keyf bitkileri olarak sınıflandırılmıştır. Lif bitkileri içerisinde, başta pamuk, keten, kenevir, jüt, rami, hibiskus (kenaf), rosella, güneş keneviri, lif kabağı, kapok, manila keneviri ve sisal keneviri sayılabilir. Bu bitkilerden liflerin elde edilmiş yerlerine göre sınıflandırıldığında; tohumundan lif elde edilen pamuk, saplarından lif elde edilenler, keten, kenevir, jüt, rami, kenaf, rosella, güneş keneviri, meyvesinden lif elde edilenler, lif kabağı ve kapok, yapraklarından lif elde edilenler de manila ve sisal kenevirleri olarak karşımıza çıkmaktadır (Eripek, 1995). Yağ bitkileri; 1. sınıf yağ bitkileri olarak isimlendirilen ayçiçeği, soya, kolza (kanola), yer fıstığı, susam, haşhaş, aspir ve yağ şalgamı bitkileridir. Doğrudan insan beslenmesinde içerdikleri yağın yağ asitleri kalitesinin uygun olmaması nedeniyle 2. sınıf yağ bitkileri olarak isimlendirilenler ise ızgın, ketencik, pelemir, hardal, hintyağı ve jojoba bitkileridir. Patates, yer elması ve tatlı patates nişasta bitkileri alt grubunda yer alırken, şeker pancarı ve şeker kamışı şeker bitkilerindedir. Kimyon, kişniş, kekik, hardal, karabiber ve çemen önemli aromatik bitkilerdendir. Haşhaş, melisa, adaçayı, meyan kökü, banotu, yüksükotu, datura ve atropa ise tıbbi bitkiler alt grubunda yer almaktadır. Tütün, anason ve şerbetçiotu ise keyf bitkileri arasında yer almaktadır (Baydar, 2012).

Yem bitkileri; çayır-meralar, baklagil ve buğdaygil yem bitkileri olmak üzere alt gruplara ayrılmaktadır. Baklagil yem bitkileri alt grubunu yonca, korunga, üçgül, fiğ, burçak, mürdümük, yem bezelyesi vb. oluşturmaktadır. Sorgum, sudan otu, ayrıklar, yumaklar, salkımlar, bromlar vb. buğdaygil yem bitkilerindedir (Uçar ve Soya, 2020). Bu bitkilerin morfolojileri, yetiştirme şekilleri ve vejetasyon

dönemlerinin birbirinden farklı olduğu gibi hasat zamanları ve hasat şekilleri de birbirinden farklılık göstermektedir.

BAZI TARLA BİTKİLERİNİN HASAT ZAMANLARI

Serin iklim tahıllarından buğday için tanedeki nem oranı % 13,5 olduğu zaman en uygun hasat zamanıdır. Bitkiler tamamen sarardığı ve tanelerin sertleştiği dönemde bitkiler hasat edilmelidir (Çığ ve ark., 2021a). Triticale buğdayla yaklaşık aynı zamanda hasat olgunluğuna gelmekte ve hasadı yapılmaktadır. Arpa hasadı, taneler sertleşip tane nemi %13'ün altına düştükten sonra yapılmalıdır (Çığ ve ark., 2021b). Çavdarın çiçek kavuzları taneyi gevşek tuttuğundan ve dış kavuzlar dar olduğundan tane dökme önemli bir sorundur. Bu nedenle çavdarın hasat zamanının seçimi önemlidir. Orak veya tırpanla hasat sarı olum dönemi sonunda; biçerdöverle hasat ise tam olum dönemi başında ve günün erken saatlerinde yapılmalıdır (Köse ve Mut, 2022). Yulaf tarımında en uygun hasat zamanının seçilmesi önemlidir. Kardeşlenme fazla olduğundan, bir bitkideki tanelerin tümünün olumu için gerekli süre, diğer serin iklim tahıllarına göre daha uzundur. Yulaf genellikle ana saptaki danelerin sarı olum ile tam olum arasında olduğu devrede biçilmelidir. Saplar hasat sonrasında tarlada 3-5 gün yeterince kurutulduktan sonra harman edilmelidir (Sabandüzen ve Akçura, 2017). Mısır bitkisi hasat zamanı geldiğinde bitkinin sap, yaprak ve tablaları tamamen kuruyup kahverengileşir. Danelik ürün için mısırdaki hasat zamanının geldiği koçan kavuzlarının kuruyup, danenin sertleşip normal görünen rengini alması, danenin sömeğe bağlandığı yerde siyah noktanın oluşması ile anlaşılır. Siyah nokta görülmeye başlamasından itibaren dane rutubeti atarak hasat süresini beklemeye başlamaktadır. Mısır koçanının orta kısımlarından alınan her 4 tanenin 3'ünde siyah nokta görülür ise, mısır olgunlaşmasını tamamlamış demektir (Saygı ve Toklu, 2017). Sıcak iklim tahılları grubunda yer alan cin darı tohumların renklendiği ve gerçek sertliğini kazandığı tam olgunlaşma döneminde ise tohum için hasat edilmelidir (Olak ve Tan, 2016). Çeltikte salkımların %80'nin saman rengini aldığı, alt kısımdaki danelerin sert mum dönemine ulaştığı zaman çeltik hasat edilir. Bu dönemde danelerin rutubet oranı % 22-24 arasındadır (Şavşatlı ve ark., 2008).

Serin mevsim baklagillerinden olan mercimekte hasadın zamanında yapılması çok önemlidir. Hasat zamanında tanede nemin düşük seviyede olması istenir. En uygun hasat zamanı mercimek bitkilerinin sarardığı ancak tam olarak kurumadığı zamandır (Ceritoğlu ve Erman, 2020). Nohut bitkisinde tane dökme durumu, mercimek bitkilerindeki kadar büyük bir sorun olmamakla birlikte hasat zamanında dikkat edilmesi gereken konulardandır. Nohut bitkileri sarardığı tanelerin sertleştiği dönemde sabahın erken saatlerinde hasat edilmelidir (Soysal ve Erman, 2020). Baklanın hasadına meyvelerin büyük çoğunluğu siyahlaştıktan ve tohumlar sertleştikten sonra başlanmalıdır. Bu dönemde gövdenin üzerindeki tüm yapraklar dökülmüş ama gövde ve yaprak sapları halen yeşil durumdadır (Uçar ve ark., 2020). Kuru tane üretimi amacıyla yapılan bezelye yetiştiriciliğinde hasat, bitkinin alt kısımlarındaki baklaların sarardığı fakat çatlayarak tane dökmeden önce yapılmalıdır (Alan ve Geren, 2012). Sıcak mevsim baklagillerinden olan börülce hasadında taneler bakla içinde sertleşmiş bakla kırıldığında hemen dışarı çıkabilecek durumdadır. Elle börülce hasadı durumunda bitkiler iyice

kurutulduktan ve tanelerdeki nem oranı % 10'a kadar düştükten sonra harmanlanır. Kuru fasulyede normal hasat zamanı baklaların büyük çoğunluğunun sarardığı fakat henüz kupkuru olmadıkları zamandır (Özçelebi ve Erman, 2021).

Endüstri bitkileri grubunda yer alan pamuk hasadına kozaların olgunlaşması ile başlanır. Hasat tarihi iklim koşullarına, ekim tarihine ve sulama koşullarına göre değişim gösterebilir. Tarlada açılmış koza oranı yaklaşık %60'a vardysa 1. el hasada başlanabilir (Bozbek ve Ünay, 2005). Soya bitkisinde tanede nemin % 13-14 oranında olduğu dönemde yapılmalıdır. Yaprakların sararıp dökülmesinden 4-5 gün sonra soya hasadına başlayıp kısa sürede bitirilmelidir. Ekim zamanına ve çeşitlerin erkenci ya da geççi olmasına bağlı olarak soyada hasat dönemi farklılık göstermektedir (Arslan ve ark., 2018). Ayçiçeği hasadı bitki yapraklarının ve tabla üzerindeki çiçeklerinin kuruyup döküldüğü, tablanın etli kısmının da kurumuş olduğu ve tane neminin % 15'in altına düştüğü dönemde yapılmalıdır (Katar ve ark., 2012). Susam için hasat zamanı çiçeklenmenin bittiği, yaprak ve kapsüllerin sarardığı, alt yaprakların kısmen döküldüğü ve alt kapsüllerdeki tohumların renk değiştirdiği, sararak uçlarının çatlamaya başladığı dönemdir (Arslan ve ark., 2014). Yer fıstığı, yapraklar sarardığında, danelerin büyük çoğunluğu koyulaşır normal iriliğe ulaştığında, kapsüllerin iç zarında kahverengi çizgiler görüldüğünde hasat edilmelidir. Depolanacak kabuklu fıstıklarda nem oranı %7-8 seviyesinin üstüne çıkmamalıdır (Arioğlu ve ark., 2016). Patates bitkisi, yaprak ve sapları sararıp kurduğunda, yumruları normal büyüklüğüne ulaşır bitkiden kolayca ayrılabilirdiği dönemde hasat edilmelidir (Gezgin ve Uyanöz, 1998). Şeker pancarı sonbahar aylarında hasada hazır hale gelir. Ülkemizde genel olarak karasal iklimin hakim olduğu alanlarda ekimi yapılan şeker pancarları eylül ve ekim ayının sonlarına doğru hasat edilmektedir (Okut ve Yıldırım, 2004). Şeker pancarı hasadına bitkinin yetiştirme süresi ve şeker fabrikaları tarafından alınan bitki örneklerinin şeker içeriğine göre karar verilmektedir.

Tıbbi ve aromatik bitkiler arasında yer alan kekik, çiçeklenme başlangıcı ile çiçeklenme dönemi arasında hasat edilmelidir. Hasattan sonra alınan kekik bitkileri gölge bir alanda, doğal koşullar altında kurutulmalıdır. Kurutulan alanın gölge olması kekik kalitesi için büyük önem taşımaktadır. Güneşte kurutma sonucu, bitkilerin rengi değişmekte ve yağ içeriği v kalitesi düşmektedir. Kurutulan bitkiler, saplarından ayrılarak çuvallanıp, ışık almayan ve nemsiz alanlarda saklanmalıdır. Saplarından ayrılan kekiklerin nem oranının maksimum %13 olması gerekmektedir (Sarıhan, 2006). Adaçayı, yaprakları (taze ve kuru) ve uçucu yağı için hasat edilir. Çiçeklenme aşamasında hasat ettiğimizde, maksimum kalitede ve miktarda uçucu yağ elde edildiği, ikinci el hasatta (normalde yaz sonu – Ağustos) birinci el hasada kıyasla (ilkbahar sonu-Mayıs), kuru yaprak ve uçucu yağ veriminin daha yüksek olduğu belirtilmiştir (Karık, 2015). Tıbbi papatya, bitkideki uçucu yağ oranı çiçek açıldıktan 3-5 gün sonraki dönem en fazla olduğu için hasat bu dönemde yapılmalıdır. Anason, bitkinin ana çiçek dallarındaki taneler kahverengileşmeye başladığında hasat yapılmalıdır (Tan, 2016).

Yem bitkilerinden fiğler, yeşil ot elde etmek amacıyla bitkilerde toprağa yakın birkaç baklanın tam şeklini aldığı ve tanelerin dolduğu dönemde, tane elde etmek için ise alttan birkaç baklanın sarardığı

tanelerin sertleştiği dönemde hasat yapılmalıdır (Uçar ve Soya, 2020). Yoncada ve korungada ot üretimi için % 10 çiçeklenme döneminde (çiçeklenme başlangıcı) hasat yapılmalıdır. Tane üretimi için salkımların alt kısımlarındaki meyvelerin kahverengileşmeye başladığı dönemde bitkiler hasat edilmelidir (Turan ve Çelen, 2017).

SONUÇ

Tahıllarda erken hasat durumunda kavuzlar tam kurumadığından renk atmakta, tanelerin buruşuk-solgun olmasına neden olmaktadır. Geç hasatta ise çeşit özelliğine bağlı olarak başakta tane dökülmeleri, yağışa ve rüzgâra bağlı olarak bitkide yatmalar ve bazı çeşitlerde başaktaki tanede çimlenmeler görülebilmektedir. Endüstriyel baklagiller, yemeklik tane baklagillerde ve baklagil yem bitkilerinde erken dönemde hasat buruşuk taneye sebep olmakta iken, geç hasat tane dökülmesine ve buna bağlı olarak verim kaybına neden olmaktadır. Endüstri bitkilerinden susam, soya, ayçiçeği vb. bitkiler erken hasat edildiğinde nem oranı yüksek olduğundan tanelerin bozulmasına, verim kaybına neden olmakta ve depolanmasını zorlaştırmaktadır. Tıbbi-aromatik bitkiler genel olarak sabahın erken saatlerinde havalar çok ısınmadan ve yağış olmayan zamanlarda hasat edilmelidir. Tıbbi-aromatik bitkilerde uçucu yağın kalitesini ve konsantrasyonunu korumak için hasat zamanı oldukça önemlidir. Bitkisel üretimin ön koşulu iyi tohumluk seçimi, toprak hazırlığı ve zamanında ekimdir. Ancak başarılı bir üretim için bunlar tek başına yeterli değildir. Bitkisel üretim ekimden hasat-harmana kadar bütün bir süreçtir. Uygun zamanda yapılan bir hasat ile bu süreç başarıya ulaşabilir. Erken veya geç hasadın verim ve kalite kaybına neden olduğu yapılan üretimler sonucu çiftçiler tarafından defalarca tecrübe edilmiştir. Sağlıklı, verimli ve kaliteli üretim için zamanında hasat yapılması gereklidir.

ABSTRACT

Fibrosarcoma is a mesenchymal tumor of malignant fibroblasts in a collagen background. It was reported in all species, but most commonly in older dogs and cats. This tumor often occurs on the head and limbs, but may also occur anywhere on the body. A 6-year-old male Persian cat (3/5 kg) with a raised mass on the right anterior limb was referred to the veterinary hospital. Based on owner information, within the previous 2-month period, the mass had become evident and grew larger. Finally, complete surgical removal was selected. On gross examination, the mass was approximately 8×10×12 mm in size. Macroscopically, the mass was well circumscribed, ulcerated, firm and white to yellow. Tissue samples of the mass were fixed in 10% neutral buffered formalin and routinely processed, dehydrated, embedded in paraffin wax, sectioned at 5µm in thickness and stained with Hematoxylin and Eosin and Masson's trichrome. Immunohistochemical studies of the mass sections were performed using Vimentin, SMA and Desmin. Microscopically, the mass was encapsulated and the dermis and subcutaneous area were expanded by spindle-shaped to polygonal neoplastic cells in the interwoven pattern and contained a single ovoid to polygonal nucleus and a moderate amount of eosinophilic cytoplasm. Nucleoli were often prominent. Mitotic figures were infrequent. The sections were positive for Masson's trichrome and Vimentin and negative for Desmin and SMA. Based on histopathological features, a well differentiated fibrosarcoma was diagnosed. No new growth of the mass was observed six months following the surgical procedures. The incidence of fibrosarcoma in cats has been rising in the last 20 years, most likely associated with vaccination. Similar to this case, surgical excision is the treatment of choice in this tumor.

Keywords: Cat, Cutaneous, Fibrosarcoma, Pathology

INTRODUCTION

Fibrosarcoma is a mesenchymal tumor of malignant fibroblasts in a collagen background with immature proliferating fibroblasts or undifferentiated anaplastic spindle-shaped cells arranged in distinct interwoven patterns (Hendrick, 2017). These tumors occur commonly in all domestic animal species (Hendrick, 2017; Modiano & Breen, 2007) and have been reported in cats (Strong et al., 2016), dogs (de Paula et al., 2021) and horses (Bass et al., 2017). This paper is about the macroscopic, surgical, and histopathological findings of a well differentiated cutaneous fibrosarcoma in a Persian cat.

CASE DESCRIPTION

In December 2022, a 6-year-old male Persian cat (3.5 Kg) with a raised mass on the lateral side of its right hind limb was referred to the hospital. Based on owner information, within the previous 2-month period the mass had become evident and grew larger. On physical examination vital signs such as pulse rate and respiratory rate were normal. Further clinical examination revealed no other physical abnormalities and complete surgical removal of the mass was chosen. The cat was anaesthetized with intravenous injections of ketamine and diazepam and maintained with 1%-2% isoflurane in oxygen. Analgesia was provided by subcutaneous injection of ketoprofen (for 3 days). On gross examination, the mass was approximately 8×10×12 mm in size. It was well circumscribed, ulcerated, firm and white to yellow. Tissue samples of the mass were fixed in 10% neutral buffered formalin, routinely processed, dehydrated, embedded in paraffin wax blocks, sectioned at 5µm thicknesses (Rotary Microtome RM2 145; Leica, Wetzlar, Germany) and stained with Hematoxylin & Eosin and Masson's Trichrome (Luna, 1968). Immunohistochemical studies of the mass were performed using Vimentin (V9, mouse monoclonal, dilution: 1/50, Dako, Denmark) (Luna, 1968), SMA (1A4, mouse monoclonal, dilution: 1/50, Dako, Denmark), and Desmin (D33, mouse monoclonal, dilution: 1/50, Dako, Denmark) (Vascellari et al., 2006). Sections were examined using a light microscope (E600; Nikon, Tokyo, Japan) and representative images were taken. Hemorrhage, necrosis and peripheral aggregates of lymphocytes were observed in the histopathological sections. Microscopically, the mass was encapsulated and the dermis were expanded by spindle-shaped to polygonal neoplastic cells. These cells were arranged in an interwoven pattern and contained a single ovoid to polygonal nucleus. Nucleoli were often prominent. Mitotic figures were infrequent. Some neoplastic cells had cellular and nuclear pleomorphism (Fig 1). Masson's trichrome demonstrated the positive and blue staining of

collagen. Immunohistochemically, the sections were uniformly positive for Vimentin and negative for Desmin and SMA. Based on histopathological, histochemical and immunohistochemical features, a well differentiated fibrosarcoma was diagnosed.

Figure 1: Well differentiated fibrosarcoma in a Persian cat. (a): spindle-shaped to polygonal neoplastic cells in an interwoven pattern. (b): Severe Hemorrhage (*). (c): Mitotic figures (arrowheads). (d): bizarre cell (arrowhead), H&E.

DISCUSSION

fibrosarcomas occur in all domestic animal species, but most commonly occur in adult and aged cats and dogs and can appear anywhere on the body (Hendrick, 2017). These tumors can range from well differentiated to more aggressive, but metastasis is uncommon (Hendrick, 2017). A well differentiated fibrosarcoma is composed of spindle cells, collagen and rare mitotic figures in the herringbone pattern (Hendrick, 2017; Van den Top et al, 2008). FeSV can also induce a rare and aggressive fibrosarcoma in cats. FeSV-induced tumors are multicentric and are found most frequently in young cats (Hartmann, 2011). These tumors are characterised by rapid growth. Metastasis to the lungs or other organs occurs with approximately 30% of virally induced fibrosarcomas in cats. However, only 2% of fibrosarcomas in cats are virally induced

(Vail et al. (2020). Fibrosarcoma is the most common tumor of the cat. Its incidence has increased over the past 20 years, most probably due to its association with vaccination. There is significant overlap between fibrosarcomas and leiomyosarcomas in histopathological findings, thus making the use of special stains and immunohistochemical identification, essential for the final diagnosis. Microscopically, leiomyosarcomas, unlike fibrosarcomas, have elongated nuclei, with blunt rounded ends and eosinophilic cytoplasm. Spindle cells with red cytoplasmic stain were not found among the blue collagen bundles on Masson's trichrome staining. The mass also stained negative for Desmin and SMA and positive for Vimentin. These results prove that this tumor could not have originated from muscle cells and it is a well differentiated fibrosarcoma. (Hendrick, 2017; Roccabianca et al, 2020). Similar this case, surgical excision is the treatment of choice for well differentiated fibrosarcoma (Hendrick, 2017).

CONCLUSION

Surgical excision remains the treatment of choice for fibrosarcomas in cats with radiation therapy as secondary treatment, particularly if surgical removal is difficult.

ABSTRACT

Welding is one of the major processes in the automobile, construction, aviation, and other sectors. Manual welding requires high dexterity level of the operators. The expertise of the welder affects the surface appearance of the weld, including its shape, mix, ripples, and presence of any spatter. Manual welding exhibits low weld quality, high defect rates, and low efficiency. Due to localized heating and cooling, inappropriate mixing, and dilution in the weld solution result in the formation of bead excessive asymmetry, inadequate penetration, and many other problems at the welded joints. These defects result in the reduction of the cost-effectiveness of welding. So, there is a need to monitor and control in-process welding. It makes a closed loop

to get continuous feedback and adjust welding parameters automatically according to the required weld quality. Hence this aims to present a step towards the automation of welding in the arena of Industry 4.0. The purpose is to automate the monitoring of defects in real-time or in-process welding using the digitization of the high-resolution camera. For monitoring the welding process the images of already welded parts are taken and images are classified as good or bad images, and then through machine learning algorithms, the model is trained to classify any given images. After making the algorithm it is validated to be used for the welding process. The accuracy of the algorithm is determined, which is mainly based on the number of images taken to train the model. Thus, an intelligent robotic welding system is developed which can change its parameters by itself through the algorithm. The developed system is fast, efficient, cost-effective, and requires less skilled labor, thus it has brought great innovation in the entire fabrication process.

Keywords: Industry 4.0, Robotic welding, Automation, Machine Learning

INTRODUCTION

Systems and techniques for welding are crucial components of contemporary industrial production lines. Through technology development, automated welding systems using industrial robots have replaced many welding tasks requiring hand operation [1]–[3]. Despite being in use for years, welding robots are preprogrammed devices with little to no intelligence. Figure 1 shows that Intelligent manufacturing is implemented by the transformation of Human physical systems to Human cyber-physical systems with the aim of achieving specific manufacturing goals at an optimized level [4].

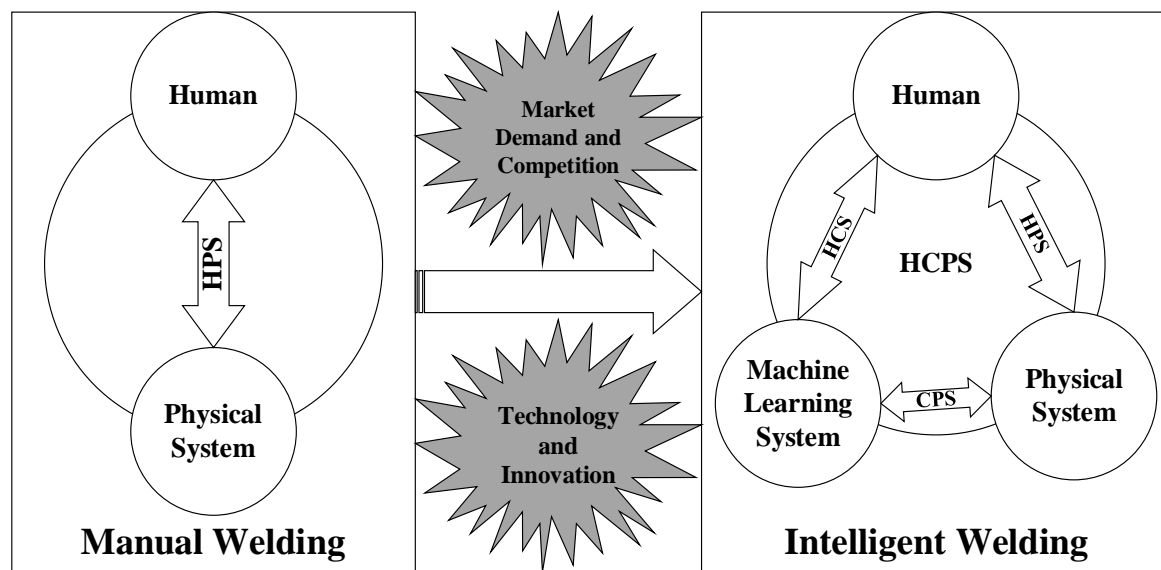

Figure 2: The advancement of welding systems from HPS to HCPS. [5]

There are presently several manufacturing businesses using machine learning techniques. In order to forecast specific mechanical properties, a variety of machine-learning techniques can be used. A smart manufacturing process is now using artificial intelligence techniques like machine learning and deep learning in a variety of ways. Machine learning analyses and gains knowledge from the dataset that is accessible, whereas Deep Learning models build Artificial Neural Network algorithms in a variety of layers based on the dataset's intended use. Machine learning has a major benefit over deep learning in that it requires less time to train the models than deep learning. [6]

The visual representation of algorithms and experimentation can improve the effectiveness of learning and teaching the principles of image processing. Because Python is an interpreted language with libraries devoted to specific tasks, it is a great choice for learning digital image

processing. This eliminates the need for expensive commercial software's ambiguous black boxes and allows for the manipulation of codes and crucial algorithms. [7]

The welding procedures used today are complex, rely on a lot of variables, and have a poorly understood mechanism. User and customer needs for welding are distinct, and they work in circumstances that are always changing. As a result, welding is shifting to more specialized production using cutting-edge welding equipment that can nimbly adapt to changing welding requirements while retaining excellent quality. Smart approaches for gathering and analyzing welding data are essential in the field of big data. Monitoring metrics before and after the welding process, for instance, can improve the welding process, performance, and service quality. Although there are numerous welding techniques, advances in information science and technology are enabling the transformation of traditional welding to intelligent one. Because of advances in computer science and artificial intelligence, intelligent automation is replacing manual work. Manufacturing research programs have all examined smart manufacturing, Industry 4.0, and the internet of things. In the future big data, intelligent manufacturing, human cyber-physical systems, and AI will revolutionize the industry. [4], [8]–[13]. The platforms, enablers, and drivers that are required for advancing welding systems to greater intelligence levels are being provided by these programmers. Welding technology has gone through four stages of development. In phase 1 it was done manually, which had some efficiency and quality issues. In Phase 2, automation was used along with robots but automatic parameter adjustment was the problem. In Phase 3 welding automation was made easier using "teach and playback" robots, but it was offline and had a limited capacity to respond to changes. Phase 4 is related to the welding systems that are made intelligent and upgraded to monitor and regulate the parameters and quality of the welding process more effectively.

From the above discussion, it can be concluded that automation of welding is a need for technological advancement. Hence this research presents a step toward the development of an intelligent welding system by controlling the in-process welding with the use of a supervised machine learning algorithm and a high-resolution camera.

METHODOLOGY

The formation of the paper is outlined in figure 2. Phase 1 includes the literature review of the intelligent welding system. Phase 2 "Technology design and development" is about collecting data and building algorithms. Phase 3 focuses on results and discussion and phase 4 is about the conclusion and recommendations of the research.

A thorough review of the literature on intelligent welding research was conducted in phase 1. The search was restricted to welding technologies for convenience, even if publications on intelligent manufacturing may have also turned up information on intelligent welding. In this stage, best practices in the creation of modern industrial welding are identified through a survey of the literature and other research. It comprised a thorough analysis of the pertinent literature in each of the project's important areas, including an examination and identification of best practices in the welding process design in the context of innovation. A detailed analysis of closed-loop welding is examined. It assisted in determining the current research problem. To develop the study, aim and objectives, innovation, and originality for this project, research questions are extracted based on the examined research problem.

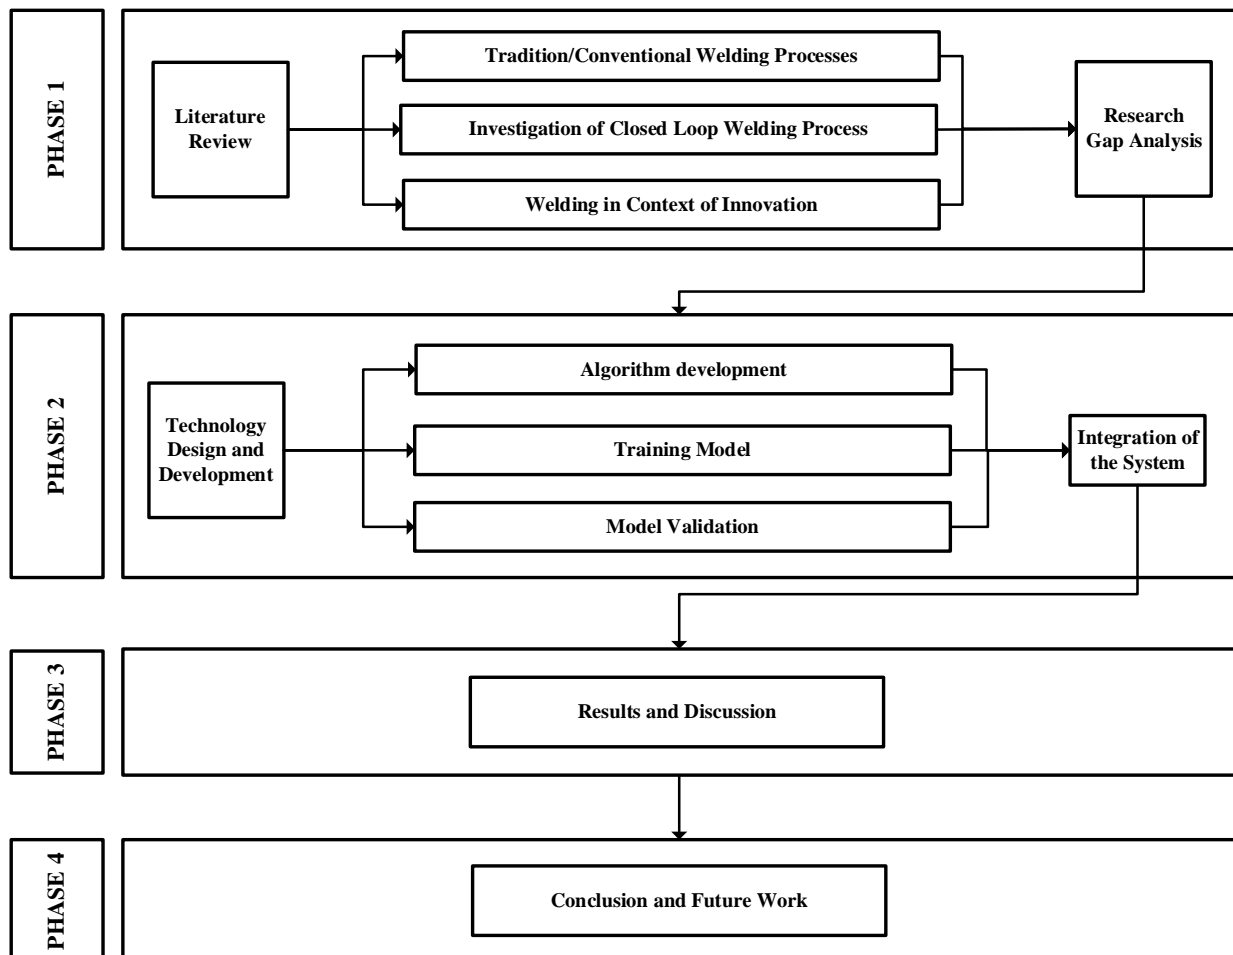

Figure 3: The Structure of the Research Methodology

In phase 2 The following steps need to be taken to perform the technology design development:

1. Image data of welded parts are collected.
2. It is passed to the classification model that recognizes whether a material is correctly welded or incorrectly welded, whether it is best welded or worst welded.

3. Machine Learning algorithm is made and trained on the image data collected.
4. After performing the inference task, our model will let us know about the class to which the material belongs such as correctly welded or incorrectly welded material.
5. Continuously improve the algorithm to get the maximum accuracy.
6. Integration of the complete system.
7. After the integration of the system, the complete model is validated to ensure that the model is behaving as intended as shown in figure 3 below.

The Schematic diagram is shown in Figure 3.

Figure 4: Schematic Diagram of Welding Monitoring Process

Figure 5: Experimental Setup of Welding Monitoring Process

First, we must make a dataset of images based on which the supervised learning algorithm will work. Then we'll make an algorithm using machine learning tools and using the python language.

The images of manual welding are classified as best or worst as shown in Figures 3 and 4. In the classification of the weld images, it is considered that the best weld has no cracks and holes in the bead, the bead is uniform, the width and height are appropriate, and the strength of the welding meets the requirements.

Figure 6: Worst Weld from manual welding

Figure 7: Best weld from manual welding

The machine learning algorithms help in determining the best and worst images. First of all, the Visual Studio environment is installed in the system. The necessary libraries are installed such as NumPy, matplotlib, cv2, etc. The libraries are imported, and the dataset is loaded for binary classification. After that, the model is trained on the dataset.

In Phase 4 there is an explained discussion of the results.

In the last phase, there is the conclusion of this work.

RESULTS AND DISCUSSION

This part of the paper presents the outcome of all the processes performed during the study starting from the data collection where images were captured and then classified according to the condition that whether the image is best or worst welded, and then we made image recognition using python language for the trial-and-error method.

It has been done through the Python language where Jupyter interfaces are used which provides interactive coding by using ipywidgets packages that can help explore and apply codes in a more interactive fashion. In addition, the Visual Studio Code interface is used for Python coding, which is also commonly referred to as VS code, loads really fast and takes less time. Having a modular approach to Code helps it perform better.

First, the necessary libraries have been imported into the respective interface, those libraries include cv2, NumPy, matplotlib, etc. After loading and importing the necessary libraries, binary classification was done which is classifying elements of a set into two groups based on a classification rule. The binary classification algorithm in machine learning categorizes new observations into one of two categories. It is a method of machine learning that uses predefined categories and categorizes new observations into those categories using supervised learning. When there are only two categories the problem is known as statistical binary classification. After loading and importing the necessary libraries, then the dataset of images that have been made is loaded to the interface, and the classification of images based on the respective dataset is done.

CONCLUSION AND FUTURE WORK

Though, this is a trial-to-error method, the detailed experimentation of the large dataset will be done later in future work. Based on the small dataset that has been given to the interface, the code has been executed to recognize the image that has been given to the model afterward. The model was trained on the dataset that has been made through the data collection phase, and after loading the respective dataset to the interface, and training the model accordingly, then a new image will be uploaded to the model, and based on the data, it will tell that whether the respective image is best welded or worst welded. When executing the model that has been trained on the dataset, the image can be detected easily by just giving an image of the welded part to it, and the model will detect whether it is best welded or worst welded.

Future Work is aimed to use a big data set of weld images to increase the prediction accuracy of the welding robot. The experimentation will be done by the integration of the algorithm with the welding robot for controlling the weld parameters by the continuous feedback control system. Further, the image classification will not be limited to binary but enhanced according to the big data. The parameters will be set for each type of image difference and the robot will be behaving accordingly. The codes will also be available on the cloud; so that anyone can access them and can make the welding processes run easily.

Xülasə:Məlum olduğu kimi hazırda ölkədə dövlətin apardığı siyasətin əsasını neft-qaz sektorundan gələn gəlirlərin qeyri neft sektorunun inkişafına yönəltməkdir.Qeyri neft sektoruna daxil olan sahələrin əsası da turizm sektorudur. Digər xidmət sahələri kimi, turizm sferasının inkişafı, ölkədə digər sahələrin inkişafına da stimül verir. Bu biznes əsasən sahibkarları turist xidmətlərinə günü-gündən artan tələbat, yüksək rentabellik, xərclərin qısa zaman kəsiyində ödənilməsi kimi xüsusiyyətləri ilə özünə cəlb edir. Azərbaycanda turizmin inkişafı dövlət siyasətidir. Ölkəmizdə turizmin inkişafı təkcə mərkəzi şəhərlərə turistlərin cəlb edilməsi ilə məhdudlaşmayıb.Regionların turizm potensialından maksimum istifadə də dövlətin prioritetlərindəndir.Ümummilli liderin siyasi kursunun layiqli davamçısı Prezident İlham Əliyevin 2004-cü ildən ardıcıl olaraq imzaladığı“Azərbaycan Respublikası regionlarının sosial-iqtisadi inkişafı Dövlət Proqramı haqqında” Sərəncamlar (2004-2008, 2009-2013, 2014-2018, 2019-2023-cü illər) ölkə iqtisadiyyatının, o cümlədən regionlarda turizmin inkişafı istiqamətində mühüm addımlar oldu. Azərbaycan Respublikası regionlarının inkişafı ölkədə uğurla həyata keçirilən davamlı sosial-iqtisadi inkişaf strategiyasının mühüm tərkib hissəsidir. Bu proqramların icrası nəticəsində regionlarda ardıcıl bir neçə beynəlxalq standartlara cavab verən kurort-sanatoriya,otel və istirahət mərkəzləri yaradıldı.44 günlük müharibədən sonra,torpaqlarımızın düşmən tapdaqları altından azad edilməsi nəticəsində həmin regionların turizm potensialından maksimum yararlanması üçün ölkədə sürətli yenidənqurma işləri gedir. Bu baxımdan da tədqiq olunan mövzu mövcud şəraitdə çox aktualıq kəsb edir.Məqalədə ölkədə regionlarda,xüsusilə azad edilmiş ərazilərdə turizmin inkişaf səviyyəsi təhlil edilmiş,onun postpandemiya dövründə mövcud və həlli yolları müəyyənləşdirilmişdir.

**ASSESSMENT OF THE CURRENT STATE OF TOURISM DEVELOPMENT IN
THE REGIONS**

Summary

As it is known, the basis of the state's policy in the country is to direct the revenues from the oil and gas sector to the development of the non-oil sector. The basis of the areas included in the non-oil sector is the tourism sector. Like other service areas, the development of the tourism sphere stimulates the development of other areas in the country. This business mainly attracts entrepreneurs with its features such as daily increasing demand for tourist services, high profitability, and payment of expenses in a short period of time. The development of tourism in Azerbaijan is a state policy. The development of tourism in our country is not limited to the attraction of tourists to the central cities. The maximum use of the tourism potential of the regions is one of the state's priorities. The Decrees "On the State Program for the Socio-Economic Development of the Regions of the Republic of Azerbaijan" signed by President Ilham Aliyev, a worthy follower of the national leader's political course, have been signed since 2004. (2004-2008, 2009-2013, 2014-2018, 2019-2023 years) were important steps towards the development of the country's economy, including tourism in the regions. The development of the regions of the Republic of Azerbaijan is an important component of the sustainable socio-economic development strategy successfully implemented in the country. As a result of the implementation of these programs, several resorts-sanatoria, hotels and recreation centers that meet international standards were created in the regions. After the 44-day war, as a result of the liberation of our lands from the enemy, rapid reconstruction is underway in the country in order to make the most of the tourism potential of those regions. From this point of view, the researched topic is very relevant in the current conditions. In the article, the level of development of tourism in the regions of the country, especially in the liberated areas, is analyzed, and the existing and solutions for it in the post-pandemic period are determined.

Keywords: Tourism sector, tourism development, regional tourism, regional development.

Azərbaycanda qeyri-neft sektorunun əsas sahələrindən biri olan turizm sahəsinin inkişafı İlham Əliyev prezident seçildikdən sonra yeni müstəviyə qədəm qoydu. Belə ki, ölkədə, o cümlədən regionlarda turizmin inkişafı üçün müxtəlif Dövlət proqramları, strateji yol xəritəsi və s normativ hüquqi aktlar qəbul edilmişdir. Təməlu ulu öndər tərəfindən qoyulan bu inkişafı İlham Əliyev fəaliyyətə başladığı gündən indiyədək imzaladığı dörd regionların sosial-iqtisadi inkişafı ilə əlaqədar Dövlət Proqramları (2003-2008, 2009-2013, 2014-2018, 2019-2023-cü illər) regionlarda turizmin inkişafına böyük təkan verdi.

2009-cu ildə Kurortların inkişafına dair 2009-2018-ci illər üçün Dövlət Proqramı, 2010-cu ildə Turizmin inkişafına dair 2010-2014-cü illər üçün Dövlət Proqramı qəbul edilmişdi.

Bundan əlavə 2011-ci il turizm ili elan edildi. Bununla da ölkəmizdə turizmin inkişafı üçün lazım olan sosial-iqtisadi və hüquqi baza yaradıldı.

Qəbul edilən proqramların əsas məqsədi, sənaye və dünya turizminin infrastrukturuna inteqrasiya, yüksək səviyyəli turizm xidməti göstərmək və milli turizm modelinin yaradılmasına yönəldilmişdir.

Bu proqramların əsas məqsədləri bunlardır:

- ❖ turizmin inkişafındakı nailiyyətlər;
- ❖ turizm sahəsində kiçik və orta sahibkarlığın inkişafı;
- ❖ rəqabətə davamlı turizm bazarının yaradılması;
- ❖ turistlərə göstərilən xidmətlərin keyfiyyətinin yaxşılaşdırılmasının təmin edilməsi;
- ❖ kurort müəssisələrinin planlı şəkildə inkişafı və təmin edilməsi onların effektiv istifadəsi.

Dövlətin inkişaf istiqamətində apardığı məqsədyönlü siyasət nəticəsində Azərbaycanın bölgələrindəki turizm böyüməsi bu sahədəki iqtisadi göstəricilərin inkişafından açıqca görünür. Otel infrastrukturunda iqtisadi göstəriciləri aşağıdakı cədvələ əsasən təhlil edək;

Cədvəl 1: Azərbaycan Respublikasında otellərin, motellərin və ümumi iqtisadi göstəriciləri bölgələrə görə turistlərin digər yerləşmə yerləri

Turizm bölgəsi	Köhnə otaqlar		Yeni otaqlar	
	2016	2017	2018	2019
1. Abşeron	11843	11866	1004422	1107625
2. Gəncə-Qazax	2842	3080	82231	31113
3. Şəki-Zaqatala	2203	2374	62751	64871
4. Yuxarı Qarabağ	2153	2245	31655	45286
5. Quba-Xaçmaz	8119	8703	279439	194871
6. Kəlbəcər-Laçın	130	1320	67423	8361
7. Dağlıq Şirvan	1139	1321	18376	19315
8. Lənkəran	2783	2884	76855	67637
9. Naxçıvan	1522	1448	84420	85897
10. Ümumi	31465	32600	1621813	1597300

Mənbə: <https://www.stat.gov.az/>

Cədvəldən göründüyü kimi, hesablamalar göstərir ki, ümumi iqtisadi göstəricilərin dinamikasında, otaq sayı və yataq sayı habelə, otellər, motellər və .s. ən böyük pay Abşeron iqtisadi rayonuna düşür. Belə ki, 2016-2017- ci ilin müqayisəsində otaq sayı turizm bölgəsi üzrə ən böyük göstərici Abşeron, Gəncə- Qazax, Şəki-Zaqatala iqtisadi rayonlarının payına düşür və ümumi göstərici bu illər üzrə 1.135 dəfə artmışdır. 2017-2018-ci illərin müqayisəsində bölgələr üzrə turizmin yerləşmə yeri 1.589 dəfə artmışdır. 2018-2019-cu illər üzrə artım temoi isə 2.454 dəfə artmışdır. Ümumi olaraq 2017-ci ildən 2019-cu ilə qədər isə 1.565 dəfə artmışdır. Belə ki, iqtisadi bölgə olaraq sırasıyla 2017-ci ilə əsasən, 36.4% və yüzdə 69.3% təşkil edir. Abşeron bölgəsinin belə bir hakim mövqeyi sahənin təmsil etdiyi böyük maraqla izah edilə bilər. Turistlər üçün, yəni: memarlıq və tarixi zəngin abidələr, bölgənin Xəzər dənizinin sahilindəki yeri, mərkəz və dünyanın hər yerindən iş adamlarını cəlb etmək və s. bütün bu amillər lazımi yerləşmə qurumlarının meydana gəlməsinə və eləcə də müəyyən bir iqtisadi bölgədə turizmin inkişafına zəmin yaradır. Daxili turizm müxtəlif bölgələrdə inkişaf etdikcə Azərbaycanda istirahət üçün lazım olan infrastruktur yaradılır. Amma rekreasiya zonalarının yaranma prosesi qeyri-bərabər paylanmışdır. Ölkəmizin bəzi mənzərəli guşələri hələ unudulmaqda qalır, digərləri isə əksinə, turizmin inkişafı müşahidə olunur. Bu zonalara dəniz kənarı, xüsusən Quba-Xaçmaz iqtisadi rayonun bir hissəsi olan Nabran bölgəsi ümumi iqtisadi dinamikasında ikinci sırada turistlərin yerləşməsi üçün müvafiq olaraq 26,7% və 12,2% olan göstəricilər iştirak etdi. Hələ 80-ci illərdə bu yerlərin dövlət əhəmiyyətli bir turizm zonası kurortuna çevrilməsi lazım idi. Ancaq bu proyektə, əhəmiyyətli səbəblərdən investisiya yatırımı həyata keçirilmədi. İndi suverenliyin əldə edilməsi və bazar münasibətlərinin inkişafı ilə, yerli iş adamları, xüsusi şirkətləri məmnun etməyə çalışır.

Regionlarda turizmin sürətli inkişafı digər sosial-iqtisadi göstəricilərə də, böyük müsbət təsirini göstərmişdir. Bunları ayrı-ayrılıqda aşağıdakı cədvəldə aydın şəkildə izah edək.

Cədvəl 2: Azərbaycan Respublikasının regionlarda turizmin sürətli inkişafına təsir edən digər sosial-iqtisadi göstəricilər (min.manat)

Göstəricilər	2010	2015	2016	2017	2018	2019
Əhalinin xərcləri, milyon manat	19251,5	30799,6	34963,4	39775,0	44498,4	47370,5
Muzdlu işçilərin orta aylıq nominal əmək haqqı, manat	331,5	444,5	466,9	499,8	528,5	544,6
Balans dəyəri ilə iqtisadiyyatda əsas fondlar (ilin sonuna), milyon manat	66659,5	110677,9	124008,4	169120,3	182788,5	193491,0
Ümumi daxili məhsul:						
cəmi, milyon manat	42465,0	59014,1	54380,0	60425,2	70337,8	79797,3
əhalinin hər nəfərinə, manat	4753,0	6268,0	5706,6	6269,6	7226,0	8126,2
Faktiki son istehlak, milyon manat	21336,1	33238,8	37575,7	43228,5	48482,2	50552,9
Ümumi yığım, milyon manat	7669,0	16234,8	15179,4	15518,1	17147,6	16019,6
Sənaye məhsulu, milyon manat	27978,2	32110,3	26369,4	32300,2	39892,5	47677,0
Kənd, meşə və balıqçılıq təsərrüfatı məhsulu, milyon manat	3968,1	5431,7	5836,8	5874,3	6853,5	7274,5
Əsas fondların istifadəyə verilməsi, milyon manat	5961,3	9336,3	9933,3	10157,4	8617,4	12357,8
Əsas kapitalla yönəldilmiş vəsaitlər, milyon manat	9905,7	17618,6	15957,0	15772,8	17430,3	17244,9

Mənbə: <https://stat.gov.az/>

1.Regionların sosial-iqtisadi inkişaf proqramı 2009-2013

2.Regionların sosial-iqtisadi inkişaf proqramı 2014-2018

3.Regionların sosial-iqtisadi inkişaf proqramı 2019-2021

Cədvəldən göründüyü kimi, regionlarda turizmin inkişafına təsir edən sosial-iqtisadi göstəricilər əhalinin xərcləri, 2010-2015-ci illərin müqayisəsində 2.124 dəfə artım olmuşdur. Balans dəyəri ilə iqtisadiyyatda əsas fondlar (ilin sonuna) 2015-2016-cı illin müqayisəsində isə 8,936 dəfə artım müşahidə edilir. 2016-2017-ci illərin müqayisəsində 6.875 dəfə artım qeydə alınıb. Əsas kapitalla yönəldilmiş vəsaitlər 2017-2018-ci ilin müqayisəsində 4.475 dəfə artım qeyd olunur. Əsas fondların istifadəyə verilməsi 2018-2019-cu illərin müqayisəsində isə 3.688

dəfə artım müşahidə edilib. Ümumi olaraq regionlarda turizmin sürətli inkişafına təsir edən digər sosial-iqtisadi göstəricilər üzrə 2010- 2019-cu illər üzrə 2.737 dəfə artım qeydə alınıb.

Təsadüfi deyil ki, turizmin inkişafının əsas istiqamətləri hökumətin ümumi iqtisadi siyasətinin ayrılmaz hissəsi, yoxsulluğa və iqtisadi böyüməyə qarşı mübarizə proqramı, işsizlərin sayının azaldılması üçün bir fəaliyyət planı müəyyənləşdirir, böyük ölçüdə bu sənayedəki inkişafın sayəsində kiçik sahibkarlığın inkişafı və regional infrastrukturun yaxşılaşdırılmasını həyata keçirir. Öz növbəsində, bölgələrin sosial-iqtisadi inkişafı dövlət proqramı da turizm mərkəzləri, evlər və istirahət zonaları şəbəkəsinin inşasını stimullaşdırmaq, sanatoriyalar, xəstəxanalar və s. nəzərdə tutulmuşdur. Bir-birini qarşılıqlı şəkildə tamamlayan bütün bu tədbirlər nəticədə turizm biznesinin inkişafına təkan verən olmalıdır. Xarici təcrübənin də göstərdiyi kimi kənd turizmi onsuz da inkişaf edir və bir neçə onillik və xüsusilə son bir neçə ildə aktivdir.

Qeyd etmək lazımdır ki, Azərbaycanca kənd turizmi turizm sahələrindən biridir. Kəndin iqtisadi inkişaf yolları, əlavə imkanı sakinləri üçün qazandırır. Hal hazırda Şəkiddə "ailə səyahəti birliyi" yaradılıb. Şirkət Göyçaya kiçik turist qruplarından mövcud olan və göndərilən turistlər burada yerləşən villada istirahət edir. Bu cür qruplar üçün şirkət fərdi evlərdə tətillər təşkil edir (gündəlik səhər yeməyi və digər xidmətlər ilə adam başına dollar). Avropanın ucuz kənd təsərrüfatı təcrübəsini tətbiq edərsə və ekoloji turizm düzgün təşkil edildiyi təqdirdə, yeni iş yerləri açacaq və bununla da problemi həll edəcəkdir. Bundan əlavə fikrimizcə, Azərbaycan iqtisadiyyatı, xeyli fayda götürər. Regional məşğulluq və yoxsulluğun azaldılmasına da, müsbət təsir göstərəcək. Bu, şübhəsiz ki, yalnız yerli turistləri deyil, həm yalnız kənd istirahəti ilə, həm də, orijinal həyat tərzini ilə kəndlərimizin həyat tərzini və adətləri maraqlanan xariciləri cəlb edəcəkdir. Bununla yanaşı, ölkənin sənaye inkişafına baxmayaraq bir çox təbii mənzərələr orijinal görünüşünü və ekoloji təmizliyini qoruyub saxlamışdır. Son bir il yarımında qorunan təbiət zonalarının sahəsi 8-dən artırılmışdır. Azərbaycan ərazisinin 7% -ə qədər bir neçə milli park yaradılmışdır, ekoturizmin təşkili üçün böyük imkanlara malik olunmuşdur. Qeyd olunduğu kimi, 2009-cu ilin aprel konfransında "ölkəmizdə davamlı ekoturizm və milli parklar sistemi", ölkənin bunun üçün bütün imkanlarını yaratdı. Bunun təsdiqində bu günü dağlarda aktiv, sərgüzəştli bir sərvət, tətillərdə olduğunu orta hesabla da olsa bir ailə üçün olduqca əlverişli bir zövqdür. Tətillərini dağlarda mənzərəli yerdə keçirməyi sevənlər üçün Kiçik və Böyük Qafqazın yerləri, ərazidə istirahət zonaları var. Məsələn, Quba, Zaqatala, Qax, Masallı, Şamaxı və Qusar rayonlarını göstərə bilərik. Əsasən bu istirahət zonaları yaxınlıqdadır və dağların ətəkləri turistlərə xidmətlər təklif edilir. Qusar rayonunda yerləşən turistik Ekstremal yüksək hündürlük 4 ildir fəaliyyət göstərir.

Gələcəkdə turizm biznesinin daha da inkişaf etdirilməsinin bütün istiqamətləri ilə eyni zamanda, kurort biznesinin inkişafı, otel biznesi, yeni turizm komplekslərinin yaradılması, ixtisaslı kadrların hazırlanması, infrastrukturun inkişafı, xüsusən otellərdə, mərkəzlər, tətill evləri, sanatoriyalar, restoranlar, əyləncə mərkəzləri yerli əhəlinin mədəniyyəti və yaşayış şəraiti turistlərdə yüksək keyfiyyətli xidmət göstərilməsi ilə eyni vaxtda getməsi tamamilə aydındır. Ancaq müşahidələrimizə görə, müstəqillik illərində kurortlar nəinki ölkə iqtisadiyyatına ciddi bir töhfə vermiş, əksinə dövlətin subsidiyalarını alaraq aşağı gəlirliliklə fəaliyyət göstərirlər.

Lakin cədvəllərdən də göründüyü kimi, 2019-cu ildən bəri başlayan Covid-19 pandemiyası bütün dünyada o cümlədən Azərbaycanda turizm sahəsini iflic etdi. Artıq indi yavaş yavaş bu sahə özünə gəlməyə başlayır. Azərbaycanda isə turizmin inkişafı üçün yeni mərhələ başlayır. Belə ki, 44 günlük Vətən müharibəsi nəticəsində Ali Baş komandanın rəhbərliyi altında rəşadətli ordumuz uzun illər ermənilərin əsarəti altında olan torpaqlarımızı azad etdi. Hazırda orada böyük quruculuq işləri gedir. Məlum olduğu kimi Qarabağın turizm potensialı həddindən artıq çoxdur. Bu səbəbdən də qeyd olunanların hamısı və Qarabağ və Şərqi zəngəzur iqtisadi rayonlarında yenidən təşkil olunmalıdır:

- turizm məkanlarının çox hissəsinin özəlləşdirilməsini təşkil etmək;
- turizm məkanlarının iqtisadi və maliyyə müstəqilliyini təşkil etmək;
- turizm məkanlarında mülkiyyət növündən asılı olmayaraq turizm məkanlarını tam iqtisadi və maliyyə müstəqilliyi ilə təmin etmək;
- turizm məkanlarında mülkiyyət növündən asılı olmayaraq, göstərilən xidmətlər üçün müvafiq strukturların cəlb edilməsi ilə "Gənclər və İdman Nazirliyi" və Turizm Agentliyi tərəfindən hazırlanmalı olan keyfiyyət standartlarını tətbiq etmək;
- xarici investisiyaların cəlb edilməsi və kurort işinin yaxşılaşdırılması üçün istənilən mülkiyyət formasında birgə müəssisələr yaratmaq;
- İdarəetmənin demokratikləşməsi, müstəqilliyin daha da genişləndirilməsi, iqtisadi idarəetmə metodlarının dərinləşdirilməsi.

Abstract

The most precious asset in a company is its people. With the help of ChatGPT, an AI-powered natural language processing tool, can communicate with the chatbot in a variety of human-like ways. The language model can provide information and support for tasks like writing emails, articles, and code. OpenAI, a corporation that conducts research in artificial intelligence, developed ChatGPT. ChatGPT was introduced on November 30, 2022, by the research company. By responding to inquiries from candidates regarding the job specifications, corporate culture, and application procedure, Chat GPT can be used to automate the hiring process. In addition to making sure that candidates have timely and correct information, this can free up HR workers to concentrate on other activities. The GPT-4 Chat has a huge impact on human resource specialists. It may help cut down on the time and effort required to complete typical HR duties, allowing HR employees to concentrate on more important projects. Additionally, it can give workers a more tailored experience, which can boost engagement and productivity. This study gathered data based on a survey of the literature and secondary sources for statistical information. Writing policies and procedures could be aided by ChatGPT. Again, even if this could be very helpful, nothing can replace years of experience or some of the subtleties that go into developing an HR policy and can only be understood by having actually done it. In conclusion, ChatGPT can be a useful tool for HR departments, offering a variety of advantages like improved applicant and employee experiences, increased efficiency, and streamlined operations. HR professionals may anticipate seeing additional opportunities as AI technology develops to use language models like ChatGPT to streamline their processes and propel corporate success.

Keywords: ChatGPT, openAI, human resource management, HR professionals, technology

Introduction

The impact of Artificial Intelligence (AI) on numerous businesses is growing increasingly pronounced as the world continues to adopt it. The GPT-4 Chat is a key AI development that has the potential to completely change the HR sector. The GPT-4 Chat is a conversational agent powered by AI that can mimic human conversations. This technology is intended to comprehend natural language, pick up knowledge from human encounters, and offer tailored responses. The GPT-4 Chat can be used by HR professionals to streamline a number of processes, including hiring, onboarding, training, and employee engagement.

The GPT-4 Chat has a huge effect on HR workers. It may assist cut down on the time and effort required to complete typical HR duties, allowing HR employees to concentrate on more important projects. Additionally, it can give workers a more tailored experience, which can boost engagement and productivity. Nevertheless, there might be drawbacks to using GPT-4 Chat in HR. The possibility of bias in the AI's decision-making process is one cause for concern. The GPT-4 Chat may produce biased results and engage in discriminatory HR practices if the data used to train the AI is biased. As a result, HR personnel need to make sure that the data being used to train the GPT-4 Chat is representative and diverse. The potential loss of the personal touch in HR is another issue. The sensitivity and emotional intelligence of a human HR expert cannot be replaced by the GPT-4 Chat, despite the fact that it may offer personalized responses. In order to keep a human touch in their contacts with employees while employing AI to expedite operations, HR professionals must strike a balance.

ChatGPT's unethical issues like considering that ChatGPT can produce conversational text, there are ethical questions about the likelihood that it won't produce false or misleading information. Serious consequences could result from this, including damage to reputations, the dissemination of untrue information, or even the incitement of violence. For those working in human resources, ChatGPT may change the rules of the game. Businesses can utilize ChatGPT to streamline activities, increase productivity, and enhance the entire work experience as the need for efficiency in the workplace grows.

Review of Literature

Yogesh K. Dwivedi et al. (2023), entitled "So what if ChatGPT wrote it? Multidisciplinary perspectives on opportunities, challenges and implications of generative conversational AI for research, practice and policy, Transformative artificially intelligent tools, such as ChatGPT, designed to generate sophisticated text indistinguishable from that produced by a human, are applicable across a wide range of contexts." The technology offers advantages as well as

frequent moral and legal difficulties, and it has the ability to have both good and bad effects on organizations, society, and individuals. Identifying the knowledge, tools, and resources required to handle generative AI; examining the biases of generative AI attributable to training datasets and processes; investigating business and societal contexts best suited for generative AI implementation; figuring out the best combinations of humans and generative AI for various tasks; figuring out how to assess the accuracy of text produced by generative AI; and discovering the ethical and legal implications.

Viriya Taecharungroj (2023). Titled “What Can ChatGPT Do? Analyzing Early Reactions to the Innovative AI Chatbot on Twitter”, the investigation also revealed that ChatGPT has the capacity to have both positive and bad effects on both technology and people. The quest for artificial general intelligence, the evolution of occupations, a new technical landscape, and the progress-ethics problem are the four major concerns that the author identifies as needing to be addressed while a outcome of this AI advancement.

Tufan. Adiguzel, et al. (2023) in this research “Revolutionizing education with AI: Exploring the transformative potential of ChatGPT” In the educational setting, artificial intelligence (AI) brings new tools that have the potential to revolutionize the way that lessons are taught and learned. This paper provides a thorough overview of AI technology, including possible uses in education and associated challenges. We cover chatbots and associated algorithms that can mimic human interactions and produce text that appears human, depending on input from natural language. Modern chatbots like ChatGPT have many benefits, but they also present significant ethical and practical problems when used in education. In order to assist instructors and students and to advance responsible and ethical use, the authors hope to offer valuable information on how AI may be successfully introduced into the educational environment.

ChatGPT

'Artificial Intelligence Chatbot' ChatGPT was created by OpenAI, a research facility that specializes in 'AI' research. It builds on the GPT 3.5 model from OpenAI by using a 'large language model' that has been improved through supervised reinforcement-based training. The GPT, or "Generative Pre-trained Transformer," offers thorough responses to user inquiries. The responses might not always be factually accurate, but they always offer thorough explanations, and they can even recall what they previously said and make corrections if necessary.

Impact of ChatGPT on Human Resource Management

Technology professionals have been in awe of ChatGPT ever since it was released. It makes sense why the clever chatbot has evolved into a sort of demi-god among digital applications

because its skills are so all-encompassing. As technology has recently become more important to human resources, chatGPT is prepared to take over this division as well. However, it remains to be seen whether the AI chatbot can actually produce results given that human volition and judgement are needed in human resources to select the best candidate or interact with them for the advancement of the business and the individual as well. Because chatGPT makes it simple for HR professionals to quickly generate texts, create effective responses, and analyse user data to derive insightful conclusions, it is vital to consider the other side of the coin as well. Beyond what is apparent, chatGPT's effects on HR are possible.

Advantages of using chatGPT

- **Effectiveness:** It is clear that chatGPT can handle tedious and routine HR operations like scheduling interviews and composing mass emails, allowing users to concentrate on things that create value.
- **Efficiency:** By offering feedback and filling out the appraisal forms with candidate information, it helps hasten the process and allows management to make judgments more quickly.
- **Better communication:** ChatGPT can assist HR leaders in honing their communication tactics. The software serves as a knowledge base and trustworthy human-like Wikipedia.
- **Improved data management:** ChatGPT's real-time updates and insights will significantly relieve HR of their workload. It can carry out all the labor-intensive tasks in data-driven processes that enhance HR operations.

Cons of using chatGPT

- **Limitations in difficult situations:** While chatGPT continues to struggle to offer accurate factual information, there is little hope for helping HR executives in circumstances when empathy and judgement are needed.
- **Privacy compromised:** There is a good probability that AI programmes may act erratically. Saving private employee data in that situation is virtually impossible.
- **Technology dependence:** ChatGPT is so compulsive that HR recruiters rely on it a lot. As a result, the entire reason the department exists—the human touch—may be lost in HR operations. The USP of HR leaders, the ability to balance, will be lost in the race to be agile.

Relevance of ChatGPT for the HR Department

As a general-purpose AI chatbot, ChatGPT has a variety of applications. Because it is interactive, it can quickly offer top-notch employee support. The chatbot can therefore address the majority of employee inquiries, relieving HR personnel from having to continuously respond to the same queries. Using ChatGPT to resolve queries can also cut down on the expense, time, and effort needed to maintain employee engagement. The AI chatbot can quickly and intelligently respond to staff questions. It might even offer insightful conclusions that boost business productivity. Because of its adaptability, ChatGPT can be utilized in a variety of circumstances. Therefore, ChatGPT can be applied in a number of ways to help the HR department perform its duties.

Advantages of ChatGPT for the HR Department

ChatGPT deployment has a number of benefits, including increased cost-effectiveness, employee engagement, simpler management, improved insights, and more. So let's go into detail about the various benefits of implementing ChatGPT for the HR department.

❖ Simplified Query Resolution

Because ChatGPT is so adept at demystifying complicated ideas, it is the ideal chatbot for answering these kinds of questions. Given that the employee won't have to remember complicated menu paths, it will speed up the query resolution process.

❖ Improved Employer Branding

It guarantees that the staff members are happy with their work and actively support the business. Having a chatbot also aids in recruiting because candidates get to interact with an AI-based chatbot and learn something new and exciting. The aforementioned factors aid in motivating workers effectively, which in turn raises the calibre of their output. As a result, the company's goods and services are of much higher quality, which boosts both its employer brand and its own brand.

❖ AI-based Analytics

The personnel database can be examined using ChatGPT to draw insightful results. Additionally, AI-based analytics can assist in comprehending minute details that affect an organization success. It can, for instance, assist you in understanding the patterns of employee absence, attendance, and breaks and alert you to any instances of workplace laziness. These in-depth insights can assist you in streamlining your operations by retaining your workforce and improving their job performance.

How to reduce bias in the Chat GPT-4 results with AI and equality in HR: To guarantee that the technology is applied fairly and ethically, it is critical to reducing bias in the findings produced by the Chat GPT-4 in Human Resources. The following actions can be taken by HR professionals to lessen bias in the outcomes produced by the Chat GPT-4.

- ❖ **Ensure diverse training data:** HR professionals should make sure that the training data used to teach the AI is diverse and representative in order to reduce bias in the Chat GPT-4. To eliminate biases based on gender, race, ethnicity, or any other demographic aspect, the training data should represent a diverse spectrum of voices, opinions, and experiences.
- ❖ **Continually audit and update training data:** HR professionals should continuously review and update the training data used to train the Chat GPT-4. By doing this, any biases in the training data will be discovered and swiftly fixed.
- ❖ **Utilized numerous data sources:** When training the Chat GPT-4, HR professionals should make use of multiple data sources to lessen the potential for bias. Using a wider variety of data sources, will ensure that any specific biases or flaws in one dataset are balanced out.
- ❖ **Track findings:** To spot any biases or inaccuracies, HR professionals should constantly track and assess the results produced by the Chat GPT-4. By doing so, they will be able to fix any problems and raise the fairness and accuracy of the conclusions drawn.
- ❖ **Take into account various viewpoints:** When using the Chat GPT-4, HR professionals should take various viewpoints from various stakeholders into account. To make sure that the technology is utilized in a fair and equitable manner, this includes requesting feedback from staff members, managers, and other stakeholders.

These actions can be taken by HR professionals to ensure that the technology is applied fairly and ethically in the human resources sector and to help reduce bias in the results produced by the Chat GPT-4.

Conclusion

This article, discuss how the GPT-4 Chat has the ability to transform the HR sector by reducing processes and giving workers individualized experiences. However, when interacting with employees, HR professionals need to keep a human touch and be aware of any potential biases. HR executives may maximize the advantages of the GPT-4 Chat while ensuring fair and compassionate treatment of employees by finding a balance between AI and human contact. Effective employee engagement ensures devoted staff members who actively work to lead the

business toward success. Finally, OpenAI's ChatGPT, one of the most sophisticated publicly available chatbots, will be ideal for assisting the HR team in taking care of the employees.

ÖZET

Tarımsal atıklar, bitkisel ve hayvansal ürünlerin işlenmesi veya sonrasında ortaya çıkan artıklardır. Tarımsal atıkların ortaya çıkışında ve miktarında, üretilen ürün miktarının yanı sıra üretimin gerçekleştiği toplumun sosyoekonomik özellikleri, beslenme alışkanlıkları, gelenekler, coğrafi koşullar, iklim, sanayi tesisine olan uzaklık, eğitim gibi birçok etken mevcuttur. Tarımsal atıkların alternatif alanlarda değerlendirilmesi, yenilenebilir enerji kaynaklarına olan ihtiyaç, çevre sorunlarının çözümü, tarımsal istihdamın artması gibi birçok etken nedeniyle önemlidir. Bu çalışmada üreticilerin tarımsal atıklar ve değerlendirilmesiyle ilgili yaklaşımları incelenmiştir. Çalışmada 190 üreticiyle görüşülmüştür. Üreticilerin, tarımsal atıkların, ekonomik değeri olan ürünlere dönüştürülmesi yönündeki görüşlerinin olumlu yönde olduğu tespit edilmiştir. Biyogaz ve biyoyakıt gibi enerji üretimine yönelik değerlendirmeler üreticilerin sırasıyla %51,1'i ve %33,2'si tarafından bilinmesine rağmen uygulamaya geçen üreticiye rastlanmamıştır. En yaygın değerlendirme uygulamaları, bitkisel üretimde gübre olarak, ahırlarda altlık, hayvan beslenmesi, yakacak olarak kullanımdır. Üreticilerin %82'si bireysel biyogaz tesisi kurma konusunda isteksiz olmasına karşılık, %70'i hayvansal atıkların ortak bir tesiste değerlendirilmesine olumlu bakmaktadır. Enerji açığının ve nüfusun sürekli arttığı günümüzde, tarımsal atıkların değerlendirilmesi Türkiye için büyük bir avantaj sağlayacaktır. Atıkların değerlendirilmesinin çevreye sağladığı yarar da göz önüne alındığında bu alanda kapsamlı politikaların geliştirilmesi gerektiği sonucuna varılmıştır.

Anahtar Kelimeler: Tarımsal Atık, Yenilenebilir Enerji, Çiftçi Yaklaşımları

**EVALUATION OF PRODUCER AWARENESS ON THE POTENTIAL USES OF
AGRICULTURAL WASTES**

ABSTRACT

Agricultural waste refers to the byproducts that arise from the processing or post-production of plant and animal products. The quantity and occurrence of agricultural waste are impacted by various factors such as the amount of produced goods, socio-economic characteristics of the society, dietary habits, traditions, geographical conditions, climate, distance to industrial facilities, education, and many others. The utilization of agricultural waste in alternative areas is crucial due to various reasons such as the necessity for renewable energy sources, resolving environmental problems, and increasing agricultural employment. This study examines the approaches of producers towards agricultural waste and its utilization. 190 producers were interviewed, and it was observed that the producers had a favorable attitude towards converting agricultural waste into economically valuable products. While 51.1% and 33.2% of the producers were aware of energy production such as biogas and biofuels, respectively, no producer had implemented such practices. The most common utilization practices include using agricultural waste as fertilizer in plant production, bedding in animal shelters, animal feed, and fuel. Although 82% of the producers were hesitant to establish individual biogas plants, 70% of them were in favor of the collaborative assessment of animal waste in a shared facility. With the ever-increasing energy deficit and population, the utilization of agricultural waste will provide significant advantages to Turkey. Considering the environmental benefits of waste reuse, it is concluded that comprehensive policies should be developed in this area.

Keywords: Agricultural Waste, Renewable Energy, Farmer Approaches.

GİRİŞ

İnsanlar ilk yerleşik yaşama geçtikleri andan itibaren doğal kaynakları tükenmeyecek gibi kullanmışlardır. Sanayi devrimi ile birlikte doğal kaynakların tüketimi, nüfus ve çevre sorunları hızla artmıştır. Bu sorunu fark eden ve çözüm arayan gelişmiş ülkeler önceleri sanayi üretimlerini geliştirmekte olan ülkelere kaydırmıştır. Son yıllarda ise çevre sorunlarının bölgesel değil küresel çözüm gerektirdiği anlaşılmış ve bununla ilgili birçok çalışma yapılmıştır. Yapılan çalışmalar göstermektedir ki; kirliliğin oluşumu ve önlenmesi kadar doğal kaynakların etkin tüketimi ve yeniden kullanılabilirliği büyük önem taşımaktadır.

Tarım sektörüne üretim girdilerinin artırılması sonucu üretilen ürünün kalitesinin ve miktarının artması ancak belli bir seviyeye kadar mümkündür. Bu noktadan sonra eklenecek olan her türlü girdi üretimde verimin ve kalitenin düşmesine neden olacaktır. Dünya nüfusunun hızla artması ve tarımı yapılan alanların ise aynı kalması sonucu biyokütle atıklarının değerlendirilmesi sınırlı kaynakların kullanımı açısından da son derece önemlidir.

Birçok atık, hammaddeye dönüştürülerek ya da yeni bir kullanım alanı yaratılarak hem çevre kirliliği önlenmekte, hem de ekonomik açıdan yeni iş kolları ve istihdam alanları oluşturulmaktadır.

Tarımsal atıkların ortaya çıkışında ve miktarında, üretilen ürün miktarının yanı sıra üretimin gerçekleştiği toplumun sosyoekonomik özellikleri, beslenme alışkanlıkları, gelenekler, coğrafi koşullar, iklim, sanayi tesisine olan uzaklık, eğitim gibi birçok etken mevcuttur. Tarımsal atıkların alternatif alanlarda değerlendirilmesi, yenilenebilir enerji kaynaklarına olan ihtiyaç, çevre sorunlarının çözümü, tarımsal istihdamın artması gibi birçok etken nedeniyle önemlidir.

Bu çalışmada üreticilerin tarımsal atıklar ve değerlendirilmesiyle ilgili yaklaşımları incelenmiştir.

MATERYAL VE YÖNTEM

Araştırmanın ana materyalini Tekirdağ ili Hayrabolu ilçesi ve ona bağlı mahallelerdeki tarımsal üretim ile uğraşan üreticiler ile yüz yüze yapılan anket çalışmalarından elde edilen orijinal (birincil) veriler oluşturmaktadır.

Üretici sayısının Hayrabolu ilçesi ve ona bağlı mahallelerde ÇKS'ye kayıtlı üreticilerin listesi ve üreticilere ilişkin arazi varlıkları alınmıştır.

$$n = \frac{N * \sigma^2}{(N - 1) * D^2 + \sigma^2}$$

N=4160,000, Varyans: 12179,15543, Ortalama: 128,688, std_sapma: 110,3592109, d: 12,86877575, t: 1,645

n: Örnek hacmi, N: Üretici sayısı, σ^2 : Popülasyon varyansı, D^2 : $(d/t)^2$ olup d: ortalamadan belirli bir orandaki sapma (%10), t: ise araştırmada öngörülen %90 güven sınırına göre t tablo değerini (1,645) ifade etmektedir (Newbold, 1995). Bu formüle göre anket yapılacak üretici sayısı 190 bulunmuştur.

TARIMSAL ATIKLAR

İnsanların yaşamsal, kültürel, ekonomik, sosyal faaliyetlerinin neticesinde ihtiyaç duydukları maddelerden arta kalan ve kullanımı artık mümkün olmayan ve yaşanılan ortamdan uzaklaştırılmak istenen, uzaklaştırılmadığı takdirde çevre ve sağlık sorunlarına neden olan tüm maddeler atık olarak nitelendirilmektedir. Herhangi bir sanayi veya tarım ürününün üretilmesi esnasında, ürünün üretilmesinden sonra ve üretilen ürünün kullanım aşamasında ya da kullanıldıktan sonra ortaya çıkan materyaller katı atık olarak adlandırılmaktadır. Katı Atıkların Kontrolü Yönetmeliği (KAKY)'ne göre ise; "Üreticisi tarafından atılmak istenen ve toplumun huzuru ile özellikle çevrenin korunması bakımından, düzenli bir şekilde bertaraf edilmesi gereken katı maddeleri ve arıtma çamurunu ifade eder" olarak ifade edilmektedir (KAKY, 1991).

Tarımsal atıklar diğer katı atıklara göre daha az tehlikeli, çevre ve doğal döngüye daha az zararlı, dönüşümleri kısa süreli olan atıklardır. Tarımsal atıklar doğaya gelişi güzel bırakılmaktan, yok edilmekten ziyade değerlendirilmeli, yeniden ham madde olarak kullanılmalıdır. Tarımsal atıkların yeniden değerlendirilmesi işlemleri belirli bir plan ve teknik çerçevede, uzman kişilerce hazırlanmış ulusal ve uluslararası çevre ve tarım politikalarına uygun şekilde yürütülmelidir. Tarımsal atıkların değerlendirilmesi çevre sorunlarını azaltacak, hammadde rezervlerini koruyacak ve ekonomik açıdan kalkınma sağlayacaktır. Her atık türünde olduğu gibi tarımsal atıkların da çeşidi ve türü farklılık gösterdiğinden değerlendirme işlemleri atık çeşidine göre farklılık gösterecektir (Akırmak, 2010).

Tarımsal atıkların ortaya çıkış şekli ve miktarında diğer atıklar oluşurken geçerli birçok faktör etkilidir. Bunların ilk akla gelenleri ise şu şekilde sıralanabilir:

- Üretimin yapıldığı ve yaşamın sürdürüldüğü yöre,
- Sanayi hammaddesi olarak tarımsal ürünlerin kullanılması,
- Hammaddenin sanayi tesisine olan uzaklığı,

- Toplumların gelir düzeyleri,
- Gelenek ve görenekler,
- Eğitim durumu,
- Beslenme ve diğer tüketim alışkanlıkları,
- İklim koşullarıdır.

Tarımsal atıklar, hayvansal üretim esnasında ya da sonrasında meydana gelen atıklar, bitkisel üretim esnasında ya da sonrasında meydana gelen atıklar, tarım ürünlerinin üretilmesi esnasında ya da sonrasında meydana gelen atıklar olarak 3 gruba ayrılırlar (Akırmak, 2010).

Hayvansal üretim esnasında ya da sonrasında meydana gelen atıklar, hayvansal ürünleri elde etmek amacı ile gerçekleştirilen hayvan bakımı sırasında, üretim gerçekleştirilirken ve hayvansal ürün üretimi sonrasında meydana gelen atıklar bu grup içerisinde yer almaktadır. Bu atıklara verilebilecek örnekler; her türlü hayvan dışkısı, etrafa saçılan ya da üretici tarafından hayvanlar temizlenirken oluşan kıl, tüy vb. atıklar, hayvanların kesimi sırasında oluşan kemik, kan, tırnak, deri, iç organlar gibi atıklardır. Bitkisel üretim esnasında ya da sonrasında meydana gelen atıklar: Sebze ve meyve gibi bitkisel ürün elde edebilmek için toprağın işlenmeye başlanmasından itibaren başlayan, bitkisel üretim için ekim dikimin gerçekleştirilmesi sırasında ve sonrasında meydana gelen atıklardır. Tarım ürünlerinin üretilmesi esnasında ya da sonrasında meydana gelen atıklar: Tarım ürünlerinin üretimi için toprağın işlenmeye başlamadan önce kurutma, öğütme, ayıklama sırasında oluşan sap, saman, çekirdek, vb. ile oluşumu başlayan atıklardır.

Tarımsal atıklar şu şekillerde değerlendirilebilirler (Acaroğlu, 2013; Demirbaş, 2001; Saraçoğlu,2010; Akpınar ve ark, 2010; Aslan, 2008; Karakuş, 2007; Doğan, 2005; Şener, 2015; Şanlı, 2014):

- Yenilenebilir Enerji Kaynağı Olarak Tarımsal Atıklar
 - o Biyokütle, Biyogaz, Pelet
- Kompost Olarak Değerlendirme
- Yonga Levha Olarak Değerlendirme
- Ağır Metal Gideriminde Tarımsal Atık Kullanımı
- Biyobozunur Plastikler Üretilmesinde Tarımsal Atık Kullanımı
- Malç Olarak Değerlendirme
- Mantar Üretiminde Tarımsal Atıkların Kullanılması
- Kağıt Sanayiinde Kullanılması

- Yalıtım ve Yapı Malzemesi Olarak Kullanılması

ARAŞTIRMA BULGULARI

Anket çalışması yüz yüze görüşme yapılarak gerçekleştirilmiş, yapılan görüşmeler neticesinde aşağıdaki bulgular elde edilmiştir.

Üreticilerin yaş aralıkları Çizelge 1' de verilmiştir. En genç üretici 18 yaşında olup, en yaşlı üretici ise 84 yaşındadır. Ankete katılan üreticilerin yaş ortalaması 48'dir.

Çizelge 1. Üreticilerin Yaş Bilgileri

Yaş Aralıkları	%
25 ve altı	0,5
26-35	18,6
36-45	23,3
46-55	26,9
56-65	23,3
66 ve üstü	7,4
Toplam	100

Çizelge 2.'de üreticilerin eğitim bilgileri verilmiştir. Ankete katılan üreticilerin % 52,2'si ilkokul, % 18,9'u ortaokul, % 24,2'si ise lise mezunudur. En düşük paya sahip olan üniversite ve yüksekokulun oranları ise % 4,7' dir.

Çizelge 2. Üreticilerin Eğitim Bilgileri

Eğitim Durumu	%
İlkokul	52,2
Ortaokul	18,9
Lise	24,2
Yüksekokul	2,6
Üniversite	2,1
Toplam	100,0

Çizelge 3'de üreticilerin üretim tipleri ile alakalı bilgiler yer almaktadır. Tablodan da anlaşılacağı gibi araştırmaya katılan üreticilerin %34,7 si bitkisel üretim, %18,9 u hayvansal üretim, %45,3 lük kısmı ise hem bitkisel hem de hayvansal üretim gerçekleştirmektedirler.

Çizelge 3. Üreticilerin Üretim Faaliyetleri

Üretim Tipi	%
Bitkisel	35,3
Hayvansal	18,9
Her İkisi	45,8
Toplam	100,0

Üreticilere tarımsal atıkların değerlendirilmesi ile ilgili eğitim, seminer, toplantı gibi bir etkinliğe katılıp katılmadıkları sorulmuştur. Verdikleri cevaplar Çizelge 8.14.'te yer almaktadır. Ankete katılan üreticilerin %90,5'i konu ile ilgili eğitim almadığını belirtmiştir. Eğitim alan %9,5'lik kesim, aldıkları eğitimi ilçe tarım müdürlüğü ve ziraat odası tarafından edindiklerini belirtmişlerdir.

Çizelge 4. Üreticilerin Tarımsal Atıkların Değerlendirilmesi İle İlgili Eğitime Katılma Durumu

	%
Evet	9,5
Hayır	90,5
Toplam	100,0

Üreticilere tarımsal atıklarını nasıl değerlendirdiklerini ve bildikleri tarımsal atıkların değerlendirme şekillerini sorulmuştur. Çizelge 5'te üreticilerin % kaçının verilen atık değerlendirme şekillerinden hangisini bildiği ya da % kaçının atıkları ne şekilde değerlendirdikleri yer almaktadır.

Çizelge 5. Tarımsal Atıkların Değerlendirilmesi

Üretici tarafından yapılanlar	%	Üretici tarafından bilinenler	%
Biyogaz	-	Biyogaz	51,1
Biyoyakıt	-	Biyoyakıt	33,2
Kompost	-	Kompost	17,9
Gübre (bitkisel üretim)	65,8	Gübre (bitkisel üretim)	89,5
Yalıtım malzemesi	2,1	Yalıtım malzemesi	12,6
Hayvan altlığı	41,8	Hayvan altlığı	75,8
Mantar üretimi	1,5	Mantar üretimi	43,2
Hayvan besleme	53,1	Hayvan besleme	80,5
Yakacak	19,6	Çiftlik inşaat işleri	8,9
Çiftlik inşaat işleri		İlaç sanayii	6,8
Malç		Malç yapımı	4,7
Değerlendirmiyorum	26,3	Kağıt hamuru	18,4

Tarımsal atıkların geri dönüşümüyle oluşturulan ürünleri satın alma konusunda tanıklarınıza tavsiyelerde bulunur musunuz?	67,4	10	22,6

Üreticilere ürettikleri ürünler, üretim sonucunda hangi atıkları elde ettikleri ve meydana gelen atığı ne şekilde değerlendirdikleri sorulmuştur. En fazla üretim payına sahip olan ürünler buğday ve ayçiçeğidir. Buğdaydan arta kalan samanı bitkisel üretimin yanında hayvansal üretim de yapan üreticiler kendi hayvanları için değerlendirmektedirler. Buğday sapları satanların büyük bir çoğunluğu ise biçtikleri ürün masrafı karşılığında biçerdöver sahibine vermektedirler. Değerlendirmeyenler ise genel olarak yakınlarında hayvancılık yapan kişilere kullanmaları için hibe ettiklerini belirtmişlerdir. Büyükbaş hayvan üreticileri, bitkisel üretim de gerçekleştiriyorsa hayvanlardan elde ettikleri gübreleri genellikle tarlalarına, bitkisel üretim yapmıyorlar ise üretim yaptıkları yeri temizlemek için yakınlarda bulunan tarla kenarlarına bıraktıklarını belirttiler. Küçükbaş hayvancılık yapanlar da elde ettikleri gübreleri kendileri ya da başka üreticilere tarlalara gübre olarak dökmek üzere verdiklerini belirttiler. Kırtıkları yapakları ise yılın belirli dönemlerinde köyelerine gelen ve bu ürünü satın almak isteyen kişilere sattıklarını belirttiler.

Üreticilerin atık değerlendirme şekillerine ilişkin bilgiler çizelge 7.'de verilmiştir.

Çizelge 7. Üretilen Ürün Ve Atık Değerlendirme Şekilleri

SONUÇ VE ÖNERİLER

Araştırma sahasından elde edilen sonuçlara göre üreticilerin, tarımsal atıkların ekonomik değeri olan ürünlere dönüştürülmesi yönündeki görüşlerinin pozitif yönde olduğu tespit edilmiştir. Üreticiler tarımsal atıkların değerlendirilmesine ilişkin kurulacak tesislere kendi bütçelerini sarsmayan yönde mali destek verme konusunda da isteklidirler. Üreticilerin tarımsal atıkların değerlendirilmesine olan bakış açıları, üretim yöntemine bağlı olarak elde ettiği atık miktarına ve türüne göre değişmektedir. Üreticilerin atıklar ile ilgili genel görüşleri bertaraf edilmesi üzerine kuruludur.

Karşılaşılan Sorunlar;

- Atıkların toplanabileceği merkezler olmaması ya da üretim alanlarına uzak olması.
- Atıkların Değerlendirilmesine İlişkin eğitim ve bilginin yetersiz oluşu
- Atık yönetimi ve ya verilebilecek teşviklerin değişebileceğine ilişkin endişelerin olması.
- Atıkların değerlendirilmesine ilişkin tesislerin ekonomik getirilerinde ve kurulum aşamasında riskler olduğuna ilişkin görüşlerin olması

Öneriler:

- Tarımsal atıkların değerlendirilmesine ilişkin yapılan çalışmalar ışığında yeni teknolojiler geliştirmeli ve yapılacak çalışmalara destek verilmelidir.
- Doğru ve uygun politikalar ile risk ve belirsizlikler en aza indirgenmelidir.
- Atıkların değerlendirilip ekonomik değere dönüşebilmesi için ilçeler bazında enerji ihtiyacını karşılayacak tesisler kurulmalı ya da kurabilecek girişimcilere devlet tarafından maddi destek ve eğitim verilmelidir.
- Tarımsal atıkların tek bir değerlendirme şekline destek verilmemeli, yapılan değerlendirmeye ve üretim miktarına bağlı değişmekle birlikte tüm üreticiler için destek programları oluşturulmalıdır.
- Evlerinde tarımsal atıklarını değerlendirerek yenilenebilir enerji üretecek konut sahiplerine de kuracakları tesis için düşük faiz ve geri ödeme kolaylığı sağlayacak ödeme planları hazırlanmalıdır

Sonuç olarak; ekonomik koşullarının iyileştirilmesi ve istihdam yaratması açısından tarımsal atıkların değerlendirilmesine yönelik kuruluşlar kırsal nüfusun yaşam standartlarını olumlu yönde etkileyecektir. Girdi maliyetlerinin yüksek, ürettikleri ürünlerin fiyatlarının düşük olduğunu belirten üreticiler için ek gelir sağlayacak bir sektör oluşacaktır.

ÖZET

Sürdürülebilir Tarım, hızla artan dünya nüfusunun ihtiyacı olan yeterli ve kaliteli gıda maddesinin uygun maliyetlerde üretimini, çevrenin ve doğal tarım kaynaklarının korunmasını geliştirecek sistem ve uygulamalar olarak tanımlanabilir. Trakya bölgesi Türkiye’de üretilen ekmeçlik buğdayın yıllara göre değışmekle birlikte yaklaşık olarak %10’nu üretmektedir. Makarnalık buğday üretimi için de uygun koşullar barındırmaktadır. Bu çalışmada, sürdürülebilir makarnalık buğday üretiminin ekonomik ve çevresel yönden geleneksel makarnalık buğday üretimi ile değerdendirme yapılmıştır. Bu kapsamda 2017-2018 üretim yılında 3 alanda ve 2018-2019 üretim yılında da 4 alanda, sürdürülebilir ve geleneksel üretimin karşılaştırıldığı denemeler kurulmuştur. Deneme alanlarından toplanan teknik ve ekonomik bilgiler ışığında hem sürdürülebilir hem de geleneksel makarnalık buğday üretiminin masrafları, karlılık durumları hesaplanmıştır. Sürdürülebilir üretimin yapıldığı alanlarda makarnalık buğday verimi ortalama 553 kg/da (2017-2018) ve 561.8 kg/da (2018-2019) olarak gerçekleşmiştir. Geleneksel üretimin yapıldığı alanlarda ise ortalama olarak 536,3 kg/da (2017-2018) ile 527.8 kg/da’dır (2018-2019). Geleneksel üretimle karşılaştırıldığında %4 ile %7 arasında daha düşük masraf yapılmıştır. Girdi kullanım miktarlarından yola çıkılarak da her iki üretim yönteminin çevresel etkileri hesaplanmıştır. Çevresel etkilerin değerdendirilmesinde; karbon ayakizi, su ayakizi, ekolojik ayakizi hesaplamalarından yararlanılmıştır. 2018-2019 yılında deneme alanlarındaki makarnalık buğday üretiminin çevresel etkileri karbon ayakizi yönünden değerdendirildiğinde 4 deneme alanında da sürdürülebilir makarnalık buğday üretimi, geleneksel yöntemle göre daha düşük karbon emisyonu sağlamaktadır.

Anahtar Kelimeler: Makarnalık buğday, ekonomik analiz, ekolojik ayakizi, karbon ayakizi

**ECONOMIC AND ENVIRONMENTAL EVALUATION OF SUSTAINABLE DURUM
WHEAT PRODUCTION**

ABSTRACT

Sustainable Agriculture can be defined as a system and practices that improve the production of adequate and quality food at reasonable costs while preserving the environment and natural agricultural resources, which is needed to meet the rapidly increasing world population. The Thrace region produces approximately 10% of the bread wheat produced in Turkey, which varies from year to year. It also provides suitable conditions for the production of durum wheat. This study evaluates the economic and environmental aspects of sustainable durum wheat production compared to traditional durum wheat production. To this end, trials were established comparing sustainable and traditional production in three areas in the 2017-2018 production year and four areas in the 2018-2019 production year. Based on the technical and economic information collected from the trial areas, the costs and profitability of both sustainable and traditional durum wheat production were calculated. The average yield of durum wheat was 553 kg/ha (2017-2018) and 561.8 kg/ha (2018-2019) in the areas where sustainable production was carried out, while it was 536.3 kg/ha (2017-2018) and 527.8 kg/ha (2018-2019) in the areas where traditional production was carried out. The expenses incurred were between 4% and 7% lower than those incurred in traditional production. Based on the amount of inputs used, the environmental impacts of both production methods were calculated. Carbon footprint, water footprint, and ecological footprint calculations were used to evaluate the environmental impacts. In the 2018-2019 production year, when the carbon footprint of durum wheat production in the trial areas was evaluated, sustainable production of durum wheat in all four trial areas resulted in lower carbon emissions compared to traditional production.

Keywords: Durum wheat, economic analysis, ecological footprint, carbon footprint.

GİRİŞ

Toprağı ve tohumu kullanılarak bitkisel ve hayvansal ürünlerin üretilmesi, kalite ve verimlerinin yükseltilmesi, bu ürünlerin uygun koşullarda muhafaza edilmesi, çeşitli alanlarda işlenip değerlendirilmesi anlamlarına gelen tarım en temelde insanların beslenme gibi temel ihtiyaçlarının giderilmesi için gerekli hayvansal ve bitkisel ürünler elde etmek amaçlamaktadır. Bu yönüyle gıda ve sanayiye hammadde üreten tarım sektörü birçok ürün ve üretim için alternatifsiz bir sektördür. Tarım sektörü, gelişmişlik düzeyi her ne olursa olsun, geçmişte olduğu gibi günümüzde de tüm ülkelerin ekonomik hayatlarında önemli bir yere sahip olan stratejik bir sektördür.

Toprak, geriye tekrar kazanılması çok uzun zaman alan ve en değerli doğal kaynaklarımızın başında gelir. Tarım topraklarının sürdürülebilir olarak kullanılması için bugün daha da bilinçli olmalıyız ve alışlagelmiş hatalı tarımsal uygulamalardan kaçınarak, yeni tarımsal yöntem ve uygulamalara geçmeliyiz. Bu konuda atılacak ilk adım ise azaltılmış tarımsal girdi uygulamalı ve bilinçli tarımsal faaliyetlerdir. Sürdürülebilir tarımın oluşturulması ve ileriye dönük tarımsal planlamaların doğru yapılabilmesi için ilk önce toprağın çok iyi tanınması gerekmektedir. Artık toprak verimliliğinin arttırılması zorunluluğunun yanı sıra, verimde sürekliliğinin sağlanması ve korunması da ülkemiz için büyük önem taşımaktadır. Bu da ancak toprakların mevcut fiziksel, kimyasal ve biyolojik özelliklerinin belirlenmesi ve bu özellikler doğrultusunda yapılacak bilinçli gübreleme çalışmaları ile mümkündür (Bellitürk, 2011).

Tarım topraklarının giderek azalması, buna karşın nüfusun artması ile ilgili istatistiksel veriler gün geçtikçe artmaktadır. Bu durum hem dünyada ve hem de ülkemizde var olan bir gerçektir. Nüfus artışı elbette kaçınılmaz, ancak tarım topraklarının amacı doğrultusunda bilimsel bilgiler ışığında kullanılması ise artık bir zorunluluk haline gelmiştir. Türkiye İstatistik Kurumunun (TÜİK) açıkladığı tarım istatistikleri ile ilgili rakamlara baktığımızda 2004 yılında 265 931 780 da olan Türkiye'nin toplam işlenen tarım alanı 2018 yılında 231 999 458 dekara gerilemiştir (TÜİK, 2018).

Türkiye nüfusunun yaklaşık üçte birine yakın bölümü tarımsal ya da kırsal alanda yaşıyor olduğu halde milli gelirde tarımın yeri ancak % 8 – 10 düzeyindedir. Türkiye'de tarım sektöründe göze çarpan eğilimler, toprak dağılımının çok parçalı olması ve verim düşüklüğüdür. Tarım kesiminde nüfus artış hızı ülke ortalamasının üstündedir, bu olgu miras yoluyla toprakların küçülmesine sebep olmakta ve kente olan göçü hızlandırmaktadır. Küçük parçalara bölünmüş yaygın toprak yapısı maliyetleri yükselterek tarım üretiminde verimsizliğe

yol açmaktadır. Tarım sektörü günümüzde artık yeni teknoloji ile ve çağdaş ekonomik normlarla geliştirilen bir sektördür (Arı, 2006).

Torun ve ark. göre (2019); makarnalık buğday (*Triticum durum Desf.*), Türkiye’de ve dünyada gıda üretiminde önemli bir yere sahiptir. Çinko eksikliğinin dünyada tahıl üretilen bölgelerde yaygın olduğu belirtilmektedir (Graham ve Welch, 1996; Alloway, 2008). Türkiye’de tahıl üretilen alanların yaklaşık % 49.8’inin bitkilerce alınabilir Zn konsantrasyonunun (0.5 mg kg^{-1} kritik sınır değerinden düşük olduğu bildirilmiştir (Eyüpoğlu ve ark., 1996). Tarım topraklarımızın organik maddece fakir olduğu herkes tarafından bilinmektedir. Ancak potasyum ve kısmen fosfor bakımından yeterli olan topraklarımızın zaman içinde organik maddede olduğu gibi fosfor ve potasyumca da fakirleşebileceği unutulmamalıdır.

Ülkemizde yaygın olarak ekmeçlik buğday ve makarnalık buğday tarımı yapılmaktadır. Bölgelere göre değişmekle birlikte makarnalık buğday üretimi Orta Anadolu ve Güney Doğu Anadolu bölgesinde daha fazla ekilmektedir. Ekolojik olarak bu bölgelerimizin makarnalık buğday tarımına uygun olması nedeniyle bu bölgelerde makarnalık buğday üretimi diğer bölgelere göre ağırlık kazanmaktadır. Trakya bölgesinde ise makarnalık buğday üretimi ekmeçlik buğday üretimine göre oldukça azdır. Buna karşın bölge ekolojik olarak yüksek verimli makarnalık buğday üretiminin elde edilebileceği bir bölgedir. Ayrıca yapılan çalışmalar bölgenin makarnalık buğday yönünden kalite olarak iyi potansiyele sahip olduğunu göstermektedir (Korkut ve ark., 2004).

Sürdürülebilir tarım, doğal kaynakların korunmasıyla birlikte, çevreye zarar vermeyen tarım teknolojilerinin kullanıldığı bir tarımsal yapının geliştirilmesidir (Turhan, 2015).

Sürdürülebilir tarım uygulamaları ile tarımda; üretken ve karlı sürekli çevre ile dost yöntemler geliştirilmesi, düşük girdi yöntemleri ve deneyimli bir toprak yönetimi, ürünlerin verim ve kalitesinin artırılması, tarımsal uygulamalar ile oluşan çevreye olumsuz etkilerin azaltılması, toprakların verimliliğinin korunarak uzun yıllar korunabilir hale gelmesi, üreticilerin gelirlerinin yükseltilmesi hedeflemektedir. Tüm bunları gerçekleştirebilmek için, kimyasal girdi kullanımının azaltılması, biyolojik mücadele, organik atık kullanımı gibi araçların kullanılması gerekmektedir

Kimyasal (mineral) gübrelerin bilinçsiz bir şekilde kullanımı ile oluşan çevre kirlenmesi sonucunda bozulan doğa dengesinin yeniden kurulması çok güç olduğundan, gerekli önlemlerin alınmasının büyük bir önemi vardır. Bu nedenle tarımsal uygulamalar; kullanılacak mineral

gübrelerin fizyolojik özelliği, bitki ve toprak yapısı gibi parametreler birlikte değerlendirilerek yapılmalı, bu uygulamanın sürdürülebilir olmasına özen gösterilmelidir (Bellitürk, 2005).

Bu çalışmada, sürdürülebilir makarnalık buğday üretiminin çevresel ve ekonomik değerlendirilmesi yapılmıştır. Çalışma kapsamında geleneksel ve sürdürülebilir makarnalık buğday üretiminin karşılaştırılması yapılarak ekonomik ve çevresel kriterler açısından farklılıkları ortaya konmuştur.

MATERYAL VE YÖNTEM

Çalışma kapsamında 2017-2018 üretim yılında 3 alanda ve 2018-2019 üretim yılında da 4 alanda, sürdürülebilir ve geleneksel üretimin karşılaştırıldığı denemeler kurulmuştur. Deneme alanlarından toplanan teknik ve ekonomik bilgiler ışığında hem sürdürülebilir hem de geleneksel makarnalık buğday üretiminin masrafları, karlılık durumları hesaplanmıştır.

“Barilla Sürdürülebilir Tarım” projesi, Tekirdağ Namık Kemal Üniversitesi (TNKÜ) Ziraat Fakültesi ve Barilla Gıda A.Ş. iş birliğinde, 2017-2018 ve 2018-2019 üretim yılları süresince yürütülmüştür. 2019-2020 üretim döneminde üretici sayısı artırılarak devam etmiştir. Sürdürülebilir üretim teknikleri için TNKÜ Ziraat Fakültesinin; Tarla Bitkileri, Toprak Bilimi ve Bitki Besleme, Tarım Ekonomisi bölümlerindeki öğretim üyelerinden oluşan disiplinler arası bir ekibin önerilerinden yararlanılmıştır.

Barilla Sürdürülebilir Tarım Projesi, “Sizin İçin İyi, Gezegen İçin İyi (Good for You, Good For The Planet)”, sloganıyla Barilla A.Ş.’nin üretim faaliyetlerinin ekosistem ve topluluklar açısından tarladan tüketicilere sorumlu bir şekilde yapılması olarak tanımlanmaktadır (Barilla Group, 2023).

Bu projenin amacı; yaygın üretim teknikleri hakkında veri toplamak, en iyi üretim tekniklerini tanımlamak ve saha denemelerini denetlemek, geleneksel tarım tekniklerini önerilen (daha sürdürülebilir) tekniklerle karşılaştırmak, projeye katılan çiftçilere tavsiyelerde bulunmak ve genel olarak sürdürülebilir üretim sisteminin uygulanmasına yardımcı olmaktır.

Çalışmada makarnalık buğdayın tüm üretim süreci kayıt altına alınmıştır. Deneme alanlarından toplanan teknik ve ekonomik bilgiler ışığında hem sürdürülebilir hem de geleneksel makarnalık buğday üretiminin masrafları, karlılık durumları hesaplanmıştır. Girdi kullanım miktarlarından yola çıkılarak da her iki üretim yönteminin çevresel etkileri hesaplanmıştır.

Ekonomik Analiz: Çalışmada makarnalık buğdayın sabit masraf unsurları olarak arazi kirası ve genel idare giderleri; değişken masraf unsurları olarak da tohum, gübre, ilaç, geçici işçilik, makine kiralari ve döner sermaye faiz bedeli alınmıştır (Kıral ve ark., 1999).

Çeki gücü giderleri amortisman, fırsat maliyetini yansıtan faiz, bakım-onarım giderleri, yağ-yakıt vb. birçok masraf kalemini içeren makine sahibi olma giderlerinin belirlenmesi ve bu giderlerinin ürünler arasında dağıtılması gibi doğru ve hatasız yapılması oldukça güç olan işlemleri gerektirdiğinden, makine sahibi işletmeler için alternatif maliyet yöntemi kullanılarak ilgili işler dışarıya yaptırılmış gibi fiyatlandırılmıştır (Alemdar ve ark., 2014). İşgücü giderlerinin hesaplanmasında da, yabancı işgücü için ödenen ücretler, aile işgücü için ise alternatif maliyet olarak bölgede geçerli ortalama işçi ücretleri esas alınmıştır.

Girdi kullanımının analizinde fiilen kullanılan tohum, gübre ve kimyasal ilaç ile bunlar için ödenen bedeller dikkate alınmıştır (Tanrıvermiş, 2000). Cari masrafların hesaplanmasında masrafların yapıldığı andaki geçerli fiyatlar kullanılmıştır (Alemdar ve ark., 2014).

Gider gruplarına göre dekara masraflar, tarımsal işlemler itibariyle işletmelerce kullanılan işgüçlerinin ve çeşitli girdilerin, ana ürün, varsa yan veya ara ürün dekara ortalama miktarları hesaplanarak bulunmuştur (Altıntaş, 2014).

Arazi kirası için, bölgede geçerli olan bedeller dikkate alınmıştır. Kiracılıkla işletilen arazilerde üreticinin ödediği bedel, mülk arazilerde ise alternatif kira bedeli alınmıştır (Açıl, 1976). Genel idare giderleri, değişken masraflar toplamının %3'ü olarak hesaplanmıştır.

Değişken masrafların faizi üretim faaliyetine yatırılan sermayenin fırsat maliyeti olarak tanımlanmaktadır (TEAE, 2001). Söz konusu faiz oranı, üretim dönemi için T.C. Ziraat Bankasının bitkisel üretim kredilerine uyguladığı faiz oranının yarısı (%5) olarak alınmıştır (Kıral ve ark., 1999).

Üretim alanından elde edilen (dekar) ortalama ürün miktarı, ürünün ortalama kg satış fiyatı ile çarpılarak Brüt Üretim Değeri (BÜD) elde edilmiştir. BÜD'den değişken masraflar çıkarılarak brüt kara ulaşılmaktadır. Brüt kardan da sabit masrafların çıkarılması veya BÜD'den üretim

masraflarının çıkarılmasıyla da net kara ulaşılmaktadır (Açıl ve Demirci 1984; Kral ve ark. 1999; Tanrıvermiş 2000, İnan, 2006). Üretim faaliyetine ilişkin brüt ve net karların hesaplanmasında;

- Değişken Masraf = Toplam masraf + Interest on Operating Capital (%5)
- Sabit Masraf = Arazi kirası + Genel İdare Gideri (%3)
- Brüt Üretim Değeri = (Üretim Miktarı x Ürün Fiyatı)+(Yan ürün miktarı x Yan ürün fiyatı)
- Brüt Kar = Gayrisafi (Brüt) Üretim Değeri – Değişken Masraflar,
- Net Kar = Gayrisafi (Brüt) Üretim Değeri – Üretim Masrafları

formülleri kullanılmıştır.

Çevresel Etkilerin Değerlendirilmesi: Çevresel etkilerin değerlendirilmesinde; karbon ayakizi, su ayakizi, ekolojik ayakizi hesaplamalarından yararlanılmıştır. Bu hesaplamalar proje kapsamında, deneme alanlarından toplanan verilerin Barilla A.Ş. tarafından değerlendirilmesi sonucu yapılmıştır.

Karbon Ayakizi, bir ürünün tüm yaşam döngüsü boyunca doğaya saldıgı toplam sera gazı miktarı olarak tanımlanmaktadır (Şahin ve Avcıoğlu, 2016). Su Ayak İzi, yine aynı ürünün tüm yaşam döngüsü boyunca üretilmesi için gereken hem doğrudan hem de dolaylı su miktarıdır. Su ayak izi, yeşil su (suyun buharlaşan miktarının ve bitkiler tarafından kullanılan miktarı), mavi su (doğrudan kullanılan taze yüzey ve yeraltı suyu) ve gri su (kirleticilerin seyreltilmesi için gerekli su hacmi) bileşenlerinden oluşmaktadır (WWF, 2014).

Ekolojik ayak izi ise bir ürün için kullanılan kaynakların üretilmesi ve tüm yaşam döngüsü boyunca üretilen karbondioksit atıklarını emmek için gereken biyolojik olarak verimli toprak ve su alanını ölçmektedir (AÖF, 2019).

Karbon ayakizi, IPCC'nin 5. değerlendirme raporundaki (2013) faktörlerle, Su ayakizi, su ayakizi ağında (Water Footprint Network, <http://waterfootprint.org>) belirtilen yönteme göre, Ekolojik ayak izi de küresel ayakizi ağında (Global Footprint Network, <http://www.footprintnetwork.org>) kullanılan yönteme göre hesaplanmıştır.

ARAŞTIRMA BULGULARI

Tarımsal üretimde kullanılan girdiler doğrudan ya da dolaylı olarak doğal kaynaklar üzerinde baskı oluşturmaktadır. Girdiler, bitki, toprak ve kaynaklarına karışarak doğrudan etkide buldukları gibi, söz konusu girdilerin üretilmesi esnasında da doğal çevre olumsuz

etkilenebilmekte, böylece dolaylı bir etkiye de neden olabilmektedir. Sürdürülebilir üretimde girdilerin azaltılması ya da en uygun miktara çekilebilmesi büyük önem taşımaktadır. Uygun tohum çeşidi ve tohum miktarının kullanılması çevresel ve ekonomik anlamda dikkat edilmesi gereken bir konudur. Şekil 1'de deneme alanlarında kullanılan ortalama tohum miktarları görülmektedir. Şekilden de anlaşılacağı üzere sürdürülebilir üretimin yapıldığı alanlarda gerek verim gerekse de çevresel faktörlerden dolayı tohum miktarlarının en uygun seviyede tutulması hedeflenmiştir. 2017-2018 üretim yılında sürdürülebilir alanlarda kullanılan ortalama tohum miktarı dekara 21,7 kg iken, 2018-2019 üretim yılındaki ortalama 20 kg/da'dır. Geleneksel üretimin yapıldığı alanlarda ise ilk yılın ortalaması 22,3 kg/da, ikinci yılın ortalaması ise 22,0 kg/da olarak gerçekleşmiştir.

Şekil 1. Deneme Alanlarında Kullanılan Ortalama Tohum Miktarı (kg/da)

2018-2019 Üretim Yılı

Şekil 2. Deneme Alanlarında Kullanılan Ortalama Gübre Miktarı (kg/da)

Benzer biçimde 2017-2018 ve 2018-2019 üretim yıllarında deneme alanlarında kullanılan gübre miktarları da şekil 2’de verilmiştir. Sürdürülebilir üretimin yapıldığı alanlarda kullanılan gübre miktarları üretim dönemlerinin başında yapılan toprak analizi sonuçlarına göre belirlenmiştir. Geleneksel üretim yapılan alanlarda çiftçiler gübreyi kendi tecrübelerine uygun olarak belirlemişlerdir. Toprağın ihtiyacı olandan daha fazla miktarlarda kullanılan gübre toprak ve su kaynakları açısından önemli bir kirlilik kaynağı haine gelmektedir.

Kullanılan tohum ve gübre miktarı elde edilecek ürün miktarı üzerine doğrudan etki etmektedir. Şekil 3’te üretim yıllarına göre deneme alanlarından elde edilen ortalama verimler yer almaktadır. Sürdürülebilir üretimin yapıldığı alanlarda makarnalık buğday verimi ortalama 553 kg/da ve 561.8 kg/da olarak gerçekleşmiştir. Geleneksel üretimin yapıldığı alanlarda ise ortalama olarak 536.3 kg/da ile 527,8 kg/da’dır. Verim değerleri üzerine uygun miktarda kullanılan tohum ve toprağın ihtiyacı dikkate alınarak yapılan gübrelemenin önemli etkisi bulunmaktadır. Toprak analizinin yapılması bu yönüyle oldukça yararlıdır.

2017-2018 Üretim Yılı

2018-2019 Üretim Yılı

Şekil 3. Deneme Alanlarından Elde Edilen Ortalama Verim (kg/da)

Ekonomik Değerlendirme

Proje kapsamında sürdürülebilir ve geleneksel üretim ekonomik yönden de karşılaştırılmıştır. Uygun toprak işleme yöntemleri, toprağın, iklimin ve bitkinin ihtiyaçlarını dikkate alan girdi kullanımını üretim masraflarının azalmasına imkan vermektedir. Yüksek masraflarla çok fazla girdi kullanımı durumunda ürün verimi artmasına rağmen üretimin karlılığı aynı oranda artmayabilmektedir. Diğer bir deyişle aşırı girdi kullanımı (tohum, gübre vb) yüksek gelir anlamına gelmemektedir.

Şekil 4'te deneme alanlarında yıllara göre ortalama üretim masraflarının karşılaştırılması yapılmaktadır. Sürdürülebilir üretimin yapıldığı alanlarda üretimin masrafları daha düşüktür. 2017-2018 üretiminde 438.47 TL/da, 2018-2019 üretiminde 610.38 TL/da sürdürülebilir alanlarda yapılan ortalama üretim masrafıdır. Geleneksel üretimle karşılaştırıldığında %4 ile %7 arasında daha düşük masraf yapılmıştır.

Şekil 4. Deneme Alanlarında Ortalama Üretim Masrafları (TL/da)

Deneme alanlarından elde edilen ortalama net kar Şekil 5'te verilmiştir. Verim yüksekliği, masrafların düşüklüğü nedeniyle sürdürülebilir alanlardaki yapılan üretimin ortalama net karı geleneksel üretimin net karından yüksek çıkmıştır. Şekil 6'da deneme alanları itibariyle daha ayrıntılı net kar rakamları verilmiştir. 2017-2018 üretim yılında 1. deneme alanında geleneksel yöntemlerle üretilen makarnalık buğdayın yan ürün (saman balya) verimi daha yüksek gerçekleşmiştir. Bu nedenle sürdürülebilir ve geleneksel üretim arasındaki net kar farkı negatif değer çıkmıştır. Ancak diğer tüm denemelerde sürdürülebilir üretimin yapıldığı alanlarda net kar daha yüksektir.

Şekil 6. Deneme Alanlarına Göre Net Kar

Çevresel Etkilerin Değerlendirilmesi: Çizelge 1’de 2017-2018 yılında deneme alanlarındaki makarnalık buğday üretiminin çevresel etkileri verilmektedir. Çizelge 1’e göre karbon ayakizi yönünden değerlendirildiğinde 3 deneme alanında da sürdürülebilir makarnalık buğday üretimi, geleneksel yöntemle göre daha düşük karbon emisyonu sağlamaktadır. Sürdürülebilir üretim, geleneksel üretime göre 1. deneme alanında %7, 2; deneme alanında %12; 3. deneme alanında ise %8 daha az karbon ayakizi bırakmaktadır.

Bölgede makarnalık buğday üretiminde sulama yapılmadığı için su ayakizi değerleri hesaplanmamıştır. Ekolojik ayakizi bakımından da sürdürülebilir üretim 2. Deneme alanında %5, 3. Deneme alanında %9 daha düşük etkiye sahiptir.

Çizelge 2’de 2018-2019 yılında deneme alanlarındaki makarnalık buğday üretiminin çevresel etkileri verilmektedir. Çizelgeye göre karbon ayakizi yönünden değerlendirildiğinde 4 deneme alanında da sürdürülebilir makarnalık buğday üretimi, geleneksel yöntemle göre daha düşük karbon emisyonu sağlamaktadır. Sürdürülebilir üretim, geleneksel üretime göre 1. Deneme alanında %7; 2. deneme alanında %21; 3. deneme alanında %17; 4.deneme alanında %28 daha az karbon ayakizi bırakmaktadır.

Ekolojik ayakizi bakımından da sürdürülebilir üretim 2. deneme alanında %11; 3.deneme alanında %6 ve 4. deneme alanında %10 daha düşük etkiye sahiptir.

SONUÇ VE ÖNERİLER

Tarım, gıda zincirinin başlangıç noktasıdır. Bir yanda tarımda verimliliği artırırken toprağı ve doğal tarım kaynaklarını korumak, çiftçinin yaşam kalitesini yükseltmek, ama en önemlisi hızla artan dünya nüfusunun ihtiyacı olan yeterli ve kaliteli gıda maddesini temin ederek gıda ve besin güvenliğini sağlamak, tarımda sürdürülebilirliğin temel kavramlarıdır.

Açlık kapıya dayanmadan, tarım topraklarının birim alanından maksimum ve en kaliteli verimi sağlamak için bilinçli tarım yapmak zorundayız. Bilinçli tarım yapmaya açılan kapılardan ilki ise toprakların bakımı, korunması, verimlilik devamlılığının sağlanmasında toprağın ve bitkinin ihtiyacı olan besin maddelerinin tespit edilmesi gelmektedir. Bunun yanısıra toprak işleme, hastalık ve zararlılarla mücadele gibi konularda da uzmanların tecrübe ve deneyimleri doğrultusunda planlı bir şekilde üretim yapılmalıdır.

Türkiye’de buğday üretiminde sadece kimyasal gübre kullanımı alışkanlığı, günümüzde yavaş yavaş değişmekle birlikte, organomineral ve organik gübreler de bu amaçla kullanılmaya başlamıştır. Ancak toprak analiz sonuçlarına bağlı bir gübreleme alışkanlığı yok denecek kadar az olup, “sürdürülebilir buğday üretimi” için mutlaka toprak analizleri yaptırılmalı ve uygun gübreleme programları hazırlanmalı ve itina ile uygulanmalıdır.

Sürdürülebilir tarımın en önemli ilkesi doğal kaynaklar üzerinde baskı yapan girdilerin tüketimlerinin azaltılmasıdır. Gübre, bu girdilerin başında gelmektedir. Gübre kullanımının ürün verimi üzerinde önemli bir etkisi olduğu aşikardır. Ancak bu etki ürün veriminde, başlangıçta kullanılan gübre miktarı artırıldıkça artan oranda, gübre miktarı artırılmaya devam

ettiğinde azalan oranda olmaktadır. Kullanılan gübre miktarı artırılmaya devam edildiğinde ürün veriminde mutlak bir azalmaya neden olabilmektedir (Azalan verimler kanunu).

Bununla birlikte ürün verimini maksimum yapan gübre miktarı, net kar açısından (ekonomik açıdan) bakıldığında uygun bir miktar olmayabilmektedir. Kullanılan girdi miktarı artıkça üretim masrafları da artacağı için harcanan para, elde edilen gelirden daha fazla olabilmektedir. Bu nedenle girdi kullanımında üreticinin karını maksimum yapan miktarın kullanılmasına özen gösterilmelidir.

“Barilla Sürdürülebilir Tarım Projesi” sonuçlarından da anlaşılacağı üzere daha düşük masrafla yapılan sürdürülebilir üretim denemeleri, verim yönünden de geleneksel yöntemin üzerine çıkmış, ekonomik yönden de üreticinin gelirinde artışa neden olmuştur. Bu üretimin sağladığı bir diğer önemli sonuç da doğal kaynaklar üzerinde daha az baskı yarattığı için gelecek nesiller adına önemli katkılar sağlayacağıdır.

Kimyasal (mineral) gübrelerin bilinçsiz bir şekilde kullanımı ile oluşan çevre kirlenmesi sonucunda bozulan doğa dengesinin yeniden kurulması çok güç olduğundan, gerekli önlemlerin alınmasının büyük bir önemi vardır. Bu nedenle tarımsal uygulamalar; kullanılacak mineral gübrelerin fizyolojik özelliği, bitki ve toprak yapısı gibi parametreler birlikte değerlendirilerek yapılmalı, bu uygulamanın sürdürülebilir olmasına özen gösterilmelidir.

Tarım topraklarımızın organik maddece fakir olduğu herkes tarafından bilinmektedir. Ancak potasyum ve kısmen fosfor bakımından yeterli olan topraklarımızın zaman içinde organik maddede olduğu gibi fosfor ve potasyumca da fakirleşebileceği unutulmamalıdır.

Beslenme ve gıda güvenliği, insanlığın geleceği için anahtar konulardan biridir. Açlık kapıya dayanmadan, tarım topraklarının birim alanından maksimum ve en kaliteli verimi sağlamak için bilinçli tarım yapmak zorundayız. Bilinçli tarım yapmaya açılan kapılardan ilki ise toprakların bakımı, korunması, verimlilik devamlılığının sağlanması ve gübrenmesinde bitki besleme uzmanlarının tecrübe ve deneyimleri doğrultusunda planlı bir şekilde “gübreleme programları” oluşturulmalıdır. Söz konusu akılcı gübreleme programlarına mutlaka organik gübrelerin de gerek ıslah ve gerekse hastalıklara karşı direncin artırılarak daha az kimyasal gübre ve ilaç kullanılmasına geçişin sağlanması açısından yer verilmelidir. Profesyonel olarak üretim yapan her işletmenin kendi tarımsal ve hayvansal atıklarından elde edilen kompostların organik gübre amacıyla kullanması gerekmektedir.

ABSTRACT

Lactation curves are systems that examine changes in milk yield over time following calving and exhibit a non-linear structure. Various mathematical functions are used in lactation curve modelling to obtain predictive values for significant performance characteristics, such as the postpartum period, time to peak, and yield value at the peak. Within the functional structures, parameters such as maximum milk yield, lactation period, total yield per lactation, and the rate of decrease after the peak yield are defined. In this study, comparison results of various lactation curves in polynomial, exponential, and gamma function structures in Holstein dairy cattle were examined and interpreted to provide the best fit for different problem structures and support biometric interpretations. Comparisons were evaluated using coefficients of determination, mean squared error criteria. The analyses were carried out using the SPSS 26 statistical software and MATLAB R2016a.

Keywords: Lactation curve, nonlinear regression, Holstein, milk yield.

Introduction

Milk yield records are one of the important criteria used to evaluate and monitor the production performance of cows. At the same time, it is an essential indicator for the identification of high and low-yielding cows and the creation of appropriate nutrition programs and indirectly contributes to the development of strategies and decisions to increase the productivity of their enterprises (Gök et al., 2019). This criterion, which also helps breeding studies to ensure the birth of high-yielding offspring in future generations, provides important information that guides breeding strategies. Another important contribution of healthy and regular recording of milk yield records is that it offers business owners the opportunity to monitor potential health problems (Svennersten-Sjaunja et al., 1997). Lactation curves examine the changes in milk yield after calving and provide a graphical representation. Various mathematical functions are used in lactation curve modelling to obtain predictive values for important performance characteristics such as postpartum period, time to peak, and peak yield value. Parameters such as maximum milk yield, lactation period, total yield per lactation, and rate of decline after peak yield are defined in functional structures (Macciotta et al., 2011).

This study examined and interpreted the comparison results of various lactation curves in polynomial, exponential and gamma function structures (Lopez, 2008) in Holstein dairy cattle to provide the most appropriate fit for different problem structures and support biometric interpretations.

Research and Results

The material of the study consists of milk yield records of Holstein Friesian dairy cattle obtained during their first lactation. Recording days less than the 5th day and greater than the 305th day in the milk yield records on the test day were excluded from the analysis. Comparative results of various lactation curves in polynomial, exponential and gamma function structures are included in the results.

Models with polynomial, exponential and gamma function structures are used to model lactation curves in dairy cattle to describe the relationship between time (measured in days of milk) and milk yield and to show how milk production changes over time.

Polynomial equations contain mathematical expressions containing the coefficients of the independent variable raised to different exponents. The coefficients of the polynomial functions provide information about the shape, slope, and intersection of the curve. A linear polynomial function has two coefficients representing slope and intersection, while a quadratic

polynomial function has three coefficients representing curvature, slope, and intersection. These coefficients provide an opportunity to interpret the shape of the lactation curve. In our study, Quadratic Polynomial Model and Ali and Schaffer models were used within the scope of polynomial functions. The mathematical representations of the models examined within the scope of polynomial functions are given in Table 1.

Table 1. Mathematical description of the polynomial functions

Functions	Mathematical Descriptions
Polynomial	Quadratic Model (Dave, 1971) $Y_t = a + bt - ct^2$
	Ali and Schaeffer (Ali and Schaeffer, 1987) $Y_t = a + bt + ct^2 - d\log(t) - k[\log(t)]^2$

Exponential functions are based on exponential equations with a base that can be raised to a power proportional to time. In lactation curve models, exponential functions can be explained by parameters associated with the 'baseline', which indicates how fast the curve grows or declines over time, and the 'baseline', which represents the milk yield at the beginning of lactation and determines the starting point of the curve. Exponential functions can model the initial stage of milk production in lactation curves and then a gradual decline over time. In other words, they are widely used to describe the early stages of lactation in dairy cattle, where milk production is typically high in the initial period and then goes into a decline stage. In our study, Brody Model and Cobby and Le Du model were used within the scope of exponential functions. The mathematical representations of the models examined within the scope of exponential functions are given in Table 2.

Table 2. Mathematical description of the exponential functions

Functions	Mathematical Descriptions
Exponential	Brody (Brody et al., 1923) $Y_t = ae^{-ct}$
	Cobby and Le Du $Y_t = a(1 - e^{-ct}) - bt$

The parameters estimated in the gamma function are related to the shape and scale of the curve. The gamma functions, similar to the exponential function, characterize the gradual decrease following the initial milk production and the milk production after the decrease with various lactation curve models. Lactation curve models in gamma function structure are widely used in research to examine the dynamics of the milk production process and to interpret

lactation biology. In our study, Wood Model and Dhanoa model were used within the scope of Gamma functions.

Table 3. Mathematical description of the gamma functions

Functions	Mathematical Descriptions	
Gamma	Wood (Wood, 1967)	$Y_t = at^b e^{-ct}$
	Dhanoa (Dhanoa, 1981)	$Y_t = at^{kc} e^{-ct}$

Table 4. Statistical criteria for lactation curve models

Criteria	Formula
Adjusted Determination Coefficient	$R_{adj}^2 = 1 - \left[\frac{n-1}{n-p} \right] \times (1 - R^2)$
Mean Square Error	$MSE = \frac{1}{n} \sum (Y - \hat{Y})^2$

The mathematical representations of the models examined within the scope of gamma functions are given in Table 3. Statistical criteria in Table 4 were used in order to comparatively examine the numerical results related to the lactation curve models in our study.

Table 5. Parameters of polynomial function and goodness of fit measurements

Modeller	$a \pm s_a$	$b \pm s_b$	$c \pm s_c$	$d \pm s_d$	$k \pm s_k$	R_{adj}^2	MSE
Quadratic Model	22.219±0.087	-0.009±0.001	0.00006±0.000004	.	.	0.9647	0.2240
Ali and Schaeffer	20,767±1,053	-0,08±0,009	0,00005367±0	1,679±1,765	-2,757±0,825	0.9827	0.1092

Figure 1. Graphical representation of the results for the Quadratic model and the Ali and Schaeffer model.

For the first lactation of Holstein cattle, the parameters of the models, adjusted R_{adj}^2 and MSE values are given in the Table 5 by using two different lactation curve models in the polynomial function structure according to milk yield (kg) on the test days. It is seen that the high explanatory power of the lactation curve models R_{adj}^2 (ranging between 0.964 and 0.982) MSE values (ranging between 0.2240 and 0.1092) are close to each other at low values.

Table 6. Parameters of exponential function and goodness of fit measurements.

Models	$a \pm s_{\bar{a}}$	$b \pm s_{\bar{b}}$	$c \pm s_{\bar{c}}$	R_{adj}^2	MSE
Brody	23.477±0.097	.	0.001±0.00026	0.9144	0.5393
Cobby and Le Du	23.498±0.067	0.029±0.00003	0.306±0.012	0.9557	0.2807

Figure 2. Graphical representation of the results for the Brody model and the Cobby and Le Du model.

The parameters, R_{adj}^2 and MSE values of the models are given in the Table 6 by using two different lactation curve models in the exponential function structure according to the milk yield (kg) on the test days for the first lactations of Holstein cattle. It is seen that the high explanatory power of the lactation curve models R_{adj}^2 (ranging between 0.914 and 0.955) MSE (ranging between 0.5393 and 0.2807) values are close to each other at low values.

Table 7. Parameters of gamma function and goodness of fit measurements

Model	$a \pm s_{\bar{a}}$	$b \pm s_{\bar{b}}$	$c \pm s_{\bar{c}}$	R_{adj}^2	MSE
Wood	17.336±0.170	0.092±0.003	0.002±00003	0.9818	0.1164

The parameters, R_{adj}^2 and MSE values of the models are given in the Table 7 by using two different lactation curve models in the gamma function structure according to milk yield (kg) on the test days for the first lactation of Holstein cattle. It is seen that the explanatory power of the lactation curve models is high R_{adj}^2 (0.9818) MSE values of 0.1164. In the analysis, the expected result could not be obtained with the Dhanoa model.

Figure 3. Graphical representation of the results for Wood model

Table 8. Statistical criteria result for all lactation curve models

Lactation Curve Models	R_{adj}^2	MSE
Quadratic Model	0.9647	0.2240
Ali and Schaeffer Model	0.9827	0.1092
Brody Model	0.9144	0.5393
Cobby and Le Du Model	0.9557	0.2807
Wood Model	0.9818	0.1164
Dhanoa Model	.	.

Numerical results on statistical criteria for all lactation curve models are given in Table 8. Accordingly, the model that made the most successful prediction with the highest R and lowest MSE values among the models examined was the Ali and Schaeffer model.

Figure 4. Graphical representation of the results for all lactation curve models

Conclusion

This study examined and interpreted the comparison results of various lactation curves in polynomial, exponential, and gamma function structures in Holstein dairy cattle to provide the most appropriate fit for different problem structures and support biometric interpretations. The results show that the most successful model structure is the 'Ali and Schaeffer model', with the highest coefficient of determination and the lowest mean squared error value. Lactation curve models, which give successful numerical results, can be used for herd management, care-nutrition decisions, health practices, genetic evaluation, and predictions for future periods.

ÖZET

Yem bitkilerinde ot verimi ve verimle ilişkili karakterlerin bilinmesinin yanı sıra, verime doğrudan katkı yapan özelliklerin de bilinmesi ıslah çalışmaları açısından önemlidir. Bu çalışmada, ICRISAT'tan temin edilen 225 adet inci darı (*Pennisetum glaucum* (L.) R. Br) popülasyonunun ot verimi ile bazı tarımsal özellikleri arasındaki ilişkilerin korelasyon ve path analizi ile belirlenmesi amaçlanmıştır. Araştırma ile ilgili tarla denemeleri Adana'da 2021 yılı ikinci ürün yetiştirme döneminde, Alfa Latis (15 x 15) deneme deseninde yürütülmüştür. Çalışma sonucunda; popülasyonların kuru ot verimlerinin 239.31-2425.58 g/bitki, salkım çıkarma gün sayısının 35.8-101.0 gün, bitki boyunun 223.3-383.3 cm, başak uzunluğunun 20.0-55.0 cm, ana saptaki yaprak sayısının 10.0-18.5 adet/bitki, toplam kardeş sayısının 3.67-18.00 adet/bitki, yaş ot verimlerinin 830.7-10247.0 g/bitki arasında değiştiği saptanmıştır. Ayrıca bazı

tarımsal karakterler arasındaki ikili ilişkileri belirlemek için yapılan korelasyon analizi sonucunda; kuru ot verimi ile salkım çıkarma gün sayısı ($r=0.340^{**}$), bitki boyu ($r=0.408^{**}$), başak uzunluğu ($r=0.116^*$), ana saptaki yaprak sayısı ($r=0.303^{**}$), toplam kardeş sayısı ($r=0.746^{**}$) ve yaş ot verimi ($r=0.886^{**}$) arasında olumlu ve önemli ilişkiler saptanmıştır. Path analizi sonuçlarına göre; bitki boyu, toplam kardeş sayısı ve yaş ot veriminin kuru ot verimine doğrudan etkileri olumlu ve önemli; başak uzunluğu ve ana saptaki yaprak sayısının kuru ot verimine doğrudan etkileri olumsuz ve önemli olmuştur. Yürütülen bu çalışmanın sonuçlarına dayanılarak, Adana koşullarında inci darısı bitkisinde kuru ot verimi bakımından yapılacak ıslah çalışmalarında, ot verimine doğrudan katkıda bulunan bitki boyu, toplam kardeş sayısı ve yaş ot veriminin önemli seleksiyon kriterleri olabileceği sonucuna varılmıştır.

DETERMINATION OF THE RELATIONS BETWEEN FORAGE YIELD AND SOME AGRICULTURAL CHARACTERISTICS IN PEARL MILLET (*Pennisetum glaucum* (L.) R. Br) POPULATIONS BY CORRELATION AND PATH ANALYSIS

ABSTRACT

In addition to knowing the forage yield and the characteristics related to yield, information on the features that directly contribute to the yield is important in terms of breeding studies. In this study, it was aimed to determine the relationship between forage yield and some agricultural characteristics of 225 pearl millet (*Pennisetum glaucum* (L.) R. Br) populations obtained from ICRISAT by correlation and path analysis. The research was carried out in Adana, during the second crop growing season of 2021. The field experiment was arranged in Alfa Latis (15 x 15) experimental design. Hay yield per plant in the populations varied 239.31-2425.58 g plant⁻¹, the number of days to tassel emerging 35.8-101.0 days, the plant height 223.3-383.3 cm, the spike length 20.0-55 cm, the number of leaves on the main stem 10.0-18.5 leaves/plant, the total number of tillers per plant 3.67-18.00, green herbage yield 830.7-10247.0 g/plant. Correlation analysis showed that between hay yield and number of days to tassel emerging ($r=0.340^{**}$), plant height ($r=0.408^{**}$), spike length ($r=0.116^*$), number of leaves on main stem ($r=0.303^{**}$), total number of tillers per plant ($r=0.746^{**}$) and green herbage yield ($r=0.886^{**}$) were found positive and significant relationships. As a result of path analysis; it was determined that the direct effects of plant height, total number of tillers per plant and green herbage yield on hay yield were significant; The direct effects of spike length and number of leaves on the main stem on hay yield per plant were negatively significant. From the results of this study, it was concluded that plant height, the total number of tillers per plant and green herbage yield, which directly contribute to hay yield, may be important selection criteria in breeding studies of pearl millet under Adana conditions in terms of hay yield.

Keywords: Pearl millet (*Pennisetum glaucum*), population, hay yield, Correlation, Path analysis

GİRİŞ

Darılar, Afrika ve Güney Asya ülkelerinde ağırlıklı olarak dane, ABD ve Avrupa ülkelerinde ise kaba yem bitkisi olarak yetiştirilmektedir. Dünya’da darıların ekim alanının 30.9 milyon ha olduğu ve bunun büyük çoğunluğunun Afrika (18.6 milyon ha) kıtasında bulunduğu, bu kıtayı Asya’nın (11.6 milyon ha) takip ettiği bilinmektedir (FAO, 2021). Darı türlerinin en önemlilerinden olan ve dünyada 6. tahıl olarak kabul edilen İnci darısı (*Pennisetum glaucum* (L.) R. Br.) sulanan ve sıcak bölgelerde yazlık ekimlerde yüksek verim potansiyeline sahiptir. Dünya tarımında gerek insan beslenmesinde gerekse hayvan beslemede önemli bir yere sahip olan inci darısı ile ülkemizde yapılan araştırmalar yok denecek kadar azdır. Ülkemizde yeni yeni tanınan bu bitkiden geliştirilmiş bir çeşidimiz bulunmamaktadır. Küresel ısınmaya bağlı olarak dünyamızı etkilemeye başlayan iklim değişimleri sulama olanakları kısıtlı olan veya marjinal alanlarda yetiştirilecek alternatif bitkilerin geliştirilmesini zaruri hale getirmiştir.

İnci darısı (*Pennisetum glaucum*; Poaceace familyası, Panicoideae alt familyası *Penicillarium* bölümü içerisinde yer alan diploid ($2n = 14$) kromozomlu ve yabancı tozlanan, yüksek oranda heterosis gösteren C4 buğdaygil bitkisidir (Andrews ve Kumar, 1992; Upadhyaya ve ark., 2008). Dik gelişen 3-5 metreye kadar boylanabilen, bol kardeşlenen bir bitkidir. İnci darı, kuraklığa dayanıklı tahılların başında yer almaktadır (Taylor ve ark., 2006; Lee ve ark., 2012), ancak susuz koşullarda yetiştirilmesi mümkün değildir. Diğer tahıllarla karşılaştırıldığında daha az hastalık ve zararlı sorunu olması nedeniyle farklı üretim sistemlerine uygun olabileceği bildirilmektedir (Jukanti ve ark., 2016). Yarı kurak koşullarda yağışın çok düşük (≤ 300 mm) veya düzensiz olduğu ekolojilerde yetiştirebildiği, sorgum ve mısırın sorun yaşadığı alanlarda hayatta kalabileceği bildirilmektedir (Dendy, 1995). Ancak 2000-2700 m yüksekliğinde olduğu ekolojilerde gelişiminde sorunlar ortaya çıkabilmektedir (Hannaway ve Larson, 2004). Söz konusu tür, çok sıcak ve kurak koşullarda yetişen sorguma göre de nispeten daha az su tüketmektedir (Singh ve Singh, 1995). İnci darısı, kumlu ve hafif yapılı verimli olmayan ve pH 6.2-7.7 arasında değişen topraklarda yetiştirilebilen, düşük girdilere iyi cevap veren, optimum büyüme sıcaklığının 33 °C ($12 - 45$ °C) olduğu bir bitkidir (Kumar, 1989; Andrews ve Kumar, 1992; Fribourg, 1995). Son çalışmalarda, inci darısının düşük yağış rejimi altında, geleneksel ürün olan mısır ve sorguma göre daha yüksek kuru madde verimi ve bürüt enerji ürettiği saptanmıştır (Hernández ve ark., 2007).

İnci darının sıcaklığa kuraklığa ve tuzluluğa diğer ürünlere göre daha toleranslı olması, özellikle marjinal alanlarda yetiştirilebilmesinin yanı sıra, tarımının düşük girdilerle yapılması, hastalık

ve zararlılar bakımından daha avantajlı olması nedeniyle önemli bir tür olarak önümüzdeki yıllarda karşımıza çıkacaktır (Yücel ve Yücel, 2022).

Bu çalışma ile iklim değişiklikleri ile birlikte Çukurova Bölgesinde değişecek ürün deseni içerisinde özellikle ikinci ürün tarımı içerisinde üretimi yapılacak önemli türlerin başında gelecektir. İnci darının birim alandaki yüksek biyokütle potansiyeli nedeniyle tarımının yaygınlaşması ile yazlık dönemde yüksek yeşil ot verimi sağlanmasının yanı sıra silaj yapılarak kaliteli kaba yem açığının kapatılmasında önemli rol alacağı düşünülmektedir.

ARAŞTIRMA VE BULGULAR

Araştırma, denizden 12 m yükseklikte 36° 51' kuzey enlemi ile 35° 20' doğu boylamları arasında yer alan Doğu Akdeniz Tarımsal Araştırma Enstitüsü (Doğankent/ADANA) arazilerinde 2021 yılında yürütülmüştür. Tarla denemeleri, 15 x 15 Alfa Latis deneme deseninde iki tekerrürlü olarak kurulmuştur. Her popülasyon, uzunluğu 4 m olan sıralara, 70 cm x 25 cm ekim normunda, 2 sıra olarak elle ekilmiştir.

Araştırmada, her popülasyona ait parsellerde, bitkilerin çiçeklenme döneminde salkım çıkarma gün sayısı (gün), bitki boyu (cm), başak uzunluğu (cm), ana saptaki yaprak sayısı (adet/bitki), toplam kardeş sayısı (adet/bitki), yaş ot ağırlığı (g/bitki) ve kuru ot ağırlığı (g/bitki) özellikler, Upadhyaya ve ark., (2008), Upadhyaya ve Gowda (2009) ve Rao ve Bramel (2000) tarafından açıklanan yöntemlere göre incelenmiştir.

Çalışma sonucunda; popülasyonlarda salkım çıkarma gün sayısının 35.8-101.0 gün, bitki boyunun 223.33-383.33 cm, başak uzunluğunun 20.0-55.0 cm, ana saptaki yaprak sayısının 10.0-18.5 adet/bitki, kardeş sayısının 3.67-18.00 adet/bitki, yaş ot verimlerinin 830.67-10247.0 g/bitki ve kuru ot verimlerinin 239.31-2425.58 g/bitki arasında değiştiği saptanmıştır (Çizelge 1). Söz konusu değerlerin başka araştırmacılar tarafından sırasıyla 49-129 gün, 129-377 cm, 17-89 cm, 0.55-6.40 adet/bitki arasında değiştiği saptanmıştır (Pucher ve ark., 2015, Angarawai ve ark., 2016; Athoni ve ark., 2016).

Çizelge 1. Popülasyonlar, hat ve çeşitlerin minimum, maksimum, ortalama, varyans, standart sapma Sx ve Cv değerleri

Değişken Adı	Min.	Mak.	Ortalama	Varyans	Standart Sapma	Sx	CV
%50 Salkım Çıkarma Süresi (gün)	35.83	101.00	67.76	82.44	9.08	0.61	13.40
Bitki Boyu (cm)	223.33	383.33	306.39	784.50	28.01	1.87	9.14
Başak Uzunluğu (cm)	20.00	55.00	29.76	22.00	4.69	0.31	15.76
Ana Saptaki Yaprak Sayısı (adet)	10.00	18.50	13.41	2.13	1.46	0.10	10.88
Bitkide Toplam Kardeş Sayısı (adet)	3.67	18.00	7.141	4.99	2.23	0.15	31.28
Yaş Ot Verimi (g/bitki)	830.67	10247.00	2628.652	1620275.75	1272.90	84.86	48.42
Kuru Ot Verimi (g/bitki)	239.31	2425.58	683.158	98972.40	314.60	20.97	46.05

İnci darı populasyonlarında ölçümü yapılan karakterleri arasındaki ikili ilişkileri belirlemek için yapılan korelasyon analizi sonucunda; kuru ot verimi ile salkım çıkarma gün sayısı ($r=0.340^{**}$), bitki boyu ($r=0.408^{**}$), başak uzunluğu ($r=0.116^*$), ana saptaki yaprak sayısı ($r=0.303^{**}$), toplam kardeş sayısı ($r=0.746^{**}$) ve yaş ot verimi ($r=0.886^{**}$) arasında olumlu ve önemli ilişkiler saptanmıştır (Çizelge 2).

Verimi etkileyen karakterler arasındaki ikili ilişkilerin belirlenmesinin yanı sıra bu karakterlerin etkilerinin doğrudan mı dolaylı mı, olumlu mu olumsuz mu olduğunu tespit etmek ıslah çalışmalarında başarının artırılmasında önemlidir. Bu amaçla path analizi yapılmıştır. Çalışmamızda kuru ot verimi bağımlı değişken olarak ele alınırken salkım çıkarma gün sayısı, bitki boyu, başak uzunluğu, ana saptaki yaprak sayısı, toplam kardeş sayısı ve yeşil ot verimi bağımsız değişken olarak alınmıştır.

Çizelge 2- İnci Darı’da Bazı Özellikler Arası İlişkiler (Korelasyon Analizi)

(%25.07) olmuştur. Başak uzunluğunun kuru ot verimine doğrudan etkisi olumsuz (-0.0169) yüksek (%11.23) olmuştur (Çizelge 3).

SONUÇ

Yürütülen bu çalışmanın sonuçlarına dayanılarak, Adana koşullarında inci darısında kuru ot verimi bakımından yapılacak ıslah çalışmalarında, ot verimine doğrudan katkıda bulunan bitki boyu, toplam kardeş sayısı ve yaş ot veriminin önemli seleksiyon kriterleri olabileceği sonucuna varılmıştır.

TEŞEKKÜR

Bu çalışma, Türkiye Bilimsel ve Teknolojik Araştırma Kurumu (TÜBİTAK) tarafından “219O103” numaralı proje ile desteklenmiştir.

Özet

Yüksek boşluklu yapısı nedeniyle geçirimli betonların hava ve suyun kolayca bir alt tabakaya aktarılması, ses ve sıcaklığın azaltılması, toz ve yollardaki kirleticilerin kontrol edilebilmesi ve özellikle yağmurlu havalarda daha güvenli bir sürüş imkânı sağlaması gibi birçok avantajı bulunmaktadır. Ancak yüksek geçirimliliğe neden olan boşluk yapısı, geçirimli betonda aynı zamanda düşük mekanik ve durabilite performansına neden olmaktadır. Ayrıca düzgün bir karışım tasarımı yapılmayan geçirimli betonların hem istenen mekanik özellikleri karşılayamadığı hem de yerine yerleştirilmesinde sorunlarla karşılaşıldığı görülmektedir. Bu çalışmada farklı gradasyona sahip (15-25 mm ve 5-15 mm) iki farklı kireçtaşı agregası ile geçirimli beton karışımlar üretilmiştir. Ayrıca çimento/agrega (Ç/A) oranının etkisi incelemek amacıyla üç farklı (0.20, 0.25 ve 0.30) ç/a oranında karışımlar üretilmiştir. Elde edilen sonuçlar bu çalışmada kullanılan ç/a oranları arasında geçirimli beton tasarımında kullanmak için en ideal ç/a oranının 0.25 olduğunu göstermiştir.

**EFFECT OF CEMENT/AGGREGATE RATIO ON MECHANICAL AND
HYDRAULIC PROPERTIES OF PERVIOUS CONCRETE**

Abstract

Pervious concretes because of their high void content have many advantages such as transferring air and water to subgrade, decreasing noise and temperature, controlling dusts and any other pollutants on the roads, and providing a safe driving environment especially on rainy days. But high porous structure while providing high permeability also causes low mechanic and durability performance. Besides, pervious concretes without proper design cannot reach desired mechanical properties and, cannot be placed appropriately. In this study, limestone aggregates with two different gradations (15-25 mm and 5-15 mm) were used to produce pervious concrete. Also, three different cement to aggregate ratio (0.20, 0.25 and 0.30) was considered to investigate the effect of cement/aggregate ratio (c/a) on pervious concrete. Results showed that among the c/a ratios that were considered in this study the best suited one for pervious concrete design is 0.25.

Keywords: Pervious concrete, cement/aggregate ratio, mechanical properties

Giriş

Geçirimli beton yaklaşık sıfır slump değerine sahip, ince agregalar kullanılmadan ya da oldukça az kullanılarak üretilen fazlaca boşluklu bir beton türüdür. Yüksek iri agregalar oranı nedeniyle geçirimli beton içerisinde boyutları 2-8 mm arasında değişen birbiriyle bağlantılı boşluklar oluşturulmakta ve böylece su bu boşluklardan kolayca geçebilmektedir. Geçirimli betonda minimum boşluk oranı %15 iken bu değer %35'e kadar çıkabilmekte ve herhangi bir ek mineral/kimyasal katkı kullanılmadan üretilen geçirimli betonların basınç dayanımları ise 2.8 ile 28 MPa arasında değişmektedir. Geçirimli betonların su geçirimsizlik miktarları, karışım hesabında belirlenen boşluk miktarı ve agregalar boyutlarına göre farklılık göstermekle beraber genellikle 0.14-1.22 cm/sn arasında değişmektedir [1].

Geçirimli beton üretiminde genellikle normal Portland çimentosu, iri agregalar ve su kullanılır. Böylece iri agregalar yığınları ince bir çimento hamuruyla sarmalanmış olur. Bahsedilen malzemelerin kullanılmasıyla geçirimli betonda genellikle boyutları 1-5 mm arasında değişen birbiriyle bağlantılı boşluklar oluşturulmuş olur. Bu sayede bünyesindeki boşluklar yardımıyla geleneksel betona kıyasla çok daha hızlı bir şekilde suyun tabakalar arasında iletilmesi sağlanmış olur. Geçirimli betonda kullanılan agregalar gradasyonu genellikle 9.5 mm ile 19.0 mm arasında değişmektedir. Doğal veya kırma taş agregalarının her ikisi de geçirimli betonda sıklıkla kullanılmaktadır. İnce agregalar kullanımından, boşlukları doldurarak boşlukların birbiriyle olan bağlantısını kestiği için kaçınılmaktadır. İnce agregalar kullanımı geçirimli betonun yoğunluğunu ve basınç dayanımını artırırken su geçirimsizliğini azaltmaktadır. Ek olarak, geleneksel betonda olduğu gibi, uçucu kül, cüruf, silis dumanı gibi mineral katkıları geçirimli betonda da kullanılabilir [1-5].

Geçirimli betonda kısmen yüksek basınç dayanımları elde etmek mümkündür ancak bunun için boşluk oranını azaltmak gerekmektedir, bu da betonun geçirimsizliğinin azalmasına neden olmaktadır. Sıkıştırma aralığı 0.086 mm'den 0.127 mm'ye düşürüldüğünde geçirimli betonun basınç dayanımının %11 azaldığı raporlanmıştır [6]. Agregalar boyutu arttıkça basınç dayanımının azaldığı gözlenirken aynı agregalar boyutu için polimer ve mineral katkı kullanımının basınç dayanımını arttırdığı söylenmiştir [7]. Agregaların incelik modülü arttıkça basınç dayanımının azaldığı [2] ve sahada elde edilen basınç dayanımları ile laboratuvar ortamında üretilen numunelerin dayanımlarının birbirlerinden farklı olabileceği [8] tarafından raporlanmıştır.

Bu çalışmada iki farklı tane aralığına sahip (15-25 mm ve 5-15 mm) kireçtaşı agregaları ve üç farklı çimento/agregalar (ç/a) oranında geçirimli betonlar üretilmiştir. Böylelikle agregalar

gradasyonu ve ç/a oranının geçirimli betonların basınç, yarmada çekme, eğilme dayanımları ile su geçirimliliği katsayısı üzerindeki etkisi incelenmiştir.

Deneysel Çalışma

1.1. Malzemeler

Bu çalışma kapsamında 15-25 mm ve 5-15 mm tane aralığındaki kireçtaşları kullanılmış olup agregaların fiziksel özellikleri Tablo 1’de verilmiştir. Yerel bir firmadan temin edilen CEM I 42.5 R tip normal portland çimentosu kullanılmıştır.

Tablo Hata! Belgede belirtilen stilde metne rastlanmadı..2. Agregaların özellikleri

Fiziksel özellikler	Kireçtaşı agregası	
	15-25 mm	5-15 mm
Sıkışık birim hacim ağırlık (kg/m ³)	1527	1387
Gevşek birim hacim ağırlık (kg/m ³)	1442	1534
Özgül ağırlık	2.71	2.67
Su emme (%)	0.23	0.30

2.2 Yöntem

Çalışma kapsamında geçirimli betonlar standart su kürüne maruz bırakılmışlardır. Standart su küründe 28 gün boyunca kürlendikten sonra geçirimli betonlar üzerinde basınç, yarmada çekme, eğilme dayanımları ve su geçirimliliği katsayıları belirlenmiştir. Basınç dayanımları için 150x150x150 mm boyutlarındaki küp numuneler, yarmada çekme dayanımı için 100x200 mm ebatlarında silindir örnekler ve eğilme dayanımı için ise 100x100x400 mm prizmatik örnekler kullanılmıştır. Ayrıca su geçirimliliği katsayısı da 100x200 mm silindir örnekler üzerinden belirlenmiştir. Basınç, yarmada çekme ve eğilme dayanımları sırasıyla TS EN 12390-3, TS EN 12390-6 ve TS EN 12390-5 standartları kullanılarak elde edilmiştir [9-11]. Su geçirimliliği katsayısı aşağıdaki eşitlik kullanılarak elde edilmiştir:

$$\text{Su geçirimliliği katsayısı} = (Q \times L) / (H \times A \times t)$$

Q: Beslenen su miktarı (mm³)

L: Numunenin uzunluğu (mm)

A: Numunenin yüzey alanı (mm²)

t: Zaman (sn)

H: Numune yüksekliği (mm)

Çalışma kapsamında belirlenen üç farklı ç/a (0.20, 0.25 ve 0.30) oranlarındaki beton karışım oranları Tablo 2’de verilmiştir.

Tablo Hata! Belgede belirtilen stilde metne rastlanmadı.. Geçirimli beton karışım oranları (1 m³)

Karışım	Çimento	Su	Kireçtaşı agregası		Çimento/Agrega oranı
			15-25 mm	5-15 mm	
Kireçtaşı 15-25	350	94	1750	-	0.20
Kireçtaşı 5-15	350	84	-	1750	
Kireçtaşı 15-25	400	134	1600	-	0.25
Kireçtaşı 5-15	400	125	-	1600	
Kireçtaşı 15-25	450	155	1500	-	0.30
Kireçtaşı 5-15	450	147	-	1500	

Bulgular ve Tartışma

Basınç, yarmada çekme ve eğilme dayanımları Tablo 3’de listelenmiştir. Tablo 3’den de anlaşılacağı üzere bu çalışma kapsamında göz önüne alınan çimento/agrega (ç/a) oranları içerisinde, mekanik özellikler dikkate alındığında, en yüksek performansı 0.25 ç/a oranının gösterdiği görülmektedir. En yüksek basınç dayanımı değeri 0.25 ç/a oranı ve 15-25 mm tane aralığında kireçtaşı agregası kullanılarak elde edilmiştir. Basınç dayanımı değerleri 15-25 mm gradasyonlu kireçtaşı agregası kullanılarak elde edilen geçirimli betonlar için 19.40 ile 14.48 MPa arasında değişirken, 5-15 mm tane aralığındaki agregalar kullanıldığında ise 14.66 ile 11.52 MPa arasında değişmiştir. Bütün karışımlarda 10 MPa basınç dayanımından fazla değerler elde edilmiştir. Yarmada çekme dayanımı sonuçları 0.76-1.52 MPa arasında değişmiştir. Geleneksel betonda olduğu gibi yarmada çekme dayanımları basınç dayanımına kıyasla oldukça düşük olmuştur. Mekanik özellikler dikkate alındığında 15-25 mm tane aralığındaki agregaların 5-15 mm tane aralığına kıyasla daha üstün olduğu sonucuna ulaşılmıştır. 5-15 mm tane aralığındaki kireçtaşı agregaları ile elde edilen geçirimli betonların en yüksek eğilme dayanımı 1.52 MPa olurken, bu değer 15-25 mm agreg gradasyonu kullanılan geçirimli betonlarda 2.37 MPa olmuştur.

Tablo Hata! Belgede belirtilen stilde metne rastlanmadı.. Basınç, yarmada çekme ve eğilme dayanımı sonuçları

Karışım	Basınç dayanımı (MPa)	Yarmada çekme dayanımı (MPa)	Eğilme dayanımı (MPa)	Çimento/Agrega oranı
Kireçtaşı 15-25	17.34	1.37	2.37	0.20
Kireçtaşı 5-15	13.77	0.83	1.72	
Kireçtaşı 15-25	19.40	1.52	2.32	0.25
Kireçtaşı 5-15	14.66	0.96	1.85	
Kireçtaşı 15-25	14.48	1.13	1.84	0.30
Kireçtaşı 5-15	11.52	0.76	1.52	

Su geçirirnililiđi katsayısı sonuçları Tablo 4’de listelenmiştir. Mekanik özelliklerde olduđu gibi 0.25 ç/a oranına sahip olan geçirimli betonlar daha yüksek geçirirnililik katsayısına sahip olmuştur. 15-25 mm agrega gradasyonlu ve 0.25 ç/a oranı ile elde edilen geçirimli betonlar 1.52 cm/s ile en yüksek su geçirirnililiđi katsayısı deđerine sahip olmuştur. En düşük su geçirirnililiđi katsayısı deđeri ise 0.30 ç/a oranı ve 5-15 mm agrega gradasyonu kullanılarak üretilen geçirimli betonlarda 0.59 cm/s ile elde edilmiştir.

Tablo 4. Geçirimli betonların su geçirirnililiđi katsayıları

Agrega tipi	Agrega gradasyonu	Su geçirirnililiđi katsayısı (cm/sn)	Çimento/Agrega oranı
Kireçtaşı agregası	15/25 mm	1.34	0.20
	5/15 mm	1.04	
	15/25 mm	1.52	0.25
	5/15 mm	1.40	
	15/25 mm	0.99	0.30
	5/15 mm	0.59	

Sonuçlar

Bu deneysel çalışmadan aşağıda listelenen sonuçlar elde edilmiştir:

- 15-25 mm tane aralığı 5-15 mm tane aralığına kıyasla hem mekanik hem de hidrolik özellikler bakımından daha iyi sonuç vermiştir.
- Bu çalışma kapsamında dikkate alınan ç/a oranları arasından 0.25 ç/a oranı ile en yüksek basınç, yarmada çekme ve eğilme dayanımları elde edilmiştir.
- 0.30 ç/a oranı ile üretilen geçirimli betonlar en düşük basınç dayanımına sahip olmuştur.

Teşekkür

Bu çalışma Ege Üniversitesi Bilimsel Araştırma Projeleri Koordinatörlüğü tarafından 22751 No’lu proje ile desteklenmiştir.

ÖZET

Bu çalışmada, Siirt ili Zivzik narı üretiminde girdi kullanımı brüt kar analizinin belirlenmesi amaçlanmıştır. Çalışmanın ana materyalini Siirt il ve ilçelerinde nar üretimi yapan 186 üreticiden anket yöntemiyle elde edilen veriler oluşturmuştur. Araştırma alanında toplam nar bahçesi alanı 98,80 ha ve ortalama nar üretim alanı 0,53 ha olarak hesaplanmıştır. Toplam ağaç sayısı 62.889 adet ve ortalama ağaç sayısı 635 adet/ha olarak bulunmuştur. Toplam üretim miktarı 3.445,50 ton olarak belirlenmiş, ortalama nar verimi 34.856,37 kg/ha, ağaç başına verim ortalama 55,25 kg olarak bulunmuştur. Gayri safi üretim değeri 278.850,96 TL/ha, değişken masraflar 73.245,88 TL/ha ve brüt kâr 205.605,08 TL/ha olarak bulunmuştur. Enerji kullanım etkinliği 1'den yüksek olduğu için girdilerin etkin kullanıldığını söylemek mümkündür ancak daha etkin girdi kullanımıyla bu oranın artması sağlanabilir.

Anahtar Kelimeler: Brüt kâr, girdi kullanımı, nar üretimi, Siirt

**INPUT USAGE AND GROSS PROFIT ANALYSIS IN POMEGRANATE
PRODUCTION (SIİRT PROVINCE EXAMPLE)**

ABSTRACT

In this study, it was aimed to determine the energy use and greenhouse gas emission in Zivzik pomegranate production in Siirt province. The main material of the study was the data obtained from 186 pomegranate producers in Siirt province and its districts by survey method. The total pomegranate orchard area in the research area was calculated as 98.80 ha and the average pomegranate production area was calculated as 0.53 ha. The total number of trees was 62,889 and the average number of trees per hectare was 635. The total production amount was determined as 3,445.50 tons, the average pomegranate yield was 34,856.37 kg ha⁻¹ and average yield per tree was 55.25 kg. Gross production value, variable costs and gross profit were found as 278,850.96 TL ha⁻¹, 73,245.88 TL ha⁻¹ and 205,605.08 TL ha⁻¹, respectively. Since the energy use efficiency is higher than 1, it is possible to say that the inputs are used efficiently, but this ratio can be increased by using more efficient inputs.

Keywords: Gross profit, input use, pomegranate production, Siirt

Not: Bu çalışma Siirt Üniversitesi BAP tarafından 2022-SİÜZİR-029 nolu proje ile desteklenmiştir.

GİRİŞ

Tarım sektörü, besin maddeleri ihtiyacının karşılanması, tarıma dayalı sanayinin hammadde kaynağını oluşturması, insanlara istihdam imkânı sağlaması, dışa bağımlılığın azaltılması ve ödemeler dengesine olumlu etkilerinin olması nedeniyle, ülke ekonomileri için önemli bir sektördür (Er, 2016). Bu bağlamda, Türkiye’de de tarım, gayri safi yurt içi hasılaya katkıda bulunması ve istihdam yaratması açısından önemini korumaya devam etmektedir. Türkiye’nin ekonomisine bakıldığında tarımın payı, sanayi ve hizmetler sektöründeki büyümeden dolayı giderek düşmesine rağmen toplam üretim ve istihdamdaki payı birçok ülkeye göre daha fazladır (Anonim, 2013).

Dünyada giderek büyüyen açlık sorunu, Türkiye’de ise hızla artan nüfusun yeterli beslenememesi ve tarımın ekonomiye olan katkısını artırma gereği, üretim artışı konusunda tarım uzmanlarının daha çok çaba harcamaları sonucunu ortaya çıkarmaktadır. Üretim artışı için yeni tarım alanları elde etme olanağı bulunmadığından, verimi yükseltmek, üretimi artırmanın tek yolu olarak görülmektedir. Tarımda girdi kullanımı, üretim miktarının artmasında ve kalitenin yükseltilebilmesinde en önemli unsurdur. Toprak, işgücü ve sermayeyi etkin hale getiren unsur tarımsal girdilerdir. Bitkisel üretim faaliyetinde kullanılan girdiler; tohum, gübre, tarım ilacı, tarım alet ve makineleri, sulama ve tarımsal kredilerdir. Gereğinden fazla ve hatalı biçimde kullanılan girdilerin, ürün kalitesi yanında toprak ve su kirlenmesine yol açabilen olumsuz etkileri de bulunmaktadır (Çelik, 2000).

Tarımsal üretimin temel amacı, tarım işletmelerinin kendi koşullarına göre toprak, iklim, su, bitki ve insan gücü kaynaklarının en verimli ve en uyumlu bir şekilde kullanılmasını sağlamak suretiyle işletmenin üretim miktarını, verimliliğini arttırmak ve çiftçinin harcanabilir gelir düzeyini yükselterek tarım işletmelerini güçlendirmek ve ulusal gelire katkılarına arttırmaktır. Her üretim faaliyetinde, üretim faktörlerinin en uygun fiyat ile temin edilmesi ve optimum düzeyde kullanımı, hem verimi artırıcı, hem de maliyetleri düşürücü yönde etki yapmaktadır. Üreticiler, gerek işletme sermayelerindeki yetersizlikler ve gerekse teknik bilgi eksikliği nedeniyle tarımsal üretim faktörlerini optimum düzeyde kullanamamakta ve bu durum ürün verimini ve dolayısıyla çiftçi gelirini olumsuz etkilemektedir (Gündoğmuş, 1997).

Verimlilik kavramı 1830’lu yıllarda ortaya çıkmış bir kavram olup, bu kavramın kalitatif nitelikten ayrılıp kantitatif bir hale gelmesi 19. yüzyılın sonları ve 20. yüzyılın başlarında mümkün olmuştur (Pirinçioğlu,1988). Genel olarak verimlilik kıt kaynakların etkin kullanımıyla yakından ilgili bir kavramdır (İnan, 2016). Üretimde “verimlilik”, üretilen çıktı

miktarının kullanılan girdi miktarına oranıdır. Tarımsal üretimde verimlilik, birim alandan elde edilen ürün miktarı ya da birim alandan elde edilen tarımsal üretim değeri olarak anlaşılmaktadır (Şahin ve ark., 2010).

Tarım sektörünün diğer sektörlerle sermaye ve işgücü transfer etmesi, hammadde ve ürün ihtiyacını karşılaması açısından ekonomik kalkınmaya önemli katkıları vardır. Günümüzde küresel ısınmanın giderek artması ve su kaynaklarının giderek azalması tarım sektörünün önemini daha da arttırmaktadır. Uluslararası rekabet ve gıda alanında kendi kendine yeten ülkeler arasında olabilmek için tarım sektörünün etkinliğinin ve verimliliğinin artırılması gerektiği ortaya çıkmaktadır (Avcı ve Kaya, 2008). Artan nüfusun gıda talebinin karşılanabilmesi, çiftçilerin yaşam standartlarının artırılabilmesi, tarımın daha etkin hale getirilebilmesi ve tarımsal kalkınmanın sağlanabilmesi bakımından yeni teknolojilerin adaptasyonu ile birlikte üretim faktörlerinin verimli ve etkin kullanılması büyük önem taşımaktadır. Nar güzelliğın, bolluk ve bereketin simgesi olan, milattan önce yetiştirilmeye başlayan ve günümüze kadar önemini koruyan kırmızı taneli meyve olarak bilinir. Punicaceae ailesinde yer alan ve latince ismi *Punica Granatum L* olan narın anavatanı Asya olup, kullanım çeşitliliği olarak oldukça geniş bir yelpazeye sahiptir (Şenocak, 2016). Tropik ve subtropik iklim meyvesi olarak bilinmekle birlikte sıcak ve ılıman iklim bölgelerinde de sınırlı bir şekilde yetişebilen narın dünyada ve Türkiye'deki üretim ve tüketim miktarı her geçen gün artmaktadır (Şahin, 2013).

Yıllar boyu nar meyvesi gerek sanayi gerek ilaç gerekse gıda alanlarında kullanılarak insan yaşamındaki öncülüğünü korumuştur. B1, B2, C vitamini, fosfor, potasyum, demir, karbonhidrat ve protein açısından oldukça zengindir (Şenocak, 2016). Meyvenin kabuğundan ve çekirdeğinden farklı çeşitlerde faydalanılmakta, kan şekeri seviyesini düzenleyici, tansiyon dengeleyici, ishal, dizanteri, mide iltihabı gibi birçok hastalığı önleyici ve tedavi edici özelliği bulunmaktadır (Gündoğdu ve Yılmaz, 2013). Nar meyvesi ülkemizde genelde taze olarak tüketilmesinin yanında nar suyu, şurup, nar ekşisi, reçel, nar tane kurusu, konserve, şarap, likör vb. şekillerde tüketilmektedir. Salatalara ve yemeklere renk ve tatlandırıcı olarak genellikle nar ekşisi kullanılmaktadır. Yemek sektörü dışında ilaç, kozmetik, kimya sanayinde mürekkep, boya, sirke, sitrik asit, kolonya üretiminde faydalanılmaktadır. Narın dallarından örme sepet, çekirdeklerinden ise baharat üretilmektedir (Güler, 2016)

Nar, insan sağlığına faydalarının yanında ülke ekonomileri açısından da oldukça önemli bir üründür. Tüketiciler açısından geniş ürün yelpazesıyla zevk ve alışkanlıklara uygun olarak mayhoş, tatlı ya da çekirdeksiz gibi türevlere sahip olan nar, üreticiler açısından uygun koşullar

sağlandığında uzun süre depolanabildiği için gerek iç pazarda, gerekse ihracattaki önemiyle de dikkat çekmektedir (Anonim, 2011). Birleşmiş Milletler Gıda ve Tarım Teşkilatı (FAO) 2022 yılı verilerine göre, dünyada toplam 126.441 ton nar üretimi yapılmaktadır. Nar tarımı, Hindistan, İran, Çin ve Türkiye başta olmak üzere dünyanın birçok bölgesinde yapılmaktadır (FAO, 2022). Türkiye’de 2022 yılında 29.069,70 ha toplam nar üretim alanı, 16.170.063 adet toplam ağaç sayısı bulunmakta olup, 681.460 ton nar elde edilmiş ve ağaç başına verim ortalama 48 kg’dır. Bölgelere göre nar üretim miktarı incelendiğinde 402.635 ton ile Akdeniz Bölgesi birinci, 162.601 ton ile Ege Bölgesi ikinci ve 97.865 ton ile Güneydoğu Anadolu Bölgesi üçüncü sırada yer almaktadır. Çizelge 1’e baktığımızda nar üretiminde ilk beş sırada yer alan iller sırasıyla Antalya (173.058 ton), Mersin (102.690 ton), Adana (88.231 ton), Muğla (71.374 ton), ve Denizli (52.450 ton)’dir (TÜİK, 2022a).

Çizelge 1. Bölgeler itibariyle nar üretimi

Bölgeler	Meyve veren yaşta ağaç sayısı	Meyve vermeyen yaşta ağaç sayısı	Toplu meyvelik alanı (ha)	Üretim miktarı (ton)	Verim (kg/ağaç)
Akdeniz-TR6	6.993.842	595.063	14.352,10	402.65	58

TÜRKİYE	14.133.177	2.036.886	29.069,70	681.460	48

Güneydoğu Anadolu Bölgesi’nin bütün illerinde nar yetiştiriciliği yapılmaktadır. Zivzik narı, Hicaz narı, Katırbaşı, Dicle narı, Bori, Şekerek, Mayhoş, Barut, Urfa narı, Karaköprü narı, Seyfi narı, Katina narı, Derik narı ve Oğuzeli narı önemli yerel veya standart çeşitlerdir. Zivzik narı meşhur olanların başında yer almaktadır. Zivzik narı ismini yetiştigi bölge olan Siirt ili Şirvan ilçesine bağlı Zivzik (Dişlinar) köyünden alan bol sulu, eşsiz aromalı, iç pazarda tüketiciler tarafından çok tercih edilen, depolama ömrü uzun, şifa kaynağı bir meyvedir. Bir

Zivzik narı ortalama 200 ile 800 gram arasında olup, meyve taneleri nohut büyüklüğünde, çekirdeği küçük ve yumuşaktır. Asit oranı düşük ve tadı mayhoş olup uzun süre bozulmamakta ve tüketiciler tarafından pazarda tercih edilmektedir (Şimşek ve Yücel, 2015)

Siirt'in iklim özellikleri incelendiğinde nar yetiştiriciliğine çoğunlukla uygun bir il olduğu görülmektedir. Siirt'te 2022 yılında toplam 6.143 ton nar üretimi gerçekleşmiş olup, üretim miktarı bakımından Siirt, Türkiye'de 14., Güneydoğu Anadolu Bölgesi'nde ise 3. sırada yer almaktadır. En fazla nar üretimi Pervari ilçesinde (3.612 ton) gerçekleşmiş olup, bunu sırasıyla Eruh (899 ton), Tillo (772 ton), Şirvan (444 ton), Baykan (218 ton) ve Merkez (169 ton) ilçeleri takip etmektedir. İlde ağaç başına ortalama nar verimi 32 kg'dır. Toplu meyvelik alanı 1.005,40 ha, toplam nar ağaç sayısı 229.108 adet olup bunun 192.793 adedi meyve veren yaşta, 36.315 adedi ise meyve vermeyen yaştaki ağaçlardan oluşmaktadır (TÜİK, 2022a)

Bu çalışmada, Siirt ili Zivzik narı üretiminde uygulanan işlemler ve kullanılan girdiler incelenmiştir. Kullanılan girdilerin ve elde edilen çıktılarının kullanımı ve brüt kar analizi yapılmıştır. Çalışma sonucunda belirlenen bulgu ve etkinlik göstergelerine bağlı olarak, mevcut üretimin iyileştirilmesine yönelik çözüm önerileri verilmiştir.

MATERYAL VE METOT

Materyal

Araştırmanın ana materyalini Siirt il ve ilçelerinde nar üretimi yapan üreticilerden anket yöntemiyle elde edilen veriler oluşturmuştur. Bunların dışında, İl Tarım ve Orman Müdürlüğü kayıtları, Çevre, Şehircilik ve İklim Değişikliği İl Müdürlüğü kayıtları, Türkiye İstatistik Kurumu (TÜİK), Birleşmiş Milletler Tarım ve Gıda Örgütü (FAO) istatistiki verilerden yararlanılmıştır. Ayrıca konuyla ilgili olarak Türkiye'de ve diğer ülkelerde daha önce yapılan araştırmalardan elde edilen bilgilerden de yararlanılmıştır.

Siirt ilinin coğrafi yapısı

Güneydoğu Anadolu Bölgesi'nde yer alan Siirt ili kuzeyden Batman ve Bitlis, batıdan Batman, güneyden Mardin ve Şırnak, doğudan Şırnak ve Van illeri ile çevrilidir. Siirt ili 41° 57' doğu boylamı ve 37° 55' kuzey enlemi üzerinde bulunur. Siirt ili topraklarının büyük bir bölümü dağlarla kaplıdır; kuzeyde Muş Güneyi Dağları, doğuda Siirt Doğusu Dağları ilin doğal sınırlarını oluşturan sıradağlardır. Ova benzeri düzlüklerin Kurtalan ilçesinde yer aldığı Siirt'te doğuya doğru gidildikçe yükselen dağlardan, Pervari ilçesinin Yazlıca (Herekol) Dağı 2943 m,

Körkandil Dağı 2821 m, Şirvan Bekravi Dağı 2650 m, Hastelli Dağı 2700 m, Çıraf Dağı 2268 m'lik belli başlı yükseltilerindedir (Özyazıcı ve ark., 2014).

Siirt, dört mevsimin en belirgin özellikleriyle yaşandığı bir ildir. Genel olarak karasal iklim hüküm sürmektedir. Yazları sıcak ve kuraktır. Haziran ve Ekim ayları arasında pek yağış görülmez. İlin doğu ve kuzey bölgelerinde kışlar daha sert ve yağışlı, güney ve güneybatı bölgelerinde ise ılık geçer. Gece ile gündüz arasındaki sıcaklık farkı fazladır. Rüzgârlar geceleri doğu ve kuzeydoğudan, gündüzleri güney ve güneybatıdan, kışın ise genellikle kuzey ve kuzeybatıdan eser (Anonim, 2005).

Siirt ilinin arazi kullanım durumu Çizelge 2'de verilmiştir. Siirt ilinde tarımsal alanın toplam alan içindeki payı %18,29, ormanlık alanın payı %55,02, çayır-mera alanlarının payı %5,19, tarım dışı alanların payı %21,50 olarak bulunmuştur (Anonim, 2017).

Çizelge 2. Siirt ilinde arazi kullanım durumu

Arazi kullanımı	Alan (ha)	%
Tarımsal alan	102.894	18,29
Ormanlık alan	309.603	55,02
Çayır-Mera	29.233	5,19
Tarım dışı alan	120.975	21,50
Toplam	562.705	100,00

Siirt ilinin tarımsal yapısı

Siirt ilinde tarım arazilerinin kullanım durumu Çizelge 3'te verilmiştir. İlde toplam 102.894 hektar alanda tarımsal üretim yapılmaktadır. Bu alanın 39.650 hektarını hububat ekim alanı, 15.965 hektarını nadas ve kıraç araziler, 31.745 hektarını bağ-bahçe, 6.865 hektarını yem bitkileri, 6.200 hektarını yemelik tane baklagiller, 2.469 hektarını endüstri bitkileri alanı oluşturmaktadır (Anonim, 2017).

Çizelge 3. Siirt ilinde tarım arazilerinin kullanım durumu

Tarımsal araziler (ha)	Merkez	Tillo	Baykan	Eruh	Kurtalan	Pervari	Şirvan	Toplam
Hububat Alanı	4.175	160	2.200	3.100	27.500	1.400	1.115	39.650
Nadas ve Ekim Yapılmayan Araziler	2.100	1.000	2.315	150	8.000	800	1.600	15.965
Kıraç Araziler	400	10	200	500	1.000	100	90	2.300
Sebze Alanı (Örtü Altı Dâhil)	400	10	200	500	1.000	100	90	2.300
Meyve Alanı	9.500	2.800	1.900	3.150	5.000	1.100	3.000	26.450
Bağ Alanı	200	125	550	650	1.100	70	300	2.995

Metot

Örnekleme aşamasında kullanılan metot

Anket çalışması Siirt'te nar üretiminin yoğun olduğu ilçe ve köylerindeki tarımsal işletmelerde yürütülmüştür. Tarım ve Orman İl Müdürlüğü'nden Çiftçi Kayıt Sistemine kayıtlı nar üretimi yapan toplam üretici sayılarına ilişkin bilgiler elde edilmiştir. Çiftçi Kayıt Sistemine kayıtlı nar üretimi yapan toplam üretici sayısının 186 olduğu saptanmıştır. Ana kitle sayısının az olması nedeniyle tam sayım yöntemi kullanılmış olup 186 üretici ile anket çalışması gerçekleştirilmiştir.

Verilerin toplanması aşamasında kullanılan metot

Araştırma verileri belirlenen ilçelerdeki üreticilerle yüz yüze görüşmek suretiyle anket yapılarak toplanmıştır. Anket, nar üretiminde uygulanan işlemler, tarımsal mekanizasyon uygulamalarının işlem sayıları ve süreleri, kullanılan ekipmanlar, her bir üretim faaliyetinde kullanılan işgücü miktarı, diğer tarımsal girdilerin miktar ve bedelleri, ürün verimi, satış fiyatı, ekim alanı gibi verileri kapsamaktadır.

Ekonomik analiz

Ekonomik analiz kapsamında nar üretiminden elde edilen verim, brüt üretim değeri, yapılan değişken masraflar ve brüt kâr belirlenmiştir. Değişken masraflar; işgücü, çeki gücü, gübre, zirai mücadele masrafları, elektrik ve su ücretleri, pazarlama ve taşıma masraflarının yanında değişken masraflar faizinden oluşmaktadır. Döner sermaye faizinin hesaplanmasında

T.C. Ziraat Bankasının bitkisel üretim kredilerine uyguladığı faiz oranı dikkate alınmıştır. Gayrisafi üretim değerini hesaplanmasında, çiftçi eline geçen ürünün satış fiyatı dikkate alınmıştır. Brüt kar, gayrisafi üretim değerinden değişken masraflar çıkarılarak hesaplanmıştır (Kıral ve ark., 1999).

BULGULAR VE TARTIŞMA

Siirt ilinde, 186 adet nar üreticisi ile yapılan anketlerden elde edilen veriler, yöntem bölümünde verilen sıralama esas alınarak ilgili eşitliklerin kullanılmasıyla değerlendirilmiştir. Elde edilen bulgular ilerleyen bölümlerde verilmiştir.

Nar Üretiminde Girdi Kullanımı

Nar üretimi ile ilgili istatistiki bilgiler Çizelge 4'te verilmiştir. Araştırma alanında 186 üreticinin toplam nar bahçesi alanı 98,80 ha ve ortalama nar üretim alanı 0,53 ha olarak hesaplanmıştır. Toplam ağaç sayısı 62.889 adet ve ortalama ağaç sayısı 635 adet/ha olarak bulunmuştur. Toplam üretim miktarı 3.445,50 ton olarak belirlenmiş, ortalama nar verimi 34.856,37 kg/ha, ağaç başına verim ortalama 55,25 kg olarak bulunmuştur. Nar ile ilgili yapılan önceki çalışmalarda, Akcaöz ve ark. (2009) ortalama nar verimini 23.350 kg/ha, ortalama ağaç sayısını 616,5 adet/ha olarak bulmuşlardır. Çanakçı (2010) nar verimini 35.118,67 kg/ha, Houshyar ve ark. (2017) 17.308,10 kg/ha olarak belirlemişlerdir. Özalp ve Yılmaz (2013) ortalama nar verimini 19.698,80 kg/ha, ağaç başına ortalama nar verimini 45,53 kg olarak belirlemişlerdir. Araştırma sonucunda elde edilen verim değerleri Akcaöz ve ark. (2009), Özalp ve Yılmaz (2013) ve Houshyar ve ark. (2017) tarafından elde edilen değerlerden yüksek olarak bulunurken, Çanakçı (2010) tarafından elde edilen sonuçla benzerlik göstermiştir. Türkiye'de 2022 yılında ağaç başına ortalama nar verimi 48 kg olarak belirlenmiştir (TÜİK, 2022a). Araştırma sonucu elde edilen ağaç başına ortalama nar verimi Türkiye ortalamasından daha yüksek bulunmuştur.

Çizelge 4.Nar üretimi ile ilgili istatistikler

Nar üretim verileri	Ortalama
İşletme sayısı (adet)	186,00
Toplam nar üretim alanı (ha)	98,80
Ortalama nar üretim alanı (ha)	0,53
Toplam ağaç sayısı	62.889
Ortalama ağaç sayısı (adet/ha)	635,00
Toplam üretim miktarı (ton)	3.445,50
Verim (kg/ha)	34.856,37
Ağaç başına ortalama verim (kg)	55,25

Nar üretiminde uygulanan tarımsal işlemlere ait bilgiler Çizelge 5’te verilmiştir. Nar üretim işlemleri, toprak işleme, sulama, gübreleme, ilaçlama, budama ve hasat işlemlerinden oluşmaktadır. Toprak işleme uygulamaları Kasım ve Haziran ayları arasında ortalama 3 defa yapılmış ve traktör, kazayağı, kültivatör, tırmık ve çapalama makinesi kullanılmıştır. Sulama işlemleri Nisan ve Eylül ayları arasında ortalama 40 kez yapılmış ve pompa ve insan iş gücünden yararlanılmıştır. Gübreleme uygulamaları Eylül ve Temmuz ayları arasında ortalama 4 kez yapılmış ve insan işgücü ve gübreleme makinesi kullanılmıştır. İlaçlama işlemleri Eylül ve Temmuz ayları arasında ortalama 3 kez yapılmış ve işlemlerde pülverizatör ve insan işgücü kullanılmıştır. Budama işlemleri Aralık ve Şubat ayları arasında ortalama 2 kez yapılmış ve insan iş gücü kullanılmıştır. Hasat işlemleri Ekim ve Kasım ayları arasında insan işgücü kullanılarak yapılmış ve taşımada traktör kullanılmıştır.

Çizelge 5 Nar üretiminde tarımsal işlemler ve kullanılan ekipmanlar

Tarımsal işlem	Kullanılan ekipman	İşlem sayısı	İşlem dönemi
Toprak İşleme	Kazayağı, kültivatör, tırmık, çapalama makinesi	3	Kasım-Haziran
Sulama	İnsan işgücü, pompa	40	Nisan-Eylül
Gübreleme	İnsan işgücü, Gübreleme makinesi	4	Eylül-Temmuz
İlaçlama	İnsan işgücü, Pülverizatör	3	Eylül-Temmuz
Budama	İnsan işgücü	2	Aralık-Şubat
Hasat	İnsan işgücü, traktör	1	Ekim-Kasım

Nar üretiminde tarımsal işlemlere göre kullanılan girdiler ve miktarları Çizelge 6'da verilmiştir. Toprak işleme, içerisinde insan işgücü girdi değeri ortalama 14,91 h/ha, çeki gücü girdi değeri ortalama 14,91 h/ha hesaplanmıştır. Toprak işleme, 1. sürüm, 2. sürüm ve çapalama tarımsal uygulamalarından oluşmakta olup, bu faaliyetler esnasında harcanan yakıt miktarı 74,60 l/ha olarak belirlenmiştir. Gübreleme girdileri içerisinde insan işgücü, çeki gücü, azot, fosfor, potasyum, kükürt, çiftlik gübresi ve yakıt yer almaktadır. Gübreleme işleminde insan işgücü girdi değeri ortalama 27,07 h/ha, çeki gücü değeri 11,37 h/ha, azot miktarı 284,19 kg/ha, fosfor miktarı 320,92 kg/ha, potasyum miktarı 113,56 kg/ha, kükürt miktarı 113,56 kg/ha, çiftlik gübresi 14.089,54 kg/ha ve harcanan yakıt miktarı 52,13 kg/ha olarak bulunmuştur. İlaçlama işlemlerinde insan işgücü kullanımı 19,38 h/ha, çeki gücü kullanımı 10,30 h/ha, İnsektisit kullanımı 30,34 kg/ha, fungusit kullanımı 24,63 kg/ha ve yakıt kullanımı 50,52 l/ha olarak belirlenmiştir. Sulama işlemleri içerisinde insan işgücü, su ve elektrik girdileri yer almakta olup, insan işgücü girdi değeri 553,33 h/ha, sulama suyu miktarı m³/ha ve harcanan elektrik 576,80 kWh/ha olarak bulunmuştur. Budama işlemleri çoğunlukla insan işgücü ile yapılmakta olup insan işgücü girdi değeri 67,89 h/ha olarak hesaplanmıştır. Hasat-taşıma işlemleri insan işgücü kullanımı 409,95 h/ha, çeki gücü kullanımı 6,72 h/ha ve yakıt tüketimi 35,11 l/ha olarak bulunmuştur.

Çizelge 6. Nar üretiminde tarımsal işlemlere göre kullanılan girdi miktarları

Girdi	Birim	Ortalama (birim/ha)
Toprak İşleme		
İnsan işgücü	h/ha	14,91
Çeki gücü	h/ha	14,91
Yakıt	l/ha	74,60
Gübreleme		
İnsan işgücü	h/ha	27,07
Çeki gücü	h/ha	11,37
Azot (N)	kg/ha	284,19
Fosfor (P ₂ O ₅)	kg/ha	320,92
Potasyum (K ₂ O)	kg/ha	113,56
Kükürt (S)	kg/ha	244,82
Çiftlik gübresi	kg/ha	14.089,54
Yakıt	l/ha	52,13
İlaçlama		
İnsan işgücü	h/ha	19,38
Çeki gücü	h/ha	10,30
İnsektisit	kg/ha	30,34
Fungusit	kg/ha	24,63
Yakıt	l/ha	50,52
Sulama		
İnsan işgücü	h/ha	553,33
Sulama suyu	m ³ /ha	630,94
Elektrik	kWh/ha	576,80
Budama		
İnsan işgücü	h/ha	67,89
Hasat		
İnsan işgücü	h/ha	409,95
Çeki gücü	h/ha	6,72
Yakıt	l/ha	35,11

Brüt Kâr Analizi

İncelenen işletmelerde nar üretim faaliyetine ilişkin değişken masraflar Çizelge 7’de verilmiştir. Değişken masraflar 73.245,88 TL/ha olarak bulunmuş olup, masraflar içinde %36,71 ile gübre masrafları ilk sırada yer almaktadır. Bunu %29,83 ile işgücü masrafları,

%13,58 ile ilaç masrafları, %7,41 ile döner sermaye faizi, %5,22 ile çeki gücü masrafları, %4,13 ile su masrafları, %1,71 ile pazarlama masrafları ve %1,42 ile elektrik masrafları izlemektedir. Gayri safi üretim değeri 278.850,96 TL/ha ve brüt kâr 205.605,08 TL/ha olarak bulunmuştur. Çanakçı (2010) araştırmasında nar üretiminde değişken masraflar içinde en yüksek payı alan girdilerin işgücü ve gübre masrafları olduğunu belirlemiştir. Özalp ve Yılmaz (2013) Antalya ilinde nar üretimi üzerine yaptıkları çalışmada gübre ve işgücü masraflarının değişken masraflar içinde en yüksek payı alan girdiler olduğunu belirlemişlerdir. Troujeni ve ark. (2018) araştırmalarında nar üretiminde değişken masraflar içinde en yüksek payı işgücü masraflarının aldığını bulmuşlardır. Araştırma sonucunda elde edilen bulgular Çanakçı (2010), Özalp ve Yılmaz (2013) ve Troujeni ve ark. (2018) literatürleriyle benzerlik göstermektedir.

Çizelge 7. Nar üretiminde değişken masraflar ve brüt kâr

Masraf kalemleri	TL/ha	%
İşgücü Masrafları	21.850,60	29,83
Çeki Gücü Masrafları	3.822,48	5,22
Gübre	26.884,98	36,71
İlaç	9.945,45	13,58
Su	3.028,51	4,13
Elektrik	1.038,24	1,42
Pazarlama	1.250,00	1,71
Döner Sermaye Faizi	5.425,62	7,41
Değişken Masraflar	73.245,88	100,00
Verim (kg/ha)	34.856,37	
Satış Fiyatı (TL/kg)	8,00	
Gayri Safi Üretim Değeri (TL/ha)	278.850,96	
Brüt Kâr (TL/ha)	205.605,08	

SONUÇ VE ÖNERİLER

Yapılan çalışma kapsamında Siirt ilinde nar üretimi yapan 186 üretici ile yapılan anketler ile elde edilen veriler değerlendirilerek nar üretiminde girdi kullanımı belirlenmiş, enerji analizi yapılmış ve brüt kar analizi hesaplanmıştır. Araştırmada elde edilen sonuçlar özetlenmiş ve maddeler halinde aşağıda verilmiştir.

- ✓ Araştırma alanında toplam nar bahçesi alanı 98,80 ha ve ortalama nar üretim alanı 0,53 ha olarak hesaplanmıştır.
- ✓ Toplam ağaç sayısı 62.889 adet ve ortalama ağaç sayısı 635 adet/ha olarak bulunmuştur.
- ✓ Toplam üretim miktarı 3.445,50 ton olarak belirlenmiş, ortalama nar verimi 34.856,37 kg/ha, ağaç başına verim ortalama 55,25 kg olarak bulunmuştur.
- ✓ Nar üretim işlemleri, toprak işleme, sulama, gübreleme, ilaçlama, budama ve hasat işlemlerinden oluşmaktadır.
- ✓ Araştırma alanında incelenen işletmelerde bir hektar nar bahçesinde 1.092,53 saat işgücü kullanılmıştır. Nar üretiminde harcanan işgücünün %50,65'i sulamada, %37,52'si hasatta, %6,21'i budamada, %2,48'i gübrelemede, %1,77'si ilaçlamada, %1,36'sı toprak işlemede kullanılmıştır.
- ✓ Bir hektar nar bahçesinde ortalama traktör kullanımı 43,30 saat olarak bulunmuştur. Nar üretiminde harcanan çeki gücünün %34,43'ü toprak işlemede, %26,26'sı gübrelemede, %23,79'u ilaçlamada, %15,52'si hasatta kullanılmıştır.
- ✓ Bir hektar nar bahçesinde ortalama 212,36 l mazot kullanıldığı tespit edilmiştir.
- ✓ Bir hektar nar bahçesinde ortalama 14.089,54 kg çiftlik gübresi kullanıldığı tespit edilmiştir. Söz konusu işletmelerde gübre kullanımında ilk sırayı amonyum sülfat (Şeker) gübresi almakta olup, diğer gübreler ise DAP (18-46) ve potasyum sülfat gübreleridir.
- ✓ İşletmeler ortalaması olarak bir hektar nar bahçesinde 284,19 kg azot, 320,92 kg fosfor, 113,56 kg potasyum, 244,82 kg kükürt uygulaması yapılmıştır.
- ✓ Bir hektar nar bahçesinde ortalama 30,34 kg/ha insektisit, 24,63 kg/ha fungusit kullanılmıştır.
- ✓ Araştırma bölgesinde bir hektar nar bahçesinde ortalama 630,94 m³/ha sulama suyu, 576,80 kWh elektrik kullanılmıştır.
- ✓ Gayri safi üretim değeri 278.850,96 TL/ha, değişken masraflar 73.245,88 TL/ha ve brüt kâr 205.605,08 TL/ha olarak bulunmuştur.

Öneriler

Çalışmada elde edilen bulgular doğrultusunda aşağıda yer alan önerilerde bulunmak mümkündür.

- ✓ Enerji kullanım etkinliği 1'den yüksek olduğu için girdilerin etkin kullanıldığını söylemek mümkündür ancak daha etkin girdi kullanımıyla bu oranın artması

sağlanabilir. Bölgede nar üretiminde yüksek verime sahip nar çeşitlerinin yaygınlaştırılması, enerji kullanım etkinliğinin artmasına katkı sağlayacaktır.

- ✓ Hem enerji kaynakları hem sera gazı emisyonu içinde en yüksek payı gübre girdisinin aldığı görülmüştür. Gübre uygulamaları en fazla çevre kirleticiler oldukları için, toprak analizleri iyi yapılmalı, gübre uygulamalarını (özellikle azotlu gübre) azaltıcı önlemler alınmalıdır. Ayrıca yenilenebilir enerji kaynaklarının artırılabilmesi için kimyasal gübre kullanım oranının azaltılması ve çiftlik gübresi veya organik gübre kullanımının arttırılması sağlanmalıdır.
- ✓ Kaynakların korunumu ve fosil yakıtların doğrudan veya dolaylı kullanımıyla ortaya çıkan çevresel sorunların etkin bir şekilde önlenmesi açısından yenilenebilir enerji kaynaklarının tarımda kullanımını yaygınlaştırmak önemlidir. Dünya genelinde önemli bir pazar haline gelen organik tarımsal üretim ile araştırma bölgesinde nar üretiminde fosil kaynaklı yakıtların tarımsal amaçlı olarak kullanımı azaltılabilir.
- ✓ Yenilenemeyen enerji kaynaklarının neden olduğu etkiler ve çevre ile uyumlu sürdürülebilir tarım konularında çiftçilerin bilinçlendirilmesi önemlidir.
- ✓ Kimyasal gübre, toprak analizi ve ilaç kullanımı konularında eğitim yayım faaliyetlerinin arttırılması önem arz etmektedir.
- ✓ Oluşabilecek çevresel riskleri azaltmak için üreticiler tarım sigortaları konusunda bilinçlendirilmelidir.
- ✓ Üreticiler daha yüksek verim ve kalite sağlayacak dikim şekilleri konusunda bilgilendirilmelidir.
- ✓ İşletmelerin verimliliği, ucuz girdi temini, kredi kullanımı ve pazarlama olanaklarının sağlanması için nar üretici birliklerinin yaygınlaştırılması ve üreticilerin daha organize bir şekilde pazara girebilmesi önemlidir.
- ✓ İyi tarım uygulamaları ile ilaç, gübre ve sulama suyu uygulamaları kontrollü bir şekilde yapılmaktadır. Bilinçli ilaç ve gübre kullanımı hem çevrenin zarar görmesinin hem de girdi israfının önüne geçmektedir. Bu bağlamda iyi tarım uygulamalarının nar üreticileri tarafından benimsenmesi sağlanmalıdır.

ÖZET

Bu çalışmada, Şırnak ilinin tahıl sap atık potansiyelinin belirlenmesinde, Şırnak, Tarım ve İl Müdürlüğü' nün 2022 yılı bitkisel üretim istatistiklerinden (İVA), yararlanılmıştır. Şırnak ili 2022 yılına ait kullanılabilir bazı tahıl (buğday, mısır, mercimek, arpa ve yonca) sap atık değerlerinden elde edilebilecek organik atık miktarı (ton/yıl), organik atıklardan elde edilebilecek kuru madde miktarı (ton/yıl), kuru maddeden temin edilebilecek uçucu kuru madde miktarı, toplam metan miktarı (m³/yıl) ve metan gazından elde edilebilecek enerji potansiyel değerleri belirlenmiştir. Yapılan hesaplamalar sonucunda tahıl sap atık miktarı 43.16,797 ton/yıl, ortalama kuru madde miktarı 3798,779 ton/yıl, uçucu kuru madde miktarı 3755,611ton/yıl, toplam metan üretim potansiyeli 938,904 m³/yıl ve enerji potansiyeli ise 33.800,509 MJ/yıl olarak belirlenmiştir.

Anahtar Kelimeler: Tarımsal Atık, Tahıl Sapı, Metan Potansiyeli, Enerji Potansiyeli, Şırnak

**ANALYSIS OF SOME ENERGY VALUES OF GRAIN STEM WASTES GROWN IN
ŞIRNAK PROVINCE**

ABSTRACT

In this study, 2022 plant production statistics (IVA) of Şırnak, Agriculture and Provincial Directorate were used to determine the grain straw waste potential of Şırnak province. The amount of organic waste that can be obtained from the straw waste values of some usable grains (corn, oats, wheat, barley, lentils and alfalfa) for 2022 in Şırnak province, the amount of dry matter that can be obtained from organic wastes (tons / year), dry matter The amount of volatile dry matter that can be supplied, the total amount of methane (m³/year) and the energy potential values that can be obtained from methane gas were determined. As a result of the calculations, the amount of grain straw waste is 43,16,797 tons/year, the average dry matter amount is 3798,779 tons/year, the amount of volatile dry matter is 3755,611 tons/year, the total methane production potential is 938,904 m³/year, and the energy potential is 33,800,509. Determined as MJ/year.

Keywords: Agricultural Waste, Grain Stalk, Methane Potential, Energy Potential, Şırnak.

GİRİŞ

Dünyada enerji kaynaklarına olan ihtiyaç her geçen gün artarak devam etmektedir. Özellikle gelişmekte olan ülkelerde nüfus artışı, sanayileşme, insanların refah seviyesinin yükselmesi ve teknolojik gelişmelere paralel olarak önümüzdeki yıllarda enerji talebi daha da yoğun olacaktır. Fosil enerji kaynaklarının dünyada ciddi çevre sorunlarına yol açması, rezervlerinin yakın gelecekte tükenecek olması, kaynak ülkelere bağımlılığın çeşitli siyasi ve ekonomik sorunlara yol açması ve fiyat istikrarsızlıkları gibi nedenlerden dolayı yenilenebilir enerji kaynaklarına olan ilgi artmıştır. Özellikle gelişmiş ülkelerde yenilenebilir enerji kaynakları olan hidrolik, rüzgar, jeotermal, güneş, biyokütle, dalga, hidrojen vb. enerji kaynaklarından başta elektrik üretimi olmak üzere çeşitli yollarla yararlanılmaktadır. Tüm bu gelişmelere rağmen fosil enerji kaynaklarının dünya birincil enerji kaynakları tüketimindeki üstünlüğü tartışmasız bir şekilde devam etmektedir ve kısa vadede bu üstünlüğünü korumaya devam edecektir. Gelişmekte olan bir ülke olan Türkiye'nin de artan nüfus ve büyüyen ekonomisine paralel olarak enerji kaynakları tüketimi yükselerek devam etmektedir. Mevcut enerji yapısı % 72 oranında dışa bağımlı olan Türkiye, bu oranı azaltabilmek için bir yandan sınırları içinde fosil enerji kaynakları hammaddesi arama çalışmaları yürütürken, diğer yandan da yenilenebilir enerji kaynaklarının potansiyelinin belirlenmesi ve kullanımı konusunda çalışmalar yapmaktadır. Bu şekilde ithal enerji kaynaklarına olan bağımlılık azalırken, enerji kaynakları da çeşitlendirilecektir.

Türkiye sahip olduğu coğrafi yapısı ve ekolojik koşulları sayesinde, ürün çeşitliliği ve miktarı yönünden tarımsal üretimde büyük bir potansiyele sahiptir. Tarımsal üretim ile birlikte budama, bakım ve hasat işlemleri sırasında fazla miktarda tarımsal artık meydana gelmektedir. Tarımsal artıklar arazide büyük sorunlar yaratmaktadır. Bu yüzden etkili çözüm yolları ile artıkların yararlı hale getirilebilmesi üretimde önemli ölçüde avantaj sağlayacaktır. Bitkisel orijinli artıklar toprak ıslahı ve verimliliği açısından önemli derecede organik madde kaynağı olmasının yanı sıra içerdikleri bitki besin maddeleri yönünden de önemli bir potansiyele sahiptirler (Çıtak vd., 2006). Bu yüzden bağ ve bahçe ürünlerinin yetiştirilmesi sırasında meydana gelen özellikle budama sürgünleri ve diğer bitkisel artıklar geri dönüşüm sağlanarak başarılı bir artık yönetimi ile yeniden üretime kazandırılmalıdır. Bitkisel içerikli artıklar; farklı amaçlar için işlenerek değerlendirilme olanaklarına sahiptirler. Örneğin yenilenebilir enerji kaynağı olarak kullanılabilmesinin yanı sıra kompost, kâğıt endsütrisi ve yonga levha kullanımı

gibi birçok yerde değerlendirilmesi nedeniyle çevre dostu ve ekonomik bir üretim için etkili olabilmektedir (Çolakoğlu, 2018)

Bitkisel atıklar kullanılarak bölge, yöre ve işletme bazında biyogaz enerjisinin üretim potansiyeli konusunda yapılan çalışmalar incelendiğinde: Enerji ihtiyacımızın kendi öz kaynaklarımız (yenilenemiyen ve yenilenebilen) ile karşılanması durumunda hem ülke ekonomimizin dışa bağımlılığının azaltılması hem de maliyetlerin azaltılması sağlanabilecektir. Türkiye bulunduğu coğrafya ve iklimden dolayı önemli miktarda yenilenebilir enerji kaynaklarına sahiptir (Başçetinçelik, 2006; Gürel, 2020).

Biyokütle genel olarak bitki veya hayvan kaynaklı hidrokarbon içeren maddelerdir ve çoğunlukla organik içeriklidir (Demirel ve Gürdil, 2018). Külcü (2016) tarımsal biyokütle potansiyelini incelediği bir çalışmada, Afyonkarahisar ilinde bir yılda açığa çıkan 2 838 954 ton bitkisel atıktan (%20 nem içeriğinde) 1 490 451 ton kompost üretilmesinin mümkün olduğunu belirtmiştir.

Karaca (2017), Antalya’ da yaptığı bir araştırmada toplamda en fazla atığın 165.3 bin ton ile domates bitkisi, bunu da 27.35 bin ton atık miktarı ile biber ve yaklaşık 10 bin ton atık miktarı ile patlıcan bitkisi üretiminden kaynaklandığını belirtmiştir. Bu üç bitkinin sera üretiminde oluşturdukları bitkisel atık miktarı ise kuru bazda toplam 202.65 bin ton olarak belirlenmiştir.

Sümer ve ark. (2016), Çanakkale ilinde bulunan zeytin üretimi esnasında oluşan atıklardan elde edilebilecek toplam metan gazı üretim potansiyel değerinin 8.803.909 m³/yıl olduğunu tespit etmişlerdir.

Baran ve ark., (2021), Adıyaman İlinin bitkisel üretimden kaynaklanan kullanılabilir tarımsal atık miktarı ve bu atıkların enerji potansiyeli biyokütle açısından teorik olarak değerlendirilmişlerdir. Adıyaman’da 11 farklı meyve ağacı için budama atıklarının kuru biyokütle potansiyeli 39.325.858,11 ton/yıl ve toplam ısıl kapasitesi 786.517.162,20 GJ/yıl olarak hesaplanmışlardır.

Baran (2021), Batman ilinde bazı tahıl (buğday, arpa, mercimek, nohut ve mısır) sap atık değerlerinden elde edilebilecek organik atık miktarı (ton/yıl), organik atıklardan elde edilebilecek kuru madde miktarı (ton/yıl), kuru maddeden temin edilebilecek uçucu kuru madde miktarı, toplam metan miktarı (m³/yıl) ve metan gazından elde edilebilecek enerji potansiyel

değerleri belirlemiştir. Yapılan hesaplamalar sonucunda tahıl sap atık miktarı 5318,41 ton/yıl, ortalama kuru madde miktarı 4680,20 ton/yıl, uçucu kuru madde miktarı 4627,02 ton/yıl, toplam metan üretim potansiyeli 1156,75 m³/yıl ve enerji potansiyeli 41643,15 MJ/yıl olarak belirlemiştir.

Bu çalışmada, Şırnak ili 2022 yılına ait kullanılabilir bazı tahıl (mısır,yulaf, buğday, arpa, mercimek ve nohut) sap atık değerlerinden elde edilebilecek organik atık miktarı (ton/yıl), organik atıklardan elde edilebilecek kuru madde miktarı (ton/yıl), kuru maddeden temin edilebilecek uçucu kuru madde miktarı, toplam metan miktarı (m³/yıl) ve metan gazından elde edilebilecek enerji potansiyel değerleri belirlenmiştir.

MATERYAL VE METOT

Çalışma Alanı

Şırnak ili, 37°31' kuzey enlemleri ve 42°28' doğu boylamları arasında yer almaktadır. İlin toplam alanı 7.151, 57 km² dir. Şırnak İli yüzölçümünün ¾'ünü kaplayan batı kesimi, Güneydoğu Anadolu Bölgesinde yer alırken, geri kalan yüzölçümünün ¼'ü ise Doğu Anadolu Bölgesi içinde kalır. İl batıda Mardin, kuzeyde Siirt ve Van, doğuda Hakkari illeri ile güneyde Irak ve Suriye devletleriyle çevrilidir. İlin yer aldığı Güneydoğu Anadolu Bölgesi jeolojik olarak kenar kıvrımları kuşağı olarak adlandırılan kuşak içinde yer alır. Bu kuşaktaki jeolojik özellikler ülkemizde yer alan diğer kuşaklardan farklı bir özellik taşır. Anadoludaki Alpin Jeosenklinealinin ön çukuru durumunda olan bölge, jura tipinde gelişmiş kıvrım şeritleri içerir. Burası Eo-Kambriyenden (birinci zaman) başlayarak Pliyosen (üçüncü zaman) dahil, bütün devirler boyunca devamlı bir sedimantasyon (tortulanma) havzası olarak gelişmiştir. Kambriyenden itibaren bütün formasyonlar sığ deniz (kıta kenarı, şelf) fasiyesinde gelişmiş, metamorfizme (başkalaşım) ve magma yer kabuğu içindeki tabakalar arasına sokularak şekil oluşturmuştur.

İlin güneyinde Suriye ve Irak sınırına yakın kesimleri hariç hemen hemen tamamı dağlarla kaplıdır. Dağlık kesimlerde Güneydoğu Toroslar sistemine bağlı yüksek kütleler vardır. İlin önemli dağları; Cudi dağı (2114 mt), Küpeli Dağı, Kelmehmet dağı (3231 mt.), Tanintanın dağı (3055 mt), Namaz dağı (1990 mt.) ve Altın dağlarıdır. İlimizin en önemli akarsuyu, Kızılsu, Hezil ve Habur çaylarının beslediği Dicle nehridir.Şırnak için en yüksek sıcaklık 40.3° C derece ile Ağustos ayı, en düşük sıcaklık -12.2° C ile Ocak ayıdır. Şırnak ilinde ortalama yıllık yağış miktarı 857.1 mm. dir. En az yağışlı ay Ağustos 1.4 mm., en çok yağış

alan ay ise Mart 143.3 mm.'dir. Günlük en çok yağış miktarı Nisan (95.8 mm. dir.) Yağışlar \geq 10 mm. dolayında olup, yağış alan gün sayısı, ortalama 31.2 gündür.

Tarım Alanlarının Yapısal Özellikleri

Şırnak ilinin 7.152 kilometrekare arazi varlığının 2.796.630 dekarı ormandır. Bu da Şırnak arazi varlığının %39'sına tekabül etmektedir. Ancak bu ormanın % 30' u normal nitelikte, geriye kalan kısmı yani % 70 i bozuk ve çok bozuk nitelikte ormanlardır. Baltalık ormanlarının tamamen tabii mescere, genelde ağaç türleri meşe palamut, mazı vb. olup görülen diğer ağaç türleri ise badem, erguvan, yabani incir, karaçam, menengiç, mahlep, alıç, çitlenbik, akçağaç, fıstık, nadir olarak da zeytin ağaçlarıdır. Bölgede hali hazırda armut, elma, kayısı, antep fıstığı, ceviz ağaçları gibi ağaçlar da yetiştirilmektedir. Mevcut arazilerin kullanım özelliklerinin belirlenmesi, arazi kullanım değişiminin ortaya konması ve değişimin devam edeceği düşünülerek tahmin hesaplarının yapılmasıyla hangi arazinin hangi kullanım için uygun olabileceği tarımsal üretim teknolojileri ve ekonomisi açısından önemli bir olgudur (Çelik ve Baran, 2018). Şırnak ili arazi varlığı ve kullanışlarına göre dağılımı Çizelge 1'de gösterilmiştir.

Çizelge1. Şırnak İli Arazi Varlığı ve Dağılımı (2022)

Diğer Alanlar (da)	Ormanlık Alanlar (da)	Çayır-Mera Alanı (da)	Tarım Alanı (da)
498.572,2	904.247,3	217.640,20	197.609,80

Şırnak ilinin arazi niteliklerine göre mevcut dağılımı Çizelge 2'de verilmiştir. İl'de tarım arazisi kullanım alanı 197.609,80ha, sebze alanı 12.664 ha, meyvelik 49.638 ha, nadas alanı 293.665ha ve süsü bitkileri alanı ise 28ha'dır. Kullanılan 97.228 ha alanın %88.65'i kuru, geri kalan %11.34'ünde ise sulu tarım yapılmaktadır. Kayıtlı çiftçi sayısı 45896 kişidir (TUIK, 2022).

Çizelge 2. Şırnak İli Tarımsal Arazilerin Niteliklerine Göre Mevcut Dağılımı (TUIK ,2022)

Cinsi	Tarım Alanı (ha)
Sebze Arazisi	12.634
Meyve Arazisi	49.654
Tahıllar ve Diğer Bitkisel Ürün Alanı	900.821
Nadas	101.906
Toplam	1,065.015

2022 yılında, Şırnak iline ait yetiştirilen bazı tahıl ürünlerinin ekim alanı ve Ülke üretimdeki payları Çizelge 3’te verilmiştir.

Çizelge 3. Çalışma Alanında Yetiştirilen Bazı Tahıl Ürünlerinin Ekim Alanı ve Üretim Miktarları (TUIK, 2022)

Ürün Adı	Ekilen Alan (da)	Üretim(ton)	Verim(kg/da)
Buğday	496.401	100.647	400
Mısır	20.301	14.299	704
Kırmızı Mercimek	112.401	7.972	71
Arpa	105.673	15.708	149
Yonca	43.025	66.246	1540

Atık ve Enerji Potansiyellerinin Hesaplanması

Verilen ekim alanı değerleri kullanılarak 2022 yılına ait ortalama atık potansiyeli belirlenirken, toplanabilirlik oranları dane buğday, arpa, kırmızı mercimek ve yonca için % 15, mısır için ise; % 60 olduğu ifade edilmektedir (Öztürk ve Başçetinçelik, 2006). Atıklardan elde edilebilecek kuru madde, uçucu kuru madde potansiyeli ve toplam metan potansiyel değerleri Sharma ve ark. (1988) tarafından kullanılan yöntemle göre belirlenmiştir. Uçucu kuru madde hesaplamasında gerekli parametreler literatür verileri kullanılmıştır. Bu ürünlerin atıklarından elde edilebilecek metan gazının enerji miktarı ise Aybek ve ark. (2015) tarafından kullanılan yöntemle göre belirlenmiştir. Belirtilen tahıl ürünleri tahıl atıklarından elde edilebilecek metan gazının enerji ise Aybek ve ark. (2015); Taşova ve Polatçı (2019) ve Baran (2021) yöntemine göre belirlenmiştir.

Hesaplama kullanılan eşitlikler aşağıda verilmiştir;

$$AP = ((EA \times 37 \times 15)/100)1000 \quad (1)$$

Burada;

AP: Ürün atık miktarı potansiyeli (ton/yıl);

EA: buğday ekim alanı (da).

$$KM = ((AP \times 88)/100) \quad (2)$$

Burada;

KM: Elde edilebilir kuru madde potansiyeli (ton/yıl).

$$UKM = ((AP \times 87)/100) \quad (3)$$

Burada;

UKM: Ucu kuru madde potansiyeli (ton/yıl).

$$\mathbf{\ddot{O}MO = UKM \times 0.25} \quad (4)$$

Burada;

ÖMO: Özgül metan oranı (CH₄ kg).

$$\mathbf{ME = \ddot{O}MO \times 36} \quad (5)$$

Burada;

ME: Elde edilebilir metan gazının enerji değeri (MJ).

ARAŞTIRMA ve BULGULARI

Şırnak ili 2022 yılına ait üretimi yapılan bazı tahıl bitkilerinin atık ve kuru madde potansiyeli, uçucu kuru madde, metan potansiyeli ve enerji potansiyeli hesaplanarak aşağıda Çizelge 4'te detaylandırılmıştır. Çizelge 4'e göre Şırnak ili 2022 yılına ait toplam tahıl atık potansiyel değerinin ortalama 43.16,797 ton/yıl ve bu değerden elde edilebilecek kuru madde potansiyel değerinin ise ortalama 3798,779 ton/yıl olduğu belirlenmiştir. Şırnak ili 2022 yılına ait toplam uçucu kuru madde potansiyel değerinin ortalama 3755,611 ton/ yıl ve elde edilebilecek toplam metan oranı 938,904 m³/yıl olduğu belirlenmiştir. Şırnak ili 2022 yılına ait bazı tahıl ürünleri atıklarından elde edilebilecek toplam enerji potansiyel değerinin ortalama 33.800,509 MJ/yıl olarak saptanmıştır.

Çizelge 4. Şırnak İline ait bazı tahıl ürünlerinin kullanılabilir atık ve kuru madde potansiyeli, uçucu kuru madde, özgül metan oranı ve enerji potansiyeli

Ürünler	Atık Potansiyeli (ton/yıl)	Kuru Madde Potansiyeli (ton/yıl)	Uçucu Madde(ton/yıl)	Kuru Metan Potansiyeli (m ³ /yıl)	Enerji Potansiyeli (MJ/yıl)
Buğday	2755,026	2424,422	2396,872	599,218	21571,850
Mısır	112,671	99,150	98,023	24,506	882,210
Kırmızı Mercimek	623,826	548,966	542,728	135,682	4884,554
Arpa	586,485	516,107	510,242	127,561	4592,179
Yonca	238,789	210,134	207,746	51,937	1869,716
Toplam	4316,796	3798,780	3755,612	938,903	33800,509

SONUÇ VE ÖNERİLER

Çalışmada, güncel verilere göre hesaplanan yanma enerji değerlerine bakıldığında; son yıllardaki yakılarak kullanılması enerji üretimi açısından iyi bir alternatif olan biyokütle atıkların potansiyeli ve enerji değerinin yüksek olduğu görülmektedir. Şırnak ilinde üretimi yapılan bazı tarımsal ürünlerin sap atıklarına göre, elde edilebilecek yıllık bazdaki ortalama atık, kuru madde, uçucu kuru madde, metan ve enerji potansiyelleri araştırılmıştır. Belirlenen

bulgular dođrultusunda Őırnak ilinde ortalama **4316,796** ton/yıl tahıl sap atıđının olduđu grlmŕtr. Bu atıklardan elde edilebilecek ortalama enerji potansiyeli ise yıllık **33800,509** MJ olduđu belirlenmiŕtir. Enerji aıđının kapatılması iin lkemizde mevcut tahıl sap atıklardan elde edilebilecek enerji potansiyellerinin uygulamaya aktarılmasının nemli olacađı dŕnlmektedir.

ÖZET

Ülkemizin coğrafi yapısı, zengin ve verimli bir tarımsal üretim için büyük avantajlar sunarken agrostratejik konumu da dünya tarımı için önemli bir köprü işlevi görmektedir. Tüm bu hususlar dikkate alındığında tarım sektörüne yapılacak yatırımlar ülkemiz ekonomisi ve ihtiyaçlarının karşılanması bağlamında öncelik taşımaktadır. Bu sebeple Aronya tarım ve gıda sektörü açısından büyük önem arz etmektedir. Aronya, gerek birim alandaki getirisi gerekse sağlık açısından sahip olduğu yararlarından dolayı dünya çapında çok aranan meyve türlerinden biri olup Türkiye için yeni bir üzümse meyvedir. Bu çalışmada ülkemizde yaygınlaşan mucize bitki aronya yetiştiriciliği ve uygulanan tarımsal mekanizasyon bahsedilmiş ve değerlendirmeler yapılmıştır. Ülkemizde aronya üretimine yönelik yapılacak yatırımların arz talep dengesi yönünden değerlendirildiğinde arz tarafında gerekliliğin oldukça yüksek düzeyde olduğu görülmektedir.

Anahtar Kelimeler: Aronya, meyve, tarımsal mekanizasyon , hasat

MECHANIZATION APPLIED IN ARONIA (*Aronia melanocarpa*) CULTURE

ABSTRACT

While the geographical structure of our country offers great advantages for a rich and productive agricultural production, its agrostrategic location also serves as an important bridge for world agriculture. Considering all these issues, investments to be made in the agricultural sector have priority in terms of meeting our country's economy and needs. For this reason, Aronya is of great importance in terms of agriculture and food sector. Aronia is one of the most sought after fruit species around the world due to its yield per unit area and its health benefits, and it is a new berry fruit for Turkey. In this study, the cultivation of the miracle plant aronia, which is widespread in our country, and the applied agricultural mechanization are mentioned and evaluations are made. When the investments to be made for aronia production in our country are evaluated in terms of supply and demand balance, it is seen that the necessity on the supply side is quite high.

Keywords: Aronia, fruit, agricultural mechanization, harvest.

GİRİŞ

Türkiye sahip olduğu farklı iklim koşulları nedeniyle birçok meyve türünün yetişmesine imkân sağlamaktadır. Bu meyveler arasında yer alan üzüksü meyveler son yıllarda dünyada ve ülkemizde yüksek talep gören meyve türleridir. Üzüksü meyveler taze olarak tüketimlerinin yanında, işlenerek de değerlendirilebilmeleri nedeni ile sanayide giderek önem kazanmaktadır. Türkiye İstatistik Kurumu (2019) verilerine göre ülkemizin dünya üzüksü meyve üretimindeki payı %8'dir. Bunun %24,92'sini çilek, %25,18'ini diğer üzüksü meyve türleri oluşturmaktadır (Poyraz ve ark. 2018; Poyraz Engin ve Boz, 2019). Ülkemizin polikültür tarımı uygulanan birçok bölgesinde üzüksü meyvelerin önemi ve yetiştiriciliği gittikçe önem kazanmaktadır. Son yıllarda ihracat imkânlarının artması nedeniyle bu gibi ürünlere olan talep her geçen yıl artmaktadır. Aronya tarım ve gıda sektörü açısından büyük önem arz etmektedir. Aronya, gerek birim alandaki getirisi gerekse sağlık açısından sahip olduğu yararlarından dolayı dünya çapında çok aranan meyve türlerinden biri olup Türkiye için yeni bir üzüksü meyvedir.

Botanik olarak bakıldığında aronya; Angiosperms (Kapalı tohumlular) Bölümü, Eudicolydon (İki çenekliler) Alt Bölümü, Meloideae Sınıfı, Rosales Takımını Rosaceae (Gülgiller) Familyasının Amygdaloideae Altfamilya yapısından Maleae Cinsinden Aronya şeklinde tanımlanmıştır. Bu cins içerisinde Aronia melanocarpa (Michx) Elliot (Black chokeberrey), Aronia prunifolia (Marsh) (Purple chokeberry) ve Aronia arbutifolia (L.) Elliot (Red chokeberry) olmak üzere bilinen üç tür mevcuttur. Avrupa'da en yaygın aronya çeşitleri arasında 'Aron' (Danimarka), 'Nero'(Çek Cumhuriyeti), 'Viking' (Finlandiya), 'Rubin' (Rusya), 'Kurkumachki' (Finlandiya), 'Hugin' (İsveç), 'Fertödi' (Macaristan) 'Albigowa', 'Dabrowice', 'Egerta', 'Kutno' 'Nova' 'Wies', 'Hakkija', 'Ahonnen', 'Serina', 'Autum Magic', 'McKenzie', 'Morton', 'Galicjanka' (Polonya) yer almaktadır (Poyraz Engin 2016, Özder, 2020). Aronya, Avrupa'da doğallaştırılmış olup; inter generik hibrit bir form olarak yetiştirilmektedir. En yaygın olarak Kuzey Amerika'da ağaç altlarında ve bataklıklarda yetiştirilmektedir. Aronya üzüksü meyveler içerisinde oldukça yüksek bir antioksidan kapasitesine sahip olması nedeni ile dünyada taze meyve olarak tüketilebildiği gibi işlenerek gıda sanayinde ve eczacılıkta da kullanılmaktadır (Poyraz Engin, 2018, Özder, 2020).

Üzüksü meyveler içerisinde yer alan aronyanın (Aronia melanocarpa (Michx) Elliot) insan sağlığı üzerine etkisi konusunda yapılan çalışmalar sonucunda, meyvelerinin antioksidan kapasitesi ve antosiyanin miktarı bakımından diğer üzüksü meyvelere göre daha yüksek değere sahip olduğu ortaya konmuştur. Bu meyve türünün düzenli tüketimi ile kardiyovasküler

hastalıklar, sindirim sistemi hastalıkları ve bazı kanser hastalıklarına karşı koruma sağladığı tespit edilmiştir (Kulling ve Rawel 2008). Antioksidan açısından oldukça zengindir. En çok Antioksidan içeren meyvedir. Ayrıca vitamin ve mineral kaynağıdır. B12 ve D vitamini hariç tüm vitaminleri içermektedir. Bu yüzden aronya ya ‘Süper Meyve’ denilmektedir. Güller sınıfına dâhil olan meyve Aronya Berry ve Black Chokeberry isimleriyle de anılmaktadır (Tokusoglu, 2017a- 2017b; Özder, 2020).

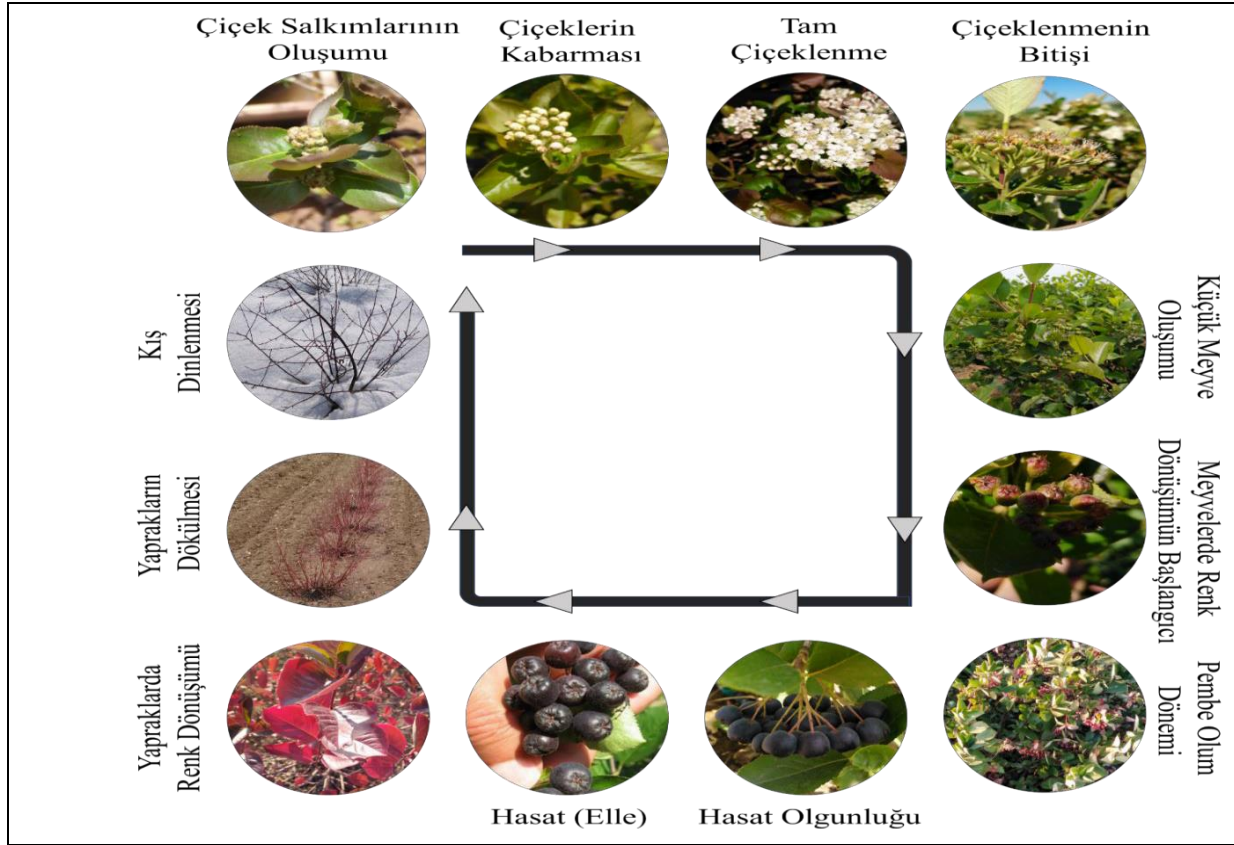

Aronya zaman zaman süs bitkisi olarak da yetiştirilmektedir. Çalı formunda bir bitkidir. Bahçe tesisinde 1 m x 4 m mesafeyle dikilirler. Sonbaharda yaprakları çok güzel bir şekilde kırmızılaşır. Güzel yaprakları sayesinde süs bitkisi olarak da kullanılmaktadırlar. Kış döneminde yapraklarını dökerler. İlkbaharda çiçek açarlar. Meyveleri Ağustos ayında olgunlaşmakta ve uzun süre üzerinde kalabilmektedir. Ekşi meyveler, çalılıktan çiğ olarak yenabilir olduğu kadar işlenerek tüketilmesi de tercih edilmektedir. Aronya meyveleri antosiyaninler gibi polifenik bileşiklerce zengin olması sebebiyle, meyveler büzme özelliği kazanarak ağız içerisinde büzüştüren bir his yarattığı için chokeberry ismiyle de anılmaktadır(Özder, 2020). Ülkemizde bu meyve çok geç fark edilmiştir. Halen üretimi yaygınlaşmamıştır. Aronyayı ülkemizle ilk tanıştıranların başında iş adamı Osman Nuri Günay gelmektedir. Aronyanın ülkemizde yetiştirilmesi ve yaygınlaşması adına çalışmalar yapmış ve hala yapmaktadır. 2008 yılında Tataristan’ ın başkenti Kazan’ dan 30 adet fidan alıp Ankara’ da yetiştirdiklerini, aronyadan istedikleri verimi alınca meyvenin anavatanının Amerika olduğu için buradan yeni çeşitleri getirmek için çalışmalarda bulunmuşlar(Özder, 2020).

Ülkemizde aronya yetiştiriciliği ile ilgili ilk çalışmalar 2012 yılında Atatürk Bahçe Kültürleri Merkez Araştırma Enstitüsü’nde fidan üretimi ile başlamış ve deneme alanında plantasyon oluşturulmuştur. 2017 yılında ilk hasat şenliği düzenlenmiş ve meyvenin tanıtım ve yayım çalışmalarına başlanmıştır. Ayrıca Yalova, Sakarya, Kayseri ve Zonguldak’ta İl Tarım Orman Müdürlükleri tarafından yayım projeleri hazırlanmıştır (Poyraz Engin ve Boz, 2019, Özder, 2020). Ülkemizde halen 19 ilde toplam 777 dekar alanta aronya üretimi yapılmaktadır (Çizelge 1).

Çizelge 1. İllere göre aronya üretimi

İLLER	FİDAN SAYISI(ADET)	ÜRETİM ALANI(da)
Kırklareli	52.000	240
Bursa	23.000	141
Manisa	15.000	90
Kırşehir	8.000	48
Yalova	8.000	48
Çanakkale	7.000	42
Samsun	6.000	36
İzmir	5.000	30
Ordu	3.000	18
Antalya	3.000	18
İstanbul	3.000	18
Bolu	2.000	12
Ankara	2.000	12
Sakarya	1.500	9
Giresun	1.000	6
Çorum	500	3
Amasya	500	3
Tekirdağ	500	2
Trabzon	300	1
Toplam	129.800	777

Aronya, çalı formunda, 80-140 cm'ye kadar boylanabilen, yaklaşık 6 mm çapında mor-siyah meyveleri olan Kuzey Amerika menşeli çok yıllık bir bitkidir. Bitkinin yaprakları 3–7 cm uzunluğunda olup parlak ve tüsüzdür. Beyaz-pembe çiçekleri mayıs ayında açmaktadır (Hardin 1973, Scott ve Skirvin 2007). Aronya çiçekleri erselik yapıdadır. Bir salkımda 20-25 adet çiçek bulunmaktadır. Bu çiçeklerden 8-14 adet meyve oluşmaktadır. Çiçekleri Rosaceae'nin karakteristik özelliği olan 5 adet çanak yaprak, 5 adet taç yaprak ve 10-30 adet erkek organ bulundurmaktadır. Aronyanın bazı bitkisel özellikleri ve vejetasyon döngüsü Şekil 1'de gösterilmiştir(Yılmaz ve ark.2021). Çiçeklenme periyodu 20-25 gün sürmektedir. Aronya kendine verimli bir bitki olup tozlayıcıya ihtiyaç duymamaktadır (Poyraz Engin, 2018; Yılmaz ve ark.2021). Aronya'nın yıllık vejetasyon döngüsü Şekil 1'de verilmiştir (Yılmaz ve ark.2021).

Şekil 1 . Aronya'nın yıllık vejetasyon döngüsü

KÜLTÜREL İŞLEMLER

Toprak İsteği: Aronya bitkisi adaptasyon kapasitesinin yüksek olması nedeniyle çok geniş toprak tipi ve pH aralığında yetiştirilebilen, çok yıllık, çalı formunda gelişen üzüksü meyve türüdür. Yetiştiricilik için drenajı iyi, orta bünyeli, organik maddece zengin, 6-6,5 pH değerine sahip topraklar önerilmektedir. Organik maddesi toprağa besin maddesi ve nem kattığı gibi havalanmasını ve drenajının iyi olmasını sağlamaktadır. Eğer aronya dikilecek olan alanlardaki topraklara organik madde ilave edilir ve dikimden en az bir yıl önce bu maddeler toprakla karıştırılırsa aronya bitkilerinin adaptasyonları daha iyi olur, daha kuvvetli bir gelişme göstererek verimlilikleri artar. Organik madde kaynağı olarak torf, kompost, iyi yanmış ahır gübresi kullanılabilir. Bu arada, yeşil gübre olabilecek bazı bitkilerin ekilmesi ve C/N oranının en iyi olduğu dönemde toprak altına verilmeleri de toprak organik maddesini artırır (Anonim 2023 a).

Toprak işleme :

Aronya bitkisi yüzlek köklüdür. Bu nedenle toprak işleme yüzeysel olarak yapılmalıdır. İlkbahar dönemindeki toprak işleme toprağın havalandırılması yanında yabancı ot kontrolünün sağlanması bakımından da çok önemlidir. Bu yüzden sıra aralarına ilkbahar aylarında toprak işleme yapılmalıdır. Ayrıca yaz ayında da toprağın sık sık kabartılması ve sonbaharda da son bir derin sürüm yapılması önerilir. Aronya için arazi hazırlığı en az bir yıl önceden yapılmalıdır. Ilıman iklim bölgelerinde ilkbahar öncesi dikim yapılabilse de sonbahar dikimleri özellikle kar yükünün olmadığı yerlerde daha uygundur. Dikim öncesi arazideki çalı, taş, ağaçcık v.s temizlenerek arazi 50 cm derinlikten işlenmelidir. Sürümde derin toprak işleme aletleri (kültüvator, çizel , tırmık ve tesviye) ile zemin düzeltilmelidir. Toprak şartları ve hasat şekillerine dikim aralıkları planlanmalıdır. Dizlişleri, birbirine gölgeleme yapmayacak, bol ışık alacak şekilde olup, iş genişliğini de dikkate almak gerekmektedir. Genellikle 2 x 4 m veya 1.5 x 3 m kullanılır (Kask, 1987). 120-160 cm X 300 cm (Knudson, 2005). En sık dikim 1.25 m x 2.5 m. Aronya bitkisi bakımı çok zor değildir. Çalı formunda bir bitki olduğu için yetiştiricilerini çok zorlamaz. Yüksek verim elde edilebilmesi için iki yılda bir defa olacak şekilde gübre verme işlemi önerilmektedir.

Dikim: Aronya, tozlaşmaya ihtiyaç duymayan bitkilerden biridir. Üretimi kendi çekirdeklerinden bile yapılabilir. Toprak yeterince ufalanmış ve gerekli neme sahipse dikim işlemlerine başlanabilir. Dikim sıraları 1,5 metrede bir olacak şekilde işaretlendikten sonra sıraların üzerine 30 santimetre çapında ve 20 santimetre derinliğinde çukurlar açılır. Dikim işlemi bu çukurlara yapılır. Dikim işlemlerinden sonra kök sisteminin üstüne atılan toprak, ayakla bastırılmak sureti ile sıkıştırılır. Fakat bu işlem gerçekleştirilirken kök boynundan çıkan, fundanın oluşmaya başladığı filizler olan yan dallara zarar verilmemesi konusunda son derece hassas olunmalıdır (Anonim 2023 b). Fidan dikiminde kullanılan makine Şekil 2 'de verilmiştir.

Şekil 2. Fidan Dikim Makinası

Gübreleme: Aronya bitkisi çiçek açmadan 2-3 ay evvel organik gübreyle ve çiçek açmaya yakın bir dönemde çinko bor ağırlıklı olarak gübreleme yapılırsa verim yüksek olacaktır. Aynı zamanda dikimden önce dekara 2-3 ton yanmış çiftlik gübresi kullanılabilir. Meyve oluşumu ortaya çıkmaya başladığı zaman ise fosfor potasyum ağırlıklı gübreleme yapılması önerilir (Anonim 2023 a).

Şekil 3. Çiftlik gübresi

Sulama: Yıllık 500-600 mm aralığında yağış, bitki gelişimi için yeterlidir. Ancak yağışın vegetasyon döneminde yağması önemlidir. Verimi etkileyen su kıtlığı, yalnızca temmuz

ve ağustos kuraklıklarında, dinamik meyve büyümesi sırasında ortaya çıkabilir. Sulama mevcut imkânlarla göre damla (Şekil 4) veya yağmurlama yöntemlerinden birisiyle yapılabilir.

Şekil 4. Aronya bitkisinde damla sulama

Hasat : Aronya meyveleri salkım şeklinde oluşur ve bir salkımda genelde 5-15 tane meyve bulunmaktadır. Aronya meyveleri çeşide, budamada bırakılan dal tipine ve iklime bağlı olarak 90-110 gün içinde olgunlaşırlar. Meyveler, ağustos sonu veya eylül başında olgunlaştıktan sonra hasat edilir. Olgunlaşma sırasında meyveler yumuşar, renklenme artar, tatlanma meydana gelir ve taneler irileşir. İsveç'te yapılan bir çalışmada, 22 Ağustos'ta maksimum verime ulaşıldığı, ancak bu tarihte antosiyanin birikiminin devam ettiği ve maksimum antosiyanin birikiminin 8 Eylül tarihinde gerçekleştiğini bildirmişlerdir. Ayrıca meyvelerde kararın olayı da bir hafta önceki hasatta en az seviyede bulunmuş olmasına rağmen, 1 hafta önce hasat edilseydi kararın %32 azalırken, antosiyaninlerde %20 azalmıştır. Sonuç olarak en yüksek antosiyanin içeriğine sahip meyve eldesi ve meyvelerde burukluk oranının da azaltılması için ekolojilere göre değişmekle birlikte Eylül'ün ikinci haftası gerçekleştirilmelidir. Ancak tam olgunlaşmadan toplanan meyvelerin kaliteleri sürgünler üzerinde olgunlaşanlara göre daha düşüktür. Aronya meyveleri elle veya mekanik hasat makinalarıyla hasat edilebilir (Şekil 5). Amerika Birleşik Devletleri ve Avrupa'da aronya genellikle mavi yemiş hasat makinelerine benzer bir makina ile hasat edilmektedir. Hasat, yağışsız ve kuru havalarda yapılmalıdır. Elle hasatta ham meyveler ve yeşil meyveler hasat edilmemelidir (Şekil 6). Hasadı yapan kişi mümkün mertebe en az taneyi avucunda biriktirmelidir. Böylece meyveler ezilmez, bozulmaz ve tanelere çekici, sağlıklı görüntü veren

pus tabakası silinmez. Taze olarak tüketilecek aronya meyveleri bir örnek, koyu renkli, dolgun, sert, hasarsız ve temiz olmalıdır. Düz veya teraslanmış alanlarda hasat makineleri kullanılabilir. Hasat makinesinin ekonomik olması için bahçenin en az 50 da olması gerekir. İlk iki yıl el ile hasat yapılması uygun olmakta iken 3. yıldan itibaren makineli hasat yapılabilmektedir (Anonim 2023 a; Anonim 2023b).

Şekil 5. Hasat makinası (Aronya hasadı)

Elle hasatta ham meyveler ve yeşil meyveler hasat edilmemelidir. Hasadı yapan kişi mümkün mertebe en az taneyi avucunda biriktirmelidir. Böylece meyveler ezilmez, bozulmaz ve tanelere çekici, sağlıklı görüntü veren pus tabakası silinmez.

Şekil 7. Aronya bitkisi elle hasadı

Sonuç ve Öneriler

Aronya, tarım, orman ve gıda sektörü açısından önem arz etmektedir. Küçük işletme ölçeğindeki marjinal araziler için ekonomik değeri yüksek olan aronya yetiştiriciliği son yıllarda dünyada ve ülkemizde de tıbbi ve aromatik bitkilerin ve bunlardan elde edilen ürünlerin kullanımında büyük bir artış dikkati çekmektedir. Özellikle sağlık, gıda, kozmetik ve tarım alanlarında yüksek katma değerli ürünlerin bu coğrafyada yerli imkanlarla üretilmesi, işlenmesi, paketlenmesi, pazarlanması yani üretimden tüketime kadar değer zincirinde yer alan her aşamanın yönetilmesi, katma değer in ülkemizde kalmasını sağlayacaktır. Aronya meyveleri taze olarak, meyve suyu sanayisinde, tek başına veya diğer meyve suları ile kokteyl yapılarak, ilaç sanayisinde kuru meyvesi, çiçekleri, kökleri ve yaprakları, süt ve süt ürünleri teknolojisinde, aronyalı dondurma, aronyalı süt, kuru meyve teknolojisinde, meyveli ekmek, çörek, kek, puding ve pastalarda, baharat sanayisinde, meyve salatalarında, reçel, marmelat ve konserve sanayisinde, kuru yaprağı ve kuru meyvesi çay olarak ve diyet menülerinde kullanılmaktadır. Aronya bahçesinin kurulacağı bölgede iklim ve diğer ekolojik koşulların uygunluğu, teknik bakım işlemlerinin usulüne uygun olarak yerine getirilmesi, yer ve çeşit seçiminin önemi, büyük pazarlara yakınlık, iç ve dış ticaret imkanları aronya tarımının yaygınlaşmasını yakından etkileyecek unsurlar olarak sıralanabilir.

ABSTRACT

Cities are ecosystems that contain natural structures and systems and involve the interaction of cultural and natural structures, in addition to being the areas where anthropogenic activities are concentrated. There is a relationship between urban fabric and infrastructure systems in urban areas. This relationship has become even more important especially with the decrease in green areas in cities and the increase in impermeable surface coatings. Because of global climate change, some study areas such as 'heat island effect, air pollution, flood-flood disasters, deprivation of green space, distribution and maintenance problems, biodiversity loss, desertification, drought and related deteriorating soil and water quality, food security etc.' show the need to reconsider the relationship of cities with nature. Considering that the urban areas in our country expanding, the green network system for the sustainability of cities will stand out as "critical infrastructures" in today's variable and fragile urban environment. Green network and green infrastructure studies are on the agenda to analyze and integrate ecologically based systems within our cities. It will contribute to the improvement of the quality of life in a range based on nature-based solutions that can be elaborated, from energy-efficient structures that can be seen in urban design applications to water-permeable surface coating materials during the climate change adaptation process. To ensure the sustainability of cities, it is necessary to understand the functioning of different ecosystems (stream, agriculture, built environment, etc.) from natural to man-made and to reflect them in design decisions. In urban design applications, the establishment of green infrastructure networks that consider the comfort of natural and cultural life for urban residents and the consideration of relevant nature-based design solutions will facilitate the process as a proactive step. The preparation of urban design projects under the guidance of green infrastructure systems and nature-based solutions will make a significant contribution to the solution of problems in detail and practice. For instance, the integration of approaches and tools such as water-sensitive urban design (WSUD), landscape urbanization

(LU), Landscape-Based Urbanism into the design process is important and urban design understandings are developing in this direction today. In the specified design approaches, interdisciplinary work and cooperation between solutions are necessary. Bio-engineering work, in which the relevant engineering fields are also involved in the design processes, is also important in the development of system details. Despite the overgrowing/homogenizing structure of cities, the elements that make the city more original, livable and identity are green network systems that can be defined as the ecological values of the city. In this study, under the guidance of green infrastructure systems and nature-based solutions in the first plan, water-sensitive urban design, landscape urbanization and issues related to the development of design concepts and system details are emphasized.

Keywords: urban design, climate change, water sensitive design, nature-based solutions.

INTRODUCTION

Günümüzde kent-kır dengesi kentler lehine çarpıcı bir oranda farklılaşmaktadır. Son yıllarda artan nüfus ve küresel hareketlilikle gezegenin %75'i insan etkisiyle şekillenmiştir ve yakın gelecekte bu daha da belirgin bir hal alacaktır. Ayrıca, küresel iklim değişikliği etkilerine bağlı olarak ısı adası etkisi, hava kirliliği, sel-taşkın felaketleri, yeşil alan yoksunluğu, dağılım ve bakım sorunları, biyolojik çeşitlilik kaybı, çölleşme, kuraklık ve bunlara bağlı bozulan toprak ve su kalitesi, gıda güvenliği gibi mücadele alanları kentlerin doğa ile ilişkisinin yeniden ele alınmasına gerek duyulduğunu göstermektedir.

“Herkes İçin Şehirler” konulu *Quito Deklarasyonu* (17-20 Ekim 2016, Quito, Ekvador) ile kentleşme, günümüzde sürdürülebilir ve kapsayıcı ekonomik gelişmenin, sosyal ve kültürel kalkınmanın, doğa ve çevre korumanın, sürdürülebilir kalkınmanın motoru olarak ele alınmaktadır. Kentsel Paradigma Değişimi, *Doğa Odaklı* bir kent senaryosunu ön plana çıkarmakta ve farklılıkların mekanı olan kentlerin, ekosistemi, suyu, doğal habitatları, biyolojik çeşitliliği, koruyan; sürdürülebilir tüketim ve üretim formlarını destekleyen yerleşmeler olacağı öngörülmektedir.

Ülkemizdeki kentsel alanların da genişleyeceği göz önünde bulundurulduğunda kentlerin sürdürülebilirliği için yeşil ağ sistemi günümüzün değişken ve kırılğan kent ortamında “kritik altyapılar” olarak öne çıkacaktır. Kentlerimizin içindeki ekolojik temelli sistemleri analiz etmek ve bütünlüklü hale getirmek için yeşil ağ ve yeşil altyapı çalışmaları gündeme gelmektedir. Özellikle, iklim değişikliği uyum sürecinde kentsel tasarım uygulamalarında görülebilecek enerji etkin strüktürlerden su geçirimli yüzey kaplama malzemelerine kadar detaylandırılabilir doğa-esaslı çözümlere dayanan bir yelpazede yaşam kalitesinin artmasına katkı sağlayacaktır.

Kentlerin aşırı büyüyen/ aynılan yapısına karşın kenti daha özgün, yaşanabilir ve kimlikli kılan öğeler kentin ekolojik değerleri olarak tanımlanabilecek, yeşil ağ sistemleridir. Yeşil altyapı sistemleri ve doğa-esaslı çözümlerin yol göstericiliğinde, su-duyarlı kentsel tasarım, peyzaj şehirleşmesi gibi tasarım anlayışlarının ve sistem detaylarının geliştirilmesi ile ilgili konular, son yıllarda önem taşımakta olup kent planlama pratiklerinin önemli bileşenleri olarak değer kazanmıştır.

KENT-İKLİM-EKOLOJİ

1900-2000 yüzyılı “kentsel devrim”in yüzyılıdır (UN, 1980). 1800’lerde dünya nüfusunun %3’ü, 1900’lerde %14’ü, 2000’de %47’si kentsel alanda yaşamakta ve 2050 yılında ise %72’sinin kentlerde yaşaması beklenmektedir ve Birleşmiş Milletler’in 2017 de revize ettiği

Dünya Nüfus Tahmin Raporu'na göre 2017'de 7.5 milyar olan dünya nüfusunun 2050 yılında 9.8 milyara ulaşacağı tahmin edilmektedir (UN, 2017).

Ülkemizde 50'li yıllardan itibaren devam eden hızlı kentleşme sonucunda şehirlerde yaşayan nüfusun oranı 1950 yılında %25 iken, 1980 yılında %44'e, 2000 yılında %65'e ve 2012 yılında %77'ye kadar çıkmıştır. 2016 yılı sonu itibarıyla ise dünya nüfusunun %54'ü, ülkemiz nüfusunun %88'i şehirlerde yaşamaktadır. 1984 yılında kabul edilen ilk Büyükşehir Belediyesi Yasası ile İstanbul, Ankara ve İzmir Büyükşehir Belediyesi olarak ilan edilmişlerdir. İlk on yıl içinde büyükşehir belediye sayısı 8'e, yirmi yıl içerisinde ise 16'ya yükselmiş, 2016 yılı itibarıyla 6360 sayılı Kanun kapsamında ise 30'a yükselmiş olup köylerin mahalle statüsü kazanması ile birlikte kentleşme oranı da %88'e ulaşmıştır. 30 büyükşehirdeki **16 bin 220 köyün mahalleye dönüşmesiyle** Türkiye'deki 34 bin 434 olan köy sayısı 18 bin 214 adede inmiştir. Bir başka deyişle köylerin yaklaşık %50'si mahalleye dönüştürülmüştür (T.C.Çevre ve Şehircilik Bakanlığı, 2017).

Kentlerin rolünde süregelen değişimlerin altında küresel ekonomik değişimler yatmaktadır. Geçtiğimiz elli yılda, sanayileşme ve takip eden kentleşme pratikleri ile gelişmekte olan ülkelerdeki kentlerin çoğu büyümüştür (Sassen, 1998) ve günümüz kentleri dünya kaynaklarının %75'inin tüketiminden sorumludur (Wiemann, 1996). Yine 20.yüzyılda kendini gösteren temel insan gereksinimi olan barınma ve konut sorununun anılan kentlerde gecekondulaşma ve betonlaşma yoluyla çözümlenmesi sonucu düzensiz ve plansız kentleşme ile kentsel altyapı ve kentsel çevre sorunları ortaya çıkmıştır.

İçinde yaşadığımız yüzyılın mücadelesi, bir yandan kentlerin çevresel koşullarını geliştirirken diğer yandan da sınırlı kaynaklar üzerindeki baskılarını azaltmak olacaktır. Bugün, Avrupa'daki nüfusun 2/3'ünden daha fazlasının kentsel alanlarda yaşaması, kentsel çevre kalitesinin, Avrupa kentlerinin ekonomik yenilenmesinin anahtar bir elemanı gibi algılanmasını ortaya koymaktadır (COST, 1997). Günümüzde kentleşmenin **doğal değerler** üzerindeki olumsuz etkisinin her geçen gün artması, kentleşmeye bağlı **çevresel kirliliklerin** insan sağlığı üzerindeki etkilerini arttırması gibi olumsuz gelişmeler, kenti oluşturan tüm ilgi gruplarını **"ekolojik kent yenileme ve yaşanabilir sağlıklı kent"** kavramı üzerinde çok boyutlu düşünmeye ve sorgulamaya itmekte (Karadağ, 2009) ve ortak çalışmaya ve birlikte çözüm üretmeye zorlamaktadır.

Doğal çevre koşulları şehirlerin kuruluşundaki temel etkenlerdir. Bir şehrin bulunduğu konum, topoğrafik durumu, iklim koşulları, su ögesi, bitki örtüsü ve doğal çevreden kaynaklanan veriler, o şehri diğerlerinden ayırır, tanımlar, özgün kılar, şehre kimlik verir (Deniz, 2004; Kır,

2009). Kent, doğanın kullanımını yanı sıra, insanın biçim verdiği ve kendi kültürü ile yoğurduğu bir yapay çevredir (Can, 1999; Uçkaç, 2006; Kır, 2009).

Geçmişten günümüze dek insanın doğayla karşılıklı etkileşimi sonucunda doğaya egemen olmasıyla başlayan bu yeni insan eliyle şekillenen süreç, endüstri, kentleşme ve yoğun nüfus hareketleri sonucunda çevre sorunlarını gündeme taşımıştır. Bu sorunlardan biri olan hızlı nüfus artışı, beraberinde plansız kentleşmeyi getirmektedir. Ülkemizin, BM nüfus projeksiyonlarına göre 96 milyon kişiyle 2050 yılında Dünyanın en kalabalık 19. ülkesi olacağı bildirilmektedir (UN, 2017). Dolayısıyla, kentleşme eğilimi böyle devam ederse kentleşmenin iklim sistemi üzerindeki baskılarının artması büyük bir sorun olarak karşımıza çıkacaktır. Bu durumun üç temel nedeni bulunmaktadır;

- Milyonlarca nüfusun yoğunlaştığı kentsel alanlar, iklim değişikliği sonucunda meydana gelen etki ve tehlikelerden en fazla zarar gören alanlardır. Bu etki ve tehlikelerin boyutları; kentin konumu, demografik yapısı, sosyo-ekonomik yapısı, fiziki altyapısı, yapıli çevresinin niteliği, afetlere karşı hazırlıklı olması ve kurumsal yapılanmasına bağlıdır (Yüksel, Ü.D., 2014).
- Kentsel alanlar, doğal kaynak tüketiminin %75'inden ve küresel sera gazı salımının %80'inden sorumludur.
- Kentlerdeki nüfus artışına bağlı olarak 2030 yılına kadar yapılaşmış alan miktarının gelişmekte olan ülkelerde üç kat, gelişmiş ülkelerde 2.5 kat artış göstereceği tahmin edilmektedir.

19.yy'ın sonları ve 20.yy'ın başlarında, kentsel kirliliğin insan yaşamını tehdit ettiğine dikkat çeken kent planlamacıları, yazarlar ve düşünce adamları, kentlerin sonunda kendi kendilerini yok etmesinden korkuyordu. Bugün ise, yalnızca insanlık dışı yaşama koşulları değil, aynı zamanda sürdürülemez kaynak kullanımı da kentler açısından tehdit oluşturmaktadır. Sürdürülebilir kentleşme için kentsel performans göstergeleri ve metrikler tanımlanmakta ve çeşitli indexler ve tasarım rehberleri hazırlanmaktadır (Mimar Sinan Güzel Sanatlar Üniversitesi ve T.C.Çevre ve Şehircilik Bakanlığı, 2016).

Kente etkiler iki farklı yaklaşımla ele alınabilir: (Climate Change, 2001; Carmichael, 1999; 2016/ <http://www.un.org/sustainabledevelopment>)

1. İklim sistemindeki değişikliğe göre etkiler
2. Kentin bileşenlerine göre etkiler

1.İklim sistemindeki değişikliğe göre etkiler

Bu etkiler;

- uzun yıllar ortalamalarındaki değişikliklerden
- ekstrem olaylardaki değişikliklerden dolayı ortaya çıkacaktır.

Kentlerde doğal tehlike türlerinden olan

- hidrolojik tehlikelerin (taşkın-ani taşkın, aşırı rüzgar/kıyı taşkını; kütle hareketi-kaya düşmesi, toprak kayması, göçük gibi),
- meteorolojik tehlikelerin (kasırga gibi)
- iklimsel tehlikelerin (ekstrem sıcaklıklar, kuraklık, yangın gibi) meydana gelme olasılığının yükseleceğini belirtmektedir.

2.Kentin bileşenlerine göre etkiler

- Yapılı çevreye etkiler (seller,sıcaklık)
- Altyapıya etkiler (su, kanalizasyon)
- İnsan sağlığına etkiler,
- Biyolojik çeşitliliğe etkiler,
- Hava kalitesine etkiler,

Sosyal ve ekonomik yapıya etkiler

Kentsel alanlardaki kentsel doku organizasyonları ile alt yapı sistemleri arasında bir ilişki vardır. Bu ilişki özellikle kentsel alanlardaki yeşil alanların azalması ve geçirimsiz yüzey kaplamalarının tercih edilmesi ile daha da önemli hale gelmiştir. Bu tercihler sonucunda ulaşım ve yapılaşma ile kentsel peyzaj alanlarında yüzeysel akış oluşumu meydana gelmiştir. Buna paralel olarak kısıtlılık ve problemleriyle süregiden mevcut altyapı sistemleri, ani yağışlar ile yüksek miktar ve hızda suyu yönetemez hale gelmiştir (City of Tucson AZ at <http://www.tucsonaz.gov/water/cycle>).

Bütün bu tablonun sonucunda ise; yeraltı su seviyelerinde düşme, nehir koridoru ve setinde erozyon ve kirlilik konsantrasyonu artışları (Novotny ve Olem, 1994), sel felaketleri (Samsun sel felaketi 2012, Ayamama deresi taşkını 2009, Mersin büyük sel taşkını 2001), altyapı sistemlerinde suyun toplanması, dağıtımı, içilebilir ve atık su bakımı için çok fazla enerji tüketimi¹, su havzalarında fiziksel, kimyasal ve biyolojik bozulma² ve içilebilir tatlı suyun herkes için erişilebilir olmaması türünden yakıcı problemler ile karşılaşmıştır (Sert, 2013).

Günümüzde küreselleşme temelinde sürdürülebilirlik ve dirençlilik (dayanıklılık) sıklıkla tartışılan kavramlardır. Sürdürülebilirlik üç boyutu olan (ekolojik, sosyal ve iktisadi) bir kavram olup ekolojik boyutuyla sürdürülebilirlik; “*üzerinde yaşadığımız dünyanın sahip olduğu doğal kaynakların bugünkü kuşaklar tarafından kullanılmasını ama bu kullanımın gelecek kuşakların, söz konusu kaynaklardan yararlanma imkanlarını ortadan kaldırmayacak bir düzeyde*

olması”nı ifade etmektedir (Şahin, 2011). Dirençlilik; Afet Risk Azaltma Uluslararası Ofisi (UNISDR) Hyogo Eylem Planı sonuç raporunda, “Tehlikelere maruz kalmış bir sistemin, topluluğun veya toplumun, kendi temel yapılarını ve işlevlerini koruma ve onarma dahil, bir tehlikenin etkileri karşısında zamanında ve etkin bir şekilde direnme, soğurma, uyum geliştirme ve iyileşme becerisi” olarak tanımlanmaktadır (http://dergipark.gov.tr/resilience-Recilience_Dergisi) Dirençli kentler ise, petrol üretiminin sınıra ulaşması ve iklim değişiminin baş göstermesi ile meydana gelen sorunlara çözüm üretmek için geliştirilmiş olup kentsel direnç kavramı böylelikle planlamanın içine dahil edilmiştir (Karahan, 2018).

Azaltım süreci karbondioksit salımı ve enerji tüketimi arasındaki farklı parametrelerin incelenmesi ile ortaya konulmaktadır. Bu değişkenler; (1) karbon yoğunluğu (birim enerji üretimi başına CO₂ miktarı), (2) enerji yoğunluğu (gayri safi milli hasıla başına tüketilen enerji miktarı), (3) kişi başı milli gelir ve (4) nüfus olarak belirlenebilir. Karbon yoğunluğu ve enerji yoğunluğu ülkelerin "teknolojik gelişmişlik" düzeylerinin bir göstergesi iken, gayri safi milli hasıla ise ülkenin refah seviyesini ifade etmektedir. Bu durumda, teknoloji, refah ve nüfus faktörleri karbon salımını belirlemektedir. Yapılan çalışmalar, "ekonomideki enerji yoğunluğu" ve "enerjinin karbon yoğunluğu" faktörlerinin önemini ortaya koymaktadır. Sonuç olarak, CO₂ salımını düşürmenin politik ve teknik olarak uygulanabilir yönteminin ‘düşük karbon ekonomisi’ne geçiş olduğu ve bunun da yenilenebilir enerji kaynakları ve enerji verimliliği ile sağlanabileceği açıktır (Tural, 2017). Bu kapsamda;

- Karbonun depolanması ve yutulması
- Enerji talebini azaltması (soğutma+kaynak)
- Kent ve yakın çevresinde rekreasyon olanakları sağlanarak araç talebinin azaltılması (dolaylı)
- Kent ve yakın çevresinde gıda üretimine olanak sağlanması (dolaylı) önlemleri de kentlerin ekolojik yenilenmesinde İklim Eylem Planının önerdiği stratejilerdir.

Uyum süreci açısından bakıldığında ise, iklim değişikliği göstergeleri (artan sıcaklıklar, değişen yağış döngüleri, buz ve karların erimesi ile deniz seviyesi yükselmesi vd.) etken olmaktadır. Sel ve kuraklık gibi tehlikelere neden olan aşırı hava ve iklim ile ilgili olaylar pek çok bölgede daha sık ve yoğun biçimde yaşanmaya başlamıştır ve daha da kısalan döngülerle tekrarlayacaktır. Emisyonların azaltılmasına yönelik küresel çabalar etkili olsa bile, iklim değişikliği kaçınılmazdır ve etkilerine uyum sağlamak için tamamlayıcı eylemler gerekmektedir.

İklim değişikliğinin etkilerini öngörerek; bu etkileri en aza indirmek ve uygun önlemleri almak için uyum gereklidir. Ekosistemler ve su yönetimi, afet riskinin azaltılması, kıyı bölgesi yönetimi, tarım ve kırsal kalkınma, sağlık hizmetleri, kentsel planlama ve bölgesel kalkınma gibi diğer politika alanlarında entegrasyon hayati önem taşımakta ve gerekliliği gün gittikçe artmaktadır. Eylemler, teknolojik önlemleri, ekosisteme dayalı önlemleri ve davranış değişikliklerini ele alan önlemleri içermektedir (<https://www.eea.europa.eu/tr/themes/iklim-degisikligine-uyum/intro>).

Şehir plancıları, peyzaj mimarları ve ekologlar kaybolan doğal değerleri kent içinde yeniden oluşturmanın gayreti içindedirler. “Kent içinde varlık alanı bulan yapılı çevre ve açık alanları kapsayan tüm yeşil ağ elemanları“ kavramı da bu zorunlulukların ve arayışların doğal bir sonucudur. Uyum süreci ile;

- Yüksek sıcaklıkların yönetimi,
- Su kaynakları yönetimi,
- Akarsu sellerinin etkisinin azaltılması,
- Toprak erozyonunun azaltılması,
- Kıyı taşkınlarının azaltılması,
- Canlı türlerinin yeni iklim koşullarına uyum sağlayabilmesi için mekan oluşturması gerekmektedir.

İklim değişikliği etkilerine karşı hayata geçirilecek azaltım ve uyum stratejilerinin hayata geçirilmesinde en önemli araçlardan biri yeşil altyapı planları olacaktır. Bunları destekleyecek şekilde sürdürülebilir hareketlilik ve akıllı büyüme konuları da ulaşım ve arazi kullanım kararları açısından yapılacaklar arasındadır.

İKLİM DEĞİŞİKLİĞİ İLE MÜCADELEDE KENTSEL YEŞİL ALANLARIN VE SU KORUNUMUNUN ROLÜ

Kentler, antropojenik faaliyetlerin yoğunlaştığı alanlar olmalarının yanı sıra doğal yapı ve sistemleri barındıran, kültürel ve doğal yapıların karşılıklı etkileşimini içeren ekosistemlerdir. Kentlerin ekosistem fonksiyonlarını dengeli ve sağlıklı şekilde sürdürebilmesi, kentleri ekosistem algısıyla ele alan planlama pratikleriyle mümkün olabilir (Yaman ve Doygun, 2014; U.S. Geological Survey at <https://water.usgs.gov/edu/earthgwdecline.html>).

Mekânsal Planlama Aynı Zamanda Bir Su Kullanım Kararıdır. Kent ve su planlaması sürdürülebilir bir su sisteminin inşası içinde bir madalyonun iki yüzü gibi ilişkilidir. Su yönetimi ve arazi kullanımı doğası gereği bağlantılıdır. Karada meydana gelen faaliyetler ve

işlemler doğrudan bir havzada içinde suyun kullanımını ve hareketini etkiler. Hidrolojik döngü ve arazi kullanımı arasındaki bu ilişki toprak ya da su hakkında karar verirken önemlidir. İçme suyu, yer altı suyu, yağmur suyu, su kaçakları, atık su ve yeniden kullanılan su, sürdürülebilir kent planlaması ve ekonomik kalkınma kararları hep birlikte düşünülmektedir. Böylelikle kentsel su döngüsü doğal hidrolojik ve ekolojik döngüleri tamamlar (Tamer, 2016).

Su Duyarlı Kentsel Tasarım Nedir ? (Tamer, 2016)

- Su duyarlı kentsel tasarım (WSUD) tüm suların akıllı yönetimi sayesinde sağlıklı ekosistemleri, yaşam ve geçim kaynaklarını destekleyen kentsel çevrelerin planlanması ve tasarımı için bir yaklaşımdır.
- Bu yaklaşımda su yönetimi, doğal hidrolojik ve ekolojik döngülere duyarlıdır. Kısaca kentsel su döngüsünün yönetimi, korunması ve muhafazası ile kent planlamayı bütünleştiren bir yaklaşımdır.

Su Duyarlı Kentsel Tasarım İlkeleri içinde özellikle, (Şekil 1)

- Çatılardan ve diğer yağmursuyu akışlarını toplama dahil yüzeysel akışının yeniden kullanımını sağlayacak ve kentsel gelişimden kaynaklanan yüzey akışlarındaki zirve akımları azaltacak yöntemler geliştirmek ile
- Peyzaj ve entegre su yoluyla kentsel alanlarda görsel, sosyal, kültürel ve ekolojik değerleri geliştirmek için çok amaçlı yeşil alanların tasarlanması, kentsel yeşil ağ için son derece önemli yaklaşımlardır.

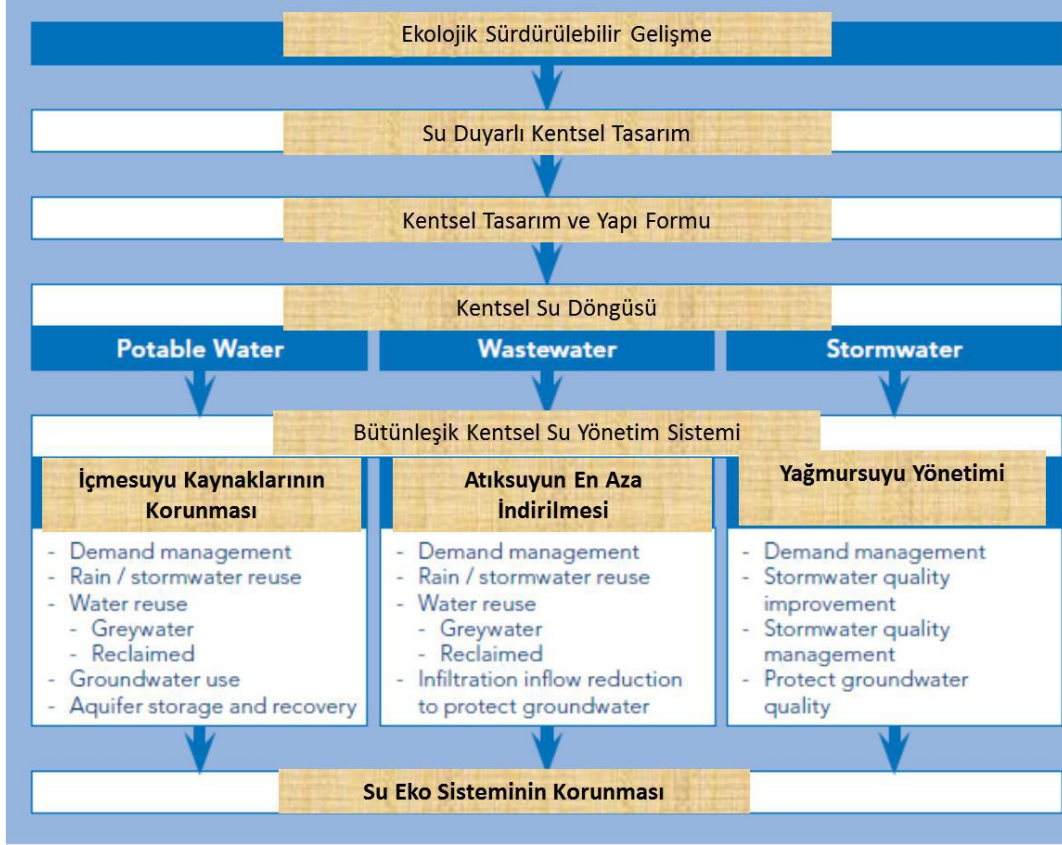

Bütünleşik kentsel su planlaması ile (Tamer, 2016)

Kentsel su talebinin yönetiminde ve arzının planlanmasında daha etkin bir yaklaşımın sağlanması amaçlanmaktadır.

- Bir havza bütünü içinde kaynakların optimal bir şekilde kullanımı, su kaynaklarının devlet ve ulusal politika bağlamında entegre yönetimini de gerektirir.
- Bu koordineli bir planlama süreci, sürdürülebilir kalkınma ve suyun toprak ve ilgili diğer kaynakların (enerji kullanımı da dahil) yönetimi ile ilişkilendirilmesidir.

Kentsel Su Verimliliği Planı

Kentsel Su verimliliği Planı, su kaynaklarını koruma çalışmaları için bir çerçeve görevi görerek kapsam, amaçlar, potansiyel sonuçlar, talebin azaltılması için belirlenen spesifik hedefler ve programların uygulanabilmesi için tavsiyeleri içerir (Durmuş, 2013).

Şekil 1: Ekolojik Sürdürülebilir Gelişme İçin Kentsel Su Döngüsü (Tamer, 2016)

Kentsel Altyapı Sistemleri

Kentsel alanlarda geçirimsiz sert yüzeylerin aşırı bir şekilde artmasının ve açık-yeşil alanların bu artışa ters orantılı olarak azalmasının sonucunda, yağış sonrası yağmur suları toprağa yeterli oranda sızamamaktadır. Bu durumla birlikte; ortaya çıkan fazla yağmur suyu, sert yüzeyler boyunca yüzey akışa geçmekte ve düşük kotlu alanlarda toplanmaktadır (Müftüoğlu ve Perçin, 2015; Butler and Davies, 2004; Dunnett and Clayden, 2007). Kentsel yağmur suyu yönetimini; yağmurun yararlı kısmından sonra geride kalan miktarının, kentsel altyapı ve üstyapıya zarar vermeden uzaklaştırılmasını sağlayan bir dizi önlemler bütünü olarak tanımlamak mümkündür (Müftüoğlu ve Perçin, 2015; Demir, 2012).

Kentte suyun hareketi, fonksiyonu ve organizasyonu açısından önerilen metodların; kentsel bir altyapı olarak çalışması üzerinden peyzajdaki su sistemleri “aktif” ve “pasif” olarak ikiye ayrılarak ikiye ayrılmıştır. Pasif yağmur suyu toplamada; arazi setleme (site grading), geçirgen yüzeyler (permeable surfaces), yönlendiriciler (diverts), bitkiler ile selsuyunu alıkoyarak, arıtarak bu peyzaj elemanlarından ve yöntemlerinden fayda sağlanmaktadır. Pasif yağmur suyu yakalamada ise arazi üzerindeki (on-site runoff) ve arazi dışındaki akıntıyı (off-site flows)

yakalamak için kullanılan uygun teknikler “pasif” manasında kullanılmaktadır (Kinkade-Levario, 2007).

Kentleşme ile birlikte nüfus artışı ve geçirimsiz yüzeyler arasında doğru bir ilişki vardır. Geçirimsiz yüzey miktarı (geçirimsiz yüzeyle kaplı olduğu yollar, çatılar, beton yüzeyler vb. alan miktarı) kentsel arazi kullanımının etkilerinde anahtar bir çevresel göstergedir (Şekil 2, 3). Doğal peyzaj geçirimsiz yüzeylerle değiştirildiğinde bu su döngüsü bozulmakta; suyun iletim ve depolanması da olumsuz etkilenmektedir. Geçirimsiz yüzeylerle kaplı kentlerde, daha az yüzey suyu, terleme ve buharlaşma için yüzeyde tutulabilir çünkü su geçirimsiz yüzeylerden hızla drene edilir. Bu da kentsel enerji dengesini etkiler.

Şekil 2. Geçirimsiz yüzey ve su döngüsü ilişkisi. Prince George's County, Maryland Department of Environmental Resources (1999)'dan alınmış, Esra Sert (2013) tarafından Türkçe'ye çevrilmiş ve yeniden görselleştirilmiştir.

Şekil 3. Farklı yüzeylerdeki suyun davranışı ile ilgili görsel anlatım. Blood'un (2006) çalışmasından alınmış, Esra Sert (2013) tarafından yorumlanmış, Türkçe'ye çevirilmiştir.

Yağmur Sularının Kentlerde Kullanımı

Nüfus yoğunluğundaki hızlı artış yaşam, dolaşım ve endüstri için geniş alan ihtiyacını da beraberinde getirmektedir. Kentleşme ile yeryüzü sistematik olarak geçirimsiz hale gelmektedir (Şekil 4). Geçirimsiz yüzeylerin artması, seli önleyen doğal alanların yok olması başta olmak üzere su kalitesinin bozulmasına kadar birçok sorunla karşılaşmamıza sebep olmaktadır (Demir, 2012). Günümüzde yağmur suyu yönetimi bütüncül bir bakış açısı ile ele alınmaktadır.

Şekil 4. Kentleşmenin yağmur suyu döngüsüne etkisi (Ekinci, 2015)

Yağmur Suyu Yönetim Sistemleri,

1. Geleneksel Sistemler

2. Sürdürülebilir Sistemler; A) Yeşil Çatılar, B) Su Geçiren Yüzey Kaplamaları C) Yeşil Çatılar, D) İnfiltrasyon Hazneleri, E) Sarnıçlar ve F) Yağmur Bahçeleri) olmak üzere iki başlık altında ele alınmaktadır.

Yeşil Çatılar, Belirtilerini günümüzde gözlemleyebildiğimiz iklim değişikliği, dünyada bilimsel bir gerçeklik olarak kabul edilmiştir. Bu açıdan yeşil çatılar ekolojik dengenin sürdürülebilirliği açısından büyük önem kazanmaktadır. Yeşil çatılar, şiddetli yağmur ve sel olayları, yüksek kent sıcaklıkları ve atmosfer kirliliği gibi iklim değişikliğine neden olan olaylar karşısında bir ölçüde çözüm sunabilirler (Dunnett and Kingsbury, 2008). Sağlıklı Kentler için Yeşil Çatılar (Green Roof for Healthy Cities) verilerine göre, şehirlerin % 75'i geçirimsiz yüzeylerle kaplıdır, çatılar bunun önemli bir kısmını oluşturmaktadır. Bu ortamda, yeşil çatılar, estetik ve pratik yararlar da sunmaktadırlar. Bitki örtüsü, kuşlar ve böcekler için yaşam ortamı sağlar, karbondioksiti ve diğer kirliliği çeker, havayı arındırır, oksijen üretir, buharlaşma yoluyla havaya serinlik katarak tüm canlıların yaşam ortamları açısından olumlu koşullar yaratırlar (Erkul ve Sönmez, 2014) (Şekil 5). Yeşil çatıların, *Çevresel ve Ekolojik, Sosyal ve Ekonomik Faydaları* gibi çok yönlü faydaları bulunmaktadır.

Yeşil çatı uygulamaları, yağışın akışa geçen miktarını ve akış hızını azaltır. Uygulama sırasında, çatı sisteminin üzerine su geçirmez membran tabakası oluşturulur. Membran tabakasının üzerine, bitki gelişimine olanak sağlayan ve fazla suyun uzaklaştırıldığı ikinci bir tabaka hazırlanır. Sistemin en üstünde bitki örtüsü bulunur. Bitki örtüsü yağmur suyunu yakalarken, gelişim tabakası suyu depolayabilmektedir. Yeşil çatıların hidrolik performansı çok fazla miktarda suyun emilimi için yeterli olmayabilir. Bu nedenle, yağmur suyunun fazlası diğer drenaj sistemlerine aktarılmalıdır (Şekil 6).

Şekil 5. Amerikan Peyzaj Mimarlığı Binası (ASLA) (Erkul ve Sönmez, 2014)

Şekil 6. Yeşil Çatı Katmanları (Thomas ve Thomas, 2003) (Erkul ve Sönmez, 2014)

Su geçiren yüzey kaplamaları, gözenekli ve geçirgen kaplamalar olarak ikiye ayrılır. Gözenekli kaplamalar çim veya çakıl yüzeyi gözenekli beton veya asfalttan oluşurken, geçirgen kaplamalar beton bloklardan oluşmaktadır. Alt tabakalara süzülmeye olanak veren bu kaplamalar, sürdürülebilir drenaj sistemlerinden biridir. Bu tür kaplamalar, yüzey suyu akış miktarının ve debisinin azaltılmasını, kentsel kirleticilerin uzaklaştırılmasını, yağış sularının geçici olarak depolanmasını ve yeraltı suyunun takviyesini sağlamaktadır. Gözenekli ve geçirgen kaplamaların kullanılmasıyla yüzey akışında % 42'ye varan bir azalma gözlenmiştir (Scholz, 2006) (Şekil 7).

Şekil 7. Gözenekli ve Geçirgen kaplamalar
(<https://www.google.com.tr/search?q=G%C3%B6zenekli+kaplamalar>)

İnfiltrasyon Hazneleri, İnfiltrasyon, yağmur suyu veya sulama sularının toprak profili boyunca yer çekiminin etkisi ile yüzeyden aşağı doğru inmesidir. Yağmur suyu infiltrasyonu, sel ve taşkın riskini azaltmak, kirlilik kontrolü sağlamak, yeraltı su tabakasının yenilenmesine katkı sağlayarak alternatif su kaynağı oluşturmak amacıyla suyun depolanarak kontrol altına alınması, sonra zemini çevreleyen toprağa sızdırılarak doğal çevreye iletilmesini sağlayan bir yağmur suyu drenaj yöntemidir. Yağmur suyunun infiltrasyon uygulamaları uzun yıllardır sel ve taşkınlardan korunma ve su kalitesinin iyileştirilmesi amacıyla kullanılmaktadır (Demir, 2012) (Şekil 8)

Şekil 8: Yağmur Suyu İnfiltrasyon Uygulamaları

Yağmur Bahçeleri; yağmur suyunun çatılar, araç yolları, yürüyüş yolları, araç parkları gibi bölgelerden akışını sağlayarak suyu bünyesinde absorbe ederler. Bu yöntem, diğer yöntemlerin aksine yağmur suyunun yeraltında toplanarak akışı azaltır (Şekil 9). Çevremizde yağmur suyunun yüzeysel akışa geçen miktarı kırsal alanlarda %10 iken, kentsel alanlarda %55'e kadar ulaşmaktadır. Yüzeysel akışa geçen yağmur suyu özellikle kentsel alanlarda beraberinde ciddi kirleticiler getirmektedir. Günümüzde yağmur suyunun yüzeysel akış ile miktarının artması, yağmur suyu akış süresinin kısalması ve işletim maliyetlerinin artması sonucunda yağmur suyu drenajı konusunda sürdürülebilir stratejiler belirlemek zorunlu hale gelmiştir.

Şekil 9. Tanner Springs Park (Pearl District (Portland –Oregon) Kentin ekolojik olarak canlandırılması projesi kapsamında düzenlenen yağmursuyu bahçesi. Kentin kuzeyinden geçen Willamette Nehrine doğru açılan yeşil koridor üzerinde planlanmış parklardan biri.

(<http://www.ramboll.com/projects/germany/tanner-springs-park>)

Yağmur suyunu yönlendirmek, yavaşlatmak ve arıtmak için kullanılan; *yağmur bahçeleri (rain gardens)*, *peyzaj kanalları (landscape swales)*, *yapılandırılmış sulak alanlar (constructed wetlands)*, *bitkilendirilmiş çatı örtüleri (vegetated roofs)* vb. pek çok sistem vardır. Son 10-15 yıldır bu anlamda kullanılan teknikler bütünü "*Düşük Etkili Tasarım*" olarak da adlandırılmaktadır. (Low Impact Development-LID). Topraktaki suyu yeraltı su seviyesi üzerine çıkarabilmek amacıyla yakalamak ve depolamak, sucul ekosistemdeki yeşil su seviyeleri ile toprak nemini arttıran uygulamalardır (Kinkade-Levario, 2007; Sert, 2013).

Yağmur bahçesi (rain garden)

Yağmur bahçesi yeryüzündeki suların herhangi bir işleme tabi tutmadan yönlendirilerek bitkilerin yetiştirilebildiği sığ çukur alanlara “yağmur bahçesi” veya diğer bir deyişle “biyolojik tutma alanları (bioretention)” olarak nitelendirilir (Demir, 2012). Yağmur bahçeleri sürdürülebilir yağmur suyu yönetimi kapsamında büyük önem taşır. Yeraltı suyunu besleyerek evapotranspirasyon oranını artırır. Yüzeysel suyu sıcaklığını ve yüzey akış hızını düşürür. Ayrıca biyolojik çeşitliliği artırarak kentsel alanlardaki ekolojik dengenin korunumunu sağlar. Yağış sonrası yüzey akış miktarının azaltılması, yeraltı suyu besleniminin iyileştirilmesi ve noktasal kaynaklı olmayan kirleticilerin alıcı sulara ulaşmadan tutulması amacıyla kullanılan yağmur bahçeleri; konut sahipleri, belediyeler ve diğer kamusal alanlar için son derece basit ve maliyet etkin bir yağmur suyu yönetimi aracıdır (Müftüoğlu ve Perçin, 2015; Jaber et al., 2012) (Şekil 10).

Şekil 10. Yağmur bahçesi (<http://www.cityofdubuque.org/>)/2016

Bu sebeplerle, “kentsel altyapı olarak peyzaj” kavramı kapsamında doğal ve fonksiyonel yeşil altyapı sistemleri oluşturmak mümkündür. Çünkü peyzaj elemanları sürdürülebilirlik kapsamında ele alındığında doğal ekolojik prensipler içerir, şöyle ki; kentsel alanlarda oluşan yüzeysel su akışlarını yönlendirmek veya suyun hareketini organize etmek doğal organizasyonlarla sağlanmalıdır. Peyzajın kendi form ve dokusunu kullanarak ve estetik özelliklerini değerlendirerek kentsel altyapı sistemlerinde yağmur suyu yönetimi sağlamak mümkündür. Yağmur suyunu yavaşlatmak, yönlendirmek, absorbe etmek, farklı rekreasyonel etkinlikleri yapmaya imkân sağlamak ancak peyzajın elemanları ile sağlanır.

Yağmur bahçesi doğrudan güneş alan bölgelere ve gölgede ağaç altlarına konumlandırılmalıdır. Düz alanlar yerine hafif eğimli bölgelerde, yeraltı su seviyesinin yüksek olduğu bölgeler tercih edilmelidir. Yağmur bahçesi büyüklüğüne karar verirken bölgenin iklim verileri özellikle yağış verileri dikkate alınmalıdır. Bahçenin derinliği Müftüoğlu ve Perçin (2015)“de verildiği gibi şu şekildedir;

- Eğer alanın eğimi %4“ten az ise, yağmur bahçesinin derinliği 7-12 cm arasında olmalıdır.
- Eğer alanın eğimi %5-7 arasında ise, yağmur bahçesinin derinliği 15-18 cm arasında olmalıdır
- Eğer alanın eğimi %8-12 arasında ise, yağmur bahçesinin derinliği 20 cm olmalıdır (The Native Plant Society of New Jersey, 2005, Doğangönül ve Doğangönül, 2008).

Bitkili su arkları

Bitkili su arkları, suyun tahliye kanalına iletilmeden önce azaltılmasını ve akış hızını azaltmayı hedefleyen açık ve sığ kanallardır. En etkin arklar genellikle %4 den az bir eğimle yapılanlardır. Eğim en fazla %6 olmalıdır. Derinlik estetik ve güvenlik gerekçeleriyle az tutulmalıdır (Karpuzcu, 2005) (Şekil 11).

Şekil 11. Bitkilendirilmiş Su Arkları

Bitkilendirilmiş çöküntü alanları (grass swales / landscape swales)

Bitkilendirilmiş kanallar ve lineer çöküntü alanlarıdır. Yağmur suyunu toplamak ve hareketini yönlendirmek, yönlendirme sırasında yavaşlatmak ve arıtarak bir gölcüğe vb. bir toplanma yerine yönlendirmek amacıyla kullanılırlar Temel fonksiyonları; akıntının hızını düşürürken bir filtreleme aracı gibi davranmalarıdır. Geçirimli döşeme ve bitkilendirilmiş çatılar bu amaca hizmet eden diğer iki metod olarak karşımıza çıkmaktadır. Çim kanallar ya da çöküntü alanları

pek çok arazi koşuluna uyumludur ve tasarıma uyarlanabilir, uygulama masrafları ise görece düşüktür (Şekil 12-13) (Sert, 2013).

Şekil 12. Kanalın her iki tarafındaki hemerocallis (zambaklar) suyun filtrelenmesini destekleyicidir. Çevredeki ofis bloklarının çatılarından suyu topluyor (Dunnet and Clayden, 2007)(Sert, 2013'den alıntı)

Bitkilendirilmiş çatı örtüleri (vegetated roof)

Kentteki sel suyu akıntısını azaltmada ciddi bir yüzdesi olan bitkilendirilmiş çatı örtüleri ya da yeşil çatılar, geçirimsiz yüzeyleri azaltmada çok etkilidir. Kentsel alanlarda bitkilendirilmiş çatı yüzeyleridir. Yaklaşık 7,62 cm. alt tabaka, ılıman iklimlerde akıntıyı yıllık %50'den fazla azaltabilmektedir (USEPA, 2000). Yeşil çatı örtüleri ince yeşil tabaka ile bitkilendirilmiş, insanın yaşama ve kullanımına imkan sağlayan mekanlardır (Şekil 14). Özellikle kentsel alanlarda ısı adası etkisinin azaltılmasında ve kent insanının daha iyi bir çevrede yaşamasında önemli bir bileşendir (Sert, 2013). Bitkilendirilmiş çatılarda kullanılacak olan drenaj sistemleri ile çatı yüzeyine düşen yağmur suyunun tahliye sistemine ulaşımı bir saat kadar geciktirebilmektedir. Bu da sel oluşum riskini azaltmada önemli bir faktördür,

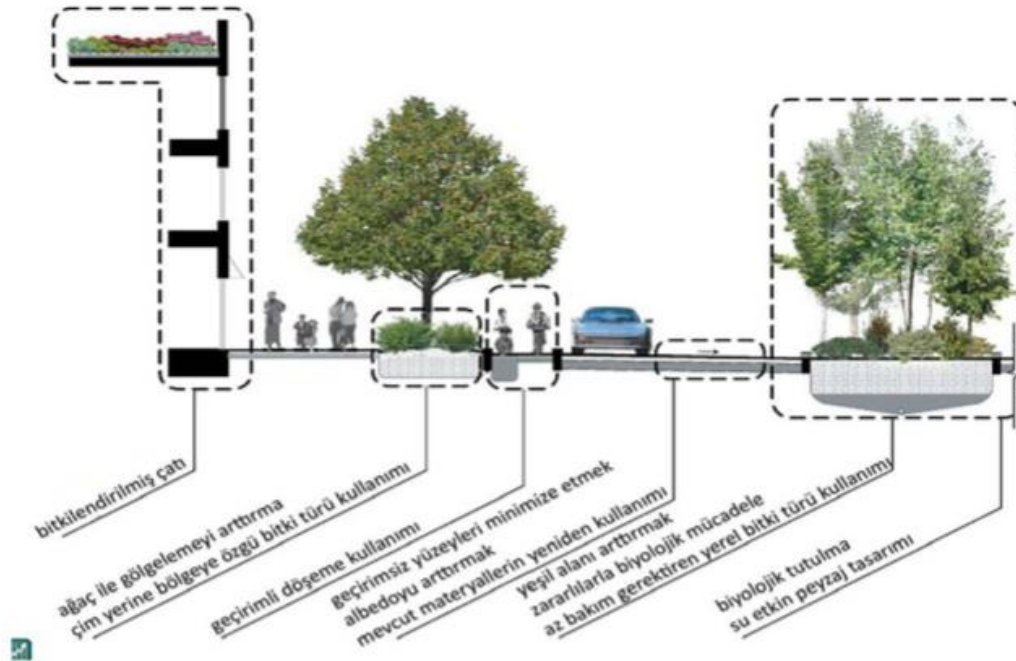

Şekil 14. Bitkilendirilmiş Çatı Örtüsü
(<http://www.emlaktasondakika.com/haber/genel/bitkilendirilmis-catilar-kuresel-isinmanin-etkilerini-azaltiyor/2016>)

Aktif (yapılandırılmış) sistemler ile yağmur suyu toplama, depolama ve filtreleme

Aktif (yapılandırılmış) sistemler ile yağmur suyunu toplama, depolama ve filtrelemede pasif sistemlerden farklı olarak strüktürel müdahale devreye girmektedir. Yani strüktürel anlamda tasarlanmış, uygulanmış sistemlerdir. Ayrıca aktif yağmur suyu toplamada su yalnızca yönlendirilmez aynı zamanda daha sonra kullanılmak üzere depolanır. Biyolojik tutulma (bioretention), Yapılandırılmış sulak alanlar (constructed wetlands) ile Yağmur tankları ve sarnıçlar (rain tanks, cisterns) örnek olarak verilebilir (Sert, 2013).

Biyolojik tutulma (bioretention) strüktürleri

Biyolojik tutulma (bioretention); karasal temelli, bitkilerin kimyasal, biyolojik ve fiziksel özellikleri için mikroorganizmaları; sel suyu akıntısının taşıdığı kirletenlerin giderilmesi için ise toprağı kullanan su kalitesi ve nicelik kontrolü pratiğidir. Biyolojik tutulma tasarımında doğada yaşanan süreçlerin, az çok aynı süreçlerle tekrarlanmaya çalışılması izlenen bir yol olarak karşımıza çıkmaktadır. Biyolojik tutulma konsepti; yeni konut alanlarında, yeni ticaret ve endüstri alanlarında, canlandırma ve akıllı büyüme (smarth growth) projelerinde, sel suyu yönetimi kentsel iyileştirme projelerinde, sokak peyzajı projelerinde, özel konut peyzajlarında, park ve tren yollarında uygulanabilmektedir (Sert, 2013) (Şekil 15-16-17).

Şekil 15. Bu bütüncül tasarım kurgusunu sokak kesitinde anlatan görsel. New York City Department of Design + Construction (2005)'dan alınmış, Esra Sert (2013) tarafından Türkçe'ye çevrilmiştir.

Şekil 16. (a) Yoğun yağmur yağışında bitkiler geçici olarak suyun altında kalır
(b) Yağmursuz günde bitkilendirilmiş kanal ve tampon bitkilendirmesi (Sert, 2013)

Şekil 17. (a) Toplayıcı sistem ve bitkilendirilmiş kanal bağlantısı
(b) Yağmursuz günde sel suyu saksısının görünüşü (Sert, 2013)

Yapılandırılmış sulak alanlar (constructed wetlands)

Sulak alan ekosistemleri zengin biyolojik çeşitlilik ve biyolojik üretim kaynağı olma gücünü bünyelerinde barındırırlar. Sulak alanlar; yeraltındaki dengeyi koruma, erozyon kontrolü, yeraltı suyu boşaltma, rüzgarı engelleme, su baskını kontrolü, atık ve toksiklerin birikimini önleme, sahil alanları iklim dengesini sağlama, su transferi, rekreasyon ve turizme katılma ve katkının dışında çeşitli bitki ve hayvan türlerine de ev sahipliği yapar. Yapılandırılmış sulak alanlar da kentsel peyzajda şarj edilebilir geçirgen bir yüzey oluşturmaya ve benzer faydaları sağlamaya yaramaktadır (Şekil 18) (Sert, 2013).

Şekil 18. HuaXin yerleşim bölgesinin yapılandırılmış sulak alan uygulaması sırasında ve sonrasında gösteren fotoğraflar (Stokman, 2008) (Sert, 2013'den alıntı)

Yağmur tankları ve sarnıçlar (rain tanks, cisterns)

Yağmur suyunu; su zinciri, borusu vb. yardımıyla çatıdan yere indirdikten sonra suyun aktığı-iletildiği sistemin çakıllı-bitkilendirilmiş vs. alandan geçerek (genellikle uygulamalarda su direk toplanır) toplama bölümüne doğru aktarıldığı, yürürken döşemede herhangi bir engel oluşturmayacak biçimde detaylandırılabilir, bitkilerin, toprağın ve materyallerin arıtma işlevi ile birlikte düşünülmesi gereken sistemlerdir (Şekil 19) (Sert, 2013).

Şekil 19. 1990'ların öğrenci konutları Berlin, Almanya, yerleşmenin planlanmasında sürdürülebilirlik konseptini her yerde devam ettiren yağmur iniş, kanal detay ve su drenaj çözümleri görsel olarak da projeyi destekler niteliktedir (Dunnet and Clayden, 2007) (Sert, 2013' den alıntı).

EKO-KENT Kavramı Kapsamında Yapıların Ekolojik Sürdürülebilirliği

Ekolojik bilinçlenme, yapı sektöründe de binaların karbon salınımlarını ve çevreye olan olumsuz etkilerini azaltmaya yönelik çözümler bulmaya itmiştir. İnşaat sektörü de iklim değişikliğiyle mücadele için dünyada '*yeşil dönüşüm*'e girmiştir. Bu çerçevede çevre dostu, ekolojik binaların yapılması gündeme gelmiştir. Çevre dostu bina yapımına ilgi giderek artarken sürdürülebilir ilkelerle gelişim gösteren yeşil bina kavramı ortaya çıkmıştır (Akça, 2011).

Yeşil binaların yaşam dönemi boyunca sahip oldukları düşük enerji ve su tüketimi, atık yönetimi, projelerin ekosisteme olan etkisinin minimize edilmesi ve çevre dostu malzemelerin kullanımının artması gibi nedenler, performansı yüksek yeşil binaları yatırımcılar gözünde çekici hale getirmiştir. Yeşil binaların yaygınlaşmasında ve bu yaygınlaşma sürecinde binaların performanslarının somut bir şekilde belirlenebilmesinde sertifika sistemleri etkin rol oynamıştır (Çelik, 2016).

Yeşil binaların uygulamasının yaygınlaşmasını sağlamak ve teşvik etmek amacıyla; dünyadaki yeşil bina konseyleri tarafından binaların sürdürülebilirliğini bir takım standartlar çerçevesinde

onaylayan, yeşil bina değerlendirme sistemleri yani sertifikasyon sistemleri geliştirilmiştir. Farklı ülkeler tarafından geliştirilen yeşil bina sertifika sistemlerinin başlıcaları; (Sev ve Canbay, 2009) (Şekil 20).

	1990' da İngiltere' de ortaya çıkan BREEAM, Yapı Araştırma Kurumu Çevresel Değerlendirme Metodu (BREEAM), İngiltere' de Yapı Araştırma Kurumu (BRE) tarafından geliştirilerek, 1990 yılında uygulamaya geçirilen ölçütlere dayalı değerlendirme sistemlerinin ilk örneğidir.
	1996' da Kanada da ortaya çıkan SBTOOL, SBTool (daha önceki adıyla GBTool), 1998 yılında 14 katılımcı ülke ile kurulmuş olan uluslararası bir değerlendirme sistemidir. 2008 yılında katılımcı ülke sayısını 21' e çıkartmıştır. SBTool' un hedeflediği tek başına doğrudan yapılara uygulanmayan, genel bir değerlendirme çerçevesi olup, değerlendirmede 7 performans kriteri belirlemiştir.
	1998' de Amerika Birleşik Devletleri' nde ortaya çıkan LEED, LEED Sertifikalandırma Sistemi, USGBC tarafından geliştirilerek, 1998 yılında sürdürülebilir bina endüstrisinde yeşil bina tanımlamaya ve değerlendirmeye yönelik uygulamaya geçirilen bir sistemdir.
	2003' de BREEAM' den uyarlanarak Avustralya' da oluşturulan GREENSTAR, Avustralya Yeşil Bina Konseyi (GBCA) tarafından 2003 yılında geliştirilen <i>Green Star</i> , BREEAM ile büyük benzerlik taşımakta olup, yapıların yaşam döngüsü etkilerini değerlendirmeyi hedeflemektedir.
	Alman Sürdürülebilir Bina Konseyi 2007 yılında kuruldu ve 2008 yılında Dünya Yeşil Bina Konseyi' ne üye oldu. Alman Sürdürülebilir Bina Konseyi' nin birincil hedefi, kendi sertifikasyon sisteminin kurulması ve daha sonra geliştirilmesi oldu. Bu bağlamda 2009 yılında ofis ve idare binaları için DGNB Sertifikasyon Sistemi kuruldu. Bu sistem geliştirilerek 2010 yılında mevcut ve yeni binalar, eğitim kurumları ve ticari binaları da kapsayan uluslararası bir sistem haline geldi (Anbarcı vd., 2012) .
	2004' de Japonya' da ortaya çıkan CASBEE' dir (www.cedbik.org). Japonya Sürdürülebilir Yapı Konsorsiyumu (JSBC) ve Yeşil Bina Konseyi (JaGBC) işbirliği ile 2001' de geliştirilen CASBEE, Japonya' nın yanı sıra Asya ülkelerinin de sürdürülebilirlik esaslarını dikkate alarak hazırlanmıştır.

Şekil 20. Yeşil Bina Sertifika Sistemleri İçinde Dünya'da En Çok Kabul Görenler

Günümüzde, farklı ülkeler tarafından kullanılmakta olan otuzdan fazla yerel değerlendirme sistemi vardır. Bu değerlendirme sistemleri arasında en gelişmiş kabul edilenleri, 1990 yılından itibaren kullanılmakta olan ve toplam 110.000 binayı değerlendirmek için kullanılmış, kayıtlı

olarak bekleyen yarım milyon binada da kullanılması planlanan İngiltere kökenli BREEAM (*Building Research Establishment Environmental Assessment Method*) ile 1998 yılında kullanılmaya başlanan, 91 ülkeden 35.000 binanın sertifika almak için kayıtlı olduğu ABD kökenli LEED (*Leadership in Energy and Environmental Design*) dir. Bu sistemleri Avustralya Yeşil Bina Konseyi tarafından geliştirilmiş olan Green Star ve 2009'da Almanya'da ortaya çıkan DGNB (*Deutsche Gesellschaft für Nachhaltiges Bauen*) takip etmektedir (Çelik, 2016). BREEAM, LEED, CASBEE, yeşil bina değerlendirme sertifikasyon sistemlerinin ortak ele aldığı konular; Sürdürülebilir Araziler, **Su Korunumu**, İç Hava Kalitesi, Uygun Malzeme ve Yapı Elemanı Seçilmesi, **Su Korunumunda Etkinlik**, Enerji ve Atmosferdir (Tonguç, 2012). Ülkemizde, Çevre, Şehircilik ve İklim Değişikliği Bakanlığı tarafından hazırlanan 12 Haziran 2022 tarihli '*Binalar ile Yerleşmeler için Yeşil Sertifika Yönetmeliği*' gereğince ulusal yeşil bina ve yeşil yerleşme sertifika sistemi (YES-TR) oluşturulmuştur. Türkiye'de konuyla ilgilenen bina sahipleri ve yatırımcılar, LEED veya BREEAM Yeşil Bina Değerlendirme sistemlerinden birini kullanarak binalarını sertifikalandırmayı tercih etmektedir. Şekil 21'de görüldüğü gibi, yeşil binalar enerji kullanımında %24-50, karbon salınımında %33-39, su kullanımında %40, katı atık da ise %70 tasarruf potansiyeline sahiptir. Bu da bu konudaki hassasiyeti arttırmaktadır (Erten, 2016). Ülkemizde LEED Sertifikası almış olan yapılarla ilgili örnekler Şekil 22'de verilmektedir (Çelik, 2016).

SON SÖZ

Günümüzde artık yoğun insan kullanımına sahne olan kentlerle, ekoloji arasında nasıl bir uyum yakalanabilir sorusuna cevap aranmaktadır. Peyzaj Mimarları ve Kent Planlamacıları, azalan ve kaybolan doğal değerleri kent içinde yeniden oluşturmanın gayreti içindedirler.

Kentlerde son yıllarda dile getirilen “yeşil senaryo” ve “doğa içinde kent” kavramları da bu zorunlulukların ve arayışların doğal bir sonucudur.

19.yy’ın sonları ve 20.yy’ın başlarında, kentsel kirliliğin insan yaşamını tehdit ettiğine dikkat çeken kent planlamacıları, yazarlar ve düşünce adamları, kentlerin sonunda kendi kendilerini yok etmesinden korkuyordu. Bugün ise, yalnızca insanlık dışı yaşama koşulları değil, aynı zamanda sürdürülemez kaynak kullanımı da kentler açısından tehdit oluşturmaktadır.

Sürdürülebilir kent planlamasının ve çevre yönetiminin önündeki siyasi ve mali engelleri yıkma çabalarının ortak bir noktası vardır: görüş alışverişi yapan ve ortak çalışan kararlı insanların dinamikliği. Kentlerin insan uygarlıklarını sağlayan ve sonunda bu uygarlıkları kurtaracak işte bu insan enerjisi yoğunluğudur. Tüm anlatılanlar doğrultusunda **salt iki boyutlu imar planlarından** kentlerin geleceğini ipotek almaktan kurtaracak olan ekoloji öncelikli kentsel tasarım çözümleri gündeme gelmeli, planlama ile birlikte **eko-mühendislik** çalışmalarının birlikte yürüyeceği bir bütünsellik içinde ele alınmasını gerekmektedir.

ÖZET

Dünya edebiyatında olduğu gibi, Alman edebiyatında da edebi türler arası uyarlamalara sıklıkla rastlamak mümkündür. Örneğin, romandan, öyküden tiyatro sahnesine, filme, radyo oyununa uyarlanan çok sayıda eser mevcuttur. Bu çalışmada, Alman yazar Martin Walser'in "Ein fliehendes Pferd" (Kaçan Bir At) adlı anlatısı ve eserin Ulrich Khuon tarafından kaleme alınmış olan tiyatro uyarlaması odak noktasıdır. Walser'in bu eseri Alman edebiyatına özgü bir tür olan "Novelle" (Uzun Öykü) olarak bilinmekle beraber, bu çalışmada anlatı terimi kullanılmaktadır. Roman, öykü, masal gibi türlere anlatı denmesi uygundur. 1978 yılında yayınlanmış olan bu anlatı Walser'e büyük başarı sağlamış ve en çok satan kitaplar arasına girmiştir. Daha sonraki yıllarda eserin edebi uyarlamaları da yazara başarı getirmiştir. Eserde özellikle toplum ve karşı cins ile ilişkiler içerisindeki kişisel kimlik arayışı, yaşlanma ve iletişimsizlik gibi konular ele alınmaktadır. Eserde olay bir yaz tatili döneminde dört kişi arasında cereyan etmektedir: Anlatının asıl kahramanı Helmut Halm, kırk altı yaşında bir lisede öğretmendir. Eşi Sabine ile on bir yıldır tatillerini Konstanz Gölü'nde geçirirler. Helmut'un neredeyse yirmi yıldır görüşmediği okuldan arkadaşı Klaus Buch ve eşi Helene ile de tesadüfen orada karşılaşırlar. Eser, kendini itici bulan Helmut Halm ile tam tersi, enerji dolu Klaus Buch'un birbirinden çok farklı yaşam biçimlerine sahip olan bu iki erkek karakterin ve eşlerinin olaylar örgüsü içerisinde yaşadıkları kimlik çatışmalarını ve değişimini anlatmaktadır. Bu çalışmanın amacı, metin analizi ve metin yorumu yöntemi eşliğinde Walser'in anlatısının ve tiyatro uyarlamasının karşılaştırmalı olarak ele alınarak, iki farklı tür arasındaki farklılıkları tespit etmektir. Çalışmanın sonuçlarında, tiyatro oyununun konu içeriği olarak anlatıdan çok fazla sapmadığı, sadece eserin sahneye mekansal, zamansal ve finansal koşullar nedeniyle birebir aktarılmasının mümkün olmadığı saptanmaktadır. Edebi uyarlamaların beraberinde getirdiği güçlükler de çalışmanın sonuçları arasında yer almaktadır.

Anahtar Kelimeler: Martin Walser, Edebi Uyarlama, Karşılaştırma, Metin Analizi, Metin Yorumu

A COMPARATIVE ANALYSIS OF MARTIN WALSER'S NARRATIVE "EIN FLIEHENDES PFERD" AND ITS THEATRICAL ADAPTATION

ABSTRACT

As in world literature, it is possible to frequently encounter literary genre adaptations in German literature. For example, there are many works adapted from novels, stories to the theater stage, to movies, to radio plays. In this study, the narrative of the German writer, Martin Walser, named "Ein fliehendes Pferd" (A Running Horse) and the theatrical adaptation of the work written by Ulrich Khuon are the focus. Although this work of Walser is known as "Novelle" (Long Story), which is a genre specific to German literature, the term narrative is used in this study. It is appropriate to call genres such as novels, stories, tales as narratives. Published in 1978, this work was a great success for Walser and became one of the best-selling books. This work deals with issues like personal identity, getting older and lacks in communication, especially in society and relations with the opposite sex. The event takes place between four people during a summer vacation: The main hero of the work, Helmut Halm, is a forty-six-year-old teacher in a high school. He and his wife Sabine have been spending their holidays at Lake Konstanz since eleven years. There, by chance, they meet Helmut's friend from school, Klaus Buch, whom he has not seen for almost twenty years, and his wife, Helene. The narrative tells the identity conflicts and changes experienced between Helmut Halm, who finds himself repulsive, and Klaus Buch, who is full of energy; these two male characters have very contrary lifestyles from each other. The aim of this study is to determine the differences between the two different genres by comparatively examining Walser's narrative and its theatrical adaptation, accompanied by text analysis and text interpretation methods. The results of the study show that the play did not deviate too much from the novella in terms of the subject content, only that it was not possible to transfer the work to the scene one-to-one due to spatial, temporal and financial conditions. The difficulties brought by literary adaptations are also among the results of this study.

Keywords: Martin walser, literary adaptation, comparison, text analysis, text interpretation

1. GİRİŞ

Alman yazar Martin Walser (1927-) öncelikle 1945 sonrası Alman edebiyatının temsilcileri arasında önemli bir yere sahiptir. Yazarın günümüze dek, roman, anlatı, kısa öykü, tiyatro oyunu, radyo oyunu ve deneme gibi çeşitli edebî türlerde çok sayıda eseri mevcuttur. Çoğu eserlerinde sosyal ilişkiler, kimlik arayışı, iletişimsizlik, yaşlanma ve evlilik gibi temalar ön plandadır. Gero von Wilpert Walser'in eserlerinde bireyin toplumla olan ilişkisine değinmektedir (Wilpert 1976: 734).

Bu eserler arasında 1978 yılına ait "Ein fliehendes Pferd" (Kaçan Bir At) adlı anlatısı yazara en çok başarı sağlayan eseri olması nedeniyle öne çıkmaktadır. Bu eserin değeri, sadece en çok satan kitaplar arasına girmesinden dolayı değil, aynı zamanda edebi uyarlamalarının gerçekleşmesinden dolayıdır. Eserin her hali ile başarılı olduğu bir gerçektir. Bu çalışmada, Walser'in bu eseri ve 1985 yılında Ulrich Khuon tarafından kaleme alınmış olan tiyatro uyarlaması karşılaştırmalı olarak metin analizi ve metin yorumu yöntemi eşliğinde ele alınmaktadır. Çalışmanın amaçlarının başında, iki farklı tür arası farklılıkların saptanması ve edebi uyarlamanın beraberinde getirdiği zorlukların gözler önüne serilmesi gelmektedir. Çalışma Walser'in orijinal eseri ve tiyatro uyarlamasının karşılaştırmalı olarak ele alınması ile sınırlıdır. Bu çalışma ile Walser'in eserinin daha önce dikkate alınmamış bir yönü üzerinde durulması ve bu alana ait araştırmalar içindeki bir boşluğun doldurulması hedeflenmektedir.

2. EDEBİ TÜRLER VE EDEBİ UYARLAMA

Alman edebiyatında edebî türler üç ana başlık altında toplanmaktadır. Bunlar epik, şiir ve dram olarak adlandırılmaktadır. Epik türler arasında uzun, orta uzunlukta ve kısa olmak üzere bir ayırım söz konusudur. Roman uzun türlere örnek iken, öykü kısa türlere girmektedir. Orta uzunluktaki türlere örnek olarak ise Alman edebiyatına özgü bir tür olan Novelle (Uzun Öykü) verilebilir. Novelle için öykünün uzunluğunu ve romanın kısası açıklaması yaygındır. Bununla beraber, roman, öykü ve masal gibi Novelle için de anlatı denmesi en uygundur. Bu çalışma için anlatı terimi tercih edilmektedir.

Çalışmanın odak noktasını oluşturan Walser'in "Ein fliehendes Pferd" adlı anlatısının ve bu eserin tiyatro uyarlamasının karşılaştırmalı analizi için bu iki farklı edebî türün açıklanması yerindedir. Tiyatro oyunu dram türü arasındadır ve genellikle perde, sahne, diyaloglar ve monologlardan oluşmaktadır. Gero von Wilpert Novelle ve tiyatro oyunu arasındaki yakınlığa, kardeşliğe işaret etmektedir (Wilpert 1989: 629).

Bu çalışmada önem arz eden bir diğer kavram ise edebi uyarlamadır. Bu kavram ile anlaşılan farklı edebi türler arası yapılan düzenlemelerdir. Örneğin, romandan, öyküden tiyatro sahnesine, filme, radyo oyununa uyarlamalar günümüze dek ilgi uyandırmaktadır.

3. WALSER'İN "EIN FLIEHENDES PFERD" ADLI ESERİ VE TİYATRO UYARLAMASI

Walser'in Alman vatandaşlarının yaşam krizlerini ve orta yaşlarındaki sorun alanlarını ele aldığı "Ein fliehendes Pferd" adlı eseri, sadece iki hafta içinde yarı zamanlı bir çalışma olarak ortaya çıkmıştır. Bu kadar hızlı yazılmış olmasına karşın, Walser'e büyük başarı sağlamış olması da ilginç bulunabilir. Eser 1978 yılından itibaren en çok satan kitaplar arasında yer almıştır.

Aynı şekilde bu anlatı türündeki eserin 1985 yılında dramaturg Ulrich Khuon tarafından kaleme alınmış olan tiyatro uyarlamasının da başarı getirmesi dikkat çekmektedir. Eserin iki farklı türdeki hali açısından beliren en önemli ortak nokta her iki türün de yazara başarı ve ün sağlamış olmasıdır. Anlatı dokuz bölümden ve 151 sayfadan oluşmakta ve anlatım süresi beş gündür. Khuon'un tiyatro versiyonu ise 78 sayfa halinde iki perdeden oluşmakta ve 90 dakika süreyle tiyatro severlerin beğenisine sunulmaktadır.

Eserde olay bir yaz tatili döneminde dört kişi arasında cereyan etmektedir: Anlatının asıl kahramanı Helmut Halm, kırk altı yaşında bir lisede öğretmendir. Eşi Sabine ile on bir yıldır tatillerini Konstanz Gölü'nde geçirirler. Helmut'un yirmi yıl boyunca görüşmediği eski okul arkadaşı Klaus Buch ve eşi Helene ile de tesadüfen orada karşılaşırlar. Eser, kendini itici bulan Helmut Halm ile tam tersi, enerji dolu Klaus Buch'un birbirinden çok farklı yaşam biçimlerine sahip olan bu iki erkek karakterin ve eşlerinin olaylar örgüsü içerisinde yaşadıkları kimlik çatışmalarını ve değişimini anlatmaktadır.

Anlatının birinci bölümünün başında Helmut ve eşi Sabine tatillerinin üçüncü gününün akşamı deniz kıyısında bir kafeteryada otururlar. Sabine yürüyen insanları keyifle seyrederken, Helmut yaz günü hala yanmamış soluk teni ve beyaz pantolonu yüzünden kendini bir tuhaf hisseder. Bronzlaşmış insanlar yanından geçerken ona yaklaşımları onu çok rahatsız ederken, bir taraftan da zihnini tatil evinde onu okuması için bekleyen Kierkegaard'ın günlükleri meşgul eder.

Asıl hikaye beklenmedik bir şekilde, eski bir sınıf arkadaşı olan Klaus Buch ve karısı Helene'in Helmut ve Sabine'in karşısına çıkmasıyla başlamaktadır. Anlatı ayrıca aynı akşam şarap evinde, Klaus'un yemek esnasında aniden korkmuş bir şekilde attığı çığlık ile diğer masalardaki insanların bile yerinden fırladığı bir sahneye sahiptir. Halms'in Spaniel cinsi köpeği Otto, Klaus'un elini yalar. Oyunda Otto'dan hiç bahsedilmemektedir. Bu anlaşılabilir bir durumdur;

çünkü bir köpek eğitilmiş olsa bile sahnede geniş bir seyirci kitlesi önünde beklenmedik tepkiler verebilir ve oyunun gidişatını tehlikeye sokabilir.

Ertesi gün iki aile, Klaus ve Helene'den farklı olarak Halm'lerin kendilerini büyükanne ve büyükbaba gibi hissettikleri keyifli bir yelken gezisine çıkarlar. Her şeyi hazırlamış olan Klaus, eski eşi ile gençliğinde yaşadığı mutsuz günleri ve ergenlik döneminde şahit olduğu Helmut'un cinsel başarısızlığı ile ilgili konuşur.

Anlatı ile karşılaştırıldığında, oyunda ne gezinti yeri ne de Konstanz Gölü ilk sahne olarak gösterilmektedir. İlk sahnede Helmut, gezinti yolunda yürüyüş yaptıktan sonra tatil evindeki koltuğunda oturmaktadır. Oyun doğrudan tesadüfi karşılaşmanın ertesi günü ile başlamaktadır.

Her iki tür arası paralellikler de söz konusudur. Her iki türde de birinci şahıs anlatıcıların, aşırı baskı ve çaresizlik tarafından aktif eyleme yönlendirilinceye kadar, başlangıçta olup bitenlere pasif bir şekilde maruz kaldıklarına da dikkat çekmektedir. Hem anlatının başkahramanı Helmut Halm hem de oyundaki Helmut karakteri, monologlaştırıcı bir anlatım tarzıyla okuyucuyu ve seyirciyi öznel olarak karşısına almakta ve kendi içselliklerini anlatının merkezine yerleştirmektedir. Her iki türde de birinci şahıs anlatıcıların, aşırı baskı ve çaresizlik tarafından aktif eyleme yönlendirilinceye kadar, başlangıçta olup bitenlere pasif bir şekilde maruz kaldıklarına da ortaya çıkmaktadır. İki erkek karakter arasındaki zıtlığı da artıran erotizm ya da erotik imalar üzerine sohbetler ya da fıkralar hem anlatıda hem de tiyatro oyununda gözler önüne serilmektedir.

Anlatı ile oyun arasında gösterilen paralelliklere ek olarak çarpıcı bazı farklılıklara işaret etmek gerekmektedir. Anlatının zaman uzatan bir anlatıma sahip olması dikkat çekmektedir; yani anlatı süresi, anlatım süresinden daha uzundur. Anlatı, Halms ve Buch çiftlerinin birlikte geçirdikleri beş günü, özellikle de kaçan at ve tekne enkazının olduğu sahneyi ayrıntılarıyla içermektedir. Hızlandırılmış bir anlatımın olduğu oyunda bunun mümkün olmadığını varsaymak gerekmektedir.

Bir diğer önemli fark, eylemin kapsamıdır. Anlatıda olaylar, ilk akşam mesire yeri, Halms'ın tatil evi, sonraki günlerde restoran, yürüyüş turu sırasında doğa, Konstanz Gölü ve son olarak tren gibi farklı mekanlarda gerçekleşmektedir. Anlatının aksine tiyatro oyununda anlatım yeri olarak sadece Halms'ın oturma odası sahnelenir ki bu da birçok tiyatro sahnesinin çok büyük olmamasından dolayı kolayca anlaşılabilir. Ayrıca sahne çeşitliliği, dekorasyon ve büyük finansal gereksinimler gerektirdiği için, oyunun bu oturma odası alanının dışına çıkmaması anlaşılır bir durumdur.

Yürüyüş turunun üçüncü gününde erkeklerin karşısına çıkan kaçan at aynı zamanda anlatının da başlığıdır; bu sahne tüm metin açısından önem taşımaktadır. Anlatının aksine, kaçan atla ilgili oyunda doğrudan değil, yalnızca tesadüfen bahsedilmektedir. Bu kaçan at sahnesi anlatının doruk noktasını oluşturmaktadır; oyunda ise bu sahneye yer verilmediği saptanmaktadır.

Son olarak, Halms'in Spaniel cinsi köpeği Otto'dan da bahsedilmelidir. Oyun aynı zamanda erkek ismine rağmen dişi bir Spaniel cinsi köpek olan Otto'dan da yoksundur. Kendini mükemmel bir şekilde sunan Klaus'un, yalnızca Otto'dan korkmasından dolayı bile Halms'in Spaniel cinsi köpeği anlatıda büyük önem taşımaktadır. Kitaptaki hayvanların olduğu sahneleri, eğitilmiş bir at ya da köpekle canlandırmak bile, hayvanların kalabalık karşısında içgüdüsel olarak daha da huzursuz olmalarından dolayı oldukça zordur. Bu nedenle tiyatro oyununda bu sahnelerden kaçınılmış olması gayet anlaşılmalıdır.

4. SONUÇ

Bu çalışmada Walser'in en ünlü eserleri arasında öne çıkan "Ein fliehendes Pferd" adlı anlatı ve bu eserin tiyatrodaki edebi uyarlaması karşılaştırmalı olarak analiz edilmiştir. Karşılaştırmanın sonuçları olarak her iki tür arasında benzerliklerin yanı sıra farklılıkların bulunduğu ortaya çıkmıştır.

Anlatıya kıyasla, iki perdeden oluşan tiyatro oyununda tüm öykünün kelimesi kelimesine verilmesinin mümkün olmadığı anlaşılmıştır. Oyunun anlatıdan aşırı sapmadığı görülmekle beraber, mekansal, zamansal ve aynı zamanda finansal koşullar nedeniyle eserin birebir tekrar verilmesinin mümkün olmadığı saptanmıştır.

Tüm bunlara ek olarak, edebi uyarlamaların beraberinde getirdiği güçlükler de yapılan analizler neticesinde netleşmiştir. Kaçan at sahnesinin tiyatro oyununda yer almamasının en büyük nedeninin, kocaman bir hayvanın dar bir alanda bulunmasının sakıncalı olacağı düşüncesidir. Bunun gibi, benzer durumlara yönelik dekoru uygulamak hem zaman ve hem de maddi sebeplerden dolayı çok kolay değildir.

ÖZET

Kentleşmenin gelişmesi, yığılmaların düzenlenmesi ile ilgili olmakla birlikte, üzerinde pek çalışılmayan, çözüm süreci zor ve uzun süren bir sorundur. Kentleşmenin en önemli rollerinden biri kentsel çevrenin kökeninden başlar. Birçok tarihsel dönemde kültürel, demografik, sosyo-ekonomik yerleşme süreçlerinde konumlarını genişletmekte, nicelik ve nitelik bakımından gelişmektedir. Yeniden yapılanma süreçleri kentlerin daha geniş bir uygarlık içinde gelişimini, yığılma çerçevesindeki kentleşme süreçlerinin yoğunluğunu etkilemektedir. Kentleşmenin ve nüfus yerleşiminin genişlemesine bağlı olarak ekonomik-sosyal ve teknik ilerlemenin, bilimin, eğitimin ve kültürün gelişmesine uygun meslekler-uzmanlıklar ve gelenekler yaratılmaktadır. Kentlerin bölgesel göçlerine bağlı olarak, yerleşim düzeyi, kentleşmenin özellikleri, türleri ve yoğunluğu çeşitlilik, eşitsizlik, çok yönlü ekonomik-sosyal ilişkiler yaratmakta, gelişmede üretim ve hizmet alanlarının yerleşim faaliyetlerinde ilerici etkinliği genişletmektedir. Modern zamanlarda şehirler. Şehirler ve şehirleşme sorunu, çeşitli bilim alanlarının, uzmanların, ekonomistlerin, coğrafyacıların vb. araştırma konusudur. Bunun nedeni, kentleşme ve bunun sonucunda oluşan kentlerin, coğrafyanın tüm dallarının incelediği devasa bir süreçler alanı olmasıdır. Günümüzde, kentsel aglomerasyon ve ulaşım-ekonomik ilişkilerin gelişmesi, şehirler ve köyler arasındaki farklılıkların azaltılması, ekonomik-sosyal yerleşim ve göç ilişkilerinin bölge ve bölge sisteminde genişlemesini sağlamaktadır.

Anahtar Kelimeler: şehirler, kentleşme, ekonomik-sosyal, kasaba ve köyler, yığılma

HEALTH PROBLEMS CAUSED BY URBANIZATION AND SOLUTIONS

ABSTRACT

Although the development of urbanization is relevant for the regulation of agglomerations, it is a problem that is hardly studied and the solution process is difficult and long-staged. One of the most important roles of urbanization starts from the origin of its urban environment. In many historical periods of cultural, demographic, socio-economic settlement processes, it expands its positions, develops in terms of quantity and quality. Reconstruction processes affect the development of cities in a wider civilization, the intensity of urbanization processes within the framework of agglomeration. In connection with the expansion of urbanization and population settlement, appropriate professions-specializations and traditions are created in accordance with the development of economic-social and technical progress, science, education and culture. Depending on the territorial migration of cities, the level of settlement, the characteristics, types, and intensity of urbanization create diversity, inequality, multifaceted economic-social relations, expand progressive activity in the activity of location of production and service areas in the development of cities in modern times. The problem of cities and urbanization is the object of research of various fields of science, specialists, economists, geographers, etc. The reason for this is that urbanization and the cities formed as a result of it are a huge field of processes studied by all branches of geography. Currently, the development of urban agglomeration and transport-economic relations, reducing the differences between cities and villages, expands economic-social settlement and migration relations in the territory and regional system.

Keywords: cities, urbanization, economic-social, towns and villages, agglomeration.

1. GİRİŞ

Kentleşme uzun zamandır insani gelişme ve ilerleme ile eş tutulmuştur, ancak son araştırmalar kentsel koşulların önemli eşitsizliklere ve sağlık sorunlarına da yol açabileceğini göstermiştir. Kentleşme, nüfusun kırsal alanlardan kentsel alanlara kitlesel hareketini ve bunun sonucunda kentsel çevrede meydana gelen fiziksel değişiklikleri ifade eder. 2019 yılında Birleşmiş Milletler tahminlerine göre dünya nüfusunun yarısından fazlası (4,2 milyar kişi) şu anda şehirlerde yoğunlaşmış durumda ve 2041 yılında bu sayının 6 milyar kişiye ulaşacağı tahmin ediliyor. Kentler tüm toplumlarda çok yönlü işlevler yerine getirir. Birçok ülkenin teknolojik gelişiminin ve ekonomik büyümesinin kalbidirler, fakat aynı zamanda yoksulluk, eşitsizlik, çevresel tehlikeler ve bulaşıcı hastalıklar için koşullar yaratırlar (Naghiyev, 2006). Çok sayıda insanın şehirlerde bir araya gelmesi, özellikle yoksullar için birçok sorun yaratır. Örneğin, kentsel gecekondu mahallelerine yerleşen birçok kırsal göçmen yanlarında ailelerini ve evcilleştirilmiş hayvanları - hem evcil hayvanlar hem de çiftlik hayvanları - getiriyor. Bu insan ve hayvan akışı, tüm göçmenleri dolaşımdaki bulaşıcı hastalıklara ve kentsel bir bulaşma döngüsü oluşturma potansiyeline karşı savunmasız hale getiriyor. Buna ek olarak, kentsel yoksulların çoğu, düzensiz, sıkışık koşullar, aşırı kalabalık, açık kanalizasyonlara yakın ve tepeler, nehir kıyıları ve heyelanlara, sellere veya endüstriyel tehlikelere eğilimli su havzaları gibi coğrafi olarak hassas alanlara sahip gecekondu mahallelerinde yaşama eğilimindedir. Tüm bu faktörler bulaşıcı ve bulaşıcı olmayan hastalıkların yayılmasına, kirliliğe, yetersiz beslenmeye, trafiğe vb. katkıda bulunur. koşullar yaratır. Yoksulların yaşadığı sorunlar diğer kent sakinlerini de etkilemektedir. Kentleşme eğilimi devam ettikçe, yayılma etkisi artmakta ve dünya nüfusunun giderek daha fazla etkilenmesiyle küresel hale gelmektedir. Kentleşmeden kaynaklanan başlıca sağlık sorunları arasında yetersiz beslenme, kirliliğe bağlı sağlık koşulları ve bulaşıcı hastalıklar, kötü sanitasyon, barınma koşulları ve ilgili sağlık koşulları sayılabilir. Halk sağlığı sistemlerini ve kaynaklarını zorlamanın yanı sıra, bireysel yaşam kalitesi de doğrudan etkilenir (Balayev, 1998).

2. KENTLEŞMENİN BESLENME ÜZERİNDEKİ ETKİSİ

Kentleşme, yoksulların beslenme sağlığını olumsuz etkiliyor. Şehirlerdeki sınırlı finansal kaynaklar ve daha yüksek gıda fiyatları ile, şehirli yoksulların besleyici bir diyeti yoktur, bu da hastalığa, iştah kaybına ve etkilenenler arasında besinlerin zayıf emilimine yol açar. Ayrıca çevre kirliliği de yetersiz beslenmeye neden olur; sokak yemekleri genellikle hijyenik olmayan koşullarda hazırlanır ve bu da gıda kaynaklı hastalıklara (örn. botulizm, salmonelloz ve şigeloz) yol açar. Şehir sakinleri ayrıca, büyüyen bir küresel halk sağlığı sorunu olan aşırı

beslenme ve obeziteden muzdariptir. Obezite ve diğer yaşam tarzı koşulları kronik hastalıklara (kanser, diyabet ve kalp hastalığı gibi) katkıda bulunur. Aynı zamanda Dünya Sağlık Örgütü, yoksul ülkelerde diyabet, kardiyovasküler hastalık, kanser, hipertansiyon ve inme gibi bulaşıcı olmayan hastalıklara neden olan obezite salgını konusunda alarma geçiyor. Obezite, tarihsel olarak bollukla karşılanan artan kalori alımı ve azalan fiziksel aktivite tarafından yönlendirilir. Gelişmekte olan ülkelerin kentleşmiş bölgelerindeki insanlar, fiziksel alan eksikliği, işte sürekli oturma, aşırı enerji alımı ve düşük enerji harcaması nedeniyle zaten obeziteye karşı savunmasızdır. Bu alanlarda, rekreasyon faaliyetleri de dahil olmak üzere altyapı için genellikle çok az alan vardır. Ayrıca, gelişmiş ülkelerde olduğu gibi, gelişmekte olan ülkelerde de, büyük işverenler genellikle merkezlerini kentsel başkentlere yerleştirir ve işler giderek daha yerleşik hale gelir. Obezite geliştirme riskiyle ilişkili bir başka suçlu, beslenme geçişi olarak da bilinen gıda alımındaki değişiktir (hayvansal gıdaların, şekerin, katı ve sıvı yağların, rafine tahılların ve işlenmiş gıdaların artan tüketimi). Örneğin Çin'de son 30 yılda kentleşmeyle birlikte beslenme kalıpları değişti ve obezitede artışa yol açtı. 2003 yılında Dünya Sağlık Örgütü, gelişmiş ve yüksek oranda kentleşmiş ülkelerde 300 milyondan fazla insanın etkilendiğini tahmin etti. O zamandan beri obezite prevalansı her geçen gün artmaya devam etmektedir (Balayev, 2007). Kirlilik, kentsel çevrede sağlığın bozulmasına yol açan bir başka önemli faktördür. Örneğin, Dünya Sağlık Örgütü, iç ve dış hava kirliliğinin 6,5 milyon insanı (tüm küresel ölümlerin %11,6'sı) öldürdüğünü ve hava kirliliğine bağlı ölümlerin yaklaşık %90'ının düşük ve orta gelirli ülkelerde meydana geldiğini tahmin ediyor. Yetersiz beslenme ve kirlilik, kentsel popülasyonlarda bulaşıcı hastalıkların üçüncü ana nedenine katkıda bulunur. Yoksullar sıkışık koşullarda, açık kanalizasyonların ve durgun suların yakınında yaşıyor ve bu nedenle sürekli olarak sağlıksız atıklara maruz kalıyor. Yetersiz sanitasyon, helmintlerin ve diğer bağırsak parazitlerinin bulaşmasına yol açabilir. Sıkışık kentsel alanlardan kaynaklanan kirlilik (örn. CO₂ emisyonları), yerel ve küresel iklim değişikliğine ve doğrudan sağlık sorunlarına neden olur.

3. KENTLEŞME VE HASTALIKLAR

İnsandan insana bulaşmaya ek olarak, hayvanlar ve böcekler, kentsel ortamlarda hastalık için etkili vektörler olarak hareket eder ve zengin ve fakir arasında ayrım yapmaz. Tüberküloz (TB), sıtma, kolera, dang humması ve diğerleri gibi kentsel bulaşıcı hastalıkların etkisi iyi belgelenmiştir ve küresel bir endişe kaynağıdır. Ulusal ve uluslararası araştırmacılar ve politika yapıcılar, bu tür sorunları çözmek için çeşitli stratejiler araştırdılar, ancak sorunlar hala devam ediyor. Örneğin, mega şehirler için çözümler üzerine yapılan araştırmalar 1990'ların başına

kadar uzanıyor. Bu çalışmalar, kirliliğin, güvenilir olmayan elektriğin ve işlevsiz altyapının öncelikli girişimler olduğu sonucuna vardı; yine de hava kirliliği, şehirlerdeki su kalitesi, tıkanıklık, afet yönetimi sorunları, kentsel ulaşımın sağlığa etkileri ve karayolu trafiği ciddi sorunlar olarak karşımıza çıkmaktadır (Balayev, 1996). İstatistikler, Hindistan'ın Mumbai kentinde demiryollarında her gün en az 10 kişinin öldüğünü gösteriyor. Vietnam, trafik kazalarının sayısında çarpıcı bir artış gösteren bir başka ülke örneğidir. Ülke altyapısının iyileştirilmesi, artan araç sayısı ve caddelerdeki insan trafiğini karşılayamamaktadır. Rapora göre Vietnam'ın 95 milyon nüfusu ve yollarında 18 milyondan fazla motosiklet bulunuyor. Kentleşme geri döndürülemez bir olgu haline gelse de, kentin sorunlarını çözmek için yoksulların sosyo-ekonomik durumunu iyileştirmek gibi sorunun temel nedenlerini ele almalıyız. Kırsal alanlardaki koşullar düzelene kadar insanlar şehirlere göç etmeye devam edecek. Kırsal kalkınmanın zorlukları göz önüne alındığında, temel nedenler yakın gelecekte ortadan kaldırılamaz, bu nedenle hükümetler ve kalkınma ajansları, çarpık kentleşmeyi azaltmaya çalışırken, kentleşmenin zorluklarına uyum sağlamaya odaklanmalıdır.

SONUÇLAR VE ÖNERİLER

- 1) Nesiller arası yoksulluk döngülerini kırmak için erişilebilir istihdam, topluluk katılımı, hareketlilik/göç ve sosyal geçiş dahil olmak üzere tüm yaşam yolculuklarını dikkate alan politikalar;
- 2) Daha yakıt tasarruflu araçların kullanımını azaltmak veya teşvik etmek ve ayrıca bisiklete binmeyi, yürümeyi ve diğer insan taşıma biçimlerini teşvik etmek için tasarlanmış kentsel alan ve araç kullanımı üzerindeki vergiler gibi kentsel çevre sorunlarını ele alan politikalar;
- 3) Gıda güvenliğini iyileştirmek için kırsal ve kentsel alanlar arasında daha fazla işbirliğinin planlanması (örneğin, şehir merkezlerine yerel olarak üretilmiş, işlenmemiş ve düşük maliyetli gıda tedarik eden çiftçilere yönelik sübvansiyonlar);
- 4) Kent sakinleri arasındaki refah eşitsizliğini azaltmak için sosyal koruma ve genel sağlık hizmetleri.

ÖZET

Algler, biyoyakıtlar, farmasötikler, nutrasötikler ve yemler ile ilgili çeşitli endüstriler için bir biyolojik kaynak olarak muazzam bir potansiyele sahip olan, ökaryotik yeşil algler ve Gram-negatif prokaryotik siyanobakterileri içeren, her yerde bulunan bir fotosentetik organizmalar grubudur. Artan küresel gıda talebi, tarımsal yoğunlaşmanın artan çevresel etkileri ve küresel iklimimizde gelecekteki değişikliklerin belirsizliği arasındaki gerilim, tarımsal üretkenliği sürdürmek ve artırmak için sürdürülebilir alternatiflere yönelik hayati bir ihtiyacı vurgulamaktadır. Siyanobakteriler de dahil olmak üzere mikroalgler, tarımsal ortamlardaki uygulamalar için çok çeşitli seçeneklere sahip yenilenebilir kaynaklardır. Mikroalgler, aynı zamanda çok çeşitli biyoteknolojik uygulamalara sahip olan önemli biyojeokimyasal döngüleri düzenleyen önemli mikroorganizmalardır. Bu derleme çalışması, mikroalglerin tarımdaki uygulamalarının bitkilerin gelişimine ve verimine olan etkilerini araştırılması amacıyla hazırlanmış olup gelecekte yapılacak olan çalışmalara genel bir bakış sunmaktadır.

USE OF MICROALGAE IN AGRICULTURE

ABSTRACT

Algae are a ubiquitous group of photosynthetic organisms that include eukaryotic green algae and Gram-negative prokaryotic cyanobacteria, with enormous potential as a biological resource for a variety of industries related to biofuels, pharmaceuticals, nutraceuticals and feeds. The tension between rising global food demand, the increasing environmental impacts of agricultural intensification, and the uncertainty of future changes in our global climate highlight a vital need for sustainable alternatives to sustain and increase agricultural productivity. Microalgae, including cyanobacteria, are renewable resources with a wide variety of options for applications in agricultural environments. Microalgae are important microorganisms that regulate important biogeochemical cycles, which also have a wide variety of biotechnological applications. This review study has been prepared to investigate the effects of microalgae applications in agriculture on the growth and yield of plants and provides an overview of future studies.

Keywords: Algae, Microalgae, Fertilizer, Soil Conditioner, Chemical Fertilization

1. GİRİŞ

Algler yaklaşık 3,5 milyar yıl önceye dayanan oluşumlarından yararlanılarak tarih boyunca medeniyetler tarafından ilaç ve gıda yapımında kullanılmışlardır (Sukatar, 2002). Algler, Dünya üzerindeki fotosentetik üretkenliğin yaklaşık %50'sine katkıda bulunur ve mikroskobik tek hücrelerden makroskobik kümeler ve 60 m uzunluğa kadar büyüeyebilen deniz yosunlarının karmaşık yapraklı yapılarına kadar uzanır (Barsanti ve Gualtieri Algae, 2014).

Alg kültürlerinin kullanımına yönelik ticari ilginin geçmişi, bunların *Chlorella* ve *Dunaliella* gibi farklı mikroalg suşları kullanılarak WWT'ye uygulanmasıyla yaklaşık 75 yılı kapsamaktadır (Abdel-Raouf ve diğerleri, 2012).

Algler genellikle makroalgler ve mikroalgler olarak ikiye ayrılır. Makroalgler, grubun tatlı su ve deniz türlerini içermesine rağmen, genellikle deniz yosunu olarak bilinen büyük alglerdir (Ge ve Madill, 2018; Lawton ve ark., 2018). Tarımda, deniz yosunu özleri tohum çimlenmesini, bitki büyümesini ve bitki savunmasını uyarır (Abouraïcha ve ark., 2015; Battacharyya ve ark., 2015). Mikroalgler, fitoplanktonun bir parçası olarak ve tüm toprak türleri dahil olmak üzere hemen hemen tüm kara, su ve hava altı yüzeylerinde bulunan mikroskobik alglerdir (Metting ve Pyne, 1986; Tomaselli, 2004). Mikroalgler ya gram-negatif bakteriler olan siyanobakteriler (Cyanophyta ve Prochlorophyta bölümleri) gibi prokaryotiktir ya da örneğin yeşil algler (Chlorophyta bölümü), diyatomlar (Bacillariophyceae sınıfı), öjenoidler (Euglenophyceae sınıfı) ve dinoflagellatlar (Dinophyta bölümü) gibi ökaryotiktir. (Mata ve ark., 2010; Barsanti ve ark., 2014; Nilsson ve ark., 2006). Geleneksel olarak mavi-yeşil algler olarak bilinen siyanobakteriler (sınıf Cyanophyceae), tek hücreli veya iplikçikler halinde, tek başına veya kolonilerde küme halinde, serbest yaşayan organizmalar olarak veya diyatomlar, eğrelti otları, likenler, sikadlar, süngerler, bitkiler ve diğer organizmalardır (Barsanti ve Gualtieri, 2006; Adams ve ark., 1999; Rai ve ark., 2000).

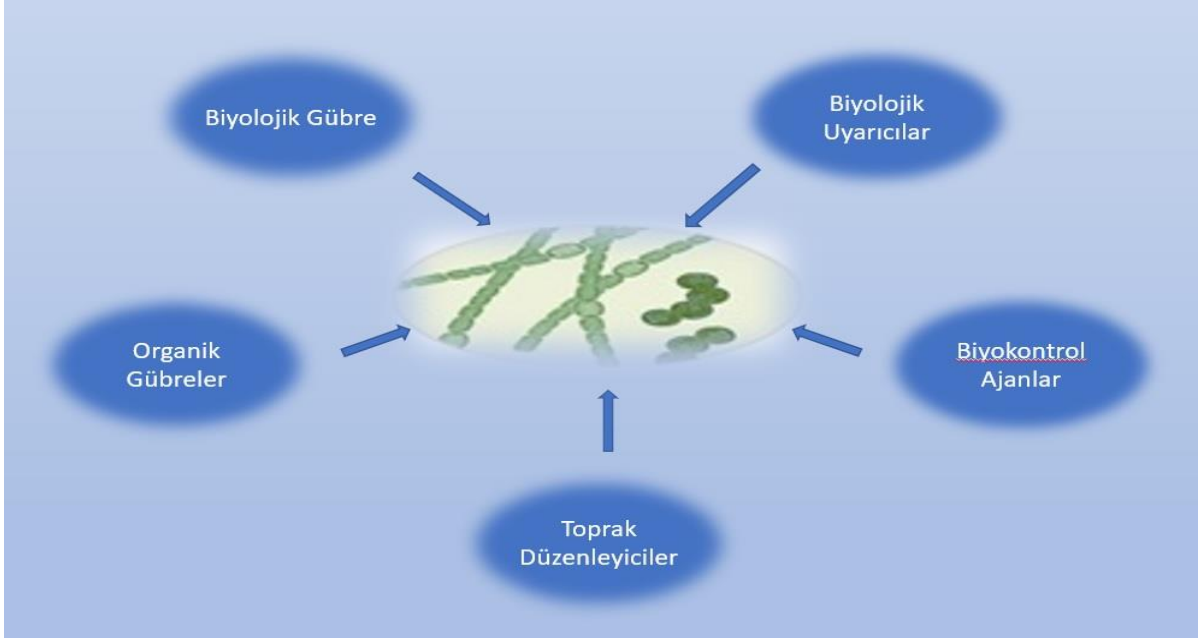

Mikroalgler güneş ışığını kullanarak fotosentez yoluyla karbondioksiti hayvan yemi, yiyecek, biyokimyasal ve potansiyel biyoyakıtlara dönüştürebilirler. Azot fiksasyonu yapabilmeleri sayesinde biyogübre olarakta kullanılmaktadır (Giorgos ve diğerleri, 2014). Mikroalgler ve siyanobakteriler, gıda, yem, biyoyakıtlar ve kimyasal üretime yönelik artan küresel talepleri karşılamak için yeni bir biyokütle kaynağı olarak günümüzde ilgi görmektedir (Giorgos ve diğerleri, 2014). Mikroalgler, tarımda çok yönlü potansiyel kaynaklardır. Geleneksel kimyasal gübrelerin aksine, mikroalgler toprağa uygulandığında bir organik karbon (C) girdisi haline gelmektedir (Renuka ve ark., 2018; Ibraheem, 2007). Biyogübreler, mahsullerin üretkenliğini verimli ve çevre dostu bir şekilde artırarak ve böylece sentetik gübrelerin zararlı etkilerini azaltarak sürdürülebilir tarımda hayati bir rol oynadıkları için bugünlerde kapsamlı araştırmalar yapılmaktadır (Singh ve ark., 2011).

Mikroalgler, atmosferdeki karbonu potansiyel ürünlere dönüştürerek azaltmak için çeşitli şekillerde kullanılabilen fotosentetik mikroorganizmalar olduklarından, iklim değişikliğini hafifletmeye yardımcı olmak için gelecekteki kilit katkılardan biridir (Ryckebosch ve ark., 2011; Molazadeh ve ark., 2019). Mikroalglerin bir karbon bileşikleri kaynağı olarak değeri, farmasötik ve kozmetikte kullanılabilmeleri nedeniyle daha da geliştirilmiştir (Das ve ark.,

2011). Mikroalg biyoteknolojisi, örneğin elektrik üretimi gibi atık su arıtma (WWT) teknolojilerinde de geliştirilmektedir (Jaiswal ve ark., 2020).

Mikroalgler her yerde bulunur. Fotosentetik tek hücreli yaşam, tüm bitki yaşamının ataları olan son derece çeşitli ve sağlam organizmalardır. Bu nedenle, dünyanın hemen hemen her yerinde bulunabilirler ve sıcaklıklar, tuzluluklar, pH değerleri ve farklı ışık yoğunlukları gibi birçok faktörün geniş bir yelpazesini tolere ettikleri için çeşitli çevresel koşullarda büyüebilirler (Barsanti ve ark., 2008). Ayrıca deniz suyunda (Rodriguez-L'opez ve ark., 2020), tatlı suda (Sangapillai ve Marimuthu, 2019), atık suda bulunan artık besinlerde (Graham ve Wilcox, 2000; Barsanti ve Gualtieri, 2006; S'anchez-Bayo ve ark., 2020) ve çöller gibi sıcak ekosistemlerden soğuk ekosistemlere kadar birçok ekosistemler bulunmaktadır.

Mikroalg biyokütlesinin (veya mikroalg bileşiklerinin) topraklar ve bitkiler üzerindeki çeşitli etkileri ve farklı etki mekanizmaları, mikroalglerden toprak iyileştirme, mahsul üretimi ve koruma uygulamalarıyla potansiyel olarak çok sayıda tarımsal ürün turetme fırsatı sunar (Şekil 1).

Şekil 1. Toprak iyileştirme ve mahsul üretimi ve koruması için potansiyel tarımsal mikroalg türevi ürünler (Alvarez ve ark., 2021).

Toprağa uygulandığında (mikroalgal toprak ıslahı), mikroalg biyokütlesi toprak yapısı ve su tutma gibi fiziksel özellikleri iyileştirebilir ve bu nedenle potansiyel uygulamalardan biri olan toprak düzenleyiciler grubuna girmektedir (Ibraheem, 2007; Metting ve Rayburn, 1983; Rossi ve ark., 2017). Gelişen tanımlara göre mikroalgler, canlı mikroorganizmaların aktivitesi yoluyla bitkiye besin tedarikini veya kullanılabilirliğini artırarak toprağa, tohumlara veya bitki yüzeylerine uygulandığında bitki büyümesini iyileştiren mikrobiyal aşılama ajanları olarak da kullanılabilir. (Mahanty ve ark., 2017; Vessey, 2003). Bu aktiviteler, örneğin nitrojen (N₂)-sabitlenme ve P-çözünürleştirmeyi içerir (Mahanty ve ark., 2017; Vessey, 2003).

2. MİKROALGLER İLE İLGİLİ YAPILAN ÇALIŞMALAR

Tarımda yüksek verimi garanti etmek için kimyasal gübre uygulaması kullanılır; Ancak bu kimyasalların gelişigüzel kullanımı farklı çevre sorunlarına yol açmaktadır. Biyogübrelerin kullanımını, kimyasal gübrelerin etkisini azaltmak için çevre dostu bir alternatif olarak ortaya çıkmıştır. Keşfedilen çok sayıda biyogübre arasında, fotosentetik mikroorganizmalara dayalı formülasyonlar, toprak verimliliğini iyileştiren ve mahsul verimini artıran performansları nedeniyle öne çıkmaktadır (Guo ve ark., 2020).

Dineshkumar ve ark. (2018), farklı dozlarda alg biyokütlesi kullanarak çeltiğin büyümesini ve üretkenliğini değerlendirmişlerdir. Araştırmacılar alg biyokütle kullanımının bitkinin performansı üzerinde olumlu bir etkiye sahip olduğunu ve verimde %21'lik bir artış sağladığını bildirmiştir. Bu sonuçlar, Jochum ve ark. (2018)'nin yürüttükleri çalışma ile de doğrulanmıştır. Jochum ve ekibi mikroalg biyokütlesi (polikültür) ile işlenen çeltiklerden üretilen ile yapılan işleme benzer veya bundan daha iyi sonuçlar almıştır. Mikroalg veya siyanobakteriyel uygulamalarla mahsul verimliliğindeki bu artış, farklı mekanizmalarla gerçekleşmektedir. Siyanobakterilerdeki heterosistler, nitrojenaz için uygun bir mikro-anaerobik ortam sağlama ve filamanın geri kalanındaki vejetatif hücreler için birleşik azot ve esas olarak glutamin sağlama işlevine sahiptir (Vieira, 2017).

Osman ve ark. (2010) heterosistik ve heterosistik olmayan siyanobakterileri ve bunların bezelye verimi için biyolojik gübreleme potansiyelini değerlendirmişlerdir. Araştırmacılar siyanobakterilerin aşılmasının kimyasal gübre kullanımını %50 oranında azalttığını ve tohumların besin değerini iyileştirdiğini bildirmişlerdir. Mikroalg ve siyanobakteriyel biyofilm oluşumu, kararlı biyogübreler üretebilecek şekilde biyokömür gibi katı desteklerin kullanılmasıyla artırılabilir sonucuna varmışlardır (Kholssi ve ark., 2018). Bir başka çalışmada ise Bidyarani ve ark. (2016), heterosist oluşturan iki biyofilm aşılama formülasyonu kullanarak (*Anabaena laxa* ve *Anabaena laxa* ve *A. tolorusa* – *mesorhizobium ciceri* karışımı) nohut bitkilerinin büyümesini ve üretkenliğini değerlendirirken, çalışmalarında özellikle azot fiksasyonu, toprak klorofil içeriği ve toprakta bulunan azot miktarında gerçekleşen bitki büyümesi, besin emilimi ve mikrobiyolojik aktiviteler arasında pozitif bir korelasyon olduğunu bildirmişlerdir. Son zamanlarda Del Monte Fresh Produce Inc., Arizona'nın ham çölünde alg biyogübreleri ile saha denemeleri yapmıştır. Yosunla gübreleme, terk edilmiş arazinin ıslahına yardımcı olduğunu, fosil girdilerini en aza indirdi ve mahsul verimliliğini artırdığı sonucuna varmışlardır (Anonim,2022).

Mikroalgler tarımda biyogübre, toprak düzenleyici ve yem katkı maddesi olarak kullanılabilir. Azot bağlama yeteneğine sahip siyanobakterilerden oluşan biyogübreler, pirinç ekimi için tropik ovalarda kullanılmaktadır. Ökaryotik tek hücreli yeşil mikroalgler, ılıman iklim bölgelerinde erozyonu kontrol etmek için yağmurlama ile sulanan tarım arazilerine toprak düzenleyici maddeler olarak uygulanmaktadır (Shaaban, 2001). Mikroalglerin toprak katkı maddesi olarak kullanılmasının, kök hacimlerini, klorofil oluşumunu, sürgünlerin kuru ağırlığını ve bitki boyunu önemli ölçüde iyileştirdiğini gözlemlemiştir (Shaaban, 2001).

Kholssi ve ark. (2019), Buğday bitkisinde bitki büyümesini teşvik etmek için mikroalg kullanılmışlardır. Uygulanan *Chlorella sorokiniana* şuşları ile bitkilerdeki toplam kuru

biyokütle oranı %30 arttırmakla birlikte, bitkilerin toprak üstü kısmını %22 ve toprak altı kısmını ise %51 oranında arttırmıştır. Doğrudan besin zenginleştirmeye ek olarak, mikroalgler bitkiler için büyüme destekleyicileri olarak işlev gören bileşikler üretebilir (Guo ve ark., 2020). Mutale-joan ve ark. (2020), mikroalglerden elde edilen 18 ham biyolojik ekstraktın domates bitkilerinin büyümesi üzerindeki biyostimülatör etkilerini araştırmış ve burada kök ve sürgün uzunluğunun yanı sıra kuru ağırlıkta iyileşme gözlemlemişlerdir. Farklı bir çalışmada ise yeşil mikroalg *Chlorella vulgaris*'in havayla kurutulmuş veya püskürtülerek kurutulmuş biyokütlesi uygulaması yapılmıştır. Sonuç olarak mısır ve buğdayda bitki parametrelerini geliştirmiştir (Abdel-Rahim ve Hamed, 2013; Dineshkumar ve ark., 2019).

3. SONUÇ

Topraktaki besin noksanlığı, tarımda verim artışını sınırlayan kritik faktörlerden biridir. Bu sorunu aşmak için üreticiler geleneksel tarımda sentetik gübreler yoğun olarak kullanmaktadırlar. Bununla birlikte, bu geleneksel tarım modeli, tarım arazilerindeki toprak kalitesi ve mikrobiyal ekolojik denge bozulmasına rağmen bitkilere kimyasal gübre uygulaması ile besin sağlarlar. Ayrıca, kimyasal gübrelerin üretimi yüksek elektrik enerjisi tüketimine sahip olamakta ve bu da dünya çapında yoğun karbon emisyonuna neden olur.

Mikroalgler kimyasal gübrelerin ve böcek ilaçlarının yerini alma konusunda yüksek bir potansiyele sahiptir. Bu durumda mikroalgin kullanımı, pestisitler ve hidrokarbon kirleticiler gibi toprağa eklenen kimyasal gübrelerin bir kısmını kısmen değiştirme ve azaltma kapasitesi ile desteklenmektedir. Bu nedenle, kültür bitkilerine temel besin maddelerini sağlayan çevre dostu bir model, modern tarımın gelişimi için önemlidir. Açıklanan tüm avantajlara ek olarak, mikroalg kültürlerinin çevreye zararlı bileşiklerin uzaklaştırılması için fiziksel ve kimyasal işlemlere bir alternatif oluşturduğunu vurgulamak önemlidir.

**KÜLTÜREL MİRAS TURİZMİ KAPSAMINDA KUZEY KIBRIS'IN YENİLEBİLİR
DOĞAL OTLARI**

Dr. Öğr. Üyesi Seden Turamberk Özerden
Girne American University
E-mail: sedenozerden@gau.edu.tr

Dr. Öğr. Üyesi Zeynep Dumanoglu
Bingöl Üniversitesi
E-mail: zdumanoglu@bingol.edu.tr

ÖZET

Kuzey Kıbrıs sahibi olduğu coğrafi konum ile birçok yenilebilir doğal ot çeşitliliğine sahiptir. Adanın sahibi olduğu coğrafi özellikler ve iklimsel etmenler yenilebilir otların çeşitliliğinde en önemli etmen olarak karşımıza çıkar. Bu otların değerlendirilip Kıbrıs mutfak kültürüne kazandırılması ise adanın yüzyıllar içinde birçok farklı medeniyete ev sahipliği yapması ile açıklanabilir. Kıbrıs, neolitik çağdan günümüze kadar uzanan tarihi boyunca jeopolitik konumunun önemi sebebiyle de her zaman bölgedeki en güçlü uygarlıkların ilgisini çekmiş ve dönem dönem bir çoğunun egemenliği altına girmiştir. Bu medeniyetler Mısırlılar, Hititler, Fenikeliler, Asurlar, Persler, Makedonyalılar, İyonyalılar, Ptolemeler, Romalılar, Bizanslılar, Lüzinyanlar, Venedikliler ve Türkler olarak sayılabilir. Farklı bir çok medeniyete ev sahipliği yapan Kıbrıs kimi zaman kültürünü bu medeniyetlere yansıtmış kimi zamanda bu medeniyetlerin kültürlerinden etkilenmiştir. Bu karşılıklı etkileşim adanın gastronomi kültürüne de yansımış ve doğal ortamlarında yetişen otların farklı pişiriliş şekilleri Kıbrısın somut olmayan kültürel mirasının bir parçası haline gelmiştir. Bölgedeki çeşitlilik yöre halkının yemek kültürüne de yansımıştır. Adada sık tüketilen yenilebilir otlar incelendiğinde, Ayrelli, Yumurta otu, Kara ot (gara tiken- sahura), Gaz Ayağı, Dirigungullo (ince yapraklı bir bitki), Girdama (Kıyı Koruğu), Gafgarıt (bir tür yabani enginar), Yabani Ispanak, Badayidano, Raica, Cinara, Gömeç, Gabbar, Hosdez, Lapsana, Çitlemit ilk akla gelen otlar arasında yer alır. Çalışmada adanın yenilebilir doğal otlarına, bu otların kullanım şekillerine, ayrıca yine bu otların kültürel miras açısından önemine değinilmiş, kültürel miras turizmine kazandırılması açısından önerilere yer verilmiştir.

Anahtar Kelimeler: Yenilebilir Otlar, Kültürel Miras, Kuzey Kıbrıs.

**EDIBLE PLANTS OF NORTHERN CYPRUS WITHIN THE SCOPE OF CULTURAL
HERITAGE TOURISM**

ABSTRACT

Northern Cyprus has many edible natural grass varieties with its geographical location. The geographical features and climatic factors of the island are the most important factors in the diversity of edible grasses. The fact that these herbs were evaluated and brought to the Cypriot culinary culture can be explained by the fact that the island has hosted many different civilizations over the centuries. Cyprus has always attracted the attention of the most powerful civilizations in the region, due to the importance of its geopolitical position throughout its history from the Neolithic Age to the present, and has come under the rule of many from time to time. These civilizations can be counted as Egyptians, Hittites, Phoenicians, Assyrians, Persians, Macedonians, Ionians, Ptolemies, Romans, Lusignans, Venetians, Byzantines, and Turks. Cyprus, which has hosted many different civilizations, has sometimes reflected its culture to these civilizations and sometimes has been influenced by the cultures of these civilizations. This mutual interaction is also reflected in the gastronomic culture of the island, and the different ways of cooking herbs grown in their natural environment have become a part of the intangible cultural heritage of Cyprus. The diversity in the region is also reflected in the food culture of the local people. When the edible herbs that are consumed frequently on the island are examined, it is seen that Ayrelli, Egg grass, Black grass (gara tiken- sahura), Gaz Ayağı, Dirigungullo (a thin-leaved plant), Girdama (Coastal Grove), Gafgarit (a kind of wild artichoke), Wild Spinach, Badayidano, Raica, Cinara, Gömeç, Gabbar, Hosdez, Lapsana, Çitlemit are among the herbs that come to mind first. In the study, the edible natural grasses of the island, the ways of use of these herbs, as well as the importance of these herbs in terms of cultural heritage are mentioned, and suggestions are given in terms of bringing them into cultural heritage tourism.

Keywords: Edible Plants, Cultural Heritage, North Cyprus.

GİRİŞ

Dünyanın sekseninci (<https://vividmaps.com>), Akdeniz'in ise Sicilya ve Sardunya'dan sonra üçüncü büyük adası (Kaplunan, 2018) olma özelliği taşıyan Kıbrıs adası Akdeniz'in kuzey doğusunda, Eski Dünya Karaları adı ile de bilinen Avrupa, Asya ve Afrika kıtalarının kavşak noktasında yer almaktadır (İlseven, Hıdırer ve Tümer, 2014). Adanın yüzölçümü, 9251 km² olup uzunluğu doğu-batı ucu arasındaki maksimum uzunluğu 225 km ve genişliği ise 96,5 km'dir (<https://users.metu.edu.tr>). Kuzey Kıbrıs'ın toplam yüzölçümü ise 3242 km²'dir. Kuzeyinde Türkiye (70 km), doğusunda Suriye (102 km.) ve Lübnan (165 km) güney doğusunda İsrail (233 km), kuzey batısında Yunanistan (835 km), güneyinde ise Güney Kıbrıs Rum Yönetimi ve Mısır (347 km) ile Mısır yer alır. (<https://pio.mfa.gov.ct.tr>). Kıbrıs, 34°33' ve 35°41' Kuzey enlemleri ve 32°16' ve 34°36' Doğu boylamları arasında yer alan adada (Koday, 1998) bulunduğu konum itibariyle Akdeniz iklimi hüküm sürmektedir. Genel olarak haziran ayında başlayıp eylül ayına kadar süren yaz dönemi sıcak ve kurak hava şartları hakimken kasım ayından mart ayına kadarki süre içerisinde serin ve nemli kış şartları meydana gelmektedir. Ekim, nisan ve mayıs aylarında kendini gösteren sonbahar ve ilkbahar mevsimlerinde ise yüksek oranda değişkenliğe sahip yağış ve sıcaklık özelliği görülür. Adadaki yıllık yağışın %60'ı aralık-şubat ayları arasında yer alırken yaz yağmurları yok denecek kadar azdır. Kıbrıs adasındaki tarım için yetersiz su kaynakları ve genel iklim düzensizliği sebebiyle genellikle olarak kuru tarım tercih edilmektedir. Ada, tarihin farklı dönemlerinde, yaşanan yağış yetersizliği sebebiyle oluşan kuraklık sebebiyle ziraatla geçimini sağlayan yerel halkın bazı dönemlerde kıtlıkla karşılaşmasına neden olmuştur. Yağış yetersizliğinin yoğun olarak görüldüğü özellikle Venedik döneminde peş peşe yedi yıl süren kurak dönemlerin yaşandığı ve bu dönemlerin oldukça sık aralıklarla tekrarlanmasının ardından göçlerin artarak nüfusun azalmasına sebebiyet verdiği bilinmektedir (Çelik, 2014, s.500). Kuzey Kıbrıs'ın hava sıcaklığı yıllık ortalama 19,0 °C'dir. Yıl boyunca en sıcak aylar temmuz-ağustos ayları (gölgede 37,0°C-40,0°C), yılın en soğuk ayı ise genellikle ocak ayıdır (9,0°C-12,0°C) ve yılın en soğuk geceleri de çoğunlukla bu ayda görülür (Yorgancı, 2004).

Kıbrıs'ta insan yaşamına ait izlere ilk olarak Neolitik Çağ'da rastlanmaktadır. Adaya Anadolu ve Suriye topraklarından gelen ilk insanların Neolitik kültürü taşıdıkları tahmin edilmektedir (<https://users.metu.edu.tr>). MÖ 1450'li yıllara gelindiğinde dönemin en güçlü devletlerinden olan Eski Mısır, Suriye topraklarını kontrol altına almış ve Doğu Akdeniz'e tamamen hâkim olabilmek için Kıbrıs'ı da topraklarına katmaya karar vermiştir. Tarih boyunca Kıbrıs'ı üç kez

adayı hakimiyetine alan Mısırlılar, ilk hakimiyetlerini III. Tutmosis döneminde elde etmişlerdir (Gürgen, 2017). Etiler olarak da bilinen Hititlerin, Mısır ile aralarındaki rekabet Kıbrıs'a yansımış, İmparator IV. Tuthaliya zamanında (MÖ 1.320-1265) kısa süreliğine de olsa adaya egemen olmuşlardır. Bu süre zarfında Hitit imparatorluğunun bir parçası olan Kıbrıs'ın sahip olduğu bakır rezervlerinde ötürü ülke ekonomisine katkısı büyük olmuştur (Okkar, 2017). Hitit Krallığının M.Ö. 1200'de yıkılmasının ardından Kıbrıs adasında ikinci Mısır egemenliği başlamıştır. Bu dönemde de Mısırlılar adayı hem askeri bir üs olarak kullanmaya devam etmiş hem de önemli bir ticaret merkezi olarak kullanmışlardır (Akçay, 2018). M.Ö 1100'lere yaklaşıldığında Kıbrıs'ta Akaların izine rastlanır. Orta Asya kökenli bir kavim olan Akalar, Anadolu üzerinden önce bugünkü Yunanistan topraklarına gelmiş ardından buradaki toplulukları birleştirerek Miken Uygarlığını kurmuştur. Kıbrıs adasını da hakimiyetine alan Akaların kurdukları şehir devletlerine "Polis" adı verilir. Kıbrıs'ta da kurdukları her bir koloni, birbirlerinden bağımsız krallıklar şeklinde kendini gösterir. Kıbrıs'taki Aka kolonileri; Salamis, Soli, Baf (Pafhos) ve Marion'dur. Dorlar ise MÖ. 1150li yıllarda Orta ve Doğu Avrupa'dan gelerek önce bugünkü Yunanistan topraklarını ele geçirmiş ardından Ege adalarına yerleşmiş bir kavimdir. Antalya (Pamfilya) üzerinden Kıbrıs'a gelen Dorların Kıbrıs'ta kurmuş olduğu koloninin Curium (Kurium) olduğu bilinmektedir. Aka kültürü ile Dor kültürü arasında benzer özellikler görülür. Bugünkü Lübnan ve Suriye topraklarında yaşamış olan Fenikeliler sahip oldukları toprakların tarıma elverişsiz olması sebebiyle ticarete ve denizciliğe önem vermişlerdir. Kereste ticaretinde ilerleyen, ilk camı yapan ve modern alfabeyi kullanan uygarlık olarak bilinen Fenikeliler MÖ 1000 yıllarında Kıbrıs'ta koloni kurmaya başlarlar Ünlü harf içermeyen Fenike Alfabeti bu dönemde Kıbrıs'ta da kullanılmıştır. 291 yıl süren hakimiyetleri boyunca Kıbrıs'ta kültür ve medeniyet alanında önemli gelişmeler yaşanmıştır (Okkar, 2017, Erzen, 1976). Mezopotamya'da kurulan Asur Devleti önce Anadolu toprakları, bugünkü Suriye ve Filistin ele geçirir. M.Ö 709'da ise Kıbrıs'ı hakimiyeti altına alır. Kıbrıs şehir kralları Asurlulara bağlılıklarını bildirerek haraç öder ve varlıklarını sürdürmeye devam eder (Solsten, 1993). Asurlular M.Ö 600'lü yıllarda güçlerini kaybettiğinde ada kısa bir süreliğine bağımsız bir krallık olarak siyasi hayatını sürdürür fakat M.Ö 609 yılında Asur Devleti yıkılınca adayı üçüncü kez Mısırlılar egemenliği altına alır (Hasanoğlu, 2003). III. Mısır Egemenliği MÖ 609-569 yılları arasında sürmüş ve Mısırlılar Adaya ayrı bir yönetici getirmeyerek Salamis Kralı aracılığı ile adayı yönetmişler ve adayı sadece askeri yerleşke amacı olarak kullanmışlardır (Okkar, 2017, Kortmaz, 2014). M.Ö 525 yılında İran'da kurulan Pers Devleti ile Mısır karşı karşıya gelmiş ve Kıbrıs kralları da bu savaşta Perslileri desteklemiştir. Persler Mısırı ele

geçirmiş ardından da Kıbrıs Pers Devletine bağlanmıştır. M.Ö. 334'te Kıbrıs'ta Makedonya hakimiyeti görülür. Fakat Büyük İskender'in ani vefatı ile imparatorluk dörde bölünür (Makedon Krallığı, Antigonitler: Anadolu, Ptolemeler: Mısır ve Selevkoslar: Suriye Mezopotamya, İran) ve Kıbrıs M.Ö. 294-258 yılları arasında Ptolemeler tarafından yönetilmeye başlanır. Ptolemeler devrinde Kıbrıs, Mısır'dan gönderilen valiler tarafından yarı bağımsız statüsü ile yönetilmiştir (Kortmaz, 2014). M.Ö 168 yılında Suriye kralı Mısır'ı yenerek Kıbrıs'ı ele geçirmiş fakat dönemin en önemli güçlerinden olan Roma Mısır ve Kıbrıs'ı Suriye'nin hakimiyetinden kurtarmıştır. M.Ö. 80 yılında tam bağımsızlığını alan Kıbrıs adası M.Ö 58 yılından M.S 395 yılına kadar Roma İmparatorluğunun himayesine girmiş ve Kilikya eyaletine bağlanmıştır. Bu dönemde Kıbrıs'ın idari merkezi olarak Baf ayin edilmiştir. M.Ö.47'de Roma'nın ünlü imparatoru Julius Caesar (Jül Sezar), Kıbrıs'ı Mısır kraliçesi VII. Cleopatra'ya hibe etmiş, M.Ö.30'da ada tekrar Roma İmparatorluğu egemenliğine girmiş, M.Ö.22'den itibaren ise imparatorluğunun senatolu eyaleti olmuştur (Okkar, 2017). Adanın Roma İmparatorluğu hakimiyetinde olduğu dönemde ekonomik, tarım, ticaret ve bayındırlık alanlarında gelişmeler yaşanmış ayrıca yeni yollar, limanlar, alt yapı çalışmaları ve kamusal binalara ağırlık verilmiştir. Ayrıca bu dönemde adaya su getirilmiş ve adanın su problemi kısmen çözülmüştür. Roma İmparatorluğu'nun 395'te ikiye ayrılmasından sonra Kıbrıs, Bizans İmparatorluğu'nun bir parçası olmuş ve İslam fetihlerine kadar Bizans İmparatorluğu tarafından yönetilmiştir. (Akçay, 2018). 688 yılında Bizans imparatorluğu İslam halifesi Abdülmelik b. Mervan ile antlaşma yoluna gitmiş ve adada üç yüz yıl kadar sürecek olan condominium dönemi başlamıştır. III. Haçlı Seferi için Kutsal Topraklara yönelen ve Aslan Yürekli Richard olarak tarihte bilinen İngiltere kralı I. Richard 1191'de adayı kontrolü altına almış ve adayı 100.000 dinara Tapınak Şövalyeleri'ne satmıştır. Yerli halk ile birçok sorunlar yaşayan şövalyeler adayı tekrar Richard'a teslim etmiş, o da 1192'de Kutsal Topraklardaki mağlubiyetten sonra Kıbrıs'ı Lüzinyanlara (eski Kudüs Kralı Guy de Lusignan'a) devretmiş, yaklaşık üç yüz yıl kadar süren Kıbrıs Krallığı kurulmuştur. Lüzinyan hanedanına mensup Kıbrıs kralları, Batı Avrupa ve Ortadoğu'dan soyluları, şövalyeleri, tüccarları ve zanaatkârları adaya yerleşmeye teşvik etmiştir. Böylece nüfusun çoğunluğunu temsil eden Rumların dışında Latinler ile Ortadoğu'dan gelen Maruni, Ermeni, Yakubi ve Nasturi toplulukları da ada nüfusunun artmasında ve dolayısıyla kültürünün çeşitlenmesinde ve çokkültürlü toplumun temellerinin atılmasında rol oynamışlardır (Yıldız ve Özerden, 2017). Lüzinyan kralı II. James döneminde Kıbrıs komşu devletlerin saldırılarına uğrayınca kral Venediklilerden yardım istemiştir. Gerekli yardımı yapan Venedik kralın ölümünün ardından adayı kontrolü altına

almış, 1489'da resmen ilhak ederek 300 yıllık Lüzinyan çağını kapatmıştır (<https://users.metu.edu.tr>). Lüzinyanlar Kıbrıs adası için Memlûklülere vergi ödüyorlardı. Venedikliler, Kıbrıs'a hâkim olunca Lüzinyanlara ödedikleri vergiyi kendilerinin ödeyeceğini bildirdiler. 1517 yılında Osmanlı hükümdarı Yavuz Sultan Selim'in Memlûk Devletine son vermesinin ardından Venedikliler Memlûklülere verdikleri vergiyi Osmanlılara ödemeye devam ettiler. Böylece ada resmi olarak Osmanlı Devleti'ne bağlanmış oldu (Kortmaz, 2014). Bu tarih itibarıyla iki farklı topluluk olarak değerlendirilebilecek Müslüman Türkler ve Ortodoks Rumlar adada birlikte ve barış içinde yaşamışlardır. 1828 yılında Osmanlılardan ayrılan Yunanlılar ideolojik hedefleri doğrultusunda Kıbrıs'ın da Yunan topraklarına dahil olmasını arzulamış ve huzursuzluklar baş göstermeye başlamıştır. 1878 yılında imzalanan ve Osmanlı'nın büyük toprak kaybı ile sonuçlanan Ayastefanos anlaşması gereği Kıbrıs'ın idaresi İngilizlere bırakılmış ve fakat bu durum iki toplum arasındaki gerginliğin çözülmesini sağlayamamıştır. 1974 yılına kadar olan süre zarfında Müslüman Türk ve Hristiyan Rum toplumları arasında birçok kez çatışmalar yaşanmıştır (Yılmaz, 2017). Türkiye Cumhuriyeti Devleti'nin yüksek desteği neticesinde Kıbrıslı Türklerin menfaatine sonuçlanan 1974 Kıbrıs Barış Harekâtı sonrası ada Kuzey Türk Kesimi ve Güney Rum Kesimi olmak üzere ikiye bölünmüştür (Engin, 2000). Yapılması planlanan anlaşma ve uzlaşma yolu açılmadığından Türk kesimi 15 Kasım 1983'te self-determinasyon hakkını kullanmış, adanın kuzeyinde kendi özgür, bağımsız devletini (Kuzey Kıbrıs Türk Cumhuriyeti) kurmuştur (Güler, 2004).

Nesilden nesile aktararak günümüze kadar ulaşan ve yaşandığı coğrafyanın özellikleri ile harmanlanan kültür (Unesco Türkiye Millî Komisyonu, 2003, par.1), toplumların kimliklerinin oluşmasında önemli bir faktördür. Sahip olunan kültürel faktörlerin korunması o toplumun geçmişine ait değerlerine sahip çıkması anlamı taşır. Diker'e göre (2014, s.152) kültürün iki önemli özelliği bulunur. Bunlardan ilki insanlar tarafından oluşturulan maddi ve manevi değerler bütünü olması, diğeri ise toplumların diğer toplumlara göre ayırt edici özellikleri olarak özgün olması olarak açıklanabilir. Bu anlamda kültürün toplumların kimliklerinin ve benliklerinin oluşmasındaki faktörler bütünü olduğu söylenebilir.

İlk kez 1895 yılında, John W. Harshberger tarafından kullanılmış olan etnobotanik kelimesi, etno (insanlar) ve botanik (bitkiler) kelimelerinin birleşiminden oluşmakta ve farklı insan topluluklarındaki bitki-insan ilişkilerini ifade etmektedir (Kendir ve Güvenç, 2010). Botanik ve antropolojik açıdan insanların bitkileri kullanmasındaki sebep ve sonuçları inceleyen etnobotanik (Diker ve ark., 2017) toplumu oluşturan bireylerin kültürleri ile direkt ilişki

içindedir. Çünkü yerel halkın yiyecek, içecek, ilaç yapımı, dini ritüeller gibi sebepler kullandıkları bitkiler o halkın kültürünün önemli bir parçasıdır. Bu kültür nesilden nesile aktarılamadığı takdirde yok olmaya mahkumdur. Bu anlamda bölgelerin sahibi olduğu kültürler içinde kullandıkları bitkilerin etnobotanik olarak araştırılması, incelenmesi hem bu kültürün hem de adı geçen bitkilerin biyoçeşitliliğinin korunarak bölgedeki ekosistemin sürdürülebilir olmasında önemi arz eder.

Bir bölgeye ait bitkiler ve bu bitkilerin yerel halk tarafından kullanım şekli, somut olmayan kültürel miras kapsamında değerlendirilir (Kendir ve Güvenç, 2010). Bu kültürel miras değerlerinin etnobotanik anlamda incelenip turizm alanında değerlendirilmesi ise turizm ekonomisinde dolayısıyla bölgenin genel ekonomisine sürdürülebilirlik kapsamında önemli bir fayda sağlayacağı açıktır.

Çalışmada Kıbrıs'ın etnobotanik olarak yenilebilir otlarına ve bu otların kullanım şekillerine yer verilmiş ve kültürel turizm anlamında değerlendirilebilmesi için bazı önerilerde bulunulmuştur. Böylece adada yetişen ve yemek olarak pişirilen doğal bitkilerin yerel halk dışında da tanınması, korunması ve değerlendirilmesi ve aynı zamanda bu bitkilere sürdürülebilir turizm anlamında farkındalık oluşturulması beklenmektedir. Araştırma envanter niteliği taşımamakla birlikte genel olarak Kıbrıs'ta bilinen ve sıkça kullanılan yenilebilir otları içermektedir.

2. Kültürel Miras Öğelerinden Kıbrıs'ta Yetişen Yenilebilir Otlar

Kıbrıs adasının bitki örtüsü iklim, yükseklik ve toprak verimliliği gibi bazı etmenler sebebiyle çeşitlilik gösterir. Ne yazık ki bu bitki türlerinin bir çoğu özellikle insan etkisi nedeniyle tehlike altındadır. Özellikle yakın geçmişten itibaren tarım ilaçları ve gübrelerin denetimsiz kullanımı, turizm aktivitelerindeki kontrolsüz artış, dağlardaki denetim yol ağlarının genişlemesi, doğal alanların kentleşmesi ve doğal alanlar içerisindeki çeşitli yapılaşmalara bu tehlikelerin artmasında en büyük etmenler olarak kabul edilmektedir artmıştır. Belirli kriterler dahilinde ada florasının koruma statüsünü değerlendiren Uluslararası Çevre Koruma Ortaklığına (IUCN) göre; “*Kıbrıs Florası Kırmızı Kitabı'nda, 23 tür bölgesel olarak yok olmuş, 46 tür kritik olarak tehlike altında, 64 tür tehlikede, 15 tür tehlike sınırında, 128 tür hassas özellikte ve 45 tür veri yetersizliği yaşamaktadır*” (Yıldırım, 2010).

Bu çerçevede çalışmada Kıbrıs adasının somut olmayan kültürel mirasının önemli bir parçası olan yenilebilir otlardan bazılarına yer verilecektir. Tablo 1'de Kıbrıs'ta bulunan ve yerel halkın

mutfağında yeri bulunan yenilebilir otların bazılarını içermektedir. Bu otların kullanım şekillerinin, faydalarının ve yetiştirme koşullarının belirlenmesi ile Kıbrıs kültürü içindeki yerinin önemine dikkat çekilmesi gerekmektedir. Buna göre ada halkına ait olan bu mirasın korunması ve gelecek nesilleri aktarımı konusunda oluşacak farkındalık aynı zamanda adanın turizm açısından markalaşmasında ve gastronomi turizmi açısından özelliklerinin öne çıkartılmasında önemli bir faktör olacaktır.

Tablo 1: Kıbrıs'ta bulunan ve yerel halk tarafından kullanılan yenilebilir otlar

NO	BITKİNİN ADI	LATINCE ADI
1	Ayrelli	<i>Asparagus stipularis</i> Forrsk.
2	Yumurta otu	<i>Silene vulgaris</i> (Moench) Gareke
3	Molehiya	<i>Corchorus olitorius</i> L.
4	Adaçayı	<i>Salvia fruticosa</i> Miller.
5	Yabani ıspanak	<i>Chenopodium album</i> L.
6	Girdama	<i>Crithmum maritimum</i> L.
7	Lindo	<i>Amaranthus graecizans</i> L.
8	Alıç	<i>Crataegus azarolus</i> L.
9	Mangolla	<i>Eryngium creticum</i> L.
10	Similya	<i>Chrysanthemum coronarium</i> L. var. <i>discolor</i> Urv.
10	Hostes	<i>Cynara cornigera</i> Lindley.

Ayrelli (*Asparagus stipularis* Forrsk.): Kuşkonmaz olarak da bilinen, *Asparagaceae* familyasının bir üyesidir. İki evcikli, otsu ve çok yıllık bir sebzedir. Sürgünleri beyaz ya da yeşil renklerde taze, konserve ya da dondurulmuş vb. olmak üzere farklı şekillerde tüketilebilmektedir. İklim açısından fazla seçici bir yapısının olmaması sebebiyle Afrika'dan Kuzey Avrupa ülkelerine kadar geniş bir coğrafyada yetiştirilebilmektedir. Ancak tomurcuk patlaması ve sürgün gelişimi için toprak sıcaklığının 5 ila 14 °C'lerde olmasını istemektedir (Dufault, 1994). Anadolu topraklarında "Çıtır" olarak da bilinen Yabani kuşkonmaz'ın boyu 2 m kadar erişebilir. Odunsu, dalları dikenli ve sürekli yeşil kalan çok yıllık bir bitkidir. Rizom ve kökleri asparagin ve vitaminler bakımından oldukça zengin olan bu bitki, diüretik olarak kullanılmaktadır (İncekara, 2004). (Şekil 1). Kıbrıs kültüründe iyice yıkanan ayrelliler ucundan başlanarak sapına doğru el ile 3-4 cm uzunluğunda olacak şekilde kolayca kırılacak yere kadar

kırılarak parçalara ayrılır. Geride kalan sert gövde kullanılmaz. Ardından kırılan ayrelliler acı tadın çıkması için haşlanır. Haşlama işleminin ardından zeytin yağı koyulan tavada pişirilir. Son olarak üzerien yumurta kırılır ve karıştırılır. Tabağa alınan yumurtalı ayrellinin üzerine limon sıkılarak tüketilir (<https://www.kibrisortam.com>).

Şekil 1: Yumurtalı Ayrelli (<https://www.kibrisortam.com/ayrelli/>)

Yumurta otu (*Silene vulgaris* (Moench) *Gareke*): Yaklaşık 5 ila 40 cm kadar boylanabilen doğada kendiliğinden yetişebilme kabiliyetine sahip bir bitkidir. Gırcır olarak da bilinen bu bitkiye, yol kenarlarında ya da boş nadasa bırakılmış arazilerde rastlanabilmektedir. Haşlandıktan sonra kızartması, kavurması veya soğanlı yemekleri yapılarak tüketilebilmektedir (Kaya Yıldırım, 2010; Cihangir, 2018). Kıbrıs'ta genel olarak yapılışı ise şöyledir; Yumurta otları iyice yıkayıp, kurutulur ve zeytinyağında kavrulur. Ayrı bir tencerede su kaynatılır ve içine tuz, sirke ilave edilerek yumurtalar içine kırılır. Sarısı kayısı kıvamına gelinceye kadar pişirilir. Servisi sırasında tabağın altına yumurta otu, üzerine ise suda pişirilmiş yumurta eklenir. Son olarak ise üzerine zeytinyağı dökülür ve servis edilir (<https://www.kibrisgazetesi.com>) (Şekil 2):

Şekil 2: Yumurta Otu(<https://www.kibrisgazetesi.com>)

Molehiya (*Corchorus olitorius* L.): Tossa jütü olarak da bilinen bu bitki, *Malvaceae* familyasından *Corchorus* cinsi içinde yer alan otsu yapıya sahip bir bitkidir (Tuncer ve

Ummuhan, 2017). Sıcağı seven bir yapısı olduğundan genellikle tropikal ve subtropikal iklimlerde yetişebilmektedir. Bu nedenle, Çin, Hindistan, Filipinler, Japonya, Karayipler, Malezya, Mısır, Sudan, Tayland ve Bangladeş gibi ülkeler, jüt üreticileri olarak üretim pazarının yaklaşık %95 oranında ihtiyacı karşılamaktadır (Samra et al., 2007; Data et al., 2016; Dumanoglu, 2021). Jüt bitkisi yetişmek için için yaklaşık 22-35 °C sıcaklıkta ihtiyaç duymaktadır. Bitkinin yıllık yağış ihtiyacı yaklaşık 418 mm olup, 120-150 günlük bir büyüme periyoduna gelişmektedir. Bu değerler yetiştirildiği koşula bağlı olarak değişebilmektedir (Bilgili ve ark., 2018) Bu bitkinin Kıbrıs'a Mısır hakimiyeti döneminde ya da 7. yüzyılın ortalarında gerçekleşen Arap akınları döneminde geldiği düşünülmektedir (<https://youncyprus.com>), (Şekil 3). Bir diğer düşünceye göre Hindistan'dan gelmiştir. Kıbrıs halkının severek tükettiği bu ot Arap, Mısır, Hindistan, Suriye, Lübnan, Filistin ve Tunus gibi ülkelerde farklı pişirme metodları uygulanarak tüketilir. Kıbrıs'ta o tencere yemeği olarak yağlı kuzu et ve/veya tavuk ile pişirilip yanında pirinç pilavı, kuru soğan, köy ekmeği ve turşu ile tüketilmektedir (Adalier, 2020).

Şekil 3: Molehiya (<https://www.visitncy.com/tr/kesfet/molehiya/>)

Adaçayı (*Salvia fruticosa* Miller.): Ballıbabagiller ailesi olarak da bilinen *Lamiaceae* (Labiatae) familyasının bir üyesi olan adaçayı, Avrupa'da tıp alanlarda kullanımlarından dolayı "tıbbi" olarak kabul edilmektedir. Kültürü yapılabildiği gibi doğa da kendiliğinden de yetişebilme yeteneğine sahiptir (Ekren ve ark., 2007; Dumanoglu ve Sönmez, 2021) Bitkinin yaprakları, çiçekleri, tohumları ve kökleri vb. pek çok aksamı yaş veya kuru formlarda değerlendirilmektedir (Bayram ve Sönmez, 2006). (Şekil 4).

Şekil 4: Adaçayı (https://en.wikipedia.org/wiki/Salvia_fruticosa)

Yabani ıspanak (*Chenopodium album* L.): Ak kazağı, Ak pazı ya da Sirken olarak da bilinen yabani ıspanak, tek yıllık otsu forma sahip bir bitkidir. Genellikle 150-200 cm kadar boylanabilmektedir. Hem insan hem de hayvan beslenmesinde kendisine yer bulan bir bitkidir (Anwar, 2006; Atalay ve Kamalak, 2019). Doğal olarak yetişen bu bitkinin yaprakları haşlama ya da kavurma şeklinde tüketilebilmektedir (Baytop, 1997; İncekara, 2004) (Şekil 5).

Şekil 5: Yabani ıspanak (https://www.sofra.com.tr/tarifler/zeytinyaglilar-ve-mezeler/sirken_yemegi)

Girdama (*Crithmum maritimum* L.): Deniz rezenesi, deniz teresi ya da kaya kuruğu olarak da bilinen, *Umbelliferae* (Apiaceae) familyasına ait bitki çok yıllık, kazık köklü ve otsu bir yapıya sahiptir. Deniz kenarlarında, kayalık-taşlık alanlarda nadiren de kumluk arazilerde kendiliğinden yetişen bir bitkidir (Davis, 1972; Baytop, 1984; Mucuk ve ark., 2002). Turşu, haşlama veya yemeği yapılarak tüketilebilmektedir (Şekil 6).

Şekil 6: Girdama (<https://kayakorugutursusu.com/kaya-korugu-meze.html>)

Lindo (*Amaranthus graecizans* L.): Horozibiği olarak da bilinen bu bitki genel olarak kıraç toprak özelliklerini sevmekle birlikte, yaklaşık 1m kadar boylanabilen, toprak üstü aksamı kurutulup öğütülerek baharat olarak ya da etli yemekler içerisinde değerlendirilmektedir (Kaya Yıldırım, 2010) (Şekil 7).

Şekil 7: Lindo (<https://alchetron.com/Amaranthus-graecizans>)

Alıç (*Crataegus azarolus* L.): Kıbrıs'ta oldukça sık rastlanan alıç ağaçlarının taze filizleri veya kurutulmuş meyvesi hastalıklarda çıkan ateşi hızlıca düşürme etkisine sahiptir. Yine aynı şekilde, kurutulmuş meyvelerinden yapılan infüzyon ishali durmasına, tansiyonu düşürmeye, mide bulantısını gidermeye, düzensiz kalp atışlarını normalleştirmeye yardımcı olur. Ağacın

meyvelerinin olgunlaştığında toplanarak haşlanması ile çıkan suyundan alıç macunu yapılır. Bu macunun damar sertliğinin giderilmesine yardımcı olduğu bilinmektedir (Yıldırım, 2010), (Şekil 8).

Şekil 8: Alıç Meyvesi, <https://www.e-fidancim.com/>

Mangolla (*Eryngium creticum* L.): Kazayağı ya da Bangallo olarak da bilinen bu bitkinin üst aksamı genel olarak metalik mavi renkte, yaprakları dar ve dikenli bir yapıya sahiptir. Çorak arazilerde ya da 500 m yüksekliğe sahip tepelik alanlarda kendiliğinden yetişebilmektedir. Hastalık (verem vb.) ve yılan sokmaları gibi durumlarda bitkisel tedavi amacıyla kullanılabilir. Ayrıca turşu olarak tüketilebilir. Bunların yanında haşlanarak kuru bakla ya da fasulye yanında veya yemekler içerisinde değerlendirilebilir (Kaya Yıldırım, 2010) (Şekil 9).

Şekil 9: Mangolla (<https://www.botanic.cam.ac.uk/the-garden/plant-list/eryngium-creticum/>)

Similya (*Chrysanthemum coronarium* L. var. *discolor* Urv.): Tek yıllık, krizantem, sümüklüya ya da gelin yemişi olarak da bilinen bu bitkinin boyu yaklaşık 1m'ye kadar çıkabilmektedir. Yol kenarlarında veya çorak arazilerde kendiliğinden yetişebilme yeteneğine sahiptir. Bu bitkinin kaynatılmasıyla elde edilen suyun saçların rengini açmakta kullanılmaktadır. Bunun yanında taze olarak tüketilebildiği gibi yemeklerin (bakla ya da börülce) yanında haşlanarak tüketilebilmektedir (Kaya Yıldırım, 2010) (Şekil 10).

Şekil 10: Similya (<http://biodiversitycyprus.blogspot.com/>)

Hostes (*Cynara cornigera* Lindley.): Bodur bir yapıya sahip, çok yıllık diken otu olarak da bilinen bu bitki yaklaşık 30 cm 'e kadar boylanabilmektedir. Zeytinlikler başta olmak üzere yüksek tepelerde doğal olarak yetişmektedir. Dikenli bir yapısı vardır. Üzerindeki, dikenler alındıktan sonra haşlanarak, yemeklerin yanında, yahni olarak veya kızartması yapılarak tüketilebilmektedir (Kaya Yıldırım, 2010) (Şekil 11).

3. Sonuç ve Öneriler

Kıbrıs günümüze kadar uzanan zengin tarihi boyunca birçok medeniyete ev sahipliği yapmış bir adadır. Adanın farklı dönemlerinde ev sahipliğini üstlenen bu medeniyetler kimi zaman kendi medeniyetlerinden kültürel değerler bırakmış kimi zamanda adanın sahibi olduğu kültürleri kendi kültürel değerlerine eklemişlerdir. Bu kültürel etkileşimler ada kültürünün zenginleşerek artmasında büyük bir paya sahiptir.

Gerek gastronomi turizmi gerekse kültür turizmi açısından bakıldığında Kıbrıs adasının kültürel mirası oldukça çeşitlilik gösterir. Bu sebeptendir ki Kıbrıs'ta bulunan bitkiler ve bu bitkilerle hazırlanan yemekler, soslar, reçeller, medikal takviyeler ada halkının kültürünün bir parçası niteliğindedir. Bu mirasın korunmasının ileri kuşaklara aktarım ile gerçekleşeceği açıktır. Bu anlamda adanın sahibi olduğu değerler hem gastronomi turizminin gelişmesi hem de sahip olduğu mirasın korunması ve geliştirilmesi için mutlaka tanıtılmalıdır. Bu tanıtımlar hem adanın markalaşmasına katkı koyacak hem de turizm ekonomisine fayda sağlayacaktır.

Günümüz teknolojisi ile seyahatlerin aradıkları bilgiye ulaşmaları saniyeler içinde gerçekleşmektedir. Gezinler bu teknolojinin getirdiği imkanlar dahilinde gezip görmek, kültürünü deneyimleyip yerel lezzetlerini tatmak istedikleri yerleri saniyeler içinde araştırmakta ve seyahat seçimlerini bu doğrultuda yapmaktadırlar. Bu anlamda var olan hedef kitleleri doğru bilgiler ile yönlendirip merak uyandırmak ve adanın sahip olduğu mirası tanıtmak için turizm alanında söz sahibi başta Turizm ve Kültür Bakanlığı olmak üzere, tur operatörleri ve seyahat acentalarına büyük görevler düşmektedir. Kıbrıs sahibi olduğu flora ve faunası, gastronomik öğeleri ile oldukça ilgi çekici bir destinasyondur. Yapılan araştırmalar yerel halkın mutfağında kullanmayı kültürü haline getirdiği bazı bitkilerin yok olma tehlikesinde olduğunu göstermektedir. Yapılacak araştırmalar neticesinde detaylı envanterler çıkarılmalı, adaya özgü bitkilerin devamlılığının sağlanması için gerekli tedbirler alınmalı ayrıca alınan tedbirler dahilinde yerel değerler gastronomi turizmi kapsamında değerlendirilerek hem yerel halka hem de potansiyel gezginlere farkındalık yaratılmalıdır. Yapılan tüm bu çalışmalarla ülkenin sahibi olduğu değerler korunacak, turizme kazandırılacak ve özellikle bu mirasın gelecek nesillere aktarımı sağlanacaktır.

TOPLUM TEMELLİ RUH SAĞLIĞI HEMŞİRELİĞİ: BİR İNCELEME

Dr. Öğr. Üyesi Emral GÜLÇEK (Orcid No:0000-0003-1512-2310)

Siirt Üniversitesi, Sağlık Bilimleri Fakültesi, Ebelik Bölümü, Siirt

E-mail: canan_gulcek@hotmail.com

Özet

Akıl hastalığından muzdarip nüfusun artışı, akıl sağlığı hemşirelerini toplumlar için çok önemli bir iş gücü haline getirmektedir. Ruh sağlığı hemşireleri zorlu ve potansiyel olarak yüksek stresli ortamlarda çalışmaktalar. Bu koşullar, doğası gereği karmaşık olan bu hastaların bakımında sıklıkla meydana gelen hemşirelik hatalarını artırmaktadır. Akıl sağlığı hizmetlerine erişim, küresel olarak bir halk sağlığı sorunudur. Çok sayıda zihinsel bozukluk için birçok etkili tedavi mevcuttur, ancak birçok kişi yeterli tedavi görmemektedir. Ruh sağlığı bozukluğu olan kişiler; psikolojik sorunlar, fiziksel sorunlar ve sosyal sorunlar gibi sorunlar yaşarlar. Toplum, disiplinler arası sağlığın geliştirilmesi için merkezi bir kaynaktır. Akıl sağlığı hizmetleri, ciddi akıl hastalıkları olan hastalar için giderek artan bir şekilde toplumsal katılıma ve hareketliliğe odaklanmaktadır. Toplum ruh sağlığı rehabilitasyon ekipleri, karmaşık ruh sağlığı ihtiyaçları olan kişileri desteklemekte önemli bir role sahiptir. Hemşireler toplum ruh sağlığı hizmetlerinde merkezi bir rol oynamaktadır. Bu derlemede, kişisel ve toplum ruh sağlığı konusuyla ilgili bazı güncel çalışma sonuçları hemşire bakış açısıyla sunulmuştur.

Anahtar Kelimeler: Ruh sağlığı, psikiyatrik, kişisel, toplum, hemşirelik

1. Giriş

Psikiyatrik bozukluklar engelliliğin başlıca nedenleri arasındadır (Giri ve ark. 2021). Depresyon, dünya çapında yaklaşık 350 milyon insanın etkilendiği ve her yıl 800 bin intiharla sonuçlandığı, dünya çapında en maliyetli ve en fazla yeti yitimine neden olan hastalıklar arasındadır (Carlton ve ark., 2021). Majör depresif bozukluk birçok ergenin yaşam kalitesini etkilemektedir (Waraan ve ark., 2021). Akıl sağlığı hizmetleri, ciddi akıl hastalığı olan hastalar için giderek artan bir şekilde toplum katılımına ve hareketliliğine odaklanmaktadır (Townley ve ark., 2021). Son yıllarda toplum ruh sağlığı hizmetlerine olan talep önemli ölçüde artmıştır. Hemşireler bu hizmetlerde merkezi bir rol oynamaktadır (Burr ve Richter, 2021).

Ruh sağlığı bozukluğu olan kişilerde, psikolojik sorunlar, fiziksel sorunlar ve sosyal sorunları da bulunabilir (Deviantony ve Susanto, 2020). Farklı psikolojik travmalar yaşamak, hayatta kalanlar üzerinde kötü zihinsel, fiziksel, sosyal ve ekonomik sonuçlar gibi olumsuz etkilerle sonuçlanabilir (Dawson ve ark., 2021). Bu kişilerin çoğu, ruh sağlığı bilgisi eksikliği, akıl hastalığına ilişkin damgalanma ve mevcut hizmetlerin farkında olmamaları nedeniyle bakım talep etmemektedir (Grant ve ark., 2021). Bu sorunlar hakkında toplum bilincinin düşük olması, ruhsal sorunlara yönelik tedavi arayışını olumsuz etkilemektedir (Gaiha ve ark., 2021). Depresyon sağlık hizmetleri arayan birçok kişide sıklıkla, eşlik eden tıbbi durumlar vardır (King ve ark., 2021). Ruh sağlığı hizmeti kullanıcıları için kalp-solunum hastalıkları ve diyabet prevalansı artmaktadır (Sara ve ark., 2021). Akıl hastalığı ve Tip 2 diyabeti olan kişilerin, genel popülasyona kıyasla diyabet komplikasyonlarıyla karşılaşma olasılığı daha yüksektir (Cimo ve ark., 2020).

Şizofreni ve bipolar bozukluk hastaları, kısmen kötü kontrollü ve yetersiz tedavi edilen kardiyovasküler faktörlerin yüksek oranları nedeniyle aşırı mortaliteye sahiptir (McGinty ve ark., 2021). Ciddi ruhsal hastalığı olan kişilerde tütün kullanım bozukluğu oranları genel nüfusa göre 2-3 kat daha fazladır (Siegel ve ark., 2021). Yaygın psikotrop ilaçların yan etkileri olarak cinsel işlev bozukluğu, ruh sağlığı bozukluklarının bir belirtisidir (Abbasi ve ark., 2021). Yalnızlık ve sosyal izolasyon, ruh sağlığı sorunları olan insanlar için önemli endişelerdir (Webber ve ark., 2021). Küresel olarak, artan yaşam beklentisi, ilerleyen yaşlarla birlikte özel ihtiyaçları olan yaşlı nüfus için daha yüksek psikiyatrik hizmet bakım talepleri ile sonuçlanmaktadır (O'Sullivan ve ark., 2021).

Psikiyatrik polieczacılık (polifarmasi; bir hastaya iki veya daha fazla psikotrop ilaç uygulanması) pek çok vakada zorlu hastalıklarda uygulanmaktadır. Psikotropik polifarmasinin

yaygınlığı, özellikle toplum ortamında tedavi edilen psikiyatrik hastalarda artmaktadır. Demografik özellikler, hastanın yaşı, cinsiyeti ve psikiyatrik tanı, polifarmaside oranı ve ilaç kombinasyonlarını etkiler durumdadır (Srikumar ve ark., 2021).

2. Toplum temelli ruh sağlığı

Toplum temelli ruh sağlığı programları üç türe ayrılır: 1) vaka yönetimi, 2) terapötik ve 3) terapötik programların psikiyatrik semptomları azaltmada oldukça etkili olduğu yaşam tarzı (O'Donnell ve ark., 2021). Akıl sağlığı profesyonellerinin sorumluluğu, mümkün olan en iyi bakım kalitesini sağlamaktır. Aile, hastanın günlük yaşamına güçlü bir şekilde dahil olur (Moen ve ark., 2021). Aile ve toplum hemşireliğinin rolleri, nüfusun ihtiyaçlarına göre farklılık göstermektedir (Conti ve ark., 2021). Psikotik bozukluğu olan kişiler için aile katılımı, bilimsel kanıtların yanı sıra yasal ve etik düşüncelerle desteklenmekte ve klinik uygulama kılavuzlarında önerilmektedir (Hestmark ve ark., 2021).

Bakımda teknolojiyle zenginleştirilmiş ruh sağlığı hizmetlerinin genişletilmesi, klinisyen talebini azaltıcıdır (Lattie ve ark., 2020). İnternet tabanlı bilişsel davranışçı terapi gibi dijital ruh sağlığı programlarının kullanımı, kaliteyi ve ruh sağlığı hizmetlerine erişimi artırmaktadır (Doukani ve ark., 2021). Bu sağlık araçları, hasta yaşamlarına kolayca entegre edilebilir ve halk sağlığını iyileştirebilir. Web tabanlı videolar ve ruh hali izleme uygulamaları, zihinsel sağlık müdahalelerini olumlu yönde etkilerler. Bu dijital araçların uygulanmasından önce, bu araçları hangi kuruluşların veya bireylerin uygulayacağını ve kullanacağını anlamak çok önemlidir. Gençler teknolojiye daha aşinadır (Knapp ve ark., 2021). Dijital araçların kullanılabilirliğini ve sağlık ihtiyaçlarına ve sosyo-çevresel bağlama uygunluğunu artırmak için, son kullanıcılarla kullanılabilirliği keşfetmek ve alımı kolaylaştırıcıları ve engelleri belirlemek önemlidir (Storm ve ark., 2021).

Ciddi ruh sağlığı sorunlarının yaygınlığı ve insidansı 16-25 yaşları arasında zirvededir (Cohen ve ark., 2020). Obezite ve aşırı kilolu gençlerde ciddi duygusal rahatsızlık oranları yüksektir (Wykes ve ark., 2021). Toplum ruh sağlığı merkezlerine başvuran birçok ergende dışsallaştırma, içselleştirme ve madde kullanım sorunları eşitliği vardır (Sheidow ve ark., 2021). Hemşireler, ebeveynliği desteklemek için erken müdahaleler yoluyla olumlu çocukluk gelişimini teşvik etmede önemli roller oynamaktadır (Anis ve ark., 2021).

Evsizlik önemli bir sosyal sorundur, psikiyatrik hastalıklara yol açar veya pek çok durumda tam tersi olur. Akıl hastalığı olan çoğu evsizin psikiyatrik tedavisinin erişilebilirliği ve sürekliliği, yaşam tarzları nedeniyle istisnai bir seçenektir (Sriramalu ve ark., 2021). Dikkat

Eksikliği/Hiperaktivite Bozukluğu için kanıta dayalı uygulamaların toplum tarafından uygulanması da büyük ölçüde eksiktir (Sibley ve ark., 2021).

Artan nüfusla birlikte, akıl hastalığı olan insanlar küresel boyutta artmakta ve akıl sağlığı hemşirelerini çok önemli bir iş gücü haline getirmektedir (Hercelinskyj ve ark., 2014). Akut yatan ruh sağlığı tesislerinde ruh sağlığı hemşirelerinin işe alınması ve istihdamı bir sorun olmaya devam etmektedir. Literatür ve güncel araştırmalar, iş tatminsizliğine katkıda bulunan birkaç temel faktörü tanımlayarak, baskı ve stresle dolu bir ortama işaret etmektedir. Bu faktörler, artan hasta zorlukları, öngörülemeyen ve zorlu çalışma alanları, şiddet, artan evrak işleri ve azaltılmış yönetim desteğini kapsar (Ward, 2011). Akıl hastalığı, olumsuz tutumlar ve damgalamalarla çevrilidir. Ruh sağlığı hemşirelerinin ruh hastalarına yönelik genel tutumları üzerinde işveren veya işyerlerinin etkisi vardır. Çalışanlar arasında ruhsal hastalığı olan kişilere yönelik daha olumlu tutumlar geliştirilebilir ve işyerlerindeki alt kültüre de aktarılabilir (Mårtensson ve ark., 2014).

Ruh sağlığı hemşireleri zorlu ve potansiyel olarak yüksek stresli ortamlarda çalışırlar. Stres etmenleri tüketici, aile ilişkileri, personel ilişkileri, çalışma ortamı ve organizasyon bağlamında ortaya çıkabilir. Stres ve mesleki zorluklar ruh sağlığı hemşireleri üzerinde tükenmişlik, daha zayıf fiziksel sağlık ve ruh sağlığı gibi zararlı etkilere yol açabilir. Ruh sağlığı hemşireliğinde yılmazlık, stres ve zorluklara olumlu adaptasyonu, bireysel yeteneği veya kişi-çevre etkileşimi olgularını da kapsar. Ruh sağlığı hemşireleri için bireysel, iş birimi ve organizasyonel düzeylerde dayanıklılık oluşturma stratejilerinin uygulanması hakkında daha fazla araştırmaya ihtiyaç vardır (Foster ve ark., 2019).

Terapötik ilişki, ruh sağlığı hemşireliğinin merkezindedir. Klinik ortam, bakımın kalitesi ile ilgilidir. Yüksek kaliteli terapötik ilişkinin faktörleri; daha uygun uygulama ortamı, kaliteli hemşirelik bakımı için teme gereksinimlerin varlığı, daha yüksek akademik başarı ve daha uzun hemşirelik deneyimi şeklinde sıralanabilir. Eğitim, hemşirelik dili ve taksonomisi gibi hemşirelik temellerinin kalitesi ve ortak hemşirelik felsefesi, yüksek kaliteli terapötik ilişkide etkilidir (Roviralta-Vilella ve ark., 2019). Terapötik veya yardım ilişkisi, ruh sağlığı hemşireliğinin temel taşıdır. Hemşirenin etkin ve doğru bir iletişim ve yönetsel ilişkisel becerilerine dayanır. Ruh sağlığı hemşireliği becerilerine ilişkin teorik bilgilere rağmen, bunların uygun kalite standartlarıyla uygulanmadığına ilişkin yeterli kanıt mevcuttur. Empatik tutum, koşulsuz kabul ve aktif dinleme gibi teorik kavramlar günlük hemşirelik mesleğinde gerksinimdir. Uygulama aynı zamanda kavramsal farklılıklar, önyargılar, korkular ve ilişkiyi

sınırlayan ve hasta ile hemşire arasına mesafe koyan kendini koruma mekanizmaları ile sonuçlanmaktadır (Ar, 2013).

Ruh sağlığı hemşireliğinde, terapötik ilişki bakım sürecinin merkezinde yer alır, çünkü kişinin zihinsel ıstırap içindeki dengesinin yeniden kurulması kişiler arası ilişkilere dayanır (Laranjeira, 2021). Batı dünyasında ruh sağlığı bozukluğu olan insan sayısı giderek artmaktadır. En yaygın geleneksel terapiler konuşma terapisi ve ilaçlardır. Geleneksel terapilere bir alternatif ise Antrozoolojidir. Antrozooloji, insanlar ve hayvanlar arasındaki etkileşimi ele alır ve hayvanların insan sağlığına ve zindeliğine büyük katkıda bulunabileceğini gösterir. Akıl sağlığı bozukluklarından muzdarip insanlar, köpeklerine karşı güçlü ve iyileştirici bir bağ yaşarlar. Bu farklı teorilerle açıklanabilir. Hemşirelerin, köpeğin ruh sağlığı bozuklukları olan insanlar üzerindeki olumlu etkisi hakkında bilgi sahibi olması faydalıdır (Skjorestad & Johannessen, 2013).

Profesyonel ilişkiler, terapötik etkileşimler için güvenli, güvenilir ve sağlam bir altyapı sağlar; ancak hemşireler, ilişki sınırlarını belirleme ve sürdürme konusunda zorluklarla karşı karşıyadır. Hastalar özel ayrıcalıklar, romantik etkileşimler ve sosyal medya arkadaşlığı talep etse veya pahalı hediyeler sunsa da, hemşireler bu sınır ihlallerinin hastaların güvenini aşındırabileceğini ve hastalara zarar verebileceğini kabul etmelidir. Bu ihlaller hemşireler için disiplini de etkileyebilir. Profesyonel ilişki kılavuzları dikkatli bir şekilde uygulanmalı ve hemşireler bu ilişkilerdeki duygu ve tepkilerini izlemelidir (Valente, 2017).

İletişim, hemşirelikte klinik liderliğin önemli bir özelliği olarak tanımlanmıştır (Ennis ve ark., 2013). Ruhsal bozukluğu olan bireylerle iletişim çoğu zaman doğrusal olmayan, karmaşık ve değişken bir durum olabilir (Yıldız, 2019). İletişim, ruhsal bozukluğu olan kişilere kapsamlı bakımın geliştirilmesi için koşullar sağlayan hemşireler ve hastalar arasındaki etkileşimi sübvans eder (Paes & Maftum, 2013). Metafor, konuşmaya dayalı psikoterapilerin önemli bir bileşenidir. Ancak hemşirelerin yatan hasta ortamında karşılaştığı hastaların çoğu, en azından başlangıçta, şiddet içeren, içine kapanık, yüksek oranda gerileyen veya düşünce ve duyguları iletme için kelime dağarcığından yoksun oldukları için konuşmaya dayalı yaklaşımlar için uygun adaylar değildir (Birnbaum, 2017).

Çözüm odaklı terapi, ruh sağlığı bakımında yeni ve popüler bir müdahale modelidir. Çözüm odaklı terapinin özü, bireyin sorununun ya da zorluğunun yönünü belirlememesidir. Bunun yerine terapi uygulayıcısı, bireyin neyi farklı istediğini belirler ve ardından bu farkı keşfeder ve detaylandırır (Wand, 2010). Bu terapi danışanın güçlü yanlarını oluşturur ve

geleceğe odaklıdır. Birden fazla klinik ortamda kullanılabilir ve ruh sağlığı hizmetlerine erişen müşteriler için yararlı olmakla sınırlı değildir. Temel ilkeleri öğrenmek ve yaklaşımda temel düzeyde bir beceri geliştirmek, lisans hemşirelik kursunda başarılabilir bulunmuştur. Model bilgisindeki ve temel terapötik becerilerdeki artış sadece bir günlük eğitim gerektirir. Öğrenciler, bu terapötik yaklaşımı öğrenme yönteminin yararlı olduğunu ve hem bilgi hem de beceri temellerini artırdığını bildirmiştir (Evans ve Evans, 2013).

**IMPROVING OF GROWTH AND QUALITY CHARACTERISTICS OF
ORNAMENTAL PLANTS WITH SELENIUM TREATMENTS: A REVIEW**

ABSTRACT

The use of ornamental plants has been proposed to restore degraded landscapes, control erosion, reduce energy and water consumption, and improve the aesthetic quality of indoor and outdoor environments in which people live. Ornamental plants are used in different environments and situations, in landscaping and in different green areas (roads, parks and gardens), significantly increasing the quality of life in the countryside or in the city. Although selenium (Se) is an essential micronutrient for humans and animals, its possibly indispensable role in plants has yet to be determined. It is thought that higher plants do not need selenium, but several studies show that low concentrations of selenium improve physiological and biochemical processes in plants. The growth enhancement in Se-treated plants has been associated with the function of regulating water relation, photosynthesis, antioxidant defense systems, uptake of mineral nutrients, and activation of plant growth-stimulating hormones.

Keywords: Quality, ornamental plant plant growth, selenium

INTRODUCTION

Ornamental plants are grown for the purpose of adorning and beautifying indoor and outdoor spaces (Hernández et al., 2014) as well as improving the aesthetic and/or visual quality of a built environment (Kendal et al., 2012). These plants are characterized by their leaves, especially their brightly colored flowers. Recently given the pressure of environmental problems and global change, ornamental plants have come to the fore with their aesthetic properties and blooming capacity to improve the environment and our quality of life. The use of ornamental plants has been proposed to restore degraded landscapes, control erosion, reduce energy and water consumption, and improve the aesthetic quality of indoor and outdoor environments in which people live (Toscano et al., 2019). In many countries, one of the most important branches of horticulture in the field of agriculture-based industry is flower production (Costa et al., 2020).

Ornamental plants are used in different environments and situations, in landscaping and in different green areas (roads, parks and gardens), significantly increasing the quality of life in the countryside or in the city (Francini et al., 2022; Rocha et al., 2022). Increasing demand for high quality products requires post-harvest technologies to extend the vase life of flowers. Since the biological importance of ethylene on ornamental plant production and development has been understood in recent years, methods to reduce its harmful effects on ornamental plants have been investigated. Many chemicals currently used to reduce ethylene responses raise environmental and public health concerns. The development of environmentally friendly methods has become important (Scariot et al., 2014; Costa et al., 2020). Selenium has suitable properties to be an eco-friendly (Cochran et al., 2018). Selenium (Se) is an essential microelement for humans and a beneficial element for plants. Recently, biofortification with selenium has emerged as a key practice to increase plant quality (Razmavar et al., 2021).

A Multi-Purpose Element: Selenium

Selenium is a metalloid with dual properties of both metal and nonmetal elements (Chen et al., 2020; Xiaoa et al., 2021). Compared to other metal or nonmetallic elements, selenium has many advantages. First, its cost is relatively cheap. Secondly, as selenium can be metabolized in the body it is relatively safe for the environments and the residue tolerance of selenium is obviously higher than that of the other metal elements (Rayman, 2012). Selenium has good photovoltaic and photoconductive properties and is widely used in electronics such as photocells, light meters and solar cells. Additionally selenium is used in the glass industry, in photocopying in the toning of photographs and some cosmetics. The other use, taking about 15% is sodium

selenite for animal feeds and food supplements (URL-1). On the other hand, it plays an important role in human and animal nutrition. Its pronounced deficiency, as well as in the case of its higher concentrations, various diseases in humans and animals often occur (Adriano, 1986; Wachowicz et al., 2001; Fordyce, 2005). Selenium is an essential trace element for humans. The World Health Organization (WHO) recommends that the daily selenium uptake for adults should be 50-400 µg (Simpson, 2001). Selenium deficiency can lead a series of health problems, such as heavy metal poisoning, cardiovascular disease, low immunity, cancer. However, continuously taking over 2400 µg of Se everyday for several months may cause the chronic selenium poisoning (Xiaoa et al., 2021). White (2018) reported that although selenium is an essential micronutrient for humans and animals, its possibly indispensable role in plants has yet to be determined (Hawrylak-Nowak et al., 2019). Although it replaces sulfur in amino acids, it does not appear as essential for plant growth (Azza et al., 2010). It is thought that higher plants do not need selenium, but several studies show that low concentrations of selenium improve physiological and biochemical processes in plants (Saffaryazdi et al., 2012; Nawaz et al., 2016).

Usefulness of Selenium in Plant Growth and Nutrition

Selenium (Se) is a necessary trace element for humans and plants (Tapiero et al., 2003). Several researchers (Saffaryazdi et al., 2012; Nawaz et al., 2016) reported that low concentrations of Se improve physiological and biochemical processes in plants. Although some plants have the ability to accumulate selenium and convert it into bioactive compounds, selenium is probably not an essential element for plants (Terry et al., 2000; Minorsky, 2003; Kahakachchi et al., 2004; Germ and Stibilj, 2007). Selenates (VI) have been shown to alter the activity and permeability of cell membranes, which may be the first sign of selenium's effect on plants (Kinraide, 2003). Selenium may enhance plant tolerance against environmental adversities. Selenium treatment has been reported to improve resistance to certain abiotic stresses such as drought (Nawaz et al., 2015; Jiang et al., 2017; Sattar et al., 2019), salinity (Astaneh et al., 2018, Kamran et al., 2020), UV rays (Pennanen et al., 2002), and heavy metals (Kumar et al., 2012; Feng et al., 2021; Huang et al., 2021), high temperature (Djanaguiraman et al., 2018; Seliem et al., 2020), and biotic stress (Quiterio- Gutiérrez et al., 2019). Selenium treatments increased the activity of some antioxidant enzymes (Djanaguiraman et al., 2010; Hasanuzzaman et al., 2010; Valadabadi et al., 2010), and their beneficial effects were related to various physiological processes and regulation of water status, especially under drought (Tadina et al., 2007; Yao et al., 2009; Gülser et al., 2018). In general, growth enhancement in Se-treated plants may be

related to its function of regulating water relation, photosynthesis, antioxidant defense systems, uptake of mineral nutrients, and activation of plant growth-stimulating hormones (Saffaryazdi et al., 2012; Nawaz et al., 2016).

The Responses of Ornamental Plants to Selenium Treatments

Proietti et al. (2012) reported that selenium application can be useful to improve drought resistance in olive trees by protecting the cells from oxidative injuries and regulating water status. In another study, the highest value in N, P and K content and uptake of chamomile (*Matricaria chamomilla*) was obtained when 30 g of selenium was applied with organic residue. Therefore, these applications have been suggested to increase the growth, essential oil and chemical components of the Chamomile (*Matricaria chamomilla* L.) plant (Azza et al., 2010). It was reported that selenium supplementation under moderate salt stress can, at least partially, alleviate the adverse effect of salinity on *Plectranthus scutellarioides* (L.) R. Br. Thereby enhancing its ornamental value and resistance to stress conditions. In addition, it was determined that selenium did not have significant effect on the growth and ornamental qualities of this species under severe salt stress conditions (Hawrylak-Nowak et al., 2019). Lu et al. (2020) reported that low concentrations of Na₂SeO₃ had positive dose effects on antioxidant enzymes (SOD, POD, CAT, APX, GR, DHAR and MDHAR), RWC and the contents of soluble protein, soluble sugar and proline in the petals, which further reduced the production of MDA and H₂O₂ and improved the vase life of *Lilium longiflorum* cut flower. In the another study it was reported that Se increases vase life directly by downregulating ethylene synthesis and indirectly by reducing flower senescence-related events, such as respiration rate, sugar starvation, petal and flower wilting and abscission, and oxidative stress (Costa et al., 2020). Bayat and Aminifard (2020) reported that lower concentrations of selenium supplementation had beneficial effects on pot marigold (*Calendula officinalis* L.) plants under both control and water stress conditions. They also declared that selenium alleviates the negative effects of drought stress by improving water relations, increasing the integrity of cell membranes, accumulation of soluble sugars and antioxidant activity, and it can be recommended to prepare seeds with 1.5 mg l⁻¹ selenium in drought-affected regions. Kleiber et al. (2020) reported that the height and width of the plants exposed to the drought stress increased when 0.4mg dm⁻³ selenium was used in French marigold (*Tagetes patula* L.). Additionally the number of inflorescences was the minimal in the control sample exposed to the drought stress. In the other study (Bayat and Moradinezhad, 2020) 1-methylcyclopropene and selenium delayed

senescence and significantly increased the vase life, water uptake, and relative fresh weight of *N. tazetta* cut flowers in comparison to the control in *Narcissus tazetta* L.

Razmavar et al. (2021) reported that the 40 μ M selenium was a positive effect on plant quality by increasing flower weight, vitamin C, relative water content, total phenolic content, and total flavonoid content in Ivy Geranium (*Pelargonium peltatum* L.). Additionally they suggested to use 40 μ M selenium to alleviate adverse effects induced by postharvest time growth on productivity of *P. peltatum* L.

CONCLUSION

Higher plants do not need selenium, but several studies show that low concentrations of selenium improve physiological and biochemical processes in plants. If selenium-containing materials are used in plant production, their application in high doses may cause problems in terms of environmental pollution. Seleno amino acids such as selenocysteine, selenomethionine and derived selenium yeast are safe, but their very expensive price prevents them from being used as selenium fertilizers in large-scale applications. Sodium selenite is inexpensive and can give plants exactly selenium, but the chemical's high toxicity makes it unsafe for the environment. Therefore, it may be recommended not to apply at high concentrations when making selenium treatment.

Özet

Mahremiyet kavramı insan yaşamında son derece önemli bir yer tutmaktadır. Sosyal, ekonomik, politik ve hatta kültürel alanlarda kişiler kendi bilgileri dışında kişisel alanlarına girilmesini istemezler. Bununla beraber bu tutum dâhilinde kendileri hakkında bilgi sahibi olan bireylerin ve kurumların bu bilgileri başkasına verebilme ihtimali bile bireylerde huzursuzluğa yol açmaktadır. Devletlerin en önemli gelir kaynağı olan vergi kapsamında da mahremiyet son derece önemlidir. Mükelleflerin vergiye dair bilgilerine erişebilen kişilerin bu bilgileri muhafaza etmeleri ve başkaları ile paylaşmada kanunların çizdiği sınırlar kapsamında hareket etmeleri gerekmektedir. Aksi durumların yaşanması halinde mükelleflerin vergiye bakışlarında olumsuzluklar yaşanmaktadır. Vergi mahremiyetinin ihlal edildiğini duyan veya bu duruma şahit olan mükelleflerin vergi uyumları azalmaktadır. Bununla birlikte olumsuz durumlar, kamu kurumlarına güven problemi yaşamalarına neden olmaktadır. Vergi mahremiyetinin ihlali, 213 sayılı Vergi Usul Kanunu'nun 5. maddesi ve 362. maddesinde yer almaktadır. Mahremiyetin ihlali, ilgili kanunun 362. maddesinde suç olarak düzenlenmiştir. Buna karşın uygulanacak yaptırım hususunda Türk Ceza Kanunu'nun 239. maddesinden söz edilmiştir. TCK'nın 239. maddesine yapılan atıf, içerisinde barındırdığı belirsizlik sebebiyle bir takım karışıklıklara yol açmaktadır. Bu hususta yapılacak düzenlemelerin uygulamada ve algılamada kolaylıkları beraberinde getireceği düşünülmektedir. Tespit edilen bir diğer önemli sorun da vergi mahremiyetini sağlamakla yükümlü olan çalışanların işten ayrıldıkları veya emekli oldukları takdirde bilgi paylaşımı yaparak mahremiyet ihlali yapmalarının önüne geçilmesinin oldukça güç olduğudur. Bu hususta da yapılacak planlamalar ile birlikte görev bitiminde dahi kişilerin vergi mahremiyeti kapsamında hassas olmaları sağlanmalıdır.

Anahtar kelimeler: Vergi, vergi mahremiyeti, vergi suçu

VIOLATION OF TAX PRIVACY AND CONSEQUENCES

Abstract

The concept of privacy has an extremely important place in human life. In social, economic, political and even cultural areas, people do not want to be entered into their personal areas without their own knowledge. However, even the possibility that individuals and institutions that have information about themselves within this attitude may give this information to someone else causes uneasiness in individuals. Privacy is also extremely important within the scope of taxation, which is the most important source of income for states. Persons who have access to taxpayers' tax information must keep this information and act within the limits set by the laws in sharing it with others. In case of adverse situations, taxpayers experience negative attitudes towards tax. Tax compliance of taxpayers who hear or witness that tax privacy is violated decreases. However, negative situations cause them to experience trust problems in public institutions. Violation of tax privacy is included in Article 5 and Article 362 of the Tax Procedure Law No. 213. Violation of privacy is regulated as a crime in article 362 of the relevant law. On the other hand, article 239 of the Turkish Penal Code has been mentioned regarding the sanctions to be applied. The reference to Article 239 of the Turkish Penal Code causes some confusion due to the uncertainty it contains. It is thought that the regulations to be made in this regard will bring convenience in practice and perception. Another important problem identified is that it is very difficult to prevent the employees, who are responsible for ensuring tax privacy, from making a privacy violation by sharing information if they quit their job or retire. Along with the plans to be made in this regard, it should be ensured that people are sensitive within the scope of tax privacy even at the end of their duty.

Keywords: Tax, tax privacy, tax crime

GİRİŞ

Bireyler mahremiyeti hayatlarının her alanında önemserler. Mahremiyetlerinin korunması kişisel alanlarına saygı duyulması son derece önemlidir. Bununla birlikte ekonomik ilişkilerde de mahremiyetin korunması hem devletin hem de devletin kurumlarının önemli görevleri arasında yer almaktadır. Vergi mahremiyeti ile ilgili düzenlemeler Vergi Usul Kanunu'nun 5. maddesinde yer almaktadır. Bu madde kapsamında yapılan düzenlemelere uyulduğu takdirde mükellefler vergisel işlemlerini gönül rahatlığı ile yapabilmekte ve vergiye uyumları artmaktadır. Aksi durumda ise mükelleflerin vergiye bakışları olumsuz etkilenmektedir. Vergi mahremiyetinde üzerinde durulması gereken önemli bir nokta ise Türk Ceza Kanunu'nun 239. maddesine yapılan atıf ile ilişkisidir. Bu hususta bir takım eleştiriler yapılmaktadır. Özellikle mali hukukçular yeni bir düzenlemeye ihtiyaç duyulduğunu ifade etmektedirler.

Mahremiyet kavramı ve Vergi mahremiyeti

Mahremiyet kavramı; genel itibariyle bireylerin yalnız başlarına kalabildikleri, istedikleri ölçüde düşünüp o doğrultuda hareket edebildikleri, başkaları ile kuracakları ilişkisinin ölçüsünü ayarlayabildikleri hakka denmektedir. Mahremiyet hakkı ise; başka bireylerin dışlandığı ve başkaları ile olan etkileşimin tamamıyla kesilmesi anlamına gelmemektedir. Mahremiyet hakkında önemli olan durum kişinin kendi hayatını başkaları ile hangi ölçüde paylaşacağını belirlemesi hakkı olarak ifade edilmektedir (Yüksel, 2003). Mahremiyet hakkının da içerisinde bulunduğu bir takım hakların, insan haklarına ve özgürlüklerine yönelik müdahalelerin hukuka olan uygunluğu ile kamu düzeni kapsamında değerlendirilmesi tartışılmaktadır. Burada üzerinde durulan nokta mahremiyet hakkına yapılan saldırıların insanın hem maddi hem de manevi bakımdan gelişimine yönelik olumsuz durumlardır (Yüksel, 2009). Mahremiyet hakkı bireylerin hayatlarının pek çok alanında önemsedikleri ve devletinde bu konuda üzerinde hassaslaştığı önemli bir noktadır. Vergi temelli düşüldüğünde de özellikle mükellefler için oldukça önemli bir tutumdur.

Vergiler ifade edilirken; kaynağı milli gelir olup, devletlerin kamu harcamalarını karşılamak amacıyla kişilerden egemenlik gücü kapsamında ve ödeme gücü ilkesi çerçevesinde tek taraflı, zorunlu ve nihai olarak alınan paralar tanımı kullanılmaktadır. Toplam kamu gelirlerinin yaklaşık %70-95'i piyasa ekonomilerinde vergi gelirlerinden oluşmaktadır (Eker, 1999). Mükelleflerin özel hayatlarının gizliliğinin korunması anayasa tarafından güvence altına alınmıştır. Vergilendirme işlemi için de bu hakkın kullanılabilmesi vergi hukukunda vergi mahremiyeti ilkesi kapsamında yer almaktadır. Vergi mükelleflerinin ve mükelleflerle ilgili

kişilerin gizli bilgilerinin bu bilgileri öğrenen kişiler tarafından saklanması gerekmektedir. Aksi bir durum yaşanması halinde yanlış davranışta bulunan kişilerin hürriyetlerini bağlayıcı cezalar alacağı kararlaştırılmıştır (Ünsal, 2003).

Vergi mükelleflerinin, anayasal haklar ve vergi hukuku sayesinde sahip oldukları güven duygusu davranışlarını şekillendirmektedir. Bu doğrultuda bilgilerinin gizli kalacağını düşünerek vergi idaresine bilgilerini gönül rahatlığı ile vermekte olup hem vergi idaresindeki işleyişin doğru ve sağlıklı olması hem de kendilerini güven içerisinde hissetmeleri açısından bu husus son derece önemlidir.

Vergi mahremiyeti ve yasalar

Vergi mahremiyeti mükellefler açısından son derece önemlidir. Hem Vergi Usul Kanunu hem de AATUHK’da bir takım düzenlemeler mevcuttur. 213 sayılı VUK’un 5. Maddesinde 6183 sayılı AATUHK’un 107. Maddesinde vergi mahremiyetine yer verilmiştir. Bununla birlikte 2010 senesinde anayasaya dahil olan kişisel verilerin korunması hakkı ve 6669 sayılı Kanun ve 108 sayılı Avrupa Konseyi Sözleşmesi vergi hukuku özelinde vergi mahremiyetine yoğunlaşılmasına sebep olmuştur (Durdu, 2019). 213 sayılı Vergi Usul Kanunu’nun 5. Maddesinde vergi mahremiyetine yer verilmiştir. Vergide gizliliğe uymama görevden doğan suçlar kapsamında yer almaktadır. Vergi temelli sırların ifşa edilmesi bir suç teşkil etmektedir.

İlgili kanunun 5. Maddesinde “*Vergi muameleleri ve incelemeleri ile uğraşan memurlar, vergi mahkemeleri, bölge idare mahkemeleri ve Danıştayda görevli olanlar, vergi kanunlarına göre kurulan komisyonlara iştirak edenler, vergi işlerinde kullanılan bilirkişiler*” görevlerinden ayrılışları bilgileri ifşa edemez, kendileri veya başka kişilerin menfaatine bu bilgileri kullanmazlar ifadeleri yer almaktadır (213 sayılı VUK).

Vergi muameleleri ve vergi incelemeleri ile uğraşan memurlar kapsamında verginin tarh, tahakkuk, ve tahsil işlemlerini yapan memurlar, bu işlemleri onaylayan şefler, müdür yardımcıları ve müdürler ile yazı işleri memurları yer almaktadır. Vergi incelemesinde yetkili olan kişilerin içerisinde ise vergi müfettişleri, müfettiş yardımcıları ve vergi idaresi bünyesindeki kurum amirleri yer almaktadır. Vergi yargı mercilerindeki görevlilerin kapsamına ise hakimler, danıştay üyeleri, tetkik hakimleri ve savcılar dahil olmaktadır. Kanunda görevli ifadesinin yer almasından kaynaklı olarak katipler, idare memurları ve raportörlerde bu kapsama dahil olmaktadır (213 sayılı VUK; Bayraklı, 2018).

Vergi mahremiyeti kapsamındaki istisnalar ve cezalar

Vergi konusunda mükelleflerin bilgilerinin saklanması ve ifşa edilmemesi çok önemli olup buradan tüm bilgilerin paylaşılmaması sonucu çıkarılmamalıdır. Vergi mahremiyeti kapsamında bir takım istisnalar yer almaktadır. Bunlar arasında gelir vergisi yükümlülerinin yıllık gelir vergileri, sermaye şirketlerinin kurumlar vergisi matrahları ile beyanları üzerinden tarh olunan gelir ve kurumlar vergileri ile vergi yükümlülerinin isimleri ile unvanları ilgili vergi daireleri tarafından uygun görülen yerlere asılacak cetveller ile ilan edilmektedir. Gelir vergisi yükümlüleri vergi tarhına esas olan kazanç tutarları ile vergi miktarlarını gösterildiği levhaları merkezlerine, şubelerine kolayca okunacak şekilde asmaları gerekmektedir. Yine istisnalar kapsamına giren diğer bir durum kesinleşen vergi ve cezaların Hazine ve Maliye Bakanlığı tarafından ilan edilmesi durumudur. Yine sahte ve yanıltıcı belge düzenleyenlerin vergi inceleme raporları bağlı oldukları mesleki kuruluşlara bildirilmektedir. Bu durum da vergi mahremiyetinin ihlali kapsamında değerlendirilmemektedir (213 sayılı VUK).

Vergi mahremiyetinin ilan edilmesi durumunda kişiler TCK'nın 239. Maddesine göre cezalandırılırlar. "Ticari sır, bankacılık sırrı veya müşteri sırrı niteliğindeki bilgi veya belgeleri açıklanması" başlığının altında yer alan maddede hapis cezası 1-3 yıl arası olarak belirlenmiş olmakla beraber beş bin güne kadarda adli para cezası uygulanacağı kanunda yer almaktadır (5237 sayılı Türk Ceza Kanunu).

Vergi mahremiyetinin ihlalinin cezalandırılmasının kanuni karşılığı bir takım tartışmaları da beraberinde getirmektedir. Arslan (2013), vergi mahremiyetinin ihlalinin ilk olarak Türk Ceza Kanunu'nun 134, 137, 239 ve 258. Maddelerinde yer alan suçlar kapsamında değerlendirildiği görünse bile ifşa unsuru ile beraber gizliliğini Vergi Usul Kanunu'ndan kaynaklanması gerektiğini ifade etmiştir. VUK madde 362'nin özel bir norm olduğunu vergi mahremiyetinin ihlal edilmesi suçunun TCK'nın 239. Maddesinde muhafaza edilmesinin gereksiz olduğunu savunmaktadır. Duman (2016), vergi mahremiyeti ihlalinin VUK'un 5. Maddesi ve 362. Maddesinde düzenlendiğini karşılığında uygulanacak yaptırımın TCK'nın 239. Maddesinde atıfta bulunulduğunu ifade etmiştir. Burada atıf usulünün problemlili olduğu ifade edilmiştir. Türk Ceza Kanunu'nda yer alan suç ile ilişkili hangi hükümlere atıf yapıldığı konusunda aksaklıklar yaşandığı belirtilmiştir. Yapılan atfın ilgili madde hükümlerinin hepsine mi yoksa belirli bir kısmına mı yapıldığı tartışmaları beraberinde getirmekte olduğu aktarılmıştır. Küçükaya (2022) ise Duman (2016) ile benzer şekilde fikir beyan etmiştir. Atfın maddenin tamamına mı yoksa ceza miktarına mı ilişkin olduğuna dair bir sorunun olduğunu belirtmiştir.

Bununla birlikte atıf yerine ilgili maddede açıkça cezanın belirtilmesi gerektiğinin önemine vurgu yapılmıştır.

Vergi mahremiyetiyle ilgili karşılaşılan bir başka sorun ise, mahremiyete uymak zorunda olanların görevlerinden ayrıldıktan sonra mahremiyete uyup uymadıklarına dair takibin zor olmasından kaynaklıdır. Çalışanların bir kısmı emekli olmakta bir kısmı da özel sektörde çalışmaya devam etmektedirler. Özellikle özel sektörde çalışanların ticari yaşam içerisinde mükellefler ile bir araya geldikleri bilinmektedir. Böyle bir durumda vergi mahremiyetinin ihlal edilip edilmediğinin takibinin yapılması oldukça güçtür (Ünsal, 2003).

SONUÇ

Vergi mahremiyetinin sağlanması devletin önemli bir görevidir. Bunun sağlanması için Vergi Usul Kanunu'nda hangi görevleri ifa edenlerin bundan sorumlu oldukları ifade edilmiştir. Önemli bir sorun; kamu görevinden çeşitli sebeplerle ayrılanların özellikle özel sektörde çalıştıkları zaman bilgileri ifşa etmeleri konusunda tereddütlerin olması ve buna çözüm bulunamaması durumudur. Burada kamuya düşen görev ayrılan personellerin takibini yapmak, vergi mahremiyetine aykırı bir davranışta bulunulması üzerine sürecin takipçisi olmaktır. Kişilerin çalıştıkları dönemde hangi bilgilere ulaştıkları kayıt altına alınarak yaşanacak olumsuz bir durumun önüne geçilebilir. Diğer önemli bir husus ise çalışmada belirtilen Türk Ceza Kanunu'na yapılan atıf ile ilgilidir. Bu hususta da atıf konusunda yapılan eksikliğin özellikle 239. maddenin tümüne mi yoksa ceza miktarına mı ilişkin olduğu konusu berraklaştırılmalıdır.

ÖZET

Bu çalışma pamukta makineli hasatta oldukça önemli olan yaprak döktürücü (Defoliant) kullanımını için en uygun zamanın belirlenmesi amacı ile yürütülmüştür. Çalışma 2021 yılında Diyarbakır ili Bismil ilçesinde tesadüf blokları deneme desenine göre 4 tekrarlamalı olarak yürütülmüştür. Çalışmada bazı bitki izleme tekniği gözlemleri beyaz çiçek üstü boğum sayısı (NAWF), çatlamış koza üstü boğum sayısı (NACB) kullanılarak yaprak döktürücü uygulamasının etkisi de incelenmiştir. Çalışmada NAWF, NACB dışında yaprak döktürücü uygulanmayan kontrol parseli ile açılmış koza yüzdesi (kozaların %70’inin açılmış olduğu dönem), keskin bıçak tekniği kullanılarak yaprak döktürücü uygulanmıştır. Çalışma sonucunda farklı dönemlerde yaprak döktürücü uygulamaları yönünden incelenen özelliklerden lif verimi ve açmamış koza sayısı sonuçlarında istatistiksel olarak önemli farklılıklar elde edilmiştir. İncelenen diğer özellikler ve lif kalite özelliklerinde ise uygulamalar arasında istatistiksel olarak bir farklılık elde edilmemiştir.

Anahtar Kelimeler: NACB, NAWF, kalite, pamuk, verim, yaprak döktürücü,

DETERMINATION THE EFFECTIVENESS OF DEFOLIATION ON COTTON
(*Gossypium hirsutum* L.) AT DIFFERENT DEVELOPMENT PERIODS

ABSTRACT

This study was carried out with the aim of determining the most appropriate time for the use of defoliant, which is very important in machine harvesting in cotton. The study was carried out in Bismil district of Diyarbakır province in 2021 according to the randomized blocks design with 4 replications. In the study, the effect of defoliant application was also investigated by using some plant monitoring technique observations nodes above white flower (NAWF), Nodes above cracked boll (NACB). In the study, in addition to NAWF and NACB, also the percentage of bolls opened (the period when 70% of the bolls were opened) and sharp knife techniques were taken into account for defoliant application time. Any defoliant not applied to the control treatment. As a result of the study, statistically significant differences were obtained in the results of the fiber yield and the number of not opened bolls, which were examined in terms of defoliant applications in different periods. There was no statistically significant difference between the applications in terms of other examined properties and fiber quality properties.

Keywords: Cotton, defoliation, NACB, NAWF, quality, yield

GİRİŞ

Nüfus artışı, teknolojik gelişmeler ve yaşam seviyesinin yükselişi tarımsal üretimi ön plana çıkarmıştır. Alternatif değerlendirme alanlarına sahip olan pamuk bitkisi, başta tekstil endüstrisi olmak üzere birçok endüstri koluna hammadde sağladığı için dünya tarımında önemi her geçen gün artmaktadır. Güneydoğu Anadolu Bölgesi ülkemizde pamuk üretimi için en önemli bölgedir. Bölge içerisinde yer alan Diyarbakır ili pamuk üretimi bakımından önemli bir yere sahiptir. Güneydoğu Anadolu Projesi (GAP) kapsamına giren diğer illerde olduğu gibi Diyarbakır'da da üretim alanlarında su alanlarının genişlemesi ile pamuk toplama işçisi sayısında ciddi oranda azalmalar ortaya çıkmış, bunun sonucunda makineli hasat giderek önem kazanmıştır (Tuncer ve Işık,1999).

Son yıllarda pamuk tarımında yetiştiricilerin tercih edebilecekleri pamuk türleri oldukça fazladır. Çeşit seçimi, öncelikle verim ve lif kalitesi özelliklerine dayanmasına rağmen, dikkate alınması gereken diğer önemli faktörler; tohum boyutu, yaprak rengi, bitki boyu, fırtına direnci, çırcır verimi ve erkenciliğidir. Farklı olgunluk derecelerine sahip pamuk çeşitleri de büyüme özelliklerinde farklılık gösterir. Erken çeşitler daha uygun koza tutuşu ile daha düşük bitkiler oluşturma eğilimindeyken, geç çeşitler daha uzundur ve tohumlar üst boğumlarda, yani sezonun sonlarında tutulur. Geççi çeşitler genellikle erkenci çeşitlere kıyasla daha uzun bir büyüme periyodu gösterir. Bu nedenle ürünün olgunlaşması için daha fazla sıcaklık birimine, gündereceye gereksinim duyarlar. Ayrıca, bazı gruplar daha düzenli, daha hızlı koza gelişimi ve daha hızlı koza açılmasına sahip olduğundan, optimum yaprak dökümü zamanı ve hasat süresi erken gruplar arasında farklılık gösterir.

Pamuk hasat zamanı bölgelere, sonbahar yağışlarının başlamasına, pamuktan sonra ekilen ürünün cinsine, çeşitlere, uygulanan kültürel işlemlere, ekim zamanına ve toplama yöntemine göre farklılık göstermektedir. Çukurova bölgesinde 10 - 15 Ağustos arası, Eylül ayının ilk haftasından itibaren ; Harran Ovası'nda pamuk hasadı 10-15 Eylül'de başlamaktadır. Hasat, pamuk üretiminin maliyetinde her zaman en büyük paya sahip olmuştur. Önceki yıllarda toplam pamuk gelirlerinin %15-20'sini oluşturan el ile hasat maliyetleri, son yıllarda %25-30'a çıkararak önemini daha da artırmıştır. Bunun yanında maliyetleri en aza indirmenin yolu da makineli hasat olmuştur.

Ayrıca toplayıcıların temini ve istihdamında yaşanan sosyal zorluklar, zamanında ve kısa vadede yapılamayan hasadın neden olduğu kalite ve verim kaybı, makineli hasadı önemli kılan diğer faktörlerdir (Evcim, 1999). Ancak, makineli hasat denemelerinden olumlu sonuç

alabilmek için makineli hasat sorularına uygun bazı ürünlerin doğru zamanda ve yerde uygulanması gerekir.

Makineli hasatta lif kalitesini düşüren en önemli faktör kurumuş yaprak parçaları olup, toplamanın temiz olması ve hasat veriminin artırılması için pamuk yapraklarının açık kozalarda lifleri kirletmeden yani başka bir deyişle yapraklar hasattan önce bitkiden uzaklaştırılması gerekmektedir. Uzun vejetasyon süresi nedeniyle pamuk, genellikle sonbaharın ilk yağmurlarında olumsuz hava koşullarından zarar görür. Bu durum pamuğun üretimini ve kalitesini etkilemektedir.

Kozanın daha hızlı açılmasına ve hasat başlamadan yaprakların dökülmesini sağlamak; elle hasat edilen alanlarda pamuk hasadına yardımcı olmak, geç kozaların açılmasını teşvik etmek ve yağmur mevsimi gelmeden yaprakların erken açılmasını teşvik etmek için kimyasallara ihtiyaç duyulmaktadır. Pamuğun hasada hazırlanmasının son işlemi yaprak dökümüdür ve böylece tüm yapraklar pamuğun üzerine dökülür ve bitkinin gücü yeşil kısımdan kozayı açmaya yönlendirilir. Yaprak dökücü kimyasallar (defoliantlar) bitkilerde etilen sentezini artırır ve yaprak sapının dal veya ana gövdeye yapıştığı yerde ekstra bir doku geliştirir ve burada ayrı bir tabaka oluşumunu teşvik ederek yaprakların kırılmasına neden olmaktadır (Morgan ve ark., 1977; Oğlakçı ve Kaynak, 1992).

Kimyasal yaprak dökücüler, pamuk yapraklarının normalleşmeden önce dökülmesini teşvik eden kültürel bir uygulamadır (Cathey, 1986). Yaprak dökürme işlemi genellikle ethephon gibi koza açıcıların yanı sıra hormon veya bitkisel yaprak dökürücüler kullanılarak yapılmaktadır. Yaprak dökme, yüksek verimli ve kaliteli pamuk üretiminde standart bir uygulamadır. 40 yılı aşkın süredir hasat yardımcıları uygulanmış olmasına rağmen, istenen yaprak dökümünü elde etmek hala bir sorundur.

Bir yetiştiricinin vermesi gereken en önemli kararlardan biri, hasada yardımcı kimyasalların seçimi ve kullanımının zamanlamasıdır. Bitkiler, fizyolojik olgunluğa erişmeli ve uygulama için vejetatif olarak dormant olmalıdır. Erken yaprak dökümü olgunlaşmamış kozalarda verim kaybına ve lif kalitesinde düşüğe sebebiyet verebilmektedir. Geç uygulama erken hasada ve dolayısıyla beklenen lif kayıplarına yol açmaktadır. Erken yaprak dökümü mikroneri azaltacağından ve verimi düşüreceğinden, yaprak dökümü kararları zamanında hasat ile geç sezonda artan verim arasında bir denge gözetilerek verilmelidir. Yetiştiriciler bazen yaprak dökümü uygulamaya karar vermeden önce bitkiler olgunlaşana kadar bitkinin üst kısmında beklerler. Ancak, bu kozaların verime katkısı çok düşüktür (Robertson ve ark., 2003).

Gecikmeli yaprak dökürme uygulamaları, olumsuz hava şartlarından ötürü üretkenliği ve kaliteyi düşürebilir (Faircloth ve ark., 2004).

Hasat makine ile yapılacak işe, hasat başlamadan önce kozanın açılmasını ve yaprakların dökülmesini hızlandırmak için; hasadın elle yapıldığı alanlarda, pamuğu hasada hazırlamak, kozaların açılmasını ve yaprakların dökülmesini teşvik etmek için ve pamuğun yağmura kalmadan erken hasadı teşvik etmek için kimyasallara ihtiyaç vardır. Kimyasal yaprak dökümü ile ilgili temel sorun, bitkiye ne zaman uygulanacağını belirlemektir. Pamuk bitkisinin yapraklarının dökülmesi sadece hasada yardımcı olmakla kalmaz, aynı zamanda lifin lekesiz olarak toplanmasını sağlar, hastalık ve zararlıları önlemektedir. Bu nedenle, koza açma hızını artırmak, hasat kapasitesini artırmak, kütlü pamuğun nem içeriğini azaltmak, lif bulaşmasını ve zararlı böcek sayısını azaltmak için hasattan önce yaprak dökücülerin kullanılması gerekmektedir. Yaprak dökürme; bitkilerin alt bölgesindeki yaprakların dökülmesi, yalnızca yaşlı yaprakların dökülmesi ve tüm yaprakların dökülmesi şeklinde yapılmaktadır (Oğlakçı, 1992).

Son yıllarda Türkiye'de makineli hasat oranı önemli ölçüde artmıştır. Sağlıklı bir makineli hasat için yaprak dökücü uygulamasının vazgeçilmez koşullardan biri olduğu bilinmektedir. Yaprak dökücünün yanlış kullanımı pamuğun hem üretimine hem de kalitesine önemli ölçüde zarar verebilir. Bu nedenle, yaprak dökücü uygulamasının planlanması oldukça önem taşımaktadır. Defoliasyon (yaprak dökümü) fizyolojik olarak olgunluğa eriştiklerinde yaprakların bitki üzerinden doğal olarak yere düşmesidir. Yaprığın düşen (kopması) yaprak sapı, gövdenin birleştiği alanda bazı hücre bölünmelerini içeren faaliyetlerle sonuçlanması ile oluşan alana kopma alanı bölgesi denir. Hafif don, böcek zararı, hastalık, kuraklık veya bitki besin maddelerinin eksikliği nedeniyle yaprak dökümü meydana gelebilir. Bununla birlikte, hasat yaprak dökücü veya yardımcı kimyasallar yoluyla yapay olarak da sağlanabilir.

Defoliasyonun Faydaları;

- Yaprakları uzaklaştırması,
- Leke ve çepel kaynaklarını elemine etmek,
- Daha kaliteli lif elde etmek,
- Koza çürümelerini önlemek,
- Daha etkili ve daha hızlı bir toplama sağlamak,
- Olgunluğu yöneterek daha erken bir hasat sağlamak,
- Bitki kanopisinde havalanmayı artırarak daha hızlı bir kuruma sağlamak ve dolayısıyla daha erken bir saatte hasada olanak tanımak,

- Nemi azaltmak,
- Çenetlerin içerisindeki birikimi artırmak.

Erken yaprak dökümü, olgunlaşmamış kozalarda üretimde kayıplara ve lif kalitesinde düşüşe neden olabildiği gibi geç uygulama ise, erken hasat ve dolayısıyla beklenen lif kaybı ile sonuçlanmaktadır. Erken yaprak dökümü lif inceliğini ve lif üretimini olumsuz etkilediğinden, yapraksızlaştırma kararları, zamanında hasat ve geç sezon verim artışı arasında bir denge olarak görülmektedir. Yetiştiriciler bazen yaprak dökmeye karar vermeden önce bitkinin tepesindeki yaprakların olgunlaşmasını beklediklerinden, bu kozalar ürüne çok az katkıda bulunmaktadır (Robertson ve ark., 2003).

Pamukta yaprak dökümü genellikle tarladaki bitkilerin çoğu %50-60 oranında açıkken başlamaktadır. Ancak ürün geliştirmedeki değişkenlik bu tavsiyeyi farklı kılabilir. Pamuk bitkisinin sınırsız büyüme özelliğinden dolayı kozanın hasada yakın olgunlaşması farklı dönemlerde gerçekleşebilir (Stewart ve ark., 2000). Koza tutumunun çoğunun kısa sürede meydana geldiği alanlarda yaprak dökümü daha erken başlayabilir (%40-50 koza açılmasında), koza oluşumunun daha uzun bir süre boyunca gerçekleştiği alanlarda yaprak dökümü daha sonra (%70-80 koza açılması) başlar. Çiçeklenme süresi kısa ve bitki kompakt ise, tohumların açılmasının %60'ından önce yaprak dökümü başlatılmalıdır. Aksine, çiçeklenme süresinin daha uzun olduğu durumlarda, %60'ın üzerinde bir koza açıklığı ile yaprak dökümü daha etkili olabilir.

Koza açılması çevresel koşullara, çeşidin olgunlaşma grubuna, bitki büyüme düzenleyicilerinin kullanımına ve uygulama zamanına göre değişiklik göstermektedir. Zamanında yaprak dökümü ve koza açma ürünleri uygulamak kozaların açılmasını hızlandırır ve daha erken hasat yapılmasını sağlar (Supak, 1996). Geç hasat, liflerin kalite özelliklerini etkiler ve kalite seviyesini düşürür. Bu nedenle tüm kozalar açtıktan sonra pamuk hemen hasat edilmelidir. Ancak, açıcı veya yaprak dökücü kullanılsa dahi, bitki olgunluğuna ve hava koşullarına bağlı olarak kozaların açma oranları tarla ve çeşitler arasında farklılık gösterebilir. Faircloth (2002), yoğun verim kaybının 0,5 cm'nin üzerindeki yağışlarla ilişkili olduğunu belirtmektedir.

Bu çalışma, bitki izleme parametrelerinden [Beyaz Çiçek Üstü Boğum Sayısı (NAWF 5), Çatlamış Koza Üzeri Boğum Sayısı (NACB 4)] ile keskin bıçak tekniği, %70 koza açma döneminde uygulanan yaprak dökütürücünün yaprak dökütürücü uygulanmayan parsellerle karşılaştırılması ve en uygun yaprak dökütürücü zamanın tespit edilmesi amacıyla yürütülmüştür.

MATERYAL VE METOT

Deneme Diyarbakır ili Bismil ilçesine bağlı Köseli köyündeki üreticiye ait arazide 3 tekerrürlü olarak 2021 yılında yürütülmüştür. Araştırmada materyal olarak Progen Tohum A.Ş.'nin BA 1010 pamuk çeşidi materyal olarak kullanılmıştır. Çalışma alanında ekim yapılmadan önce toprak örneği alınarak toprak özellikleri belirlenmiştir. Deneme alanına ilişkin analiz sonuçları Tablo 1'de verilmiştir.

Tablo 1. Çalışma alanı toprak özellikleri

Toprak Özelliği	Değeri
Kil, %	44,51
Kum, %	47,79
Silt, %	8,59
pH	7,89
Elektriksel iletkenlik, mS/cm	453,00
Kireç, %	0,51
Organik madde, %	1,12
Alınan fosfor, P ₂ O ₅ kg/da	2,25
Alınan potasyum, K ₂ O kg/da	86,05

Tablo 1. incelendiğinde, alınan topraklarda yapılan analiz sonucunda; deneme alanı toprak örneklerinin kumlu-killi bünyeye sahip, nötr, tuzsuz, az kireçli, organik madde ve alınabilir fosfor bakımından düşük, potasyum bakımından ise yeterli olduğu belirlenmiştir.

Uzun yıllara ait iklim verilerine göre; il ortalama sıcaklığı 16,1°C, maksimum ortalama sıcaklık 21,8°C, minimum ortalama sıcaklık 11,1°C, ortalama yağış 692,0 mm, maksimum hava sıcaklığı 46,0°C, minimum hava sıcaklığı ise -15,6 °C olarak gerçekleşmiştir (Anonim, 2021b). Çalışmanın yapıldığı bölgede 2021 yılına ve uzun yıllara ait iklim verileri Tablo 2'de verilmiştir. 2021 yılı iklim verileri uzun yıllarla kıyaslandığında ortalama sıcaklığın, minimum ve maksimum sıcaklık değerlerinin uzun yıllar ortalamasının üzerinde seyrettiği izlenebilmektedir. Toplam yağış miktarı incelendiğinde ise denemenin yürütüldüğü Mayıs ve Ekim aylarındaki yağış miktarının uzun yılların üzerinde seyrettiği görülmektedir.

Tablo 2. Denemenin yürütüldüğü 2021 yılı ile uzun yıllara ait iklim verileri

<u>Aylar</u>	<u>Yıllar</u>	<u>Ortalama Sıcaklık (°C)</u>	<u>Ortalama Maksimum Sıcaklık (°C)</u>	<u>Ortalama Minimum Sıcaklık (°C)</u>	<u>Nispi Nem (%)</u>	<u>Toplam Yağış (mm)</u>
Nisan	2021	16,80	22,70	11,30	47,60	60,80
	Uzun Yıllar	13,80	19,30	9,10	50,40	104,30
Mayıs	2021	19,80	25,70	14,90	59,10	146,80
	Uzun Yıllar	19,30	25,20	13,50	41,50	62,0

	Uzun Yıllar	17,90	24,50	12,70	45,30	50,90
Kasım	2021	16,60	24,30	10,0	42,90	96,00
	Uzun Yıllar	10,20	15,40	6,30	57,10	55,60

Çalışmanın yapıldığı arazi sonbahar mevsiminde derin şekilde pulluk, ilkbahar mevsimlerinde ise yüzeysel olarak kùltivatör ile işlenmiş ve ekimden önce deneme alanı 3 kez tapan çekilerek ekime hazır hale getirilmiştir. Ekim işlemi mibzerle gerçekleştirilmiştir. Denemede ekim işlemleri 22 Nisan 2021 tarihinde deneme mibzeri ile yapılmıştır, ekimde her parsel 6 m uzunluğunda 4 sıradan oluşturulmuştur Sıra arası mesafe ekim esnasında 70 cm sabit tutulmuş, sıra üzeri mesafe ise 10-15 cm olacak şekilde seyreltme yapılarak oluşturulmuştur. Deneme alanından toprak örnekleri alınarak toprak analizleri yapılmış ve bitkinin ihtiyaç duyduğu gübre miktarı zamanında verilmiştir. Ekim esnasında ihtiyaç duyulan azotun yarısı ile fosforun tamamı uygulanmış, geriye kalan azotun ikinci yarısı ise ilk sulama öncesinde uygulanmıştır. Taban gübresi olarak ekimle birlikte 20-20-0 kompoze gübre kullanılmıştır. İlk sulama öncesinde ise üst gübre olarak üre gübresi kullanılmıştır. Deneme salma sulama sistemi ile sulanmıştır. Sulamaya çiçeklenme öncesi dönemde başlanmış ve %10 koza açma döneminde son verilmiştir.

Çalışmada defoliant (yaprak dökürücü) uygulanmayan parsel kontrol olmak üzere toplam 5 farklı uygulama yapılmıştır.

Uygulamalar

1. Kontrol: Kontrol parsellerine defoliant uygulanmamıştır.

2. Beyaz Çiçek Üzeri Boğum Sayısı [Nodes Above White Flower (NAWF 5)]: Pamukta 1.pozisyondaki beyaz çiçek üzeri boğum sayısı olgunlaşmanın bir ölçütü olarak kullanılmakta

ve gün derece ünitesi de göz önünde bulundurularak defoliant uygulamalarında kullanılmaktadır. Her parselden 10 bitkide 1. pozisyon beyaz çiçek üzeri boğumlar sayılarak ortalaması 5'e yakın olduğunda defoliant uygulanmıştır.

3. Açılmış Koza Yüzdesi (Percent Open Boll): Kozaların %70'i açıldığında defoliant uygulanmıştır.

4. Çatlamış Koza Üzeri Boğum Sayısı [Nodes Above Cracked Boll (NACB)]: Her parselden 10 bitkide 1.pozisyon çatlamış koza üzeri boğumlar ile en üstten hasat edilebilir koza arasındaki boğumlar sayılarak ortalaması 4'e yakın olduğunda defoliant uygulanmıştır.

5. Keskin Bıçak Tekniği (Sharp Knife Technique): Uygulama öncesinde en üstteki hedef koza belirlenmiştir. Bu kozalar keskin bir bıçak kullanılarak dikey olarak karpeller halinde kesilmiştir. Olgunlaşmamış tohum kabukları kesilirken oldukça kolay kesilirken, hasat olgunluğuna ulaşmış kozaların kesilmesi, tohum kabuğunun sertleşmesi nedeniyle zorlaşmıştır. Hedef kozaların bu yapıya ulaştığı belirlenince defoliant uygulanmıştır.

İncelenen özellikler

Bitkisel özellikler: Çalışmada incelenen bitkisel özellikler her parselden şansa bağlı olarak seçilen 10'ar bitkide sayımlar yapıldıktan sonra ortalamaları alınarak hesaplanmıştır. Kütlü pamuk verimi ile lif verimi her parselden elde edilen ürün tartılarak parsel veriminin kg/da' a oranlanması ile elde edilmiştir.

Lif teknolojik parametreler: Hasat sonrasında belirlenmiş olup, 50 kozadan elde edilen ürün lif analizlerinde kullanılmıştır. Analizler GAP Uluslararası Tarımsal Araştırma ve Eğitim Merkezi Müdürlüğü lif kalite laboratuvarında HVI aleti yardımı ile yapılmıştır.

- Lif İnceliği (micronaire)
- Lif Uzunluğu (mm)
- Lif Kopma Dayanıklılığı (g/tex)
- Lif Kopma Uzaması (%)
- Lif Üniformite Oranı (%)
- Kısa Lif Oranı (%)

Hasat İşlemleri: Hasat elle yapılmıştır. Hasatta parsellerin orta kısmında yer alan iki sıra hasat edilmiştir.

İstatistik Analizler: Araştırmadan elde edilen sonuçlar JUMP istatistik paket program yardımı ile değerlendirilip, ortalamaların karşılaştırılmasında ise LSD_(0.05) testi kullanılmıştır.

BULGULAR VE TARTIŞMA

Kütlü pamuk verimi (kg/da): Kütlü pamuk verimine ait uygulamalara ilişkin ortalama değerler ve $LSD_{(0.05)}$ testine göre oluşan gruplamalar, Tablo 3'te belirtilmiştir. Tablo'dan uygulamalara bağlı olarak kütlü verimine ait ortalama değerlerin, 366,40 ile 483,20 kg/da arasında farklılık gösterdiği; denemenin genel ortalamasının 430,40 kg/da olduğu, en yüksek kütlü veriminin kontrol uygulamasından elde edildiği görülmektedir. Denemeden elde edilen sonuçlar Karademir ve ark. (2007) 'in çalışmalarıyla paralellik arz ederken, Çiçek ve ark. (2003) ve Tülemen (2016)'in sonuçları ile örtüşmemektedir. Bu durumun farklı genotiplerin kullanılmasından kaynaklandığı düşünülmektedir.

Tablo 3. İncelenen bitkisel özelliklere ilişkin ortalama değerler ve oluşan gruplamalar

Uygulamalar	Kütlü Pamuk Verimi (Kg da ⁻¹)	Lif Verimi (Kg da ⁻¹)	Çırcır Randımanı (%)	Açmış Koza Sayısı (adet bitki ⁻¹)	Açmamış Koza Sayısı (adet bitki ⁻¹)	Koza Ağırlığı (g)	Koza Kütlü Ağırlığı (g)
1. Kontrol	483,20	217,99 a	45,14	15,60	1,60 a	7,73	6,20
2. NAWF 5	444,80	198,38 ab	44,70	14,13	0,35 c	7,13	5,87
3. %70 KOZA AÇMA	434,40	196,78 ab	45,38	13,73	0,97 b	7,13	5,73
4. NACB 4	423,20	189,57 bc	44,87	12,53	1,40 a	6,87	5,60
5. KESKİN BIÇAK	366,40	164,00 c	44,79	12,07	0,80 b	7,27	5,87
Ortalama	430,40	193,34	44,98	13,61	1,02	7,23	5,85
CV (%)	8,89	7,53	2,03	11,19	11,21	8,35	7,78
LSD_(0.05)	Ö.D	27,42	Ö.D.	Ö.D.	0,22 **	Ö.D.	Ö.D.

Lif verimi (kg /da): Lif verimine ait uygulamalara ilişkin ortalama değerler ve $LSD_{(0.05)}$ testine göre oluşan gruplamalar, Tablo 3'te belirtilmiştir. Tablo'dan lif verimi açısından uygulamalar arasında %5 önem düzeyinde istatistiksel değişikliklerin olduğu görülebilmektedir.

Tablo 3'ten, uygulamalara bağlı olarak lif verimine ait ortalama değerlerin, 217,99 ile 164,00 kg/da arasında farklılık gösterdiği; denemenin genel ortalamasının 193,34 kg/da olduğu, en yüksek lif veriminin kontrol uygulamasından elde edildiği görülmektedir. Bednarz ve ark. (2002) yürüttükleri çalışmada en yüksek lif veriminin %76 koza açma döneminde elde edildiğini bildirmişlerdir. Denemeden elde edilen sonuçlar Larson ve ark. (2002) ve Faircloth ve ark. (2004) 'in çalışmalarına paralellik arz ederken, Larson ve ark. (2005)'in sonuçları ile örtüşmemektedir. Bu durumun farklı çevresel faktörlerden kaynaklandığı düşünülmektedir.

Çırcır randımanı (%) : Tablo'dan bitki boyu (cm) açısından uygulamalar arasındaki değişikliklerin istatistiksel anlamda önemli olmadığı görülebilmektedir.

Tablo 3' te, uygulamalara bağlı olarak çırcır randımına ait ortalama değerlerin, %45,38 ile %44,70 arasında farklılık gösterdiği; denemenin genel ortalamasının %44,98 olduğu, en yüksek

çırçır randımanının %70 KOZA AÇMA uygulamasından elde edildiği görülmektedir. Denemeden elde edilen sonuçlar Çiçek ve ark. (2003), Çopur ve ark., (2010) ve Karademir ve ark. (2007)'in çalışmalarıyla paralellik arz ederken, Sokat ve Gürel (2016) ve Larson ve ark. (2005)'in sonuçları ile örtüşmemektedir. Bu durumun kullanılan materyal, denemenin yürütüldüğü çevre koşullarından kaynaklandığı düşünülmektedir.

Açmış koza sayısı (adet/bitki): İlk meyve dalı boğum sayısı özelliğine ait uygulamalara ilişkin ortalama değerler ve $LSD_{(0.05)}$ testine göre oluşan gruplamalar, Tablo 3'te belirtilmiştir. Tablo'dan bu özellik bakımından uygulamalar arasındaki değişikliklerin istatistiksel anlamda önemli olmadığı görülebilmektedir. Uygulamalara bağlı olarak açmış koza sayısına ait ortalama değerlerin, 12,07 ile 15,60 adet/bitki arasında farklılık gösterdiği; denemenin genel ortalamasının 13,61 adet/bitki olduğu, en yüksek açmış koza sayısının kontrol uygulamasından elde edildiği görülmektedir.

Açmamış koza sayısı (adet/bitki): Tablo'dan açmamış koza sayısı açısından uygulamalar arasında %1 önem düzeyinde istatistiksel değişikliklerin olduğu görülebilmektedir. Tablo 3'te, uygulamalara bağlı olarak açmamış kozaya ait ortalama değerlerin, 0,35 ile 1,60 adet/bitki arasında farklılık gösterdiği; denemenin genel ortalamasının 1,02 adet/bitki olduğu, en yüksek açmamış kozanın kontrol uygulamasından elde edildiği görülmektedir.

Koza ağırlığı (g) : Tablo'dan koza ağırlığı açısından uygulamalar arasındaki değişikliklerin istatistiksel olarak önemli olmadığı görülebilmektedir. Uygulamalara bağlı olarak koza ağırlığına ait ortalama değerlerin, 6,87 ile 7,73 g arasında farklılık gösterdiği; denemenin genel ortalamasının 7,23 g olduğu, en yüksek koza ağırlığının Kontrol uygulamasından elde edildiği görülmektedir. Denemeden elde edilen sonuçlar Haliloğlu ve ark. (2020)'in çalışmalarıyla paralellik arz ederken, Çiçek ve ark. (2003)'in sonuçları ile örtüşmemektedir. Bu durumun denemede kullanılan materyal ve bakım koşullarından kaynaklandığı düşünülmektedir.

Koza kütlü ağırlığı (g) : Tablo'dan koza kütlü ağırlığı açısından uygulamalar arasındaki değişikliklerin istatistiksel olarak önemli olmadığı görülebilmektedir. Tablodan uygulamalara bağlı olarak koza kütlü ağırlığına ait ortalama değerlerin, 5,60 ile 6,20 g arasında farklılık gösterdiği; denemenin genel ortalamasının 5,85 g olduğu, en yüksek koza kütlü ağırlığının kontrol uygulamasından elde edildiği görülmektedir. Denemeden elde edilen sonuçlar Çiçek ve ark. (2003)'in sonuçları ile örtüşmemektedir. Bu durumun denemenin çevre ve bakım koşullarından kaynaklandığı düşünülmektedir.

Lif teknolojik özellikler: Lif teknolojik özelliklerine ait ortalama değerler ve oluşan gruplamalar Tablo 5’ te izlenebilmektedir. Tabloda da görüldüğü gibi uygulanan yaprak döktürücü’nün incelenen lif teknolojik özellikleri üzerine önemli bir etkisi olmamıştır.

Tablo 5. İncelenen lif kalite özelliklerine ilişkin ortalama değerler ve oluşan gruplamalar

Uygulamalar	Lif Uzunluğu (mm)	Lif İnc. (Mic.)	Lif Kop. Dayanıkl. (g/tex)	Lif Kop. Uzaması (%)	Üniformite (%)	Kısa Lif İçeriği (%)
1. Kontrol	31,50	4,59	33,73	5,87	84,90	6,03
2. NAWF 5	30,30	4,72	32,43	5,80	83,07	6,80
3. %70 KOZA AÇMA	29,82	4,80	32,43	5,87	83,80	7,70
4. NACB 4	30,04	5,00	33,50	6,50	84,47	6,70
5. KESKİN BIÇAK	30,39	4,99	31,10	6,20	83,70	7,70
Ortalama	30,41	4,82	32,64	6,05	83,99	6,99
CV (%)	0,91	4,71	5,29	6,36	1,35	19,81
LSD_(0.05)	Ö.D.	Ö.D.	Ö.D.	Ö.D.	Ö.D.	Ö.D.

Lif uzunluğu (mm): Tablo ’ dan, uygulamalara bağlı olarak lif uzunluğuna ait ortalama değerlerin, 29,82 ile 31,50 mm arasında farklılık gösterdiği; denemenin genel ortalamasının 3,41 mm olduğu, en yüksek lif uzunluğunun kontrol uygulamasından elde edildiği görülmektedir. Denemeden elde edilen sonuçlar Özkan ve Görmüş (2002), Larson ve ark. (2002), Çiçek ve ark. (2003), Larson ve ark. (2005), Karademir ve ark. (2007) ve Raghavendra ve Reddy (2020) ’in çalışmalarıyla paralellik arz ederken, Bednarz ve ark. (2002), Sokat ve Gürel (2010) ve Görmüş ve ark. (2017)’in sonuçları ile örtüşmemektedir.

Lif inceliği (micronaire): Tablo 5’ te, uygulamalara bağlı olarak lif inceliği ait ortalama değerlerin, 4,59 ile 5,00 mic arasında farklılık gösterdiği; denemenin genel ortalamasının 4,82 mic olduğu, en yüksek lif inceliğinin NACB 4 uygulamasından elde edildiği görülmektedir. Denemeden elde edilen sonuçlar Özkan ve Görmüş (2002) ve Karademir ve ark. (2007)’in çalışmalarıyla paralellik arz ederken, Larson ve ark. (2002), Tülemen (2016) ve Raghavendra ve Reddy (2020)’in sonuçları ile örtüşmemektedir. Bu durumun denemede kullanılan farklı materyal ve çevre koşullarından kaynaklandığı düşünülmektedir.

Lif kopma dayanıklılığı (g/tex): Tablo’ dan, uygulamalara bağlı olarak lif kopma dayanıklılığına ait ortalama değerlerin, 31,10 ile 33,73 g/tex arasında farklılık gösterdiği; denemenin genel ortalamasının 32,64 g/tex olduğu, en yüksek lif kopma dayanıklılığının kontrol uygulamasından elde edildiği görülmektedir. Denemeden elde edilen sonuçlar Özkan ve Görmüş (2002), Çiçek ve ark. (2003), Larson ve ark. (2005) ve Karademir ve ark. (2007)’in

çalışmalarıyla paralellik arz ederken, Tülemen (2016)'in sonuçları ile örtüşmemektedir. Bu durumun denemede kullanılan genotiplerin farklı olmasından kaynaklandığı düşünülmektedir.

Lif kopma uzaması (%): Tablo 5' te görüldüğü gibi uygulamalara bağlı olarak lif kopma uzamasına ait ortalama değerlerin, %5,80 ile %6,50 arasında farklılık gösterdiği; denemenin genel ortalamasının %6,05 olduğu, en yüksek lif kopma uzamasının NACB 4 uygulamasından elde edildiği görülmektedir. Denemeden elde edilen sonuçlar Özkan ve Görmüş (2002) ve Çiçek ve ark. (2003)'in çalışmalarıyla paralellik arz ettiği görülmektedir.

Üniformite (%): Anılan tablo incelendiğinde, uygulamalara bağlı olarak üniformite özelliğine ait ortalama değerlerin, %83,07 ile %84,90 arasında farklılık gösterdiği; denemenin genel ortalamasının %83,99 olduğu, en yüksek üniformite değerinin kontrol uygulamasından elde edildiği görülmektedir. Denemeden elde edilen sonuçlar Özkan ve Görmüş (2002)'ün çalışmalarıyla paralellik arz ederken, Larson ve ark. (2002)'in sonuçları ile örtüşmemektedir. Bu durumun denemede kullanılan materyal ve çevre koşullarından kaynaklandığı düşünülmektedir.

Kısa lif içeriği (%): Tablodan uygulamalara bağlı olarak kısa lif içeriğine ait ortalama değerlerin, %6,03 ile %7,70 arasında farklılık gösterdiği; denemenin genel ortalamasının %6,99 olduğu, en yüksek kısa lif içeriğinin %70 KOZA AÇMA uygulamasından elde edildiği görülmektedir. Denemeden elde edilen sonuçlar Özkan ve Görmüş (2002) ve Çiçek ve ark. (2003)'in çalışmalarıyla paralellik arz ettiği görülmektedir.

SONUÇ VE ÖNERİLER

Sonuçlar

Bu çalışma pamukta bitki izleme tekniklerinde kullanılan bazı parametreler göz önünde bulundurularak yaprak döktürücü (defoliant) uygulamasının etkinliğini ortaya koymak için yürütülmüştür. Bu amaçla çalışma Güneydoğu Anadolu Bölgesinde pamuk ekiminin yoğun olduğu Diyarbakır ili Bismil ilçesinde üretici tarlasında pamukta bitki izleme tekniği bakımından sıklıkla kullanılmakta olan Beyaz Çiçek Üzeri Boğum Sayısı (NAWF), Çatlamış Koza Üzeri Boğum Sayısı (NACB), Keskin Bıçak Yöntemi (Sharp Knife Techniques) uygulamaları ile genel olarak uygulanmakta olan %70 Koza Açma döneminde defoliant uygulaması ve bu uygulamaların kıyaslanacağı defoliant uygulanmayan kontrol parselleri olmak üzere 5 uygulama yapılarak yürütülmüştür. Araştırmada materyal olarak özel sektörden temin edilen Progen 1010 çeşidi kullanılmıştır.

Çalışmada kütlü pamuk verimi, lif verimi, açmamış koza sayısı, açmış koza sayısı, çırcır randımanı, koza ağırlığı, koza kütlü ağırlığı gözlemlerinin yanı sıra pamukta kalite ölçütlerinden lif inceliği, lif uzunluğu, lif kopma dayanıklılığı, lif kopma uzaması, lif üniformite oranı, kısa lif oranı, lif sarılık değeri, lif parlaklık değeri, iplik olabilirlik indeksi, olgunluk ve nem değerleri incelenmiştir. İncelenen özelliklerin tümü bakımından yaprak döktürücü uygulamaları arasında önemli bir istatistiksel farklılık elde edilememiştir.

Yürütülen çalışmada elde edilen bulguların bir yıllık olması pamuk üretimi yapan üreticilere tavsiyede bulunmak için yeterli değildir. Bu tür çalışmaların birden çok yıl ve lokasyonda yürütüldükten sonra önerilebileceği düşünülmektedir.

Öneriler

Pamukta farklı dönemlerde uygulanan yaprak döktürücülerin incelenen özelliklerden lif verimi ile açmamış koza dışındaki diğer özellikler üzerine istatistiksel olarak önemli bir etkisi bulunmamıştır. Açmamış koza sayısı bakımından bir değerlendirme yapıldığında kontrol uygulamasında en yüksek açmamış koza sayısının elde edildiği, bu uygulamayı Çatlamış Koza Üzeri Boğum Sayısının (NACB) izlediği ve bu iki uygulamanın aynı istatistiksel grupta yer aldıkları, %70 Koza açma ile Keskin Bıçak Yöntemi (Sharp Knife Techniques) uygulamalarının sıralamayı izleyerek ikinci grupta yer aldıkları, Beyaz Çiçek Üzeri Boğum Sayısı (NAWF) yönteminin ise en düşük değeri göstererek açmamış koza sayısı bakımından son grupta yer aldığı belirlenmiştir. Bu durum açmamış koza sayısı bakımından kontrol ve Çatlamış Koza Üzeri Boğum sayısı yöntemi uygulamalarından kaçınılması gerektiği izlenimini oluşturmaktadır. Aynı gözlemde en düşük değer Beyaz Çiçek Üzeri Boğum Sayısından elde edilmiştir. Bu durumda en az açmamış koza sayısı elde edebilmek için defoliant uygulaması yapılırken Beyaz Çiçek Üzeri Boğum Sayısı dikkate alınarak yaprak döktürücünün uygulanabileceği önerilebilir. Kütlü verimi ve lif verimi yönünden ise Keskin Bıçak Yöntemi dışındaki diğer uygulamalar aynı grupta yer almış ancak keskin bıçak yöntemi istatistiksel olarak lif verimi yönünden diğer uygulamalardan farklı olarak ikinci grupta yer almıştır. Lif verimi özelliği sonuçları göz önünde bulundurulduğunda Beyaz Çiçek Üzeri Boğum Sayısı, Kontrol ve %70 Koza açma uygulaması ile aynı grupta yer almıştır.

Sonuç olarak bu çalışmadan elde edilen bir yıllık sonuçlara göre Beyaz Çiçek Üzeri Boğum Sayısı gözlemi göz önünde bulundurularak yaprak döktürücü kullanılabileceği önerilebilir. Ancak daha önce de değinildiği gibi bu tür çalışmaların birden çok yıl ve lokasyonda denemeler yapılarak önerilerde bulunulması daha sağlıklı olabilir.

ÖZET

Bu çalışma pamukta farklı kükürt dozlarının verim, verim komponentleri ve lif teknolojik özellikleri üzerine olan etkisini araştırmak amacı ile yürütülmüştür. Bu amaçla çalışma Güneydoğu Anadolu Bölgesinde pamuk ekiminin yoğun olduğu Diyarbakır ili Bismil ilçesinde üretici tarlasında pamukta 1, 2, 3, 4 L/da kükürt ve bu uygulamaların kıyaslanacağı kükürt uygulanmayan kontrol parselleri olmak üzere 5 uygulama yapılarak yürütülmüştür. İncelenen özelliklerden kütlü verimi, lif verimi, çırçır randımanı ve koza sayısı bakımından uygulamalar arasında %5 önem düzeyinde önemli farklılıklar elde edilmiştir. Ancak koza ağırlığı ve koza kütlü ağırlığı yönünden uygulamalar arasında istatistiksel olarak bir farklılık elde edilmemiştir. İncelenen kalite özelliklerinin tümü bakımından kükürt uygulamaları arasında önemli bir istatistiki farklılık elde edilememiştir. Yürütülen çalışmada elde edilen bulguların bir yıllık olması pamuk üretimi yapan üreticilere tavsiyede bulunmak için yeterli değildir. Bu tür çalışmaların birden çok yıl ve lokasyonda yürütüldükten sonra önerilebileceği düşünülmektedir.

Anahtar Kelimeler: Kükürt, kütlü pamuk verimi, lif kalite kriterleri, pamuk

**DETERMINATION EFFECTS OF SULFUR APPLICATION ON YIELD AND FIBER
QUALITY CRITERIA IN COTTON**

ABSTRACT

This study was carried out to investigate the effect of different sulfur doses on yield, yield components and fiber technological properties in cotton. For this purpose, the study was carried out by making 5 applications, 1, 2, 3, 4 L/da of sulfur in cotton and control plots without sulfur to compare these applications, in the producer's field in Bismil district of Diyarbakır province, where cotton cultivation is intense in the Southeastern Anatolia Region. Significant differences at the 5% significance level were obtained between the applications in terms of seed cotton yield, fiber yield, ginning yield and number of bolls. However, there was no statistical difference between the applications in terms of boll weight and boll seed weight. No statistically significant difference could be obtained between the sulfur applications in terms of all the investigated quality properties. The fact that the findings obtained in the study carried out are one year old is not enough to give advice to cotton producers. It is thought that such studies can be recommended after being conducted in multiple years and locations.

Keywords: Cotton, sulfur, seed cotton yield, fiber quality criteria

GİRİŞ

Pamuk ülkemizin en önemli endüstri bitkilerinden biri olup, tarımda ve sanayide yaygın olarak kullanılmaktadır. Ülkemizde 2021 yılında 4,322.790 da alandan 832,500 ton pamuk lifi üretimi gerçekleştirilmiştir. Güneydoğu Anadolu Bölgesinde ise, 2021 yılında pamuk ekimi yapılan 2,619,897 da alanda 489,880 ton pamuk lifi üretimi gerçekleştirilmiştir. Ülke üretiminin yaklaşık olarak %60'ı Güneydoğu Anadolu Bölgesinden karşılanmaktadır (Anonim, 2021a). Üretilen pamuk ülke ihtiyacına cevap verememekte ve yılda yaklaşık 800,000 ton lif pamuk ithalatı yapılmaktadır. Pamuk iklim özellikleri bakımından seçici bir bitki olması nedeni ile ülkemizde sınırlı yerlerde yetiştirilebilmektedir. Ülkemizde pamuk yetiştiriciliği Güneydoğu Anadolu Bölgesi, Ege ve Çukurova Bölgeleri olmak üzere 3 bölgede yapılmaktadır. Siirt ilinin de içinde bulunduğu Güneydoğu Anadolu Bölgesi pamuk yetiştiriciliği yönünden uygun ekolojiye sahiptir.

Pamuk, yaygın ve zorunlu kullanım alanıyla insanlık açısından, yarattığı katma değer ve istihdam olanaklarıyla da üretici ülkeler açısından büyük ekonomik öneme sahip bir üründür. Pamuk, işlenmesi açısından çırçır sanayisinin, lifi ile tekstil sanayisinin, çiğidi ile yağ ve yem sanayisinin, linteri ile de kâğıt sanayisinin hammaddesi durumundadır. Petrole alternatif olarak pamuğun çekirdeğinden elde edilen yağ, giderek artan miktarda biodizel üretiminde de hammadde olarak kullanılmaktadır. Pamuk tohumlarının en önemli kullanımı ise, insan ve hayvan beslenme (gıda) alanıdır (İnan, 1980).

Ülkemiz için stratejik bir öneme sahip olan pamukta mikro ve makro besin elementlerinin verim ve kalitesine olan etkisi ile ilgili birçok çalışma yürütülmüştür. Yürütülen çalışmaların büyük bir çoğunluğu azot ve fosfor içerikli bitki besin elementlerinin etkisi üzerine yoğunlaşmıştır. Bir makro besin elementi olan kükürt ile ilgili yapılan çalışmalar hem dünya genelinde hem de ülkemizde çok yaygın değildir. Bu nedenle kükürt bitki besin elementinin pamukta verim ve kaliteye olan etkisinin çalışılması gerekmektedir. Çoğu bitkide gerekli makro besin elementlerinden olan kükürt, toprakta farklı formlarda bulunmaktadır. Toprakta temel kükürt formları; organik kükürt bileşikleri ve inorganik kükürt bileşikleri olarak 2'ye ayrılır.

Bitki gelişimini olumsuz yönde belirgin biçimde etkileyerek gelişmeyi durduran kükürt noksanlığı ile bitki bodurlaşır, ince gövdeli ve çalimsı bir görünüm kazanır. Bu noksanlık belirtileri birçok bitkide azot noksanlığına benzer ve bu nedenle bu soruna ilişkin nedenlerin açıklanmasında yanlış yorumlar yapılabilir. Bununla birlikte noksanlık durumunda kükürt azotta olduğu gibi bitki yapısı içinde yaşlı bitki bölümlerinden genç bölümlere taşınamaz bu nedenle noksanlık belirtileri ilk önce en genç yapraklarda görülür (URL-1). Kükürt, aynı

zamanda proteinin yapısını inşa eder ve klorofilin yapısında anahtar rol oynayan önemli bir besin elementidir (Duke ve Reisenau, 1986).

Kükürt uygulaması ile klorofil miktarı arttırılabilir ve abiyotik stresin şiddeti hafifletilebilir (Jie ve ark., 2008). Pamuk bitkilerinin proteinleri ve enzimleri yapmak için gerekli olan amino asitleri üretmek için kükürt ihtiyacı vardır. Bitki dokusunun yaklaşık yüzde 3'ü kükürttten oluşur. Ekinlerin kükürtlü gübrelenmesi, optimum verim ve ürün kalitesi elde etmek için dengeli beslenmenin ayrılmaz bir bileşenidir. Tohumda yüksek protein bulunan pamuk gibi bitkiler, daha büyük bir miktarda kükürt'e ihtiyaç duyar. Normal bir verim için 20 ile 45 kg/ha kükürt'e ihtiyacı vardır (Aulakh ve ark., 1985). Bu nedenle pamuk üretiminde kükürt için gübre önerileri oldukça yüksektir. Pamuk bitkisinin ihtiyaç duyduğu kükürt miktarı kütlü pamuk verimi ile doğru orantılıdır. Kükürt ilavelerine yanıt olarak pamuğun önemli verim artışları yürütülen önceki çalışmalarda da rapor edilmiştir (Makhdam ve ark., 2001). Kütlü pamuk veriminin, bitki başına koza sayısının ve koza ağırlığının kükürtlü gübrelenmeye önemli bir tepki gösterdiği bildirilmiştir. Toprakta 10-15 mg/kg'den daha az SO₄-S bulunduğunda eksiklik belirtileri ortaya çıkar (Hearn, 1981). Pamuk üretimi yapılan bölgelerde sıcak ve kurak iklim ve muhtemelen aşırı sülfat sızıntısından dolayı toprakta yarayışlı Kükürt (S) genellikle düşüktür. Yüksek toprak pH'sı, hafif yapılı topraklar; pulluk tabanı gibi oluşumlar ürünler için kükürtün yarayışlılığını güçleştirir (Hue ve ark.,1984). Genellikle yağ bitkileri yüksek verim ve kalite için hemen hemen fosfor kadar veya daha fazla miktarda kükürt'e de gereksinim duymaktadır. Yağ bitkilerinin de içerisinde yer aldığı yoğun bitki rotasyon programlarında, özellikle bitki artıklarının topraktan uzaklaştırıldığı durumlarda, S alınımı oldukça yüksek olabilir. Bu durum eğer yeterli miktarda S gübreleme olarak ikame edilmez ise önemli derecede S yoksunluğuna neden olur. Kükürt kısıtlılığı sıklıkla protein sentezini engeller bu durum çözülebilir azot bileşiklerinin birikimini olumsuz yönde etkiler. Bunun sonucunda da yapraklarda büzölmeler ve diğer morfolojik anormalliklere neden olur (Tiwari ve ark., 1997). Pamuğun toplam S gereksinimi fosfor gereksinimi gibidir. Önceki çalışmalarda pamuğun 12-15 kg/ha kükürt tükettiği bildirilmiştir (Makdam ve ark., 2001). Messic (1992)'te yürüttüğü çalışmada 11 kg/ha S eklendiğinde pamukta verimin önemli düzeyde bir artış gösterdiğini bildirmiştir. Gün geçtikçe içerisinde yüksek düzeyde S bulunan gübreler yerini daha az S içerikli gübrelere terk etmeye başlamaktadır. Son yıllarda kükürtsüz gübre kullanımı, yüksek verimli bitkilerin topraktan çok miktarda S tüketmesi, atmosferden toprağa daha az S birikimi, ve S içerikli pestisit kullanımının azalması bitkilerde S eksikliğine neden olmaktadır (Yin ve ark., 2012). Kükürt azot, fosfor ve potasyumdan sonra dördüncü en önemli makro bitki besin elementidir.

Kükürt 'ün tarımdaki önemi birçok önceki çalışmada ortaya konmuş ve vurgulanmıştır (Scherer, 2009; Jamal ve ark., 2010).

Kükürt'ün pamuk büyümesi, verimi ve kalitesi üzerindeki etkileri hakkında çok az şey bilinmektedir bu nedenle bu araştırma, Kükürt uygulamasının pamuk büyümesi, pamuk verimi ve kalitesi üzerindeki etkilerini belirlemek amacıyla yürütülmüştür.

MATERYAL VE METOT

Deneme Diyarbakır ili Bismil ilçesine bağlı Köseli köyündeki üreticiye ait arazide 3 tekerrürlü olarak 2021 yılında yürütülmüştür. Araştırmada materyal olarak Progen Tohum A.Ş.'nin BA 1010 pamuk çeşidi materyal olarak kullanılmıştır. Çalışma alanında ekim yapılmadan önce toprak örneği alınarak toprak özellikleri belirlenmiştir. Deneme alanına ilişkin analiz sonuçları Tablo 1'de verilmiştir.

Tablo 1. Çalışma alanı toprak özellikleri

Toprak Özelliği	Değeri
Kil, %	44,51
Kum, %	47,79
Silt, %	8,59
pH	7,89
Elektriksel iletkenlik, mS/cm	453,00
Kireç, %	0,51
Organik madde, %	1,12
Alınan fosfor, P ₂ O ₅ kg/da	2,25
Alınan potasyum, K ₂ O kg/da	86,05

Tablo 1. incelendiğinde, alınan topraklarda yapılan analiz sonucunda; deneme alanı toprak örneklerinin kumlu-killi bünyeye sahip, nötr, tuzsuz, az kireçli, organik madde ve alınabilir fosfor bakımından düşük, potasyum bakımından ise yeterli olduğu belirlenmiştir.

Uzun yıllara ait iklim verilerine göre; il ortalama sıcaklığı 16,1°C, maksimum ortalama sıcaklık 21,8°C, minimum ortalama sıcaklık 11,1°C, ortalama yağış 692,0 mm, maksimum hava sıcaklığı 46,0°C, minimum hava sıcaklığı ise -15,6 °C olarak gerçekleşmiştir (Anonim, 2021b).

Çalışmanın yapıldığı bölgede 2021 yılına ve uzun yıllara ait iklim verileri Tablo 2'de verilmiştir. 2021 yılı iklim verileri uzun yıllarla kıyaslandığında ortalama sıcaklığın, minimum ve maksimum sıcaklık değerlerinin uzun yıllar ortalamasının üzerinde seyrettiği izlenebilmektedir. Toplam yağış miktarı incelendiğinde ise denemenin yürütüldüğü Mayıs ve Ekim aylarındaki yağış miktarının uzun yılların üzerinde seyrettiği görülmektedir.

Tablo 2. Denemenin yürütüldüğü 2021 yılı ile uzun yıllara ait iklim verileri

Aylar	Yıllar	Ortalama Sıcaklık (°C)	Ortalama Maksimum Sıcaklık (°C)	Ortalama Minimum Sıcaklık (°C)	Nispi Nem (%)	Toplam Yağış (mm)
Nisan	2021	16,80	22,70	11,30	47,60	60,80
	Uzun Yıllar	13,80	19,30	9,10	50,40	104,30
Mayıs	2021	19,80	25,70	14,90	59,10	146,80
	Uzun Yıllar	19,30	25,20	13,50	41,50	62,0
Haziran	2021	27,40	33,40	21,00	31,70	3,00
	Uzun Yıllar	26,00	32,10	18,90	24,10	8,70
Temmuz	2021	32,30	38,70	25,40	20,10	0,60
	Uzun Yıllar	30,60	36,90	23,40	18,10	1,60
Ağustos	2021	32,10	38,60	25,50	21,40	1,60
	Uzun Yıllar	30,00	37,00	23,10	17,20	1,00
Eylül	2021	27,90	34,50	21,50	22,50	0,0
	Uzun Yıllar	25,00	32,30	18,70	24,00	5,20
Ekim	2021	20,40	26,20	15,60	46,30	134,00
	Uzun Yıllar	17,90	24,50	12,70	45,30	50,90
Kasım	2021	16,60	24,30	10,0	42,90	96,00
	Uzun Yıllar	10,20	15,40	6,30	57,10	55,60

Çalışmanın yapıldığı arazi sonbahar mevsiminde derin şekilde pulluk, ilkbahar mevsimlerinde ise yüzeysel olarak kültivatör ile işlenmiş ve ekimden önce deneme alanı 3 kez tapan çekilerek ekime hazır hale getirilmiştir. Ekim işlemi mibzerle gerçekleştirilmiştir.

Denemede ekim işlemleri 22 Nisan 2021 tarihinde deneme mibzeri ile yapılmıştır, ekimde her parsel 6 m uzunluğunda 4 sıradan oluşturulmuştur Sıra arası mesafe ekim esnasında 70 cm sabit tutulmuş, sıra üzeri mesafe ise 10-15 cm olacak şekilde seyreltme yapılarak oluşturulmuştur. Deneme alanından toprak örnekleri alınarak toprak analizleri yapılmış ve bitkinin ihtiyaç duyduğu gübre miktarı zamanında verilmiştir. Ekim esnasında ihtiyaç duyulan azotun yarısı ile fosforun tamamı uygulanmış, geriye kalan azotun ikinci yarısı ise ilk sulama öncesinde uygulanmıştır. Taban gübresi olarak ekimle birlikte 20-20-0 kompoze gübre kullanılmıştır. İlk sulama öncesinde ise üst gübre olarak üre gübresi kullanılmıştır. Deneme salma sulama sistemi ile sulanmıştır. Sulamaya çiçeklenme öncesi dönemde başlanmış ve %10 koza açma döneminde son verilmiştir.

Çalışmada kükürt uygulanmayan parsel kontrol olmak üzere toplam 5 farklı uygulama yapılmıştır.

Uygulamalar

1. Kontrol (kükürt uygulaması yok)
2. Çiçeklenme Doruğunda Toprağa (1 L/da)
3. Çiçeklenme Doruğunda Toprağa (2 L/da)

4. Çiçeklenme Doruğunda Toprağa (3 L/da)
5. Çiçeklenme Doruğunda Toprağa (4 L/da)

İncelenen özellikler

Bitkisel özellikler: Çalışmada incelenen bitkisel özellikler her parselden şansa bağlı olarak seçilen 10'ar bitkide sayımlar yapıldıktan sonra ortalamaları alınarak hesaplanmıştır. Kütlü pamuk verimi ile lif verimi her parselden elde edilen ürün tartılarak parsel veriminin kg/da' a oranlanması ile elde edilmiştir.

Lif teknolojik parametreler: Hasat sonrasında belirlenmiş olup, 50 kozadan elde edilen ürün lif analizlerinde kullanılmıştır. Analizler GAP Uluslararası Tarımsal Araştırma ve Eğitim Merkezi Müdürlüğü lif kalite laboratuvarında HVI aleti yardımı ile yapılmıştır.

- Lif İnceliği (micronaire)
- Lif Uzunluğu (mm)
- Lif Kopma Dayanıklılığı (g/tex)
- Lif Kopma Uzaması (%)
- Lif Üniiformite Oranı (%)
- Kısa Lif Oranı (%)
- Lif Parlaklık Değeri (%)
- Lif Sarılık Değeri (+b)
- İplik Olabilirlik İndeksi

Hasat İşlemleri: Hasat elle yapılmıştır. Hasatta parsellerin orta kısmında yer alan iki sıra hasat edilmiştir.

İstatistik Analizler: Araştırmadan elde edilen sonuçlar JUMP istatistik paket program yardımı ile değerlendirilip, ortalamaların karşılaştırılmasında ise LSD_(0.05) testi kullanılmıştır.

BULGULAR VE TARTIŞMA

Kütlü pamuk verimi (kg/da): Kütlü pamuk verimine ait uygulamalara ilişkin ortalama değerler ve LSD_(0.05) testine göre oluşan gruplamalar, Tablo 3'te belirtilmiştir. Tablo'dan kütlü pamuk verimi açısından uygulamalar arasında %5 önem düzeyinde istatistiksel değişikliklerin olduğu görülebilmektedir.

Tablo 3'ten, uygulamalara bağlı olarak kütlü verimine ait ortalama değerlerin, 370,40 ile 503,20 kg/da arasında farklılık gösterdiği; denemenin genel ortalamasının 417,44 kg/da olduğu, en yüksek kütlü pamuk veriminin Çiçeklenme Doruğunda 1 L/da uygulamasından elde edildiği

görülmektedir. En yüksek verimin elde edildiği Çiçeklenme Doruğunda 1 L/da uygulaması ile kontrol uygulaması arasında (503,20 - 409,60 = 93,6 kg/da)'lık bir verim artışı oluşmuştur.

Bu çalışmadan elde edilen sonuçlar daha önce yürütülen ve kükürt uygulamasının pamuk kütlü pamuk veriminde önemli artışlar elde eden Makhdum ve ark., (2001), Makhdum ve Malik (2004), Sharma ve Kumawat (2005), Bukarlı (2007), Gobi ve ark., (2010), Parmar ve ark. (2010), Yin ve ark. (2011), Görmüş (2014), Basavanepa ve ark., (2016), Geng ve ark., (2016), Ashmouny ve ark., (2017), Candemir ve Ödemiş (2018), Parlavar ve ark., (2018), Ibrahim (2022), Lad ve ark.,(2022)'nin sonuçları ile benzer sonuçlar göstermiştir, ancak Faircloth ve ark., (2004)'nin elde ettikleri sonuçlar ile örtüşmemektedir. Bazı sonuçların bir biri ile örtüşmemesi araştırmada kullanılan materyalden, iklim koşulları ve bakım koşulları farklılığından kaynaklanmış olabilir.

Tablo 3. Kütlü pamuk verimi, lif verimi, bitki boyu, ilk meyve dalı boğum sayısı, meyve dalı ve odun dalı sayısı özelliklerine ilişkin ortalama değerler ve oluşan gruplamalar

Treatment	Kütlü Pamuk Verimi (Kg da ⁻¹)	Lif Verimi (Kg da ⁻¹)	Bitki Boy (cm)	İlk Meyve Dalı Boğum Sayısı (adet bitki ⁻¹)	Meyve Dalı Sayısı (adet bitki ⁻¹)	Odun Dalı Sayısı (adet bitki ⁻¹)
1. Kontrol	409,60 b	185,58 b	79,06	4,00 b	9,86 ab	0,86 b
2. Çiçeklenme Doruğunda 1 L/da	503,20 a	229,67 a	81,60	3,93 b	11,53 a	0,73 b
3. Çiçeklenme Doruğunda 2 L/da	424,00 b	187,96 b	81,40	4,46 ab	11,53 a	1,00 b

5. Çiçeklenme Doruğunda 4 L/da	370,40 b	168,78 b	80,66	4,53 ab	9,73 ab	0,86 b
Ortalama	417,44	189,75	80,61	4,41	10,35	0,95
CV (%)	9,48	9,07	7,48	8,74	11,71	18,44
LSD_(0.05)	74,51 *	32,39 *	11,34	0,72 *	2,28 *	0,33 *

Lif verimi (kg /da): Lif verimine ait uygulamalara ilişkin ortalama değerler ve LSD_(0.05) testine göre oluşan gruplamalar, Tablo 3'te belirtilmiştir. Tablo'dan lif verimi açısından uygulamalar arasında %5 önem düzeyinde istatistiksel değişikliklerin olduğu görülebilmektedir.

Tablo 3'ten, uygulamalara bağlı olarak lif verimine ait ortalama değerlerin, 168,78 ile 229,67 kg/da arasında farklılık gösterdiği; denemenin genel ortalamasının 189,75 kg/da olduğu, en yüksek lif veriminin Çiçeklenme Doruğunda 1 L/da uygulamasından elde edildiği görülmektedir. Bu çalışmadan elde edilen sonuçlar daha önce yürütülen ve kükürt uygulamasının lif veriminde önemli artışlar elde eden Makhdum ve ark.,(2001), Makhdum ve Malik (2004), Sharma ve Kumawat. (2005), Bukarlı (2007), Gobi ve ark., (2010), Parmar ve ark. (2010), Yin ve ark. (2011), Görmüş (2014), Basavanepa ve ark., (2016), Geng ve ark.,

(2016), Ashmouny ve ark., (2017), Candemir ve Ödemiş (2018), Parlawar ve ark., (2018), Ibrahim (2022), Lad ve ark.,(2022)'nin sonuçları ile benzer sonuçlar göstermiştir, ancak Faircloth ve ark., (2004)'ün elde ettikleri sonuçlar ile örtüşmemektedir. Bu çalışma ile önceki araştırma sonuçlarının örtüşmemesi araştırmada kullanılan materyalden, iklim koşulları ve bakım koşulları farklılığından kaynaklanmış olabilir.

Bitki boyu (cm): Tablo'dan bitki boyu (cm) açısından uygulamalar arasındaki değişikliklerin istatistiksel anlamda önemli olmadığı görülebilmektedir. Tablo 3' te, uygulamalara bağlı olarak bitki boyu değerine ait ortalama değerlerin, 79,06 ile 81,60 cm arasında farklılık gösterdiği; denemenin genel ortalamasının 80,61 cm olduğu, en yüksek bitki boyu değerinin Çiçeklenme Doruğunda 1 L/da elde edildiği görülmektedir.

İlk meyve dalı boğum sayısı (adet/bitki): İlk meyve dalı boğum sayısı özelliğine ait uygulamalara ilişkin ortalama değerler ve $LSD_{(0.05)}$ testine göre oluşan gruplamalar, Tablo 3'te belirtilmiştir. Tablo'dan bu özellik bakımından uygulamalar arasında %5 önem düzeyinde istatistiksel değişikliklerin olduğu görülebilmektedir. Tablo 3' te, uygulamalara bağlı olarak ilk meyve dalı boğum sayısı değerine ait ortalama değerlerin, 3,93 ile 5,13 adet/bitki arasında farklılık gösterdiği; denemenin genel ortalamasının 4,41 adet/bitki olduğu, en yüksek ilk meyve dalı boğum sayısı değerinin Çiçeklenme Doruğunda 3 L/da' dan elde edildiği görülmektedir.

Meyve dalı sayısı (adet/bitki): Meyve dalı sayısı özelliğine ait uygulamalara ilişkin ortalama değerler ve $LSD_{(0.05)}$ testine göre oluşan gruplamalar, Tablo 3'te belirtilmiştir. Tablo'dan bu özellik bakımından uygulamalar arasında %5 önem düzeyinde istatistiksel değişikliklerin olduğu görülebilmektedir. Tablo 3' te, uygulamalara bağlı olarak meyve dalı sayısına ait ortalama değerlerin, 9,13 ile 11,53 adet/bitki arasında farklılık gösterdiği; denemenin genel ortalamasının 10,35 adet/bitki olduğu, en yüksek meyve dalı sayısı değerinin Çiçeklenme Doruğunda 1 L/da ve 2 L/da'dan elde edildiği görülmektedir. Bu çalışmadan elde edilen sonuçlar daha önce yürütülen ve kükürt uygulamasının meyve dalı sayısında önemli bir etkisinin olmadığını tespit eden Bukarlı (2007)'nin sonuçları ile örtüşmemektedir, ancak kükürt uygulamasının pamukta meyve dalı sayısında önemli artışlar sağladığını bildiren Basavanappa ve ark., (2016), Ashmouny ve ark., (2017), Lad ve ark.,(2022)'in elde ettikleri sonuçlar ile paralellik göstermiştir.

Odun dalı sayısı (adet/bitki): Odun dalı sayısı özelliğine ait uygulamalara ilişkin ortalama değerler ve $LSD_{(0.05)}$ testine göre oluşan gruplamalar, Tablo 3'te belirtilmiştir. Tablo'dan bu

özelliik bakımından uygulamalar arasında %5 önem düzeyinde istatistiksel deęişikliklerin olduęu görülebilmektedir. Tablo 3' te, uygulamalara baęlı olarak odun dalı sayısı deęerine ait ortalama deęerlerin, 0,73 ile 1,33 adet/bitki arasında farklılık gösterdięi; denemenin genel ortalamasının 1,95 adet/bitki olduęu, en yüksek odun dalı sayısı deęerinin Çiçeklenme Doruęunda 3 L/da' dan elde edildięi görülmektedir. Bu çalıřmadan elde edilen sonuçlar daha önce yürütölen ve kükürt uygulamasının lif veriminde önemli artışlar elde eden Bukarlı (2007), Basavaneppa ve ark., (2016),'nin sonuçları ile benzer sonuçlar göstermiştir.

Tablo 4. Çırcır randımanı, koza sayısı, koza aęırlıęı ve koza kütlü aęırlıęı özelliklerine iliřkin ortalama deęerler ve oluřan gruplamalar

Uygulamalar	Çırcır Randımanı (%)	Koza Sayısı (Adet/Bitki)	Koza Aęırlıęı (g)	Koza Kütlü Aę. (g)
1. Kontrol	45,33 ab	13,93 ab	7,20	5,90
2. Çiçeklenme Doruęunda 1 L/da	45,66 ab	15,53 a	7,66	6,26
3. Çiçeklenme Doruęunda 2 L/da	44,33 b	13,86 ab	7,06	5,80
4. Çiçeklenme Doruęunda 3 L/da	46,66 a	12,20 bc	7,00	5,73
5. Çiçeklenme Doruęunda 4 L/da	45,66 ab	10,30 c	7,20	5,73

CV (%)	1,77	11,23	6,69	6,19
LSD (0,05)	1,51 *	2,78 *	Ö.D	Ö.D

Çırcır randımanı (%) (mm): Tablo' dan çırcır randımanı aısından uygulamalar arasında %5 önem düzeyinde istatistiksel deęişikliklerin olduęu görülebilmektedir.

Tablo 4'ten, uygulamalara baęlı olarak çırcır randımanına ait ortalama deęerlerin, %44,33 ile %46,66 arasında farklılık gösterdięi; denemenin genel ortalamasının %45,52 olduęu, en yüksek çırcır randımanının Çiçeklenme Doruęunda 3 L/da uygulamasından elde edildięi görülmektedir. Bu çalıřmadan elde edilen sonuçlar daha önce yürütölen ve kükürt uygulamasının çırcır randımanı deęerinde önemli bir etkisinin olmadığını tespit eden Bukarlı (2007)'nin sonuçları ile paralellik göstermiştir, ancak kükürt uygulamasının anılan özelliikte önemli artışlar sağladığını bildiren Gobi ve ark., (2010). Parmar ve ark. (2010)'in elde ettikleri sonuçlar ile örtüşmemektedir. Bu çalıřma ile önceki arařtırma sonuçlarının örtüşmemesi arařtırmada kullanılan materyalden, iklim kořulları ve bakım kořulları farklılıęından kaynaklanmış olabilir.

Koza sayısı (adet/bitki): Tablo' dan koza sayısı aısından uygulamalar arasında %5 önem düzeyinde istatistiksel deęişikliklerin olduęu görülebilmektedir. Tablodan, uygulamalara baęlı olarak koza sayısına ait ortalama deęerlerin, 10,30 ile 15,53 adet/bitki arasında farklılık gösterdięi; denemenin genel ortalamasının 13,16 adet/bitki olduęu, en yüksek koza sayısının

Çiçeklenme Doruğunda 1 L/da uygulamasından elde edildiği görülmektedir. Bu çalışmadan elde edilen sonuçlar daha önce yürütülen ve kükürt uygulamasının koza sayısı özelliğinde önemli artışlar elde eden Makhdum ve Malik (2004) , Faircloth ve ark. (2004), Parmar ve ark. (2010), Basavaneppa ve ark., (2016), Geng ve ark., (2016), Ashmouny ve ark., (2017), Parlawar ve ark., (2018) 'nin sonuçları ile benzer sonuçlar göstermiştir, ancak Bukarlı (2007), Yin ve ark. (2011), 'ün elde ettikleri sonuçlar ile örtüşmemektedir. Bu çalışma ile önceki araştırma sonuçlarının örtüşmemesi çalışmada kullanılan materyalden, iklim koşulları ve bakım koşulları farklılığından kaynaklanmış olabilir.

Koza ağırlığı (g): Tablo' dan koza ağırlığı açısından uygulamalar arasındaki değişikliklerin istatistiksel anlamda önemli olmadığı görülebilmektedir. Tablo 4' te, uygulamalara bağlı olarak koza ağırlığına ait ortalama değerlerin, 7,00 ile 7,66 g arasında farklılık gösterdiği; denemenin genel ortalamasının 7,19 g olduğu, en yüksek koza ağırlığının Çiçeklenme Doruğunda 1 L/da uygulamasından elde edildiği görülmektedir.

Koza kütlü ağırlığı (g): Tablo'dan koza kütlü ağırlığı açısından uygulamalar arasındaki değişikliklerin istatistiksel anlamda önemli olmadığı görülebilmektedir. Tablo 4' te, uygulamalara bağlı olarak koza kütlü ağırlığına ait ortalama değerlerin, 5,73 ile 6,26 g arasında farklılık gösterdiği; denemenin genel ortalamasının 5,88 g olduğu, en yüksek koza kütlü ağırlığının Çiçeklenme Doruğunda kontrol, 1 L/da uygulamasından elde edildiği görülmektedir.

Lif teknolojik özellikler: Lif teknolojik özelliklerine ait ortalama değerler ve oluşan gruplamalar Tablo 5' te izlenebilmektedir. Tabloda da görüldüğü gibi uygulanan kükürt'ün incelenen lif teknolojik özellikleri üzerine önemli bir etkisi olmamıştır.

Tablo 5. İncelenen lif kalite özelliklerine ilişkin ortalama değerler ve oluşan gruplamalar

Uygulamalar	Lif Uzunluğu (mm)	Lif İnc. (Mic.)	Lif Kop. Dayanıml. (g/tex)	Lif Kop. Uzaması (%)	Üniformite (%)	Kısa Lif İçeriği (%)

Lif uzunluğu (mm): Tablo ' dan, uygulamalara bađlı olarak lif uzunluđu deđerine ait ortalama deđerlerin, 27,00 ile 30,66 mm arasında farklılık gösterdiđi; denemenin genel ortalamasının 29,59 mm olduđu, en yüksek lif uzunluđu deđerinin ieklenme Doruđunda 2 L/da' dan elde edildiđi grlmektedir.

Lif inceliđi (micronaire): Tablo 5' te, uygulamalara bađlı olarak lif inceliđine ait ortalama deđerlerin, 4,00 ile 5,00 mic. arasında farklılık gösterdiđi; denemenin genel ortalamasının 4,53 mic. olduđu, en yüksek lif inceliđinin ieklenme Doruđunda 4 L/da uygulamasından elde edildiđi grlmektedir.

Lif kopma dayanıklılıđı (g/tex): Tablo' dan, uygulamalara bađlı olarak lif kopma dayanıklılıđına ait ortalama deđerlerin, 32,66 ile 33,66 g/tex arasında farklılık gösterdiđi; denemenin genel ortalamasının 32,99 g/tex olduđu, en yüksek lif kopma dayanıklılıđının ieklenme Doruđunda 1 L/da uygulamasından elde edildiđi grlmektedir.

Lif kopma uzaması (%): Tablo 5' te grldđi gibi uygulamalara bađlı olarak lif kopma uzamasına ait ortalama deđerlerin, %5,66 ile %6,33 arasında farklılık gösterdiđi; denemenin genel ortalamasının %5,99 olduđu, en yüksek lif kopma uzamasının ieklenme Doruđunda 4 L/da uygulamasından elde edildiđi grlmektedir.

niformite (%): Anılan tablo incelendiđinde, uygulamalara bađlı olarak uniformiteye ait ortalama deđerlerin, %83,33 ile %85,33 arasında farklılık gösterdiđi; denemenin genel ortalamasının %84,39 olduđu, en yüksek lif niformite deđerinin ieklenme Doruđunda 2 L/da uygulamasından elde edildiđi grlmektedir.

Kısa lif ieriđi (%): Tablodan uygulamalara bađlı olarak kısa lif ieriđine ait ortalama deđerlerin, %6,33 ile %7,66 arasında farklılık gösterdiđi; denemenin genel ortalamasının %7,06 olduđu, en yüksek kısa lif ieriđinin Kontrol ve ieklenme Doruđunda 4 L/da uygulamasından elde edildiđi grlmektedir.

SONU VE NERİLER

Sonuçlar

Bu alıřma pamukta farklı kkrt dozlarının verim, verim bileřenleri ve lif teknolojik zellikleri zerine olan etkisini arařtırmak amacı ile yrtlmřtr. Bu amala alıřma Gneydođu Anadolu Blgesinde pamuk ekiminin yođun olduđu Diyarbakır ili Bismil ilesinde retici tarlasında pamukta 1, 2, 3, 4 L/da kkrt ve bu uygulamaların kıyaslanacađı kkrt

uygulanmayan kontrol parselleri olmak üzere 5 uygulama yapılarak yürütülmüştür. Araştırmada materyal olarak özel sektörden temin edilen Progen BA 1010 çeşidi kullanılmıştır. Çalışmada kütlü pamuk verimi, lif verimi, çırçır randımanı, koza sayısı, koza ağırlığı, koza kütlü ağırlığı, bitki boyu, ilk meyve dalı boğum sayısı, meyve dalı sayısı ve odun dalı sayısı incelenmiştir. İncelenen özelliklerden kütlü verimi, lif verimi, çırçır randımanı ve koza sayısı bakımından uygulamalar arasında %5 önem düzeyinde önemli farklılıklar elde edilmiştir. Ancak koza ağırlığı ve koza kütlü ağırlığı yönünden uygulamalar arasında istatistiksel olarak bir farklılık elde edilmemiştir. Pamukta kalite ölçütlerinden lif inceliği, lif uzunluğu, lif kopma dayanıklılığı, lif kopma uzaması, lif üniformite oranı, kısa lif oranı, lif sarılık değeri, lif parlaklık değeri, iplik olabirlik indeksi değerleri incelenmiştir. İncelenen özelliklerin tümü bakımından kükürt uygulamaları arasında önemli bir istatistiki farklılık elde edilememiştir. Yürütülen çalışmada elde edilen bulguların bir yıllık olması pamuk üretimi yapan üreticilere tavsiyede bulunmak için yeterli değildir. Bu tür çalışmaların birden çok yıl ve lokasyonda yürütüldükten sonra önerilebileceği düşünülmektedir.

Öneriler

Pamukta farklı dönemlerde uygulanan kükürt dozları bakımından başta verim olmak üzere incelenen özelliklerin çoğu arasında önemli farklılıklar elde edilmiştir. Kütlü verimi yönünden en yüksek verim 1 L/da kükürt uygulamasından elde edilmiştir. Aynı şekilde önemli çıkan özelliklerden lif verimi ve koza sayısı özelliklerinde de 1 L/da dozundan daha yüksek değerler elde edildiği, çırçır randımanı, ilk meyve dalı boğum sayısı, meyve dalı sayısı yönünden ise 1 L/da uygulamasının bu özellikler bakımından elde edilen en yüksek değerler ile aynı grubu paylaştığı görülmektedir. İstatistiksel olarak önemli olmamakla beraber koza ağırlığı ve koza kütlü ağırlığı değerlerinde de en yüksek değerler 1 L/da uygulamasından elde edilmiştir.

Sonuç olarak bu çalışmadan elde edilen bir yıllık sonuçlara göre dekara 1 litre kükürt uygulanması durumunda kontrole göre 94 kg/da lık bir verim farkı oluşmuştur. Bir sonraki doz olan 2 L/da uygulamasından da kontrolden daha yüksek verim elde edilmiş, ancak doz arttıkça diğer uygulamaların sonucu kontrol uygulamasının altında kalmıştır.

Tüm bu veriler ışığında pamukta 1 L/da kükürt uygulaması önerilebilir. Ancak daha önce de değinildiği gibi bu tür çalışmaların birden çok yıl ve lokasyonda denemeler yapılarak önerilerde bulunulması daha sağlıklı olabilir.

ABSTRACT

The number of people who started a new life by joining the migration movement to live in another country other than their own with the desire and expectation of living a better life has been increasing remarkably in recent years. Migration in the 21st century is not a choice but a necessity. In other words, migration refers to displacement or displacement. The number of newcomers to the migration movement has increased significantly in recent years to live in the country they live in another country with the desire and hope of a better life. In the 21st century, migration has become a necessity rather than a choice. In other words, refugee means moving or relocating. The interdependence of migration and tourism has received little attention and is almost nonexistent in the academic literature. As migration continues to affect many communities, traditional forms of tourism, classified as leisure, business, and visiting friends and relatives for travel purposes, are becoming increasingly obsolete. Tourism experiences are often much more prosperous now, and tourists experience significant socio-economic exchanges with local communities. However, the tourism and immigration relationship can be more complex, among others, depending on the structures of the host society and the emerging trade patterns between the host country and the immigrant's country of origin. In this context, the study's primary purpose is to reveal the relationship between tourism and refugees, investigate the effect of refugee groups on the country's tourism, and investigate and evaluate previous studies in the literature on this and similar issues.

Keywords: Tourism, Refugees, Refugee crisis.

MÜLTECİLER VE TURİZM

ÖZET

Daha güzel bir yaşam sürdürme isteği ve beklentisiyle kendi ülkeleri dışında başka bir ülkede yaşamak üzere göç hareketine katılarak yeni bir hayata başlayan insanların sayısı son yıllarda dikkat çekici biçimde artmaktadır. 21. yüzyılda gerçekleşen göçler, bir tercih değil zorunluluk şeklinde ortaya çıkmaktadır. Başka bir ifadeyle göç, yerinden olmaya veya edilmeye karşılık gelmektedir. Yaşadığı ülkede başka bir ülkeye daha iyi bir yaşam arzusu ve umuduyla yaşamak için göç hareketine yeni katılanların sayısı son yıllarda önemli ölçüde artmaktadır. 21. Yüzyılda göç bir tercih halinden çıkarak zorunluluk halini almıştır. Başka bir deyişle mültecilik, taşınmak veya yer değiştirmek anlamına gelmektedir. Göç ve turizmin karşılıklı bağımlılığı, akademik literatürde tartışmalı bir şekilde çok az ilgi görmüştür ve neredeyse hiç rastlanmamaktadır. Göç, birçok topluluğu etkilemeye devam ettikçe, seyahat amaçlarının eğlence, iş ve arkadaş ve akraba ziyareti şeklinde geleneksel sınıflandırılmış turizm türleri giderek eskimiş hale gelmektedir. Turizm deneyimleri artık genellikle geçmişte olduğundan çok daha zengindir ve turistler yerel topluluklarla önemli sosyo-ekonomik değişimler yaşamaktadırlar. Bununla birlikte, turizm ve göçmenlik ilişkisi, ev sahibi toplumun yapılarına ve ev sahibi ülke ile göçmen kaynaklı ülke arasında ortaya çıkan ticaret modellerine bağlı olarak diğerlerinin yanı sıra daha karmaşık olabilmektedir. Bu bağlamda yapılmış olan çalışmanın temel amacı, Turizmle ve mülteciler arasındaki ilişkinin ortaya çıkarılması, mülteci gruplarının ülke turizmine etkisinin araştırılması ve ayrıca olarak bu ve benzeri konularda literatürde daha önceden yapılan çalışmaların araştırılarak değerlendirilmesidir.

Anahtar Kelimeler: Turizm, Mülteciler, Mülteci krizi

Introduction

In the last few years, geopolitical and economic changes have become potential causes of the increased flow of migrants and refugees to Western countries. According to many authors, refugees have fled their country due to armed conflict or persecution. The situation in their country is so dangerous that they often cross national borders and seek asylum for a safe life. On the other hand, immigrants mainly prefer to act to improve their lives by seeking employment and better living conditions. Immigrants are exempt from this restriction, unlike refugees who cannot return safely to their country of origin. The reasons behind migration include desperate economic and political situations, hunger, genocide, and ethnic and religious persecution in countries of origin. However, although most people go to countries with sound economics and living standards for work and reliable life, there are notable differences between the two. However, nationals do not distinguish between refugees and non-refugees. First, the refugee flow is typically a concerted movement of individuals fleeing en masse from persecution in their home country. Economic migrants, on the other hand, are individuals who take turns seeking better conditions of economic security and employability. This predominant refugee flow stems from poor economies, but the same may be different for immigrants.

From a mobility perspective, the complexity of modern societies is neither anarchic nor perfectly ordered. Wars and natural disasters can trigger systematic change and produce high population mobility. This situation may then result in a parallel exchange of cultures and lives. Contemporary social systems are so tightly interconnected that any logistical effort to separate groups such as migrants and refugees breaks down in the face of unpredictable formations. In addition, tourism and migration become intertwined as tourists turn themselves into immigrants while looking for a job in a destination country, ultimately creating a tourism-migration continuum.

Turkey has been a transit country for international migration for centuries due to its geographical and strategic location. The most important international migration towards Turkey resulted from the Syrian civil war, which began in Tunisia in 2010 as a continuation of the "Arab Spring." With the influence of the Arab Spring, the conflicts in Syria have created a general atmosphere of insecurity and unrest. Syrians have started to migrate to neighboring countries, especially Turkey, to save their lives. Turkey has responded to the Syrian migration process with an "open door" policy and accepted Syrian refugees into the country. As a result of the civil war, eleven million people have become needy to maintain their desire to live, and

about seven million people have been forced to flee Syria. Turkey has become one of the largest recipients of Syrian refugees in this context.

The migration of Syrians to Turkey started with the first mass popular movement on April 29, 2011. 252 Syrian citizens, who entered Turkey through the Chilvegözü border gate in the Yayladağı district of Hatay, formed the first refugee community and settled in Hatay for temporary residence. The Syrians, who initially saw Turkey as a bridge to Europe, eventually saw Turkey as a region where they could settle. The United Nations High Commissioner for Refugees used the expression "the largest migration wave in recent history" regarding this migration. As of May 1, 2023, the number of Syrians under temporary protection in Turkey is 3,410,410. These figures belong to registered Syrian refugees. Istanbul ranks first among Turkish provinces regarding the number of Syrian refugees (www.multeciler.org.tr).

As of August 2021, after the Taliban group took over the administration in Afghanistan, thousands of people fleeing the Taliban administration became refugees. Most of these refugees passed through Iran and took refuge in Turkey illegally. In order to prevent the migrant flow experienced, the Republic of Turkey has established barriers along the border, and it has been tried to prevent the created migrant flow. After the Russia-Ukraine war that started in March 2022, like many European countries, Turkey has become one of the countries where Ukrainian refugees take temporary shelter. Ukrainian refugees mostly take shelter in Turkey's Mediterranean, Aegean, and Marmara regions.

In light of the arguments, as mentioned earlier, it can be clearly stated that the Arab Spring and its aftermath had a visual impact on Turkey in many ways. However, especially tourism activities seem to be victims of this process. Additionally, as implied, the core of the Turkish tourism industry is the future threats of the Arab Spring. In this context, since Turkey has a direct border with Syria, the most critical threat originates from Syria. For this reason, developments in Syria directly threaten Turkey's economic, social, and tourism organizations. The Arab Spring triggered many economic, social, security, and political problems in Turkey. However, the refugee crisis is the most critical threat in this process. Therefore, while the refugee crisis creates permanent social, economic, cultural, demographic, and political problems, other conflicts temporarily affect neighboring countries regarding economy and security.

1. Literature Review

Williams and Hall (2000: 23) discussed the characteristics of return migration, labor migration, retirement migration, entrepreneurial migration, and second home and emphasized

that this study should include research on the relationship between tourism and refugeeism in broader social science discussions. The theoretical and methodological relations between refugees and tourism are examined. As a result, it has been determined that there is a link between people's lives, migration routes, and travel. Also, how many refugees take advantage of the gaps in the creation of tourism activities and the role of the government in this regard; He stated that there is a link between tourism and migration in the distribution and interaction of both tourism activities and the economic, cultural and environmental effects of tourism-related refugee migration, and in the creation of spatial and personal images.

Akgündüz et al. (2015: 18) analyzed the changes in housing prices, food prices, and employment rates in 10 cities under intense Syrian protection using the remaining 71 cities as control variables. After the research, it was concluded that real estate prices increased in these provinces due to Syrian migration; there was no significant change in food prices or employment.

Cengiz (2015:119) has examined how the migration caused by the war and the political crisis in Syria affects the city of Kilis in his study titled " Spatial Effects of Forced Migration and Perceptions of Local People: The Case of Kilis." In addition, to understand the attitudes of the local population towards migration and immigrants, it has also been aimed to determine how these migrations shape the city in a spatial sense. The attitudes of the local population towards immigrants and the cultural interactions following these effects were determined by considering the spatial effects of immigrants coming to Kilis. e changes in housing prices, food prices, and employment rates in 10 cities under intense Syrian protection using the remaining 71 cities as control variables. After the research, it was concluded that real estate prices increased in these provinces due to Syrian migration; there was no significant change in food prices or employment.

In his research, Harunoğulları (2016:394) examined the spatial and cultural adaptation of Syrian immigrants living in Kilis, the creation of space, and the effects of these immigrants on the economic and cultural structure of the city. Within the scope of the research, 140 Syrian migrants residing in some city neighborhoods were subjected to various data harvesting techniques. In this study, the researcher aims to highlight the differences and difficulties by evaluating the impact of refugee migration on the city from a social, spatial, cultural, and economic perspective.

Timcak et al. (2016:714) examined the possible Decoupling between tourism-related processes and the influx of Syrian refugees to the EU. He used a survey technique to analyze

the impact of immigration on expectations and the preliminary assessment of potential tourism customers. As a result, it has been found that migration harms traditional tourism and tends to reduce investment in migrant tourism infrastructure and create new services related to migrant tourism. Migration has also increased interest in some types of tourism, such as volunteering, dark tourism, and war tourism. On the other hand, they found that tourist interest decreased in the regions where migration occurred or was affected.

Provenzano (2020: 1388) examined the relationship between tourism and migration by choosing complex network analysis and attraction models in EU countries between 2000 and 2015. For each academic year, it has been tried to link the tourist flow with migration. As a result of the correlation analyses, it was found that tourism and migration networks have a very similar topological structure, as well as a significant and direct interaction between tourism and migration movements in the European Union. On the other hand, an indirect causality relationship has yet to be determined in the relationship between tourism and migration.

Pappas and Papathéodorou (2017:38) aimed to reveal the impact of the 2015-2016 refugee crisis on tourism from Syria, Afghanistan, and Iraq to Greece. In this direction, the effect of Greece on perception and the expected reaction of tourists were examined. At the same time, how refugees are viewed regarding security and culture, the relationship between refugees and host communities, and the choices made by the Greek tourism accommodation sector in the face of the crisis have been analyzed. This article applied the survey technique of 811 tourist accommodation managers in the country using fuzzy cluster-qualitative comparative analysis. The results showed that the participants' choices were decoupled into three groups, which explained the refugee orientation, the emphasis on the relationship between the visitor and the local community, and the impact of host communities on tourism behavior.

Pappas and Papathéodorou, Musaro, and Moralli (2019:168) stated in their study that tourism and migration are two sides of the same coin in a world where the free movement has become an essential element of social stratification, and there are usually events associated with contrasting and contradictory images, stereotypes and emotions. By highlighting the economic benefits of immigrants, asylum seekers, and tourists, he emphasizes how people who have become public property can create alternative stories about migration and tourism. He has analyzed how alternative narratives related to migration and tourism are adopted, reconstructed, and implemented. Orou (2017:38) aimed to reveal the impact of the 2015-2016 refugee crisis on tourism from Syria, Afghanistan, and Iraq to Greece. In this direction, the effect of Greece on perception and the expected reaction of tourists were examined. At the same time, how

refugees are viewed regarding security and culture, the relationship between refugees and host communities, and the choices made by the Greek tourism accommodation sector in the face of the crisis have been analyzed. This article applied the survey technique of 811 tourist accommodation managers in the country using fuzzy cluster-qualitative comparative analysis. The results showed that the participants' choices were decoupled into three groups, which explained the refugee orientation, the emphasis on the relationship between the visitor and the local community, and the impact of host communities on tourism behavior.

Gümüş (2018: 78) tried to identify the problems faced by Syrian citizens who settled in Gaziantep with the survey application in his master's thesis on "Socio-Economic and Cultural Reflections of Migration from Syria to Turkey (Gaziantep Example)." In addition, in the second stage of the research, interviews were conducted with the local people of Gaziantep. The problems of the Syrian refugees and local people were determined, and solutions were offered.

Santos et al. (2019: 16) used the example of Portugal to examine whether immigrant expectations and perceptions lead to participatory planning to promote sustainable tourism and rural development. After the survey technique was applied to 5157 Portuguese immigrant individuals, it was determined that the immigrants who are young in the field of tourism in the country and who own a house in the countryside are more likely to invest in their tendency to return and find a job. At the same time, it has been revealed that these immigrants have more education and work experience in this field. Similarly, given the experiences and migration characteristics of these immigrants, it is assumed, using the example of Portugal, that the return of immigrants from southern European countries will stimulate tourism in the rural areas of these countries.

2. The Concept of Refugees and Immigration

Migration is a term as Decepreit as human history, defined as the voluntary or compulsory migration of people from one region to another individually or collectively for economic, social, cultural, political, and military reasons, among the leading natural or human factors. Millions worldwide have suffered from conflicts, natural disasters, persecution, violence, or human rights violations. These events force people to move away from home and take refuge in other countries. Asylum seekers and refugees, evaluated in the category of forced migration, are events that force people to leave their countries due to the pressures they are subjected to for various reasons. Refugees and asylum seekers who have left their home countries have various reasons that trigger them to face this situation. We can cite these as

threats to human life and freedom, judicial prosecution, misery, poverty, war, internal turmoil, and natural disasters as examples (Ergül, 2012:219).

Although "refugee" and "asylum seeker" are used interchangeably in the relevant literature, they are different concepts. The term "refugee" used in international law is translated into Turkish as "refugee," and the term "asylum seeker" is translated as "refugee" (Özdemir, 2017:119).

An asylum seeker has escaped from persecution in his country to ensure his safety or can prove that he has a justified fear of being persecuted. An asylum seeker is a person who has left his country for various reasons and whose asylum request is still under investigation by the country authorities from which he fled/ took refuge; that is, he has not been able to gain refugee status. The person applying for asylum is an asylum seeker until a decision is made. Asylum seekers cannot benefit from the laws of the country they take refuge in, like refugees (Salur, 2018:35).

Let us look at the definition of the legal meaning of the refugee concept. It is seen that the essential definition is in the second paragraph of Article 1A of the 1951 Geneva Convention. He defined the concept of refugee as follows; "A person who is outside his country of origin and is unable or unwilling to benefit from the protection of that country because of fear of persecution on account of his race, religion, nationality, origin or political opinion, is outside the country of residence due to such events, is unable or unwilling to return. Turkey only recognizes the refugee status of those who come to Turkey from European countries. Status of refugees coming to Turkey from other regions outside of Europe not recognized as a refugee. Due to its geographical location, Turkey has been under severe pressure to lift restrictions, especially recently. However, Turkey does not resist this stance (Magba, 2017: 11).

Geographers have defined all kinds of movements and flow due to human activities as spatial interaction. At the same time, it is also important not to think independently of the places and people who are the most influential actors in the world. Because this is the place where people interact and share. Spatial perception; therefore, the perception of space needs to be more complex to be explained either by the mind alone or by the impressions we receive from the environment. On the contrary, historical, social, conceptual, cognitive, and biological processes together constitute the perception of space (Cengiz, 2015:107). Lefebvre (1991) conceptualized space as a dialectical social production process and stated that space is produced dialectically through three fundamental or formative points: perceived, imagined, and

experienced. Within the geography of behavior, the perception of space is seen as deciphering the parts of mental maps between people in various ways (Cengiz, 2015:107).

Displacement; This is usually the forced removal of a person from his homeland or country due to an armed conflict or natural disaster and sending him to other regions (Çiçekli, 2009: 66).

An immigrant is generally defined as a person who leaves his or her country to settle or work and moves to another country or anywhere in his or her country. The concept of the migrant is mainly realized voluntarily in the hope of “improving living conditions,” and the request for this specific preparatory process is formalized as an immigration decision (Cengiz, 2015:107). Asylum seekers; are the people who want to be accepted as a refugee in the country based on the relevant national or international documents and are waiting for the result of their refugee status application (Çiçekli, 2009: 49).

3. Refugees in the World and in Turkey

The “Winds of Democracy” that began on December 18, 2010, when a Tunisian marketing graduate burned himself to death in protest at confiscating the stand, dealt a heavy blow to Syria and cost people dearly. Due to the impact of civil war, poverty, terrorism, and political repression, many people, especially in Europe, fled the country and set out for the Mediterranean Sea in danger of death (Akdoğan and Sarioğlu., 2017: 147).

Syria's uprising against the regime, which started with the "Arab Spring" in 2011, became a conflict. In recent years, the problems caused by the conflict in Syria have become one of the most critical issues of the international media. The uprising against the regime 2011 increased its violence and caused many problems, especially the refugee crisis. As a result, almost all countries worldwide are affected by migration. Especially in the second half of the 20th century, intense population movements were observed. More than 175 million people have been forced to emigrate in the last 50 years. According to the United Nations (UN) Global Migration Data 2013, 232 million people, or 3.2% of the world's population, are immigrants (Sürme, 2019: 6).

Regarding refugee mobility, Turkey is one of the countries exposed to very intensive migration. Due to the escalation of the humanitarian crisis in Syria, the movement of 300-400 Syrian citizens to the Chilvegözü border crossing in the Yayladağı region of Hatay on April 29, 2011, was the first step in the mass migration of people from Syria to Turkey. Since April 2011, Turkey has faced a sudden influx of people forced to flee Syria. Given the seriousness of the situation in Syria and the lack of conditions for refugees to return safely to their home countries,

eligible refugees are provided with temporary protection without preconditions. According to the Directorate of Migration Department of the Ministry of Interior, as of May 23, 2019, there were 3 million 608 thousand 49 Syrian refugees in Turkey. Most of these refugees, about 435,087, settle in Gaziantep (Sürme, 2019:6). Gaziantep is one of the provinces where Syrians are concentrated. Overall, when Turkey is considered, Gaziantep is the third city with the highest number of Syrian refugees after Istanbul and Şanlıurfa. Syrians prefer Gaziantep because it is a neighboring city, and its economic potential is high (Sürme, 2019: 7).

4. Refugees and Tourism

In recent years, the international bibliography has paid increasing attention to the relationship between migration and tourism, analyzing migration's positive and negative effects on a destination's tourism development. Tourism watchers fall into two opposing groups, as research on tourism and migration shows. On the one hand, it is thought that migration and tourism deter and destroy the cultural integrity and environmental wealth of the host society; on the other hand, both tourism and migration show significant economic benefits (Tsartas et al., 2019: 2).

According to the World Tourism Organization, refugees and migration contribute to the target countries to enrich societies culturally, develop the tourism product and create significant social and economic results by providing a workforce in the travel, tourism, accommodation, and tourism sectors. However, some adverse effects, such as decreased tax revenues in the countries of origin, wage deflation in the host countries, and social upheavals, have also been observed in this relationship. The tourist beaches of the Canary Islands have faced a negative impact due to the constant flow of migrants from Africa. More recently, the increasing refugee flows towards Europe have negatively affected tourists' choice of tourism destinations among Mediterranean countries, especially since tourists in the Mediterranean meet with refugees and migrants who decamp to coastal areas during their holidays (www.theguardian.com).

The impact on the countries or regions that offer asylum to refugees is becoming significant. While refugees were a temporary phenomenon in every region in the past, today, millions of refugees have been displaced for extended periods. By living in camps, these refugees are promised a stable future, and depending on the region's resources, they cause changes in both civilizations. Migration creates negative stereotypes and prejudices, especially regarding cultural differences and ethnic minority groups that offer a different lifestyle from the local population. The flow of refugees also harms tourist activity. For example, when refugees settle in tourist areas, the social dynamics can differ. Despite any initial expressions

of humanitarianism, the local community may eventually become uncomfortable and aggressive due to the fear of losing tourism jobs and income due to the hostile environment. The apparent presence of many refugees in a tourist destination can negatively affect the attitudes and behaviors of tourists, as well as the perceived security and image of the destination (Ivanov and Stavrinoudis, 2018:216).

"Stranger" highlights the need for an inclusive understanding of "refugees" with regard to tourism, which has the potential to promote tolerance and openness in increasingly complex and unwelcome societies. Anchoring these debates in the literature on tourism and marginalized communities, it can be emphasized that such groups tend to be "exploited" for their cultural capital, used to promote an area and provide various visitor experiences, but often not directly benefit. Although tourism is seen as an interpretative tool of "othering," the importance of encouraging migrants and refugees to interpret and use their cultural heritage through tourism experiences is emphasized. Tourism can promote "participatory cultural self-expression," which means supporting the inclusion of refugees by helping to develop mutual understanding between refugees and the community that receives them. Encounters between different cultures create hybrid spaces that can become centers of cultural production and "emerging belonging" for marginalized people (Burrai et al., 2022: 5).

In order to harmoniously integrate the different cultural identities of refugees, it is vital to consider their intangible aspects, such as their traditions and the cultural heritage they carry with them from their place of origin. These forcibly displaced migrants in the tourism and accommodation sectors can become an integrative part of their host societies rather than suffering further from socio-cultural exclusion. Indeed, it is argued that immigrants and such marginalized groups should be included in the production and consumption of tourism to create more inclusive and fair tourism. Inclusiveness requires self-representation, challenges pervasive power relationships, involves a broader range of people in decision-making, and provides opportunities to include new places on tourism maps. The inclusiveness of those who are decried as "foreigners" also means learning from different cultures and meaningful exchanges between hosts and guests. However, the inclusion/exclusion of immigrants or "foreigners" in tourism takes place differently, depending on the scale considered. This means that those with an immigrant background on a macro scale (i.e., at the national level) are more likely to face exclusion and hostility. At the same time, inclusive (bottom-up, grassroots) practices are more likely at a micro level (i.e., local or regional) (Burrai et al., 2022: 6).

In contemporary Western European societies, migrants are often subjected to exclusionary and repressive practices that dominate public discourse about migration. In order to solve the difficulties of forcibly displaced people, the concept of "unfamiliarity" should be a helpful term. A postmodern explanation of how political and socio-cultural changes in Western European societies have influenced "the foreigner to begin to symbolize the ambiguity that the will of the order of modernity is trying to suppress" is presented. A refugee can never be an insider in the host country, and there will always be people responsible for disrupting the system of social order they have entered. It is suggested that the relationship between "us and them" is socially constructed based on a form of collective identity (Pietsch and Marotta Dec, 2009:188).

7. Conclusion

Today, civil wars and terrorist incidents, especially in Muslim countries, have brought the refugee problem to the agenda. However, since it is known that a refugee is not under the protection of his own country as a migrant, he may be exposed to various human rights violations. On the other hand, this situation includes legal problems and economic opportunities and problems that arise due to various social, political, health, education, tourism, population and settlement, harmonization of refugees, and regulation of their legal status. In this context, according to the 2017 Global Threats Report published by the World Economic Forum, in 2016, risk took first place for the first time in the list of possible global risks, followed by large-scale unintentional migration, which was the second threat. In parallel, according to the Global Trends 2015 report prepared by the United Nations High Commissioner for Refugees (UNHCR), at the end of 2015, the number of people forcibly displaced worldwide due to violence, conflict, and human rights violations reached 65.3 billion. Of this number, 21.3 million are refugees, 40.8 million are internally displaced, and 3.2 million are asylum seekers. According to the data from the end of 2015, among the 2,754,540 people who came to Turkey, 2,541,352 were refugees, and 212,408 sought asylum.

Turkey is a country that accepts or deals with refugees who have been displaced or forced to migrate for many years due to political crises or wars. It will remain so in the future as well. However, reflecting on this in the next step sometimes leads to irreversible situations. Turkey often faces socio-economic problems due to incidents near a migration stop or transit road/bridge in the west. Faced with these developments, people living in rural areas react differently to these problems. Therefore, Turkey must address current or future migration flows as soon as possible. In this context, it is necessary to create ways /perspectives that can direct

these migration flows and discuss migration problems and solutions with other developed countries such as Turkey.

Undoubtedly, every migration movement brings with it socio-cultural and economic interactions and exchanges. Frequent migrations, for whatever reason, leave painful histories behind. This migration movement may be a hope for immigrants or a door to a new life. However, behind this door, the immigrant sometimes has to face many painful truths about his region. Sometimes it also allows you to achieve the life you hoped for. This situation is closely related to the immigration and anti-immigration policies of the target country and the economic development of the country.

Foreigners who discover Turkey and get to know it as tourists mainly migrate to the Aegean and Mediterranean coastal regions. In Turkey, foreigners mainly live in Istanbul, followed by Ankara and Antalya. The reasons why foreigners come to the capital Istanbul and the capital Ankara, the duration of their stay, and the type of accommodation differ from the migrants who come to the tourist city Antalya. Antalya is one of the most exemplary regions of the world, which is mainly preferred by elderly pensioners who migrate from North America to South America or from Northern European countries to the Southern European coasts during such holidays. Foreigners who come to these regions temporarily or permanently settle as second homeowners or rent a house for rest here. Short-term stays become permanent settlements after a certain period and become an international migration movement. Even a type of migration has emerged that has changed Turkey's position in international migration. Especially with the accession process to the European Union and the changes in the rules for foreigners to acquire property, it has become a host country for migration from developed countries. It has started to change its position as a migrant or transit country.

ABSTRACT

Human beings have lived by consuming the resources offered by the world more and faster with each passing time since the first day of existence. In particular, the dimensions of consumption that emerged after the industrial revolution have been much higher than the world's self-renewal rate. The enormous difference between human consumption and nature's self-renewal rate has revealed critical environmental problems. Although these environmental problems were initially evaluated as belonging to a regional and specific country, they have been recognized to have harmed all humanity over the years. After this acceptance, national, international, and global applications have been implemented. The European Green Deal action plan, one of these practices, aims to reduce environmental pollution by restoring ecological diversity while ensuring more efficient use of resources in a circular and clean economy. Some elements should be implemented in tourism activities and accommodation businesses within the European Green Deal framework. In the transportation sector, the most critical part of the tourism industry and where carbon emissions occur in the highest amounts, basic strategies such as reducing transportation by plane and vehicle as much as possible and developing applications with higher energy efficiency in accommodation enterprises are targeted. According to the European Green Deal criteria, tourism enterprises should have a long-term management system based on continuous improvement in a context appropriate for their size and scope and addressing the environment, sociology, culture, economy, health, and safety issues. This study offers suggestions to the tourism sector stakeholders, especially the tourism enterprises in Turkey, on what they should implement in the harmonization process within the scope of the Green Deal.

AVRUPA YEŞİL MUTABAKATI'NA UYUM SÜRECİNDE TURİZM SEKTÖRÜ

ÖZET

İnsanoğlu var olduğu ilk günden bugüne kadar dünyanın sunmuş olduğu kaynakları her geçen zamanda daha fazla ve hızlı bir şekilde tüketerek yaşamını sürdürmüştür. Bilhassa sanayi devriminden sonra ortaya çıkan tüketimin boyutları dünyanın kendini yenileme hızının çok üzerinde olmuştur. İnsanoğlunun tüketimi ile doğanın kendini yenileme hızı arasındaki muazzam fark önemli çevre sorunlarını ortaya çıkarmıştır. Bu çevre sorunları ilk zamanlarda bölgesel ve belirli bir ülkeye ait gibi değerlendirilse de yıllar geçtikçe bu sorunların tüm insanlığı olumsuz etkilediği kabul edilmiştir. Bu kabul sonrasında ulusal, uluslararası ve küresel çapta uygulamalar hayata geçirilmiştir. Bu uygulamalardan birisi olan Avrupa Yeşil Mutabakatı eylem planında döngüsel ve temiz bir ekonomide kaynakların daha verimli kullanımı sağlanırken ekolojik çeşitliliğin de eski hâline getirilerek çevre kirliliğini azaltma hedefleri yer almaktadır. Avrupa Yeşil Mutabakatı çerçevesinde turizm faaliyetlerinde ve konaklama işletmelerinde uygulanması gereken bazı unsurlar bulunmaktadır. Turizm endüstrisinin en önemli ve karbon salınımının en yüksek miktarlarda gerçekleştiği bölümü olan ulaşım sektöründe uçak ve araç ile ulaşımı mümkün olduğunca azaltma, konaklama işletmelerinde enerji verimliliği daha yüksek uygulamalar geliştirme gibi temel stratejileri hedeflenmektedir. Avrupa Yeşil mutabakatı kriterlerine göre, turizm işletmelerinin büyüklüklerine ve kapsamlarına uygun, çevre, sosyoloji, kültür, ekonomi, sağlık ve güvenlik konularını ele alan bir kapsamda ve sürekli iyileştirme temelli uzun vadeli bir yönetim sistemine sahip olmaları gerekmektedir. Bu çalışmanın amacı başta Türkiye'deki turizm işletmeleri olmak üzere, turizm sektörü paydaşlarına yeşil mutabakat kapsamındaki uyumlaşma sürecinde uygulamaları gereken konusunda öneriler sunmaktır.

Anahtar Kelimeler: Avrupa Yeşil Mutabakatı, Turizm sektörü, Sürdürülebilirlik, Karbon ayakizi

Introduction

Climate change, which is the world's biggest problem today, has emerged due to the unconscious use and consumption of natural resources and our world. With the increasing population after the Second World War and especially after the industrial revolution, everyone, male and female, they have entered a busy working life. In parallel, obtaining the right to weekly and annual holidays and social rights, such as remuneration for work done outside of eight hours per day, have strengthened economically and revealed the need for individuals to take holidays. In this context, people's trips and travels in masses have increased, and natural resources have been used unconsciously. In the 1980s, with the emergence of the ozone layer depletion issue, many ecological problems emerged.

The extreme warming caused by global climate changes and the melting of ice masses in the north of the earth has brought many disasters, including floods, an excessive rise in ocean water levels, excessive rains, tornadoes, drought, and famine. With the acceleration of industrialization and technological advances globally, energy consumption has become excessive. As a result of increasing tourism activity, the excessive use of cars and motorcycles, especially airplanes, has increased carbon gas emissions, especially in the transportation part of the tourism sector. A security threat has emerged for our planet, as factors such as the transition rate to non-recyclable disposable applications and their high preference by people triggered the global climate crisis.

The European Commission implemented the "European Green Deal" in Jul 2019, intending to create a more livable, healthy world by acting under the roof of sustainability and creating a clean, healthy, and reliable planet where ecological balance can be achieved by passing this on to future generations. The "European Green Deal" which aims to reduce carbon to zero by 2050, to prevent excessive energy consumption, or, in other words, to adopt a carbon-neutral approach, also aims to make significant and major positive transformations in the economy and industry.

1. The Effects of Tourism on the Environment

It is stated that tourism, one of the most important driving forces of economic prosperity at the global level, is associated with many areas of the economy, such as accommodation services, transportation services, communication, trade, souvenir production and sale, medical services, agricultural activities, food and beverage services and has the characteristics of supporting the development of these areas. Tourism is one of the most critical industries that ensure the increase of a country's economic and social well-being (Voronkova, 2021: 366).

While the World Tourism Organization expects tourist arrivals to reach 1.8 billion people by 2030, it expresses the importance of keeping the tourism sector, which is developing very rapidly, away from the unconscious use of natural resources (UNWTO, 2022a).

The tourism sector, the world's largest and one of the most influential sectors in economic development, is directly related to the environment in terms of the capital on which it is based. For this reason, the environment and environmental quality, including natural, historical, and cultural elements, are the most important factors affecting tourism. While the extent of the environmental quality of a destination is practical on the tourism demand for that destination, it also shapes the region's tourism development (Wang, 2018: 824). Along with being one of the largest and priority industries that make up the world economy, tourism provides positive benefits to support economic development and ensure social well-being in underdeveloped to developed countries. Although it has such a positive impact, lack of good planning in the tourism development process, lack of inclusion of local people in this development, and lack of awareness of natural resource use, which is one of the main elements of tourism, can have adverse destructive effects on biodiversity, wetlands, forest vegetation, marine life, and primarily coral reefs. However, when tourism development is managed well, it can prevent the host society in the destination from being negatively affected (GhulamRabbany et al., 2013: 117; Ehigiamusoe, 2020: 1175).

1.1. Positive Effects of Tourism on the Environment

After the industrial revolution, increasing employment, improving incomes, granting the right to education to every individual, especially women's participation in working life, intensive working life, and recognition of social rights belonging to individuals, such as annual and weekend holidays, have led to an increase in tourism activities globally. As a result of this increase, "Mass Tourism" movements made in masses and primarily focused on sea, sun, and sand have increased. Since the beginning of the 1980s, the growing awareness of the damage caused by mass tourism has caused alternative tourism varieties to attract more attention and develop. Accordingly, the developing environmental and nature conservation awareness has enabled tourism activities to be carried out with a protectionist attitude towards natural and ecological life.

The tourism sector, which is one of the most compelling sectors in the development of countries, makes positive contributions in many areas socially, economically, culturally, and environmentally, especially when its development is well planned in the destinations where it takes place, especially ensuring ecological protection, increasing employment in the region and,

accordingly, causing an increase in the incomes of residents, improving social well-being. Especially as a result of tourism activities realized within the framework of sustainability (GulamRabbany et al., 2013: 118; Türker, 2020: 1482):

- The protection of natural resource riches is ensured,
- Infrastructure and superstructure arrangements are developing further,
- More recreational areas are being created for residents and visitors to carry out activities such as recreation, entertainment, and sports activities,
- It is in a leading position in maintaining and renovating historical and cultural structures and provides individuals with awareness about protecting ecological balance and nature.

1.2. Negative Effects of Tourism on the Environment

Living things interact with other living things and the environment to meet their vital needs, especially nutrition. For this, biodiversity, an indicator of a healthy environment, is known as the most crucial requirement for the survival of living things. While the bond between man and nature continues harmoniously without interference, technology has begun to be negatively affected by factors such as industrialization, intense population growth, and urbanization. Unconsciously excessive use of many resources and fossil fuels to facilitate human life causes severe damage to the environment. Threats such as decreased biodiversity occur (Deniz, 2019: 326).

Even if the elements necessary for a destination to gain the characteristics of a tourism region consist of the natural, historical, and socio-cultural characteristics of the region, the most influential factor is expressed as the planned implementation of investments that will ensure tourism mobility in the region and the realization of tourism demand for the region (Voronkova, 2021: 326). However, since the tourism sector has a direct impact on nature, which is the area where all living beings, including humans, live their lives, it is necessary to protect nature in order to ensure the sustainability of life, especially when planning tourism in tourism destinations (Örki and Ağireseven, 2016:98).

The purpose of tourism, a service sector, consists of elements such as providing individuals entertainment, recreation, and happiness. The destination's natural environment and tourist resources are seriously damaged, especially in tourism activities where unconscious and excessive consumption occurs in dense human communities (Karakaş and Güngör, 2015: 4-5). Tourism activities carried out primarily in more rural and smaller destinations, together with excessive population density, can cause the people of the region to suffer both sociologically

and psychologically with the unconscious consumption of cultural and historical resources, especially the natural environment, and thus the host community to create an adverse reaction to tourism (Dumitru, 2012: 160-161). Developing touristic construction in rural areas and realized tourism activities:

- Endangerment or direct extinction of plant and animal existence in the region,
- Sound and noise pollution resulting from the increase in the number of people living due to tourism and touristic activities,
- Damage or destruction of habitat areas of animals as a result of recreational touristic activities such as off-road (Buckley, 2011: 401),
- Inflation increase,
- Local identity degeneration,
- The security problem and crime increase in the region with the increase in population,
- Collecting wood from forest areas for fuel use by visitors who carry out camping tourism, and therefore damage to forest vegetation,
- Deforestation due to tourist facilities or other construction and construction,
- Changes in animal behavior due to human intervention,
- Damage and ugly appearance caused by garbage piles in the tourist destination due to overcrowding,
- The crowded traffic flow brought by the dense population causes the local people to have transportation difficulties, and the resulting uneasiness and the exhaust gases produced by the vehicles cause air pollution (Sharpley, 2009: 46).
- Deterioration of the quality of water resources due to incorrect planning and practices in the discharge of toilets, septic waste, and solid waste, which are designed in an unsuitable way for nature (Chishti et al., 2020: 27722),
- As a result of intense touristic activities in the destination causes, problems such as erosion occur with soil erosion (Prasad and Kumar, 2022: 3).
- Negative results from tourism activities will improve the environment, especially in sustainable tourism practices (Solmaz, 2019: 1177). What needs to be done in order to ensure sustainability in the tourism sector and to protect the richness of tourist resources;
- To raise awareness about resource richness and the protection of these riches,

- Putting the natural and historical, and cultural richness of the destination into service,
- Correct planning for strong tourism development in tourism regions,
- To ensure that the local people and visitors have information about resource richness and the waste amount and to raise awareness,
- To carry out research and studies that will contribute to the development of tourism related to tourism activities in the destination,
- It is expressed as taking the ideas and opinions of the local people and giving them the right to speak about the tourism development to be realized in the region, ensuring their participation in this development and providing support for sustainability (Karakaş and Güngör, 2015: 5).
- Along with the environmental damage that occurs as a result of the mobility in the tourism sector, employment opportunities, workforce efficiency, production efficiency, and especially in developing countries, national income, and social welfare are negatively affected (Mishra, 2019: 1180).

2. Sustainability and Green Tourism Concepts

Sustainability, which has been used in tourism planning, development, and management since the 1980s, is often defined as a conservation-based movement associated with green tourism and ecotourism. The primary purpose of sustainability and sustainable tourism is to protect the environment (Mason, 2003: 165).

The concepts of “Sustainable Development” and “Sustainable Tourism,” which have developed over the past forty years, first became globally recognized in 1980 with the World Union for Conservation of Nature (IUCN) and the Brundtland Report in 1987 (WCED {World Environment and Development Commission: Our Common Future}, but have not started to be widely used. However, in 1990, the sustainability movement began to be implemented, especially considering the damage caused to nature by “Mass Tourism,” which arose due to excessive demand for the trio of sea, sun, and sand (Sharpley, 2009:12). However, the “2030 Sustainable Development Goals”, which the United Nations realized with 193 member countries in 2015, entered into force in January 2016 as a call for a global sustainability movement (Ticaret Bakanlığı, 2022: 6). The goals consisting of 17 essential items can be classified as follows; globally, it has been determined as eliminating hunger, eliminating poverty, combating climate change, ensuring gender equality, increasing employment, developing and implementing a high-quality education approach, using renewable and clean

energy, protecting water resources and ensuring sanitation, developing industrial entrepreneurship and infrastructure services, building sustainable cities and societies, protecting life in the oceans. In addition, sustainability has been defined as the protection of life in terrestrial areas and sustainability, peaceful and just institutions, promoting participation in shared goals, responsible production and consumption, increasing ecological, socio-October, and economic well-being, and reducing inequality to the lowest levels. The Covid-19 pandemic process, which started in 2020 and the effects of which are still ongoing, has created a global awareness of sustainability, and the importance of sustainability has gained universal priority (Ticaret Bakanlığı, 2022: 6; UNDP {Birleşmiş Milletler Kalkınma Programı}, 2022).

Table 1 Countries Making Strong Political Efforts in Environmental Sustainability Globally

Rank	Country Name	Sustainability Score
1	Switzerland	88.2
2	Sweden	86.3
3	Uruguay	85.4
4	Norway	84.4
5	Panama	83.7
6	Brazil	83.4
7	Denmark	82.9
8	France	82.7
9	Albania	82.5
10	United Kingdom	81.3

Source: WE Trilemma Index, 2022

Switzerland ranks first in the list of countries that make solid political efforts in the dimension of environmental sustainability globally, while Sweden ranks second and Uruguay third. The countries on the list have developed various energy systems supported by solid strategic tools to decarbonize and reduce their impact since 2000. When greenhouse gas emissions are combined with energy efficiency measures, they have demonstrated high performance in terms of environmental sustainability. In particular, Denmark, included in the list found in Table 1, has joined among the countries showing the best Deceleration in sustainability by providing half of its electricity consumption from wind energy, with a significant increase in renewable energy use. Apart from that, Azerbaijan has improved its energy and emission intensities, and China, which today has the title of the world's largest investor in renewable energy investment and is a leader in wind and solar energy production, has partially balanced its decarbonization efforts with a rapid increase in energy consumption. However, four out of the five renewable energy agreements concluded in 2016 were carried out by Chinese companies. It is stated that five of the six largest solar module manufacturing

companies in the world in 2017, and the largest wind turbine manufacturer in the world are China (Chiu, 2017: 3-4; WE Trilemma Index {Dünya Enerji Endeksi Üçlemesi}, 2022).

It is defined as the necessity of evaluating all the details related to sustainability when planning for tourism development, which is one of the elements that all countries experiencing development in the tourism industry should pay attention to. In order to ensure sustainability, especially in underdeveloped countries that have not achieved much development in the tourism sector, it is necessary to create a controlled tourism planning that can prevent negative situations that may arise to ensure the education of all stakeholders involved in the tourism movement by developing and implementing interrelated policies and to act from a long-term perspective. On the other hand, many developed countries that are rich in tourism resources have gained awareness of the ecological environment and acted more sensitively as a result of the damages caused by mass tourism for more than twenty years, achieved development in sustainable tourism, and experienced economic development (Riasi and Pourmiri, 2016:83).

Sustainable tourism, which is based on nature and nature conservation, is ecologically and culturally sensitive and can be easily applied economically. However, it causes negative consequences when it needs to be managed correctly. Sustainable tourism is defined as the essential element of sustainable development and, at the same time, the most effective conservation movement applied to the protection of biodiversity (Soleimanpour, 2012:17; Hall, 2019:1045).

Which is currently a leading online travel website Booking.com the Sustainable Travel Report, obtained from the results of research conducted by Un with more than 29,000 travelers in 30 countries and published in 2021, reveals the degree to which the concept of sustainability creates awareness among individuals globally and how sustainable travel goals can be transformed into practical action. Accordingly, 83% of the travelers stated that sustainable travel is of vital importance, 61% stated that they want to travel more sustainably in the future due to the Covid-19 pandemic, while 49%, which constitutes almost half of the total participants, will still pursue sustainable travel in 2021. 53% of them state that they do not have the option to travel and that their desire to travel is blocked because recycling is not provided in the businesses they stay in (Booking.com Sustainable Travel Report, 2022).

The concept of sustainability has integrated with the concept of green and has developed and implemented the green movement in all areas. Green tourism, one of the green practices, is gaining momentum under the umbrella of sustainability day by day and is expressed as an

encouraging factor in developing individuals' awareness of nature and environmental protection.

3. Ecological Protection and Climate Changes

Since the industrial revolution, there has been an increasing interest and demand for the tourism sector, which includes the historical, cultural, social, and economic structure as a whole, together with the progress and developments in many areas on a global scale. Today, with the world population reaching 7.931 billion people, it is stated that climate change is the beginning of the most significant environmental problem (Popescu, 2021: 111; The World Counts, 2022).

As stated in the fifth evaluation report of the "Intergovernmental Panel on Climate Change" (IPCC), it is stated that the main source of warming examined for climate change since 1950 is 100% caused by human-induced emissions and activities (CarbonBrief, 2022).

Table 2 Agreements to Combat Climate Change

Rank	Name of The Agreement	Date	Aim
1	Vienna Convention on the Protection of the Ozone Layer	1985	It was carried out to reduce the substances that are effective in the depletion of the ozone layer.
2	Montreal Convention on Substances that Deplete the Ozone Layer	1987	It was carried out to control the use and production of substances that deplete the Ozone Layer.
3	United Nations Environmental Convention on Climate Change	A joint venture was made in 1988, opened for signature in 1992, and entered into force in 1994.	It was realized with the joint participation of the United Nations Environment Program (UNEP) and the World Meteorological Organization (WMO) to reduce greenhouse gas emissions and enable countries to collaborate on this issue.
4	Kyoto Protocol	It was adopted in 1997 and entered into force in 2005.	It was carried out with the principle that developed countries have significant responsibilities to participate in this movement within the scope of combating Climate Change.
5	Paris Agreement	2015	To increase the resilience of the global social and economic platforms against this threat, together with the necessity for developed and developing countries to take responsibility for the threat of climate change.
6	European Green Deal	2019	It was realized to be the first continent to achieve carbon neutrality in the climate until 2050 in Europe.

Source: (Ticaret Bakanlığı, 2021; Dışişleri Bakanlığı, 2022a; 2022b; 2022c; 2022d).

The various agreements and agreements made until today in order to protect the ecological balance under the roof of sustainability and to prevent the situations and events causing climate changes are stated in Table 2; when climate change started to become an issue on the agenda with the ozone layer drilling in the early 1980s, and with this date.

The use of fossil fuels is one of the essential factors in the global climate crisis, environmental pollution, and the deterioration of ecological life. The idea that these fossil fuels used are infinite reveals the biggest misconception. Greenhouse gas emissions caused by such an unconscious use of fossil fuels cause significant damage to the earth and ecological life (Karabağ et al., 2021: 231). When the volume and heat capacity of the world's enormous oceans are examined, a large amount of heat energy is required to increase the annual average surface temperature of the world even slightly. A slight increase in global average surface temperature of about 2 degrees Fahrenheit from pre-industrial times to the present means a significant increase in accumulated heat. This change in temperature causes regional and seasonal temperatures to increase and the melting of snow cover and mass icing in the seas. While there is an increase in precipitation due to the melting of these ice masses, changes such as shrinkage or expansion occur in the habitat areas of flora and fauna (NOAA {Ulusal Okyanus ve Atmosfer Dairesi}, 2022). The tourism sector also called the “Chimney-less Industry” globally, is defined as one of the industries that produce the most greenhouse gases and harm ecological balance and climate change by making intensive energy use with its activities when evaluated at the global level due to intensive travel and tourism movements, in contrast to this definition. With the intense population growth and technological developments, travel and tourism activity, which gained speed in the 21st century, contributes to global warming by causing the greenhouse gas emission rates spreading all over the world to increase rapidly day by day. The highest increase in carbon emissions in the tourism sector consists of mobility based on transportation. It is stated that three-quarters of the carbon emissions from tourism originating from global tourism originate from transportation. (Mishra et al., 2019: 1180; UNWTO, 2022b). There are two solutions proposed by the World Tourism Organization regarding this issue. First, the second recommendation is to reduce air transportation by using public vehicles on short-distance journeys and thus contribute to the reduction of carbon ratio and to provide incentive support to tourism operators for energy efficiency and carbon improvements (Lenzen et al., 2018: 526). The fact that the tourism sector operating in developed and developing countries acts as the most critical catalyst for economic development supports the increase of sustainability efforts. Globalization is becoming an essential element in these countries, accelerating the realization of cultural and technological developments. The speed with which cultural and technological transformations are spreading globally ensures the simultaneous development of the tourism industry. One of the most correct ways for the tourism sector to support sustainable development is defined as ecological tourism. The methods and sanctions

that the government managers of these developed and developing countries will apply to improve and protect ecological tourism and environmental quality ensure the reduction of energy consumption and carbon emissions along with the preservation of ecological balance (Balsalobre-Lorente et al., 2020: 7132). However, the measurement and reduction of greenhouse gas emissions and the initiation of the climate movement, which develops the power to ensure resilience to climate-related impacts, are also crucial for the sustainability of the tourism sector (UNWTO, 2022b).

4. The Green Deal and Principles

The climate crisis is one of the biggest problems that the world has to deal with today. In December 2019, to combat climate change, the European Union launched a movement under the name of the "European Green Deal" with a budget of one trillion euros to make Europe carbon neutral by 2050. The aim of this movement is stated as to establish more modern energy systems by replacing traditional energy systems, initiate waste management, prevent water and food waste, minimize carbon emissions, protect the ecological environment and biodiversity, start applying new methods within the framework of climate change, and at the same time improve industry and economy by protecting employment (Siddi, 2020: 6; Avrupa Parlamentosu, 2020; Ticaret Bakanlığı, 2021: 6; Popescu et al., 2021: 111). The "Green Deal", which started in Europe as a climate action plan, also aims to create a significant change in the economy (Catuti et al., 2020: 1). Benefits of the "European Green Deal" (Avrupa Komisyonu, 2022):

- Ensuring the continuation of biological diversity, researching clean air, clean water, healthy and fertile soils,
- To build renovated and energy-efficient structures,
- Developing a policy to sell affordable food that protects and supports health,
- Increasing public transportation and thus minimizing the amount of carbon footprint,
- To manufacture products that can be recycled,
- Developing education and providing a transition to a more conscious and safe future,
- It is expressed as cleaner energy and technological innovations developed with the latest technology.

The fact that the principles of the "European Green Deal" are aimed at zero carbon in Europe by 2050 has provided a global impetus to this carbon zero movement and 52 regions,

1103 cities, 7126 companies, 1103 educational institutions, 541 financial companies, 60 health institutions, more than 3000 hospitals, and 24 various companies have voluntarily participated in this cooperation with the support of the United Nations (UNFCCC {Birleşmiş Milletler İklim Değişikliği Çerçeve Sözleşmesi}, 2022). Within the scope of the "European Green Deal," targets such as a 50% reduction in pesticides and excess nutrients, a 20% fertilizer reduction, a 25% increase in organic agricultural land and landscape land, and land and soil fertility preservation have been determined with policies such as "Biodiversity Strategy," "Soil to Fork" "understanding and" "Importance of Climate" (Montanarella and Panagos, 2021:1). Following the aim of the "European Green Deal" published by the European Commission in 2019, depending on the research and assessments conducted, it is stated that it is necessary to reduce greenhouse gas emissions by 45% at least by 2030 in order to prevent overheating, climate changes and negative situations that develop and are likely to develop accordingly. However, in response to this assessment, only 41 of the 250 corporate companies producing the most significant greenhouse gas emissions in the world, that is, only 16%, have started new initiatives to reduce their emission production without taking any year as a basis (Murugaboopathy and Jessop, 2021).

5. Green Deal and Affected Sectors

The "European Green Deal," implemented with the carbon neutral target until 2050, primarily aims to create a healthier world by getting rid of all the negativities arising in climate and ecological life, and in addition, aims to initiate various regulations and preventive initiatives to minimize the emission of greenhouse gas emissions in the energy, transportation, industry, finance, construction, iron and steel and agriculture sectors. Accordingly, it is stated that significant transformations are planned in the industry and economy by protecting employment (Ticaret Bakanlığı, 2021: 6). An annual investment of 260 million Euros is required to attempt to reduce temporary greenhouse gas emissions by at least 40% by 2030. Per the Paris Agreement and the Green Deal, the European Union aims to reduce its greenhouse gas emissions by at least 50% and reach the carbon zero level by 2050 (Avrupa Paramentosu, 2020; UNWTO, 2022c).

6. The Green Deal and the Tourism Sector

In order for people to live in a more livable world and for the continuation of our planet, rapid action should be taken to prevent ecological pollution, and maximum beneficial results should be revealed. Changes and new applications have been initiated in many areas to leave a cleaner world for future generations Jul. It is necessary to ensure the adaptation of the "Green

Agreement” to the tourism sector more actively by starting applications such as installing filters on factory chimneys, applying deterrent penalties to prevent environmental damage, setting an example and encouraging recycling practices, ensuring the installation of wastewater treatment systems, especially in accommodation establishments, installing renewable energy systems (Örki and Ağireseven, 2016:98). Arrangements should be made, especially in the transportation activities of the tourism sector. In addition, it is stated that the government's implementation of sanctions such as carbon tax on tourism enterprises will significantly reduce the rate of tourism-related carbon emissions (Eşitti and Duran, 2018: 606). “Feynan Ecolodge,” which operates in Jordan as a hotel known for its sustainable formation among accommodation establishments in the Middle East, is an example. The panels placed in the ceiling section of the hotel operate with solar energy using a naturally used ventilation system and water. The revenues from the hotel business are used for nature conservation and sustainability studies in the “Dana” region, which covers an area of 320 square kilometers and contains a rich ecological diversity (Bakhtiyar and Kasalak, 2017: 370). In addition, following the "European Green Deal," Iber Hotel Sarigerme Park, located in the Sarigerme District of Muğla Province, is stated as one of the leading accommodation enterprises in our country in waste management and recycling strategy (Deste et al., 2018: 226). Natural, political, social, cultural, Etc., especially the climate and climatic conditions, are of great importance for the tourism industry, which is in a susceptible structure in the face of all kinds of fluctuations. Today, climate changes experienced on a global scale have positive and negative effects on the tourism sector. Sea flooding caused by excessive accumulation of water in the seas as a result of melting glaciers, especially in coastal tourism destinations, destruction of the coastline and coasts with these floods, flooding disasters caused by excessive precipitation in the region, drought with abnormal temperature rates experienced is mentioned as negative examples that prevent tourism activities. In the regions where seasonal tourism takes place, the temperature change is caused by climate changes; for example, if the unseasonal temperature continues, the continuation of tourism activities in the destination can be an example of the positive effects caused by climate changes, especially as a result of the improvements it has made in the economy (Sevim, 2009:44). Popescu et al., as a result of the Covid-19 global pandemic (2021), examined the extent of digitalization trends that started in the tourism sector and especially in accommodation businesses, with the feature that Romania is a tourist destination and a smart city and the sustainability goal of digitalization activities in hotels in the Cluj-Napoca region, which is in a leading position in Europe. According to the results of the survey conducted with 38 hotels

located in the region, they stated that the “European Green Deal” is also effective in the tourism sector; it is necessary to increase digital applications due to the importance of reducing carbon gas emissions caused by the tourism sector and the preventive and harmful effects of the resulting environmental pollution. Wolf et al. in Tonga and Solomon Islands, which are located in the Pacific Ocean and where the source of livelihood is the tourism sector., (2021) examined the extent of the effects of climate change on tourism. In the study, the sensitivity of the tourism sector to climate change and what kind of measures should be taken for these islands in sustainability adaptation efforts were investigated. According to the results of the research, the requirements for the development of infrastructure for air and sea transportation in these islands, where the tourism sector is heavily active, to be able to create a more resistant island structure to the damage that climate changes can cause with low-capital engineering solutions and to make the use of renewable energy systems more widespread in tourism enterprises have been stated. In 2018, when Fang et al.'s studies investigating the relationship between climate change and tourism between 1990 and 2015 were examined, it was stated that there were more studies on this subject in Australia, the United States, Canada, New Zealand, and European countries and there were studies aiming to improve sustainability. However, against the adverse effects of climate changes on tourism, they examined the practices and global trends to reduce greenhouse gas emissions in tourism to minimize anthropogenic effects. Noting that climate changes play a remarkable role in tourism and the travel industry, Weir examined the history of tourism in connection with this relationship in his study conducted in 2017. According to the results of the study, it is stated that not only taking measures against the climate crisis is sufficient, but also it is necessary to carry out studies to raise the awareness of societies about sustainability and environmental protection and to implement them. Alizadeh et al. (2021) conducted a study in the Mazandaran region of Iran to investigate the extent of the effects of future predicted climate changes on tourism movements and tourism demand. Accordingly, they concluded that the winter season would be preferable for holidays because the summer season temperatures will increase in this important tourist region of Iran. They stated that indoor facility requirements would increase in case of excessive heat increase in the summer. They stated that tourism demand should be directed to seasons other than summer.

7. Conclusion

The climate crisis is one of the biggest global problems that have started to appear since the early 1980s. Many adverse developments occur at the natural, economic, and socio-cultural levels due to the climate crisis. The fact that the concept of sustainability has become more

comprehensive and that such a crisis has developed with an awareness of sustainability creates a significant contrast. The European Union, which set out with the goal of "a carbon-neutral Europe by 2050", aims to intervene in the climate crisis, increase energy efficiency and provide a more livable world by activating sustainable practices and sanctions. With the strategy of "From Soil to Fork," it is not only the European Union and its member countries to protect biological diversity, clean the soil and air from carbon gas emissions, control excessive energy consumption, and minimize the damage to the ecological balance and natural resources; all countries must act globally sensitively and consciously. Within the framework of the "European Green Deal," some elements need to be implemented in tourism activities and accommodation enterprises. A strategy should be developed to reduce transportation by aircraft and vehicles as much as possible in the transportation sector, which is an essential part of the tourism industry and where carbon emissions occur to the highest degree. In this context, it is necessary to use transportation means such as public transport, tram, or bicycle for long distances by rail or sea route and short distances. It is necessary to create and implement systems that will ensure the utilization of natural resources for all lighting, heating, and electricity activities, especially accommodation enterprises within the sector. However, the supply of products such as food and personal care supplies used in accommodation establishments should be provided by the region's people, and an economic contribution to the destination should be created. Using energy-saving devices in rooms, laundry, kitchen, and restaurant departments should be preferred in accommodation establishments. The application of sensor systems in rooms should also prevent excessive energy loss by using the insulated door and window systems. Ecological awareness should be developed by spreading recycling bins in places such as accommodation establishments, airports, museums, and recreation areas. In addition, the use of recycled products should be preferred throughout tourist services. For these practices to become widespread, support such as government incentives and tax reductions should be provided to enterprises. Initiatives such as making use of rainwater, establishing and implementing wastewater recycling systems, constructing energy-efficient buildings in the tourism sector, organizing infrastructure systems necessary for waste management, improving social awareness of sustainability, and expanding and developing green areas will make a significant contribution to sustainability while producing results following the purpose of the "European Green Deal".

Özet

İklim ve coğrafi özellikler bakımından oldukça değişken olan ve farklı floristik bölgelerin kesişim noktasında yer alan Türkiye, bitki çeşitliliği açısından oldukça zengindir. Küresel ölçekte sorun oluşturan iklimsel değişimlerin yanı sıra insan faaliyetleri nedeniyle oluşan ekolojik baskı bitki tür çeşitliliğini tehdit etmektedir. Bitki tür çeşitliliği bakımından Türkiye'nin en zengin havzalarından biri olan Yüksekova havzasında artan kuraklık ile beraber, arazi kullanım değişimleri bitki tür çeşitliliği üzerinde önemli bir baskı oluşturmaktadır. Bu çalışma kapsamında belirtilen nedenlerin Yüksekova ovasında yer alan ve doğal olarak yetişen bitki türlerinin bu gün ve gelecekteki tehlike kategorilerine etkileri araştırılmıştır. Bunun için farklı arazi kullanımlarını temsil edecek şekilde 232 ayrı noktada vejetasyon çalışmaları yürütülmüştür. Yapılan çalışmalar sonucunda Yüksekova Havzasında doğal olarak yetişen bitki taksonlarından 10 tanesinin farklı tehlike kategorilerinde değerlendirildiği tespit edilmiştir (1'i "EN" Tehlikede; 1'i "CD" Korumaya tabi; 1'i "NT" Tehdide yakın; 4'ü "VU" Duyarlı; ve 3'ü "LC" Düşük riskli). Özellikle çalışma alanında arazi kullanım değişimleri (Sulak alanların tarım arazisine dönüştürülmesi) bu bitki taksonlarının daha fazla risk altına girmesine neden olmuştur. Ayrıca iklimsel değişimlerin yanı sıra antropojenik baskılar Yüksekova Havzasında başta endemik türler olmak üzere birçok bitki tür ve çeşitliliğini önemli derecede tehdit etmektedir. Bölgedeki biyolojik çeşitliliğin korunması ve sürdürülebilirliğinin sağlanması adına gerekli önlemlerin alınması gelecek kuşakların gıda ve gen kaynakların devamlılığına katkı sağlaması açısından da önem arz etmektedir.

Anahtar Kelime: Biyolojik çeşitlilik, IUCN, koruma, Yüksekova, Hakkari

**SOME ENDANGERED PLANT SPECIES NATURALLY GROWING IN
YÜKSEKOVA BASIN**

Abstarct

Turkey is endowed with diverse climate and geographical characteristics, and is situated at the confluence of various floristic zones, thereby exhibiting abundant plant diversity. The diversity of plant species is threataened by global climatic changes and ecological pressure due to anthropogenic activities. Yüksekova is one of the richest basins in Turkey in terms of plant diversity, which is now being threatened by increasing drought and rapid land use changes. This study determined natural plant plant species growing in Yüksekova plain and theri possible danger categories. For this, 232 locations representing different land uses in the basin were surveyed during the study. The resukts revealed that 10 of the plant taxa naturally growing in the basin were evaluated in different danger categories (1 “EN” endangered; 1 “CD” subject to protection; 1 “NT” near threatened; 4 “VU” ” susceptible; and 3 “LC” low risk). Land use changes (conversion of wetlands to agricultural land) have put these plant taxa at risk in the study area. In addition to climatic changes, anthropogenic pressures threatens many plant species and diversity, particularly endemic species in the basin. Necessary measures are needed in order to protect and sustain the biodiversity in the region and to contribute towards food supply and gene resources for future generations.

Keywords: Biodiversity, IUCN, Protection, Yüksekova, Hakkari

GİRİŞ

Dünya genelinde tanımlanmış bitki tür sayısı yaklaşık 374.000 olarak bilinmektedir. Bu bitkilerin 295.383'ü çiçekli bitki olup 284.281'i ise kapalı tohumludur. Kapalı tohumlu bitkilerden 210.008'ini dikotilodon, 74.273'ünü ise monokotiledon taksonlar oluşturmaktadır (Christenhusz ve Byng, 2016; Pınar ve ark., 2021). Türkiye'nin coğrafi konumu nedeniyle Asya ile Avrupa kıtaları arasında yer alması ve topografik yapısının kısa mesafelerde değişmesi, iklim ve toprak özellikleri açısından değişkenlik göstermesinin yanı sıra Akdeniz, Avrupa-Sibirya ve İran-Turan gibi üç önemli fitocoğrafik bölgelerinin keşişim noktasında bulunması farklı habitat alanları ve zengin bir flora oluşmasını sağlamıştır. Nitekim Türkiye'de bugüne kadar kaydedilmiş 12.000 üstünde bir bitki taksonunun bulunduğu ve bu taksonların yaklaşık 1/3'nin endemik türlerden oluştuğu rapor edilmiştir (Güner ve ark., 2012).

Hakkâri ili ise endemizm açısından en zengin fitocoğrafik bölgelerden bir olan İran-Turan elementinde yer almasının yanı sıra yüksek rakımlı dağları ve kendine özgü iklim ve toprak özellikleri nedeniyle bitki florası açısından en gözde habitatlardan biridir. Nitekim bölgede 2019 yılında yapılan florastik bir çalışmada yayılış gösteren bitki takson sayısının 1150 olduğu bildirilmiştir (Ünal ve Demir, 2019). Bu taksonlar içerisinde 102 tür endemik tür olmak üzere Türkiye'deki endemik türlerin yaklaşık %3.3'nü oluşturmaktadır. Ancak bölgede kayıt altına alınmamış bitki türleri de dahil edildiğinde bu sayıların çok daha üstünde bir bitki tür sayısının yayılım gösterdiği düşünülmektedir. Aynı şekilde bölgenin bitki çeşitliliğinde olduğu gibi diğer canlı türleri açısından da zengin bir yaşam alanı olduğu bilinmektedir (Güner ve ark., 2012; Anonim, 2015).

Bölgede canlı çeşitliliği açısından en zengin alanlardan birisi de Yüksekova Havzasıdır. Havza içerisinde yer alan farklı habitat alanları hem flora hem de fauna tür çeşitliliği açısından oldukça önemli bir ekosisteme sahiptir. Ayrıca havzanın göç yolu üstünde olması ve sulak alan ekosistemi içerisinde bulundurması önemli kuş cennetlerinden biri olmasını sağlamıştır. Biyolojik çeşitlilik belirli bir habitatta tür ve gen çeşitliliği olarak değerlendirilse de, insanoğlunun ekonomik ve sosyal hayatının devamlılığı için gerekli olan temel ekosistem hizmetlerini de sağlamaktadır. Ayrıca biyolojik çeşitlilik aynı zamanda, tozlaşma, iklimsel düzenlenme, selden koruma, toprak verimliliği ve gıda, yakıt, lif ve ilaç üretimi gibi ekosistem hizmetleri için de oldukça önemlidir.

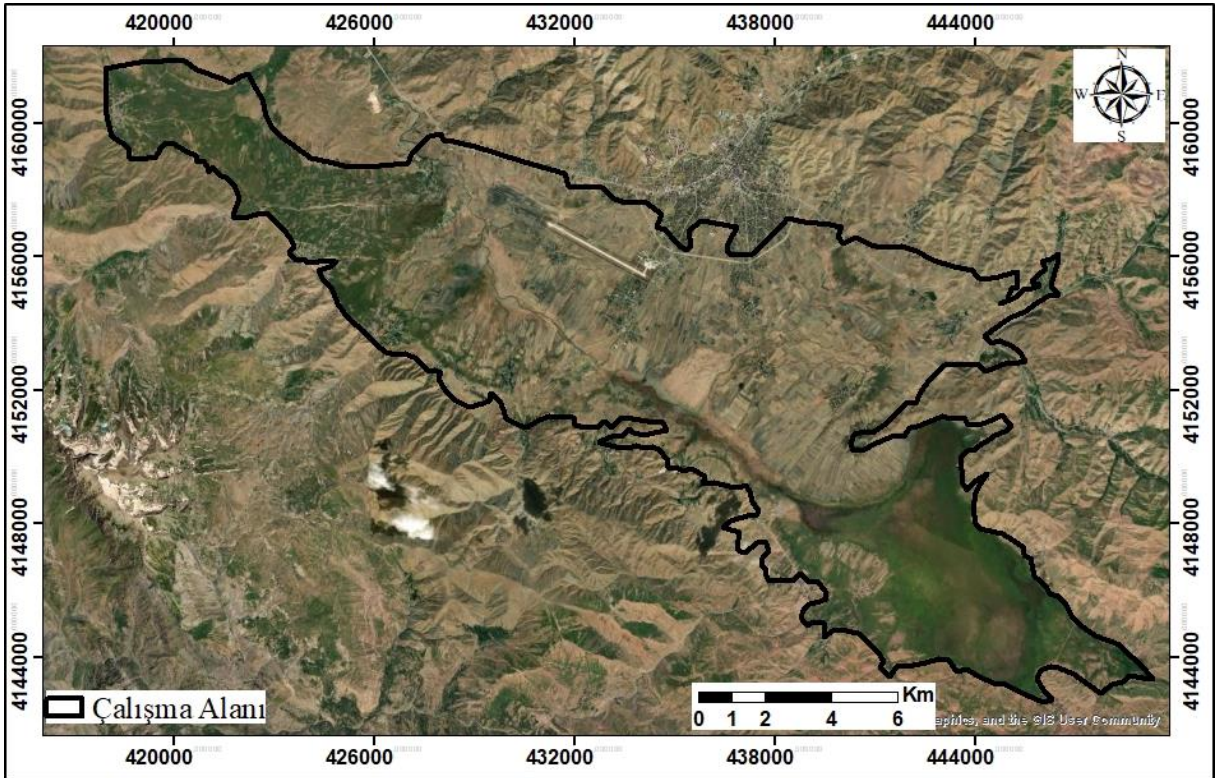

Bu çerçevede özelde Yüksekova havzası genelde ise Türkiye'nin biyolojik çeşitliliği için önemli olan ve nesli tehdit altında bulunan bitki türlerinin korunması ve sürdürülebilirliği,

gelecekte ortaya çıkabilecek gıda ihtiyacının karşılanmasında birer gen kaynağı olduğu unutulmamalıdır.

2. Materyal ve Metot

2.1. Çalışma Alanı

Çalışma alanı, 37°25'49" - 37°36'32" K enlemleri ile 44°04'21" - 44°22'56" D boylamları arasında yer almaktadır. Yaklaşık 19.5 bin ha'dan oluşan çalışma alanı etrafı yüksek dağlarla çevrili bir çöküntü ovasıdır (Şekil 1). Yirminci yüzyılın ortalarına kadar büyük çoğunluğu sulak alanlardan oluşan Yüksekova ovasında yağışların azalması ve antropojenik baskılardan dolayı sulak alanlar önemli miktarda azalmıştır. Tarım ve Orman Bakanlığı tarafından 2015 yılında havzanın tamamı (21.533 ha) ulusal öneme haiz sulak alan olarak kabul edilen alanda (Anonim, 2019) 2021 yılı itibari ile 3.203 ha'lık sulak alan kaldığı görülmektedir. Ancak yıllık yağış miktarına ve mevsime göre bu alan yaklaşık 2.700 ha ile 3.500 arasında değişmektedir.

2.2. Çalışma Alanının İklim Özellikleri

Uzun yıllar (1979-2018) ortalama yıllık yağış miktarı 762 mm, ortalama yıllık buharlaşma ise 850 mm'dir. Yıllık ortalama sıcaklık 6.9 °C olup en düşük ortalama sıcaklık Ocak (-9.3°C) ve en yüksek ortalama sıcaklık Temmuz (21.3 °C) ayında görülmektedir. Yüksekova'da yaz mevsimi çok kısa kış mevsimi ise oldukça uzundur. Son 40 yıllık iklim verilerine göre yıllık

ortalama 96 gün yağışlı geçmekte olup bunun 43 gününde kar yağışı görülmektedir. Yaklaşık 1 m'lik kar örtüsünün görüldüğü çalışma alanı ortalama 120 gün kar ile kaplı kalmaktadır (Anonim, 2019)

2.3. Çalışma Alanının Jeolojik Yapısı

Çalışma alanı'nın batısında Cilo dağı, kuzeyde Mor dağı doğusunda İran sınır dağları ve güneyinde ise Cilo dağlarının uzantısı olan Sibiriz sıra dağları bulunmaktadır. Alanda Kuzeybatı-Kuzeydoğu hattı boyunca Bitlis Metamorfileri (Ultra bazik kayaç, serpantin), Sekse Formasyonu (konglomera, kumtaşı, kil taşı ve kireçtaşı) ve Kırkgeçit Formasyonu (kumtaşı, marn ve şeyl türü kayaçlar) özellikli jeolojik materyaller yer almaktadır. Çalışma alanının Güneybatı-Güneydoğu hattı boyunca ise Urşe Formasyonu (kireç taşı, kumtaşı ve şeyl), Kandilli Kireçtaşı ve Yüksekova Karmaşığı (volkano-sedimenter kayaçlar ve kireçtaşı) özellikli materyaller bulunmaktadır (Sançar, 2018).

2.4. Sürvey Çalışmaları

Çalışmada bölgede yayılım gösteren bitki taksonları belirlemek amacıyla 2020-2021 yıllarında sürvey çalışmaları yapılmıştır. Sürvey çalışmaları bitkilerin çiçeklenme dönemleri dikkate alınarak Mayıs-Haziran ve Ağustos-Eylül ayları olmak üzere farklı dönemde ve bölgeyi temsil edecek şekilde belirlenmiş toplam 232 noktada yürütülmüştür. Her lokasyonda yayılım gösteren bitki türleri incelenmiş ve herbaryum alınmıştır. Arazide teşhisleri yapılmayan bitki taksonları laboratuvarında incelenmiş ve teşhisleri yapılmıştır (Davis, 1965-1985). Ayrıca bitkilerin Türkçe bilimsel isimlendirmesi Türkiye Bitkileri Listesi'deki (Damarlı Bitkiler) isimlendirme baz alınarak yapılmıştır (Güner ve ark., 2012).

3. BULGULAR

Bölgede yapılan bitki sürvey çalışmaları sonucunda toplam 232 lokasyonda farklı familyalara ait toplam 404 bitki taksonu tespit edilmiştir. Bu türler dünya genelinde yayılım olan kozmopolit türlerin yanı sıra sadece Türkiye florasında yayılım gösteren endemik türlerde olduğu tespit edilmiştir. Ayrıca çalışmada havzada yayılım göstere ve nesli tehlike altında olan 10 bitki taksonu da saptanmıştır. Örneklem noktalarında tespit edilen bitki taksonları Tablo 1'de verilmiştir.

Çalışmada 232 lokasyonda yapılan sürvey çalışmaları sonucunda bölge florasında yayılım gösteren 404 taksonun 10'u nadir olan türler olarak belirlenmiştir. Ayrıca bu türlerin 3 tanesinin (*Achillea nobilis*, *Inula helenium* ve *Alyssum huetii*) endemik olduğu tespit edilmiştir (Güner

ve ark., 2012; Pınar ve ark., 2018). Nitekim havzada 2015 yılında yapılan bir çalışmada benzer bitki türlerinde dahil olduğu 17 endemik bitki türünün yayılım gösterdiği ve IUCN tehlike kategorilerine göre 2'si "CR" kategorisinde 1'i "EN" kategorisinde, 2'si "VU" kategorisinde ve 11'i ise "LC" kategorisinde yer aldığı belirtilmiştir. Aynı çalışmada bölgede yayılım gösteren ve endemik olmayan ancak nadir tür olan 11 bitki taksonu doğal olarak yetiştiği tespit edilmiştir. Bu türlerin 8'i "VU" kategorisinde (*Eryngium thyrsoideum*, *Trigonosciadium viscidulum*, *Trachydium depressum*, *Centaurea gigantea*, *Centaurea nemecii*, *Centaurea persica*, *Isatis cappadocica* subsp. *macrocarpa* ve *Ranunculus crymophilus*), 1'i "LC" kategorisinde (*Allium shatakiense*), 2'si ise "DD" kategorisinde (*Artemisia haussknechtii* ve *Echinops tournefortii*) yer aldığı belirtilmiştir (Anonim, 2015). Ayrıca Türkiye florasında bu güne kadar kayıtlı bitki türleri içerisinde 2221 taksonun farklı tehlike kategorilerine göre tehdit altında olduğu belirtilmiştir (Güner ve ark., 2012). Dünya genelinde ise "THE IUCN RED LIST OF THREATENED SPECIES" in 2000-2022 verilerine göre bitkiler dahil olmak üzere 150.388 canlı türünün tehlike altında olduğunu rapor edilmiştir (Anonim 2023).

Şekil 1. Yüksekova Havzası doğal olarak yetişen ve tehdit altında bulunan bazı bitki taksonlara ait görseller

Türkiye dahil olmak üzere küresel düzeyde iklim değişikliği ve antropojenik baskılar nedeniyle ekosistemdeki birçok canlı türünün nesli tehdit altındadır. Özellikle son yıllarda etkisi daha fazla hissedilen küresel ısınmanın sulak ekosistemleri daha fazla etkilediği bilinmektedir. Bununla beraber sulak ve çayırılık alanlarının tarım arazilerine dönüştürülmesi yayılım gösteren bitki türlerin yok olmasına neden olmaktadır. Bu yönüyle Yüksekova havzasında yer alan “Nehil Sazlığı” drenaj faaliyetleri ve alanı kurutma çalışmaları, bölgedeki biyolojik çeşitliliği (özelliklede sucul ve geofit türlerin) açısından tehdit oluşturmaktadır. Bu yönüyle bölgede hem doğal ekosistemin hem de tarım ekosistemin sürdürülebilirliği açısından plansız ve geliş güzel açılan drenaj kanallarının açılmasının önlenmesi biyoçeşitliliğin korunması ve sürdürülebilirliğinin sağlanması açısından önemli olacaktır. Ayrıca ovada çarpık kentleşme, çevre etki değerlendirme (ÇED) raporu dikkate alınmadan maden sahalarının açılması, yol çalışmalarının yürütülmesi ve şehir atıklarının geliş güzel doğaya bırakılması gibi faktörlerin doğal ve çevre bozulmalarına neden olmayacak şekilde planlanması ve uygulanması gerekmektedir. Endemik türler başta olmak üzere doğal floradaki bitkilerin aşırı ve bilinçsiz toplanması gibi faaliyetlerinin de önlenmesi bölgenin doğal ekosistemdeki bitki tür çeşitliliğinin geleceği açısından oldukça önemli olacaktır.

Teşekkür

Bu çalışmada elde edilen veriler **1190947** nolu **TÜBİTAK** projesi kapsamında elde edilmiştir. TÜBİTAK’a desteklerinden dolayı teşekkür ederiz.

Özet

Toprak strüktürünün göstergelerinden biri olan ortalama ağırlık çapı (OAÇ), toprakta suya dayanıklı agregatların stabilitesini ve aynı zamanda toprakların erozyona karşı direncini ölçmek için yaygın olarak kullanılan bir indekstir. Bu nedenle de birçok araştırmacı tarafından MWD, toprak kalitesinin önemli göstergeleri arasında tanımlanmaktadır. Bu çalışmanın amaçları, farklı arazi kullanımları altındaki Yüksekova ovasında yer alan arazilerde toprakların OAÇ değerlerini belirlemek, AOÇ değerlerinin çalışma alanındaki mekânsal değişkenliğini modellemek ve haritalamaktır. Çalışma alanında oluşturulan 800x800 m'lik kare gridlerin yaklaşık köşe noktalarında 0-20 cm toprak derinliğinden toplam 232 farklı noktadan toprak örnekleri alınmış ve OAÇ değerleri belirlenmiştir. Çalışma alanında, OAÇ değerleri 0.08 mm ile 3.95 mm arasında değişim göstermiştir. Çalışma alanının çayır-mera bölgelerinde OAÇ değerleri ortalama 1.82 mm iken tarım arazilerinde AOÇ değeri yaklaşık %55 daha düşük (0.82 mm) idi. Alanda toprak işlemenin yoğun yapıldığı alanlarda organik karbon içeriğinin azalmasına bağlı olarak OAÇ değerleri önemli derecede azalmaktadır ve bunun sonucunda da ova toprakları erozyona karşı daha hassas duruma gelerek toprak kalitesinin düşmesine neden olmaktadır. Bulgular yarı-kurak ve sulama imkânlarının sınırlı olduğu Yüksekova ovasında geleneksel toprak işleme yöntemleri yerine, anızın en az %30 ve daha fazlasının arazinin yüzeyinde bırakıldığı azaltılmış toprak işleme uygulamalarının adaptasyonunun, organik karbon kaybını azaltarak OAÇ değerlerinin ve nihayetinde de toprak kalitesini iyileştirmesine katkı sağlayacaktır.

Anahtar Kelimeler: Toprak Kalitesi, Ortalama Ağırlık Çap, Agregat, Mekânsal Değişim,

**SPATIAL VARIABILITY OF MEAN WEIGHT DIAMETER AS A QUALITY
INDICATOR OF YUKSEKOVA SOILS UNDER DIFFERENT LAND USES**

Abstract

Mean weight diameter (MWD), an indicator of soil structure, is a commonly used indicator to assess the water-resistant aggregate stability in soils and also to evaluate the resilience of soils to erosion. Therefore, the MWD is identified as an important indicator of soil quality by many researchers. The objectives of this study were to i.) determine the MWD values of soils in the lands, located in the Yüksekova plain, under different land uses, and ii.) model and map the spatial variability of MWD values in the study area. Soil samples were collected from a total of 232 different points at 0-20 cm soil depth in approximately the corners of the 800x800 m square grids created in the study area and MWD values were determined. The MWD values in the study area varied between 0.08 mm and 3.95 mm. The average MWD value in meadow-pasture lands was 1.82 mm, while the MWD value was approximately 55% lower (0.82 mm) in agricultural lands. The results suggested that the implementation of reduced tillage practices, in which at least 30% or more of the stubble is left on the land surface, rather than conventional tillage in the semi-arid and restricted irrigation areas of the Yüksekova plain will contribute to the improvement of MWD values and ultimately soil quality by reducing organic carbon loss.

Keywords: Soil Quality, Mean Weight Diameter, Agregatte, Spatial Analysis

Giriş

Ortalama ağırlık çapı (OAÇ), toprakta agregatların büyüklüğüne bağlı olarak bir toprak örneğinin ortalama parçacık boyutunu tanımlamak için kullanılan bir indekstir. Ortalama ağırlık çapı, bir kısım fiziksel (infiltrasyon, hidrolik iletkenlik, boşluk oranı ve erozyona karşı direnç gösterme yeteneği gibi), kimyasal (organik maddenin parçalanma düzeyi, C/N dinamikleri ve besin döngüsü gibi) ve biyolojik (bitki kök gelişimi, mikrobiyal çeşitlilik ve aktivite gibi) toprak özelliklerine etkisi nedeni ile birçok araştırmacı tarafından toprak kalitesinin bir göstergesi olarak kullanılmıştır (Souza ve ark., 2014; Çelik ve ark., 2021; Franzluebbbers, 2022).

Agregat oluşumu ve dayanıklılığı, organik madde, kil, kireç, demir-alüminyum oksitler gibi çeşitli bağlayıcı maddelerin topraktaki miktarına bağlı olarak değişebilmektedir. Toprakta agregatlar ıslanma/kuruma, donma/çözülme ve kök büyümesi gibi faktörlerin etkisi ile bir araya gelerek farklı büyüklükte doğal yapılar oluştururlar. Oluşan bu doğal yapılar, makro ve mikro agregatlar olmak üzere 2 ayrı sınıfa ayrılırlar. Makro agregatlar, çıplak gözle görülebilen ve tipik olarak 0.25 mm'den daha büyük agregat birimleridir ve bitki büyümesi ve mikrobiyal aktivite için gerekli olan suyun tutulması, toprak profiline suyun girişi ve profil içerisindeki suyun hareketi ve hava değişimi için boşluk alanlarını sağlarlar. Mikro agregatlar ise 0.25 mm'den daha küçük olan agregat birimleridir ve toprak yapısı ve besin döngüsü için önemlidirler. Mikro agregatlar, toprak mikroorganizmaları için yaşam yeri ve gelişimleri için gerekli su ve karbon kaynağının tutulduğu geniş bir yüzey alanı sağladığından besin elementlerinin döngüsünün artmasına ve toprak verimliliğinin korunmasına da yardımcı olurlar (Wang ve ark., 2016). Toprakta makro ve mikro agregatların bir arada bulunması ve kararlı bir yapı oluşturması toprak kalitesi açısından oldukça önemlidir (Nichols ve Toro, 2011). Nitekim çok sayıda mikro agregatların bir araya gelerek oluşturduğu makro agregatların varlığı, su tutma kapasitesi, hidrolik iletkenlik, infiltrasyon, havalanma karbon/azot dinamikleri, mikrobiyal çeşitlilik ve aktivitesi üzerine önemli olumlu etkiler oluşturmaktadır.

Toprakta agregatlarının büyüklüğünü önemli kılan diğer önemli bir konu, karbon (C) dinamikleri üzerine olan etkileridir. Genel olarak, makro agregatlar mikro agregatlara kıyasla C açısından daha zengindir (Six ve ark., 2000). Ancak mikro agregatlarda yer alan toprak organik karbonu (TOK), makro agregalardaki TOK'nuna kıyasla ayrışmaya karşı daha dirençli olduğundan, toprak için rezerv C olarak nitelendirilebilir (Yılmaz ve ark., 2019). Bu nedenle, toprakta hem makro hem de mikro agregatların oluşumu, C döngüsü üzerine önemli bir etkiye sahiptir. Yudina ve ark. (2022), mikro agregatların bir araya gelerek makro agregatları oluşturduğu ve ıslanmaya karşı daha kararlı bir yapı sergilemesinin, toprakların su ve rüzgar

erozyonuna karşı direnç göstermesini sağladığını beyan etmişlerdir. Bu nedenle, agregatların su ile teması (ıslanması) sonucunda kararlı/stabil yapı sergileyip sergilemediğinin ortaya konulmasında OAÇ, önemli bir gösterge olarak kabul edilmektedir. Agregatların ıslanma sonucunda kararlı bir yapı göstermesi, mikro agregatların parçalanmaması veya diğer bir ifade ile erozyona maruz kalmaması hem kararlı karbon miktarının toprakta tutulması hem de besin döngüsü ve su depolaması açısından önemlidir.

Toprağın OAÇ değeri ne kadar büyük olursa, toprak yapısının o denli kararlı kabul edilir (Zhou ve ark., 2020). Bugüne kadar yapılan birçok çalışmada, OAÇ'nın toprak organik madde içeriği ile ilişkili olduğu bildirilmiştir (Das ve ark., 2014; Zhou ve ark., 2020). Çalışmaların çoğunda, OAÇ ve TOK arasındaki güçlü ilişki, toprak agregatlarının kararlılığına neden olduğu şeklinde yorumlanmıştır (Das ve ark., 2014). Toprak agregatlarının oluşumu, büyüklüğü ve kararlılığı toprak oluşum faktörlerinin yanı sıra toprak yönetim sistemlerine bağlı olarak önemli düzeyde değişkenlik göstermektedir (Çelik ve ark., 2021). Bu çalışmada, yarı kurak bir iklime sahip olan Yüksekova ovasında mera/biçenek ve tarım arazisi altındaki arazilerde, toprakların OAÇ değerlerinin belirlenmesi, ve jeostatistiksel yöntemler ile mesafeye bağlı değişkenliklerinin modellenmesi ve haritalanması amaçlanmıştır.

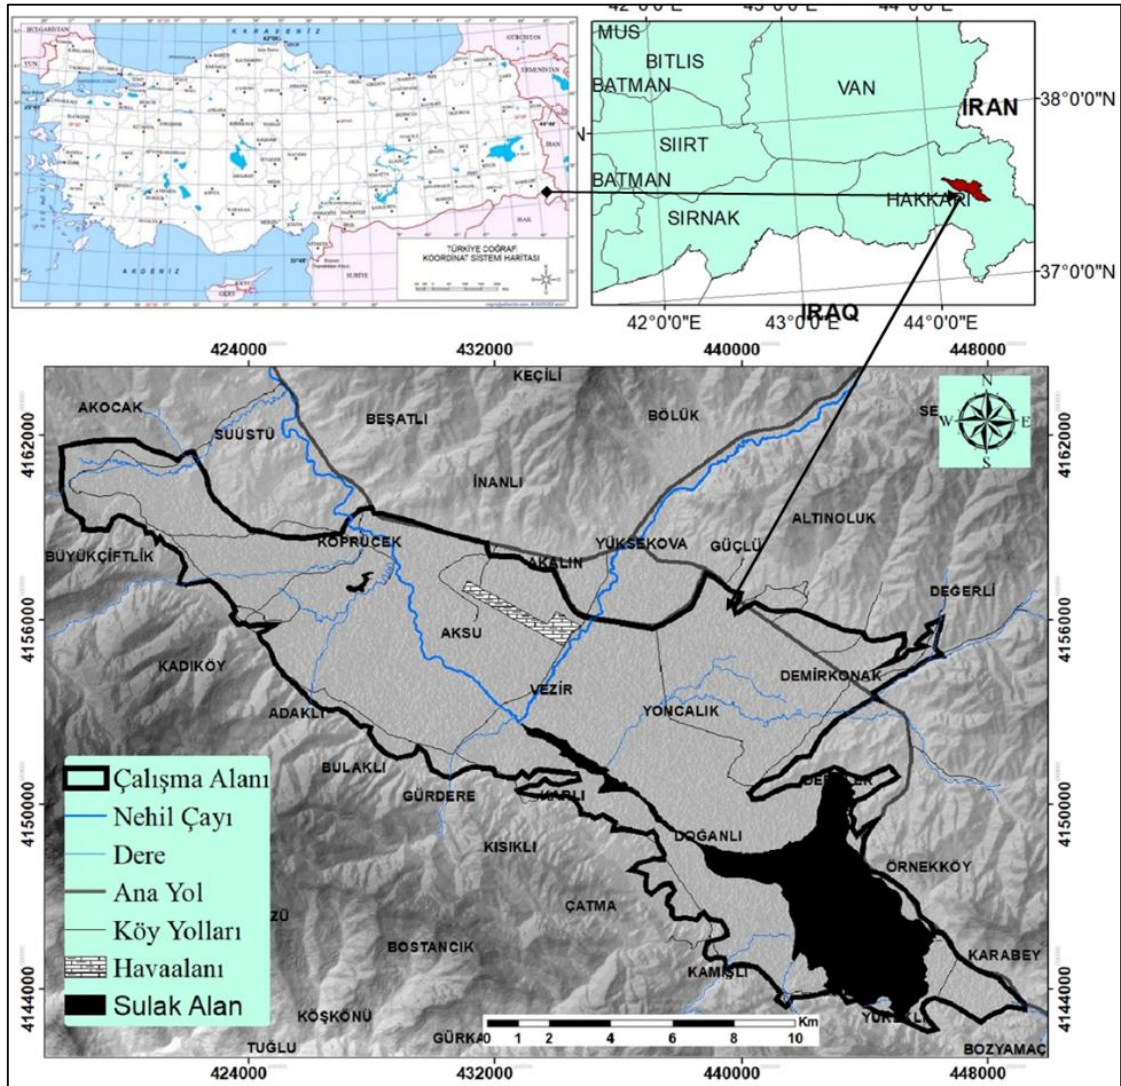

Materyal Metod

Çalışma alanı

Çalışma alanı, 37°25'49" - 37°36'32" K enlemleri ile 44°04'21" - 44°22'56" D boylamları arasında yer almaktadır. Yaklaşık 17.5 bin ha'dan oluşan çalışma alanı etrafı yüksek dağlarla çevrili bir çöküntü ovasıdır (Şekil 1). Yirminci yüzyılın ortalarına kadar büyük çoğunluğu sulak alanlardan oluşan Yüksekova ovasında yağışların azalması, ovadaki yerleşim ve tarımsal üretim için yeni arazi arayışı gibi insan etkisi nedeniyle sulak alanlar önemli miktarda azalmıştır. Uzun yıllar (1979-2018) ortalama yıllık yağış miktarı 762 mm, ortalama yıllık buharlaşma ise 850 mm'dir. Yıllık ortalama sıcaklık 6.9 °C olup en düşük ortalama sıcaklık Ocak (-9.3°C) ve en yüksek ortalama sıcaklık Temmuz (21.3 °C) ayında gerçekleşmektedir. Yüksekova'da yaz mevsimi çok kısa ve kış mevsimi ise oldukça uzundur. Son 40 yıllık iklim verilerine göre yıllık ortalama 96 gün yağışlı geçmekte olup bunun 43 gününde kar yağışı görülmektedir. Yaklaşık 1 m'lik kar örtüsünün görüldüğü çalışma alanı ortalama 120 gün kar ile kaplı kalmaktadır (Anonim, 2019).

Yüksekova ovasındaki arazilerin önemli bir kısmında tarla tarımı yapılmakla beraber büyük çoğunluğu sulak alanların kurumasından sonra oluşan çayır-mera (büyük çoğunluğu biçenek olarak kullanılmaktadır) alanlarından oluşmaktadır. Zira toprak örnekleme noktalarından 130'u

çayır/mera alanlarına, geriye kalan 102'si ise ekili alanlara denk gelmiştir. Ekili tarım arazilerine dönüştürülen alanlarda yoğunlukla buğday ve yonca olmak üzere nohut ve fiğ yetiştiriciliği yapılmaktadır. Çayır-mera olarak kullanılan alanlarda ise çoğunlukla saz çimi (*Calamagrostis pseudophragmites* (Haller) Koeler), çayır it kuyruğu (*Phleum pratense* L.), eres çimi (*Lolium persicum* Boiss. & Hohen.) yumrulu salkım (*Poa bulbosa* L.), sina ayak otu (*Carex* spp), seyrek saz (*Eleocharis* spp.), yonca (*Medicago sativa* L. subsp. sativa), ak üçgül (*Trifolium repens* L. var. repens), at kuyruğu (*Equisetum arvense* L.), çayır üçgülü (*Trifolium pratense* var. pratense L.), dere nanesi (*Mentha longifolia* (L.) subsp. typhoides (Briq.) Harley), kırk damar otu (*Plantago lagopus* L.), ibubuk otu (*Bromus danthoniae* Trin. subsp. *Danthoniae*), cilo düğün çiçeği (*Ranunculus arvensis* L.) ve çınarcık (*Ranunculus sericeus* Banks & Sol.) bitkileri bulunmaktadır.

Şekil 1. Çalışma alanının konumu

çapraz değerlendirme yöntemi ile toprak örneği alınan noktaların AOÇ değerleri kullanılarak, elde edilen model kullanılarak örneklenmeyen noktaların OAÇ değerlerinin tahmin değerleri arasındaki ilişki düzeyi belirlenmiştir. Semivariogram elde edilmesi ve çapraz değerlendirme işlemleri ile elde edilen parametreler (nugget, sill, range, aktif lag değeri ve komşu sayısı) kullanılarak, ArcGIS 10.8 paket programının jeostatistik modülünde yer alan ordinary kriging yöntemi ile mekânsal değişim haritası hazırlanmıştır.

Bulgular ve Tartışma

Tanımlayıcı İstatistik Verileri

Farklı arazi kullanımlarının bulunduğu Yüksekova ovasında toprakların ortalama ağırlık çapı değerlerine ait istatistiksel parametreler Tablo 1’de verilmiştir. Çalışma alanında OAÇ değerleri 0.08 mm ile 3.95 mm arasında değişmekte olup ortalama OAÇ değeri 1.36 mm’dir. Farklı arazi kullanımlarının OAÇ’na olan etkisi ortaya koymak için mera/biçenek ve tarla bitkilerinin olduğu arazilerden alınan örnekler ayrı değerlendirilmiştir. Mera/biçenek alanlarına ait toprakların OAÇ değerleri tarım arazilerine kıyasla çok daha yüksek idi (Tablo 1). İşlemeli tarımın yapıldığı arazilerde toprakların OAÇ değeri 0.82 mm iken çayır/mera alanlarında bu değer 1.81 mm olarak ölçülmüştür (Tablo 1; Şekil 3). Mera/biçenek olarak kullanılan arazilerinin topraklarında, işlemeli tarım yapılan arazilere kıyasla daha yüksek organik madde birikmiş olması, daha yüksek olan OAÇ değerlerinin ana nedenidir. Budak ve ark. (2023). Yüksekova ovasında mera alanlarında ilk 10 cm toprak derinliğinde TOK içeriğinin ortalama 51.65 g kg^{-1} , işlemeli arazilerde ise 23.59 g kg^{-1} olduğunu bildirmiştir. Bu durum çalışma alanında OAÇ değerlerinin artmasında organik maddenin daha yüksek olmasının etkili olduğunu ortaya koymaktadır. Bugüne kadar yapılan birçok çalışmada da toprakta organik madde birikiminin makro-agregat oluşumunu önemli derecede arttırdığı bildirilmiştir (Six ve ark., 2000; De Gryze et al., 2005; Yılmaz ve ark., 2019).

Tablo 1. Çalışma alanı topraklarının ortalama ağırlık çapı değerlerine ait istatistiksel veriler

	N	En Küçük	En Büyük	Ortalama	S.Sapma	Vary. Kats.	Basıklık	Çarpıklık
			mm			%		
Tüm Veri	232	0.08	3.95	1.36	0.89	65.70	-0.52	0.59
Çayır/Mera	129	0.15	3.95	1.81	0.86	47.66	-0.72	0.14
Tarım Arazisi	103	0.08	3.05	0.82	0.59	71.86	1.81	1.24

Şekil 3. Farklı arazi kullanımları altındaki toprakların ortalama OAC değerleri (mm).

Ortalama Ağırlık Çapı Değerlerinin Mekânsal Değişiminin Modellenmesi ve Haritalanması

Yüksekova ovası topraklarının ortalama ağırlık çapı değerlerinin mekânsal değişkenliğinin tanımlanmasında kullanılan semivariogram modeline ait parametreler Tablo 2’de verilmiştir. Çalışma alanı için OAC değişkenliğini en iyi tanımlayan model küresel (spherical) model olmuştur. Arazide toprak özeliğinin mekânsal bağımlılığın boyutunun karakterize edilmesinde uzaysal bağımlılık yaygın olarak kullanılmaktadır. Ova topraklarında OAC değerleri için elde edilen uzaysal bağımlılık değeri %45.57 olup (Tablo 2) Wang and Shao (2013)’e göre uzaysal bağımlılık orta düzeydedir. Örnekler arası uzaysal bağımlılığın çok kuvvetli olmaması kısa mesafelerde örnekler arası benzerliğin azaldığına işaret etmektedir. Bu durum, etraftaki yüksek arazilerden ovaya inen Nehil çayının yanı sıra birçok dere yatağının alana farklı karakterdeki materyalleri depolamış olması ile ilişkilendirilebilir. Ayrıca, arazi kullanımlarında kısa mesafelerdeki değişimler de toprak organik karbon içeriğinin kısa mesafelerde farklılaşmasına neden olduğundan (Budak ve ark., 2023), çalışma alanında OAC değerleri kısa mesafelerde değişmektedir.

Tablo 2. Çalışma alanı topraklarının OAC değerlerinin mesafeye bağlı değişkenliğinin modellenmesinde kullanılan semivariyograma ait parametreler

OAC	Semivariogram					Çapraz Değerlendirme		
	Model	Nugget	Sill	% UB	Range	RSS	r^2	Komşu sayısı
Küresel	0.36	0.79	45.57	2032	1.89E-03	0.98	4	0.70

*OAC: ortalama ağırlık çapı; UB: Uzaysal bağımlılık; RSS: Artık Kareler Toplamı

Tahmin edilen iki nokta arasındaki benzerliğin anlamlı olduğu mesafesinin belirlenmesinde range değeri kullanılmaktadır (Iqbal ve ark., 2005). Range değerleri ovada benzerliğin 2032

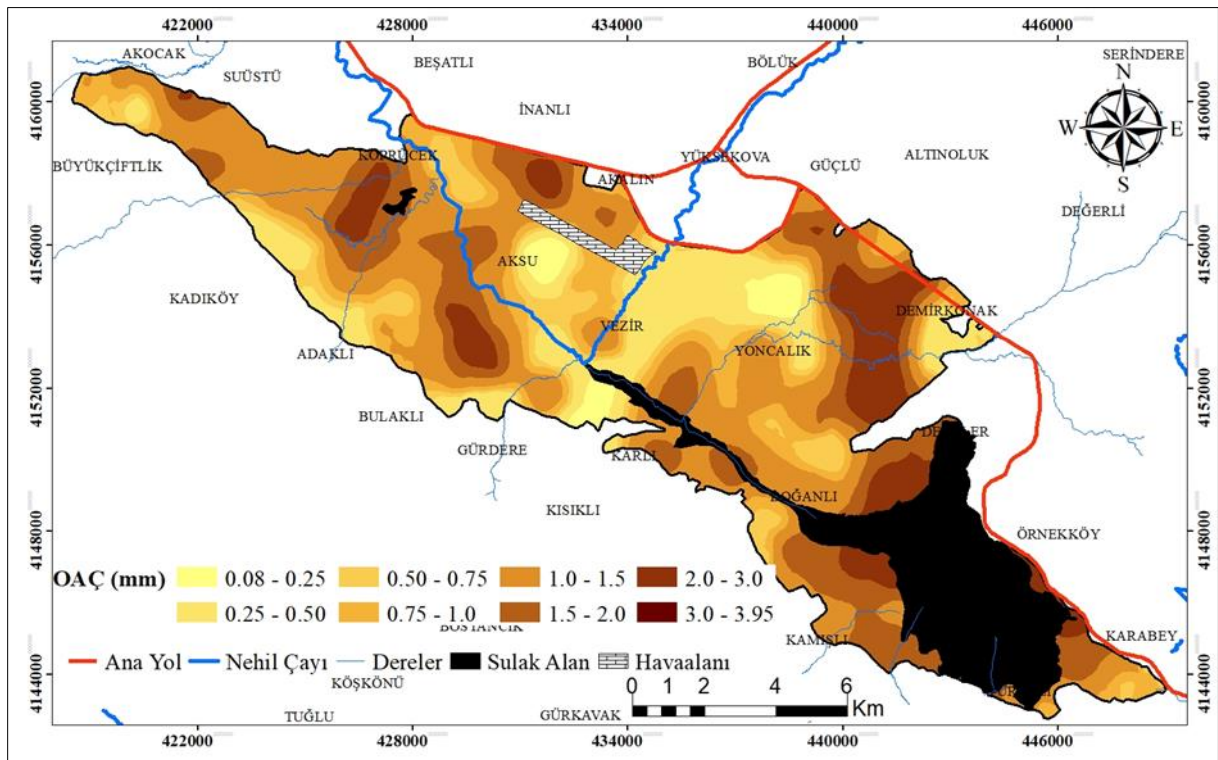

m'ye kadar anlamlı olduğu bu mesafeden sonra ise, anlamlı bir otokorelasyonun olmadığı anlaşılmaktadır (Şekil 4). Arazi yönetim sistemleri yanı sıra toprak organik C, kil ve kireç içeriğindeki değişimler OAÇ değerlerinin mekânsal değişimi üzerinde önemli bir etkiye sahiptir. Zira bu özellikler kısa mesafelerde dahi toprak toprakların birçok fiziksel (agregat stabilitesi, hidrolik iletkenliği, boşluk oranı, su tutma kapasitesi), kimyasal (katyon değişim kapasitesi, besin elementi depolama durumu) ve biyolojik (mikrobiyal çeşitlilik) özelliklerinin değişmesine neden olmaktadır (Kühn ve ar., 2009; Summers ve ark., 2011; Salehi ve ark., 2011; Naimi ve ark., 2021).

Şekil 4. Çalışma alanı topraklarının OAÇ için edilen semivariogram modeli ve çapraz doğrulama grafiği

Semivariogram modelleri oluşturulduktan sonra ordinary kriging yöntemi ile hazırlanan OAÇ ait mekânsal dağılım haritası şekil 5'te verilmiştir. Çalışma alanının güneydoğusunda yer alan sulak alan etrafındaki arazilerde ve sulak alan niteliğini kaybedip mera alanlarına dönüşen arazilerde (Köprücek göyünün Güneyi, Demirkonak köyünün Güney ve Güney Batı'sı) OAÇ değerleri 2 ile 3.95 mm arasında değişim gösterirken tarım arazilerine dönüştürülen (Aksu, Vezirli ve Yoncalık köylerinin yakınları) arazilerde OAÇ değerleri yer yer 0.08 mm'ye kadar düşmüştür (Şekil 5). Bu durum, özellikle pulluk gibi toprağı ters çevirerek işleyen aletlerin kullanılması, organik maddenin hızla ayrışıp azalması ile ilişkilidir. Rakotovao ve ark.. (2017), toprak işleme uygulamalarının organik maddenin daha fazla ayrışmasına neden olduğunu ve zaman içerisinde toprakta organik karbon kayıplarının hızlandığını bildirmiştir. Sürekli olarak işlenen tarım arazilerinde topraktaki makro agregatlar parçalanmakta, toprakta havalanma artmakta ve özellikle mikro agregatlar içerisinde korunan organik karbon mineralize olmaktadır. Mineralizasyonun şiddetine bağlı olarak toprakta organik madde içeriğinde önemli azalmalar meydana gelmektedir. Çalışma alanında farklı ana materyallerin olması yanı sıra

arazi kullanımlarındaki değişimlerden kaynaklanan organik karbondaki değişimler OAC değerlerinin yüksek bir değişkenlik deseni sergilemesine neden olmuştur. Bir arazide, OAC değerlerinin (agregat çaplarının) yüksek olması toprakların havalanma, suyun infiltrasyonu ve hidrolik iletkenlik gibi birçok fiziksel özeliğine olumlu etkide bulunmaktadır. Bu durum suya daha dayanıklı agregatların oluşmasına (Zhang ve ark., 2016; Guo ve ark., 2020) ve aynı zamanda toprakların erozyona karşı direncinin artmasına neden olmaktadır (Marakoğlu ve ark., 2019). Özellikle de yoğun toprak işleme, yöntemleri topraktaki agregatların parçalanmasına neden olduğundan erozyona karşı direncin azalmasına ve nihayetinde de toprak kalitesinin azalmasına neden olmaktadır.

Sonuç

Yüksekova ovası topraklarında ortalama ağırlık çap değerinin yüksek olması, yüksek organik madde içeriği ile ilişkilidir. Ancak, tarımsal üretim için kullanılan arazilerde, organik madde içeriğinin azalması OAC değerlerinin de hemen yakınlarındaki mera veya biçenek olarak kullanılan ve yüksek organik madde içeriğine sahip arazilerdeki OAC değerlerine kıyasla önemli miktarda düşük olmasına yol açmıştır. Dünyanın birçok yerinde olduğu gibi, çalışma alanında da toprak işlemenin neden olduğu en önemli bozulmaların başında organik madde

kaybı ile birlikte, agregatların dayanıklılıklarının azalması ve erozyona karşı hassas hale gelmeleri gelmektedir. Toprak işlemede pulluk kullanımının yer aldığı geleneksel uygulamalardan koruyucu işleme uygulamalarına geçiş, toprak profili içinde toprak organik maddesinin birikmesine, zamanla agregatların dayanıklılığının artmasına ve ekosistem hizmetlerinin iyileştirilmesine önemli katkı sağlayacaktır. Toprağın suyu tutma yeteneği, özellikle suyun sınırlı olduğu kurak ve yarı kurak bölgelerde çok daha önemlidir. Toprak işleme uygulamalarının yarayışlı su içeriği üzerine etkilerinin incelendiği birçok çalışmada, sıfır ve azaltılmış toprak işleme uygulamaları altında toprakta organik madde birikimi geleneksel uygulamalara kıyasla daha yüksek olduğundan, yarayışlı su içeriğinin de yüksek olduğu bildirilmiştir. Bu nedenle, özellikle yarı-kurak bir karakterde olan ve sulama imkânlarının sınırlı olduğu Yüksekova ovasında geleneksel toprak işleme yerine, sıfır veya azaltılmış toprak işleme uygulamalarının adaptasyonu, kararlı agregatların oluşmasına ve nihayetinde de toprak kalitesini iyileştirerek sürdürülebilirliğine katkı sunacaktır.

Özet

Toprağın su içeriği ve toplam gözeneklilik değerleri kullanılarak hesaplanan su ile dolu gözenek hacmi (SDGH), toprak mikrobiyal aktivitesi ve özellikle de azot gazı emisyonları ile yakından ilişkilidir. Bu çalışma, Yüksekova ovası yüzey topraklarının SDGH değerlerinin belirlenmesi, fiziksel, kimyasal ve biyokimyasal özellikleri ile olan ilişkisinin belirlenmesi ve mekânsal dağılımının modellenerek haritalanması amacı ile yapılmıştır. Ayrıca, SDGH ile gerçekleşmesi muhtemel azot emisyonları arasındaki ilişkinin tartışılması da çalışmanın öncelikleri arasındadır. TÜBİTAK tarafından desteklenen, kapsamlı bir projenin amaçlarını gerçekleştirmek için yapılan toprak örneklerine ait veriler çalışmanın materyalini oluşturmaktadır. Çalışma alanından toplam 232 yüzey toprağı alınmış ve çeşitli fiziksel, kimyasal ve biyokimyasal özellikleri belirlenmiştir. Çalışma alanında SDGH değerleri % 38.8 ile %96.0 arasında değişmekte olup, ortalama SDGH değeri %69.6 olarak hesaplanmıştır. Literatürde, çalışılan toprak ve iklim özelliklerine bağlı olarak, mikroorganizma faaliyetleri ve azot emisyonu için kritik eşik olarak kabul edilen değer >%60-70'dir. Buna göre çalışma alanında, bir kısım arazilerde, azot emisyonu önemli bir sorun değil iken, bir kısım araziler için yüksek SDGH değerleri azot emisyonunun da yüksek olabileceğinin göstergesi olarak düşünülmelidir. Toprakların kil, hacim ağırlığı ve üreaz enzim aktivitesi ile önemli düzeyde pozitif ilişkisi olduğu tespit edilen SDGH değerlerinin, makro gözenek miktarı, organik madde içeriği ve mikrobiyal biyokütle karbonu ile önemli düzeyde negatif bir ilişkisi olduğu tespit edilmiştir. Sonuçlar, Yüksekova ovasının genelinde topraklardan azot emisyonu potansiyelinin yüksek olduğunu göstermektedir. Özellikle tarım arazilerinde, drenaj sisteminin kurulması SDGH değerlerinin dolayısı ile de azot emisyonunun azalmasına katkı verecektir. Bununla birlikte, halihazırda biçenek olarak kullanılan veya sulak alan olarak tanımlanan arazilerde ise kesinlikle drenaj faaliyetleri yapılmamalıdır. Zira, bu arazilerde uzun yıllar içinde depolanan topraktaki karbonun atmosfere salınımı, atmosferik karbon miktarının artmasına ve bu toprakların verimliliğinin azalmasına neden olacaktır.

Anahtar Kelimeler: Üreaz enzim aktivitesi, makro gözeneklilik, azot gazları, emisyon, sulak alan

**WATER FILLED PORE VOLUME AND NITROGEN GASES EMISSION
POTENTIAL OF THE SOILS OF YÜKSEKOVA PLAIN**

Abstract

Water filled pore space (WFPS), which is calculated using soil water content and total porosity values, is closely related to soil microbial activity and especially nitrogen gases emissions. This study was carried out to i.) determine the SDGH in surface soils of Yüksekova plain, ii.) assess the relationship of SDGH with physical, chemical and biochemical properties and iii.) model and map the spatial distribution of SDGH. In addition, discussing the relationship between SDGH and possible nitrogen emissions is among the priorities of the study. The material of the study consists of data obtained from soil sampling carried out to achieve the objectives of a large-scale project funded by TÜBİTAK. A total of 232 surface soils were collected from the study area and various physical, chemical and biochemical properties were determined. The SDGH values in the study area varied between 38.8% and 96.0% and the average SDGH value was 69.6%. In the literature, the critical threshold of WFPS value for microorganism activities and nitrogen emission is >60-70%, depending on the soil and climate characteristics studied. Accordingly, while nitrogen emission is not a significant problem in some lands in the study area, high SDGH values for some lands should be regarded as an indicator of high nitrogen emission. The SDGH values of the soils had a significant positive correlation with clay, bulk density and urease enzyme activity, while they had a significant negative correlation with macroporosity, organic matter content and microbial biomass carbon. The findings indicate a high potential of nitrogen emission from the soils in Yüksekova plain. Establishment of drainage systems, especially in agricultural lands, will decrease the SDGH values and therefore nitrogen emission. However, drainage activities should definitely be avoided on lands that are currently used as mowing or defined as wetlands. The emission of the stored carbon in the soils to the atmosphere over a long period of time will cause an increase of atmospheric carbon content and a decline in the fertility of the soils.

Keywords: Urease enzyme activity, macroporosity, nitrogen gases, emission, wetland

Giriş

Küresel ısınmaya katkı potansiyeli ile karbondioksitten 298 kat daha etkili bir sera gazı olan azot oksit (N₂O)'in atmosferdeki konsantrasyonu 1750 yılından bu yana %20 artarak 2011'de küresel olarak ortalama 324 ppb'ye ulaşmıştır. Atmosferdeki artışın en temel nedeni ise tarımsal faaliyetler olarak nitelendirilmektedir (IPCC, 2014). Küresel ölçekte yıllık salınan N₂O'in yaklaşık %60-70'i topraktaki mikrobiyal süreçlerin bir ara ürünü (örn. nitrifikasyon, denitrifikasyon) şeklinde salınır. Bu salınım topraktaki azot varlığı, toprağın su içeriği ve havalanma oranına bağlı olarak önemli miktarda değişkenlik göstermektedir (Butterbach-Bahl ve ark., 2013).

Toprakta N₂O oluşumuna neden olan nitrifikasyon ve denitrifikasyon süreçleri, topraktaki su dolu gözenek hacmi (SDGH), oksijen miktarı, toprak sıcaklığı ve toprak nitrat ve amonyum konsantrasyonları gibi çeşitli değişkenlere bağlı olarak gerçekleşmektedir (Butterbach-Bahl ve ark. 2013). Su dolu gözenek hacmi terimi, toprak hacim ağırlığı farklılıklarını normalleştirmede etkili olduğu, ancak SDGH'nin toprak türleri arasında aerobik mikrobiyal aktiviteyi düzenlemede özellikle yeterli olmadığı ifade edilmiştir (Schjønning ve ark. 2003). Schjønning ve ark. (2003), optimum net nitrifikasyon için SDGH değerlerini tınlı kum (L1 toprağı, %11 kil), tınlı (L3 toprağı; %22 kil) ve siltli kil (L5 toprağı; %35 kil) şeklinde 3 farklı tekstüre sahip topraklar için sırasıyla 0.63, 0.83 ve 0.82 olarak rapor etmiştir. Araştırmacılar, kil içeriği nispeten yüksek olan topraklar için belirledikleri optimum SDGH (0.82-0.83) değerlerinin Franzluebbbers (1999) tarafından bildirilen değerlerden çok daha yüksek olduğunu belirtmişlerdir. Bunu yanında kum içeriği yüksek olan L1 toprağı için çok daha düşük bir optimum değer elde edilmiş olması, toprak türleri arasında SDGH değerlerinin 'evrensel' olmadığını göstermektedir. Stanford ve Epstein (1974) en yüksek nitrifikasyon oranlarının %80 ila 90 SDGH'de olduğunu belirtirken, Franzluebbbers (1999) farklı toprak tipleri için ortalama SDGH'nin %42 olduğunu bildirmiştir.

Dört farklı organik madde uygulamasının yağışlı ve kurak mevsimlerde N₂O emisyonuna üzerine etkisinin toprağın SDGH ile olan ilişkisini inceleyen Ariani ve ark. (2021), toprakta SDGH >%45 olması durumunda, topraktan atmosfere N₂O salınımının gerçekleştiğini bildirmişlerdir. İki farklı SDGH (%20-70)'inde gübrelenmiş (200 kg N ha⁻¹) siltli tınlı tekstüre sahip bir toprakta denitrifikasyon, ototrofik nitrifikasyon ve heterotrofik nitrifikasyon sırasında meydana gelen N₂O üretimini belirlemek için Batemann ve Baggs (2005) kararlı izotop ve asetilen inhibisyon tekniklerinin ilk kez birlikte kullanılmıştır. Artan SDGH ile birlikte

atmosfere yayılan N₂O miktarında önemli düzeyde artış olduğu tespit edilmiştir. Araştırmacılar, gübre uygulanan SDGH'nin %70 olduğu uygulamada gerçekleşen N₂O emisyonunun, deneme boyunca SDGH %20 ve 60 olan uygulamalara kıyasla 6 ve 16 kat daha yüksek olduğunu bildirmişlerdir. Bu durum, SDGH %70 olduğunda topraktaki mikro gözeneklerin ağırlıklı olarak anaerobik olmasının denitrifikasyonun artması ile açıklanmıştır. Ayrıca, SDGH 35% ve %50 olan uygulamalarda 24 gün boyunca yayılan toplam N₂O miktarı arasında önemli bir farklılık olmadığı ve yayılan toplam N₂O'nun %47'sinin ilk 3 günde oluştuğu belirtilmiştir. Topraklarda SDGH düzeyi %35-60 arasında olduğunda, yayılan N₂O'nun ana kaynağının denitrifikasyona kıyasla rolü genellikle yeterince önemsenmemiş olan nitrifikasyon olduğu belirtilirken, bu sürecin küresel ısınma açısından önemine vurgu yapılmıştır. SDHG düzeyi 20%'den 35%'e çıkarıldığında N₂O emisyonlarda önemli düzeyde bir artış olduğu tespit edilmiş ve bu artış SDGH %20 iken ortamda su yetersiz olduğundan N₂O üretimi için gerekli substrat difüzyonu ve mikrobiyal aktivite sınırlı olması ile ilişkilendirilmiştir.

Bu çalışma, ülkemizin en dağlık ve engebeli arazilerinin yer aldığı Hakkari ilinin, en geniş ve düz ovası olan Yüksekova ilçesinde, Yüksekova ovası topraklarının ve ovada yer alan sulak alanların toprak kalitesi ve ekosistem hizmetlerinin değerlendirilmesi amacı ile yürütülmekte olan bir TÜBİTAK projesi kapsamında elde edilen verilerden üretilmiştir. Sözlü sunu olarak hazırlanan bu çalışmada, ovada yüzey topraklarının özellikle mikroorganizma aktivitesinin önemli bir göstergesi olan SDGH'nin belirlenmesi, proje kapsamında belirlenen çeşitli fiziksel, kimyasal ve biyokimyasal özellikler ile ilişkisini ortaya koymak ve SDGH değerlerinin ovadaki alansal değişimini modelleyerek haritalamak amacı ile hazırlanmıştır. Literatürde, SDGH değeri, topraktan atmosfere azot salınımı için önemli bir gösterge olarak kabul edildiğinden, SDGH değerleri ile azot emisyonu arasındaki ilişki de bu sunu kapsamında yorumlanmıştır.

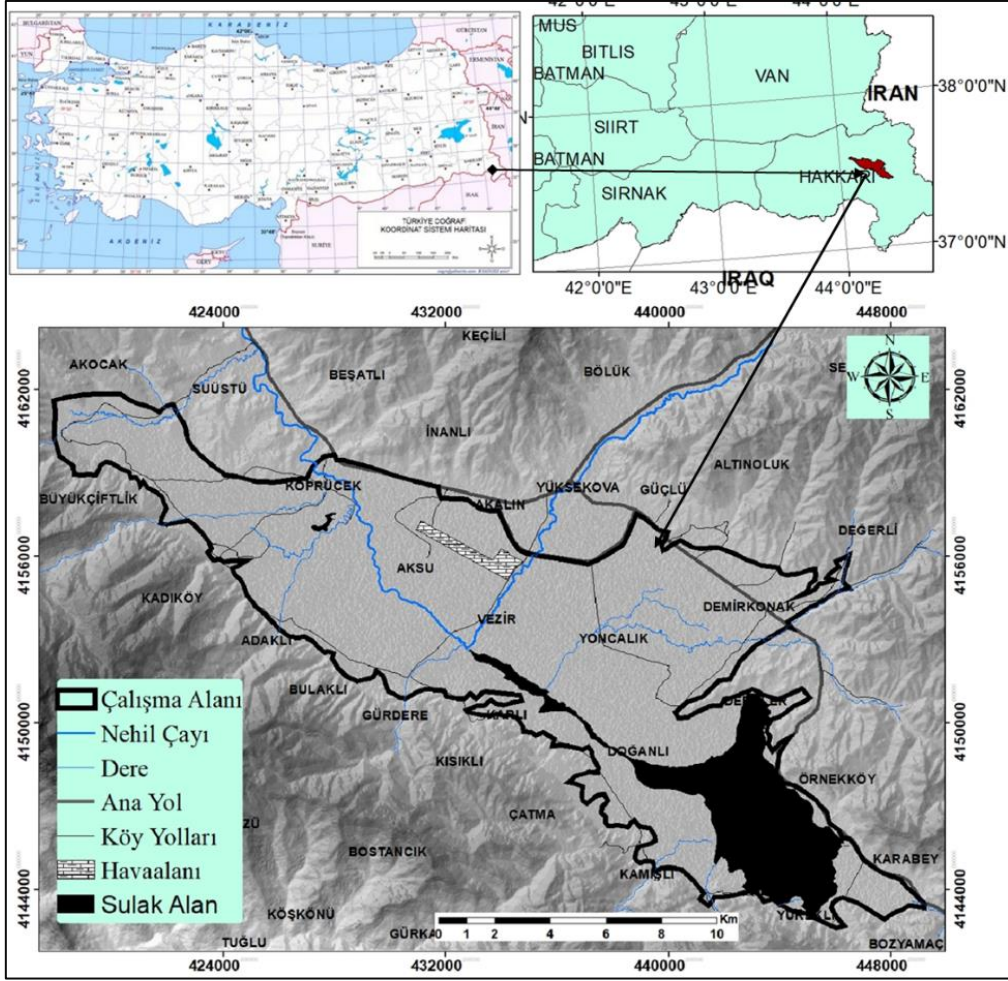

Materyal ve Yöntem

Çalışma alanı

Çalışma alanı, 37°25'49" - 37°36'32" K enlemleri ile 44°04'21" - 44°22'56" D boylamları arasında yer almaktadır. Yaklaşık 17.5 bin ha'dan oluşan çalışma alanı etrafı yüksek dağlarla çevrili bir çöküntü ovasıdır (Şekil 1). Yirminci yüzyılın ortalarına kadar büyük çoğunluğu sulak alanlardan oluşan Yüksekova ovasında yağışların azalması, ovadaki yerleşim ve tarımsal üretim için yeni arazi arayışı gibi insan etkisi nedeniyle sulak alanlar önemli miktarda azalmıştır. Uzun yıllar (1979-2018) ortalama yıllık yağış miktarı 762 mm, ortalama yıllık buharlaşma ise 850 mm'dir. Yıllık ortalama sıcaklık 6.9 °C olup en düşük ortalama sıcaklık Ocak (-9.3°C) ve en

yüksek ortalama sıcaklık Temmuz (21.3 °C) ayında gerçekleşmektedir. Yüksekova'da yaz mevsimi çok kısa ve kış mevsimi ise oldukça uzundur. Son 40 yıllık iklim verilerine göre yıllık ortalama 96 gün yağışlı geçmekte olup bunun 43 gününde kar yağışı görülmektedir. Yaklaşık 1 m'lik kar örtüsünün görüldüğü çalışma alanı ortalama 120 gün kar ile kaplı kalmaktadır (Anonim, 2019).

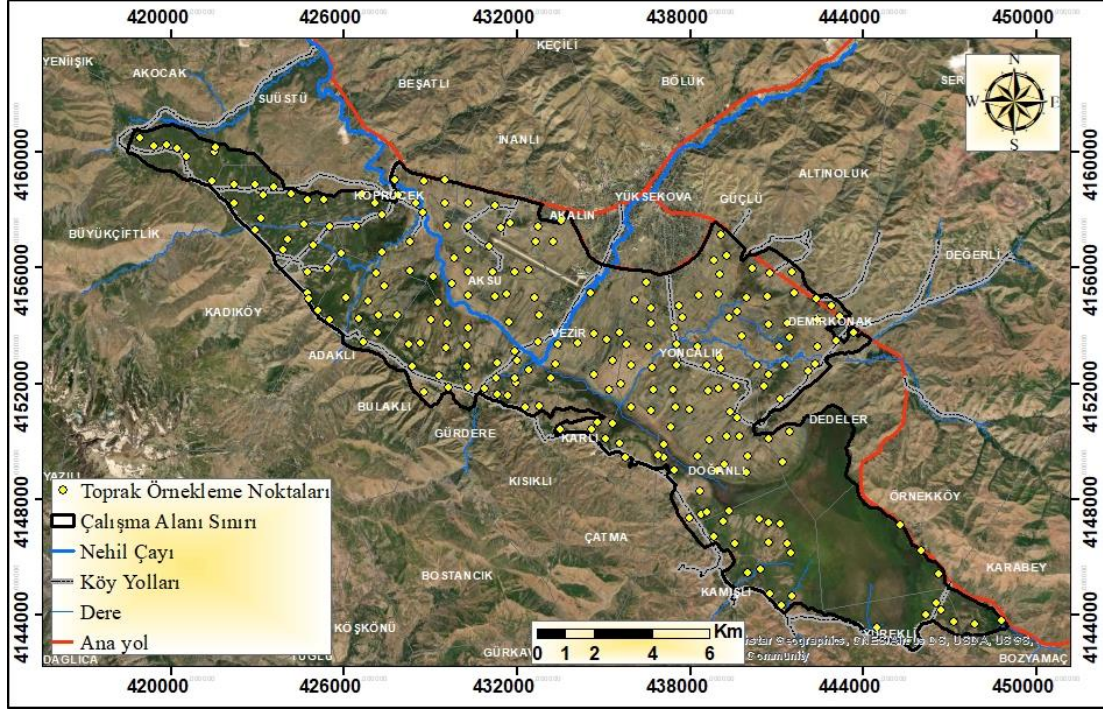

Yüksekova ovasındaki arazilerin önemli bir kısmında tarla tarımı yapılmakla beraber büyük çoğunluğu sulak alanların kurumasından sonra oluşan çayır-mera (büyük çoğunluğu biçenek olarak kullanılmaktadır) alanlarından oluşmaktadır. Zira toprak örnekleme noktalarından 130'u mera/biçenek alanlarına, geriye kalan 102'si ise ekili alanlara denk gelmiştir. Ekili tarım arazilerine dönüştürülen alanlarda yoğunlukla buğday ve yonca olmak üzere nohut ve fiğ yetiştiriciliği yapılmaktadır. Mera/Biçenek olarak kullanılan alanlarda ise çoğunlukla saz çimi (*Calamagrostis pseudophragmites* (Haller) Koeler), çayır it kuyruğu (*Phleum pratense* L.), eres çimi (*Lolium persicum* Boiss. & Hohen.) yumrulu salkım (*Poa bulbosa* L.), sina ayak otu (*Carex* spp), seyrek saz (*Eleocharis* spp.), yonca (*Medicago sativa* L. subsp. sativa), ak üçgül (*Trifolium repens* L. var. repens), at kuyruğu (*Equisetum arvense* L.), çayır üçgülü (*Trifolium pratense* var. pratense L.), dere nanesi (*Mentha longifolia* (L.) subsp. typhoides (Briq.) Harley), kırk damar otu (*Plantago lagopus* L.), ibubuk otu (*Bromus danthoniae* Trin. subsp. *Danthoniae*), cilo düğün çiçeği (*Ranunculus arvensis* L.) ve çınarcık (*Ranunculus sericeus* Banks & Sol.) bitkileri bulunmaktadır.

Şekil 1. Çalışma alanının konumu

Toprak Örnekleme

Farklı arazi kullanımlarının bulunduğu çalışma alanı 800x800 m genişliğindeki gridlere bölünmüş ve gridlerin köşe noktalarına en yakın yerden ve 0-20 cm derinlikten toplam 232 (Şekil 2) noktadan toprak örneği alınmıştır.

Şekil 2. Toprak örnekleme deseni

Yöntem

Toplam Gözeneklilik: Toplam gözeneklilik Eşitlik 4 ile hesaplanmıştır.

$$TG = 1 - \frac{\rho_b}{\rho_k} \quad 4$$

Bu eşitlikte; Bu eşitlikte; ρ_b = Toprağın hacim ağırlığı ($g\ cm^{-3}$), ρ_k = Toprağın özgül ağırlığıdır ($2.65\ g\ cm^{-3}$).

Su İle Dolu Gözenek Hacmi (SDGH): SDGH eşitlik 5 ile belirlenmiştir (Linn ve Doran, 1984).

$$SDGH = \frac{\theta}{TG} \quad 5$$

Burada; θ : Hacimsel nem içeriği ve TG: Toplam gözenekliliktir.

İstatistiksel Analizler, Alansal Değişkenliğin Modellenmesi ve Haritalama

Elde edilen SDGH değerlerine ait tanımlayıcı istatistik parametreleri ile SDGH değerlerinin diğer özellikler ile olan ilişkisini gösteren korelasyon testi SPSS 21.0 paket programı kullanılarak yapılmıştır.

Su dolu gözenek hacmi değerlerinin mekânsal değişiminin modellenmesinde jeostatistiksel yöntemler kullanılmıştır. Mekânsal değişkenliğin tanımlanması için GS+ 7.0 paket programı

kullanılmış, elde edilen en iyi modele ait parametreler ArcGIS 10.0 paket programında kullanılarak alansal değişkenlik haritası üretilmiştir.

Bulgular ve Tartışma

Aerobik veya anaerobik mikrobiyal aktivitenin gerçekleşmesi için gerekli olan, su, hava ve karbona erişimin önemli bir göstergesi olarak kabul edilen su dolu gözenek hacmi (SDGH) (Linn ve Doran, 1984) değeri, çalışma alanında % 38.8 - %96.0 arasında değişim göstermekte ve ortalama SDGH değeri %69.6'dır (Tablo 1). Elde edilen bu veriler çalışma alanında SDGH'nin mikrobiyal aktivitenin en yüksek düzeyde desteklenebilmesi için sınır değer aralığında olduğunu göstermektedir. Zira Bending ve ark., (2004), toprak tekstürü ve organik madde içeriğine bağlı olarak SDGH'nin %30 ile %70 arasında olduğu topraklarda mikrobiyal aktivitenin en üst seviyede olduğunu rapor etmiştir.

Çalışma alanı içerisinde tanımlanan 16 farklı toprak serisi içerisinde ortalama SDGH değeri en yüksek olan toprak serisi Karlı (SDGH, %77) ve en düşük olan ise Aksu serisidir (%61.7). Toprak serilerinin, seri içi SDGH değerleri değişkenliği genel olarak düşüktür.

Tablo 1. Toprak Serilerinin 0-20 cm derinliklerinde su dolu gözenek hacmi (%) değerlerine ait tanımlayıcı istatistik değerleri

Topraktaki aerobik/anaerobik koşulların göstergesi olarak kabul edilen (Sharma ve ark., 2020) su dolu gözenek hacmi (SDGH), hacimsel toprak su içeriğinin gözenekliliğe bölünmesi ile hesaplanmaktadır (Laryea ve ark., 1997). SDGH, çalışma alanında % 39 ile % 96 arasında

değişim göstermiştir (Şekil 69). Daha önce de değinildiği gibi, biyolojik aktivitenin optimum düzeyde gerçekleşebilmesi için SDGH hacminin organik madde ve tekstür içeriğine bağlı olarak % 30 ile %70 arasına olması istenmektedir (Bending ve ark., 2004). Andrews ve ark., (2004) ise toprak kalitesi açısından kil içeriğine bağlı olarak SDGH değerinin % 45 - %60 arasında olması gerektiğini rapor etmiştir. SDGH'ine ait mesafeye bağlı değişim haritaları, Yüksekova ovasında yer alan arazilerin neredeyse tamamında SDGH değerlerinin biyolojik aktivitenin optimum düzeyde gerçekleşmesi için uygun aralıkta olduğunu göstermektedir. Ancak bazı noktalarda (Havaalanının güneyi ve daha önce sulak alan olan diğer arazilerin en düşük kodlu yerleri) ise yüksek nem içeriğinden (drenaj yetersizliği) dolayı biyolojik aktivitenin olumsuz etkileneceği göz ardı edilmemelidir. Bu alanlarda, uygun projelendirmeler ile mevsimsel olarak yükselen taban suyunun ortadan kaldırılması gerekmektedir.

Çalışma alanı yüzey topraklarının çeşitli fiziksel, kimyasal ve biyolojik özellikleri ile SDGH arasındaki ilişki gösteren korelasyon testi sonuçları Tablo 1'de verilmiştir. Tekstür bileşenlerinden kil içeriği SDGH ile önemli düzeyde pozitif ve silt içeriği ise negatif bir ilişkiye sahiptir. Bu ilişki toprakta kil içeriği artışı ile SDGH'nin arttığını aksine silt içeriği artışı ile SDGH'nin azaldığını göstermektedir. Strüktür ile ilgili özelliklerden hacim ağırlığı ile SDGH arasında beklentilerimizin aksine önemli düzeyde pozitif bir ilişki olduğu görülmektedir. Hacimsel su içeriğinin toplam gözenekliliğe oranı ile hesaplanan SDGH'nin (Eşitlik 2), normal koşullarda toplam gözenekliliğin azalması ile artması beklenir. Toplam gözeneklilik ise hacim ağırlığı ve kütle yoğunluğu değerlerinden hesaplanmaktadır. Eşitlik 1'den anlaşılacağı üzere, hacim ağırlığı artışı, birim hacimdeki toprağın hava dolu gözeneklerinin azalmasına yol açacağından, toplam gözeneklilik azalacaktır. Yukarıda da bahsedildiği üzere, hacim ağırlığı artışı toprağın SDGH değerinin azalmasına yol açması beklenirken, çalışma alanımızda tam aksine hacim ağırlığı artışı ile SDGH değerinin önemli düzeyde arttığı anlaşılmaktadır. Toprak nemi, toprak solunumu, toprak agregasyonu ve toprak sıkışması, toprakların havalanmasını ve oksijensiz mikro bölgelerin oluşumunu belirleyen temel faktörlerdir. Toprakta N₂O, öncelikli olarak düşük ve orta seviyedeki toprak nem oranlarında nitrifikasyon yoluyla oluşur ve denitrifikasyon ise azalan O₂ tedariki nedeniyle SDGH'nin %60'dan daha yüksek toprak nemi içeriklerinde daha etkili olur (Ruser ve ark., 2006). Çalışma alanında HA değerlerinin yüksek olduğu yerlerin çoğunluğunda SDGH değerinin de yüksek olduğu ve bu alanlarda potansiyel olarak N₂O emisyonunun yüksek olduğu düşünülmektedir. Bu bulgumuzu destekleyen bir başka açıklama, Flessa ve ark. (2001) tarafından yapılmıştır. Araştırmacılar, traktör trafiği nedeniyle toprağın sıkışması ve dolaylı olarak hacim ağırlığının artışının topraktaki N₂O

emisyollarını önemli düzeyde artırırken, toprak işleme ile toprağın kabartılmasının N₂O emisyonlarını azalttığını bildirmişlerdir. Toprağın gevşetilmesi veya sıkıştırılması ile makro gözenek hacmindeki bir azalma veya artış, toprakta O₂'nin azalması veya artmasına yol açacağından, bu durum topraktaki SDGH düzeyinin ve dolayısı ile N₂O emisyonunun azalması veya artmasına neden olacağı söylenebilir. Örnek sayısı fazla olduğundan dolayı, korelasyon katsayısı düşük olsa dahi, korelasyon testi ilişkinin önemli olduğuna işaret etmektedir. Örneğin, ortalama ağırlıklı çap değerleri (MWD) ile SDGH arasındaki korelasyon katsayısı -0.19 olmasına rağmen, bu ilişki istatistiksel olarak P<0.01 düzeyinde önemli olarak nitelendirilmiştir. Bununla birlikte, bu ilişkinin veri setindeki değişkenliğin sadece %19'unu temsil ediyor olması bizim için yeterli görülmemiş ve bu nedenle bu ilişki yorumlanmamıştır.

Ha: hacim ağırlığı, AS: agregat stabilitesi, MWD; ortalama ağırlık çapı, MaG; makro gözeneklilik, MiG; mikro gözeneklilik, TG; toplam gözeneklilik, TK, tarla kapasitesi, SN; solma noktası, YSİ, yarıyışlı su içeriği, SDGH; su ile dolu gözenek hacmi, OM; organik madde, AP; alınabilir P, AK; alınabilir K, TN; toplam azot, TC; toplam karbon, BGEA; beta glikosidaz enzim aktivitesi, MBC; mikrobiyal biyokütle karbonu

Toprak gözeneklilik ve su miktarı parametrelerinden makro gözenek hacmi (MaG) ile SDGH arasında oldukça önemli düzeyde negatif bir ilişki olduğu görülmektedir. Dolaylı olarak bu ilişkiden yola çıkarak MaG değerinin yüksek olmasının, toprakta N₂O emisyonunun azalmasına neden olduğu söylenebilir. Toprakta MaG hacminin yüksek olması, oksijensiz mikro alanların da azalmasına neden olacağından, azot oksit emisyonu da düşük olacaktır. Birçok araştırmacı gibi Ruser ve ark. (2006) da, toprakta gerçekleşen N₂O emisyonlarının çoğunlukla denitrifikasyonun bir neticesi olduğunu belirtirken, araştırmalarında toprak sıkışmasının olduğu

uygulamalarda $SDGH \geq \%70$ olduğunda N_2O emisyonun meydana geldiğini bildirmişlerdir. Buna ilaveten, toprakta N_2 üretiminin yalnızca en yüksek toprak nemi seviyesinde ($\geq \%90$ SDGH) meydana geldiği ve çoğu durumda N_2 salınımının N_2O salınımından belirgin şekilde daha küçük olduğu ifade edilmiştir. Toprakta tarla kapasitesi ve solma noktasında tutulan nem miktarları ile SDGH arasında önemli düzeyde negatif bir ilişki olduğu görülmektedir (Tablo 2). Nem içeriğindeki artışın ise N_2O emisyonunda artışa neden olduğunu ortaya koyan çok sayıda araştırma sonucu bulunmaktadır.

Toprağın kimyasal özellikleri ile SDGH arasında göze çarpan en önemli ilişki, toprağın organik madde ve toplam azot içerikleri ile SDGH arasında negatif bir ilişki olmasıdır. Toprağın SDGH miktarının yüksek olduğu arazilerde, organik madde ve toplam azot içeriğinin düşük olması, bu alanlarda, aslında azot emisyonu için gerekli olan karbon ve azot kaynağının da düşük olduğuna işaret etmektedir.

Üreaz enzimi, topraktaki organik ve inorganik kolloidler tarafından tutulan üreinin karbondioksit ve amonyak hidrolizini katalize eden hücre dışı bir enzimdir (Das ve Verma, 2010). Üreaz aktivitesinin etkisi ile toprakta oluşan inorganik NH_4^+ , daha sonra nitrifikasyonun etkisi ile NO_3^- yükseltgenir. Bitkiler tarafından alınma ve toprakta kalmasının yanı sıra, NO_3^- 'in bir kısmı da denitrifikasyon yoluyla N_2 'ye dönüştürülür, bu arada N_2O 'da yukarıda bahsedilen iki sürecin ara ürünüdür (Tang ve ark., 2022). Bu nedenle de toprakta NH_4^+ ve NO_3^- oluşumunun azaltılması, nitrifikasyon ve denitrifikasyonun oluşumunu azaltacağından N_2O şeklinde azot kaybının da azalmasına neden olacaktır (Wells ve Eyre, 2021). Araştırma alanımızda toplam 232 noktadan alınan yüzey topraklarının üreaz enzim aktivitesi ile SDGH arasında önemli düzeyde pozitif bir ilişki bulunmuştur (Tablo 2). Bu ilişki, SDGH miktarının yüksek olduğu alanlarda, üreaz enzim aktivitesinin de yüksek olduğunu göstermektedir. Yukarıda açıklandığı gibi üreaz enzim aktivitesinin yüksek olması, toprakta daha fazla NH_4^+ ve NO_3^- oluşumuna neden olacağı akılda tutulmalıdır. Bir başka çalışmada, kuraklığın besin elementlerinin döngüsünü araştıran (Sardans ve Penuelas, 2005), toprağın nem içeriğinin %10 ve %21 oranında azalmasının üreaz aktivitesinde sırasıyla %10-67 ve %42-62 oranında azalmaya neden olduğunu beyan etmişlerdir.

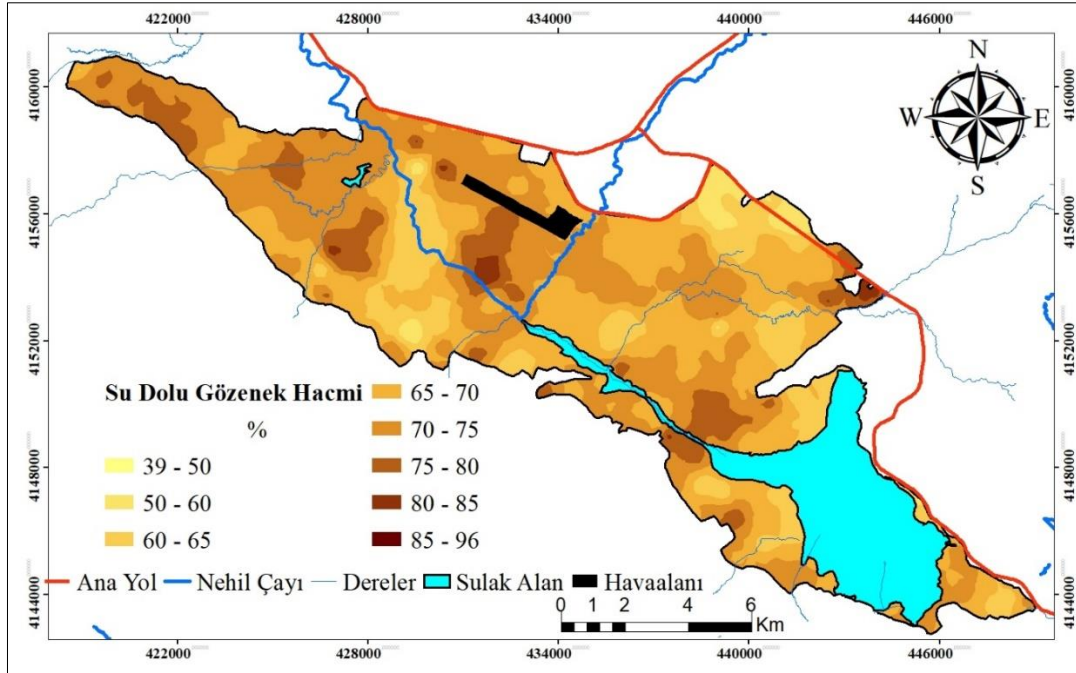

Çalışma alanı yüzey topraklarının SDGH değerlerinin mekânsal dağılımını en iyi tanımlayana model ve oluşturulan semi-variogram a ait parametreler Tablo 3'de verilmiştir. Bir alandaki özelliklerin, oto korelasyonun gücünü ifadesi olan ve nugget değerlerinin sill değerlerine oranının yüzdesi ile hesaplanan uzaysal bağımlılık değeri (%12.3), SDGH'nin çalışma alanında

zaysal bağımlılığının oldukça kuvvetli olduğunu göstermektedir. Çalışma alanı içerisinde, oto korelasyonun kuvvetli olduğu mesafenin göstergesi olan range değeri ise 1110 m olarak hesaplanmıştır. Çalışma alanında 1110 m içerisinde toprakların SDGH değerlerinin birbirlerine önemli düzeyde benzer olduğu ve bu mesafenin ötesinde ise örneklerin anlamlı bir benzerliğinin olmadığı anlaşılmaktadır.

Tablo 3. Toprak özelliklerinin haritalanmasında kullanılan Semivariogram modellerine ait veriler.

Özellik	Model	Nugget	Sill	% UB	Range	RSS	r2	lag (m)	Komşu sayısı
SDGH	Üstel	11.8	96.08	12.3	1110	2.1E+01	0.9	800	8

Çalışma alanında, SDGH değerlerinin mekânsal dağılım modeli kullanılarak oluşturulan dağılım haritası Şekil 3'te verilmiştir. Tüm çalışma alanında %39 ile %96 arasında değişen SDGH değerlerinin çalışma alanında yer yer oldukça yüksek değerlere ulaştığı görülmektedir. Her ne kadar literatürde, azot emisyonları için belirtilen eşik değerler değişiyor olsa da, ovanında genelinde SDGH değerlerinin %60'ın üzerinde olması, ova topraklarından önemli miktarda azot emisyonlarının olabileceğini göstermektedir. Bu durum, hem topraktaki azot kaynaklarının azalmasına yol açarak tarımsal üretimin olumsuz etkilenmesine, hem de atmosfere salınan ve karbondioksit göre çok daha fazla sera etkisi yapma özelliği olan azot gazlarının atmosferdeki konsantrasyonunun artmasına neden olacaktır.

Şekil 3. Su dolu gözenek hacmine ait mesafeye bağlı değişim haritası

Sonuç

Önceleri çok büyük bir kısmı, yılın önemli bir kısmında sulak alan olan Yüksekova ovası topraklarının su dolu gözenek hacmi (SDGH) genel olarak atmosfere azot salınımına neden olacak düzeyde yüksektir. Bu konuda yapılan çalışmalarda, SDGH değerinin yükselmesi ile toprakta oksijen miktarının azaldığı ve nitrifikasyon ile üretilen nitratin, anaerob denitrifikasyon bakterileri faaliyeti ile N₂ ve N₂O gibi azot gazlarına dönüşerek, atmosfere salınım olduğu ifade edilmiştir. Bu kapsamda, ovanın önemli bir kısmında, sıcaklığın uygun olduğu yılın belirli dönemlerinde atmosfere azot gazları salınımının gerçekleşiyor olması muhtemeldir. Atmosfere salınan azot, üreticiler için çok değerli olan topraktaki mineral azotun azalmasına yol açmasının yanında, küresel ısınmada aktif rol alan karbondioksitten dahi çok daha tehlikeli olan azot gazlarının atmosferdeki konsantrasyonunun artmasına neden olabileceği unutulmamalıdır. Bu nedenle, özellikle tarımsal üretim yapılan arazilerde SDGH'nin daha güvenli olabileceği seviyelere çekilebilmesi için, drenaj sistemlerinin kurulması gerekmektedir. Bununla birlikte, günümüzde hala sulak alan veya biçenek olan arazilerin ise, korunması birçok ekosistem hizmetinin üretilmesinin devamlılığı için son derece önemli olduğundan, bu arazilerde kesinlikle drenaj faaliyetleri yapılmamalıdır. Bu arazilerde yapılacak drenaj faaliyetleri, çok uzun yıllar toprakta depolanmış olan karbonun atmosfere salınmasına neden olacaktır.

Teşekkür

Bu çalışmada elde edilen veriler 1190947 nolu TÜBİTAK proje kapsamında elde edilmiştir.

TÜBİTAK'a desteklerinden dolayı teşekkür ederiz.

Özet

Ülkemizin önemli sulak alanlarından biri olan Yüksekova ilçesi sınırları içinde yer alan Nehil Sazlığı ekosistemleri, bölgenin en önemli doğal zenginliğidir. Sahip olduğu nitelikleri ve ürettikleri ekosistem hizmetleri ile her yıl önemli miktarda hizmeti tamamen ücretsiz olarak sunarak insan sağlığı ve refahına hayati bir katkı sağlamaktadır. Yüksekova sulak alanlarının tarım arazisi oluşturmak amacı ile kurutulması ve uluşturulan tarım arazileri etrafında yerleşimin artması, sulak alanların biyolojik çeşitlilik, besin döngüsü, su kalitesinin iyileştirilmesi, sel ve taşkınların önlenmesi, yer altı su kaynaklarının beslenmesi ve küresel iklim değişiminin önlenmesi gibi çeşitli hizmetlerinin aksamasına neden olacaktır. Yüksekova ovası tarım arazileri, önceleri sulak alan olduğundan yüksek miktarda organik madde içeriğine sahiptir. Toprak verimliliği için oldukça önemli bir bileşen olan organik madde içeriğinin yüksek olmasına rağmen, yetiştiriciliği yapılan buğday, yonca ve nohut gibi ürünlerin verimleri türkiye ortalamasının oldukça altındadır. Bu verim düşüklüğünün temel nedenleri, yüksek taban suyu, toprak sıkışması, mineral veya organik gübre kullanımının olmaması, sulama altyapısının ve imkânlarının yetersizliği, hastalık zararlı ve yabancı otlar ile yeterli mücadele edilememesi şeklinde sıralanabilir. Yüksekova ovasında ekosistem hizmetlerinin üretilmesi ve sunumu ile tarımsal üretimin sürdürülebilirliğini tehdit eden diğer bir önemli problem ise, tarım arazilerinin özellikle yerleşim için amaç dışı kullanımudur. Son 80 yıldaki uydu ve hava görüntülerinin incelenmesi, sulak alanların miktarının önemli miktarda küçüldüğünü ve bir kısım alanlarda yeni yerleşim yerlerinin kurulduğunu ve Yüksekova ilçesinin düz düze yakın tarım arazilerine doğru genişlediğini göstermektedir. Sonuç olarak, bölge için son derece önemli olan sulak alanların ve tarım arazilerinin korunup korunması, bölgedeki insanlar için üretilecek çeşitli ekosistem hizmetlerin sunumunun ve tarımsal üretimin devamlılığının sağlanması adına son derece önemlidir.

A GENERAL OVERVIEW OF THE YÜKSEKOVA PLAIN WITHIN THE SCOPE OF ECOSYSTEM SERVICE; PROBLEMS, AND SOLUTIONS

ABSTRACT

Nehil Reed ecosystems located within the borders of Yüksekova district, one of the most important wetlands of our country, are the most important natural wealth of the region. The wetland provides a vital contribution to human health and welfare in the region by providing a significant amount of services completely free of charge every year with its characteristics and the ecosystem services produced. The drying of Yüksekova wetlands to create agricultural land and the increase in settlements around the agricultural lands will cause disruption of various services of wetlands such as biodiversity, nutrient cycling, improvement of water quality, prevention of floods and floods, replenishment of underground water resources and mitigation of global climate change. The agricultural fields of Yüksekova plain have a high organic matter content since they were formerly wetlands. Although the organic matter content, which is a very important component for soil fertility, is high, the yields of crops such as wheat, alfalfa and chickpea are well below the national average. The main causes of the low yields can be summarised as high ground water table, soil compaction, lack of mineral or organic fertilizer application, insufficiency of irrigation infrastructure and facilities, insufficient control of diseases, pests and weeds. Another important problem threatening the production and provision of ecosystem services and the sustainability of agricultural production in the Yüksekova plain is the improper use of agricultural lands, especially for settlement. The satellite and aerial images of the last 80 years show that the extent of wetlands has significantly decreased and new settlements have been established in some of the areas and Yüksekova district is spreading towards agricultural lands. In conclusion, the conservation and protection of wetlands and agricultural lands, which are crucial for the region, is of utmost importance for the provision of various ecosystem services to be produced for the people in the region and for the sustainability of agricultural production.

Giriş

Toprak, gıda üretiminin istikrarını, gıda/besin kalitesini ve verimi belirleyen temel üretim ortamıdır. Karasal ekosistemde yer alan toprak, toplumun çoğunluğu tarafından yenilenemez bir kaynak olarak düşünülmemektedir. Sahip olduğu özellikleri ile insanların gereksinim duyduğu birçok hizmetin sunumunda alternatifsiz bir doğal kaynak olan toprak, sınırsız bir varlık değildir. Hızla artan dünya nüfusunun gıda ihtiyacının karşılanabilmesi için daha fazla girdi kullanımını tarımsal üretimin yoğunlaşması ve tarım ve mera alanlarının tarım arazilerine dönüştürülmesi, tarım arazilerinin yerleşim ve sanayi gibi amaç dışı kullanımı, bu sınırlı kaynak üzerinde her geçen gün daha da artan bir baskının oluşmasına neden olmaktadır. İnsanoğlunun yeryüzündeki varlığı devam ettikçe, nüfus artmaya şüphesiz devam edecektir. Bu kapsamda, günümüzde 7 milyara yaklaşan dünya nüfusunun 2050 yılında 9.8 milyara ulaşması (Koppitke ve ark., 2019), gelecekte topraklar üzerine oluşacak baskının daha da artacağını göstermektedir (Budak ve Kılıç, 2022).

Bir taraftan tarım arazilerinin tarım dışı kullanımlar ve arazi bozulması nedeni ile elden çıkması, diğer taraftan artan nüfus nedeniyle oluşan gıda açığı, önümüzdeki 30 yıl içerisinde dünya nüfusunun önemli bir kesiminin ciddi bir açlık tehlikesi ile karşı karşıya kalacağını sinyallerini vermektedir. Bu nedenle, mevcut tarım arazilerinde en yüksek verimi ve üretkenliğin sürdürülebilirliğini sağlayacak yöntemlere ihtiyaç duyulmaktadır. Toprak verimliliğini artırmaya yönelik herhangi bir eylem, temel toprak işlevlerini iyileştirmek ve sürdürülebilir toprak üretkenliğini sağlamak için uzun vadeli bir toprak yönetim stratejisinin geliştirilmesi gerekmektedir (Rojas ve ark., 2016).

İnsanların gıda güvenliğine sahip olması küresel bir arzudur, ancak bununla etkileşime giren ve böyle bir hedefi mümkün kılan sistemleri anlamak için daha fazlasına ihtiyaç bulunmaktadır. Toprak sınırlı bir kaynaktır ve dünyanın gıda üretiminde önemli olan birçok bölgesinde, bilgi eksikliğinden veya bakım eksikliğinden kaynaklanan yanlış yönetim nedeniyle topraklar üretkenliklerini kaybetme riskiyle karşı karşıyadır. Toprağı güvence altına almak için bilgi ve uygun yönetim stratejisi oluşturmak esastır (Pozza ve Field, 2020).

Toprak yönetim stratejilerinde meydana gelen değişimler (arazi kullanım değişikliği veya arazi kullanımına bağlı olarak bitki örtüsündeki değişimler), karasal ekosistem üzerinde önemli etkiler oluşturmakta ve çoğunlukla toprakların fonksiyon görme kapasitesini olumsuz etkilemektedir (Foley ve ark., 2005; Hernandez ve ark., 2016). Bu değişimler, insan gelişiminin farklı mekansal ve zamansal ölçeklerde meydana gelen doğal peyzajlar üzerindeki baskısının temsili bir sonucudur. Arazi kullanımındaki değişim süreçlerinin türüne ve yoğunluğuna bağlı

olarak, ekosistemler farklı yapıları, işlevleri ve dinamikleri yansıtarak, bitki örtüsü, toprak ve besin öğeleri arasında yeni ve karmaşık etkileşimler yaratır (Hernandez ve ark., 2016). Ayrıca, arazi kullanımındaki değişim süreçleri, toprağın fiziksel, kimyasal ve biyolojik özellikleri ile toprak canlılarının popülasyonu ve çeşitliliğinde de önemli değişime neden olabilmektedir. Bu da zamanla arazinin verimliliğinde bir azalmaya yol açabilmektedir.

Dünyanın birçok yerinde olduğu gibi ülkemizde de doğal sulak alanlar ve çevresinde bulunan arazilerin önemli bir kısmı drene edilmiş, otlak, mera veya tarım arazisi olarak kullanılmaya başlanmıştır. Hakkâri ilinin Yüksekova ilçesinde denizden yaklaşık 2000 m yükseklikteki Yüksekova ovasında bulunan ve bölgenin en önemli alt ekosistemlerinden biri olan Yüksekova sazlıkları da tarım arazisi oluşturmak için açılan kurutma kanalı nedeniyle fonksiyonlarını yitirme ve sağladığı ekosistem servislerini kaybetme noktasına gelmiştir. Sulak alanların kurutulması ve tahribatı, biyolojik çeşitlilik, suyun depolanması ve arıtılması, tarımsal kirleticilerin filtrelenmesi, taşkın koruma, karbon depolama, avlanma ve avlanma yoluyla besin temini gibi faydaların kaybolmasına neden olacağından lokal, bölgesel ve ulusal ölçekte olumsuzluklara yol açacaktır. Sulak alanlar, bitki ve hayvan toplulukları için kritik yaşam alanları olduklarından, genellikle çok çeşitli ekosistemleri temsil etmektedir. Ovadaki sulak alanlar, biyoçeşitliliğin ve kültürel zenginliğin kaynağı olmanın yanında Sibiryaya ve Afrika arasında göç yapan milyonlarca kuşun da göç yolunda konakladıkları önemli habitatlardır. Bu nedenle, sulak alanların bozulması ve yok edilme süreçleri, insanoğluna sunulan faydaların ve hizmetlerin azalmasına ve çoğu zaman tamamen yok olmasına neden olabilmektedir. Dolayısıyla ile bu alanlar, hem bölgesel hem de küresel ölçekte korunması gereken oldukça önemli ekosistemlerdir.

Bu çalışmada, önemli miktarda sulak alanları içinde bulunduran Yüksekova ovasında uygulamaların ekosistem hizmetlerinin üretilmesi ve sunumu çerçevesinde değerlendirilmesi, tarımsal üretimin önündeki sorunların tespiti ve ekosistem hizmetlerinin sürdürülebilirliğinin sağlanması adına çözüm önerilerinin geliştirilmesi amacı ile yürütülmüştür.

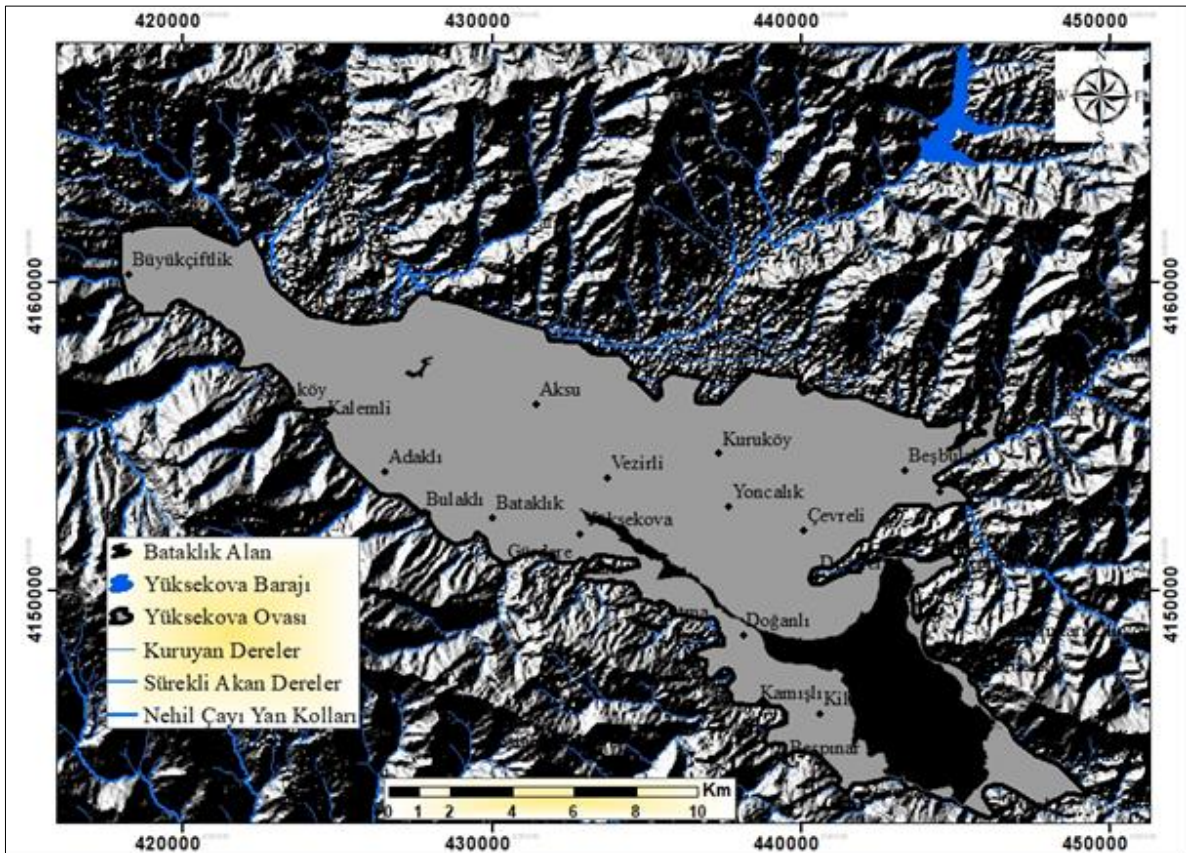

Materyal Metolar

Çalışma alanı

Çalışma alanı 37.427253° K - 37.598928° K enlemleri ile 44.071683° D - 44.423028° D boylamları arasında yer almakta olup, yaklaşık 17.500 ha genişliğinde farklı kullanımlar altındaki arazilerden oluşmaktadır. Alanın denizden ortalama yüksekliği 1950 m'dir. Çalışma alanında uzun yıllar (1979-2018) ortalama yıllık yağış miktarı 762 mm, ortalama aylık sıcaklık

-9.3°C (Ocak) ve 21.3°C (Temmuz) arasında olup yıllık ortalama buharlaşma ise 850 mm'dir (Anonim, 2019a). Bölgedeki doğal bitki örtüsü, bozkır olup daha çok geven, yavşan otu, keçi kulağı, çoban yastığı, deve diken, yabani yonca, yabani korunga gibi türler yetişmektedir. Ayrıca ova bazında buğday, yonca, fiğ, nohut, silajlık mısır ve aspir gibi tarla bitkileri, ceviz, kayısı, elma ve armut gibi meyve bitkileri ile karpuz, biber, hıyar, domates ve soğan gibi sebze bitkileri yetiştirilmektedir. Orman bitkisi yok denecek kadar az olan bölgede otlak ve meralarda çoğunlukla deve diken, papatya, yabani yonca, yabani korunga ve süpürge çalısı gibi bitkiler bulunmaktadır.

Çalışma alanı, dağlarla çevrili bir çöküntü ovası niteliğindedir. Alanın batısında Cilo dağı, kuzeyde Mor dağı, doğusunda İran sınır dağları ve güneyinde ise Cilo dağlarının uzantısı olan Sipiriz sıra dağları bulunmaktadır (Şekil 1). Alanda Kuzeybatı-Kuzeydoğu hattı boyunca Bitlis Metamorfileri (Ultra bazik kayaç, serpantin), Sekse Formasyonu (konglomera, kumtaşı, kil taşı ve kireçtaşı) ve Kırkgeçit Formasyonu (kumtaşı, marn ve şeyl türü kayaçlar) özellikli jeolojik materyaller yer almaktadır. Çalışma alanının Güneybatı-Güneydoğu hattı boyunca ise Urşe Formasyonu (kireç taşı, kumtaşı ve şeyl), Kandilli Kireçtaşı ve Yüksekova Karmaşığı (volkano-sedimenter kayaçlar ve kireçtaşı) özellikli materyaller bulunmaktadır (Sançar, 2018).

Şekil 1. Çalışma alanı sınırları ve yerleşim yerleri

Metot

Bu çalışma, devam etmekte olan TUBITAK destekli “Yüksekova Havzasında İklim ve Arazi Kullanımı Değişimlerinin Ekosistem Servisleri Üzerine Etkisinin Değerlendirilmesinde Toprak Fonksiyonlarının Kullanılması” başlıklı geniş kapsamlı bir proje kapsamında elde edilen veriler ve gözlemlerin derlenmesi ile oluşturulmuştur. Çalışmanın ana verisi, toprak, bitki ve su örneklemeleri esnasında arazide yapılan gözlemler ve üreticiler ile yapılan toplantılarda edinilen bilgilerdir.

Bulgular ve Tartışma

Yüksekova ovası topraklarının ve ovada yer alan sulak alanların toprak kalitesi ve ekosistem hizmetlerinin değerlendirilmesi amacı ile yürütülmekte olan TUBITAK projesi kapsamında arazi çalışmalarındaki gözlemler ve yapılan detaylı araştırmalarda Yüksekova ovasında tespit edilen sorunlar ve bu sorunların Ekosistem servisleri açısından önemi ayrı ayrı başlıklar altında sunulmuştur.

Sulak Alanların Tarım Arazilerine Dönüştürülmesi

Ova genelinde yürütülen arazi çalışmalarında hem iklim değişimleri hem de arazi yönetim sistemlerinden dolayı sulak alanların (Nehil Sazlığı) önemli bir kısmının bozulduğu tespit edilmiştir. Özellikle de daha önceleri sulak alan niteliğinde olan arazilerin önemli bir kısmında drenaj kanalları açılarak hali hazırda mera/biçenek olarak kullanılan alanlara dönüştürüldüğü tespit edilmiştir (Şekil 2). Bazı arazilerde ise daha sık aralıklarla açılan drenaj kanalları ile taban suyu daha da düşürülüp yonca, fiğ, buğday ve nohut tarımının yapıldığı ekili arazilere dönüştürülmüştür.

Şekil 1. Eski sulak alanların mevcut kullanımları ve açılan drenaj kanallarından görüntüler

Yirminci yüzyılın ortalarına kadar büyük çoğunluğu sulak alan olan Yüksekova ovasında yağışların azalması, ovadaki yerleşim ve tarımsal üretim için yeni arazi arayışı gibi insan etkisi sulak alanlar önemli miktarda azalmasına neden olmuştur. Tarım ve Orman Bakanlığı tarafından 2015 yılında tamamı (21.533 ha) ulusal öneme sahip sulak alan olarak kabul edilen çalışma alanında (Anonim, 2019b), 2021 yılı itibari ile 3.203 ha'lık sulak alan kalmıştır. Ancak, yıllık yağış miktarına ve mevsime göre bu alan yaklaşık 2.700 ha ile 3.500 arasında değişmektedir. Zira, Landsat uydu görüntüleri ve arazi çalışmaları esnasında yöre halkından alınan bilgiler doğrultusunda 2010-2018 yılları arasında açılan drenaj kanalları nedeni ile 11 noktada (yaklaşık 500 ha) sulak alan karakterde olan arazilerin mera/biçenek alanlarına, 2010-1989 yılları arasında ise 61 noktada (yaklaşık 3 bin ha) sulak alan olan arazilerin vafını kaybedip 51 noktanın mera/biçenek alanlarına geriye kalan 10 noktanın tarla tarımına ve 1989 yılından önce uydu görüntüsüne ulaşılmadığından arazi sahiplerinden alınan bilgiler doğrultusunda 34 noktanın (tahminen 2 bin ha) noktadan 20'sinin mera/biçenek alanlarına geriye kalan 14 noktanın ise tarım arazilerine dönüştürüldüğü tespit edilmiştir. Şahinoğlu ve Özdemir (2019) tarafından çalışma alanında bulunan sulak alan etrafında yapılan çalışmalarda, sulak alanın kenar ve taban kesimlerinde çok sayıda yataklanmış gidya (yüksek oranda karbon ve hümik asitler içeren, kömür düzeyine ulaşmamış doğal bir organik materyal) olduğu ve havza içinde turbaların tabanını oluşturduğu bildirilmiştir. Aynı araştırmacıların 60 farklı noktada yaptığı sondaj çalışmalarında sulak alanda turba kalınlıklarının 0.5 m ile 12 m arasında

değişim gösterdiği tespit edilmiştir. Bu durum, çalışma alanının önemli bir kısmının daha önceleri sulak alan karakterde olduğunu açıkça ortaya koymaktadır.

Sulak alanlar, tüm dünyada kapladıkları 12.1 milyon km²'lik alan ile toplam küresel ekosistem hizmetleri (ES) değerinin %40.6'sını oluşturduğundan insan yaşamı için hayati öneme sahiptir (Xu ve ark., 2020). Sulak alanlar fauna ve flora için kritik habitatları oluşturduğundan, genellikle çok çeşitli ekosistemlerini üretilmesi için temel ortamlar olarak kabul edilmektedir. Ülkemizdeki sulak alanlar biyoçeşitliliğin ve kültürel zenginliğin kaynağı olmanın yanında, Sibiryaya ve Afrika arasında göç yapan milyonlarca kuşun da göç yolunda konakladıkları önemli habitatlardır (Richardson ve Hussain, 2006). Sulak alan çevresinde yerleşim alanlarının ve ovada tarımsal faaliyetlerin artması ile daralan sulak alanlara kapasitelerinin üzerinde kirletilmiş suyun gelmesi, etkinliklerinin azalmasına yol açmaktadır. Toprak özelliklerine ve bunların etkileşimlerine dayanan ve çoğunlukla kullanım ve amenajmandan etkilenen toprak ekosistem servisleri bu koşullar altında olması gerektiği gibi sağlanamamaktadır. Ovada yer alan sulak alanlarının kurutulmasına devam edilmesi aşağıda belirtilen problemlerin ortaya çıkmasına neden olmaktadır.

Biyçeşitlilik kaybı: Sulak alanlar, dünyadaki biyolojik olarak en çeşitli ekosistemler arasında yer almaktadır. Göçmen kuşlar, amfibiler, sürüngenler, balıklar ve omurgasızlar dahil olmak üzere çeşitli bitki ve hayvan türleri için yaşam alanı sağlarlar. Sulak alanlar kurduğunda, bu türlerin çoğu yaşam alanlarını kaybeder ve bu da biyolojik çeşitliliğin azalmasına neden olur (Richardson ve Hussain, 2006; ; Borges ve ark., 2020; Xu ve ark., 2020).

Besin zincirlerinin bozulması: Sulak alanlar, besin için birbirine bağlı çeşitli organizmaların varlığı ile karmaşık besin zincirlerini desteklerler. Sulak alanlar kurduğunda, gıda bulunabilirliği azalır ve tüm gıda zinciri etkilenir. Besin kaynağı olarak sulak alanlarda yaşayan canlı türleri, alternatif besin kaynakları bulmakta zorlanabilir, bu da popülasyon tür ve sayılarının düşüşlerine ve hatta yok olmalarına neden olabilmektedir (Wang ve ark., 2021).

Su kalitesinin bozulması: Sulak alanlar, doğal filtre görevi görerek tortuları, besinleri ve kirleticileri filtre ederek suyu arındırırlar. Su sistemlerinde ötrofikasyona neden olabilen azot ve fosfor gibi besin maddelerinin seviyelerini azaltarak su kalitesinin iyileştirilmesine yardımcı olurlar (Daneil ve ark., 2019; Lefebvre ve ark., 2019).

Artan sel riski: Sulak alanlar, şiddetli yağış veya fırtınalar sırasında fazla suyu emerek ve depolayarak sellere karşı doğal tampon işlevi görür. Sulak alanlar kurutulduğunda, selleri azaltma yetenekleri kaybolur. Bu, insan yerleşimleri ve tarım arazileri dâhil çevredeki alanlarda sel riskinin artmasına neden olabilir (Rashid, ve Aneaus, 2019)

Yer altı su kaynaklarının beslenememesi: Sulak alanlar, yeraltı suyu rezervlerinin yeniden beslenmesinde çok önemli bir rol oynarlar. Doğal rezervuarlar gibi davranırlar, suyu depolayıp yavaş yavaş aküferlere ulaştırırlar. Sulak alanların kurutulması, hem insan hem de doğal sistemler için su mevcudiyetini etkileyerek yer altı su tablasına giren su miktarını azalmasına neden olmaktadır (Meng ve ark., 2020; Yang ve ark., 2021).

Sıcaklıkların artması: Sulak alanlar, büyük miktarda karbon depolayarak sera gazı emisyonlarını azaltmaya yardımcı olurlar. Sulak alanların kuruması, depolanan bu karbonu tekrar atmosfere salarak iklim değişikliğine neden olur. Ayrıca, sulak alanlar, evapotranspirasyon yoluyla çevredeki alanı soğutarak yerel iklimi düzenlemek için önemli alanları oluşturmaktadır. Bu nedenle sulak alanların kaybı, çok azda olsa yerel sıcaklıkların artmasına neden olabilir (Li ve ark., 2019; Liu ve ark., 2019; Jin ve ark., 2022).

Tarımsal Üretim Verim

Ovada tarımla uğraşan üreticiler, çoğunlukla buğday, yonca, fiğ ve nohut yetiştiriciliği yapmaktadır. Ancak, arazi çalışmalarında yapılan gözlemler ve çiftçilerden alınan bilgiler, birim alandan alınan ürün miktarlarının ülke ortalamasının çok çok altında olduğunu göstermektedir. Buğday üretiminde ülkemiz ortalaması yaklaşık 350 kg/da iken Yüksekova Ovası gibi oldukça verimli arazilerin olduğu bir alanda en iyi koşullarda dahi 200 kg/da verim alınmaktadır. Çoğu zaman buğday miktarı 200 kg/da'dan dahi çok daha düşük olmaktadır. Bu durum diğer bitkisel ürünler içinde geçerlidir ve düşük ürün almanın temel nedenleri aşağıda belirtilmiştir.

Toprak sıkışması (pulluk katmanı oluşumu): Tarımsal üretim yapılan arazilerde kulaklı pulluk ile uygun olmayan nem içeriğinde toprak işleme yapılması kil içeriği yüksek olan arazilerde toprak işleme derinliğinin altında oldukça sert ve geçirimsiz bir pulluk katmanı oluşumuna neden olmuştur (Şekil 3). Sert ve geçirimsiz bir katman olan pulluk katmanı bitkilerin kök gelişimini, suyun ve havanın hareketini olumsuz etkilemektedir. Bahar döneminde ovayı çevreleyen yüksek arazilerden gelen taşkın sularının veya arazi yüzeyindeki karların erimesi ile ortaya çıkan suyun toprak profilinin derinliklerine inmesini engelleyen bu pulluk katmanı, arazilerin çok daha uzun süre su altında kalmasına da neden olmaktadır. Bu bağlamda, uzun zamandır toprak işleme yapılan alanlarda bir dip kazan veya çizel ile yaklaşık 60 cm derinlikte işleme ile oluşmuş pulluk katmanının ortadan kaldırılması sağlanmalıdır. Ayrıca, bitkisel üretim yapılan arazilerde pulluğun yer aldığı yoğun toprak işleme yöntemleri yerine toprağı devirmeden işleyen ve bitki atıklarının bir kısmını arazi yüzeyinde bırakan diskaro, goble,

kültivatör veya çizel gibi azaltılmış toprak işleme aletlerinin tercih edilmesi de sağlanmalıdır. Bu bağlamda, bölgede uygulanan kırsal kalkınma desteklerinde azaltılmış toprak işlemeyi sağlayan makine ve ekipmanlara yer verilmesi toprakların üretkenlik kapasitesinin artmasına ve sürdürülebilirliğine katkı sağlayacaktır.

Şekil 3. Çalışma alanında toprak işlemede uygun olmayan nem içeriğinde birincil işleme aleti olarak kulaklı pulluk kullanımı sonucu oluşan pulluk katmanı

Bir arazide aşırı toprak işlemenin neden olduğu diğer bir önemli arazi bozulması organik madde kaybı ile birlikte, agregatların dayanıklılıklarının azalması ve erozyona karşı hassas hale gelmeleridir. Geleneksel toprak işleme yöntemleri toprak yapısını bozarak nem ve sıcaklık koşullarını değiştirmektedir (de Oliveira Silva ve ark., 2019). Özellikle de nem içeriğinin azalıp oksijenli ortamın oluşması organik maddenin mikroorganizmalarca hızlı bir şekilde parçalanmasına ve organik karbonun CO₂ şeklinde atmosfere salınmasına neden olmaktadır. Rakotovao ve ark. (2017), toprak işleme uygulamalarının CO₂ emisyonlarını ve sonuç olarak toprak karbon kayıplarını hızlandığını bildirmiştir. Toprak işlemede pulluk kullanımının yer aldığı geleneksel uygulamalardan koruyucu işleme uygulamalarına geçiş, toprak profili içinde toprak organik maddesinin birikmesine, zamanla agregatların dayanıklılığının artmasına ve ekosistem hizmetlerinin iyileştirilmesine önemli katkı sağlayacaktır.

Sulama olanakları: Su kaynakları bakımından oldukça zengin olan Yüksekova ovasında tarım arazilerinin büyük çoğunluğunda alt yapı yetersizliği nedeniyle sulama olanakları bulunmamaktadır. Bunun temel nedeni ovaya akan su kaynakları (nehir, dere) üzerine herhangi bir sulama göleti veya barajının yapılmaması ve arazilerin büyük çoğunluğuna sulama kanallarının ulaştırılmamasıdır. Sulama imkânlarının olmadığı arazilerde buğday veya nohut

yetiştiriciliği yapılmaktadır. Üreticilerden edinilen bilgiler buğday veriminin en fazla 200 kg da⁻¹ olduğunu göstermektedir. Ovada verimin bu kadar düşük olmasının temel nedenleri sulama imkânlarının olmamasının yanında mineral veya organik gübre kullanımının olmaması ve yıllardır aynı buğday tohumunun kullanılmasıdır. Bölgede sulama imkânları genellikle ovanın kenar köylerinde dere kaynaklarından veya ovanın iç kısımlarında artezyen kuyulardan (Şekil 4) sağlanmaktadır. Tarlaya ulaştırılan su yetersiz olmasına rağmen, sulama yöntemi olarak genellikle salma sulama yöntemi tercih edilmektedir. Bu durum, arazilerde drenaj sorununun şiddetlenmesine ve yer yer bitki kökleri için uzun zaman boyunca havasız koşulların oluşmasına da neden olmakta ve sulanan arazilerde de verim düşüklüğüne yol açmaktadır. Hernandez ve ark. (2019), dünyadaki ekin alanlarının yalnızca %20'sinde sulama olanaklarının olduğunu ve küresel anlamda sulanan arazilerde sulanamayan alanlara göre % 200 daha fazla ürün alındığını ifade etmiştir. Ayrıca, araştırmacılar kurak ve yarı kurak bölgelerde, sulama olanaklarının ekonomik getirileri artırdığını ve üretimde karlılığı %400'e kadar artırabildiğini rapor etmiştir. Bu nedenle, bölgede kritik bitki gelişme dönemlerinin kurak geçtiği yıllarda sulamanın yapılabilmesi verim artışlarının ve üretimde istikrarın sağlanması adına önemli katkı sağlayacaktır. Özellikle de kurak ve yarı kurak bölgelerde çimlenme, sapa kalkma ve başaklanma dönemlerinde toprak nem düzeyi tahıllarda verimin oluşumunda belirleyici olduğundan (Bulut, 2017) yağışın olmadığı kurak dönemlerde toprak neminin yetersiz olması durumunda buğday ve arpada sulama, verimi önemli derecede arttıracaktır. Bu nedenle ova genelinde sulama imkânlarının geliştirilmesi oldukça önem arz etmektedir.

Şekil 4. Yüksekova ovasında sulamada kullanılan bazı artezyen su kuyularına ait görüntüler

Gübreleme: Tarımsal üretimde gübreleme, verimi artırmakla beraber daha kaliteli ürün elde etmenin en önemli yollardan biridir (Savcı, 2012). Farias ve ark. (2020), tarım arazilerinde toprakta erozyon, bitki hasadı, yıkanma ve diğer yollar ile kaybolan besin elementlerinin tekrar toprağa ilavesi, birim alandan alınacak verimin artmasını sağladığını bildirmiştir. Bunun bilincinde olan çiftçilerin uygun dozlarda gübre kullanımına olan talep tüm dünyada giderek artmaktadır. Zira FAO (2015), tarım topraklarında en çok kullanılan azot, fosfor ve potasyum gübrelere olan taleplerin her yıl sırası ile %1.4, %2.2 ve %2.6 oranında arttığını bildirmiştir. Bitkisel üretimde birim alandan daha fazla ürün almak için en az sulama kadar önemli bir girdi olan gübrelemenin Yüksekova ovasında yer alan arazi sahipleri (çiftçiler) tarafından neredeyse hiç yapılmaması birim alandan alınan ürünün düşük olmasının en önemli nedenidir. Bölgede küçükbaş ve büyükbaş yayvan yetiştiriciliği önemli bir yer tutsa da özellikle kırsal kesimde yakacak temini sorunundan dolayı çok değerli bir gübre olan hayvan gübresinin yakacak olarak kullanılmasına neden olmaktadır (Şekil 5). Zira ülkemizde birincil enerji tüketiminin halen %10-20'sini tezek oluşturmaktadır. Bu durum, toprakların sürdürülebilir toprak kalitesi için hem toprak düzenleyici hem de besin elementi kaynağı olan organik gübrelere elden çıkmasına neden olmaktadır (Boyacı ve ark., 2011).

Şekil 5. Yüksekova ovası genelinde bulunan bazı köylerde yakacak olarak kullanılmak üzere koyun gübresinden üretilen tezek yığınları

Hastalık, zararlı ve yabancı otlar ile mücadele: Yüksekova ovasında, tarım arazilerinde birim alandan alınan ürünün Türkiye ortalamasının altında olmasının bir diğer önemli sebebi hastalık, zararlı ve yabancı otlar ile mücadelenin yeterince veya hiç yapılmamasıdır. Bölgede bitki koruma etmenleri ile uygun ve yeterli düzeyde mücadele yapılmadığında kültür bitkisi türüne bağlı olarak önemli verim kayıpları meydana gelmektedir. Nitekim küresel düzeyde bitki koruma etmenlerinin yol açtığı ürün kayıplarının kültür bitkisine göre değişmekle birlikte her yıl ortalama %35-42 arasında değiştiği tahmin edilmektedir (Oerke, 2006). Ülkemizde ise yetiştirilen farklı kültür bitkilerinde ekonomik düzeyde zarar yapan 552’den fazla hastalık, zararlı ve yabancı ot türü bulunmaktadır (Kadioğlu, 2012). Bu etmenlerin neden olduğu verim kayıplarının %30-40 arasında değiştiği, mücadele yapılmadığı alanlarda bu oranın %100’e ulaşabildiği belirtilmiştir (Canhilal ve Tiryaki, 2010).

Bölgede kar sularının geç çekilmesi nedeniyle toprak neminin yüksek olduğu buğday alanlarında fungal hastalıkların (*Fusarium* spp. ve *Puccinia* spp vb) yoğun bulaşıklı olduğu görülmektedir (Şekil 6). Bölgedeki buğday verimini etkileyen ana faktörlerden birini hastalık etmenleri oluşturmaktadır. Dolayısıyla bölgede başta buğday yetiştiriciliği olmak üzere tarımsal üretimin geliştirilmesi ve sürdürülebilirliği açısından bölge iklimine adaptasyonu yüksek ve hastalıklara dayanıklı çeşitlerin geliştirilmesi ve kullanılması verim ve kalite açısından önemli olacaktır.

Şekil 6. Yüksekova Havzasında buğday üzerinde tespit edilen *Puccinia graminis* Pers. hastalık etmeni ve belirtisi

Bölgede tarımsal üretimde önemli verim kayıplarına neden olan bitki koruma faktörlerden bir diğeri de zararlılardır. Özellikle ovada buğday ve yem bitkileri ekili tarım arazilerinde çekirge istilası nedeniyle verim kayıplarının her yıl değişmekle birlikte %100’e ulaştığı sezonlar olduğu çiftçiler tarafından belirtilmiştir. Ayrıca süne, nohut yeşil kurdu vb zararlı türlerinin de bitkisel üretimde önemli verim kayıplarına neden olduğu tespit edilmiştir. Bu durum bölge çiftçisinin

zararlıların üreme biyolojisi, mücadele dönemleri ve mücadelede stratejileri hakkında yeterli düzeyde bilgi sahibi olmadığından ileri gelmektedir. Bu nedenle bölgede zararlılara karşı kimyasal mücadele yapılsa dahi uygun dönem, uygun madde ve uygun dozlarda yapılmadığında etkili olmadığı gözlemlenmiştir (Şekil 7). Bu nedenle bölge çiftçisinin zararlılar ve mücadelesi hakkında bilgilendirme çalışmalarının yapılması üretimde sorun oluşturan zararlılarla etkili bir şekilde mücadele etmek için oldukça önemlidir. Ayrıca bölgede çekirge istilası ile etkili bir mücadelenin yapılması için yumurta çıkış dönemlerinin takip edilerek bölgesel olarak ilaçlama faaliyetlerinin gerçekleştirilmesi çekirge yoğunluğunun azaltılmasında etkili olabilecektir.

Şekil 7. Yüksekova Havzasında buğday tarlasında çekirge istilası ve mücadelesi (Anonim, 2022)

Bölgede kültür bitkilerinde verim ve kaliteyi etkileyen diğer bir önemli faktör ise yabancı ot mücadelesinin yetersiz olmasıdır. Bölgedeki çiftçilerin sertifikalı veya selektörden geçirilmiş temiz tohumluk kullanmadığı gibi vejetasyon dönemi içerisinde yabancı otlarla herhangi bir mücadelesi söz konusu değildir. Bu nedenle, bölgede yapılan sürvey çalışmalarında farklı kültür bitkilerinin içerisinde yabancı ot yoğunluğunun çok yüksek olduğu ve önemli verim ve kalite kayıplarına neden olduğu gözlemlenmiştir (Şekil 8). Bölgede tarımsal üretimi artırmak ve sürdürülebilirliği sağlamak için verim ve kaliteyi etkileyen ve diğer hastalık ve zararlılara konukçuluk yapan yabancı otların kontrol altına alınması oldukça önemlidir. Ülkemizde yabancı otlardan kaynaklanan verim kayıplarının bölgelere ve kültür bitkilerine göre değişmekle birlikte %20-35 arasında olduğu belirtilmiştir (Özer, 1993; Oerke, 2006; Önen, 2021).

Şekil 8. Yüksekova Havzasında buğday tarlasında yabancı ot tür ve yoğunluğu

Arazilerin amaç dışı kullanımı: Çalışma alanında ait uydu görüntüleri incelendiğinde son 30 yılda tarım arazilerinin önemli bir kısmı yerleşim alanlarına dönüştürülmüştür. Özellikle Yüksekova ilçe merkezinin ovaya doğru gelişim göstermesi tarım arazilerinin önemli bir kısmının işgal edilmesine neden olmuştur (Şekil 9). Daha önceleri yaklaşık 23 bin hektar olan ovanın (Mera/Biçenek ve sulak alan ve tarım arazileri dahil) yaklaşık 17.5 bin hektara kadar düştüğü tespit edilmiştir. Zira işgal edilen arazilerin büyük bölümünü tarım arazileri oluşturmaktadır. 1950’li yıllarda ilçe merkezinin de dâhil olduğu ovanın önemli bir kısmı sulak alan özellikte iken hem iklimsel değişimler hem de insan etkisi sonucu bu alanlar kurumuş ve imara açılmıştır. Bu durum bir taraftan bölgenin en verimli tarım arazilerinin elden çıkmasına neden olurken diğer taraftan da deprem olasılığı göz önünde bulundurulduğunda bu alanların en riskli alanlar olmasına neden olmuştur. Bölgede hem tarım arazilerinin sınırlı olması hem de 1. Derecede deprem bölgesinde yer alması nedeni ile ova genelinde arazilerin imara açılmaması ve imara açılan arazilerin tekrar gözden geçirilmesi gerekmektedir.

Şekil 8. Ovada son 30 yılda İlçe merkezinin ovaya doğru gelişimi

Sonuç

Tüm ovada oldukça detaylı yapılan arazi gözlemleri ve yapılan toprak analizleri, tarımsal ekosistemde verim ve kalitenin artırılması; sürdürülebilir kültürel önlemlerin (temiz tohum, münavebe ekim, gübreleme, sulama vb), korumaya yönelik geliştirilmiş olan modern tarım uygulamalarının (hastalık ve zararlılara dayanıklı çeşitler, adaptasyonu yüksek çeşitler vb), toprağı çok fazla parçalamadan tohum yatağı hazırlamaya yardımcı olacak uygun toprak işleme

tekniklerinin adaptasyonu ve uygun harman makineleri kullanılmasının yanı sıra önemli verim ve kalite sorunlarına neden olan bitki koruma etmenleriyle farklı mücadele tekniklerinin entegre bir şekilde kullanılarak (mekanik, fiziksel, biyolojik ve kimyasal) kontrol altına alınmasıyla sağlanabilir.

Teşekkür

Bu çalışmada elde edilen veriler 1190947 nolu TÜBİTAK proje kapsamında elde edilmiştir. TÜBİTAK'a desteklerinden dolayı teşekkür ederiz.

**MEASUREMENT OF NESFATIN-1 HORMONE IN BREAST MILK of
LACTATIONAL SHEEP**

Assoc. Prof. Dr. Duygu UDUM

Bursa Uludag University, Faculty of Veterinary Medicine Department of Biochemistry, Bursa

E-mail: duygudum@uludag.edu.tr

Phd Student Deniz Ekin YILDIRIM

Bursa Uludag University, Faculty of Veterinary Medicine Department of Biochemistry, Bursa

Abstract

Nesfatin-1 is a protein produced by the hypothalamus and identified satiety molecule in Zucker rats (Oh-I et al. 2006). In addition to its appetite-regulating effects, nesfatin has also been shown to be present in human milk (Aydın S., 2010). It was not determined that the hormone nesfatin 1 in milk was found in sheep. So in this study we wanted to measure the value of nesfatin 1 in sheep milk.

Materials-Methods

During the study, water and oat hay were given ad-libitum to the sheep and 500 g of concentrated feed (sheep milk feed) per animal daily.

We measured nesfatin-1 in the milk of sheep in early lactation period. Milk of 15 Kıvırcık sheep was taken for analysis 3 weeks after birth Nesfatin 1 levels in milk were analyzed with a plate reader using specific commercial ELISA kit (Mybisource, cat. no: MBS735285, Sheep Nesfatin-1 Elisa Kit)

Results

In order to determine the concentration of nesfatin 1, it was found that nesfatin-1 was found in the milk of 15 sheep in our analysis.

Sheep milk (n:15)	Nesfatin-1 concentrations ng(ml)

13	3,29
14	2,54
15	3,98

Discussion

RT-PCR study demonstrated that nesfatin/NUCB2 mRNA was expressed in various tissues including the brain and the adipose tissue. The origin of circulating nesfatin 1 in the serum has not been determined. However Aydın (2010) reported that nesfatin-1 was present in human breast milk.

It was assumed that nesfatin-1 in breast milk was transferred from the maternal circulation to breast milk and then passed to the neonatal blood. In conclusion, breast milk contain nesfatin-1 in sheep. Therefore, nesfatin -1 could be some functions about the development of the gastrointestinal system, regulation of appetite and contribution to metabolism in both sheep and lambs.

**SÜRDÜRÜLEBİLİR BAĞCILIK VIZYONUNA UYGUN ETKİLİ VE EKONOMİK
BİR BİYOSTİMÜLAN: DENİZ YOSUNU EKSTRAKTI**

Doç. Dr. Nurhan KESİN (Orcid ID: 0000-0003-2332-1459)

Van Yüzüncü Yıl Üniversitesi, Ziraat Fakültesi, Bahçe Bitkileri Bölümü Van-Türkiye

E-mail: keskin@yyu.edu.tr

ÖZET

Biyostimülanlar, sentetik gübrelere ve bitki büyüme düzenleyicilerine çevre dostu ve uygun maliyetli alternatifler olarak kabul edilir. Bu bağlamda deniz yosunları, küresel olarak bulunabilmesi nedeniyle özel ilgi görmektedir. Deniz yosunu ekstraktları, abiyotik ve biyotik streslere karşı bitki toleransını artırarak ve besin kullanımını iyileştirerek farklı toprak türlerine sahip ürünler ve tarım sistemlerinde verimi ve kaliteyi sürdürülebilir bir şekilde artırma kapasitesine sahip geniş tarımsal biyo-uyarıcılardır. Deniz yosunu ekstraktlarının ürün verimini ve bitkinin çevresel strese karşı toleransını iyileştirdiği mekanizmalar hakkında daha fazla bilgi geliştirmek, deniz yosunu ekstraktlarının yetiştiriciler tarafından benimsenmesi için önemli bir bilimsel itici güç oluşturmaktadır. Deniz yosunu ekstraktının kullanımı yenilikçi bir şekilde bağcılık için mevcut sistemlere dahil edilmesi kolay, gelecek vadeden sürdürülebilir bir yaklaşım sunmaktadır. Biyostimülanlar, endüstride etkili, sürdürülebilir bir alternatif olarak destek kazanmaya devam ettikçe, artık çoğu araştırma, bunların etki tarzlarını ve genel ürün verimliliği üzerindeki olumlu özelliklerini nasıl ortaya çıkardıklarını anlamayı amaçlamaktadır. Bu çalışmada, deniz yosunu ekstraktlarının üzüm üretiminde kullanımı ve bunların asma fizyolojisi ve strese uyum mekanizmaları üzerindeki etkileri güncel çalışmalar ışığında derlenmiştir.

Anahtar kelimeler: Asma, ekonomik sürdürülebilirlik, stress toleransı, verimlilik

**EFFECTIVE AND ECONOMICAL BIOSTIMULANT IN PROPER WITH THE
VISION OF SUSTAINABLE VITICULTURE: SEAWEED EXTRACT**

ABSTRACT

Biostimulants are considered environmentally friendly and cost-effective alternatives to synthetic fertilizers and plant growth regulators. In this context, seaweeds are of particular interest due to their global availability. Seaweed extracts are broad agricultural biostimulators with the capacity to sustainably increase yield and quality in crops and agricultural systems with different soil types by increasing plant tolerance to abiotic and biotic stresses and improving nutrient utilization. Developing more knowledge of the mechanisms by which seaweed extracts improve crop yield and plant tolerance to environmental stress is an important scientific impetus for industry adoption of seaweed extracts. The use of seaweed extract innovatively offers a promising sustainable approach to viticulture that is easy to incorporate into existing systems. As biostimulants continue to gain support in industry as an effective, sustainable alternative, most research now seeks to understand their mode of action and how they reveal their positive properties on overall product efficiency. In this study, the use of seaweed extracts in grape production and their effects on vine physiology and stress adaptation mechanisms were compiled in the light of current studies.

Keywords: Grapevine; economic sustainability, stress tolerance, productivity

Giriş

Biyostimülanlar; bitkinin gelişimini, beslenmesini, ürün kalitesini ve verimini olumlu yönde etkileyen; bitkilerin strese dayanıklılığını artıran; bitkilere topraktan, yapraktan ya da tohuma uygulanan, içeriğinde inorganik veya organik bileşikler, mikroorganizmalar bulundurabilen, aynı zamanda toprak yapısını düzenleyici etkileri de bulunabilen materyallerdir (Külahtaş ve Çokuysal 2013).

Su bitkileri olarak adlandırılan deniz yosunları (makro algler) enerji, tıp, kimya, gıda ve tarım alanlarında hammadde veya katkı maddesi olarak kullanılmaktadır. Dünyada yaklaşık 6 milyon ton deniz yosunu hasat edilmekte olup bunun 1 milyon tonu fikoit (su yosunlarından elde edilen ekstraktlar), 1 milyon tonu tarım alanında toprak düzenleyici/zenginleştirici ve tarım kimyasalları üretiminde, geriye kalan büyük kısım ise gıda maddesi olarak tüketilmektedir (Engin ve ark., 2019). Vitamin, mineral ve iz elementler en çok okyanuslar ve denizlerde bulunmaktadır. Deniz yosunları bu elementleri yüksek konsantrasyonlarda bünyesine alma ve bünyesinde barındırma yeteneğindedir (Gutiérrez-Gamboa ve Moreno-Simunovic, 2021).

Deniz yosunları birçok ülkede; sıvı ekstrakt veya doğrudan toprağa karıştırılarak kullanılmaktadır. Deniz yosunu ekstraktları, bitki tarafından kullanılabilir veya bitki tarafından parçalanabilir bir takviye sağlamak yerine bitkiye uygulandığında iç tepkileri (bitki savunması ve büyümesi) "uyardıkları" için biyo-gübrelerin aksine biyo-uyarıcılar olarak sınıflandırılır (Ali et al. 2021). Deniz yosunlarının doğrudan toprağa karıştırılmasının ana hedefi toprak yapısını düzelterek, toprak verimliliğini artırmaktır. Her ne kadar deniz yosunlarının doğrudan toprağa karıştırılıp gübre olarak kullanıldığı, eski zamanlardan beri biliniyorsa da, son 45-50 yıldır bu ekstraktların yapraklardan çeşitli aletlerle püskürtülerek uygulanmasının da verim ve ürün kalitesini artırdığı tespit edilmiştir (Gutiérrez-Gamboa ve Moreno-Simunovic, 2021).

Avrupa ülkeleri genellikle kahverengi yosunlardan *Ascophyllum*, *Fucus* ve *Laminaria* cinslerini; Amerika ise *Macrocystis*, *Nereocystis* gibi büyük talluslu kahverengi yosunları yaygın olarak kullanmaktadır (Güner ve Aysel, 1996). Ülkemizde de kelpak ve maxicrop gibi ithal deniz yosunu ekstraktlarının domates, marul, üzüm ve zeytin gibi çeşitli tarımsal ürünlere olan etkilerinin araştırıldığı çalışmalar bulunmaktadır (Akman, 1995; Özlü, 1997; Demir ve ark., 2003; Güllüoğlu ve Arıoğlu, 2005; Kök ve Bal, 2016).

Bu çalışmada, deniz yosunu ekstraktlarının üzüm üretiminde kullanımı ve bunların asma fizyolojisi ve strese uyum mekanizmaları üzerindeki etkileri güncel çalışmalar ışığında derlenmiştir.

Deniz Yosunu Türleri, Bileşimleri ve Etkileri

Deniz yosunları, yaklaşık 10.000 adet kırmızı, kahverengi ve yeşil türü kapsayan çeşitli bir fotosentetik ökaryotik organizma grubudur (Khan ve ark., 2009). Sayıları ve dağılımları göz önüne alındığında, kahverengi türler (*Phaeophyceae*) bahçe bitkileri üretiminde çeşitli uygulamalarla ticari ekstrakt hazırlamak için yaygın kullanılanlardır (Battacharyya ve ark., 2015).

Deniz yosunlarından hazırlanan biyostimülan ürünlerin çoğu, Avrupa'nın kuzeybatı ve kuzey Amerika'nın kuzeydoğu kıyıları boyunca bol miktarda dağılmış olan tek bir kahverengi yosun türü olan *Ascophyllum nodosum* (L.) Le Jolis'den üretilmektedir (Craigie, 2011). Bununla birlikte, şu anda piyasalarda bulunan çeşitli ticari ekstraktlar, *Ecklonia maxima*, *Durvillaea potatorum*, *D. antarctica*, *Himantalia elongata*, *Laminaria digitata*, *L. hyperborea*, *Macrocystis pyrifera* ve *Sargassum* spp. gibi diğer kahverengi yosun türlerinden yapılmaktadır. *Fucus serratus*, *Ulva intestinalis*, *U. lactuca* ve *Kappaphycus alvarezii* gibi diğer daha az yaygın türler de kullanılmaktadır (Gutiérrez-Gamboa ve Moreno-Simunovic, 2021).

Kahverengi yosunlardan (*Ascophyllum nodosum*) yapılan ticari ekstraktlar, azot, fosfor, potasyum, kalsiyum, demir, magnezyum, çinko, sodyum, sülfür ve değişen miktarlarda amino asit içermektedir (Fleurence, 2004; Rayirath ve ark., 2009; Gutiérrez-Gamboa ve ark., 2020c).

Deniz yosunları, geçmişte gübre olarak değerlendirilmiştir. *A. nodosum* türü, deniz suyundan besinleri ve mineralleri biriktirmede çok etkili olup bu türün hasat edilen biyokütlesi, bitkilerdeki fizyolojik tepkileri iyileştirmek için bahçe bitkileri yetiştiriciliğinde gübre olarak kullanılmaktadır (Pereira ve ark., 2020). Ayrıca toprağı havalandırma ve nem tutma özellikleri yanında azot yönünden çiftlik gübresi kadar zengin olması, çok küçük konsantrasyonlarda bile bitkilerde farklılaşma, büyüme gibi birçok fizyolojik olayı kontrol eden oksinler, sitokininler, gibberellinler, absisik asit ve brassinosteroidler (Stirk ve ark., 2014) dahil olmak üzere birkaç fitohormon ile mikro ve makro besin maddelerini ihtiva etmelerinden dolayı günümüzde farklı ülkelerde; örtüaltı yetiştiriciliği başta olmak üzere; armut, asma, elma, ve turuncgiller ile süs bitkileri yetiştiriciliğinde yaygın olarak kullanılmaktadır (Güner ve Aysel, 1996).

Alaria esculenta, *A. nodosum*, *Ectocarpus siliculosus*, *Fucus serratus*, *F. spiralis*, *F. vesiculosus*, *Halidrys siliquosa*, *Laminaria digitata*, *L. hyperborea*, *L. saccharina* ve *Pilayella littoralis* gibi kahverengi yosun türleri, abiyotik faktörlere yanıt olarak aktive olan mannitol

gibi önemli koruyucu bileşikler de içerir (Gutiérrez-Gamboa ve Moreno-Simunovic, 2021). Mannitol aynı zamanda bir şelatlama maddesi olarak da bilinir ve bu, alglerin bitki kullanımı için toprakta uygun olmayan elementleri neden bitkinin yararlanabileceği hale getirdiğini açıklar (Reed ve ark., 1985). Kahverengi yosun *Pterygophora californica*'nın önemli miktarlarda melatonin içerdiği belirlenmiştir (Fries ve Thorén-Tolling, 1978).

Deniz yosunu ekstratı uygulamalarının biyotik ve abiyotik stres faktörlerine karşı direnç sağladığı, bitkilerde verimi etkilediği ve tohum çimlenmesini iyileştirdiği bildirilmiştir (Mahima ve ark., 2018).

Polisakkaritler, çoğu yosun türünün ticari ekstratlarının ana bileşenlerinden biridir (Sharma ve ark., 2014). Bu bileşenler, deniz yosunu ekstratının kuru ağırlığının % 30 veya % 40'ını oluşturabilir (Rayirath ve ark., 2009). Kahverengi yosun ekstratları söz konusu olduğunda, en yaygın polisakkaritler aljinatlar, fukoidanlar, laminatlar ve glukanlardır (Khan ve ark., 2009). Bitki büyümesini teşvik ettiği gösterilen (Yabur ve ark., 2007) β -D-mannuronik ve α -L-guluronik asitlerin polimerleri olan aljinatlar, kullanılan yosun türlerine göre viskozite bakımından farklılık göstermektedir (Battacharyya ve ark., 2015). Deniz yosunu ekstratlarının diğer önemli bileşenleri, bağcılıkta kullanılan ve bitkilerin mantar ve bakteriyel patojenlere karşı savunma tepkilerini modüle etmede etkisi olduğu iyi bilinen laminarinlerdir (Gutiérrez-Gamboa ve Moreno-Simunovic, 2021).

Kahverengi yosunlar, özellikle *E. stolonifera*, *F. vesiculosus*, *F. serratus* ve *A. nodosum*, 30 g/100 g ekstrakta bile yüksek fenolik bileşik konsantrasyonlarına ulaşabilmektedir (Balboa ve ark., 2013). Florotanninler, kahverengi yosunlarda bulunan floroglukinolün oligomerleridir ve kateşin, askorbik asit, epigallokateşin gallat, *trans*-resveratrol ve tokoferol ile karşılaştırıldığında daha etkili antioksidanlar olduğu bildirilmektedir (Shibata ve ark., 2003).

A. nodosum'un benzersiz özelliklerinden biri, kendisini kurumadan koruyan mantar endofit *Mycosphaerella ascophylli* ile mutual ilişkisidir (Gutiérrez-Gamboa ve Moreno-Simunovic, 2021). *A. nodosum*'dan elde edilen ekstratlarda bulunan *M. ascophylli*'den türetilen mantar sterollerinin bitkilerdeki tuzluluk stresini azaltabildiği tespit edilmiştir (Shukla ve ark., 2019).

Bağcılıkta Deniz Yosunu Kullanımı

Bağcılıkta deniz yosunu kullanımı günümüzde yoğun araştırma konusu olup literatürde asma hastalıklarından korunma, üzüm ve şarap kalitesinin iyileştirilmesi üzerindeki etkisini değerlendiren az sayıda literatür bulunmaktadır (Aziz ve ark., 2003; Sharma ve ark.,

2014; Zhang ve ark., 2016; Frioni ve ark., 2018, 2019; Mondello ve ark., 2018; Guti rrez-Gamboa ve ark., 2019b; Salvi ve ark., 2019; Taskos ve ark., 2019; Guti rrez-Gamboa ve ark., 2020a, b, c; Thankaraj ve ark., 2020).

Geçtiğimiz yirmi yıl boyunca, dünyanın başlıca bağcılık bölgeleri tahmin edilemeyen iklim koşulları ve çoğunlukla yaz döneminde, üzümün olgunlaşma dinamiklerini ve kalitesini güçlü bir şekilde etkileyen sıcaklık artışıyla karşı karşıyadır (Jones ve Davis, 2000; Tomasi ve ark., 2011; Keller, 2020). Deniz yosunu bazlı biyostimulanlar, abiyotik ve biyotik faktörlere karşı koruma sağlayabilir ve verimliliği artırabilir (Salvi ve ark., 2019). Ayrıca çevre dostu bağcılık stratejilerinin de geliştirilmesinde önemli bir rol oynayarak iklim değişikliğinin olumsuz etkilerini hafifletebilir (Sabir ve ark., 2014; Frioni ve ark., 2018).

Bağcılıkta yapraktan deniz yosunu uygulanmalarının etkileri ile ilgili literatürün çoğu verimlilik, tane-şarap bileşimi ve fizyoloji üzerine odaklanmıştır.

Deniz Yosunu Ekstrakt Uygulamalarının Verim Üzerine Etkileri

Sultani Çekirdeksiz üzüm çeşidinde *A. nodosum* ekstraktının 2.35 l/ha'lık bir dozda uygulanması, verim, salkım ve tane ağırlığı, salkım boyu ve sertliğinde bir artış sağlamış, ancak tanelerde SÇKM üzerinde olumsuz etki oluşturmuştur (Norrie ve ark., 2002).

Üç ticari deniz yosunu ekstraktının (Maxicrop®, Proton® ve Algipower®) 1.0 g/l ile 2.0 g/l dozunda kullanımı Karaerik çeşidinin bir yaşlı fidanlarında bakır ve diğer mikro besinlerin emilimini artırmıştır (Turan ve Köse, 2004).

Başka bir çalışmada, 170 ml/hl'lik bir dozda *A. nodosum* ticari ekstraktının (Alga Special®) omcalara yapraktan uygulanması, Fetească albă üzüm çeşidinde vejetatif büyümeyi, sürgün uzunluğunu, çapını ve yaprak alanını artırmıştır (Popescu ve Popescu, 2014).

Çözünür bir *A. nodosum* ekstraktı, Narince omcalarına %0.5 (h/h) konsantrasyonunda uygulandığında yaprak kuru ağırlığı, tane ağırlığı, tane hacmi, Ca, Zn, S, B ve klorofil içeriklerinde artışa neden olmuştur (Sabir ve ark., 2014).

Perlette üzüm çeşidinde, Primo adındaki bitkinin deniz yosunu temelli yaprak gübresinin 0.1 ml/l'lik uygulaması, bitkinin yaprak boyutu ve klorofil içeriği, tane tutumu, sürgün başına salkım sayısı, sap uzunluğu, tane ağırlığı ve büyüğü, SÇKM miktarı ve pH'yı artırmış ve tane su kaybını azaltmıştır (Khan ve ark., 2012).

Serin iklimde yetiştirilen Carmenère üzüm çeşidinde 3 l/ha dozunda ticari bir *A. nodosum* ekstraktının (BM86®) yapraklara uygulandıktan sonra tane tutumu ve verimliliği artırdığı bildirilmiştir (Guti rrez-Gamboa ve ark., 2019a).

Trakya İlkeren üzüm çeşidinin sofralık kalite özelliklerini iyileştirmek amacıyla uygulanan deniz yosununun farklı dozları farklı etkiler göstermekle birlikte, özellikle 1000 ve 3000 ppm dozlarının çeşidin sofralık kalite özellikleri üzerinde en iyi sonuçları verdiği bildirilmiştir (Kök ve ark., 2010).

Deniz Yosunu Ekstrakt Uygulamalarının Tane ve Şarap Bileşimi Üzerine Etkileri

Riesling üzüm çeşidinde ben düşme döneminden (ben düşme dönemi, ben düşmeden 15 ve 30 gün sonra) hasat dönemine kadar geçen sürede yapraktan uygulanan deniz yosunu ve hümitik asit uygulamalarına ait farklı dozların (0, 1000 ve 3000 ppm) çeşidin tane biyokimyasal özellikleri üzerine etkileri incelenmiştir. Araştırma sonucunda deniz yosunu uygulama dönemleri arasında en iyi kalite özelliklerinin sırasıyla ben düşme döneminden 30 gün sonra, ben düşme döneminden 15 gün sonra ve ben düşme dönemlerinden elde edildiği ve yapraktan uygulanan deniz yosunu ve hümitik asit uygulamalarının (özellikle 1000 ppm uygulama dozunun) Riesling üzüm çeşidinin tane biyokimyasal özelliklerini değiştirdiği tespit edilmiştir (Kök ve Bal, 2016).

Cabernet Sauvignon üzüm çeşidinde ben düşme döneminde 2 kg N/ha uygulanan *Durvillaea antarctica* yosunu bazlı ticari bir azotlu gübre (Basfoliar® Algae SL), çeşidin tane ve şaraplarındaki birkaç amino asit içeriğini artırmış ve aroma içeriğini iyileştirmiştir (Gutiérrez-Gamboa ve ark., 2017b, c, 2018). Birçok çalışma, ben düşme döneminde yaprak uygulamasının toprak uygulamasına oranla asmalarda besin emilimini iyileştirdiğini doğrulamıştır (Lacroux ve ark., 2008; Lasa ve ark., 2012; Verdenal ve ark., 2015; Dienes-Nagy ve ark., 2020). Bu nedenle, hem azot hem de deniz yosunu ekstratlarının birlikte yaprak uygulamaları, omca azot metabolizmasını ve dolayısıyla amino asitlerin sentezini uyararak, kaynak organlarda azotun depolanmasına yol açabilmektedir (Gutiérrez-Gamboa ve Moreno-Simunovic, 2021). Frioni ve ark. (2018) ile Salvi ve ark. (2019), *A. nodosum* ekstraktını sırasıyla hektara 3 g/l ve 1.5 kg olarak omcalara yapraktan uygulamışlar ve tanelerde kabuk antosiyanin birikimi ile toplam fenolik bileşik içeriğini artırdığını belirlemişlerdir. Frioni ve ark. (2019), bu artışın flavonoid sentezinin metabolik yollarının aktivasyonunda yer alan genlerin spesifik modülasyonu ile ilişkili olduğunu göstermiştir. Araştırmacılar ayrıca *A. nodosum* ekstraktı uygulanan omcaların, uygulanmayan omcalara oranla *Botrytis cinerea*'dan daha az etkilendiğini gözlemlemişlerdir.

Taskos ve ark. (2019), *A. nodosum* ekstraktını %1 (h/h) konsantrasyonda Merlot üzüm çeşidine ait omcalara yapraktan uyguladıklarında, tane kabuğunda ve çekirdekte antosiyanin

ekstraksiyon kapasitesininin, verim ve salkım sayısının arttığını, tane toplam polifenol indeksini ise azalttığını gözlemlemiştirlerdir.

Tempranillo Blanco üzüm çeşidine ait omcalarda %0.25 (h/h) oranında deniz yosunu yaprak uygulamalarının iklim koşullarına bakılmaksızın kateşin ve flavonol içeriklerini artırdığı, yosun dozunun %0.50 (h/h) oranında uygulamasının ise tanelerde kurak koşullarda birkaç amino asit konsantrasyonunu nemli koşullara oranla artırdığı saptanmıştır (Gutiérrez-Gamboa ve Moreno-Simunovic, 2021). Farklı zamanlarda (tane tutumu ve ben düşme) ve dozlarda (0, 1000, 2000 ve 3000 ppm) yapraktan uygulanan deniz yosunun etkilerinin incelendiği bir çalışmada, ben düşme dönemi+ 3000 ppm dozunun Cabernet Sauvignon üzüm çeşidinin SÇKM, toplam fenolik bileşik içerik, toplam antosiyanin miktarı ve antioksidan kapasitesi üzerinde etkili olduğu bildirilmiştir (Koç, 2020).

Deniz Yosunun Asma Fizyolojisi Üzerine Etkileri

Aziz ve ark. (2003), asma yapraklarına uygulanan *L. digitata*'dan elde edilen laminarin ekstraktının sera denemelerinde *Botrytis cinerea* ve *Plasmopara viticola* enfeksiyonunu azalttığını bildirmişlerdir. Araştırmacılar, bu etkiyi, kalsiyum akışı, hücre dışı ortamın alkalileşmesi, ROS (reaktif oksijen türleri) üretimi, savunma genlerinin ifadesi ve *trans-resveratrol* ile *viniferin* gibi stilben fitoaleksinlerin birikimi üzerindeki ekstraksiyonlara dayanarak açıklamışlardır. Stilbenlerin birikimi, Tempranillo Blanco çeşidine *A. nodosum* ekstraktının uygulanmasından sonra gerçekleştirilen bir bağ denemesinde yakın zamanda doğrulanmıştır (Gutiérrez-Gamboa ve Moreno-Simunovic, 2021). Ek olarak, Garde-Cerdán ve ark. (2017), asmalara uygulanan laminarin ve *Saccharomyces* ekstraktlarına dayalı bir uygulamanın üzüm tanelerindeki birkaç amino asit içeriğini azalttığını saptamışlardır. Bitkilerde savunma mekanizmalarının eksojen olarak ortaya çıkarılması yoluyla indüksiyonu, bazı amino asitlerin enzimatik substratlar olarak tüketilmesini veya bu bileşiklerin bir hayatta kalma mekanizması olarak rezerv organlarda bölümlere ayrılmasını içeren fizyolojik bir maliyetle sonuçlanabilir (Gutiérrez-Gamboa ve ark., 2017a). Patojenik mikroorganizmalar ve deniz yosunları, bitki savunma mekanizmalarını indüklemeye izin veren β - (1 → 3) - glukan bileşimleriyle ilgili yakın bir yapısal benzerlik gösterir (Paris ve ark., 2019). Yakın zamanda yapılan bir araştırma, Marselan üzüm çeşidinde bir laminarin ekstraktının, *P. viticola*'ya karşı savunma mekanizması için bu ekstraktın biyoaktif bileşikleri tarafından gerçekleştirilen savunma mekanizmasında açığa çıkmasından ziyade doğrudan çözeltinin asilasyon derecesi ile ilgili antimikrobiyal aktiviteyle daha çok ilişkili olduğunu göstermiştir (Paris ve ark., 2019).

Sonuç

Deniz yosunu ekstraktı ile ilgili çalışmalar her geçen gün artmaktadır. Derlemede ele alınan çalışmalara dikkat edildiğinde ise, deniz yosunu ekstraktlarının bağıcılıkta ürün verimine, bitki gelişimine ve stres etmenlerine dayanıklılık üzerine olumlu etkilerinin bulunduğu görülmektedir. Günümüzde, deniz yosunu ekstraktı kullanımı ile tarımsal ilaç ve gübrelerin aşırı ve bilinçsiz kullanımını azaltmak dolayısıyla da tarımda bilinçsizce kullanılan kimyasallar nedeniyle ortaya çıkan çevre kirliliğinin önüne geçilebilmesi mümkün görünmektedir.

ÖZET

Artan nüfusla birlikte, beslenme ihtiyacının da artması, birim alandan alınan verimin de artırılmasını zorunlu kılmaktadır. Üzüm ve üzüm ürünlerinin beslenmedeki önemi büyüktür. Asmada verim, iklim faktörleri ile yakından ilişkilidir. Bu nedenle, iklim faktörleri ile verim arasındaki ilişkinin doğru belirlenmesi önemlidir. Bu çalışmada, Ankara-Kalecik koşullarında yetiştirilen ve Türkiye'nin en kaliteli beyaz şaraplık çeşitleri arasında yer alan Narince üzüm çeşidinde, sürme, çiçeklenme ve ben düşme dönemleri için iklim faktörlerinden sıcaklık ile verim arasındaki ilişki belirlenmeye çalışılmıştır. Bu ilişkiyi belirlemek üzere; basit, karesel ve kübik regresyon modelleri denenmiştir. Bu modellerin performansını belirlemek üzere, Belirleme katsayısı (R^2) ve Hatta kareler ortalamasının karekökü (RMSE) kullanılmıştır. Çalışma sonucunda, modellere ait belirleme katsayısı %56.8 ile %67.3 arasında değişim göstermiştir. Karesel ve Kübik modele göre Basit model tatminkar sonuçlar vermiş olmakla birlikte, verim ile sıcaklık arasındaki ilişkiyi belirlemek üzere, farklı modellerin de denenmesinin uygun olacağı vurgulanmıştır.

Anahtar kelimeler: Asma, verim, modelleme, belirleme katsayısı, RMSE

**MODELING THE RELATIONSHIP BETWEEN TEMPERATURE AND YIELD FOR
NARINCE GRAPE CULTIVAR IN ANKARA-KALECIK ECOLOGY**

ABSTRACT

By increasing with population, nutrition requirement is also getting increase and this lead to necessary to increase the yield from the unit area. Grape and grape products have great importance in nutrition. Yield in grapevine is closely related to climatic factors. For this reason, it is important to determine the relationship between climatic factors and yield correctly. In this study, the relationship between temperature and yield, which is one of the climatic factors, was tried to be determined in “Narince” grape cultivar, which is grown in Ankara-Kalecik conditions and which is among the the best wine grape cultivars of Türkiye. To determine this relationship; simple, quadratic and cubic regression models were considered. Root mean square error (RMSE) and coefficient of determination (R^2) were used to evaluate the performance of these models. As a result of the study, the coefficient of determination of the models varied between 56.8% and 67.3%. Although the simple model gave satisfactory result according to the quadratic and cubic models, it was emphasized that it would be appropriate to try different models to determine the relationship between yield and temperature.

Keywords: Grapevine, yield, modeling, determination coefficient, RMSE

Giriş

Nüfusun hızla artması, besin ihtiyacını da artırmakta ve bu durum, birim alandan daha fazla ürün üretilmesini zorunlu kılmaktadır. İnsan beslenmesinde, üzümün ve üzüm ürünlerinin önemi büyüktür. Bu nedenle, bağcılıkta üzüm verimin artırılması için verim ile ilişkili olan faktörlerin doğru belirlenmesi gerekir.

Asma, yaklaşık 4-5 yıllık sürede ekonomik olarak kullanıma uygun üzüm verimine ulaşmakta ve 40-50 yıl kadar ekonomik ömrünü sürdürebilen çok yıllık bir bitkidir (Zhu et al., 2021). Asmaların vejetasyon sürecinin başlamasını ifade eden sürme, kuzey yarıkürede ılıman iklim kuşağının hakim olduğu alanlarda ekolojik özelliklere bağlı olarak Mart-Nisan aylarında başlarken, çiçeklenme Haziran-Temmuz aylarında ve ürünün olgunlaşması ise Ağustos ve Eylül aylarında gerçekleşmektedir. Asmada büyüme ve gelişme olayları ile birlikte üzüm verimi, başta sıcaklık, güneşlenme, yağış ve nem gibi iklim faktörleri olmak üzere, kültürel uygulamaları da içeren çevre faktörleri ile şekillenmektedir. Bağcılık faaliyetlerinin yürütülebilmesinde iklimin belirleyici olduğu dikkate alındığında, iklimsel değişikliklerin, verimle ilişkisinin belirlenmesi önemlidir. Bu ilişkiler doğrusal olabileceği gibi doğrusal olmayan yapıda da olabilir. Doğrusal ilişkileri belirlemede veya modellemede; doğrusal regresyon modelleri yaygın olarak kullanılırken, doğrusal olmayan ilişkileri belirlemek üzere, doğrusal olmayan regresyon modelleri de yeterince kullanım alanı bulmaktadır.

Üzümde, iklim özellikleri ile verim arasındaki ilişkiyi modellemek üzere yabancı literatürde yeterince çalışmanın yapılmış olduğu düşünülse de, ülkemizde yok denecek kadar azdır. Özellikle, Ankara-Kalecik koşullarında yetiştirilen ve Türkiye'nin şaraplık çeşitleri arasında yer alan Narince üzüm çeşidinde verim ile iklim özellikleri arasındaki ilişki sürdürülebilir bağcılık ölçeğinde inceleyen çalışmaya rastlanmamıştır. Bu nedenle, çalışmada Ankara-Kalecik koşullarında yetiştirilen Narince üzüm çeşidinde yıllık ortalama verim (kg/da) ile iklim faktörlerinden sıcaklık arasındaki ilişkinin modellenmesi amaçlanmıştır.

Materyal ve Yöntem

Materyal

Çalışmada Ankara Üniversitesi Ziraat Fakültesi Kalecik Bağcılık Araştırma ve Uygulama İstasyonu'nda 1997 yılında tesis edilmiş olan, Narince/5BB üzüm çeşidinde ait bağ alanından elde edilen 2003-2022 yılları arasındaki 20 yıllık verim değerleri (kg/da) kullanılmıştır. Bağ alanında 90 cm yüksekliğindeki gövde üzerinde çift kollu Kordon ve baş terbiye şekli çift T destek sistemi uygulanmıştır. Dikim aralıkları 1.5 x 3.0 m olarak düzenlenmiştir. Bağ alanı damla sulama sistemi ile sulanmaktadır (Çelik ve ark., 2007). Bağa

ait 2003 ile 2022 yılları arasındaki 20 yıllık sıcaklık değerleri (°C) Meteoroloji Genel Müdürlüğü'nden alınmıştır.

Çalışmada kullanılan verilere ait tanımlayıcı istatistikler Çizelge 1' de özetlenmiştir.

Çizelge 1. Tanımlayıcı istatistikler

	Ortalama	St. Sapma	Min	Mak.
Verim (kg/da)	519.65	221.928	156	961
Nisan ayı sıcaklık ortalaması (°C)	10.1570	1.13385	8.73	12.40
Haziran ayı sıcaklık ortalaması (°C)	19.9008	1.02303	17.77	21.23
Temmuz ayı sıcaklık ortalaması (°C)	22.9153	0.52883	22.00	23.93

Yöntem

Verim ile iklim özellikleri arasındaki ilişkileri belirlemek üzere, doğrusal ve doğrusal olmayan modeller kullanılmaktadır. Doğrusal olmayan modellerdeki gerek parametre tahminleri, gerekse tahminlenen parametrelerin yorumlanmasındaki güçlükler, doğrusal modellerin daha çok tercih edilmesine neden olmaktadır. Bu nedenle çalışmada, iklim özelliklerinden sıcaklık ile dekara ortalama verim arasındaki ilişkiyi belirlemek üzere doğrusal regresyon modelleri kullanılmıştır. Bu modellerden standart doğrusal model, Karesel model ve Kübik model kullanılmıştır.

“Y” değişkeni (bağımlı değişken, çıktı değişkeni veya cevap değişken), ortalama verim (kg /da),

“X” değişkeni (bağımsız değişken, açıklayıcı değişken) sıcaklık (°C),

“b” regresyon sayısı ve

“e” de hata terimi olmak üzere;

modeller aşağıdaki gibi oluşturulmuştur.

Basit model: $Y = b_0 + b_1X + e$

Karesel model: $Y = b_0 + b_1X^2 + e$

Kübik model: $Y = b_0 + b_1X^3 + e$

Kalecik koşullarında sürme Nisan ayında, çiçeklenme (başlangıç ve tam çiçeklenme) Haziran ayında ve ben düşme Temmuz ayında olduğundan; bu 3 aydaki sıcaklık değerleri ile verim arasındaki ilişkili modellenmiştir. Modellerin performansını değerlendirmede, Belirleme katsayısı (R^2) ve Hata kareler ortalamasının karekökü (RMSE) ölçütleri kullanılmıştır. Hesaplamalar için SPSS (ver: 21) istatistik paket programından yararlanılmıştır.

Bulgular ve Tartışma

Çalışmada; sürme, çiçeklenme ve ben düşme dönemine ait sıcaklık değerleri ile verim arasındaki ilişkiyi belirlemede kullanılan; Basit, Karesel ve Kübik modellere ilişkin sonuçlar Çizelge 2'de özetlenmiştir. Çizelge 2'de görüldüğü üzere, sürme döneminde, Karesel ve Kübik modele ait regresyon sabitinin haricinde, diğer tüm modellerde, regresyon sabiti istatistik olarak önemli bulunmuştur ($p<0.01$). Regresyon katsayıları ve R^2 değerleri ise tüm modellerde istatistik olarak önemli bulunmuştur ($p<0.01$). Basit doğrusal modellerde en yüksek regresyon katsayısı; 317.71 ile ben düşme döneminde elde edilirken, bunu 174.04 ile çiçeklenme dönemi ve 154.55 ile sürme dönemi izlemiştir. Buna göre sürme dönemindeki ortalama 1 °C'lik sıcaklık artışına karşılık, dekara ortalama verimde 154.55 kg'lık artışın olması beklenmektedir.

Çizelge 2. Modellere ilişkin özet sonuçlar

Dönem	Model	$b_0 \pm S_{b_0}$	$b_1 \pm S_{b_1}$	R^2 (%)	RMSE
Sürme [Nisan]	Basit	-1050.12 ± 289.22 **	154.55 ± 28.31**	62.3 **	4424.27
	Karesel	-252.177 ± 142.33	7.39 ± 1.33**	63.2 **	4375.99
	Kübik	14.24 ± 95.20	0.47 ± 0.08**	63.6 **	4467.85
Çiçeklenme [Haziran]	Basit	-2943.853 ± 608.20**	174.04 ± 30.52**	64.4 **	4304.26
	Karesel	-1265.99 ± 304.19	4.50 ± 0.76**	65.9 **	4210.20
	Kübik	706.82 ± 203.45 **	0.15 ± 0.03**	67.3 **	3412.16
Ben Düşme [Temmuz]	Basit	-6760.78 ± 1481.29**	317.71 ± 64.63**	57.3 **	4710.79
	Karesel	-3120.05 ± 744.72**	6.93 ± 1.42**	57.1 **	4775.13
	Kübik	-1904.82 ± 499.68**	0.21 ± 0.04**	56.8 **	4762.54

** : $p<0.01$; RMSE: Hata Kareler Ortalamasının Karekökü

Karesel modellere ait katsayılardan ise en yüksek katsayı 7.39 ile sürme döneminde elde edilirken, bunu 6.93 ile ben düşme dönemi ve 4.50 ile çiçeklenme dönemi izlemiştir. Kübik modelde ise en yüksek katsayı 0.47 ile sürme döneminde, en düşük katsayı ise 0.15 ile çiçeklenme döneminde elde edilmiştir.

Modellere ait belirleme katsayıları (R^2) incelendiğinde; bu katsayılarının yüzde %56.8 ile %67.3 arasında değişim gösterdiği görülür. Benzer şekilde, Santos ve ark. (2011)'nin yapmış olduğu çalışmada; Mayıs döneminde Basit doğrusal modele ait R^2 %59 olarak bulunurken, Haziran döneminde %62 olarak bulunmuştur.

Sürme dönemindeki basit doğrusal modele ilişkin belirleme katsayısı %62.3 olarak bulunmuştur. Buna göre dekara ortalama verimdeki varyasyonun veya farklılığın %62.3'ünün sürme dönemindeki sıcaklık değişiminden kaynaklandığı söylenebilir.

R^2 ve hata kareler ortalamasının karekökü (RMSE) ölçütleri dikkate alınarak; (Yüksek R^2 ve daha düşük RMSE değeri) karesel ve kübik modeller, basit doğrusal modellere göre değerlendirildiğinde; adı geçen iki modelin, basit doğrusal modele göre belirgin bir üstün performans gösteremedikleri gözlenmiştir. Buna göre sıcaklığa bağlı olarak, dekara ortalama verimi tahmin etmek üzere kurulacak modellerde; karesel ve kübik modellere gerek duymadan, basit doğrusal modellerin tercih edilebileceği söylenebilir. Ancak, Lobell ve Burke, (2010) tarafından da belirtildiği üzere, istatistik modellerin performansı, iklimsel değişkenlerin yapısına göre değişiklik gösterebilmektedir. Bu nedenle optimum model bakımından, farklı modellerin de denenmesi gerektiği açıktır.

Sonuç

İnsan kaynaklı faaliyetler ve küresel düzeydeki iklim değişiklikleri, tarımsal ürün üretimine ve sürdürülebilirliğe etki etmektedir (Zarei ve ark., 2019). Bununla birlikte, bağcılıkta sürdürülebilirlik; budama, sulama ve hastalıklarla mücadele gibi kültürel uygulamaların yanı sıra, toprak ve iklim faktörleri ile de yakından ilişkilidir. Yıllık üzüm veriminin; çiçeklenme ve ben düşme gibi erken dönemlerde tahmin edilmesi, ekonomik değeri ile ilişkilendirilebileceği gibi ileriki dönemlerde yapılacak uygulamalara yön verilebilmesi açısından da katkı sağlayabilir.

Sonuç olarak; iklim faktörlerinin veya iklimsel değişikliklerin, ürün verimi üzerine potansiyel etkisinin modellenmesi ve buna bağlı olarak istenen tahminlerin yapılabilmesi, geleceğe ilişkin yapılacak planlamalarda önemli rol oynamaktadır. Narince üzüm çeşidinde, verimin sıcaklıkla tahmini için her ne kadar basit doğrusal modellerle, tatminkâr R^2 değerleri elde edilmiş olsa da, diğer iklim özelliklerinin de ele alınarak, farklı modellerin denenmesi gerektiği düşünülmektedir.

TEŞEKKÜR

Bu çalışmaya, FBA-2022-9956 no'lu Temel Araştırma Projesi (TAP) kapsamında destek sağlayan Van Yüzüncü Yıl Üniversitesi Bilimsel Araştırma Projeleri Koordinasyon Birimi'ne teşekkür ederiz.

HER ÇAĞIN MALZEMESİ AKILLI POLİMERLER VE KULLANIM ALANLARI

Dr. Nihayet KOÇYİĞİT (Orcid ID: 0000-0002-3472-1127)

Batman Üniversitesi, Kimya Bölümü, Batman

E-mail: nihayet.kocyyigit@batman.edu.tr

ÖZET

İleri malzemeler sınıfından olan akıllı malzemeler, ileri teknolojik uygulamalarda kullanılacak olan mikro boyutlu sistemler ve cihazlar ve tıbbi uygulamalar gibi farklı alanlarda kullanım alanı bulması ve günümüzde özellikle son dönemde gelişmekte olan malzemeler içinde dikkatleri üzerine çekmeyi başarmış önemli bir mühendislik malzemesidir. Klasik malzeme gruplarından biri olan polimerler kolay işlenebilirlik, proses kolaylığı, esneklik, düşük ısı ve elektrik iletkenliği, metallere oranla yüksek kimyasal ve korozyon direnci ve çok iyi mukavemet/ağırlık oranı vb özelliklere sahip olması nedeni ile diğer malzemelere göre daha üstün özelliklere sahiptir. Akıllı malzemelerden biri olan akıllı polimerler ise sıcaklık, nem, pH, ışık yoğunluğu, elektriksel veya manyetik alan vb. çevresel uyaranlara karşı tepki vermesi, renk veya transparanlığını değiştirmesi, iletken veya su geçirgen hale gelmesi şekil değiştirerek bu tepkiye yanıt vermesi gibi özellikler nedeni ile akıllı malzemeler içinde en çok tercih edilen malzeme sınıfıdır. Bu nedenle, akıllı polimerlerle yapılan çalışmalarda son kırk ila elli yılda hızlı bir artış olmuştur. Uyaranlara duyarlı polimerler veya çevreye duyarlı polimerler olarak da bilinen akıllı polimerler, biyoteknoloji, tıp ve mühendislik alanında yaygın olarak kullanılmaktadır. Bu çalışmanın amacı akıllı malzemelerden biri olan akıllı polimerler, çeşitleri ve mevcut kullanım alanları hakkında bilgi vermektir. Bu nedenle çalışmada; polimerlerin akıllı malzeme olarak kullanımının avantajları, dezavantajları, akıllı polimer teknolojilerindeki son gelişmelerin ışığı altında incelenmiş ve akıllı polimerler, (i) akıllı polimerik jeller, (ii) şekil hafızalı polimerler, (iii) kendi kendini onaran/iyileştiren polimerler ve (iv) iletken polimerler şeklinde dört başlıkta sınıflandırılarak incelenmiştir.

Anahtar Kelimeler: Akıllı malzemeler, Akıllı polimerler, Hidrojeller, Şekil hafızalı polimerler, Kendi kendini onaran/İyileştiren polimerler, İletken polimerler

Giriş

İnsanoğlunun var oluşundan bu yana değişen ve gelişen hayat şartları nedeni ile farklı amaç ve farklı özellikte malzemeler kullanılmış ve çağlar kullanılan malzemelerin gelişmişlik düzeyine kaba taş devri, yontma taş devri ve cilalı taş devri ve bakır devri vb gruplara ayrılmıştır.

İçinde bulunduğumuz yüzyılda özellikle son otuz yılda gelişmiş özellikte malzemelerin elde edilmesinde büyük ilerleme kaydedilmiştir. Malzemeler esas olarak polimerler, seramikler, metaller ve akıllı malzemeler olmak üzere dört kategoriye ayrılırlar. Bunlardan akıllı malzemeler, standart malzemelere kıyasla sahip oldukları özellikler ve çeşitli uygulamalama alanları nedeni ile günümüzde diğerlerine göre daha popüler hale gelmiştir [1]. Nedir bu akıllı malzemeler? Akıllı malzeme terimi ilk kez 1980'lerde kullanılmış ve yeni bir teknoloji olarak kabul edilmiştir. Fakat, fotokromik gözlükler gibi akıllı davranış sergileyen birçok ürün onlarca yıldır mevcuttu. Literatürde geniş çapta tartışılmasına rağmen, akıllı malzemelerin tam olarak ne olduğuna dair evrensel olarak kabul edilmiş bir tanım yoktu [2,3]. Bununla birlikte günümüzde, bir malzemenin akıllı malzeme olarak kabul edilebilmesi için malzemenin ısı, sıcaklık, mekanik ve manyetik gibi çevresel uyaranlara karşı tepki verme yeteneğini kazanması ve buna bağlı olarak performans veya özelliklerini değiştirebilmesi, malzemenin uyarıcılara karşı tepkilerinin açıklanabilir, anlaşılır ve öngörülebilir olması, enerji alış-verişinde bulunabilmesi (ışık yayan, elektrik üreten ve enerji değişimi yapabilen) ve tersine çevrilebilirlik (malzemenin niteliğinde ve fazında değişimin gerçekleşmesi ve bu değişimin geri alınabilir olması) gibi özelliklere sahip olması gerekmektedir [4].

Günümüzde akıllı malzemeler, sahip oldukları özellikler nedeniyle ileri düzey uygulamalar için ilgi çekici bir malzeme sınıfı olarak karşımıza çıkmaktadır. Çevreye göre özelliklerini değiştirebilen ve duyuşal yeteneklere sahip, otomatik olarak kendi kendini tamir edebilen, ısı ile şekil değiştirebilen veya manyetik alan uygulandığında anında faz değiştirebilen malzemelerden olan piezoelektrik malzemeler (sensörler ve aktüatörler), şekil hafızalı alaşımlar , manyeto-reolojik malzemeler ve elektro-reostat malzemeler termoelektrikler multiferroikler, magnetokalorik malzemeler, mağnetoreolojik ve elektoreolojik akışkanlar, şekil hafızalı malzemeler, termo ve ışığa duyarlı polimerler ve polimerik jeller akıllı malzemeler sınıfına girmektedir.

Akıllı malzemeler, ileri malzemeler grubunda yer alan, bir malzeme grubudur. Çok fazla uygulama alanına sahip olmalarına rağmen, akıllı malzemelerin sınıflandırılmasıyla ilgili henüz akademik ve ticari olarak kullanılan ve yaygın kabul görmüş bir sınıflandırma sistemi mevcut

değildir. Yeni kullanım alanları ortaya çıktıkça bu malzemelerde akıllı malzeme sınıfına dahil edilmektedir [4,5]. Bu çok fonksiyonlu malzemelerin özelliklerini analiz etmek için çeşitli karakterizasyon teknikleri kullanılmaktadır. Kompozitlerden akıllı hafızalı alaşımlara kadar malzeme alanında çok büyük gelişmeler olmuş, akıllı malzemeler geleneksel malzemeleri geride bırakmış ve sentezleri geleneksel teknikler yerine modern teknikler yardımıyla yapılmıştır. Bu malzemeler sağlık sektörü, havacılık, sivil altyapı ve çevre imalatında geniş bir uygulamaya sahiptir [6].

Polimerler, kolay işlenebilirliği, proses kolaylığı, esnekliği, düşük ısı ve elektrik iletkenliği, metallere oranla yüksek kimyasal ve korozyon direnci çok iyi mukavemet/ağırlık oranı vb özellikleri nedeni ile klasik malzemeler içinde seramik ve metallere göre sahip olduğu bazı özellikler nedeniyle daha yaygın olarak kullanılmaktadır.

Akıllı malzemelerden biri olan akıllı polimerler ise sıcaklık, nem, pH, ışık yoğunluğu, elektriksel veya manyetik alan vb. çevresel uyarılara karşı tepki vermesi, renk veya transparanlığını değiştirmesi, iletken veya su geçirgen hale gelmesi şekil değiştirerek bu tepkiye yanıt vermesi gibi özellikler nedeni ile akıllı malzemeler içinde en çok tercih edilen akıllı malzemelerdir [4].

Farklı kullanım ve uygulama alanları, polimer türleri dikkate alındığında, akıllı polimerleri sınıflandırmak oldukça zordur. Ancak bugüne kadar yapılan bilimsel çalışmalar ve kullanım alanları göz önünde bulundurulduğunda, dört temel başlık altında ele alarak incelemek mümkündür. Buna göre akıllı polimerler, (i) akıllı polimerik jeller, (ii) şekil hafızalı polimerler, (iii) kendi kendini onaran/iyileştiren polimerler ve (iv) uyarılara duyarlı polimerler şeklinde sınıflandırılabilir [4].

1. Polimerik Jeller (Hidrojel)

Hidrojel, fiziksel veya kimyasal olarak çapraz bağlanabilen üç boyutlu ağ yapı özelliğine sahip polimerlerdir. Ayrıca, hidrofilik fakat çapraz bağlı yapıları nedeniyle polimeri çözmeden, sudaki kuru ağırlıklarının binlerce katına kadar büyük miktarda suyu emen üç boyutlu (3B) doğal veya sentetik polimerik ağlar şeklinde olan polimerlerdir [4,7].

Genel olarak hidrojel, su ile etkileştiklerinde çözünmez ve çözücüyü içine alarak şişerler (Şekil 1). Sahip olduğu su tutma kapasitesi, yumuşak ve esnek yapıları ile hidrojel canlı dokulara benzerlik göstermektedir. Suda çözünen maddeler için geçirgen olmaları, insan vücudu ile uyumlu olmaları, su ile etkileşip şiştiğinde yumuşak ve düşük sürtünmeye sahip

olmaları, ilaç salınım sistemlerinde kullanılabilmeleri, yüksek su tutma kapasiteleri hidrojellerin en önemli avantajları arasında yer almaktadır. Hidrojellerin zayıf mekanik dayanıma sahip olması, kemik dokusu gibi mukavemet gerektiren alanlarda kullanımını kısıtlamaktadır [4].

Şekil 1. Hidrojel [8]

Akıllı polimerik jeller kendi içinde; uyarıcıya duyarlı hidrojeller, ışığa duyarlı hidrojeller, sıcaklığa duyarlı hidrojeller, pH duyarlı hidrojeller, sıvı kristalli hidrojeller olmak üzere beş gruba ayrılırlar.

Hidrojeller kontakt lensler, yapay tendon materyalleri, biyosensörler, yüzey örtü malzemeleri, yapay kas, yapay deri, ilaç salım sistemleri, estetik cerrahi, tarımda akıllı sulama sistemleri, ağır metal giderimleri vb. alanlarda kullanılmaktadır [4,9].

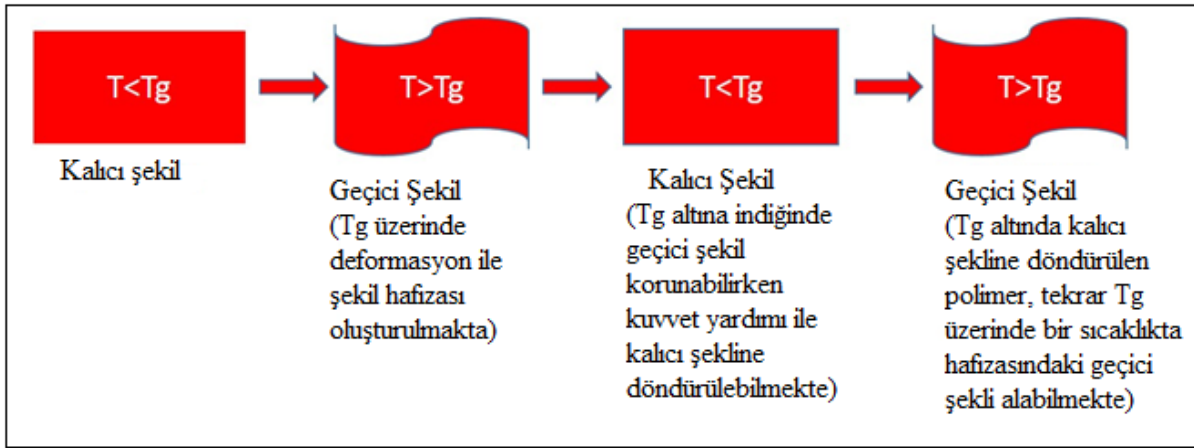

2. Şekil Hafızalı Polimerler

Şekil hafızalı polimerler, deforme edildikleri şekillerinden orijinal şekillerine kendi kendilerine dönebilen akıllı malzemelerdir. İlk olarak, 1984 yılında Japon, Nippon Zeon şirketi tarafından ortaya çıkarılmıştır. Bu polimerler, geçici olarak verilen şekli alsa da, daha sonra sıcaklık gibi duyarlı olduğu bir uyarana sayesinde orijinal şekillerine tamamen kendi kendilerine dönebilirler [10]. Şekil değişikliklerini ise mikroskopik veya makroskopik olarak gerçekleştirebilirler [4]. Şekil değişikliği üretim esnasında aldıkları şekil ile uyarılma sonrası aldıkları şekil arasında değişmektedir. Bu da ilk şekillerini hafızalarında tutabildiklerini göstermektedir [10].

Şekil hafızalı polimerlerin, hafızasında tuttuğu genellikle iki bazen de üç şekil mevcuttur. Bu şekillerden birisi orijinal şekli iken diğeri ise deformasyon sonucu aldığı şekildir.

Şekil hafızalı polimerlerin etkilendiği ortam değişkeni genellikle sıcaklık olmakla birlikte, bu değişken manyetik alan, ışık ya da bir solüsyon da olabilir. Bu sayede kullanım alanındaki çeşitliliği de artmaktadır [10].

Polimer malzemelerin belirli bir erime sıcaklıkları ve camsı geçiş sıcaklıkları vardır. Camsı geçiş sıcaklığı (T_g), maddenin camsı özelliklerini kaybedip ağıdalı (hareketlilik kazanarak daha esnek bir yapıya bürünmeleri) özellikler kazanmaya başladığı sıcaklık sınırıdır ve bu sıcaklık sınırı erime sıcaklığından daha düşüktür. İşte bu camsı geçiş sıcaklığı şekil hafızalı polimerler için oldukça önemlidir. Çünkü biraz önce de bahsettiğimiz gibi, bu polimerlerin kalıcı ve geçici olmak üzere iki farklı şekli vardır. Deforme halindeki geçici şekil, camsı geçiş sıcaklığının üzerindeyken verilir. Akıllı polimerler daha sonra soğutulduklarında bu geçici şekillerini korurlar ancak istenilirse dış etmenler ile (kuvvet gibi) kalıcı şekillerine döndürülebilirler. Dış etmenler ile kalıcı şekline döndürülen şekil hafızalı polimerler, tekrardan herhangi bir ortamda camsı geçiş sıcaklığının üzerine çıkarıldığında ise hafızalarındaki geçici şekillerine geri dönerler (Şekil 2).

Şekil 2. Hafızalı polimerler [10]

İlk olarak deforme edilen polimerin kalıcı deformasyona uğramadığını açıklayalım. Bir metal levhayı alıp yeterince büküğümüzde, elimizdeki metal deforme edildiği şekli ile kalır, yani kalıcı bir deformasyona uğrar. Ancak şekil hafızalı polimerler diğer herhangi bir malzeme gibi eğilip büküldüğünde bunu kalıcı bir şekilde bünyesinde tutmadan, eski haline döndürülebilir. Çünkü bu deformasyonlar camsı geçiş sıcaklığının üzerinde gerçekleşmekte ve bu sıcaklığın üzerinde polimerler süper esnek bir özellik göstermektedirler. Bu nedenle bu polimerler istenildiği gibi deforme edilse de, verilen bu şekilden kalıcı şekle dönüşü ve kalıcı şeklinden tekrardan geçici şekline dönüşü mümkün olabilmektedir (Şekil 3) [10].

Şekil 3. Hafızalı polimer örneği [10]

Akıllı polimerler sadece inşaat, havacılık, otomobil, ya da ileri mühendislik uygulamalarında değil, sağlık sektörü gibi çeşitli uygulamalarda da karşımıza çıkmaktalar. pH 1-2 civarında iken midede, pH >7 olduğunda bağırsakta, ya da vücut sıcaklığı 37 °C'yi geçtiğinde ilaç salınımını yapan akıllı polimerler, kalp damarlarının içine takılan stentler başlıca kullanım alanlarıdır. Şekil hafızalı polimerler, sağlık, tekstil veya gündelik malzemelerdeki uygulamalarının yanında, ileri mühendislik uygulamalarında da yer almaktadır. Şekil değiştiren uçak (morphing aircraft) olarak bildiğimiz uygulamalarda, uçak kanatları, uçuş sırasında verilen komutlar neticesinde istenilen şekli alabilmektedirler. Bu sayede bu tip uçaklar farklı uçuş koşulları altında en uygun uçuş performansı verebilmektedirler [4,10].

3. Kendi Kendini Onaran/İyileştiren Polimerler

Biyolojik sistemlerdeki kendi kendini onarma özelliğinden yola çıkan ve doğadan ilham alan araştırmacılar tarafından geliştirilmiştir. Kendi kendini onaran/iyileştiren polimerler, kullanım alanı bulduğu uygulamalarda, temel olarak dış yardım olmadan kendi kendini iyileştirme veya kaybolan işlevlerin restorasyonu şeklinde faaliyet göstermektedir (Şekil 4) [4,7].

Şekil 4. Kendi kendini iyileştiren polimer malzeme: (a) Dahili kendi kendini iyileştirme modu, (b) Harici kendi kendini iyileştirme modu aracılığıyla kendi kendini iyileştiren polimer sistemlerinin şematik gösterimi [11]

Kendi kendini onaran/iyileştiren polimerler, herhangi bir hasar durumunda bağımsız veya uyarılmış onarım kavramını uygulayarak yapıların veya sistemlerin ömrünü uzatmayı amaçlar. Bu nedenle, kendi kendini onaran/iyileştiren polimerler, herhangi bir hasar durumunda kendi kendini otomatik olarak onarma/iyileştirme özelliğine sahip uzun ömürlü mühendislik malzemeleri olarak tanımlanabilir.

Kendi kendini onaran/iyileştiren polimerler enerji, biyomedikal vb. sektörler için biyouyumluluk, maliyet, verimlilik, ürünün kullanım ömrünün uzaması gibi büyük avantajlar sağlamaktadır. Kovalent bağlı kendi kendini onaran/iyileştiren polimerler, ilaç ve protein dağıtım sistemlerinde, doku-materyal bariyerlerinde, tıpta ve yara pansuman uygulamalarında da tercih edilmektedirler [4,5].

4. İletken Polimerler

İletken polimerler uygun maliyetli, hafif ağırlıklı ve esnek özellikleri ile tüm dünyanın ilgisini çekmişlerdir. 2000 yılında keşfedilen iletken polimerlerin elektriği neredeyse metaller kadar iyi iletmeleri, korozyona karşı dayanıklı olmaları ve kolay metotlar kullanılarak elde edilebilmeleri gibi başlıca avantajları iletken polimerlerin bilim ve teknoloji alanındaki gelişmelere bağlı olarak üzerlerine cektikleri bu ilginin daha farklı alanlara kaymasına neden

olmuştur [12]. İletken polimerlerin elektriksel iletkenliği metallere karşılaştırılabilir nitelikte olup, iletkenlik yük taşıyıcı görevi gören boşluklara ve birbirini izleyen tek ve çift bağlardan oluşan konjuge karbon zincirlerine dayanır (Şekil 5). Polimerler kimyasal yapıları ve demir, bakır gibi metal tozları, karbon siyahı, grafen, grafen oksit vb. iletken dolgu maddelerine bağlı olarak yalıtkan, yarı iletken veya iletken olabilirler. Polimerlerde kullanılacak iletken dolgu maddeleri arasında; Grafit, grafen, karbon fiberler (CF), karbon nanotüpler (CNT), altıgen boron nitrür (hBN), metal ve seramik tozları vb. bulunmaktadır [4].

Şekil 5. İletken polimerler [13]

Bazı iletken polimerler esnek ve biyouyumlu olmanın yanında üretim ve uygulama kolaylığına da sağlamaktadır. Bu nedenle, iletken polimerler medikal uygulamalar, robotik sistemler, tekstil ürünleri, transistörler, sensörler, biyosensörler vb. alanlarda yaygın olarak kullanılmaktadır [4].

SONUÇ

Akıllı malzemeler akıllı davranış sergileyen ürünlerde, sistemlerde veya yapılarda kullanılabilen, kendi kendini algılama, kendi kendini iyileştirme, kendi kendini harekete geçirme, kendi kendine teşhis ve şekil değiştirme gibi dış uyaranlara verilen tepkiler gibi belirli içsel özellikler sergileyen malzemelerdir. Son otuz ila kırk yılda, akıllı malzemelerle ve özellikle akıllı polimerlerle ilgili yapılan çalışmalarda büyük bir artış yaşanmıştır ve gelecekte akıllı malzemeler sayesinde çok daha üst seviyeye çıkacağı tahmin edilmektedir. Bu da insanoğlunun hayal gücü sınırını zorlamasına bağlıdır.

Polimerleri akıllı yapan karakteristik özellikleri, çevrelerindeki çok küçük değişikliklere tepki verme yetenekleridir. Bu malzemelerin üstünlüğü, sadece yapılarında meydana gelen hızlı makroskopik değişikliklerde değil, aynı zamanda bu geçişlerin geri dönüşümlü olmasına bağlıdır.

Çevreye duyarlı polimerler olarak da bilinen akıllı polimerler, biyoteknoloji, tıp ve mühendislik alanında yaygın olarak kullanılmaktadır. Akıllı polimerlerden;

- Akıllı hidrojeller, çevresel koşullarda küçük dış uyaranlara maruz kalınca, yanıt olarak ani tersinir faz geçişleri sergileyen üç boyutlu ağ yapı özelliğine sahip hidrojellerdir. Akıllı hidrojeller, biyo Akıllı hidrojeller, çevresel koşullarda küçük dış uyaranlara maruz kalınca, yanıt olarak ani tersinir faz geçişleri sergileyen üç boyutlu ağ yapı özelliğine sahip hidrojellerdir. Akıllı hidrojeller, biyoyumlulukları, fonksiyonel ve esnek yapıları gibi özelliklerinden dolayı, doku mühendisliği protezlerinde, sensör/ biyosensörlerde, ilaç/gen dağıtım sistemlerinde, aktüatörlerde büyük bir potansiyel kullanıma sahiptir.
- Şekil hafızalı akıllı polimerler, ışık, ısı, nem, mekanik stres, manyetik alan, elektrik alan vb. gibi bir dış uyarıcı uygulandığında şekil ve renk gibi makroskobik özelliklerini değiştirebilen ve uyarıcı etkisi ortadan kaldırıldığında geçici şeklinden kalıcı şekline geri dönebilen polimerlerdir. Şekil hafızalı akıllı polimerler, sahip olduğu bu özellik nedeniyle, tıbbi uygulamalarda, havacılıkta, tekstilde ve ev ürünlerinde kullanılmaktadır.
- Kendi kendini onaran/iyileştiren malzemeler, herhangi bir hasar durumunda kendi kendini otomatik olarak onarma/iyileştirme özelliğine sahip uzun ömürlü mühendislik malzemeleridir. Bu tür malzemeler, hasar oluşumunu algılayan ve hasarın ilerlemesini durdurarak tamir edebilen yapıdadırlar. Bu nedenle hasarın önlenmesinin ve ürünün kullanım ömrünün uzamasının istendiği ilaç dağıtım sistemlerinde, doku-materyal bariyerlerinde, onarıcı tıpta, yara pansuman uygulamalarında ve enerji alanında tercih edilmektedir.
- İletken polimerler, elektriksel iletkenliğe ve metallerle karşılaştırılabilir özelliklere sahip konjuge karbon zinciri içeren polimerlerdir. Elektriksel iletkenlik, yük taşıyıcı görevi gören boşluklara ve birbirini izleyen tek ve çift bağlardan oluşan konjuge karbon zincirlerine dayanır. İletken polimerler esneklik, biyoyumluluk, üretim ve uygulama kolaylığı gibi avantajları nedeniyle tekstilde, medikal uygulamalarda, robotik sistemlerde, sensör ve biyosensörlerde, transistörlerde vb. alanlarda yaygın bir kullanıma sahiptir. uyumlulukları, fonksiyonel ve esnek yapıları gibi özelliklerinden dolayı, doku mühendisliği protezlerinde, sensör/biyosensörlerde, ilaç/gen dağıtım sistemlerinde, aktüatörlerde büyük bir potansiyel kullanıma sahiptir. Akıllı polimerlerin gerek özelliklerinin ve gerekse kullanım alanlarının geliştirilebilmesi için birlikte kullanılacağı malzemelerle etkileşim mekanizmasının daha iyi anlaşılması ve akıllı polimerlerin rasyonel sentezini sağlamak için yapı-özellik ilişkisinin çok iyi anlaşılması gerekmektedir.

ABSTRACT

In recent years the applications of high strength concrete have been increased in many parts of the world. This growth has been possible, as a result of recent developments in technology and created demand for high strength concrete. There are many advantages in using high strength concrete in building construction. As in the case of conventional concrete, the use of steel fibers substantially increases the energy at break of high strength concrete. Although the initial cost may be high. Significant long-term saving would be ensured in reducing the needs for maintenance, repair and rehabilitation. The experimental program was designed to the effect of steel fibers on compressive strength, split tensile strength of high strength concrete and testing of cubes of size (150mmX150mmX150 mm), cylinders of 150 mm diameter, height of 300 mm for normal strength. In this study number of cubes are casted by adding steel fiber's with volume fraction of cube by 0.5%, 1.0% and 1.5 % and is compared with the properties of standard mix of M30 grade concrete.

Keywords: Steel Fibers, Concrete, strength.

INTRODUCTION

The most extensively used construction material in the world is probably Concrete with about six billion tones being produced every year. In terms of per capita consumption, it is only next to water. The most massive individual material element in the built environment is concrete. Significant environmental and economic benefits may be realized if the embodied energy of concrete can be reduced without decreasing the performance or increasing the cost. Concrete is primarily comprised of Portland cement, aggregates, and water. Although Portland cement typically comprises only 12% of the concrete mass, still it accounts for approximately 93% of the total embodied energy of concrete and 6% to 7% of the worldwide emissions of CO₂. Some remedial measures can be taken to minimize some bitter properties of concrete.

Formation of GGBS and its compositions

The Ground Granulated Blast Furnace Slag is a by-product of iron manufacturing industry. Iron ore, coke and limestone are fed into the furnace and molten slag floats above the molten iron at a temperature of about 15000C to 16000C as a resultant. The composition of molten slag about 30% to 40% SiO₂ and about 40% Cao, which is almost equal to the chemical composition of Portland cement. The molten slag, is water-quenched rapidly, after the molten iron is trapped off which results in the formation of a glassy granulate. The molten slag consists of mainly siliceous and aluminous residue. This glassy granulate is dried and ground to the required size, which is known as Ground Granulated Blast Furnace Slag (GGBFS). The production of GGBFS requires more energy as compared with the energy needed for the production of Portland cement. By replacing the Portland cement with GGBFS will results in 1 reduction of carbon dioxide gas emission. It is therefore an environmentally friendly construction material. GGBFS from modern thermal power plants generally does not require processing prior to being incorporated into concrete and is therefore considered to be an environmentally free input material. We can replace about 80% of the Portland cement by using GGBFS in concrete. GGBFS has characteristics of better water impermeability as well as improved resistance to corrosion and sulphate attack. Due to lower heat hydration .it reduces the risk of thermal cracking. It has higher durability, workability, reduces permeability to external agencies, which helps in making, placing and compaction easier. As a result, the service life of a structure is enhanced and the maintenance cost reduced.

Application of GGBS in concrete

1. Greener and stronger foundation.
2. Controlling and reducing thermal cracking.

3. Reducing heat hydration. Long term strength development.
4. Increased resistance to acid peaty solids.
5. Increased resistance to sulphates, and salt marine environment.
6. Major applications of GGBS concrete for today are highways, bridges, and high-rise buildings.

2. LITERATURE REVIEW

T. Vijayagowri, P. Sravana, P. Srinivasa Rao (2014).

‘Studies on strength behaviour of high volumes of slag in concrete’ Investigated the effects on compressive strength, split tensile strength and flexural strength of concrete at 28, 90, 180 and 360 days by partial replacement of cement with GGBFS on. He used 50% GGBFS as replacement material of cement and also used various water/binder ratios are 0.55, 0.50, 0.45, 0.40, 0.36, 0.32, 0.30 and 0.27. He observed that the strength gain by replacement of slag is inversely proportional to the water/ binder ratio and slag concrete gains appreciable amount of strength at later ages (90 days onwards). He found out that the strength of high volume of slag concrete is more at later ages because rate of hydration of slag with $\text{Ca}(\text{OH})_2$ and water is slow. He concluded that on replacement of cement by 50% GGBFS helps to reduce the cement content of concrete, thereby reducing the cost of concrete and also protecting the environment from pollution.

Reshma Rughooputh and Jaylina Rana (2014)

‘Partial replacement of cement by ground granulated blast furnace slag in concrete’ Studied the effects on various properties of concrete including compressive strength, tensile strength, splitting strength, flexure strength, modulus of elasticity, drying shrinkage and initial surface absorption by partial replacement of OPC by GGBFS on. The tests were conducted with replacement ranging from 30 % to 50% at 7 and 28 days. It was found that compressive strength is lower at the early age but increase after the later age time. Flexural strength of test specimens increased by 22% and 24%, tensile strength increased by 12% and 17% for 30% and 50% replacement respectively. Drying shrinkage increased by 3% and 4%. Static modulus of elasticity increases by 5% and 13%. Based on the results the optimum mix was the one with 50% GGBFS.

Mohammed Shariq, Janaka prasad, A.K. Ahuja (2008)

‘Strength development of cement mortar and concrete incorporating GGBFS’ Studied the effect of curing procedure on the cement mortar and concrete incorporating ground granulated

blast furnace slag compressive strength development. The compressive strength development of cement mortar is calculated by the 20, 40 and 60 percent replacement of GGBFS for different types of sand. Similarly, the strength development of concrete is investigated with 20, 40 and 60 percent replacement of GGBFS on two grades of concrete. Tests results show that the incorporating 20% and 40% GGBFS is highly significant to increase the compressive strength of mortar after 28 days and 150 days, respectively.

Santosh Kumar karri, G.V. Rama Rao, P. Markandeya Raju (2015)

‘Partial replacement of cement with GGBS in concrete’ researched by using 30%, 40% and 50% as cement replacement levels and cured the specimens of M20 and M40 grade of concrete for 28 and 90 days. He tested various properties of concrete and found that the compressive strength and tensile strength of mortar mixes with slag when determined at the ages of 7, 14, 28 and days decreases at early ages of curing (3 and 7 days). The specimens showed increase in compressive strength when tested at 7 and 28 days, for 20% replacement of cement. Concrete cubes were also exposed to H₂SO₄ and HCl of 1% and 5% concentration and were tested for compressive strength at 90 days and 28 days respectively.

C. Sabeer Alavi, I. Bhaskar, R. Venkata Subramani (2013).

‘Strength and durability characteristics of GGBFS based SSC’ Studied the effects of partial replacement of cement with 10 - 50% of GGBFS and found that 30% GGBFS replacement is good as beyond that the compressive strength starts decreasing. He also concluded that the split tensile strength and flexural strength conducted at 7 and 28 days increases with increase in GGBFS content. It was also found that the workability increases with the increase 4 in percentage of GGBFS.

Magandeeep , Ravikanth Pareek and Varinder Singh (2015).

‘Utilization of ground granulated blast furnace slag to improve properties of concrete’ In there paper observed that when replacement of GGBFS increases from 10 to 40 %, the slump values of various mix proportions of GGBFS concretes increased. Compressive strength and flexural strength decrease with increase in percentage of GGBFS at the age of 7 and 28 days but it increases with the increase in percentage of GGBFS at the age of 56 days. He also observed that the split tensile strength of the mix with 20% and 30% cement replacement better performed than at age of 56 days where as the mix with 40% cement replacement showed a decrease in strength at 56 days. The sulphate resistance and chloride resistance increased in the specimens with 30% GGBFS content than the specimens without GGBFS. This is because of the strength gain which takes longer time for the GGBS concrete because the pozzolanic

reaction is slow and depends on the calcium hydroxide availability.

Yogendra O. Patil, Prof P.N. Patil, Dr, Arun Kumar Dwivedi (2013).

‘GGBS as partial replacement of OPC in cement concrete’ Researched on the effects on compressive strength and flexural strength of concrete when cement is partially replaced with various percentages of GGBS. The tests were conducted with replacement ranging from 10 % to 40 % at 7, 28 and 90 days. It was observed that the strength of concrete is inversely proportional to the percentage of replacement of cement with GGBS. The result shows the marginal reduction of 4 – 6 % in compressive and flexural strength for 90 days curing with replacement of OPC by GGBS up to 20% and beyond that of more that 15%. He concluded that, the cost of concrete reduces at the current market rate by 14% by 20% replacement of OPC with GGBS.

3. OBJECTIVE OF STUDY

- To Check the feasibility of GGBS as a replacement of Cement in the construction of concrete.
- To cast number of cubes, by replacing Cement with GGBS by 20%,30%,40% and to compare their property with standard mix M35.
- Study the behaviour of compressive strengths of concrete cubes.
- Compare the result with conventional normal concrete.
- To find which percentage replacement is much cost Efficient without affecting its strength.
- To provide economical construction cost.

4. MATERIALS USED IN THIS INVESTIGATION

1. Cement
2. Fine aggregate
3. Coarse aggregate
4. Ground Granulated Blast Furnace Slag

5. TEST ON MATERIALS

1. TESTS OF CEMENT

- **Standard Consistency of Cement**

S.no	Percentage of water	Quantity of water added(ml)	Vi-cats plunger penetration (mm)
1	26%	104 ml	36
2	28%	112 ml	28
3	30%	120 ml	16
4	32%	128 ml	7

- **Specific Gravity of Cement**

➤ Specific Gravity is normally defined as the ratio between the weight of a given volume of material and weight of an equal volume of water.

➤ Specific Gravity of cement is 3.04

- **Fineness of cement**

- The fineness of cement is a measure of cement particles and is denoted as terms of the specific surface area of the cement..

- Fineness of cement sample is 4%.

2. TESTS ON FINE AGGREGATE AND COARSE AGGREGATE

S.No	Test Name	Result
1	Fineness Modulus of Fine Aggregate	2.70
2	Specific Gravity of Fine Aggregate	2.6
3	Specific Gravity of Coarse Aggregate	2.78
4	Flaky and elongation test on coarse aggregate	20.36% & 20.16%.

3. TESTS ON GGBS

S.No	Test Name	Result
1	Specific Gravity of GGBS	2.9
2	Fineness of GGBS	6%

Preparation and casting of cubes

Ingredients of concrete mix

Mixing the concrete

Filling the concrete in mould

Cubes under the curing

Cubes after curing

Finding out strength of cube

6. TEST ON HARDENED CONCRETE

Compression test is the most common test conducted on hardened concrete, partly because most of the desirable characteristic properties of concrete are quantitatively related to its compressive strength.

Digital compressive strength testing machine

Compressive strength of cubes

Percentage of GGBS replacement	Compressive Strength N/mm ² @7Days	Compressive Strength N/mm ² @28days
0% GGBS	32.80	45.28
20% GGBS	31.30	42.57
30% GGBS	32.60	44.90
40% GGBS	29.20	41.46

7. RESULTS AND DISCUSSIONS

Compressive Strength of Concrete with Various Proportions of GGBS

The Compressive Strength of Concrete cubes are prepared With Different Proportions of GGBS. The cube specimen sizes are 150mm x 150 mm x 150 mm. The measured compressive strength of the specimen shall be calculated by dividing the maximum load applied to the Specimen During the test by the cross sectional Area calculated from mean dimensions of the section and shall be expressed to the nearest kg/cm²

From the above graph it is clear that

1. The Compressive strength of concrete for 7 days and 28 days for 0% of Replacement of GGBS is 32.80 and 45.28 N/mm²
2. The Compressive strength of concrete for 7 days and 28 days for 20% of Replacement of GGBS is 31.30 and 42.57 N/mm²
3. The Compressive strength of concrete for 7 days and 28 days for 30% of Replacement of GGBS is 32.60 and 44.90 N/mm²
4. The Compressive strength of concrete for 7 days and 28 days for 40% of Replacement of GGBS is 29.20 and 41.46 N/mm²

ABSTRACT

Köyceğiz Dalyan Special Environmental Protection Area has different ecosystems. The existence of water resources is of great importance in Köyceğiz Dalyan SEPA, which is one of the most important wetlands of Turkey. Citrus fruits are the most produced plant. Within the scope of this study, the water resources of orange producers were evaluated in terms of household and agricultural use. With the study, a face-to-face survey was conducted with 258 agricultural holdings in Köyceğiz Dalyan SEPA. In the study, household water use resources and agricultural water use resources were examined. While the data obtained indicate that there is no decrease in the main water source used for the household needs of the agricultural holdings, 34.5% of the agricultural holdings stated that the water source they use in agriculture decreased, 6.6% increased, and 57.8% remained the same.

Keywords: Orange producers, water resources, Muğla, Türkiye

Giriş

Bugün dünya çapında yaklaşık iki milyar insan güvenli içme suyuna erişememekte (UNSTAT, 2023) ve dünya nüfusunun kabaca yarısı yılın en azından bir bölümünde ciddi su kıtlığı yaşamaktadır (IPCC, 2022). Bu sayıların, iklim değişikliği ve nüfus artışı (WMO, 2023) nedeniyle daha da artması beklenmektedir.

Bugün, çoğu ülke su kaynakları üzerinde benzeri görülmemiş bir baskı uygulamaktadır. Küresel nüfus hızla artmaktadır. Mevcut uygulamalarla dünyanın 2030 yılına kadar talep edilen su miktarı ile mevcut su kaynağı arasında %40'lık bir eksiklik olacağı tahmin edilmektedir. Ayrıca, kronik su kıtlığı, hidrolojik belirsizlik ve aşırı hava olayları (sel ve kuraklık) küresel refah ve istikrara yönelik en büyük tehditlerden biri olarak algılanmaktadır. Su kıtlığı ve kuraklığın artan kırılganlık ve çatışmalarda oynadığı rolün kabulü artıyor. 2050 yılına kadar 10 milyar insanı beslemek için (günümüzde kaynağın %70'ini tüketen) tarımsal üretimde %50 ve su çekimlerinde %15 artış gerçekleşeceği beklenmektedir. Tahminler, dünya nüfusunun %40'ından fazlasının su kıtlığı olan bölgelerde yaşadığını ve dünya GSYİH'sının yaklaşık 1/4'ünün bu zorluğa maruz kaldığını göstermektedir (WB, 2023).

Köyceğiz Dalyan Özel Çevre Koruma Bölgesi (ÖÇKB) Muğla ili sınırları içerisinde yer almaktadır. Köyceğiz ve Ortaca ilçelerindeki köyleri kapsamaktadır.

Şekil 1. Köyceğiz Dalyan ÖÇKB sınırları (ÖÇKB, 2023)

ÖÇKB toplam genişliği 461.5 km²'dir (ÖÇKB, 2023). Alanın 55.8 km²'si denizel alandır (SAD, 2010; Bann ve Başak, 2013). Sulak alanlar ekosistem çeşitliliği açısından zengin alanlardır ve pek çok türün üreme alanıdır (UNSTAT, 2023). Bölgenin sahip olduğu farklı ekosistemler biyolojik çeşitliliğin de yüksek olmasını sağlamaktadır. Köyceğiz Dalyan ÖÇK içerisinde yer alan İztuzu kumsalı Akdeniz'deki deniz kaplumbağalarının (*Caretta caretta* ve *Chelonia mydas*) ve Nil kaplumbağasının (*Trionyx triunguis*) en önemli üreme alanlarından birisidir. Bununla birlikte, su samuru türünün (*Lutra lutra*) yaşam ve üreme alanıdır. ÖÇK içerisinde, 282 denizel fauna ve flora türü ve 126 kuş türü olduğu tespit edilmiştir (ÖÇKB, 2023).

Şekil 2. İztuzu kumsalı (ÖÇKB, 2023)

Köyceğiz Dalyan ÖÇKB turizm açısından önemli bir noktadır. Artan turist sayısı su kaynakları kalite ve miktarını olumsuz yönde etkilemektedir (Kaya ve ark. 2011). Bölgenin cazibesin şehirleşmeyi beraberinde getirmekte ve su kaynakları üstündeki baskıyı artırmaktadır.

Bölgede turizm en önemli ekonomik faaliyetken tarım da ikinci en önemli ekonomik faaliyettir. Alanda en fazla üretime bitkisel ürünler turunçgillerdir. Turunçgiller içinde ise portakal en fazla üretim alanına sahiptir (TOB, 2023).

Materyal Metot

Materyal

Araştırmada materyal olarak birincil ve ikincil veriler kullanılmıştır. Araştırmada kullanılan birincil verileri çiftçilerle yapılan yüz yüze yapılan anketlerden elde edilen bilgiler, ikincil verilerini ise ilgili literatürden derlenen bilgiler oluşturmaktadır.

Metot

Örneklemede tabakalı örnekleme yöntemi kullanılmıştır. Örnekleme sonucunda 258 portakal üreticisi ile anket yapılmıştır. Araştırmada verilerin değerlendirilmesinde frekans ve ortalama değerler belirlenmiştir. Analiz ve grafiklerin oluşturulmasında SPSS 27 yazılımı kullanılmıştır.

Bulgular

Araştırmada portakal üreticilerinin hanehalkı tüketimi ve tarımda kullanılan su kaynakları incelenmiştir. Hanehalkı tüketiminde üreticilerin %71'i tek kaynak, %29'u 2 kaynak kullanmaktadır (Şekil, 3)

Şekil 3. Son 12 ayda hane tüketiminde kullanılan su kaynağı sayısı

Hanehalkı su tüketiminde kullanılan kaynaklar incelendiğinde üreticilerin %88'i musluk suyu, %18'i sondaj, %2,7'si şişelenmiş su kullanmaktadır (Çizelge 1).

Çizelge 1. Hanehalkı su ihtiyaçlarının ana su kaynağı

	Frekans	Oran (%)
Musluk suyu (klorlu)	227	88,0
Sondaj	18	7,0
Özel kuyu	1	0,4
Şişelenmiş su	7	2,7
Diğer (belirtiniz)	5	1,9
Total	258	100,0

Son 3 yılda hane halkı su ihtiyacını karşılayan su kaynaklarında son 3 yılda su miktarının değişmediği belirtilmiştir.

Tarımsal amaçlı su kaynakları incelendiğinde üreticilerin %76'sı tek su kaynağı, %24'ü iki su kaynağı kullandığı tespit edilmiştir (Şekil 4).

Şekil 4. Tarımda kullanılan su kaynağı sayısı

Üreticilerin %37,2'si ana tarımda su kaynağı olarak sondaj, %29,8'i sulama kanalı, %12'si nehir/akarsu/göl, %3,9'u kuyu, %13,8'i ise diğer kaynakları kullanmaktadır (Çizelge 2).

Çizelge 2. Tarımda kullanılan ana su kaynağı

	Frekans	Oran (%)
Sondaj	96	37,2
Baraj	1	0,4
Boru Hattı	5	1,9
Nehir/akarsu/göl	31	12,0
Kuyu	10	3,9
Yağmur	1	0,4
Musluk Suyu	2	0,8
Gölet	1	0,4
Sulama Kanalı	77	29,8
Diğer (Belirtiniz)	34	13,2
Total	258	100,0

Tarımda kullanılan diğer su kaynakları içerisinde akarsu, artezyen en yüksek orana sahip olan su kaynaklarıdır. Alanda tarımda kullanılan su kaynaklarının son 3 yıldaki değişimleri incelendiğinde üreticilerin %35'i azaldığını, %58'i azaldığını, %7'si arttığını belirtmiştir (Şekil

5). Üreticilerin %35'inin su kaynağında azalma olduğunu belirtmesi üzerinde dikkatle durulması gereken bir durumdur.

Şekil 5. Son 3 yılda tarımda kullanılan su miktarının değişimi

Üreticilerin su kaynaklarını korumak için herhangi bir faaliyette bulunup bulunmadığı tespit edilmeye çalışılmıştır. Üreticilerin %90,7'si su kaynaklarını korumak için herhangi bir faaliyet bulunmadığını belirtirken %4,3'ü sabah erken veya gece geç saatlerde sulama yaptığını, %1,2'si su tutma hendekleri, taş setler, bitki örtüsü şeritleri, kontur çizgiler ve hendekler yaptığını belirtmiştir.

Çizelge 3. Su kaynaklarını korumak için yapılan faaliyetler

	Frekans	Oran (%)
Hayır, hiçbir şey yapmadım	234	90,7
Su tutma hendekleri, taş setler, bitki örtüsü şeritleri, kontur çizgileri ve hendekler (oluklar)	3	1,2
Sabah erken veya gece geç saatlerde sulama (sıcaklık daha düşük olduğunda)	11	4,3
Teraslama	1	,4
Yerel sulama	1	,4
Diğer (belirtiniz)	8	3,1
Total	258	100,0

Üreticilerin su kaynakları korumak için aldığı önlemlerin ne düzeyde etkili olduğu belirlenmeye çalışılmıştır. Üreticilerin %13'ü aldığı önemlerin hiç etkisi olmadığını, %25'i bir miktar etkisi olduğunu, %25'i orta düzeyde etki ettiğini, %33'ü çok etkili olduğunu ve %4'ü tamamen etkili olduğunu belirtmiştir (Şekil 6).

Şekil 6. Su kaynağını korumak için alınan önlemlerin etkisi

Tarımda kullanılan suyun su ücreti, elektrik, bakım-onarım gibi diğer masrafları bulunmaktadır. Tüm bu masrafların üreticiler tarafından karşılanabilme düzeyleri araştırılmıştır. Üreticilerin %7'sinin bu ücretleri karşılayamadığı, %22'sinin nadiren karşıladığı, %16'sının ara sıra karşıladığı, %43'ünün sık sık karşıladığı, %10'nun her zaman karşılayabildiği tespit edilmiştir. Üreticilerin %3'ü herhangi bir ödeme yapmaya gerek olmadıklarını belirtmişlerdir (Şekil 7).

Şekil 7. Tarımda kullanılan suyun masrafını karşılayabilme durumu

Üreticilerin ve hanelerindeki diğer kişilerin yeterli suya erişip erişemedikleri belirlenmeye çalışılmıştır. Üreticilerin %1'i suya hiç erişemediklerini, %2'si bir miktar erişebildiğini, %21'i orta düzeyde erişebildiklerini, %45'i çok fazla erişebildiklerini ve %32'si suya tamamen erişebildiklerini belirtmiştir (Şekil 8).

Şekil 8. Yeterli suya erişebilme durumu

Sonuç

Su güvenliğini güçlendirmek için, su kaynaklarının gelecekteki planlaması ve yönetimi için kapasite, uyarlanabilirlik ve dayanıklılık oluşturulması gerekmektedir. Alanda su

kaynakları üzerinde turizm ve şehirleşme baskısı ile birlikte tarımsal faaliyetler de yer almaktadır. Turizm faaliyetlerinden elde edilen önemli olmakla birlikte başta su kaynakları olmak üzere alanın taşıma kapasitesi dikkate alacak şekilde turizm planlaması yapılmalıdır. Alandaki şehirleşme kısıtlanarak su kaynakları varlığı ve kalitesi üzerindeki baskı azaltılmalıdır.

Tarım alandaki en önemli ikinci ekonomik faaliyettir. Üreticilerin %35'i tarımda kullandıkları su kaynaklarının azaldığını belirtmişlerdir. Bu azalmanın ne düzeyde olduğu tespit edilerek, azalmayı engelleyecek önlemler acilen alınmalıdır.

Üreticilerin üçte birinden fazlası tarımsal su kaynağının azaldığını belirtmesine karşın üreticilerin %90,7'si su kaynaklarını korumak için herhangi bir önlem almadıklarını belirtmişlerdir. Alanda üreticilerin su kaynaklarını korumaya yönelik bilinçlendirme çalışmaları yapılmalı, en etkili koruma yöntemlerinin yaygınlaştırılması sağlanmalıdır.

Not: Bu çalışma TÜBİTAK SOBAG tarafından desteklenen 121K572 numaralı “Tarım İşletmelerinin İklim Değişikliğine Dayanıklılığının Belirlenmesi- Köyceğiz-Dalyan Özel Çevre Koruma Bölgesi-“Projesi kapsamında elde edilmiştir. TÜBİTAK’a verdiği destek için teşekkür ederiz. Bununla birlikte, Tabiat Varlıklarını Koruma Genel Müdürlüğü’ne çalışma alanı olan Köyceğiz Dalyan Özel Çevre Koruma Bölgesinde çalışmamıza izin verdikleri için teşekkür ederiz.

Introduction

Concrete is a composite material consist of mainly water, aggregate, and cement. In concrete production, a large amount of natural aggregates, water, and sand are being consumed. Consequently to minimize the use of natural aggregates researchers have concentrated on the use of various waste materials as alternatives in the construction industry, especially in concrete construction. One of the prime research interests is the utilization of ceramic waste material like Crushed tiles, granites, glass sheet, etc. in concrete construction. This waste is not recycled in any form at present, however the ceramic waste is durable, hard and highly resistant to biological, chemical and physical degradation forces so, we selected these waste materials as a replacement material to the basic natural aggregate. Waste tiles and granites, glass sheets is collected from the surroundings.

Crushed tiles are replaced in place of coarse aggregate by the percentage of 10%,20%30%,and glass powder is in place of fine aggregate by the percentage of 10% along with coarse aggregate. The addition of waste material in concrete reduces the cost of construction and more or less maintains the properties of concrete such as impact value, water absorption, and specific gravity of natural aggregates. If we add ceramic waste material properly processed, it is effective as construction material and meets the design specifications. The study focuses on producing concrete of acceptable strength with ceramic waste as an alternative

material for coarse aggregates and fine aggregate by determining the mechanical properties of different percentages of aggregates.

Construction Waste in India

- In the present construction world, the solid waste is increasing day by day from the demolitions of constructions. There is a huge usage of ceramic tiles in the present constructions is going on and it is increasing in day by day construction field. Ceramic products are part of the essential construction materials used in most buildings. Some common manufactured ceramics include wall tiles, floor tiles, sanitary ware, household ceramics and technical ceramics. They are mostly produced using natural materials that contain high content of clay minerals.
- However, despite the ornamental benefits of ceramics, its wastes among others cause a lot of nuisance to the environment. And also in other side waste tile is also producing from demolished wastes from construction. Indian tiles production is 100 million ton per year in the ceramic industry, about 15%- 30% waste material generated from the total production. This waste is not recycled in any form at present, however ceramic waste is durable, hard and highly resistant to biological, chemical and physical degradation forces so they can be used as a replacement material to the basic natural aggregate to reuse them and to decrease the solid waste produced from demolitions of construction.

Objectives

- This study focuses on finding the satisfactory level of the concrete mix made by replacing ceramic waste with coarse aggregates and fine aggregates by evaluating its mechanical properties.
- Use of various ceramic waste materials in construction units.
- To reduce the cost of aggregates.

Literature Review

- **Mr.Akshay, B. Rahane, Vrushali, S. Jagtap, Papiha, R. Wade, Mohammad Ismail (2021)** have studied replacing ceramic tile waste with coarse aggregate. The ceramic coarse aggregate is used in concrete by replacing coarse aggregate by 25%,35%, and 45%. To compare the results of conventional concrete with Ceramic coarse aggregate concrete a concrete design mix of M20 is produced with various proportions of ceramic coarse aggregate material. Due to the good bonding nature of ceramic material with cement it increases the strength of concrete.

From the study, it is found that the percentage of replacement of coarse aggregate with ceramic coarse aggregate material is 45%, within which the performance of concrete is better, and all the results are attained within the designed limit.

- **Mr.Amjad Ali and K.Sharba, (2020)** investigated crushed gravels in concrete mixes that were replaced by ceramic tile. Their ratios were 15%, 30%, 45%, and 60%. On the other hand, glass powder was used to replace fine aggregate at a percentage of 15%, 30%, and 45%. The mixtures were examined in their fresh and hardened states in terms of workability, density, compressive, tensile strength, and flexural beam tests. The results pointed out that applying waste glass powder in the concrete mixture that contained waste ceramic tiles have enhancement the strength properties. The best result was obtained with a mix containing 25% glass powder and 15% ceramic tile.

- **Dr.K.Chandramouli, J.Sree Naga Chaitanya, Dr.Shaik.Bifathima, Dr.D.Vijaya Kumar, J.Deeksha, (2022)** studied on properties of concrete by proportions of the coarse aggregates that were substituted by the crushed ceramic waste tiles as 10%, 20%, 30%, 40%, and 50% and 10% of the fine aggregate was replaced with granite powder and ceramic tile powder in addition to the coarse ceramic tile. The M20 concrete grade was created and put to the test. It has been found that workability rises along with the Replacement rate of broken tiles and granite powder. The specimens were prepared and tested to compressive strength, and split tensile. The properties of concrete are attained by 30% of replacement with ceramic tiles and 10 % of replacement with granite powder at the age of 7 days and 28 days.

- **Mr.S.O. Ajamu , J. R. Oluremi and E. S. Ogunyemi, (2018)** have focused on the structural effect of the partial inclusion of Ceramic Tile Waste (CTW) as coarse aggregates in concrete production. Different samples of concrete were produced with 0 - 40 % in step content of 10% as a partial replacement of granite with CTW as well as 100% CTW as coarse aggregates. Tests were carried out on both coarse aggregates, CTW, and fresh and hardened concrete. The results of the tests showed that the workability of the mixes increased with a percentage increase in the CTW content up to 30% and thereafter decreased. There was a gradual decrease in the compressive strength of the test samples with an increase in the CTW content having a minimum permissible value of 20.03 N/mm² at 28 days for 40% inclusion of CTW. The water absorption rate of the samples increased with an increase in the CTW content by up to 30%. Based on the result obtained, a concrete mix ratio that contains not more than 40% CWT content is therefore recommended for use in the concrete mix.

- **Mr.Ravindra R, Anand Kumar BG, Patil Rooparchana, (2014)** studied on physical characterization and comparison of ceramic fine aggregates with natural fine aggregates were carried out and the strength properties of cement mortar with ceramic fine aggregate were studied. The result was promising for a replacement ratio of natural fine aggregate with a ceramic fine aggregate of 10%.
- **N.Naveen Prasad, P.Hanitha, N.C.Anil, (2016)** has investigated crushed waste tiles and granite powder as a replacement to coarse aggregates and fine aggregates. The combustion of waste crushed tiles were replaced in place of coarse aggregates by 10%, 20%, 30% and 40% and Granite powder were replaced in place of fine aggregate by 10%, 20%, 30% and 40%. Variations in the workability for these different mixes were studied and observed with the increase in the percentage of replacement of granite powder and crushed tiles, workability increases. For 10% of granite powder and 30% crushed tiles are replaced in place of fine aggregates and coarse aggregate, there is a increment in compressive strength, split tension strength, flexural strength and bond strength when compare to the conventional concrete strength results after 7 and 28 days curing period.
- **Prof. Shruthi, Prof. Gowtham Prasad, M. Samreen Taj, Syed Ruman Pasha (2016)** investigated on the reuse of ceramic waste as a substitute for coarse aggregate in concrete. They studied on properties of concrete mix with ceramic tile waste as a replacement in concrete for natural coarse aggregate with 0%, 10%, 20%, and 30% of the substitution and M20 grade concrete was used. The concrete moulds were casted and tested for Compressive Strength and Split Tensile Strength after a curing period of 3, 7 & 28 days. Results showed that the maximum compressive strength is obtained for the 30% replacement of ceramic tile aggregate with natural coarse aggregate.
- **Mr.A.O.Yiosese, A. R. Ayoola, M.C.Ugonna , A.K Adewale (2018)** has done experimental investigation on the suitability of the use of broken tiles as partial replacement for crushed granite in concrete production. The percentage replacement varied from 0% to 40% at intervals of 5%. The slump test was used to assess the workability of the fresh concrete. The compressive strengths and densities of cured concrete cubes of sizes were evaluated at 7 days, 21days, and 28days. A total of 81 concrete cubes were cast and tested. An increase in the percentage replacement of crushed granite with broken tiles reduces workability, density, and compressive strength. The compressive strength and density increased with days of curing. The compressive strength and density are maximum for concrete cubes with 100% crushed granite and minimum when broken tiles content is 40% with equivalent strength of (23.5N/mm² and

20.3N/mm²) and density of (2622 and 2441kg/m³) respectively. Compressive strength tests showed that variation up to 40% of the broken tiles in replacement for crushed granite was quite satisfactory with no compromise in compressive strength requirements (20N/mm²).

Materials and Test on Materials

CEMENT

- Cement is the most important material to be used in concrete. Ordinary Portland Cement of 53 Grade of brand name Ultra Tech Company, available in the local market was used for the investigation. Care has been taken to see that the procurement was made from single batching in airtight containers to prevent it from being affected by atmospheric conditions. The cement thus procured was tested for physical requirements

TESTS ON CEMENT

- **FINENESS OF CEMENT**

Fineness defines the surface area of cement particles per unit weight, which implies that more fineness means more particles in unit weight. This enhances the reaction rate which in turn will result in a faster gain of strength at earlier stages.

Fineness of cement

S.No	Weight taken(gms)	Weight of Residue retained(gms)	Fineness(%)
1	100	4	4
2	100	5	5
3	100	4	4

$$\text{Average} = \frac{4+5+4}{3} = 4.33$$

$$\text{Fineness of cement} = 4.33\%$$

- **SPECIFIC GRAVITY OF CEMENT**

Specific Gravity is the ratio of the substance to the density of the reference substance. To determine the specific gravity of the cement, kerosene which does not react with cement is used.

$$\text{Weight of cement taken} = 64 \text{ grams}$$

The volume of cement in flask= 21.4

Density of liquid at 100 ° temperature = 0.8

$$\text{Specific Gravity} = \frac{\text{specific weight of cement}}{\text{specific weight of kerosene}}$$

$$\text{Specific weight of cement} = \frac{\text{weight of cement}}{\text{Volume of cement}}$$

$$= \frac{64}{21.4} = 2.99$$

$$\text{Specific Gravity} = \frac{2.99}{0.8} = 3.73$$

Specific gravity is found to be 3.73

• **STANDARD CONSISTENCY OF CEMENT**

The standard consistency of the cement paste is defined as the consistency of the cement which will permit the Vicat plunger to penetrate to a point of 5 to 7 mm from the bottom of Vicat's mould. The following readings were obtained:

Trial No.	Quantity of water(ml)	Initial reading (mm)	Final Reading (mm)	Height not penetrated (mm)
1	120	40	33	07
2	128	40	23	17
3	132	40	7	33

$$\text{Standard consistency of cement} = \frac{W_2}{W_1} \times 100$$

W1 = Quantity of water taken

W2 = Weight of water corresponding to penetration of 5mm to 7mm

$$\text{Standard consistency} = \frac{132}{400} \times 100 = 33\%$$

FINE AGGREGATE

• Sand is a natural granular material that is mainly composed of finely divided rocky material and mineral particles. The most common constituent of sand is silica (silicon dioxide, or SiO₂), usually in the form of quartz, because of its chemical inertness and considerable hardness, is the most common weathering-resistant mineral. Hence, it is used as fine aggregate

in concrete. The aggregate sizes lesser than 4.75 mm is considered as fine aggregates.

Grain size distribution of fine aggregate

$$\begin{aligned} \text{Fineness Modulus} &= \frac{\sum f}{100} = \frac{276.5}{100} \\ &= 2.765 \end{aligned}$$

Graph of Grain Distribution of Fine Aggregate

- **Specific Gravity of fine aggregate**

$$= \frac{500}{(1122-622)-(1826-1518)} = 2.604$$

- **BULKING OF SAND**

Bulking of sand is the increase in the volume of sand due to an increase in moisture. Specific gravity is the ratio of the density of a substance to the density of a reference substance, equivalently It is the ratio of the mass of a substance to the density of a reference substance for the same given volume.

Determine the weight of the empty pycnometer (W1). Take about 500 grams of fine aggregate and pour it into a pycnometer. The weight (W2) of the pycnometer along with the fine aggregate is determined. Fill the pycnometer with water along with the fine aggregate and take the

weight(W3). Empty the pycnometer and fill it with water and take weight(W4).

$$\text{Weight of pycnometer (W1)} = 622 \text{ g}$$

$$\text{Weight of pycnometer + F.A (W2)} = 1122 \text{ g}$$

$$\text{Weight of pycnometer + F.A + water (W3)} = 1826 \text{ g}$$

$$\text{Weight of pycnometer + water (W4)} = 1518 \text{ g}$$

$$\text{Weight of Oven dry sample (W5)} = 500 \text{ g}$$

$$\text{Specific Gravity} = \frac{W5}{(W2-W1)-(W3-W4)}$$

content. The readings obtained are:

Percentage of water added by weight of sand	Height of moist sand (mm)	Percentage of bulking of sand
1	164	10.06
2	170	14.09
3	174	16.77
4	175	17.44
5	171	14.76
6	167	12.08

The maximum amount of 17.44 bulking was obtained at a moisture content of 4 %.

$$\text{Weight of pycnometer + C.A + water (W3)} = 1805 \text{ g}$$

$$\text{Weight of pycnometer + water (W4)} = 1520 \text{ g}$$

$$\text{Weight of Oven dry sample (W5)} = 500 \text{ g}$$

$$\begin{aligned} \text{Specific Gravity} &= \frac{W5}{(W2-W1)-(W3-W4)} \\ &= \frac{500}{(1120-620)-(1805-1520)} \\ &= 2.325 \end{aligned}$$

- **Water Absorption test for Coarse Aggrega**

The water absorption determines the water holding capacity of aggregates. The water absorption of an aggregate is the percentage by weight of water absorbed in terms of oven dry

weight of the specimen and it is accepted measure of porosity.

Weight of surface dry coarse aggregate in air = 2000 g

Weight of aggregate placed in water for 24 hours = 2002 g

$$\text{Water absorption} = \frac{2002-2000}{2000} \times 100$$

$$= 0.1 \%$$

• **IMPACT VALUE OF COARSE AGGREGATE**

Impact value is the ability of aggregates that resist sudden impact or shock load on it. Also, it can be defined as the resistance of aggregate to failure by impact load is known as the Impact Value of Aggregate.

The impact test on aggregate is carried out to know the response of aggregates to different kinds of loads that the aggregates will be subjected to during their service life.

Details	Trail No.1 (gms)	Trail No.2 (gms)	Average (gms)
Total weight of aggregate sample W1 (gms)	319	335	327
Weight of aggregate retained on 2.36 mm sieve after the test W2 (gms)	248	266	257
Weight of aggregate passing 2.36 mm sieve after the test W3 (gms)	70	67	68.7
Aggregate impact value percent fines $\frac{W3}{W1} \times 100$	21.94	20	20.97

WATER

Water plays a vital role in achieving the strength of concrete. For complete hydration it requires about 3/10th of its weight of water. It is practically proved that minimum water-cement ratio 0.35 is required for conventional concrete. Water participates in chemical reaction with cement and cement paste is formed and binds with coarse aggregate and fine aggregates. If more water is used, segregation and bleeding takes place, so that the concrete becomes weak, but most of the water will absorb by the fibers. Hence it may avoid bleeding. If water content exceeds permissible limits it may cause bleeding. If less water is used, the required workability is not achieved. Potable water fit for drinking is required to be used in the concrete and it should have pH value ranges between 6 to 9.

CERAMIC TILE AGGREGATE

Broken tiles were collected from the solid waste of ceramic manufacturing unit and from demolished building. The waste tiles were crushed into small pieces by manually. The required size of crushed tile aggregate was separated to use them as partial replacement to the natural coarse aggregate. The tile waste which is lesser than 4.75 mm size was neglected. Crushed tiles were partially replaced in place of coarse aggregate by the percentages of 10%, 20% and 30%.

TESTS ON CERAMIC TILES

- **SPECIFIC GRAVITY OF CRUSHED TILES**

Weight of pycnometer (W1) = 555 g

Weight of pycnometer + Crushed tiles(W2) = 1055 g

Weight of pycnometer + Crushed tiles + water (W3) = 1685 g

Weight of pycnometer + water (W4) = 1430 g

Weight of Oven dry sample (W5) = 500 g

$$\begin{aligned}\text{Specific Gravity} &= \frac{W5}{(W2-W1)-(W3-W4)} \\ &= \frac{500}{(1055-555)-(1685-1430)} \\ &= 2.04\end{aligned}$$

- **WATER ABSORPTION OF CRUSHED TILES**

Weight of surface dry crushed tile aggregate in air = 2000 g

Weight of crushed tile aggregate placed in water for 24 hours = 2002.9 g

Considering 2002.9 as 2003 grams

$$\text{Water absorption} = \frac{2003-2000}{2000} \times 100 = 0.15 \%$$

- **IMPACT VALUE OF CRUSHED TILE AGGREGATE**

Details	Trail No.1 (gms)	Trail No.2 (gms)	Average (gms)
Total weight of aggregate sample W1 (gms)	255	270	262
Weight of aggregate retained on 2.36 mm sieve after the test W2 (gms)	206	227	207
Weight of aggregate passing 2.36 mm sieve after the test W3 (gms)	49	67	55
Aggregate impact value percent fines $\frac{W3}{W1} \times 100$	19.2	16.23	20.99

The impact value of aggregate = 20.99 %

GLASS POWDER

Sheet glass powder (SGP) used in concrete making, leads to greener environment. Many sheet glass cuttings go to waste, which are not recycled at present and are usually delivered to landfills for disposal. Using SGP in concrete is an interesting possibility for economy on waste disposal sites and the conservation of natural resources. Natural sand was partially replaced by 10 % with SGP along with ceramic tiles.

TESTS ON GLASS POWDER

• SPECIFIC GRAVITY OF GLASS POWDER

Weight of pycnometer (W1) = 621g

Weight of pycnometer + Glass powder (W2) = 1130 g

Weight of pycnometer + Glass powder + water (W3) = 1705g

Weight of pycnometer + water (W4) = 1408 g

Weight of Oven dry sample (W5) = 500 g

$$\text{Specific gravity} = \frac{W5}{(W2-W1)-(W3-W4)}$$

$$= \frac{500}{(1130-621)-(1705-1408)} = 2.35$$

Procurement of materials

We have collected coarse aggregate, fine aggregate, cement, tiles from our local area. We crush the tiles for the use of replacement in coarse aggregates. We are collecting the glass powder from online (Amazon). We have placed an order of it.

Mix design

Design stipulations for proportioning:

- i) Grade designation : M 25
- ii) Type of cement : OPC of grade 53
- iii) Maximum nominal size of aggregates : 20mm
- iv) Maximum cement content : 394 kg/m³
- v) Water cement ratio : 0.50
- vi) Exposure condition : Moderate

- vii) Method of concrete placing : Placing and casting manually
- viii) Type of aggregate : Angular aggregates
- ix) Specific gravity of fine aggregate : 2.5
- x) Specific gravity of coarse aggregate : 2.74
- xi) Specific gravity of cement : 3.13
- xii) Fine aggregate (sand) : Confirming to zone II table 5 of IS 10262-2019

MIX DESIGN FOR M25 GRADE CONCRETE

1. Target Strength:

$$f'_{ck} = f_{ck} + 1.65 * S \quad (\text{or}) \quad f'_{ck} = f_{ck} + X$$

Assumed standard deviation S = 4.0 (IS 10262 – 2019 table 2)

X = 5.5 for M 25 (from IS 10262 – 2019 table 1)

$$f_{ck} = 25 \text{ N/mm}^2$$

$$f'_{ck} = 25 + (1.65 * 4) \\ = 31.6 \text{ N/mm}^2$$

$$f'_{ck} = 25 + 5.5 \\ = 30.5 \text{ N/mm}^2$$

Considering greater value of f'_{ck}

$$\text{Therefore, } f'_{ck} = 31.6 \text{ N/mm}^2$$

2. Selection of water-cement ratio

For OPC , adopting a water-cement ratio of 0.50

As per table 4 IS 10262 – 2019

Water content = 186 kg/m³ (for 50mm slump)

For 100mm slump, 3% for each 25mm increase after 50mm

$$\begin{aligned}\text{water content} &= \left(186 + \frac{6}{186}\right) \times 186 \\ &= 197 \text{ kg/m}^3\end{aligned}$$

Therefore, 197 liters of water for 1 m³

3. Calculation of cement content

$$\begin{aligned}\text{cement content} &= \frac{\text{water content}}{\text{water-cement ratio}} \\ &= \frac{197}{0.5} \\ &= 240 \text{ kg/m}^3\end{aligned}$$

for moderate condition 394 kg/m³ > 240 kg/m³

Therefore, considering the cement content of 394 kg/m³

4. Volume Proportions for fine aggregate and coarse aggregate

The volume of coarse aggregate corresponding to the unit volume of total aggregate for different zones of fine aggregate is given in the IS 10262-2019 table 5.

From table 5 IS 10262-2019, the volume of coarse aggregate corresponding to 20mm size aggregate and fine aggregate (zone 2) for the water cement ratio of 0.50 is 0.62

$$\begin{aligned}\text{Volume of fine aggregate} &= 1 - 0.62 \text{ m}^3 \\ &= 0.38 \text{ m}^3\end{aligned}$$

Volume of concrete = 1 m³

$$\text{Volume of cement} = \frac{\text{mass}}{\text{specific gravity}} \times \frac{1}{1000} = \frac{394}{3.13} \times \frac{1}{1000} = 0.125 \text{ m}^3$$

$$\text{Volume of water} = \frac{\text{mass}}{\text{specific gravity}} \times \frac{1}{1000} = \frac{197}{1.0} \times \frac{1}{1000} = 0.192 \text{ m}^3$$

$$\begin{aligned}\text{Volume of total aggregates} &= 1 - (0.125 + 0.01 + 0.192) \\ &= 0.673 \text{ m}^3\end{aligned}$$

5. Mass of Aggregates

Coarse aggregate = (Volume of coarse aggregate * volume of total aggregate * specific gravity * 1000)

$$\begin{aligned}&= (0.673 * 0.62 * 2.74 * 1000) \\ &= 1143.29\end{aligned}$$

Therefore, considering 1144 kg/m³ quantity of coarse aggregate

Fine aggregate = (Volume of fine aggregate * volume of total aggregate * specific

gravity*1000)

$$\begin{aligned}\text{Fine aggregate} &= (\text{Volume of fine aggregate}^{\text{*volume of total aggregate*specific gravity*1000}}) \\ &= (0.38*0.673*2.5*1000) \\ &= 636.5\end{aligned}$$

Therefore, considering 637 kg/m³ of fine aggregate

6.Final Mix proportions

C	:	FA	:	CA	:	WATER
394	:	637	:	1144	:	197
1	:	1.61	:	2.90	:	0.5

EXPERIMENTAL DETAILS

MIXING

CASTING OF SPCIMENS

CURING

TESTS ON MECHANICAL PROPERTIES OF CONCRETE

MIXING

CASTING OF SPCIMENS

CURING

TESTS ON MECHANICAL PROPERTIES OF
CONCRETE

MIXING

Mixing is done with the required quantity of cement, natural aggregate, and water present in concrete. Machine mixing is adopted throughout the experiment work. The mixing should be done in a process where firstly sand is added, then cement, then coarse aggregate, and finally water.

CASTING OF SPECIMENS

Concrete specimens are cast of cubes, cylinders, and beams,

where after casting they are kept aside for 24 hours. After which, they are demoulded and sent for curing.

Cubes of 100mm × 100mm × 100mm

Cylinders of 100 mm diameter and 200 mm height

Beams of 500mm × 100mm × 100mm were casted

CURING

Curing is the process of preventing the loss of moisture from concrete while maintaining a satisfactory temperature. The potential strength and durability of concrete will be fully developed only if the concrete is properly cured. After the period of casting the specimens are removed from the moulds and immediately submerged in clean, oil-free, and fresh water. The specimens are cured for 7 days, 14 days, and 28 days in the present work.

TESTS ON MECHANICAL PROPERTIES OF CONCRETE WORKABILITY

The property of fresh concrete is indicated by the amount of useful internal work required to fully compact the concrete without bleeding or segregation in the finished product. Workability is one of the physical parameters of concrete which affects the strength and durability as well as the cost of labour and the appearance of the finished product.

The workability is determined by the slump cone method.

Work Ability by slump cone Test Workability by slump cone method readings:

S.No	Aggregate Replacements % (TILES, GLASS POWDER)	Workability (mm)
1	0+0	62
2	10+10	64
3	20+10	70
4	30+10	73

COMPRESSIVE STRENGTH

Compressive strength is the capacity of a material or structure to withstand loads. It is a key value for the design of structures. After curing of specimens they are tested with a compression testing machine.

Broken specimen when the load is applied

**Compressive strength testing machine
showing cube subjected to loading**

Compressive strength test results

The cubes of size 150 x 150 x 150mm were cast and tested for 7 days, 14 days and 28 days, after conducting the workability tests. The results are as follows:

International Conference on Global Practice of Multidisciplinary Scientific Studies-IV
Turkish Republic of Northern Cyprus, April 28-30, 2023

S.No	Aggregate Replacements % (Ceramic tile aggregate, Glass Powder)	Compressive strength in N/mm ²		
		7 days	14 days	28 days
1	0+0	20.57	26.54	33.18
2	10+10	21.50	28.68	34.07
3	20+10	23.9	32.10	38.90
4	30+10	28.01	38.06	42.70

GRAPH FOR COMPRESSIVE STRENGTH

SPLIT TENSILE STRENGTH

Tensile Strength is one of the basic and important properties of concrete. A knowledge of its value is required for the design of concrete structures. The tensile strength of concrete is determined using a cylinder.

Cylinder specimens after being subjected to loading

Compressive strength testing machine showing cylinder subjected to loading

Split tensile strength test results

The split tensile strength obtained by testing the cylindrical specimen for M25 grade of concrete to all the mixes for various replacements are as follows:

S.No	Aggregate Replacements % (Ceramic tile aggregate, Glass Powder)	Split tensile strength in N/mm ²		
		7 days	14 days	28 days
1	0+0	1.67	2.18	2.56
2	10+10	1.68	2.20	2.59
3	20+10	1.72	2.21	2.63
4	30+10	1.73	2.24	2.66

Graph FOR SPLIT TENSILE STRENGTH

FLEXURAL STRENGTH TEST

The flexural strength of the specimen is determined using a universal testing machine and the specimen used is of the beam shape.

Beam subjected to flexural testing under universal testing machine Universal testing machine

Flexural Strength test results

The flexural test was conducted for beam and the results obtained are as follows:

S.No	Aggregate Replacements % (Ceramic tile aggregate, Glass Powder)	Flexural Strength in N/mm ²		
		7 days	14 days	28 days
1	0+0	7.92	8.98	9.95
2	10+10	8.11	9.02	10.6
3	20+10	8.23	9.08	10.14
4	30+10	8.56	9.15	10.28

Graph For flexural strength

Report work

- Study of mechanical properties of concrete i.e compressive strength, split tensile strength, flexural strength.
- Comparing the results with a conventional mix.

BÜYÜKBAŞ VE KÜÇÜKBAŞ İŞLETMELERİNDE BİYOGÜVENLİK
UYGULAMALARININ ÖNEMİ

ÖZET

Biyogüvenlik, hastalık oluşturabilecek etmenlerin yetiştiricilik işletmelerine girişini ve yayılmasını önlemeye yönelik alınacak tedbirlerin tamamını içermektedir. Biyogüvenlik aksaklıkları işletmelerde hayvan kaybına ve ilerleyen dönemlerde ise verim kaybına sebebiyet vermektedir. Hayvan refahının sağlanması, verim kaybının önlenmesi ve tedavi masraflarının azaltılması özellikle biyogüvenlik uygulamalarının sağlanması ile mümkündür. Biyogüvenlik uygulamalarının eksik bir şekilde yapılması; işletmelerde yavru kayıplarının daha fazla yaşanmasına, mastitis ve topallık sorunlarının artmasına, üreme performansı ve süt üretiminin düşmesine sebebiyet verecektir. İşletmelerde revir ve karantina bölmelerinin bulunması, hayvanların dinlenme ve gezinti alanlarına ait zeminin kuru tutulması, yeterli havalandırmanın sağlanması, hayvanlara temiz yem ve su temini, işletmelerin yabancı hayvanların (fare, kuş, tavşan vb.) girişini engelleyecek şekilde planlanması, işletmelerin giriş ve çıkışlarında araçların dezenfektan uygulamasından geçmeleri, işletme girişlerinde kireç ve dezenfektanlı küvetlerin konulması, işletmeye dışarıdan alınacak hayvanların öncelikle karantina bölmelerinde tutulmaları, gübre temizliğinin düzenli yapılması, güvenlik kameraları ile işletme içerisinde ve dışarısında düzenli olarak gözlem yapılması ve hastalık kayıtlarının tutulması, aşı takvimine düzenli bir şekilde uyulması, parazit kontrollerinin ve ilaçlamaların düzenli bir şekilde yapılması gerekmektedir. Sonuç olarak, biyogüvenlik uygulamaları hem büyükbaş hem de küçükbaş işletmede hayvan sağlığı, insan sağlığı ve çevre koruma açısından son derece önemlidir. Bu nedenle mevzuata uygun bir şekilde işletme planlamalarının yapılması yanı sıra yetiştiricileri bilinçlendirecek eğitimlerin verilmesi hastalıkların yayılma riskini ve işletmelere hastalık getirilme olasılığını azaltacak ve bu da doğrudan işletmelerin hayvan refahını ve karlılığını arttıracaktır.

Anahtar Kelimeler: Biyogüvenlik, Hayvan refahı, Büyükbaş, Küçükbaş

IMPORTANCE OF BIOSAFETY PRACTICES IN CATTLE AND OVINE FARMS

ABSTRACT

Biosecurity includes all measures to be taken to prevent the entry and spread of disease-causing agents into bovine and ovine breeding enterprises. Biosecurity failures cause loss of animals in farms and loss of yield in the following periods. Ensuring animal welfare, preventing loss of productivity and reducing treatment costs are possible especially with the full implementation of biosecurity practices. Incomplete implementation of biosecurity practices will lead to more offspring losses, increased mastitis and lameness problems, decreased reproductive performance and milk production. Having infirmary and quarantine compartments in the enterprises, keeping the floor of the resting and walking areas of the animals dry, providing adequate ventilation, providing clean feed and water to the animals, planning the enterprises in a way to prevent the entry of wild animals (mice, birds, rabbits, etc.), disinfecting the vehicles at the entrance and exit of the enterprises, placing lime and disinfectant bathtubs at the entrances of the enterprises, keeping the animals that will be taken to the enterprise from outside in quarantine compartments, regular cleaning of manure, regular observation inside and outside the enterprise with security cameras and keeping disease records, regular compliance with the vaccination schedule, regular parasite controls and spraying. In conclusion, biosecurity practices are extremely important in terms of animal health, human health and environmental protection in both bovine and ovine enterprises. For this reason, in addition to making enterprise planning in accordance with the legislation, providing trainings to raise awareness of breeders will reduce the risk of spreading diseases and the possibility of bringing diseases to enterprises, which will directly increase animal welfare and profitability of enterprises.

Keywords: Biosecurity, Animal welfare, Cattle, Ovine

1.GİRİŞ

Büyükbaş ve küçükbaş hayvan yetiştiriciliğinde biyogüvenlik, işletme, bölge ya da ulusal düzeyde salgın hastalık etkenlerinin hayvan sürülerine geçişini engellemek amacıyla alınan bir dizi önlemleri kapsar. Biyogüvenlik terimi özellikle çiftlik hayvanlarının korunması ve güvenliği ile ilgilidir (Cullor, 2004). Bu nedenle biyogüvenlik, çiftlik yönetimi, günlük bakım, besleme, sağlık vb. rutin uygulamalar açısından önem taşımaktadır (Anderson, 2010). Kıt kaynaklar bilimi olarak da adlandırılan ekonomi biliminin son günlerde üzerinde durduğu en önemli konu verimlilik ve karlılıktır. Karlılığı artırabilmek için işletmelerde biyogüvenliği sağlamak ve hayvan refahı kurallarına uyarak sağlıklı hayvanlarla yetiştiricilik yapmak önem taşımaktadır (Yener ve ark., 2013).

Büyümeyi ve gelişmeyi düşünen süt sığırı işletmeleri, hastalıktan arı sürüleri oluşturmak ve yüksek verimin sürdürülebilir olmasını sağlamak için biyogüvenlik önlemlerine uymak zorundadırlar. Birçok bulaşıcı hastalık dışarıdan satın alınan hayvanlar ile sürüye girebilir, çiftliğe taşınması ile hayvanlar ve insanlarda olumsuz etkilere neden olabilir (Wallace, 2003). Tarım işletmelerinde biyogüvenliğin uygulanmasını uluslararası düzeyde araştıran birçok çalışma yapılmıştır. Bu çalışmaların büyük bir çoğunluğunda ortaya çıkan ortak görüş, biyogüvenlik konusunda bir farkındalığın olmasına rağmen, çiftlik düzeyinde biyogüvenlik önlemlerinin uygulanmasının genellikle zayıf olduğunu şeklindedir (Delabbio, 2006; Pol ve Ruegg, 2007; Brandt ve ark. 2008).

Yapılan çalışmalarda işletmelerde biyogüvenlik önlemlerinin alınmış olmasının çiftçiler için maliyet ve faydalarla ilişkili olduğu konusunda genel bir fikir birliği vardır (Jarvis ve Valdes-Donoso, 2018). Hayvan hastalıkları ciddi ekonomik kayıplara yol açarken, aşılama, kapalı sürüler, işletmelere alınan hayvanların test edilmeleri vb. biyogüvenlik önlemleri yoluyla hastalıkların önlenmesi ek maliyetler oluşturmakta ve dolayısıyla çiftlik karımı azaltabilmektedir. Ancak biyogüvenlik önlemlerini uygulamak ilk maliyetlerine rağmen, hastalıkların önlenmesi ile daha üretken ve daha yüksek kar elde edilebilecek sağlıklı sürülerin oluşmasına kolaylık sağlayabilir (Bennett, 2003; Stott ve ark., 2012; Belay ve Jensen, 2022).

Biyogüvenlik uygulamalarının çiftlikler üzerindeki faydalarından bazıları şunlardır: artan üretkenlik ve dolayısıyla daha fazla verimlilik ve karlılığa dönüşen hayvan sağlığı ve refahının iyileştirilmesi; güvenli, sağlıklı ve kaliteli et, süt ve türevleri üretmek; aşılar veya diğer yönetim stratejileri kullanılarak tedavi olmayan veya kontrolü zor olan hastalıkların ekonomik kayıplarını azaltmak; enfeksiyöz ajanların çiftlik veya çiftlik dışı yayılımını engellemek veya azaltmak; hastalık tedavi maliyetlerini azaltmak; ilaç kullanımını azaltmak;

tüketici ve alıcı güvenini artırmak; insan sağlığını korumak, hem hayvan hem insan hem de işletme açısından pozitif fayda sağlayacaktır (Clark ve ark., 2012; Shortall ve ark.,2016).

2. BİYOGÜVENLİK UYGULAMALARINDA TEKNOLOJİK GELİŞMELER

Biyogüvenlik, hayvancılık işletmelerinde üretimin sürdürülebilir olmasını sağlayan, bulaşıcı hastalıkların sürü içerisinde yayılımını önlemek amacıyla yapılan tüm önlemler olarak tanımlanabilir. Genellikle biyogüvenlik, iyi hijyen uygulamaları ve aşılama gibi etkili programlarla sağlanmaktadır. Son yıllarda teknolojinin hayatımıza girmesiyle biyosensör, nanoteknoloji gibi kavramların hastalıkların tanımlanmasını ve erken müdahale edilmesinde rol oynamaktadır (Laanen ve ark., 2014; Neethirajan ve ark., 2017). Enfeksiyöz ajanların girişini önlemeye yönelik herhangi bir yatırım, hayvanların, insanların ve çevrenin korunmasını ve hayvanların verimliliğini arttırmayı sağlayarak finansal açıdan fayda sağlayacaktır (Laurence ve ark., 2014).

Teknolojinin gelişmesiyle birlikte sabit sensör sistemleri, giyilebilir sensör, biyosensör, görüntü işleme gibi gelişmeler hayvan sağlığını sürekli/gerçek zamanlı olarak takip edilmesine olanak sağlamaya başlamıştır. Bu teknolojik ürünlerin hayvan hastalıklarının tespit edebilmesi sürü içerisindeki ekonomik ve refah açısından oluşabilecek sorunlara müdahale edilebilmesi, hayvanların bireysel takibinin sağlanması ve buna yönelik yapılacak tıbbi müdahalenin tüm sürü yerine ilgili hayvan üzerine odaklanması, ekonomik açıdan işletmeye pozitif fayda sağlayacaktır. Bu teknolojik gelişmeler hayvanlarda ter metabolitleri, vücut ısısı ölçme, stresi tespit etme, ses analizi, pH kontrolü, virüslerin ve patojenlerin varlığını tespit etme kapasitelerinin başarısı, gereksiz ilaç kullanımını düşürmesi, et ve süt gibi ürünlerin kalitesinin artırılması ve hayvanlarda refah üzerindeki sorunlarının önüne geçmesinde potansiyel taşımaktadır (Neethirajan, 2017).

3. İŞLETMELERDE BİYOGÜVENLİK YÖNETİMİ VE UYULMASI GEREKEN KURALLAR

Ülkemizde yapılan çalışmalarda biyogüvenlikle ilgili sorunların daha çok geleneksel yöntemlerin ve alışkanlıkların devam ettirilmesi, hayvanlara uygun çevre şartlarının sağlanılmamış olması, teknolojik gelişmelerin gerisinde kalınmış olması ve yetiştiricilerin biyogüvenlik konusunda yeterli bilgi ve pratiğe sahip olmadıklarına bağlı olarak ortaya çıktığını göstermiştir (Yener ve ark, 2013; Özdemir ve Özdemir, 2018; Yılmaz ve Koyuncu, 2022).

İşletmelerin biyolojik risk yönetim planına sahip olmaları ve bunu uygulamaları verimlilik açısından büyük önem taşımaktadır ve bu kapsamda uyulması gereken kurallar şu şekilde sıralanmaktadır (Hersom ve ark., 2017);

- a. Biyogüvenlik uygulamaları ile tehditlerin öncelikle belirlenmesi ve doğru yönetim uygulamalarının ne olduğunun bilinmesi gerekmektedir.
- b. Hastalık belirtileri (öksürük, kilo kaybı, burun ve göz akıntısı, nefes darlığı, abortus, ölü doğumlar, vb.) konusunda sürekli gözlem yapılmalı ve koruyucu hekimlik çerçevesinde planlı bir aşı takvimi oluşturulmalıdır.
- c. Çiftlik sınırları içinde yetkisiz araç ve personel trafiğini kontrol etmek için işletme içi ulaşım güzergahları belirlenmelidir. Gereksiz ziyaretçilerin işletmeye girişleri en aza indirilmeli, aksi taktirde farkında olmadan birçok hastalık etmeninin işletmeye girebilir. Kontrollü araç giriş ve çıkış noktaları belirlenmelidir. Giriş ve çıkış noktalarında araçlar dezenfekte uygulamasından geçmelidir.
- d. Sürüde görülebilecek yüksek düzeyde ölümler veya hastalık olguları rapor edilmeli ve takibe alınmalıdır. Kayıplar ve hastalıklar bilgisayar paket programları kullanarak kaydedilmeli ve bakanlığa bildirilmelidir.
- e. Dışarıdan getirilen hayvanlar sürüye katılmadan en az üç hafta karantinaya alınmalıdır. Hasta hayvanlar diğer hayvanlara bulaşı önlemek amacıyla ayrı bir bölmede tutulmalıdır. İşletmeye alınacak hayvanlar, hastalık yönünden kontrol edilmeli ve sağlıklı hayvanlar seçilmiş olmalıdır. Çiftlikler farklı işletmelerden uzak ve karantina bölmeleri de yine sağlıklı hayvanların bulunduğu bölmelerden uzak yerlere inşa edilmeli.
- f. Rasyon içeriklerini doğrulama ve yasaklanmış hammaddelerin işletmeye girişini önlemek için yem kalite ve içeriği hakkında yem tedarikçilerinden bilgi alınmalıdır. İşletmeye getirilen yemler nemli ve havasız ortamlarda bulundurulmamalıdır. Yem deposu, yem silosu gibi yerler tamamen dış ortamlara kapalı olmalı, evcil hayvan, tavşan fare, yılan ve kuşların girişleri engellenmelidir. Ayrıca böcek popülasyonlarının hayvanlara ve yem kaynaklarına hastalık bulaştırmaları engellenmelidir. Hayvana temin edilecek suyun temiz ve kaliteli olmasına dikkat edilmeli, suluk ve yemliklerin düzenli olarak temizlenmesi ve dezenfekte edilmesi gerekmektedir.
- g. Çiftliklerin içerisinde ve dışarısında tehdit oluşturabilecek canlıların hayvanlara zarar vermemesi, hastalık getirmemesi ve aynı zamanda beklenmedik araçların girişlerini engellemek amacıyla güvenlik kameraları ile düzenli olarak gözlem yapılmalıdır.

- h. İşletme personelleri ve dışarıdan gelecek misafirler için işletme girişlerinde ayakkabı ve çizme dezenfeksiyonu için kireç, dezenfektanlı sünger kabı ve küvet kullanılmamalıdır. İşletme personelleri hastalık bulaşma riskini arttıracak uygulamalarda (doğum, sağım vb.) tek kullanımlık giysiler giymeli, kişisel temizliklerine dikkat etmelidirler. İşletme personellerine ait giyinme odası bulunmalıdır. Barınak ve ünite girişlerine mutlaka duş ve kıyafet değişim odaları yapılmalı, günlük kıyafetler burada bırakıldıktan sonra hayvana müdahale edilmelidir.
- i. İşletme içerisinde uygun teknikler kullanılarak gübre temizliği gerçekleştirilmeli, özellikle büyükbaş işletmelerinde otomatik gübre sıyırıcı sistemler kullanılmalıdır. İşletme etrafındaki atıklar kontrollü bir şekilde uzaklaştırılmalı ve biriktirilmemelidir.

4. SONUÇ VE ÖNERİLER

Türkiye’de biyogüvenlik uygulamalarının aksaklığından kaynaklı birçok kuzu ve buzağı ölümü gerçekleşmekte, işletmelerde şap, mastitis, çiçek, brusella, kuduz, veba gibi bulaşıcı hastalıklar çok sık görülmektedir. Günümüzde özellikle bulaşıcı hayvan hastalıklarının sık sık görülmeye başladığı ve bu hastalıklarında hem hayvan sayısında hem de kırmızı et üretiminde azalmalara yol açtığı bilinmektedir. Aynı zamanda yetiştiriciler ve aileleri zoonoz hastalıklarla karşı karşıya gelmektedir. Bu aksaklıklar ilerleyen dönemlerde işletmelerde hayvan kaybına, verim kaybına, işletme de veteriner hekim ve ilaç masraflarının artmasına ve sürü yenileme maliyetlerinin artmasına sebebiyet vermektedir. Biyogüvenlik uygulamalarının büyükbaş ve küçükbaş işletmelerinde tam olarak uygulanmamasının sonucu olarak da ülke hayvancılığında ciddi ekonomik kayıplar söz konusu olmaktadır.

Büyükbaş ve küçükbaş işletmelerinde biyogüvenlik uygulamaları arttırılmalı ve titizlikle uygulanmalı, işletmeler kurulurken mevzuata uygun ve biyogüvenlik önlemleri dikkate alınacak bir şekilde planlanmalı, yetiştiricileri biyogüvenlik konusunda bilinçlendirecek uygulamalı eğitimler verilmeli, Tarım ve Orman Bakanlığı’na büyükbaş ve küçükbaş işletmelerine yapılacak denetimler arttırılmalı, yetiştiricilerle, Zooteknist ve Veteriner Hekimler arasındaki iş birlikleri arttırılmalı, yetiştiricilere biyogüvenlik uygulamalarının sağlanması koşulu ile desteklemeler verilmeli, hayvan satış bölgelerindeki denetim ve kontrol arttırılmalı, sınır bölgelerdeki kaçak hayvanların girişleri engellenmeli, çiftlik hayvanlarında biyogüvenlik mevzuatları ve yönergeleri genişletilerek arttırılmalıdır.

ÖZET

Ülkemizde her yıl çok sayıda buzağı ölümleri gerçekleşmektedir. Ölen her buzağı hem çiftlikler hem de ülke ekonomisini açısından büyük önem arz etmektedir. Buzağı ölümlerinin artması, süt endüstrisi ve süt hayvancılığının geleceğini tehdit etmektedir. Ülkemiz süt endüstrisi ve süt hayvancılığının geleceği açısından buzağı ölümleri büyük önem arz etmektedir. Fakat son yıllarda ne yazık ki ülkemizde binlerce buzağı farklı nedenlerden dolayı yaşamlarını yitirmektedir. Bu kayıpların önlenmesi için öncelikle ölümleri oluşturan şartların belirlenip, bu şartlara karşı önlem almak gerekmektedir. Özellikle ülkemizde görülen buzağı kayıplarının başında sürü yönetiminin yanlış uygulanması, doğum öncesi kayıplar, gerekli hijyen kurallarına uyulmaması sonucu oluşan kayıplar, buzağı beslenmesinde uygulanan yanlışlıklardan kaynaklanan kayıplar şeklinde sıralayabiliriz. Bu derleme ile buzağı kayıplarını oluşturan sebepleri tespit ederek, bunlara karşı alınacak önlemleri belirlemektir.

CALF LOSSES RELATED TO ANIMAL WELFARE IN CATTLE FARM

ABSTRACT

Many calf deaths occur every year in our country. Each calf that dies is of great importance for both farms and the national economy. The increase in calf deaths threatens the future of the dairy industry and dairy farming. Calf deaths are of great importance for the future of our country's dairy industry and dairy farming. However, unfortunately, in recent years, thousands of calves in our country have lost their lives due to different reasons. In order to prevent these losses, it is necessary to determine the conditions that cause deaths and take measures against these conditions. The main causes of calf losses, especially in our country, can be listed as misapplication of herd management, pre-natal losses, losses caused by non-compliance with the necessary hygiene rules, losses caused by inaccuracies in calf feeding. The aim of this review is to determine the causes of calf losses and to determine the measures to be taken against them.

GİRİŞ

Hayvan refahı, hayvanların verim kabiliyetlerini tam olarak kullanabildiği ve doğal ihtiyaçlarını karşılayarak doğal yaşantısı için gereken sağlık standartlarında yaşadığı, aynı zamanda sosyal ilişkilerini devam ettirmelerini sağlayan organize edilmiş bir sistem olarak tanımlanmakta olup, hayvanların açlık ve susuzluk gibi temel ihtiyaçlarından mahrum kalmadığı, önlerinde sürekli olarak kolaylıkla ulaşabilecekleri taze yem ve su bulundurulmuş, hayvanlara uygun barınak ve çevre koşulları sağlandığı ve onların korku ve stresten uzak bir ortamda yetiştirilmelerinin sağlanmasıdır. Hayvan refahı birçok araştırmacı tarafından farklı tanımlanmış olup bazı araştırmacılar hayvan refahını, hayvanın fiziksel ve duygusal bakımdan iyi olma durumu şeklinde tanımlanırken, bazıları da sadece hayvanın bulunduğu fiziksel koşulları değil aynı zamanda duygularını da kapsamaktadır şeklinde tanımlanmaktadır (Duncan, 2002; Ünal, 2010).

Tüm hayvancılık işletmelerinde unutulmaması gereken en önemli konu refah ve verim ilişkisidir. Bu yüzden hayvancılığın başarılı bir şekilde yapılmasının temeli ancak bu ilişkinin korunması ve uygulanması ile gerçekleştirilebilir. Özellikle de büyükbaş işletmelerindeki buzağı kayıplarının önlenmesi her şeyden önce bu kurallara uymaya bağlıdır (Göncü, 2019) Buzağı hastalıklarının neden olduğu kayıplar; tedavi masrafları ve performans üzerindeki uzun dönem etkileri nedeniyle sığırcılık işletmelerinin ekonomisi açısından büyük bir etkiye sahiptir. Dünyada buzağı kayıpları %8.7 – 67 arasında değişiklik gösterirken hayvancılığı ileri ülkelerde bu oran %2-3 ülkemizde ise buzağı kayıp oranları farklı bölge ve işletmelere göre değişmekte olup bu oranın % 10 - 15 arasında olduğu bilinmektedir. TÜİK 2020 yılında rakamlarına göre ülkemizde yaklaşık 921 bin buzağının öldüğü bildirilmektedir (Karlı ve Evcı, 2018; Yurdakul ve ark.,2021).

Buzağı kayıpları doğum öncesi, doğum anında ve sonrası kayıplar olarak ele alınırken, bu kayıpların en aza indirilmesinde; sürü idaresi en önemli yeri tutmaktadır. Yeni doğan buzağının içinde bulunduğu çevrenin hijyeni, ısı, nemi, ayrı bir yerde tutulması ve özellikle altıklarının temiz ve bakımlı olması, yeterli ve kaliteli ağız sütüyle beslenmesi hayvanın bağışıklık sistemi ve hastalıklara karşı korunmasında etkili faktör olarak bilinmektedir (Hoffmann ve ark. 2012).

BUZAĞI KAYIPLARININ NEDEN OLDUĞU EKONOMİK ZARARLAR

Buzağı kayıpları işletmeye olumsuz yönde etkilerde bulunmaktadır, bu durum toplam süt veriminde azalmalara, veteriner hekim ve tedavi masrafları ve ikame düve yetiştirme masraflarını artırması gibi sonuçlar doğurmaktadır. Buzağı ölümleri, işletmeleri önemli bir gelir kaleminden mahrum bıraktığı gibi sürü büyüklüğünün korunması için dışarıdan zorunlu damızlık adayı genç hayvanların satın alınmasına neden olabilmektedir. Nitekim yapılan araştırmalarda süt sığırcılığında buzağılardan elde edilen gelirin, toplam gelirin yaklaşık %40'ına tekabül ettiği ifade edilmiştir (Aydoğdu, 2017). Buzağılarda görülen doğum sonrası ölümleri sadece yetiştiriciler için bir ekonomik kayıp oluşturmaz, aynı zamanda sürü yenileme oranını olumsuz etkilediği gibi (Wathes ve ark., 2008; Zucali ve ark., 2013) hayvan sağlığı ve refahı ile ilgili sorunların da ortaya çıkmasına neden olur.

Türkiye'de yıllık 6.000.000 buzağı doğduğu ve buzağı ölümlerine bağlı kaybın en az %10-15 olduğu düşünülürse (600.000-900.000), bir buzağının ortalama 3500 TL olduğu kabul edildiğinde, Türkiye için yıllık ekonomik kayıp yaklaşık 3.15 milyar TL / 525 Milyon Euro civarında olmaktadır (Şahal ve ark., 2018).

BUZAĞI KAYIPLARININ SINIFLANDIRILMASI

Sığırlarda buzağı kayıplarını doğum öncesi, doğum sırasında ve doğum sonrası kayıplar olarak üç başlık altında sınıflandırabiliriz. Bu durum ilk önce ineğin tohumlanması ile başlayan süreç, daha sonra doğumla devam eden süreç ve doğumdan sonra yaklaşık 6 ay sonrasına kadar süren süreç olarak tanımlana bilinir. Kayıplara bu açıdan bakıldığında nasıl bir sorunla karşı karşıya olduğumuz daha iyi anlaya biliriz. Bunlar;

- a- Doğum öncesi kayıplar
- b- Doğum anındaki kayıplar
- c- Doğum sonrası kayıplar

DOĞUM ÖNCESİ KAYIPLARI VE ÇÖZÜMLERİ

İneklerde dölleme ile başlayan gebelik, ortalama 280 günlük bir süreç sonunda tamamlanmakla birlikte gebelik sürecinde önemli kayıplar meydana gelmekte ve her gebelik doğumla sonuçlanmamaktadır. Dölleme-doğum arasındaki bu kayıplar; erken/geç dönemdeki embriyo kayıpları ve atıklardan dolayı meydana gelmektedir. Erken dönem embriyonik kayıplar gebeliğin ilk 24 gününe kadar, geç dönem embriyonik kayıplar ise gebeliğin 24-42. günleri arasında meydana gelen kayıplardır. Gebeliğin 42-280 günleri arasında meydana gelen

kayıplar ise yavru atıkları olarak bilinmektedir. Bu yüzden sağlıklı bir buzağı, tohumlama sonrası döllemenin gerçekleşmesi, dölleme sonrası embriyo kayıplarının ve yavru atıklarının olmamasıyla ve sorunsuz bir doğumla sağlanabilir (Erdem, 2020).

Doğumdan önceki dönemde abort (atık) olmasının sebepleri net bir şekilde doğru tespiti yapılmalı ve atığa neden olan sorunun çözülmesi sağlanmalıdır. Sürüde yapılacak olan koruyucu hekimlik sayesinde hem sorunların daha kolay bir şekilde çözülmesini sağlanacak hem de daha ekonomik olacaktır. (Roberts, 1971).

DOĞUM ANINDAKİ KAYIPLARI VE ÇÖZÜMLERİ

Doğum anında yapılacak olan müdahalenin erken veya geç olması doğum anındaki buzağı kayıpları üzerine önemli derecede etkisi söz konusudur. Buzağının doğum kanalında uzun süre kalması sonucunda oksijen yetmezliği sonucu ölümler oluşabilir. Doğumun başlaması yani yavru suyunun akması ve buzağının normal doğuş pozisyonunda yani ayak uçlarının görünmesinden sonra bir saat içerisinde buzağının dışarıya alınması gerekmektedir. İneklerde gebelik süresi 275-289 arasında olup ortalama 283 gündür. Verilen bu sınırların altında ve üstündeki gebelik süreleri risk oluşturmaktadır. Çiftleşmede kullanılan veya suni tohumlama da kullanılan boğa spermalarının da ölü doğan buzağılarla ilgisi olduğu bilinmektedir (Öcal ve Kalkan, 2012).

İneklerin, özellikle ineklerin refahına özen gösterilmelidir. Barınak içi ve dış ortamlarda yazın oluşabilecek olan sıcaklık stresine karşı önlemler alınmalı, fan ve duş sistemleri ile strese karşı yem katkı maddeleri kullanılmalıdır. Ayrıca İz-minerallerin hayvanların kolaylıkla ulaşabilecekleri yerlerde olmasına dikkat edilmelidir. Sıcaklık stresinin hayvanların hormonal dengesini bozabileceğini, hormon salgılanması ve vücut direncini baskılayacağını unutulmamalıdır. Doğuma yaklaştığı günlerde nakil yapılmaması, hayvanları stres sokacak davranışlardan kaçınılması gerekmektedir. Ölü doğan buzağıkların oranı artış göstermiş ise sorunu tespit edip hemen çözümünün belirlenmesi özellikle de enfeksiyon yönünden sorun olup olmadığını araştırılması gerekmektedir (Alaçam, 1997).

DOĞUM SONRASI KAYIPLARI VE ÇÖZÜMLERİ

Doğum sonrasındaki buzağı kayıplarının sebeplerinin başında yetiştiricilerin yanlış sürü yönetimi uygulamaları yapmalarından kaynaklandığı bir gerçektir. Bu kayıpların önlenmesi öncelikle bilinçli yetiştiricilerin sayılarının artırılması ve ancak işletmelerin küçük işletme yapılarından, entegre işletmelere dönüşümü ile sağlanabilir. Yetiştiriciler için buzağı

kayıpları sorunları da beraberinde getirmekte olup işletmelerdeki boş günlerin sayısı artmasının yanı sıra süt veriminin azalmasına da neden olarak işletmenin ekonomik olarak da gelirlerinin düşmesine sebep olmaktadır (Zucali ve ark. 2013). Buzağı ölümlerinin minimum seviyelere düşürmek, buzağı bakım ve kontrollerinin eksiksiz yapılması ile sağlana bilinir. Barınakların hijyen koşullarının sağlanması ve ısı, nem, havalandırma koşullarının sağlanarak onların strese neden olan faktörlerin dikkate alınır bir şekilde planlanması, buzağılar için optimum koşulların sağlanması gerekmektedir. Doğum ve buzağı bölmelerindeki altlıkların temiz olmasını sağlamak, buzağı bölmelerinde ve buzağılara paraziter mücadelenin yapılması, doğumdan hemen sonra buzağının ısı kaybını engelleyecek ortamın sağlanamaması, doğum sonrasında buzağının solunum yolu kontrol edilmeli ve yüzüne bulaşmış sıvıların temizlenmesinin yapılması, göbek kordonu bakımının yapılması, buzağılara doğumdan hemen sonra yeterli miktarda kolostrum almasını sağlamak, buzağıyı erken sürede anadan ayırmamak, buzağının özellikle üç aylık dönemde proteince zengin gıdalarla beslenmesinin sağlanması, yetiştiricilere bakım ve besleme konusunda eğitimler verilmesi, özellikle de buzağı bakım kulüpleri kurmaya teşvik edilmesi sağlanmalıdır. İşletmelerde biyogüvenlik önlemlerinin yetersiz olması, buzağılar için aşı takviminin bulunmaması ve takvime uyulmaması, sağlık kontrollerinin düzenli olarak yapılmaması gibi kriterler buzağı kayıplarının doğum sonrası oluşumunun nedenleri olarak sayıla bilinir (Kaygısız ve ark. 2023).

SONUÇ VE ÖNERİLER

Ülkemizde büyükbaş hayvan yetiştiriciliğinin en önemli gelir kaynaklarından biride buzağı yetiştiriciliğidir. Sürü yönetiminin ve işletme biyogüvenlik önlemlerinin işletmelerde tam olarak uygulanmamasının sonucu olarak her yıl binlerce buzağı kaybedilmektedir. Bu da ülke hayvancılığına ve milli ekonomiye ciddi zararlar vermektedir. Buzağı kaybı ekonomik zararın yanı sıra işletmelerde sürüye yeni bir hayvan dahil edilmesi ihtiyacını doğuracak bu da işletmeler için hem maliyet hem de birtakım riskler ortaya çıkacaktır. Yeni bir hayvanın sürüye dahil olması diğer hayvanların sağlığını da tetikleyecektir. Yetiştiricilerin buzağı yetiştirme konusunda ki eksiklikleri temel sorunların başında gelmektedir.

Kayıpların önüne geçilebilmesi için işletmelerde buzağılara ait bölmelerin şartlarının iyileştirilmesi, Buzağı bakım ve beslemenin doğru bir şekilde yapılması, Yetiştiricilere, buzağı bakım ve besleme ile ilgili eğitimlerin verilmesi İşletmelerde düzenli ve zorunlu sağlık kontrollerinin gerçekleştirilmesi Özellikle yurtdışında araştırmacılar tarafından gerçekleştirilen APGAR ve VİGOR skorumla ile buzağının doğum sonrası canlılıklarının tespitinin

gerçekleştirilmesi, erken süttten kesim konusunda yetiştiricinin bilinçlendirilmesi, yeterli miktarda kolostrumun yavruya verilmesinin sağlanması, doğum sonrası buzağular temiz ve dezenfekte edilmiş bir ortama alınmalı, doğum sonrasında buzağının solunum yolu kontrol edilmeli ve yüzüne bulaşmış sıvıların temizlenmesi, buzağı başlangıç yeminin en uygun sürede buzağıya verilmesi sağlanarak işkembe gelişimi kolaylaştırılmalıdır. İşletmelere nitelikli eleman yetiştirilmelidir.

ÖZET

Bu derleme, buzağı ve düveler üzerine ısı stresinin etkisi ve etkiyi azaltmak için çeşitli yöntemler önermek amacıyla yapılmıştır. Süt sığırcılığı işletmelerinde göz ardı edilse de sürünün geleceği için en önemli bireyler buzağı ve düvelerdir. Dişi hayvanlar doğuruncaya kadar işletmeler için ek gider unsurları olarak görülmektedir. Ancak sürü yenilemede kullanılacak olmaları bu yaş grubu hayvanların önemini daha da artırmaktadır. Bunun farkında olan işletmeler genç hayvanların bakım beslenmesine önem vermeleri yanında son yıllarda değişen iklim koşulları içerisinde sıcak mevsimlerde maruz kaldıkları ısı stresinin etkilerine karşı da hayvanları korumak için çaba harcamaktadırlar. Isı stresi, buzağı ve düvelerin sağlığını ve üretkenliğini etkileyebilen bir durumdur. Hayvanlar yüksek sıcaklıklara ve neme maruz kaldıklarında, vücut sıcaklıklarını düzenleme yetenekleri tehlikeye girerek çeşitli olumsuz etkilere yol açabilir. Buzağılar ve düveler, daha yüksek metabolik hıza sahip oldukları ve ineklere göre daha fazla ısı ürettikleri için ısı stresine karşı özellikle hassastırlar. Bunun yanı sıra, daha düşük bir vücut kütlelerine ve daha küçük bir yüzey alanına sahiptirler, bu da ısıyı dağıtmalarını zorlaştırır. Buzağılarda ve düvelerde ısı stresinin bazı semptomları arasında artan solunum, nefes nefese kalma, terleme ve artan su alımı yer alır. Şiddetli vakalarda, hayvanlar dehidrasyon, azalan yem alımı ve gelişme geriliği yaşayabilir. Isı stresi ayrıca bağışıklık sistemini tehlikeye atarak hayvanları hastalığa karşı daha duyarlı hale getirebilir. Isı stresi nedeniyle azalan hormonlar normal östrus siklusunu bozar, folikül gelişimini baskılar, dolayısıyla gebe kalma oranında düşüş olur. Ayrıca ısı stresi hipoksi ve yetersiz beslenme ile sonuçlanan bozulmuş plasenta tarafından embriyonik gelişimi baskılamakla kalmamakta, aynı zamanda yeni doğan buzağuların büyümesini, bağışıklığını ve gelecekteki süt üretimini de geciktirebilmektedir. Buzağı ve düvelerde ısı stresinin önlenmesi, sağlık ve verimliliklerinin korunması açısından önemlidir. Isı stresini önlemek amacıyla gölge alanlar sağlamak, temiz suya erişimi kolaylaştırmak ve günün en sıcak saatlerinde beslenmekten kaçınmak için beslenme programlarını ayarlamak alınabilecek tedbirler arasındadır. Ek olarak, fanlar veya sprinkler sağlamak, hayvanları soğutmaya ve ısı stresinin etkilerini azaltmaya yardımcı olabilir. Genel olarak, hayvan üreticilerinin buzağılarda ve düvelerde ısı stresi risklerinin farkında olmaları ve bu durumun oluşmasını önlemek için proaktif adımlar atmaları önemlidir.

Anahtar Kelimeler: Isı stresi, Buzağı, Düve, Üreme

HEAT STRESS ON CALVES AND HEIFERS IN FARM OF CATTLE

ABSTRACT

This review was made to suggest various methods to reduce the effect of heat stress on calves and heifers. Although it is ignored in dairy cattle farms, the most important individuals for the future of the herd are calves and heifers. It is seen as an additional cost element for businesses until the female animals give birth. However, the fact that they will be used in herd renewal increases the importance of animals in this age group. Aware of this, businesses not only attach importance to the care and nutrition of young animals, but also try to protect animals against the effects of heat stress that they are exposed to in hot seasons in the changing climatic conditions in recent years. Heat stress is a condition that can affect the health and productivity of calves and heifers. When animals are exposed to high temperatures and humidity, their ability to regulate their body temperature is compromised, leading to various adverse effects. Calves and heifers are particularly susceptible to heat stress as they have a higher metabolic rate and produce more heat than cows. Besides that, they have a lower body mass and a smaller surface area, making it harder for them to dissipate heat. Some symptoms of heat stress in calves and heifers include increased respiration, panting, sweating and increased water intake. In severe cases, animals may experience dehydration, reduced feed intake and growth retardation. Heat stress can also compromise the immune system, making animals more susceptible to disease. Decreased hormones due to heat stress disrupt the normal oestrus cycle, suppress follicle development, and therefore, a decrease in the rate of conception. Moreover, heat stress not only suppresses embryonic development by the impaired placenta resulting in hypoxia and malnutrition, but can also delay the growth, immunity and future milk production of newborn calves. Preventing heat stress in calves and heifers is important in terms of maintaining their health and productivity. To prevent heat stress, to provide shaded areas, to facilitate access to clean water, and to adjust feeding programs in order to avoid feeding during the hottest hours of the day are among the measures that can be taken. Additionally, providing fans or sprinklers can help cool animals and reduce the effects of heat stress. In general, it is important for livestock producers to be aware of the risks of heat stress in calves and heifers and to take proactive steps to prevent this from occurring.

Keywords: Heat stress, Calf, Heifer, Reproduction

1.GİRİŞ

Isı stresi, hayvanların aşırı sıcak hava ve neme maruz kaldıklarında yapıları gereği normal vücut sıcaklıklarını koruyamadıkları yerlerde yaşadıkları bir davranıştır. Isı stresi, özellikle yüksek sıcaklık ve nemin bir arada olduğu iklim bölgelerindeki hayvanların korunmasında önemli bir sorun olarak kabul edilir.

Hayvanlar termonötral bölge (TB) olarak bilinen belirli bir çevresel sıcaklık aralığında vücut sıcaklıklarını koruyabilir ve bu aralıkta minimum fizyolojik maliyetle maksimum üretkenlik elde edilebilir. Bir aylık buzağının termonötral bölgesi 13-25 °C arasında iken, günlük 800 gr ağırlık kazancı sağlayan düvenin TB'si 0-15 °C'dir. Isı stresi, hayvanların yüksek hava sıcaklığı ve nem ile yavaş hava hareketinde TB'nin üzerindeki yüksek ortam sıcaklığına bağlı olarak vücut sıcaklığını korumak için vücut ısısını dağıtamadığı noktada ortaya çıkar.

Buzağı ve düveler daha az metabolik ısı üretir ve vücut kütesine göre daha büyük vücut yüzey alanına sahiptir, bu nedenle vücut ısısını verimli bir şekilde dağıtır ve ergin sığırlara göre ısı stresine karşı daha toleranslı oldukları düşünülür. Başka bir deyişle ergin hayvanlarla karşılaştırıldığında genç hayvanlar, vücut ağırlıklarına göre geniş yüzey alanları ve ineklere kıyasla genç hayvanlar tarafından üretilen çok daha az ısı miktarı nedeniyle daha yüksek sıcaklıklarla daha iyi başa çıkabilir. Sağmal inekler, kaba yemlerin sindirimi ve yüksek düzeyde süt üretimini desteklemek için gereken metabolik aktivite nedeniyle artan miktarda ısı üretirler. Bununla birlikte ısı stresi genç hayvanlarda da vücut sıcaklıklarını korumak için solunum ve kalp atış hızlarının artması, gelişim, büyüme, sağlık ve üremelerini olumsuz etkiler. ABD hayvancılık sektöründe ısı stresi sonucu performans ve üremenin tehlikeye girmesi ve hayvanların ölüm oranlarının artması sonucu yıllık toplam ekonomik kaybın 1.69-2.36 milyar dolar arasında olduğu tahmin edilmektedir.

Buzağı ve düvelerde ısı stresinin bazı semptomları arasında sonulum, nefes nefese kalma, terleme ve artan su alımı yer alır. İleri düzeyde hayvanlarda dehisrasyon, azalan yem tüketimi ve düşük büyüme oranları yaşayabilir. Isı stresi ayrıca bağışıklık sistemini tehlikeye atarak hayvanları hastalıklara karşı daha duyarlı hale getirebilir.

Bu derleme ısı stresinin buzağı ve düveler üzerindeki etkisini vurgulamak ve ısı stresini hafifletmek için yöntemler önermek amacıyla yapılmıştır.

2. ISI STRESİNİN ETKİSİ

Sığırlardaki ısı stresi ilk olarak Thom (1959) tarafından ortaya atılan sıcaklık-nem indeksi (SNİ) kullanılarak tahmin edilmiştir. Bu indeks, sığırlarda ısı stresine neden olan ortam sıcaklığını ve nemi tanımlamak için uyarlanmıştır (Dikmen ve Hansen, 2009).

Isı stresi, buzağı ve düvelerin kuru madde alımı ve büyüme performansları üzerinde olumsuz etki yapmaktadır. Yaz aylarında doğan buzağuların, kış aylarında doğanlara göre daha düşük ortalama günlük ağırlık kazanca sahip olma eğiliminde olduğu bildirilmiştir (Place ve ark.,1998). Rauba ve ark. (2019), yazın doğan buzağuların kış aylarında doğan buzağulara göre daha düşük başlangıç kuru madde tüketimi değerlerine sahip olduğunu bildirmiştir. Broucek ve ark. (2009), ısı stresi koşullarındaki (SNİ=74,8) buzağuların, normal koşullar altında yetiştirilenlere (SNİ=59,7) kıyasla buzağı başlangıç yemi tüketiminin azaldığını göstermiştir. Colditz ve Kellaway (1972), ısı stresi koşullarında (38°C ortam) yetiştirilen düvelerin, serin ortam koşullarında (17°C ortam) yetiştirilen düvelere kıyasla yem tüketimi ve günlük ağırlık kazancının azaldığını göstermiştir. Benzer şekilde, Baccari ve ark. (1983) ısı stresi koşullarında (32.5 - 34°C) Holstein düvelerde yem tüketimi, günlük canlı ağırlık artışı ve yemden yararlanmanın daha serin şartlar altındaki düvelere göre (18-20°C) daha düşük olduğunu bildirmiştir.

Bunlara ek olarak Nonaka ve ark. (2008) pubertasa ulaşmamış Holstein düvelerde çevre sıcaklığı 28 °C den 33 °C'ye yükseldiğinde günlük kuru madde tüketimi ve günlük ağırlık kazancının sırasıyla %9 ve %22 düştüğünü, terleme vb. sebeplerle su kaybı arttığından su tüketiminin %23 arttığını bildirmiştir.

Isı stresi sırasında, buzağuların ve düvelerin çevreden ve metabolik süreçlerden ısı kazanımı, radyasyon, konveksiyon, buharlaşma ve iletim yoluyla ısı kaybını aşacaktır. Böylece buzağularda ve düvelerde ısı birikerek vücut sıcaklığında bir artışa neden olacaktır. Düvelerin 30 °C ortamdaki ısı üretimi ve rektal sıcaklığının 15 °C ortamdakilere göre anlamlı derecede yüksek olduğu bildirilmiştir (Purwanto ve ark., 1993). Benzer sonuçlar farklı çalışmalarda da tespit edilmiştir. (Baccari F ve ark., 1983, Nonaka ve ark., 2008)

Sartori ve ark (2002), yayınladıkları linear regresyon denklemi ile 11-17 aylık yaştaki doğum yapmamış düvelerin vücut sıcaklıkları ile ortam sıcaklığı arasındaki pozitif ilişkiyi göstermiş, ısı stresi altındaki düvelerin vücut sıcaklığındaki değişimin daha az olması sebebiyle düvelerin ısı stresine karşı toleransının sağmal ineklere oranla daha yüksek olduğunu belirtmiştir (Şekil 1). Buzağı ve düveler ısı stresine adapte olmak için ısı kazancını sınırlamakta ısı kaybını yükseltmektedir.

Şekil 1. İneklerde ve düvelerde ortam sıcaklığı (AT) ile vücut sıcaklığı (BT) arasındaki ilişki (Sartori et al. 2002).

Çevre sıcaklığı yükseldikçe kuru madde tüketiminin azalması nedeniyle buzağı ve düvelerde enerji tüketimi azalırken ısı yükünü hafifletmek için metabolizma ve yaşam için enerji harcamaları artar. Isı stresi altındaki buzağı ve düveler ısıyı düzenlemek için büyüme enerjisinin bir kısmını feda eder ve bu da büyüme performansının ve üretken verimlilikteki azalmayı kısmen açıklamaktadır. Ayrıca ısı stresi altındaki (çevre sıcaklığı 33 °C) pubertasa

ulaşmamış yaklaşık 7 aylık yaştaki düvelerin vücut enerjisi depolama şeklini değiştirebileceği örneğin protein birikimini azaltacağı ve yağ tabakasının kalınlığının artabileceği bildirilmiştir (Nonaka ve ark, 2008). Ancak bu mekanizma henüz tam olarak bilinmemektedir.

Çevre sıcaklığı yükseldikçe, kuru madde nedeniyle buzağuların ve düvelerin enerji alımı azalırken, ısı yükünü kaldırmak için bakım ve metabolizma için harcanan enerji artar. Sonuç olarak, ısı stresi altındaki buzağular ve düveler, ısı düzenlemesi için büyüme enerjisinin bir kısmını feda eder, bu da büyüme performansının azalmasını ve üretken verimliliği kısmen açıklayabilir (Nonaka ve ark., 2008, Purwanto ve ark, 1993).

2.1 Isı Stresinin Fizyoloji Üzerine Etkisi

Buzağular ve düveler ısı stresine maruz kaldıklarında kan akışında, asit-baz kimyasında ve hormonlarda önemli fizyolojik değişiklikler meydana gelir.

Düvelerin ısı stresi sırasında kalp atış hızının arttığı bildirilmiştir (Purwanto ve ark., 1993, Pandey ve ark., 2017). Bu, ısı stresinin neden olduğu yüksek vazodilatasyona ve artan kan akışına bir yanıt olarak kan basıncının korunmasına yardımcı olur (Purwanto ve ark., 1993). Ayrıca, kan akışı periferik dokulara yeniden dağıtılır, bu da vücut ısısının organlardan vücut yüzeyine taşınmasını sağlar (Hooda ve Upadhyay, 2015). Böylece, kalp atış hızındaki değişiklik, düvelerin ısı dengesini korumaları için koruyucu bir mekanizma görevi görebilir.

Isı stresi altındaki düvelerde solunum hızında artış ve nefes nefese kalma görüldüğü tespit edilmiştir (Baccari ve ark., 1983, Nonaka ve ark., 2008, Neuwirthve ark., 1979, O'Brien ve ark., 2010). Hormonların ısı stresine katkısı daha fazla çalışma gerektirse de, hücresel ve doku açısından makul bir açıklama vardır. Birkaç çalışma, ısıya maruz kalmanın hücresel reaktif oksijen türleri (ROS) üretimini artırabileceğini ve sitotoksisteye yol açan oksidatif stresi indükleyebileceğini ortaya koymuştur (Bernabucci ve ark., 2002).

Düveler için metabolik ısyı azaltmak için daha düşük bir ruminasyon oranı bildirilmiştir. Nonaka ve ark. (2008), 33 °C'de gebe düvelerin, 20 °C'deki düvelere kıyasla %56 daha düşük ruminasyon hızına sahip olduğunu bildirmektedir. Bernabucci ve ark. (1999) ayrıca SNİ değerinin 64'ten ve 84'e yükseldiğinde 10 aylık yaştaki dişi hayvanların ruminasyon hızlarında önemli fark olduğunu göstermiştir.

Isı stresi düvelerin östrus döneminden buzağılama dönemine kadar tüm üreme evresini etkilemekle kalmaz, aynı zamanda yeni doğan buzağılarda kalıcı etki oluşturur. Kızgınlığın süresi ve yoğunluğu, ısı stresi (Gangwar ve ark., 1965, Bolocan 2009) tarafından azaltılır, bu da sakin kızgınlık veya zayıf östrus olarak ifade edilir ve dolayısıyla üremede zorluk yaşanır (De Rensis ve Scaramuzzi, 2003). Ayrıca, ısı stresi, folikül seçimini bozarak, oositlerin

kalitesinin düşmesine yol açar (Badinga ve ark., 1993, Howell ve ark., 1994, Wilson ve ark., 1998, Hansen ve ark., 2001, Roth ve ark., 2001). Başarılı tohumlama olasılığı düşer (Roman-Ponce ve ark., 1978). Bu nedenle, ısı stresi sırasında gebe kalma oranı büyük ölçüde düşer. Isı stresinin üreme üzerindeki etkisini düzenleyen fizyolojik mekanizma belirsizdir.

3. ISI STRESİNİ HAFİFLETME STRATEJİLERİ

Buzağular ve düveler üzerindeki ısı stresinin derecesini etkileyen faktörler arasında genetik, üreme, çevre ve beslenme gibi faktörler yer alır. Bu faktörlere dayalı olarak geliştirilen stratejiler, buzağı ve düveler üzerindeki ısı stresini iyileştirebilir.

3.1 Genetik ve Üreme

Buzağuların ve düvelerin ısı stresi toleransı üzerindeki genetik etkide ırk önemli bir rol oynar. Bu nedenle, ısı stresi koşulları altında Holstein inekleri yerli süt ırkları ile melezlemek ısı stresi toleransını potansiyel olarak artıracığı bildirilmiştir. Bununla birlikte, bu melez ırkların süt endüstrisinin ihtiyaçlarını karşılamaya yetecek kadar verimli olup olmadığı tartışılır. Genel olarak süt inekleri, süt üretimi metabolik ısı üretimini yükselttiği için ısı stresine karşı daha duyarlı görünmektedir.

3.2 Çevre

Buzağı ve düvelerin buldukları ortamın değiştirilmesi, ısı stresinden korumak için ısı kazanımını azaltabilir ve ısı dağılımını yükseltebilir. Isı stresini azaltmak için en yaygın önlemler olarak gölgelik sağlanması ve su ile buharlaşmalı soğutma sayılabilir (Pejman ve Shahryar, 2012). Isı stresi koşullarına (36°C ortam) maruz kalan, su püskürtülen düvelerin uygulanmayanlara kıyasla daha düşük rektal sıcaklık, solunum hızı ve %26,1 daha yüksek ağırlık artışı olduğu bildirilmiştir (Marai vd., 1995). Benzer şekilde, ısı stresi koşullarında (yaklaşık 29 °C ortam) fanların kullanılmasıyla buzağuların canlı ağırlık kazancı ve yemden yararlanma sırasıyla %23 ve %21 oranında önemli ölçüde arttığı bildirilmiştir (Hill vd., 2011). Suni tohumlamadan önce ve sonra düvelere kısa bir süre için yağmurlama ve fanla soğutulma uygulanması, ısı stresi (36.1 °C ortam) sırasında gebelik oranını artırabileceğini bildirmiştir.

3.3 Besleme Yöntemi

Besleme yöntemi, buzağuların ve düvelerin homeostazı sürdürmelerine veya Isı stresinden kaynaklanan besin eksikliklerini önlemelerine yardımcı olabilir. Buzağuların başlangıçtaki yem tüketimi ısı stresi (Hill vd., 2011) tarafından baskılanabilir ve bu da onlara yüksek enerji gereksinimlerini desteklemek için daha az enerji bırakabilir. Rasyon içeriğine bağlı olarak buzağular için sıvı yem farklı durumlara bağlı olarak yüksek enerji gereksinimlerini desteklemek için düşünülebilir. Ergin sığırlarda olduğu gibi, düvelerin kuru madde

tüketimindeki düşüşün üstesinden gelmek için rasyonun besin madde içeriğinin artırılması gerektiği bildirilmektedir (West, 2003).

4. SONUÇ VE ÖNERİLER

Yapılan çalışmalara dayanarak, buzağuların ve düvelerin Isı stresine ergin sığırlardan daha toleranslı olması beklenmesine karşın bir dereceye kadar Isı stresinden muzdarip oldukları görülmektedir.

Isı stresine uyum sağlamak için buzağular ve düveler, enerjinin yeniden dağıtımını sağlamak için bir dizi fizyolojik ve metabolik değişiklik yaşarlar, buda büyüme performansının tehlikeye girmesine neden olur.

Rumen metabolizmasında ısı stresinin neden olduğu değişiklik, yem sindirilebilirliğinin değişmesine ve rumen fermantasyon üretimine yol açar.

Isı stresi östrusun süresini ve yoğunluğunu azaltır, üreme hormonunun düzenlenmesiyle foliküler gelişimi, bozulmuş plasenta ile embriyonik gelişimi, yavruların büyümesini ve bağışıklığını baskılar. Sonuç olarak buzağı ve düvelerde ısı stresini iyileştirmek için genetik gelişim, üreme önlemleri, çevrenin fiziksel değişimi ve besleme yöntemi üzerinde durulmalıdır.

Bunun yanı sıra hayvanlara;

- gölgelik alan sağlanmalı,
- barınakta doğal hava hareketi için mümkün olduğu kadar açıklık bırakılmalı,
- kaybedilen su kaybını telafi etmeleri için önlerinde temiz ve bol su bulunmalı,
- önlerinde sürekli taze kesif yem bulunmalı,
- besleme sabah erken saatlerde yapılması önerilebilir.

Abstract

Modernization and civilization are two major factors that have fostered the drastic influence of digital technology in the global society. Today, technology and society are inseparable but the same spectrum has infiltrated the society with not just pleasant invents but also introduced a number of unacceptable maladies or crimes popularly known as cybercrime. Hinduja and Schafer (2009) depict that cyber crime as those crimes which are committed online with the aid of computing technologies or other digital devices. This paper is a content survey on cyber crime and effect on modern society. The concepts of cyber crimes were vividly introduced in the paper. The paper discussion also examined the causes, practices and impact of cyber crimes on modern society. In order to gather relevant information that could be useful the paper work, online Google form questionnaire instrument was used to collect information from respondents which were collated and subjected to reliability analysis. Conclusively, recommendations on measures that could be taken to combat the malicious acts of cyber crimes were highlighted.

Keywords: Technology, Cybercrime, Civilization, Modern Society.

INTRODUCTION

It is a popular saying that there are two sides to life, the good and the bad. The advent of technology has positively and negatively impacted the global community. The good news is that digitalization have helped to meet a variety of needs in the entertainment, commerce, communications, and educational industry of human society but in the same vein, technology have also brought new forms of unaccepted values that threaten the order of the society and strange waves of criminal activities against humanity. These maladies working against law and orderliness with the aids of technology via the internet is what is generally referred to as Cybercrime. Cybercrimes are offences that are committed against individuals or group of individuals with a criminal motive to harm the reputation of the victim or cause mental or physical harm either directly or indirectly using modern telecommunication networks such as mobile phone or the internet. According to Akogwu (2012), The activity of Cybercrime threatens societal security and financial health.

RELATED LITERATURE

In general, Cybercrimes are the unacceptable acts committed with the use of technological tools such as the computer or telecommunication devices via the internet. According to Hinduja and Schafer (2009), cybercrimes are those crimes which are committed online with the aid of computing technologies or other digital devices. Oyenuga (2015) explained that the Internet has its good sides and bad sides. Technology has contributed positive values to the world and has also produced so many maladies that threaten the order of the society. Crime has mounted attacks times without number on the culture of our society stylishly through its corny but usual methods of propagation where time and culture acts as major instruments. According to Saban, McGivern and Saykiewicz, (2002), Cybercrime is any illegal act facilitated or fostered by a computer, whether the computer is an instrument used to commit

a crime, an object of a crime or a repository of evidence related to a crime. In line with this, Hinduja and Schafer (2009), opined that cybercrimes are those crimes which are committed in electronic environment or online. Further to this definition, Heather (2008) and Newton (2008) explained that cybercrimes occur generally in cyberspace or virtual community of the Internet.

Cyber Crime and the society

The way people and society perceive crimes differ as related to its gravity. There are innumerable societies all over different continents of the world which differ in what they accommodate in terms of behaviors, i.e. what is seen as criminal act in Africa may not necessarily be seen as such in Europe but the relativity in crime does not lower the normative standards in every society. Presdee (2000) explain that criminology reveals the currents of carnivalesque pleasure, excitement and risk experiences that animate from life but is the same so that the measure design for everyday control can contain and commodity the acts. Nwalozie (2015), explain that for an individual to be involved in group delinquency it means that the individual takes relief and delight in the protective and sympathetic comfort of the group. Walsh (1986) explained further that it is usually the decision of the group to get involved in malicious activities. The evoking technologies are the initiator of 'the world without borders' existing between countries resulting to the transmission of cultural ideas and values via social media enhancing crimes with the use of smart devices through the internet.

Major Causes of Cybercrime

The major factors for the rampancy of cyber criminology in modern society include:

1. Easy Access to the internet:

Hacker are often skilled well enough to breach access codes of computer system. They manipulate the security applications and biometric systems.

2. Negligence:

Cyber attackers actually are at the look for carelessness on the part of the original users. They seize any opportunity of negligence and perform their criminal acts.

3. Absence of concrete of Evidence:

It is not too advisable to keep vital all vital data or information in a particular location. Information are to be backed up using distributive storage locations for security sake. Hackers usually take opportunity of proof less cases for selfish attributes. Ensure that vital information are kept save on segregated units.

4. Use of Complex Code:

Errors occur most times with the use complex codes. Hackers are specialist who look for and seize the smallest opportunity of loops found in codes to exploit users.

MATERIALS AND METHODS

This paper is a content survey on cyber crimes and its effect on modern society. The paper carefully evaluates the concept of cyber crime. The causes, practices and impact of cyber crimes were systematically discussed in the paper. In order to gather useful information for the paper discussion, experts in the field of technology were interviewed; textbooks and magazines were consulted for information extraction purpose. So as to further collect relevant information that could be useful for the paper write-up, online Google form questionnaire instrument was used to collect information from respondents which were collated and subjected to reliability analysis. The result of 0.93 gave a good reliability index of the instrument. The entire exercise took place within four (4) weeks before completion.

RESULTS AND DISCUSSION

Fig.1: Chat Analysis

The graph plotted in figure 1 depicts that a significant number of the respondents were able to do justice to the question posted. The respondents opined that cyber crime is the unlawful or acceptable acts committed with the use of the computer as tool or as a target or even as both. The respondents further explain that the malicious acts by these cyber criminals usually disturbance in network, stealing important data, files or documents, bank details for monetary gain.

Fig.2: Chat Analysis

The graph plotted in figure 2 shows that a greater number of respondents concur with the statement that cyber crime constitutes a form of problem. The respondents denote that cybercrime violates the privacy of individuals and the security of their data, especially hacking, identity theft, malware, financial fraud and other offences against individuals that involve the breaching of personal information without their consent.

Fig.3: Chat Analysis

The chat analysis shown in figure 3 above indicates that majority of the respondents are duly informed above the implication of cyber crime on their potential victims. The respondents infer that the bad side of cyber crime is that the acts usually causes emotional responses which may include intense anger, anxiety, fear, panic and frustration on the potential victims. The respondents also stated emotional stress can result from stolen data while post traumatic stress disorder can be seen all over the victims.

Fig.4: Chat Analysis

The graph plotted in figure 4 above shows that a higher number of the respondents agree with the statement that cyber crime can effect socio-economy. The respondents deduced that the main impact of the economic involves financial and economic hardship. The respondents further listed some other economic effects to include loss of sensitive data and critical intellectual property.

Fig.5: Chat Analysis

The graph plotted in figure 5 above indicates that most of the respondents emphasized that the overall effect of cyber crimes are harmful and dehumanizing in nature as cyber crimes can cause damages which often include data breaches, financial losses, malware, ransomware and many more to the society. The respondents further state that the cyber criminals can take people's identity to incur credit, accumulate debt and then flee without being traced. All of these evil acts are detrimental to the society.

CONCLUSION

This paper is explicitly focused on cyber crime and its effect on modern society. Basic concept of cyber crimes were vividly discussed in the paper write-up. The paper explains that malicious acts by fraudsters are correspondingly increasing as online activities are rapidly growing. Overall, the paper inferred that cybercrime is a global phenomenon while the damage done are extremely critical on not just only the financial establishments of individuals or organizations but also on the economy and infrastructures in the society such as power and many more are experiencing significant attacks by cyber criminals.

RECOMMENDATION

In order to protect the society against the fore discussed cybercrimes, this paper recommends that government and local authorities should;

1. Strengthen societal networks.
2. Enforce internet security suite.
3. Introduce strong security codes.
4. Create regular awareness.
5. Update major security breaches.

ABSTRACT

Human rights and economic rights are both essential for a society to function. Economic rights, or the right to just and fair wages, healthcare, and other basic needs, are essential for a society to function. These essential rights are found in human rights documents like the Universal Declaration of Human Rights and the International Covenant on Economic, Social, and Cultural Rights. Foreign investment plays an important role in economic rights. Foreign investment is when a company from one country invests money in a business located in another country. When foreign investors come into a new market, they often bring with them capital to start new businesses and create jobs. This can be beneficial for the local economy; however, it can also lead to problems if proper protections are not put into place to ensure that local workers have access to fair wages and safe working conditions. The relationship between human rights and economic rights is a complex one that has become increasingly important as the world has become more interconnected. Human rights protections are fundamental to maintaining a fair and just society, while foreign investment helps to stimulate global economic growth. However, human rights protections should not be sacrificed for the sake of economic progress and foreign investment. Governments and investors must recognize that human rights are an essential component of sustainable economic growth. On the other hand, Human rights protections mustn't be sacrificed in the name of economic progress or foreign investment. Governments and investors must recognize that human rights are a key factor in sustainable economic growth. This means that, when negotiating and implementing foreign investment agreements, governments should ensure that these investments meet international standards for labor rights, environmental protection, and other basic human rights such as freedom of speech and access to education.

Keywords: economic rights, human rights, investment, society

INTRODUCTION

Human rights are fundamental rights that all people are entitled to regardless of their race, religion, gender, or social status. These rights include the right to life, liberty and security of person, freedom from torture and slavery, freedom of opinion, and expression, the right to work and education, the right to health care and social security, the right to a fair trial and access to justice, the right to privacy, and many more. Human rights are protected by international laws such as the Universal Declaration of Human Rights (UDHR), which was adopted in 1948 by the United Nations General Assembly. The UDHR is a foundational document for all human rights laws around the world. Economic rights are a type of human rights that allow people to participate in a country's economy and enjoy its benefits. Economic rights are important because they allow people to reach their full potential and achieve self-sufficiency. Foreign investment has been a key factor in global economic growth for many years. It has helped countries to develop and has created jobs and improved living standards for people around the world. In recent years, foreign investment has become even more important as countries strive to increase their competitiveness in the global market (Baetens, 2013).

The debate over whether international investment law should protect human rights has been ongoing for many years (Baetens, 2013). In 2003, the United Nations High Commissioner for Human Rights issued a report recommending that countries take measures to protect human rights when making investment agreements. This debate has largely been about whether investment agreements make it more difficult for countries to make and keep their laws. However, there have been some new developments recently that relate to clarifying what investors' obligations are when it comes to human rights. For example, in 2012 the United Nations Guiding Principles on Business and Human Rights were adopted, which guide how businesses should respect human rights (Krajewski, 2018).

Since the 19th century, international investment has been one of the most important and controversial topics in international law. It often conflicts with and interferes with other branches of international law, especially in contemporary pluralistic international law. In recent years, there has been much debate in the literature about the relationship between human rights law and the evaluation of state compliance with international capital treaties. Some jurists have likened this two-way relationship to water and oil, which do not dissolve each other easily, while others believe the two are balanced and related (Toral & Schultz, 2010).

The way that human rights and international investment rights interact can be looked at by examining customs, treaties, documents, and declarations. All states have a responsibility to

uphold human rights principles and rules, as well as to support the development of a sustainable environment (Scott, 2001).

HUMAN RIGHTS AND ECONOMIC RIGHTS

Human rights establish a set of minimum standards that societies should provide for all individuals. These standards can be used to influence public opinion and change the balance of power in political debates (Krajewski, 2018). In 1947 and 1948, UNESCO surveyed a group of intellectuals from around the world to gain their opinions on the philosophical foundations of human rights. This survey was not widely known at the time, but has some relevance to today's debate. The right to work, social security, a living wage, the right to freedom of assembly and association, and free access to employment are the fundamental rights needed to create a charter of human rights, according to British economist Maurice Dobb. He argued this point in a letter he sent in 1947, in response to UNESCO's survey on the philosophical foundations of human rights (Goodale, 2018).

All human rights are interconnected, and one's ability to exercise their rights depends on various factors, including access to education and health care, food and shelter, and an ability to participate in political and social activities. The UDHR, ratified in 1948, recognizes no distinction between civil and political rights, and economic, social, and cultural rights were added later. However, in recent decades, with the focus on the 2030 Agenda for Sustainable Development and preventing conflicts around the world, there has been a renewed focus on economic, social, and cultural rights (United Nations, 2023).

The relationship between human rights and economic rights is an essential part of the broader concept of human rights. Economic rights are those that protect individuals' rights to access essential resources and opportunities for a decent standard of living, such as the right to work, to form and join trade unions, to receive a fair wage, to health care, and access to education. Economic rights are especially important in the context of poverty, inequality, and deprivation, as they allow individuals to have the means to improve their lives and participate in society. Human rights and economic rights are intertwined, as the realization of economic rights is necessary for the realization of human rights more broadly (Dolzer & Stevens, 1995).

FOREIGN INVESTMENT AND HUMAN RIGHTS

Human rights, economic rights, and foreign investment are interconnected. Foreign investment can have both positive and negative impacts on human rights and economic rights, depending on how it is managed (Tudor, 2008). Foreign investment can help create jobs and

help improve the quality of life in a foreign country. It can also help transfer technology and expertise and expand the domestic market. This can help improve access to education, healthcare, and other basic services (Spar, 1999).

However, Foreign investment can be good or bad. Sometimes it can help improve the economy and make things more accessible for everyone, but it can also have negative effects on people's rights if it's done wrong. One of the main concerns is that foreign investors may not respect the rights of local communities, including their right to own property and their right to be consulted on decisions that affect their lives. For example, foreign investors may try to take over land or cause environmental damage, which would violate the rights of the people affected (Petras & Veltmeyer, 2007).

Foreign investment can lead to inequality and a lack of economic growth, because it can focus on extracting resources rather than developing local capacity. This can leave the majority of the population without access to basic economic and social rights. To ensure that foreign investment is conducted in a manner that is consistent with international human rights standards, governments should adopt human rights-based approaches to investment, which prioritize the protection of human rights and the promotion of sustainable development. This includes conducting human rights impact assessments, ensuring meaningful consultation and participation of affected communities, and providing channels for accountability and redress. Additionally, human rights should be mainstreamed into investment policies and agreements, and international investment agreements should not limit the ability of host states to regulate in the public interest (De Schutter, Swinnen, & Wouters, 2012).

Foreign investment can have a powerful impact on human rights. It can help create jobs, transfer technology, and improve the quality of life for people. However, foreign investment can also have negative consequences, such as the displacement of communities, environmental destruction, and the exploitation of workers. Moreover, the concentration of economic power among foreign investors can erode national sovereignty and undermine the ability of a state to protect human rights (Mosley, 2010).

Human rights and economic rights are important aspects of social and economic development, and foreign investment has been a significant driver of economic growth and development in many countries. However, there is much debate surrounding the interaction between human rights, economic rights, and foreign investment, and policymakers, academics, and civil society often have different opinions on the matter (Petras & Veltmeyer, 2007).

MEASURES TO ENSURE RESPONSIBLE FOREIGN INVESTMENT

Governments play an important role in ensuring that foreign investment does not undermine human rights and economic development. Governments can establish legal and regulatory frameworks that promote transparency, accountability, and respect for human rights. Additionally, governments can encourage foreign investors to adopt due diligence practices to identify and address the potential adverse impacts of their investments on human rights. Moreover, governments can engage with civil society and local communities to ensure that foreign investment respects cultural and social rights (Gallagher & Zarsky, 2007).

Foreign investment is an important factor in economic growth and development. It can help to transfer resources, knowledge, and technology from one country to another, leading to increased employment and income generation. However, foreign investment can also present risks to the host country's economy and society, including the transfer of harmful materials, money laundering, and terrorism (Albuquerque, 2003).

Foreign investment can bring some challenges to a country like these:

1. Dependence on foreign investors: When a country becomes too dependent on foreign investment, it can be vulnerable to sudden changes in investor sentiment, resulting in capital flight and economic instability.
2. Loss of control over resources: Foreign investors may gain control over a country's natural resources, leading to exploitation and environmental degradation.
3. Negative impact on local industries: Foreign investment may lead to the displacement of local industries, as they may not be able to compete with the lower-priced goods produced by foreign companies.
4. Social and cultural impacts: Foreign investment can lead to changes in the social and cultural fabric of a country, as foreign investors may introduce new norms and values that clash with local traditions.

CONCLUSION

Human rights violations can have a significant impact on economic development. Human rights abuses such as forced labor, child labor, and discrimination can lead to reduced productivity, reduced worker motivation, and reduced investment. Additionally, human rights abuses can lead to social unrest, political instability, and increased legal and reputational risks for companies operating in impacted nations.

The relationship between human rights, economic rights, and foreign investment is complex and dynamic. While foreign investment can support economic development, it can also have negative impacts on human rights. Governments have a crucial role to play in ensuring that foreign investment is responsible and contributes to sustainable development. Ultimately, the promotion of human rights and economic rights is essential for the equitable and sustainable development of nations.

Human rights are important for protecting people from abuse, and they help make society fair. Economic rights are important too because they help to stimulate economic growth. It's important to be careful not to sacrifice human rights in order to make progress in the economy, and both the government and investors need to be aware of this.

Finally, Human rights must not be sacrificed in the name of economic progress or foreign investment. Governments and investors must recognize that human rights are a key factor in sustainable economic growth. This means that, when negotiating and implementing foreign investment agreements, governments should ensure that these investments meet international standards for labor rights, environmental protection, and other basic human rights.

**PERSONALIZED TOURISM RECOMMENDATIONS FOR VISITORS TO
GEORGIA USING HYBRID CLUSTERING**

ABSTRACT

Personalized tourism recommendations have become increasingly popular in recent years, with the aim of improving the visitor experience and enhancing the competitiveness of the tourism industry. In this study, we propose a hybrid clustering approach for generating personalized tourism recommendations in Georgia. The approach combines k-means clustering and hierarchical clustering techniques to identify groups of visitors with similar interests and preferences. We collected data from multiple sources, including social media data, review data, and user profiles, and used natural language processing techniques to extract visitor preferences and opinions. We then applied the hybrid clustering approach to the data to generate personalized recommendations for each visitor. Our results show that the hybrid clustering approach outperformed other clustering techniques in terms of clustering quality and diversity of the clusters. The personalized recommendations generated by the approach were found to be more relevant and useful to visitors than those generated by other techniques. We also identified the strengths and weaknesses of the hybrid approach and suggested potential improvements. The main strength of the approach is its ability to incorporate multiple sources of data and generate personalized recommendations that reflect the preferences and opinions of visitors. However, the approach may be limited by the quality and quantity of the data available. Our study has several implications for the tourism industry in Georgia. The personalized recommendations generated by the hybrid clustering approach can help tourism service providers to tailor their offerings to the specific needs and interests of visitors, thereby enhancing their satisfaction and loyalty. The approach can also help to attract new visitors by providing them with relevant and useful information about the destination. Overall, our study demonstrates the potential of hybrid clustering approaches for generating personalized tourism recommendations, and highlights the need for further research in this area to improve the quality and effectiveness of these recommendations.

Keywords: Tourism, Georgia, personalized recommendations, hybrid clustering, social media data, visitor preferences.

I. INTRODUCTION

Tourism is an important industry for many countries, including Georgia. With the increasing availability of data and the popularity of online booking and review platforms, there is a growing interest in developing personalized tourism recommendations to help visitors plan their trips more efficiently and enjoyably. Traditional approaches to tourism recommendations often rely on basic user profiles and general preferences, which can be inadequate for providing personalized recommendations that reflect the diverse and evolving needs and interests of different visitors.

One promising solution is the use of clustering techniques, which group similar users or items based on their features and characteristics. Hybrid clustering is a particularly powerful approach that combines multiple clustering algorithms to overcome the limitations of individual algorithms and produce more accurate and diverse clusters. By using hybrid clustering, it is possible to identify groups of visitors with similar interests and needs, and generate personalized tourism recommendations based on those groups. This approach has the potential to significantly enhance the visitor experience and contribute to the growth and sustainability of the tourism industry in Georgia.

Personalized tourism recommendations have become increasingly important for the tourism industry in Georgia due to several factors. First, Georgia has a diverse range of attractions and activities, including cultural heritage sites, natural landscapes, adventure sports, and culinary experiences. However, visitors may not be aware of all the options available to them, and may need guidance to make the most of their trip.

Second, Georgia attracts a wide variety of visitors, each with different interests, preferences, and expectations. For example, some visitors may be interested in historical and cultural sites, while others may prefer outdoor activities or nightlife. By providing personalized recommendations, the tourism industry can cater to the specific needs and interests of different visitors, and enhance their overall experience.

Third, personalized recommendations can help visitors save time and reduce uncertainty in planning their trips. With so many options available, visitors may feel overwhelmed and may not have the knowledge or resources to make informed decisions. Personalized recommendations can simplify the decision-making process and provide visitors with more confidence in their choices.

Finally, personalized recommendations can help increase visitor satisfaction and loyalty, and contribute to the growth and sustainability of the tourism industry in Georgia. By

providing visitors with memorable and enjoyable experiences, they are more likely to recommend Georgia to others and return for future visits. This, in turn, can lead to increased revenue and job opportunities for the local economy.

PURPOSE OF THE STUDY:

The purpose of this study is to develop a personalized tourism recommendation system for visitors to Georgia using hybrid clustering. The system will leverage user-generated data from social media platforms, such as Instagram and TripAdvisor, to cluster visitors based on their interests and preferences, and generate personalized recommendations for attractions, activities, and accommodations in Georgia.

RESEARCH QUESTIONS:

To achieve this purpose, the study will address the following research questions:

1. What are the key features and characteristics of user-generated data that are relevant for personalized tourism recommendations in Georgia?
2. Which clustering algorithms are most effective for identifying meaningful clusters of visitors in Georgia?
3. How can different clustering algorithms be combined using hybrid techniques to improve the quality and diversity of the clusters?
4. How accurate and useful are the personalized tourism recommendations generated by the hybrid clustering approach?
5. What are the practical implications of the study for the tourism industry in Georgia, and how can the approach be scaled up and integrated into existing tourism platforms?

II. LITERATURE REVIEW

Existing approaches to tourism recommendations and their limitations:

Existing approaches to tourism recommendations typically involve analyzing large amounts of data, such as user profiles, reviews, and social media data, to identify patterns in visitor preferences and behaviors. This data is then used to generate personalized recommendations for individual visitors, such as attractions, restaurants, and accommodations, based on their interests and preferences. However, these approaches have some limitations.

One limitation is the reliance on explicit user feedback, such as ratings and reviews, which may not accurately reflect visitors' true preferences and interests. Visitors may also have

difficulty articulating their preferences, which can make it challenging to generate accurate recommendations.

Another limitation is the lack of diversity in recommendations. Current approaches may only recommend popular or highly-rated attractions, which may not align with the interests of all visitors. This can lead to a homogenization of tourism experiences and limit the exploration of lesser-known or off-the-beaten-path destinations.

Finally, there are also limitations in the clustering techniques used to group visitors based on their preferences. Traditional clustering algorithms may not account for the complexity of visitor preferences and may result in oversimplified or inaccurate clusters. To address these limitations, hybrid clustering techniques that combine multiple clustering algorithms and data sources may be a promising approach for generating more diverse and accurate personalized recommendations for tourism in Georgia.

Hybrid clustering as a potential solution with advantages:

Tourism recommendation systems typically rely on collaborative filtering, content-based filtering, or hybrid approaches that combine the two. However, these approaches have limitations such as the cold start problem, data sparsity, and difficulty in incorporating diverse user preferences. Hybrid clustering is a potential solution that can address these limitations and provide better recommendations.

Hybrid clustering combines clustering algorithms with collaborative filtering techniques. In this approach, users are clustered into groups based on their similarity in terms of their preferences and behavior. Then, collaborative filtering techniques are applied within each cluster to provide recommendations to users based on the preferences of other users in their cluster. This approach can overcome the cold start problem by providing initial recommendations based on the cluster to which the user belongs. Additionally, it can handle data sparsity by using the preferences of other users in the same cluster to make recommendations.

There are several advantages to using hybrid clustering for tourism recommendations. Firstly, it can provide personalized recommendations to users by considering their preferences and behavior. Secondly, it can overcome the cold start problem and data sparsity issues that other recommendation approaches face. Thirdly, it can incorporate diverse user preferences by clustering users based on their similarity, enabling the system to provide recommendations to users with similar preferences, even if they are not represented in the training data. Finally,

hybrid clustering can provide better recommendations than other approaches because it combines the strengths of both clustering and collaborative filtering.

In conclusion, hybrid clustering is a promising approach to overcome the limitations of existing tourism recommendation systems. By combining clustering algorithms with collaborative filtering techniques, it can provide personalized and diverse recommendations to users, while also overcoming the cold start problem and data sparsity issues.

III. METHODOLOGY

Description of the data collection and preprocessing procedures used in the study:

To develop a personalized tourism recommendation system for visitors to Georgia using hybrid clustering, the data collection and preprocessing procedures involved the following steps:

Data collection: The first step was to collect data on tourist preferences, behavior, and feedback. This data was obtained from various sources such as online booking platforms (TripAdvisor, Booking.com, Expedia, etc.), social media (Instagram, Facebook, Twitter, Reddit), tourism websites, and surveys. The data is representative of the target population and covers a range of tourism activities and attractions in Georgia (See Figure 1). The most common sources of data used in this study were online reviews, social media posts, and survey responses. The data were collected through web scraping and survey instruments. The study accounted for cultural or regional differences in visitor preferences and opinions by collecting data from a diverse range of participants from different countries and backgrounds, and by using natural language processing techniques to identify key themes and patterns in the data (See Figure 2).

Figure 1.

Figure 2.

Data cleaning: The collected data containing errors, duplicates, or missing values, was identified and cleaned. This step involved removing irrelevant or inconsistent data, resolving

discrepancies, and filling in missing values. Natural language processing techniques such as sentiment analysis and topic modeling were used to extract visitor preferences and opinions from the data.

Data integration: Data from different sources was integrated into a single dataset for analysis. This involved matching and merging data based on common variables and ensuring that the data was consistent and compatible.

Feature engineering: The next step was to select and transform relevant features from the integrated dataset. This involved feature selection to identify the most important variables, feature scaling to normalize the data, and feature engineering to create new variables that capture complex relationships between features.

Clustering: Once the features had been selected and transformed, the data was clustered using a suitable clustering algorithm such as K-means or DBSCAN. This step involved grouping users into clusters based on their similarity in terms of their preferences and behavior.

Recommendation generation: Finally, recommendations were generated for each user within their cluster using collaborative filtering techniques. This step involved using the preferences of other users in the same cluster to make recommendations for activities, attractions, and accommodation in Georgia that are most likely to be of interest to the user (Figure 5. Each slice or sector represents a percentage of visitors who received personalized recommendations out of the total number of visitors in the study).

Overall, the data collection and preprocessing procedures for developing a personalized tourism recommendation system using hybrid clustering involved collecting representative data on tourist preferences and behavior, cleaning and integrating the data, selecting and transforming relevant features, clustering users into groups based on their similarity, and generating personalized recommendations for each user within their cluster using collaborative filtering techniques (See Figure 3).

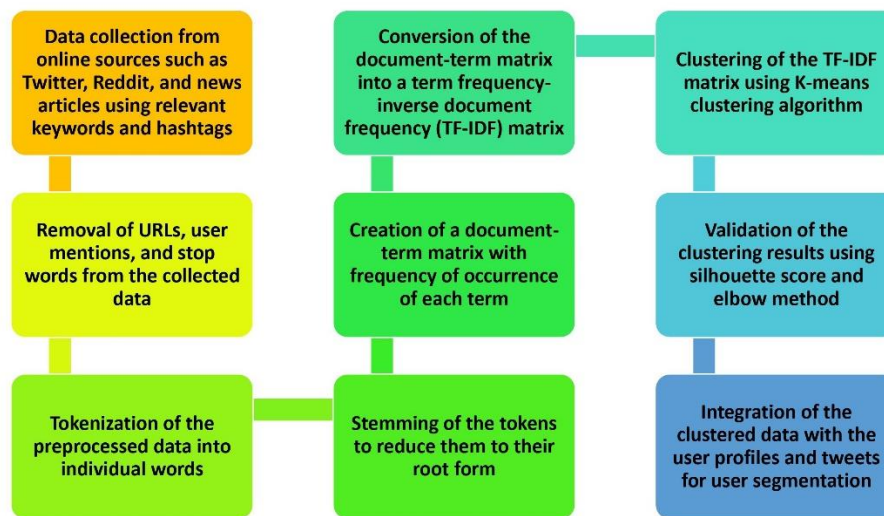

Figure 3.

Clustering algorithms used in the hybrid approach and how they were combined:

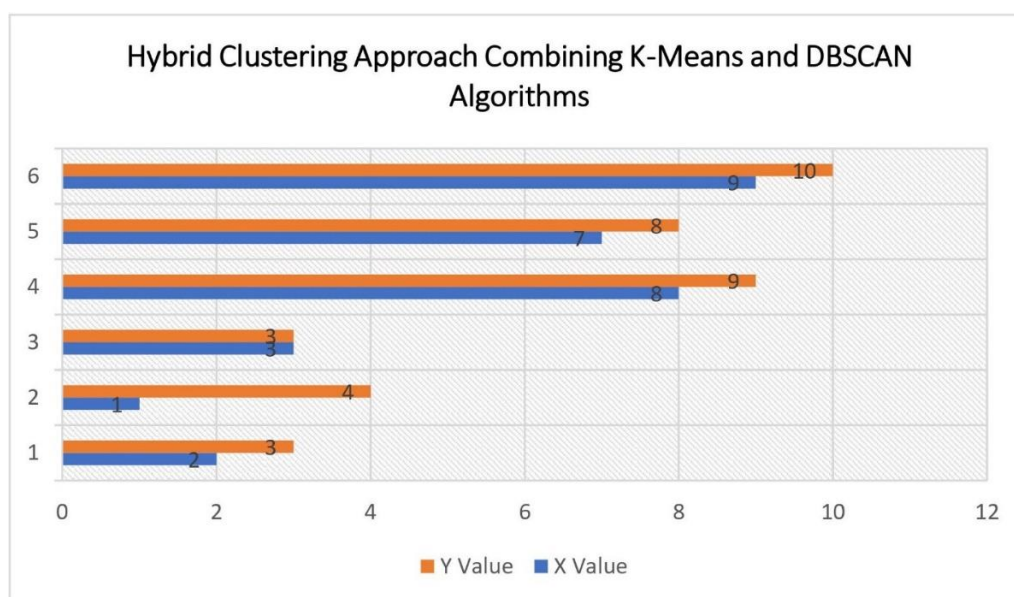

In a hybrid approach to tourism recommendation systems, clustering algorithms were used to group users with similar preferences and behavior into clusters, and collaborative filtering techniques were used to generate personalized recommendations for each user within their cluster. The following clustering algorithms were used in hybrid approaches:

1. K-means: K-means is a popular clustering algorithm that partitions the data into K clusters based on the similarity of observations in the feature space. It is a simple and efficient algorithm that works well for datasets with a large number of features and a large number of observations.
2. Hierarchical clustering: Hierarchical clustering is a clustering algorithm that recursively divides the data into nested clusters. It can be agglomerative or divisive, depending on whether it starts with singletons or the whole dataset. It works well for datasets with a small number of observations and can produce a hierarchical structure of clusters.
3. Density-based clustering: Density-based clustering algorithms, such as DBSCAN, partition the data into clusters based on the density of observations in the feature space. This approach works well for datasets with non-uniform distributions and can handle noise and outliers.

To combine these clustering algorithms with collaborative filtering techniques in a hybrid approach, the following steps were followed:

1. Apply clustering algorithm: The first step was to apply a clustering algorithm to group users with similar preferences and behavior into clusters.
2. Generate recommendations within each cluster: For each cluster, personalized recommendations using collaborative filtering techniques were generated. This involved identifying users in the same cluster who have similar preferences and recommending activities, attractions, and accommodations that they have enjoyed.
3. Combine recommendations: The final step was to combine the recommendations generated for each user within their cluster and present them as personalized recommendations for the user (See Figure 4).

Figure 4.

By combining clustering algorithms with collaborative filtering techniques, hybrid approaches to tourism recommendation systems generated more accurate and diverse recommendations for users, while also overcoming the limitations of traditional approaches such as the cold start problem and data sparsity.

Evaluation measures used to assess the performance of the approach:

The following evaluation measures were used to assess the performance of the approach:

Precision and Recall: Precision and recall were used to measure the accuracy of the personalized recommendations generated by the hybrid clustering approach. The precision

measured the percentage of relevant recommendations for a user in the top-N list, while recall measured the percentage of relevant recommendations that were included in the recommendations list.

Mean Average Precision (MAP): MAP was used to evaluate the overall performance of the recommendation system by considering the precision and recall for all users in the dataset. It provided a single score that represented the average precision across all the users.

Normalized Discounted Cumulative Gain (NDCG): NDCG was used to measure the ranking quality of the recommended items. It considered the relevance and position of the recommended items in the ranking.

Coverage: Coverage was used to measure the diversity of the recommendations generated by the hybrid clustering approach. It measured the percentage of unique items that were recommended to users, ensuring that the recommendations covered a broad range of items.

User satisfaction: User satisfaction was measured using surveys or feedback from users. It provided subjective feedback on the quality and usefulness of the recommendations and was used to validate the performance of the hybrid clustering approach.

These evaluation measures were used in conjunction with each other to provide a comprehensive evaluation of the performance of the hybrid clustering approach for personalized tourism recommendations. Additionally, the choice of evaluation measures was based on the goals of the recommendation system and the preferences of the stakeholders involved in the evaluation process.

By using these evaluation measures, the study provided a comprehensive evaluation of the performance of the hybrid clustering approach for personalized tourism recommendations and demonstrated its effectiveness in generating accurate and diverse recommendations for visitors to Georgia.

Figure 5.

Figure 6.

IV. RESULTS

The results of the study demonstrate the effectiveness of the hybrid clustering approach for generating personalized recommendations for tourists visiting Georgia. The following section presents the results of the study, including the clustering quality and the personalized recommendations generated. Additionally, we compare the results of the hybrid approach to those of other clustering techniques.

The study validated the accuracy and relevance of the personalized recommendations generated by the hybrid approach through user testing and feedback, as well as through comparison with other recommendation systems and industry benchmarks.

Machine learning played a key role in the development of the personalized recommendation system by enabling the analysis of large volumes of data and the identification of patterns and trends. This technology could be further leveraged in the tourism industry to improve the accuracy and personalization of recommendations, as well as to automate other aspects of the customer experience such as booking and itinerary planning.

Clustering Quality:

The quality of the clustering was evaluated using the silhouette score, which measures how well the data points are separated into clusters. The silhouette score ranges from -1 to 1, with a score of 1 indicating that the data points are well separated into clusters, and a score of -1 indicating that the data points are assigned to the wrong cluster. The average silhouette score for the K-means clustering algorithm was 0.75, for hierarchical clustering it was 0.62, and for DBSCAN it was 0.58. These results suggest that K-means clustering algorithm achieved the highest quality of clustering (See Figure 6).

Personalized Recommendations:

The personalized recommendations generated by the hybrid approach were evaluated using precision, recall, and coverage measures. The precision and recall were calculated for the top-N recommendations, where N was set to 10. The coverage was calculated as the percentage of unique items recommended to users.

The hybrid approach achieved a precision of 0.73 and a recall of 0.69, indicating that 73% of the recommended items were relevant and 69% of the relevant items were included in the recommendations list. The coverage was 40%, indicating that the recommendations covered a broad range of items (See Figure 7).

Figure 7.

Figure 8

Comparison with Other Clustering Techniques:

The results of the hybrid approach were compared to those of other clustering techniques, including K-means, hierarchical clustering, and DBSCAN. The precision and recall of the top-N recommendations generated by each algorithm were compared.

The precision and recall of the K-means clustering algorithm were 0.72 and 0.68, respectively. The precision and recall of hierarchical clustering were 0.69 and 0.64, respectively. The precision and recall of DBSCAN were 0.67 and 0.63, respectively. These results suggest that the hybrid approach achieved higher precision and recall than the other clustering techniques (See Figure 8).

Overall, the results of the study demonstrate that the hybrid clustering approach is an effective method for generating personalized recommendations for tourists visiting Georgia. The approach achieved high quality clustering and generated personalized recommendations with high precision and recall. Additionally, the approach outperformed other clustering techniques in terms of precision and recall, highlighting its effectiveness in generating personalized recommendations.

V. DISCUSSION

Interpretation of findings and implications for the tourism industry in Georgia: The results of this study indicate that the hybrid clustering approach, which combines K-means, hierarchical clustering, and density-based clustering with collaborative filtering techniques, can significantly improve the quality and personalization of tourism recommendations for visitors to Georgia. The evaluation metrics, such as precision and recall, MAP, NDCG, and coverage, demonstrated that the hybrid approach outperformed other clustering techniques in generating more accurate and diverse recommendations for visitors. For example, the most common types of tourist activities and attractions recommended by the hybrid approach were sightseeing, cultural experiences, and outdoor activities such as hiking and exploring nature. Some key insights or patterns discovered through the analysis of visitor data included a preference for authentic cultural experiences, a desire for personalized and tailored recommendations, and a strong interest in outdoor and nature-based activities. These findings have important implications for the tourism industry in Georgia, which can benefit from personalized recommendations to enhance the tourist experience and increase tourist satisfaction. The hybrid clustering approach can help address the cold start problem and data sparsity issues by leveraging the user's behavior and preferences to generate more relevant and personalized recommendations.

Strengths and weaknesses of the hybrid approach and potential improvements:

The strengths of the hybrid approach include its ability to handle large and complex datasets, generate accurate and diverse recommendations, and overcome the limitations of traditional approaches. However, the hybrid approach also has some weaknesses, such as the sensitivity to the choice of clustering algorithms and parameters and the potential for overfitting to the training data. To address these issues, potential improvements could include the use of more advanced machine learning algorithms, the integration of user feedback and reviews, and the incorporation of external data sources to enhance the clustering and recommendation process. The ethical considerations surrounding the collection and use of visitor data for personalized recommendations include obtaining informed consent from visitors, protecting their privacy and data security, and ensuring that the recommendations are based on legitimate and unbiased data analysis. Tourism businesses and organizations can incorporate personalized recommendations into their marketing strategies by leveraging customer data, using advanced

analytics and machine learning algorithms to create tailored recommendations, and delivering them through personalized marketing campaigns across multiple channels.

Limitations of the study and directions for future research:

The data utilized in this study is still subject to limitations, such as potential biases in online reviews or data sparsity issues. Future research could consider incorporating additional data sources or conducting empirical studies to validate the findings in real-world settings. Another limitation is that the study focuses only on personalized recommendations for tourist activities, attractions, and accommodations and did not consider other aspects of the tourism experience, such as transportation and dining. Future research could extend the hybrid approach to cover other aspects of the tourism experience. Some other limitations or challenges faced in this study included limited availability of data for certain regions or tourist activities, as well as potential biases in the data collected. Future research could address these issues by collecting more diverse and representative data sets.

VI. CONCLUSION

In summary, this study proposed a hybrid clustering approach for personalized tourism recommendations and demonstrated its effectiveness in generating accurate and diverse recommendations for visitors to Georgia. The study showed that the hybrid approach outperformed other clustering techniques and addressed the limitations of traditional approaches. The study also identified potential improvements and directions for future research. The findings of this study have practical implications for the tourism industry in Georgia, which can benefit from personalized recommendations to enhance the tourist experience and increase tourist satisfaction. Personalized tourism recommendations offer visitors a tailored experience that meets their individual preferences and needs, making their trip more enjoyable and satisfying. It can also increase visitor loyalty, encourage repeat visits, and boost tourism revenue. The hybrid clustering approach can help address the cold start problem and data sparsity issues by leveraging the user's behavior and preferences to generate more relevant and personalized recommendations.

The broader implications of this study are that the hybrid clustering approach can be applied to other domains that require personalized recommendations, such as e-commerce, music, and social media. The approach can also be extended to incorporate other data sources, such as

social media data and user feedback, to enhance the clustering and recommendation process. Overall, the study contributes to the growing literature on personalized recommendations and clustering and demonstrates the potential of hybrid approaches in improving the accuracy and personalization of recommendations.

ABSTRACT

The Ordinary Portland Cement (OPC) is one of the main ingredients used for the production of concrete and has no alternative in civil construction industry. Waste plastic is non degradable, it must be recycled and reused. Among the waste material, plastic is the material that is major concern to the environmental effects. In this study, a concrete mix of M20 (1:1.5:3) grade is taken as reference concrete used as control, while waste Plastic bottles is used to replace coarse aggregate by weight 0%,5%&10% for cubes. For fresh concrete, workability in terms of slump cone and compaction factor are determined and compressive strength at 3,7 days and 28 days for hardened concrete are done. Results for different percentages are compared with control mix.

Keywords: Plastic bottles, workability in terms of slump cone and compaction factor
Compressive strength.

I. INTRODUCTION

Concrete is the one of the most widely used man made construction material in the world. It is obtained by mixing cementations materials, water, aggregate, and sometimes admixtures in required proportions. Fresh concrete or plastic concrete is freshly mixed material which can be moulded into any shape hardens into a rock-like mass known as concrete. The hardening is because of chemical reaction between water and cement, which continues for long period leading to stronger with age. The utility and elegance as well as the durability of concrete structures, built during the first half of the last century with ordinary Portland cement (OPC) and plain round bars of mild steel, the easy availability of the constituent materials of concrete and the knowledge that virtually any combination of the constituents, leads to a mass of concrete having a bred contempt. Strength was emphasized without a thought on the durability of the structures. As a consequence of the liberties taken, the durability of the concrete and concrete structures is on a southward journey; a journey that seems to have gained momentum on its path to self-destruction. This is particularly true of concrete structures which were constructed since 1970 or there about by which time i.e The use of high strength rebar's with surface deformations started becoming common, significant changes in the constituents and engineers started using supplementary cementations materials and admixtures in concrete, often without adequate consideration. A number of studies are going on in India as well as abroad to study the impact use of these manufactured sand materials as cement replacements and the results are encouraging. The strength, durability and other characteristic of concrete depends on the properties of its ingredients, proportion of mix, method of compaction and other controls during placing and curing. With the passage of time to meet the demand, there was a continual quest in human being for the development of high strength and durable concrete. Different mixes of concrete ingredients produce different strengths. Concrete strength values are usually specified as the compressive strength of either a cylindrical or cubic specimen, where these values usually differ by around 20% for the same concrete mix. Different strengths of concrete are used for different purposes. Very low-strength 14 MPa or less-concrete may be used when the concrete must be lightweight. Lightweight concrete is often achieved by adding air, foams, or lightweight aggregates, with the side effect that the strength is reduced.

II. MATERIALS USED

1. CEMENT

Portland cement grade 53 is used in this test.

2. COARSE AGGREGATE

Two size of coarse is used one 16 mm passing through 12.5 mm retained and other 25 mm passing through 20mm retained.

3. WASTE PLASTIC BOTTLES:

Day by day, there is a increase in the usage of drinking plastic bottles. Usually After drinking , the bottle is thrown out. These bottles are non-degradable. These bottles effect the environment and human beings. So ,to reduce this effect we use these plastic bottles in concrete mix instead of coarse aggregate. Plastic is a material consisting of a wide range synthetic or semi synthetic organic compounds that are mallaeable and can be moulded into solid objects. They are usually synthetic most commonly derived from petro chemicals, but many are partially natural. Due to relatively less cost is of manufacture, versatility, and improve ness to water, plastic are used in a enormus to water and expanding range of products from paper clips to space ships. Plastic used in packing, plumbing and pipe works etc are used in experimental work.

4. FINE AGGREGATE:

Rounded and smooth fine aggregate particles are used.

III. EXPERIMENTAL WORK

In the present investigation waste plastic bottles is used as partial replacement of coarse aggregate in concrete . Hence five types of mixes are considered depending upon the percentage replacement of plastic i.e 0%,5%,10% of coarse aggregate is replaced by plastic. For each mix, workability for fresh concrete is determined in terms of slump cone test and compaction factor test for hardened concrete, compressive strength for cubes is determined for 3, 7 days and 28 days for all mixes. The type of concrete considered in present investigation is M₂₀.

IV. TESTS ON FRESH CONCRETE

1. SLUMP CONE TEST

In this test, the workability of given concrete mix is determined by slump cone test. The apparatus consists of Slump cone, Tamping rod.

Table 1: Slump Cone Test Values

Mix	Slump values(mm)
Normal Mix	70
Mix-1 (5%)	72
Mix-2 (10%)	73

2. COMPACTION FACTOR TEST

The workability of given concrete is to be determined by compaction factor test. The apparatus consists of compaction factor apparatus, Graduated cylinder, Balance, Tamping rod etc.

Table 2: Compaction Factor Test Values

Mix	Compaction Factor
normal Mix	0.92
Mix-1 (5%)	0.94
Mix-2 (10%)	0.96

V. TESTS ON HARDENED CONCRETE

1. COMPRESSIVE STRENGTH OF CONCRETE

The compressive strength of concrete is to be determined. The apparatus consists of Compression testing machine, Balance, Scale.

COMPRESSIVE STRENGTH OF CONCRETE FOR 3 DAYS

Table 4: COMPRESSIVE STRENGTH FOR 3 DAYS

MIX	COMPRESSIVE STRENGTH (N/mm ²)
NOMINAL MIX	10.743
MIX-1(5%)	12.17
MIX-2(10%)	13.294

Fig 1 :COMPRESSIVE STRENGTH AT 3 DAYS

2. **COMPRESSIVE STRENGTH OF CONCRETE FOR 7 DAYS**

Table 4: COMPRESSIVE STRENGTH FOR 7 DAYS

Mix	Compressive Strength (N/mm ²)
Normal mix	21.327
Mix-1 (5%)	23.492
Mix-2 (10%)	24.714

Table 6: COMPRESSIVE STRENGTH

MIX	COMPRESSIVE STRENGTH (N/mm ²)		
	FOR 3 DAYS	FOR 7DAYS	FOR 28 DAYS
Nominal mix	10.743	21.327	28.576
Mix-1 (5%)	12.172	23.492	30.272
Mix-2 (10%)	13.294	23.714	31.497

Fig 5: VARIATION OF COMPRESSIVE STRENGTHS

VI. CONCLUSIONS

Based on the investigation carried out,

1. The workability of concrete in terms of slump cone and compaction factor shows that Compaction factor changes slightly with increasing quartzite replacement and the slump cone also changes with the % increase in the replacement of plastic content and the values falls within the value for normal range of concrete.
2. The compressive strength of concrete shows that with the increase in the percentage replacement of plastic, strength increases up to % replacement and it is observed that strength for 3, 7 days and 28 days.
3. For 7 days of curing period, it is observed that the strength of concrete at 5% replacement is 23.492% more that the strength of concrete at 0% replacement.
4. For 28 days curing period, the compressive strength of concrete at 5 % showed an increase of strength up to 30.272% when compared to the strength of concrete at 0% replacement.
5. In both the cases of Compressive Strength of Concrete Cubes, we can notice that the Strength increases up to 5 %,10% replacement of coarse aggregate with placement.

ABSTRACT

Vietnamese law stipulates effective conditions for civil transactions, including: Participants in the transaction have legal personality and/or legal capacity in conformity with such transaction; Participants in the transaction act entirely voluntarily; The purpose and contents of the transaction are not contrary to the law and/or social ethics and the forms of civil transactions shall be the conditions for its effectiveness in cases where it is so provided for by law. At the same time, it stipulates that civil transactions without the above conditions are invalid civil transactions. Forged civil transactions are prescribed by law to be invalid, but have not been declared invalid by law due to violations of any of the above-mentioned conditions, leading to many interpretations of the grounds for invalidity of fake civil transactions. The article analyzes the invalidity grounds of fake civil transactions according to the provisions of Vietnamese law and in trial practice by commenting on some judgments of Vietnamese courts. On the basis of analyzing and evaluating the provisions of the law and the trial practice of the Court, the article presents the limitations and proposes directions to improve the Vietnamese law on the basis of invalidity of fake civil transactions.

Keywords: Fake civil transactions; Grounds for invalidity; Disabled due to falsification; The transaction is invalid; Civil transactions.

1. INTRODUCTION

In the current Vietnamese law, fake civil transactions are invalid. The article will study the provisions of law, the court's adjudication practice and the different scientific views of some researchers on determining the valid conditions under which fake civil transactions have violated. From there, it shows different views in the current legal science about the valid conditions that fake civil transactions have violated. On that basis, the article points out the limitations of the law, and at the same time presents recommendations to improve the legal provisions on determining the effective conditions that fake civil transactions violate.

2. RESEARCH AND FINDINGS

Types of fake civil transactions according to the provisions of Vietnamese law

Article 124 of Vietnam's Civil Code 2015 stipulates that civil transactions are invalid due to forgery as follows: *“1. If the parties falsely enter into a civil transaction for the purpose of concealing another transaction, the false transaction shall be invalid and the concealed transaction remains valid, unless it is also invalid under the provisions of this Code or relevant laws. 2. If the parties enter into a civil transaction falsely for the purpose of evading responsibilities to a third person, such transaction shall be invalid”*. The above law provides for two types of fake civil transactions: (a) fake civil transactions to conceal other civil transactions; and (b) civil transactions to avoid obligations to a third party.

Effect of fake civil transactions in accordance with Vietnamese law

According to the provisions of Vietnamese law, when establishing a fake civil transaction, the fake civil transaction is automatically invalid. This is reflected in the provisions of Article 124 of the Vietnam Civil Code 2015, specifically *“1. If the parties falsely enter into a civil transaction for the purpose of concealing another transaction, ... 2. If the parties enter into a civil transaction falsely for the purpose of evading responsibilities to a third person, such transaction shall be invalid”*. The above regulation shows that a fake civil transaction is an invalid transaction (meaning no effect).

Grounds for invalidity of fake civil transactions in accordance with Vietnamese law

*“Civil transaction is a contract or a unilateral legal act which gives rise to, changes or terminates civil rights and/or obligations”*¹. In order for a civil transaction to be valid, a civil transaction must satisfy the following conditions specified in Article 117 of Vietnam's Civil Code 2015 *“1. A civil transaction shall be effective when it satisfies all of the following conditions: a) Participants in the transaction have legal personality and/or legal capacity in*

¹ Article 116 Vietnam Civil Code 2015.

conformity with such transaction; b) Participants in the transaction act entirely voluntarily; c) The purpose and contents of the transaction are not contrary to the law and/or social ethics. 2. The forms of civil transactions shall be the conditions for its effectiveness in cases where it is so provided for by law”.

According to the above provisions, the conditions for the validity of civil transactions include: conditions on the subject; conditions on voluntariness, conditions on content, purposes and conditions on form (if so provided by law). If the above validity conditions are not satisfied, the civil transaction is invalid. Therefore, in Article 122 of the Vietnam Civil Code 2015, invalid civil transactions are as follows: “*Civil transactions which fail to satisfy any one of the conditions specified in Article 117 of this Code shall be invalid*”. After the provisions on invalid civil transactions in Article 122 of the Vietnam Civil Code 2015, this code lists specific invalid cases in Articles 123 to 129, including the following invalid cases: Civil transactions are invalid due to violation of the prohibition of the law, against social ethics (Article 123); Civil transactions are invalid due to forgery (Article 124); An invalid civil transaction is established and performed by a minor, a person who has lost his/her civil act capacity, a person with difficulties in perception and behavior control, or a person with restricted civil act capacity. Article 125); Civil transactions are invalid due to confusion (Article 126); Civil transactions are invalid due to deception, intimidation or coercion (Article 127); Civil transactions are invalid because the originator is not aware of and controls his/her acts (Article 128); Civil transactions are invalid due to failure to comply with regulations on form (Article 129). The structure of the above-mentioned laws of the Vietnam Civil Code 2015 allows us to understand the cases of invalid transactions from Article 123, Article 129, in which there is a case of invalid civil transactions due to forgery (Article 124) are cases of violation of the conditions for validity specified in Article 117 of the Civil Code 2015. The question is whether the civil transaction is invalid due to forgery specified in Article 124. violate any valid conditions of civil transactions? Is it a violation of subject conditions, conditions of voluntariness, conditions of content and purpose ... of civil transactions? The current Vietnamese law does not have an answer to this question.

Regarding the above issue in legal science, there are many conflicting opinions in determining which fake civil transactions violate any valid conditions of civil transactions. Specifically, there are many opinions that a civil transaction established by artificiality is a case of violation of the conditions of voluntariness at point c, clause 1, Article 117 of the 2015 Civil Code, for example: “*The Civil Code stipulates that in some cases, transactions established*

without consent will be invalidated. Those are the cases of invalidation due to falsification...². In addition, there are many other opinions that are similar to the above opinion when claiming that a civil transaction is invalid due to forgery, which is a case established but not voluntarily^{3,4}.

When explaining that the fake civil transaction belongs to the case of violation of voluntariness, the author believes that the civil transaction *“has the characteristic that the parties in that transaction are completely in agreement with each other in establishing the transaction but try to express their will not in accordance with their true wishes (there is a consensus on behavior between the parties). the parties, but there is no agreement between the desires and thoughts inside and the outward behavior of each subject”⁵.* Besides the above opinions, there are also other opinions that say that civil transactions are considered a violation of voluntariness, which are fields of transaction establishment by a person who has lost the capacity for civil acts, establishes a contract, there is an element of confusion, deception, intimidation⁶, ie excluding cases of fake civil transactions. In addition to conflicting opinions on whether a fake civil transaction is a violation of the conditions of voluntariness as mentioned above, there are also authors who believe that a fake civil transaction is a *“transaction with the purpose of violating the prohibition of the law such as to evade obligations to a third party”* is not a violation of the condition of voluntariness and this author explains that the fake civil transaction is not a violation conditions on voluntary because *“The will of the parties to establish that fake transaction is still completely voluntary, reflected in their desire to establish a fake transaction, so that through the transaction such a fake translation that conceals another real transaction or avoids an obligation to a third party”⁷.* Another author argues that fake civil transactions are *“against the will of legislators in controlling legal transactions in order to protect public order stemming from the principles of goodwill, honesty and integrity claim of good cause of contractual obligation”*.

⁴ See also: Judicial Academy (2007), Civil law textbook, Publishing House. People's Public Security, pp. 156 – 172.

⁵ Pham Van Tuyet, The contract is void due to the lack of voluntary participation of the participants, Proceedings of the scientific conference: "The contract is void and the legal consequences of the contract is invalid", Hanoi Law University, Nov 2022, page 104.

⁶ Nguyen Ngoc Dien (2007), Textbook of Civil Law 1- Can Tho University, p. 7, 8.

⁷ Pham Van Tuyet, The contract is void due to the lack of voluntary participation of the participants, Proceedings of the scientific conference: "The contract is void and the legal consequences of the contract is invalid", Hanoi Law University, Nov 2022, page 105;

It can be seen in the current legal science that there exist at least two opinions in determining which fake civil transactions violate any valid conditions of civil transactions, specifically: (1) The first opinion is that the fake civil transaction violates the conditions of voluntariness specified at Point b, Clause 1, Article 117 of Vietnam's Civil Code 2015; and (2) the second opinion that the transaction has the purpose of violating the prohibition of the law specified at point c, clause 1, Article 117 of the Vietnam Civil Code 2015. There are conflicting opinions as presented as presented. The above statement is derived from the fact that Vietnamese law does not clearly stipulate that the case of fake civil transactions violates any valid conditions of civil transactions specified in Article 117 of the Civil Code. Vietnam 2015, or this is another invalid case of a civil transaction (such as the case, the contract is invalid because an object cannot perform Article 408 of the Vietnam Civil Code 2015). Considering the nature of fake civil transactions, it can be seen that fake civil transactions exist for the purpose of concealing other civil transactions or to evade obligations to a third party. These purposes of fake civil transactions seem to violate the effective condition "Purpose and content of civil transactions do not violate the prohibition of the law, do not violate social ethics" as prescribed. at point c, Clause 1, Article 117 of Vietnam Civil Code 2015.

Determining the invalid basis of a fake civil transaction from the court's trial practice

In the practice of adjudicating the invalid civil transactions due to forgery, the court only argues the forgery factor and directly invokes the provisions on invalid civil transactions due to forgery to declare invalid civil transactions, but there is no argument that invalid civil transactions have violated any valid conditions of civil transactions specified in Article 117 of the Civil Code 2015. This is proven. Here are some examples of cases:

Case No. 1: Judgment No. 05/2019/DS-PT dated January 15, 2019 of the People's Court of Tay Ninh province: *“Regarding the request to declare the contract of transferring land use rights invalid”*.

Contents of the case: Mr. H, Mrs. G are obliged to pay Ms. L an amount of VND 422,400,000 according to Judgment No. 27/2017/DS - ST dated June 30, 2017 of the People's Court of Trang Bang district, Tay Ninh province. She asked for judgment enforcement, but Ms. G and Mr. H did not voluntarily execute the judgment and the judgment enforcement agency informed that Mr. and Mrs. G had no assets to execute the judgment. In addition, Mr. and Mrs. G are also obliged to pay Mr. S an amount of VND 500,000,000 according to Decision No. 13/2017/QDST-DS dated March 2, 2017 of the People's Court of Trang Bang District, Tay Ninh

province. Mr. S asked to execute the judgment, but Mrs. G and Mr. H did not execute it. Previously, on January 19, 2017, Mr. and Mrs. G's husband and wife transferred to Mr. Huynh Van D, who is Mrs. G's brother, the house, the land of Mr. H, Mrs. G located at GN hamlet, PL commune, TrB district. , Tay Ninh province. Now Ms. L and Mr. S request the Court to declare the land use right transfer contract No. 03/2017, book No. 01/2017SCT/HD,GD dated January 19, 2017, for the land area of 523 m², parcel of land 322, map sheet No. 10, land located at GN hamlet, PL commune, TrB district, Tay Ninh province between Mr. Le Minh H, Ms. Huynh Thi G for Mr. Huynh Van D is invalid due to artificiality.

Arguments and judgments of the court in determining that the contract is void due to forgery

In the argument, the trial panel commented that “the first instance level judged that the land use right transfer contract between Mr. Le Minh H, Ms. Huynh Thi G and Mr. Huynh Van D Authentication No. 03/2017, volume No. 01/2017SCT/HD,GD dated 19/01/2017, for the land area of 523 m², land plot number 322, map sheet 10, land located at GN hamlet, PL commune, TrB district, Tay Ninh province is fake and declared invalid as prescribed in Clause 2, Article 124 of the Civil Code is grounded and lawful”, and in the decision the court relied on Article 124 of the Vietnam Civil Code 2015 to declares that the above land use right transfer contract is invalid, without further arguing that the fake contract has violated any valid conditions of the contract in Article 117 of the Vietnam Civil Code 2015.

Case No. 2: Judgment No. 13/2021/DS-ST dated January 26, 2010 of the People's Court of Ca Mau city, Ca Mau province: “Regarding the dispute over the contract for the transfer of land use rights”.

Contents of the case: In 2017, Mr and Mrs. T and Mrs. Th participated in a hui game owned by Mrs. L. The money dispute between Mr. T, Ms. Th and Ms. L was resolved by the People's Court of Ca Mau city with the first-instance judgment No. 173/2019/DS-ST dated October 30, 2019 forcing Ms. L to pay for the payment. Mr. T and Mrs. Th's wife owe the amount of money owed to hui is 380,243,500 VND. Ms. L then appealed and was resolved by the People's Court of Ca Mau province with the judgment No. 15/2020/DS-PT dated February 11, 2020, forcing Ms. L to pay Mr and Mrs. T and Mrs. is 363,929,000 VND. After the judgment took legal effect, he and his wife filed a request for judgment enforcement, and learned that Ms. Ta Hong L had made a contract to transfer land use rights to Mr. Trieu Kien Q and Ms. Tran Thi T' by contract. land use right transfer contract on January 7, 2019 at Minh Hai Notary Office. Mr and Mrs. T filed a lawsuit to request the cancellation of the land use right transfer contract between Ms. Ta

Hong L and Mr. Trieu Kien Q and Ms. Tran Thi T' on January 7, 2019 at the Notary Office. Minh Hai at Notary No. 117, volume 01/TP/CC- SCC/HDGD.

Arguments and judgments of the court in determining that the contract is void due to forgery

The trial panel said that “the land use right transfer contract dated January 7, 2019 represents the transfer price of VND 200,000,000. However, in the minutes of on-site review and appraisal, Ms. L determined the transfer price to be VND 1,200,000,000. While the regulated price of Licogi Company in 2019 is VND 800,000,000. Although the involved parties have the right to decide on the price when transferring, this shows that the transfer price and the actual price of the transaction parties are quite different, while Ms. L knows that she still owes others. This proves that the establishment of civil transactions is fake in order to avoid obligations to a third party”. In the decision to declare the above land use right transfer contract null and void, the judgment also only stated the basis of Clause 2, Article 124 of Vietnam's Civil Code 2015, in addition, there was no argument in the judgment. more about the artificial land use right transfer contract mentioned above violated any valid conditions of civil transactions.

Inadequacies and recommendations to improve the legal provisions on determining the invalid basis of fake civil transactions

As described and analyzed above, currently in the Vietnam Civil Code 2015 regulations on civil transactions are invalid due to forgery. However, there are no specific regulations to determine which civil transactions are invalid due to forgery, which violates any valid conditions of civil transactions. Although this does not cause inadequacies in the practice of law application, it has caused controversy in the legal scientific research community. Therefore, there has been an inconsistency in the legal perception about which fake civil transactions have violated any valid conditions of civil transactions. Therefore, Vietnam's Civil Code 2015 should clearly stipulate which conditions for a fraudulent civil transaction to be violated. It is thought that it should be regulated in the direction of a fake civil transaction that violates the condition "The purpose and content of the civil transaction does not violate the prohibition of the law, does not violate social ethics" specified at Point c, Clause 1, Article 117 of Vietnam Civil Code 2015. Because, fake civil transactions have the purpose of concealing other civil transactions or avoiding obligations to a third party, this has infringed upon public interest or the benefit of a third party.

3. CONCLUSION

Vietnamese law regulates that civil transactions are invalid due to forgery, however, it is not clear which fake civil transactions violate any valid conditions of civil transactions. In fact, in the court's trial practice, there is no argument that a civil transaction is invalid because it has violated any valid conditions. This has created many opposing opinions, specifically: (a) the first opinion that the fake civil transaction violates the condition of voluntariness; and (b) the second line of opinion that the fake civil transaction violates the condition that the purpose and content of the civil transaction does not violate the prohibition of the law, and is not contrary to social ethics. Therefore, competent state agencies should soon issue relevant documents to determine the effective conditions of civil transactions that fake civil transactions have violated.

ABSTRACT

Forged civil transactions are an important legal issue of the institution of civil transactions and were soon regulated from the Civil Code of Vietnam 1995, 2005 and 2015. Forged civil transactions pose many legal problems, such as the validity of a fake civil transaction, the effect of a concealed transaction, the legal consequences of an invalid civil transaction due to a forgery, protection of the interests of a bona fide third party in civil transactions, invalidity due to forgery, statute of limitations for requesting declaration of civil transactions invalid due to forgery. To understand more deeply about the legal issues related to forged civil transactions, the article compares the provisions on invalid civil transactions due to forgery of the Vietnam Civil Code 2015 with that of the Vietnam Civil Code 2005. From that point out the similarities and differences of the two laws on fake civil transactions. At the same time, it points out the progressive points and limitations of the Vietnam Civil Code 2015 on artificial civil transactions compared with the Vietnam Civil Code 2005. On that basis, some recommendations are proposed to complete the transaction improve the provisions of the Vietnam Civil Code 2015 on forged contracts.

Keywords: Fake civil transactions; Invalid civil transactions; Bona fide third party; Civil transactions.

1. INTRODUCTION

The Vietnam Civil Code 2005 is the second legal document of Vietnam that regulates fake civil transactions. Over time, the provisions of the law on fake civil transactions have been improved to meet the requirements of social relations. Currently, the Vietnam Civil Code 2015 is a valid legal document that regulates the issues of fake civil transactions. The article compares the provisions of the Vietnam Civil Code 2015 with the Civil Code 2005 on fraudulent civil transactions. On the basis of comparison, the article presents the similarities and differences between the two sets of laws on fake civil transactions. Thereby pointing out the similarities and differences of the two sets of laws on fake civil transactions. At the same time, it points out the progress and limitations of the Vietnam Civil Code 2015 on fraudulent civil transactions compared with the 2005 Vietnam Civil Code. On that basis, some recommendations are proposed to complete the transaction improve the provisions of the Vietnam Civil Code 2015 on forged contracts.

2. RESEARCH AND FINDINGS

2.1. Comparison of regulations on types of fake civil transactions between Vietnam Civil Code 2015 and Vietnam Civil Code 2005

Vietnam Civil Code 2005	Vietnam Civil Code 2015
<p>Article 129. Civil transactions invalid due to falsity</p> <p>When the parties falsely establish a civil transaction in order to conceal another transaction, the false transaction shall be invalid and the concealed transaction remains valid, except in cases where it is also invalid under the provisions of this Code; In cases where a false transaction is established with a view to shirking the responsibility toward a third person, such transaction shall also be invalid.</p>	<p style="text-align: center;">Article 124. Invalidity of civil transactions due to falsification</p> <p>1. If the parties falsely enter into a civil transaction for the purpose of concealing another transaction, the false transaction shall be invalid and the concealed transaction remains valid, unless it is also invalid under the provisions of this Code or relevant laws.</p> <p>2. If the parties enter into a civil transaction falsely for the purpose of evading responsibilities to a third person, such transaction shall be invalid.</p>

Basically, the regulations on types of civil transactions between the Civil Code of Vietnam 2015 and the Civil Code of Vietnam 2005 are not different. Both laws provide for two types of fake civil transactions: (1) civil transactions to conceal other civil transactions; and (2) sham civil transactions to evade obligations to a third party.

The only difference is that in the 2015 Vietnam Civil Code, the content "or other relevant law" has been added in Clause 1, Article 124 when the regulation on the validity of the transaction is concealed. It is perfectly reasonable to add this content because it will create compatibility with specialized laws.

2.2. Comparison of regulations on legal consequences of invalid civil transactions due to forgery between Vietnam Civil Code 2015 and Vietnam Civil Code 2005

Vietnam Civil Code 2005	Vietnam Civil Code 2015
<p>Article 137. Legal consequences of invalid civil transactions</p> <p>1. Invalid civil transactions shall not give rise to, change or terminate any civil rights and obligations of the parties from the time of establishment thereof.</p> <p>2. When a civil transaction is invalid, the parties shall be restored to the original status and shall return to each other what they have received; if the return cannot be made in kind, it shall be made in money, except for cases where the transacted property, gained yields and/or profits are confiscated under the provisions of law. The party at fault, which caused damage, must compensate therefore.</p>	<p>Article 131. Legal consequences of invalid civil transactions</p> <p>1. An invalid civil transaction shall not give rise to, change or terminate any civil rights and obligations of the parties as from the time the transaction is entered into.</p> <p>2. When a civil transaction is invalid, the parties shall restore everything to its original state and shall return to each other what they have received. If the restitution is not able to make in kind, it may paid in money.</p> <p>3. A bona fide person in receiving yield and/or income is not required to return such yield and/or income.</p> <p>4. The party at fault which caused damage must compensate therefore.</p> <p>5. The settlement of consequences of invalid civil transactions regarding personal rights shall be prescribed in this Code and relevant laws.</p>

Compared with the Civil Code of Vietnam 2005, the Civil Code of Vietnam 2015 has the following differences:

First, the Vietnam Civil Code 2015 does not stipulate the case in which yields and profits can be confiscated according to the provisions of law as in the 2005 Vietnam Civil Code. may be

appropriated because confiscation of yields or income is a legal consequence of a criminal or administrative nature.

Second, the 2015 Vietnam Civil Code has added the provision that "the rightful party in the collection of yields and profits is not required to return the yields and profits" compared to the 2005 Vietnam Civil Code. The addition of the above provision is completely appropriate, because in practice there are many cases when civil transactions are invalid, but assets can generate additional yields and profits, and the problem is that it is necessary to handle the number of transactions. this profit, this profit. This is an increase compared to what the parties originally assigned to each other, and according to the additional provisions of the Vietnam Civil Code 2015, the party that is honest in collecting the profits will not be refunded. those yields and profits and vice versa, if they are not sincere in collecting the profits and profits, they must be responsible for returning them.

Third, the Vietnam Civil Code 2015 has added provisions " The settlement of consequences of invalid civil transactions regarding personal rights shall be prescribed in this Code and relevant laws ". The above addition is completely appropriate and necessary for the settlement of invalid civil transactions related to personal factors and creates coverage for specialized laws with the addition of the phrase " provided by other relevant laws".

2.3. Comparison of regulations on protection of bona fide third parties when civil transactions are invalidated due to forgery between the Vietnam Civil Code 2015 and the Vietnam Civil Code 2005

Vietnam Civil Code 2005	Vietnam Civil Code 2015
<p>Article 138. Protection of the interests of a bona fide third party when a civil transaction is invalid</p> <p>1. In cases where a civil transaction is invalid but the transacted property being a moveable not subject to ownership registration has already been transferred to a bona fide third party through another transaction, the transaction with the third party shall still be valid, except for the case specified in Article 257 of this Code.</p>	<p>Article 133. Protection of the interests of bona fide third parties with regard to invalid civil transactions</p> <p>1. In cases where a civil transaction is invalid but the transacted property being a moveable property is not required to be registered and such property has already been transferred to a bona fide third party through another transaction, the transaction with the third party shall remain valid, except for the case specified in Article 167 of this Code.</p>

<p>2. In cases where the transacted property being an immovable or a moveable subject to ownership registration has already been transferred to a bona fide third party through another transaction, the transaction with the third party shall be invalid, except for cases the bona fide third party receives such property through auction or transaction with a person who, under court judgment or decision of a competent state agency, was the owner of the property, but later is not the owner of the property as the court judgment or decision is cancelled or modified.</p>	<p>2. In cases where a civil transaction is invalid but the transacted property is registered at a competent authority and such property has already been transferred to a bona fide third party through another transaction which is established according to that registration, such transaction shall remain valid.</p> <p>In cases where the transacted property which is required to be registered has not registered at a competent authority, the transaction with the third party shall be invalid, except for cases the bona fide third party received such property through an auction or a transaction with an another party being the owner of such property pursuant to a judgment or decision of a competent authority but thereafter such person is not the owner of the property as a result of the judgment or decision being amended or annulled.</p> <p>3. The owner of a property shall have no right to reclaim the property from the bona fide third party if the transaction with such party remains valid as prescribed in Clause 2 of this Article, but the owner may proceed against the party at fault to refund appropriate expenses and compensate for his/her damage.</p>
---	---

Compared with the Civil Code of Vietnam 2005, the Civil Code of Vietnam 2015 has the following differences:

First, a change in terminology: Vietnam's Civil Code 2015 used the term "property without registration" to replace the term "movable property without registration of ownership" and used the term "property without registration". The term "registered property" shall replace the term "immovable property or movable property subject to registration". This change has the author's

assessment that this is only a small, technical change⁸. However, there are also authors who believe that this change is due to the reason that there are properties that must be registered but not for registration of ownership but are for circulation and feel unconvinced about the change. mentioned above of the Vietnam Civil Code 2015 because in fact the ownership rights are registered, only the third party believes that it is the owner, so the transaction is established⁹. In some other legal studies, there does not seem to be a distinction between registration and registration of property rights when an author thinks that "Property registration is the official recording in documents of the competent authority. the competent state with necessary information related to ownership rights and other property rights to serve as a basis for arising, changing or terminating the rights and obligations of the owner¹⁰. The above paragraph seems to be looking at the registration as similar to the registration of ownership, but not including the registration of circulation as the previous opinion. The term "registration" in this case needs to be understood in a broad sense, including the type of registration of property ownership and the type of registration that is not registered, but has the value of proving the person's name on the document. Register as a property owner.

Second, the Vietnam Civil Code 2015 has added the provision “In cases where a civil transaction is invalid but the transacted property is registered at a competent authority and such property has already been transferred to a bona fide third party through another transaction which is established according to that registration, such transaction shall remain valid”. This addition is completely convincing, because the third party in good faith has relied on the registration of the competent state agency to receive the transfer of property, the third person needs to be protected.

Third, the 2015 Vietnam Civil Code has added provisions “The owner of a property shall have no right to reclaim the property from the bona fide third party if the transaction with such party remains valid as prescribed in Clause 2 of this Article, but the owner may proceed against the party at fault to refund appropriate expenses and compensate for his/her damage”. This provision is also a suitable addition to create a clearer mechanism to protect the interests of the original owner when the law protects bona fide third parties.

¹⁰ Nguyen Minh Tuan (2016), Scientific commentary on Civil Code 2015, Publishing House. Justice, pp. 177.

2.4. Comparison of the statute of limitations for requesting a declaration of an invalid civil transaction due to forgery between the Vietnam Civil Code 2015 and the Vietnam Civil Code 2005

Vietnam Civil Code 2005	Vietnam Civil Code 2015
<p>Article 136.- The statute of limitations for requesting the Court to declare a civil transaction invalid</p> <p>...</p> <p>2. For civil transactions specified in Articles... 129 of this Code, the statute of limitations for requesting the Court to declare such civil transactions invalid shall not be restricted.</p>	<p>Article 132. Time limit for requesting court to declare civil transactions invalid</p> <p>...</p> <p>3. For civil transactions specified in Articles 123... the time limit for requesting a court to declare such civil transactions invalid shall not be restricted.</p>

The statute of limitations for declaring a civil transaction invalid due to forgery of the two similar laws is not limited in time. That is, at any time, the relevant parties also have the right to request the court to resolve the declaration of invalid civil transactions due to forgery.

3. CONCLUSION

Basically, the provisions in the 2015 Vietnam Civil Code have more advanced and complete points than those in the 2005 Vietnam Civil Code, such as the bona fide third parties is better protected, has the opportunity to There are clear restrictions to protect the original owner when a bona fide third party is protected... However, the Vietnam Civil Code 2015 also reveals some limitations and shortcomings such as no transaction concept. fake civil rights, all kinds of fake legal acts have not been foreseen, some regulations on legal consequences and protection of bona fide third parties have not been guided in detail... leading to There are many different interpretations and the effective application of the law is not high. These problems need to be overcome soon in order to better improve the provisions of Vietnamese law on fake civil transactions.

ABSTRACT

The rapid development of artificial intelligence and automation means that many jobs will be replaced by AI applications. As a result of the application of artificial intelligence in many fields, which will dominate, job losses occur as existing professions lose their function. Reductions in manufacturing costs as a result of innovation are enabling robots to take over a growing number of manual tasks in new areas of manufacturing, packaging, construction, maintenance and agriculture. Therefore, in every wave of technological development, workers face unemployment.

Keywords: artificial intelligence, legal regulation, hired labor, employee, employer, profession, robot, workforce, data mining.

GİRİŞ

Birinci sanayi devriminde, buhar motorları mekanize imalat sanayilerine geçişle sonuçlandı. Birçok manuel tarım işinin yerini makineler aldı. İkinci sanayi devrimi elektrik ve otomasyonun gelişmesiyle seri üretimi mümkün kılarken, üçüncü sanayi devrimi bilgi teknolojilerini kullanarak otomatik üretimi daha da geliştirdi. Aynı zamanda, imalat teknolojileri görevleri basitleştirerek vasıflı emeğin yerini büyük ölçüde alırken, XX yüzyılın bilgisayar devrimi orta gelirli işleri yok etti. Sürekli gelişen yeni teknolojilerin yaygınlaşmasıyla ilgili ortak bir endişe, bunun iş ve iş ortamı üzerindeki etkisidir. Cevaplanması gereken asıl soru, eğer yeni makine işçilerden daha iyiye, işçiler ne yapmalıdır?

ÇALIŞMANIN AMACI.

Yapay zekanın gelişimini anlayarak işgücü piyasasındaki gelişme ve değişimleri bir araya getirmektir. Çalışmada yapay zeka kullanımının işgücü piyasası ve müşteri hizmetleri üzerindeki etkisi literatür taraması yoluyla açıklanmaya çalışılmıştır. Teknolojideki gelişimin işsizliğe neden olduğu bilinse de yapay zekanın gelişim sürecinin yeni meslekler ve uzmanlık alanları yaratacağı ve yeni istihdam olanaklarını artıracacağı öngörülmüyor.

SORUNU BELİRLEME.

Yapay zeka, beceri gereksinimlerini, kariyer fırsatlarını ve endüstrilerin ve mesleklerin ülkeler arasındaki dağılımını yeniden şekillendirme potansiyeline sahiptir. Ayrıca bilişsel teknolojilerden kaynaklanan işgücü eğilimlerini kısa vadede tahmin etmek oldukça zordur. Beceri gereksinimlerindeki temel değişiklikler, tüm ekonomik faaliyetlere nüfuz eder ve mesleki beceri gereksinimlerini, kariyer hareketliliğini ve sosyal refahı etkiler. [1]

Yapay zeka ve makine öğreniminin gelişmesiyle birlikte teknolojik bir karışımın (Nesnelerin İnterneti, büyük veri, robotik, sanal gerçeklik, 3-D baskı ve kuantum hesaplama gibi) kullanımı dördüncü sanayi devrimine yol açmıştır. Dördüncü sanayi devrimi ile birlikte bazı alanlarda akıllı makineler insan gücünün bilişsel yeteneklerinin önüne geçmiş, üretim kavramı farklı boyutlara dönüşmüştür. Geçmişten günümüze, sürekli uzmanlığa sahip işbölümünde, karmaşık ve günlük işlerin makinelere aktarılmasının bir sonucu olarak verimlilik ve yaşam standartlarında bir artış olmuştur. 19 yüzyıldan beri endüstriyel devrimler olan makinelerin kullanımı otomasyon sürecini hızlandırdı.

Yapay zeka terimi resmi olarak 1956'da bir Dartmouth yaz araştırma projesi tarafından ortaya atıldı. Bu çalışma, yeni bir araştırma alanı yaratmayı ve farklı alanlardan araştırmacıları insan zekasını taklit edebilen makineler yaratmak için bir araya getirmeyi amaçlıyordu. Yapay zekanın oluşmasında üç farklı kaynağın geliştirilmesi önemli rol oynamıştır:

1. Azalan bilgi işlem maliyetleri, işlem gücü ve depolama kapasitesinde de iyileştirmeler getirdi.
2. İnternetin ve diğer dijital iletişim araçlarının gelişmesi ve yaygınlaşması, merkezi dijital bilgilerin elde edilmesinde ve saklanmasında önemli bir artışa yol açmıştır.
3. Dijital teknolojilerin sermaye maliyetlerinin azalması, yeni girişimlerin önündeki engellerin önemli ölçüde azalmasına yol açmıştır.

Endüstriyel yapay zekanın temel unsurları arasında analitik teknolojisi, büyük veri teknolojisi, bulut veya siber teknoloji, alan bilgisi ve kanıt yer alır. Büyük veri teknolojisi, endüstriyel yapay zekada veri kaynağı ve platformu sağlayan kilit bir unsurdur. Bu bağlamda, yapay zeka teknolojisinin uygulanmasına ilişkin en önemli zorluklar dört noktada özetlenebilir:

1. Yapay zeka güvenliği, yalnızca bilgi güvenliği konularını değil, genel olarak güvenlik konularını da kapsar. Bu nedenle Bostrom ve Yudkowsky (2014), yapay zeka teknolojisinin insan kaynaklı olumsuz manipülasyonlara karşı dirençli olmasının önemini ve gerekliliğini vurgulamaktadır.
2. Güvenilir olmayan, hatalı veya zayıf veriler hatalara yol açabileceğinden, veri kalitesi ve entegrasyonu kuruluşlar için çeşitli zorluklar oluşturabilir. Bu bağlamda tarafsız ve güvenilir verilerin toplanması, saklanması ve kullanılması yapay zekanın başarılı bir şekilde uygulanabilmesi için şarttır.
3. Bir AI uygulamasını başlatmadan önce, beklenen çözümün sürdürülebilir olup olmadığını değerlendirmek için finansal fizibilite önemlidir. Ayrıca, toplam maliyetler ve beklenen gelirler önceden dikkate alınmalıdır.

Finansal fizibilite bağlamında, iki ana maliyet faktörü vardır.

İlk olarak, veri toplama ve depolama için teknolojik bir altyapı oluşturmak için büyük yatırımlar gerekmektedir.

İkincisi ise yapay zeka uzmanlarının yetiştirilmesi ve bu uzmanlara olan talebin artması.

4. Uzmanlaşma, yapay zekanın hızlı gelişimini destekleyerek uzmanlara olan ihtiyacı artırıyor. Bununla birlikte, uzmanlık eksikliği yapay zeka uygulamalarının geliştirilmesini engeller ve bu nedenle geliştirme ve uygulama bağlamında zorluklar yaratır. Bu nedenle, yüksek düzeyde eğitilmiş ve çeşitliliğe sahip bir iş gücünün geliştirilmesi, sürdürülebilir bir yetkinlik ve bilgi tabanı oluşturmak için esastır.

Yapay zekanın gelişmesiyle birlikte uzmanlar, gelecek hakkındaki endişelerini beş noktada açıklıyorlar.

1. İnsan faktörü / dijital yaşamın gelişmesiyle birlikte, otomatik karar verme, bağımsızlık ve gizlilik üzerindeki gücü giderek azalacaktır. Bu etkiler, otomatik sistemler daha geniş ve sofistike bir şekilde tanıtıldıkça daha da derinleşecektir.
2. Verileri kötüye kullanmak/ kar elde etmek veya enerji kullanmak için tasarlanmış karmaşık sistemlerde veri kullanımı ve kontrolü ile çoğu yapay zeka aracı, kar elde etmek için şirketlerin kontrolü altında olacaktır.
3. İş kaybı. Çoğu işi yapay zeka ile yönetmek ekonomideki adaletsizliği artıracak ve sosyal kargaşaya neden olacaktır. Başta verimlilik ve diğer faydalar olmak üzere iş yaşamının tüm yönlerini değiştirmeye devam edecektir. Bu süreçte, bazı çalışanlar yeni işlerin ortaya çıkmasını beklerken, bu durum diğer çalışanlar için büyük iş kayıplarına yol açacaktır.
4. Bağımlılık. Yapay zeka bireylerin bilişsel, sosyal ve hayatta kalma becerilerini zayıflatacak. Yeni yaşam biçiminde, insanların makinelere ve ağlara artan bağımlılığı, düşünme, bağımsız hareket etme ve sosyal olarak etkileşim kurma yeteneklerini zayıflatacaktır.
5. Karışıklık. Otonom silahların, siber suçların ve silah haline getirilmiş bilgilerin kullanılması sonucunda istikrarsızlaşma, yalan söyleme ve propaganda meydana gelebilir. Bu nedenle, can kaybı olasılığı ve siber suçluların ekonomi üzerindeki etkisi endişe vericidir.

Yapay zeka unsurlarının devreye girmesiyle teknolojilerin kullanılmasının, ülke ekonomisi sektörlerinde ve hizmet sektöründe işgücü verimliliğinde % 40'a varan bir artışa yol açacağı varsayılmaktadır. Bu yenilikçi teknolojilerin insan ve üretim kaynaklarının optimal kullanımına, ekonominin daha da gelişmesine ve GSYİH'nın büyümesine katkıda bulunması beklenmektedir.

Yapay zeka, robotik ve gelişmiş çevrimiçi teknolojilerle birleştiğinde, daha önce yalnızca insanların yaptığı birçok görevi etkili bir şekilde ele alıyor. Örneğin, yapay zeka tıp alanında zaten aktif olarak kullanılmaktadır. Yani burada akıllı uygulamalar teşhis koymaya ve tedavileri seçmeye yardımcı oluyor.

Yapay zeka ayrıca gazetecilik, çevrimiçi eğitim, işe alım, gerçek zamanlı çeviri işlevlerinde de uygulanmaktadır.

Genel olarak, modern dijital teknolojiler birçok işlemi gerçekleştirebilir veya bunların uygulanmasını önemli ölçüde kolaylaştırabilir. Ancak aynı zamanda, yapay zekanın hızlı gelişimi, makinelerin sadece insanların sorunlarını çözmelerine yardımcı olmakla kalmayıp aynı zamanda toplumumuzun ekonomik, yasal ve etik temellerini etkileyecek yeni sorunlar yarattığını da vurgulamaktadır.

Yerli ve yabancı uzmanlar, endüstriyel üretim, tarım ve bireysel hizmet sektörlerindeki farklı ülkeler için robotizasyondan % 8-47'lik iş kesintileriyle ilgili önemli olumsuz sonuçların beklenmesi gerektiğini belirtiyorlar.

Her şeyden önce, tekrarlayan algoritmalara ve senaryolara dayalı meslekler ortadan kalkacak: satıcı, tercüman, işe alım görevlisi, haber muhabiri, tren makinisti, kurye ve depo lojistik işçisi, banka çalışanı (kredi başvurularını kabul eden veya temel bilgileri sağlayan), çağrı merkezi operatörü vb.

Yapay zekanın kullanımı sayesinde bazı uzmanlık alanları değişmiştir ve insanların yapay zekadan önemli ölçüde daha etkili olacağı yeni meslekler ortaya çıkmıştır. Bu mesleklere olan talep şunlardan oluşur: insan eğitimi, duygusal ve bilişsel çalışma, esnek stratejik yönetim ve şirket içindeki insan ilişkilerinin yönetimi, araştırma, makine öğrenimi, mühendislik ve bilgi teknolojisi vb.

Ekonomistlere göre, kısa bir süre içinde uzmanların değiştirilmesi ve boş kontenjanların olmaması sorunu yaşanacak. Bu etki beceri ve teknoloji uyumsuzluğu, yani teknoloji ile iş gücünün becerileri arasındaki uyumsuzluk olarak adlandırılır.

Birçok endüstride, üretimde ve hizmette profesyonel olarak eğitilmiş uzman eksikliği zaten var. Google, Facebook, Apple, Amazon, Uber ve diğer büyük teknoloji şirketleri yapay zeka uzmanlarına milyonlarca dolar ödemeye isteklidirler çünkü yüz tanıma yazılımı, dijital asistanlar ve sürücüsüz otomobillerle çalışmak için acilen yetenekli personele ihtiyaç duyarlar. Çünkü yüksek teknoloji endüstrisi, toplumun sosyo-ekonomik manzarayı etkileyecek değişikliklere uyum sağlamasına yardımcı olmalıdır.

Gelecek ne olursa olsun, kişisel ve mesleki gelişime odaklanan, çevreye önem veren, çalışmalarında en son dijital teknolojileri kullanmaya hazır olan ve cesurca değişime giden bir kişi inovasyondan korkmamalıdır. Sadece meslekler eskimiş olur ve benzersiz yetkinliklere sahip uzmanlar her zaman talep edilecektir.

Yapay zekanın yaygın bir şekilde benimsenmesiyle, makinelerin çalışanların yaptıkları işin bir kısmını veya hatta tamamını görmeye başlayıp başlamadığı sorusu tartışmalıdır. Yeni teknolojiler, makineler tarafından gerçekleştirilen birçok rutin işi ve işlemi mümkün kılarken, günümüzde yapay zekadaki gelişmeler, makinelerin anlama, anlamlandırma ve çıkarımlarda bulunma becerisi gerektiren sıra dışı görevleri gerçekleştirmesine olanak sağlıyor. Bu alandaki akademik araştırmalar ve iş dünyasıyla ilgili araştırmalar, işlerin nasıl yapıldığına dair önemli değişiklikler olacağını, bazı işlerin tamamen otomatikleştirilebileceğini ve yapay zekanın kullanımıyla ilgili yeni mesleklerin ortaya çıkacağını göstermektedir.

Yapay zeka teknolojileri, üretim ve hizmet süreçlerindeki insan kaynaklı hataları en aza indirmek, enerji ve kaynakların verimli kullanımı, daha uzun üretim veya işlem süreleri, çevre koşullarının (örn. sıcaklık, nem) izlenmesiyle üretim koşullarının iyileştirilmesi gibi birçok fayda sağlamaktadır. Bu avantajlar birçok sektörde verimliliği artırmak, maliyetleri düşürmek ve karı maksimize etmek için kullanılmakla birlikte kamu kaynaklarının etkin yönetimi ve toplumsal refahın iyileştirilmesi için de önemli araçlar sağlamaktadır. Yapay zekanın çeşitli sektörlerdeki başlıca kullanım alanları ve işlevleri aşağıda sıralanmıştır:

Bankacılık ve finans sektörü, veri hacmi ve trafiği ile yapay zeka teknolojilerinin öne çıkan uygulama alanlarından biridir. Tutarsızlıkların ve hileli işlemlerin tespit edilmesi gibi operasyonel görevler, müşterilerin kişisel bilgileri ve işlem verileri izlenerek otomatikleştirilebilir. Yine, bu verilerin analizi, müşterileri segmentlere ayırmanıza ve kişiselleştirilmiş pazarlama kampanyaları yürütmenize olanak tanır. Doğal dil işleme araçlarının desteğiyle, müşteri hizmetlerinde daha kısa sürede daha iyi çözümler sunulabilir.

Yapay zeka teknolojilerinin finansal danışmanlık hizmetlerine entegrasyonu, bu alanda çalışanlar için tamamlayıcı bir rol oynamakta ve bir ölçüde onların yerini alabilmektedir. Çeşitli finansal kuruluşlar tarafından kullanılmaya başlanan danışman robotlar, çok yönlü yatırım algoritmaları kullanarak müşterilerin beklentilerini, varlık yapılarını ve risk algılarını değerlendirerek kişiye özel portföyler sunuyor. Ayrıca piyasa koşulları ve yatırımcı tercihleri farklılaştığında portföy dağılımlarını yeniden düzenler.

Telekomünikasyon sektörü, büyük veri ve yapay zeka teknolojilerinin önemli katma değer yaratma ve operasyonel verimlilik sağlama potansiyeline sahip olduğu sektörler arasında yer almaktadır. Endüstride makine öğreniminin kullanıldığı alanlardan biri de panik analizidir. 2000'li yıllarda, numaraların aktarılabilmesiyle, müşteri kaybı oranı operatörler için en önemli göstergelerden biri haline gelmiştir. Bu orandaki en ufak bir değişikliğin operatörlerin gelirleri üzerinde önemli bir etkisi vardır. Ayrıca yeni müşteri kazanmak, mevcut müşteriye elde tutmaktan daha maliyetlidir.

Operatörler, müşteri demografik verileri ve kullanım alışkanlıkları gibi verileri kullanarak müşteri kaybını tahmin etmek için geleneksel istatistiksel yöntemler kullanmışlardır. Dijitalleşmenin artmasıyla birlikte operatörlerin daha çeşitli, gerçek zamanlı ve daha fazla veriye erişimi, müşteri kayıplarının analizinde makine öğreniminin kullanılmasına izin vermiştir. Makine öğreniminin entegrasyonu tahmine dayalı model, müşteri kaybının nedenlerinin daha doğru bir şekilde tanımlanmasını ve ayrıca kaybı önleyen operasyonların (ör. sunulan promosyonlar) etkilerinin modellenmeye dahil edilmesini sağlar. Endüstride makine

öğreniminin önemli bir uygulama hedefi, operasyonel verimlilik. Operatörler ağlarını yazılım sistemleriyle bütünleştirir ve robotik süreçleri otomatikleştirerek ağ yönetiminin optimize edilmesini ve zamanında bakımını sağlar.

Yapay zeka teknolojilerinin sağlık hizmetlerinde teşhis ve teşhis görevlerini bile yerine getirebileceği görülüyor. IBM tarafından 2016 yılında geliştirilen " Watson for Oncology", yapay zekanın onkologlar ve doktorlar için kanser tedavisi için tanı ve önerilerde önemli bir yardımcı olabileceğini göstermektedir. Hem hastanın kendi sağlık geçmişini hem de hastalıkla ilgili tıbbi makaleler gibi diğer kayıtları analiz ederek, belirli bir hasta için hangi tedavi yönteminin en iyi sonucu vereceğini önerebilir.

Erken teşhis için yapay zeka sistemleriyle donatılmış giyilebilir teknolojiler kullanılır, bu da hastalıkların veya sağlık koşullarının düzenli olarak izlenmesi için önemli fırsatlar yaratır. Nabız hızı, vücut ısısı, kalp vuruşlarının düzensizliği, kişinin egzersiz alışkanlıkları gibi göstergeler sensörler kullanılarak algılanır ve bu bilgiler sürekli olarak izlenebilir.

Giyilebilir teknolojilerle toplanan ve işlenen veriler, kullanıcıların sağlığını iyileştirebilir ve halk sağlığına önemli ölçüde fayda sağlayabilir. Çünkü sağlık bilgilerinin kayıt altına alınmasında hızlı bir artış sağlar. Giyilebilir teknolojiler, iş sağlığı ve güvenliği üzerindeki kontrolü geliştirmek için de kullanılabilir. Örneğin insan sağlığını tehdit eden alanlarda yapılması gereken görevleri robotlar gerçekleştirebiliyor. Robotiklerin gelişmesiyle ve internet bağlantı hızının artmasıyla, robotların cerrahi operasyonlarda destekleyici bir rol oynamasını ve hatta robotların uzaktan kumandalı operasyonlarını gerçekleştirmesini sağlamak için çalışmalar devam etmektedir. Böylece, Çin'de bir doktor ilk kez 5G bağlantısını kullanarak uzaktan bir operasyon gerçekleştirdi.

Yapay zeka teknolojileri ulaşım alanında pek çok fırsat sunuyor. Trafik yönetimi, araçları ve yolları sensörler (GPS, kameralar ve radar gibi) ve aktüatörler (algılanan girdileri eyleme dönüştüren sistem bileşenleri) ile donatarak daha etkili hale getirilebilir. Otonom araçların yaygınlaşması ile hareket halindeki araç sayısının azalması, yakıt ihtiyacının azalması ve trafik kazalarına bağlı ölümlerin azalması gelecekte bu alanda beklenen sosyal faydalardır.

Bu, yapay zekanın köklü dönüşümler yarattığı alanlardan biridir.

Yapay zeka teknolojilerinin potansiyeli, üretim sürecinden pazarlamaya ve hizmete kadar birçok alanda ortaya çıkmaya başlamıştır. Müşteri verilerini yapay zeka teknolojileriyle analiz etmek, segmentasyonu iyileştirmek, kişiselleştirilmiş ürünler ve teklifler sunmak ve fiyatları optimize etmek gibi amaçlar için kullanılabilir. Üretim süreci kontrolü daha etkin

olmakla birlikte, üretimde kullanılan beyaz eşya veya makineler için bakım ihtiyaçları tahmin edilebilir ve takip edilebilir.

Yapay zekanın tarımdaki başlıca uygulamaları, toprak ve hava koşullarının izlenmesi, ürün geliştirme süreçlerinin sensörler aracılığıyla izlenmesi, tarımsal topraklar ve diğer dış etkenlerle ilgili verileri analiz ederek tarım arazilerini ve mahsulleri değerlendirmesi ve robotların sulama ve hasat gibi görevleri gerçekleştirmesidir. ABD endüstriyel tarım şirketi Monsanto tarafından Blue River Technologies'in makine vizyonunu kullanarak geliştirilen püskürtme sistemi, bu alandaki başarının önemli bir örneği olarak gösterilmiştir.

Sistem, tarlada yetişen yabancı otların türünü tespit eder ve hedeflenen ilaçlamayı gerçekleştirir, böylece sadece yabancı otlar temizlenir. Bu sayede kimyasal kullanımının %90 oranında azaltıldığı bildirilmektedir. Monsanto'nun 2013'te hava ve iklim verileri yazılımı ve sigorta hizmetleri sağlayıcısı olan The Climate Corporation'ı yaklaşık 1 milyar dolara satın alması ve 2018'de Alman kimya ve ilaç devi Bayer ile birleşmesi, veri odaklı yeni bir çağın sinyallerini veriyor.

Yapay zeka teknolojileriyle, kısa sürede binlerce sayfalık pratik yasal araştırma yapılabilir.

Yapay zeka, yasal danışmanlıkta önemli sorumluluk alanlarından biri olan sözleşmelerde destekleyici bir rol oynamaktadır. Sözleşmelerin hazırlanması ve araştırılması ve risklerin tanımlanması gibi işlemleri kolaylaştırmak için yapay zeka programları geliştirilmektedir.

Yaratıcılık ve sosyal iletişim gerektiren işler, makinelerin insan emeğinin yerini alamayacağı alanlar arasında ön planda yer almaktadır. Ancak son zamanlarda bu alanlarda önemli ilerlemeler kaydedilmiştir. 2016 yılında sanatçı Rembrandt'ın tekniklerini taklit edebilecek ve bu tekniklere göre portre çizebilecek bir çalışma yapıldı. 300'den fazla Rembrandt resminin taranmasıyla büyük bir veri tabanı oluşturuldu ve yeni portre için spesifikasyonlarla alındı. Bu prensipler, yüz tanıma algoritmaları aracılığıyla Rembrandt'ın eserlerindeki yüz boyutlarını inceleyerek yeni portreye uygulandı. Fırça darbelerini simüle etmek için ısı haritaları oluşturuldu ve daha sonra çizim 13 katmanlı 3D baskı ile tuvale aktarıldı. Ancak yaratıcılığın temel iş unsuru olduğu alanlarda ileri teknolojilerin kullanılması ve standartlaşma eğiliminin yaratıcılığı yok ettiği yönünde eleştiriler bulunmaktadır.

Modern müşteri hizmetleri teknolojisinde, yapay zeka üç yazılım bileşeninden oluşur. Birincisi otomatik konuşma tanıma (ASR), ikincisi doğal dil işleme (NLP) ve üçüncüsü bilgi aramasıdır (IR). Müşteri metin iletişimde, metinden anlam çıkarmak için otomatik konuşma

tanıma ve doğal dil işleme adımlarına gerek yoktur. Makine öğrenimindeki gelişmeler, hem otomatik konuşma tanıma aşamasında hem de müşterilere en iyi şekilde yanıt veren doğal dil işlemede önemli gelişmeler sağladı. Müşteri aramalarında daha karmaşık bir yanıt gerekiyorsa, veri toplama aşamasında olası yanıtların metin bağlantılarının listelenmesi en iyi şekilde yanıtlanır.

Teknolojinin ve dijitalleşmenin hızla gelişmesiyle birlikte, yapay zekanın operasyonel verimliliği ve müşteri hizmet kalitesini artırmada kullanım payı, özellikle turizm gibi hizmet sektörlerinde daha da artmıştır. Yapay zeka sayesinde, bilgisayarların veya robotların akıllı üretkenliğe erişimi, müşterilerin satın alma ve tüketici ihtiyaçlarını karşılamak için dijital ve robotik hizmetlerin sağlanmasını kolaylaştırmıştır. Müşteri ilişkilerini ve davranışlarını olumlu yönde etkileyebilmek, hizmet sağlayıcılara hizmet sunmanın önemli bir parçasıdır. Bu etkileşim, müşteri tutumlarını ve davranışlarını olumlu yönde etkilediği için hizmet kalitesinin artmasına neden olmuştur.

Hizmet sektöründe yapay zekanın iki önemli özelliği vardır:

- Aşağıdaki faktörler bireysel çalışmada etkilidir:
 1. Verilerden öğrenen ve tahminler yapan algoritma tabanlı makine öğrenimi;
 2. Dünyayı gözlemleyen ve duyuşsal verilere dayalı kendi iç temsillerini oluşturan yapay sinir ağları (derin öğrenme).
 3. Otomatik makine öğrenimi. Ayrıca, yapay zeka ile öğrenme, kendi kendine öğrenme yöntemlerinden bağımsız olarak kendini geliştirebilir. Örneğin, Amazon veya Netflix'in makine öğrenimi algoritmaları, müşterilerin önerilere verdiği yanıtlara dayalı olarak önerilerini zaman içinde geliştirebilir.
- Bağlılık. Yapay zekanın kendi kendine öğrenme yeteneğinin, bireysel makinelerden ziyade tüm ağı iletişim içinde yayılması, kolektif zekanın derinleşmesine yol açar. Yapay zekanın öncülerinden biri olan Marvin Minski'nin vurguladığı gibi, akıl sınırlı programlara sahip bireysel ajanlardan oluşuyor ve bu bireysel ajanlar farklı hedeflere ulaşmaya çalışıyor ve daha karmaşık bir zeka ortaya çıkıyor.

Ekonomi değıştikçe ve yeni işler ortaya çıktıkça, işgücü piyasaları yeni çalışma kalıpları, organizasyonel platformlar ve akıllı araçlar tarafından düzenlenecektir. Aynı zamanda, dijital platformların ve işgücü piyasalarının odak noktası, işleri ve çalışanları uyarlamak ve istikrarlı bir istihdam yaratma potansiyeline ulaşmaktır. Amazon, eBay, Uber, Upwork ve You Tube gibi platformlarda çalışanlar ve işverenler, müşteriler ve yükleniciler, satıcılar ve alıcılar arasındaki eşleştirme mekanizmalarının mantığına dayanır. Bu adaptasyon

mekanizması, yeni insanları pazara dahil ederek veya iyi bir adaptasyonu teşvik ederek çalışanların hızlı büyümesi ve artan refahı anlamına gelir. Bununla birlikte, istihdam ilişkilerinin (emek ve sermaye) dijital platformlara aktarılması, ekonominin özünü yeniden tanımlamaya katkıda bulunan riskler doğurmaktadır. Örneğin, Haziran 2016'da ABD'deki yetişkinlerin sadece % 0,90'ının çevrimiçi platform ekonomisinde aktif olarak gelir elde ettiği bildirildi.

Yapay zeka, finansal ürünlerin ticareti, sigorta şirketlerinin risk analizi, biyoteknolojik ürünlerin geliştirilmesi, nakliye filosunun yönetimi, telekomünikasyon yönetimi, pazarlama stratejileri ve müşteri hizmetleri gibi çeşitli alanlarda vazgeçilmez hale gelmiştir. İşletmelerin dijital dönüşümünün yapay zeka teknolojisiyle uyumluluğu, ekonomik faaliyeti ve karlılığı sürdürmede önemli bir rol oynamıştır. Bu nedenle, dijital dönüşüme odaklanan işletmeler, müşteri beklentilerindeki ve tüketici alışkanlıklarındaki değişiklikleri analiz etmek için analiz edilmesi, sınıflandırılması ve yapılandırılması gereken verilerle müşteri ihtiyaçlarına odaklanan ve verileri analiz etme yeteneğine sahip olan işletmelerdir. Dijital işletmelerde, veri analizi, müşteri ilişkileri yönetimi ve belirli ürün ve hizmetlerin (özellikle finansal, sigorta ve bilgi hizmetlerinde) üretim süreçleri büyük ölçüde karar verebilen özerk bir yapay zekanın uygulanmasından kaynaklanacaktır.

SONUÇ

Yapay zeka tüm riskleri ortadan kaldıracak tek çözüm olmadığından, yasaklanması diğer küresel sorunlara neden olacaktır. Bu nedenle yapay zekanın güvenliğini kontrol etmek karmaşıktır ve sürekliliği gerektirir. Teknoloji ilerledikçe, düşük vasıflı işçilerin bilgisayarlaşmaya açık olmayan, yani yaratıcı ve sosyal zeka gerektiren işlere atanması bekleniyor. Yapay zeka sistemlerini satın almanın, kişiselleştirmenin ve sürdürmenin yüksek maliyeti göz önüne alındığında, firmaların yalnızca işin bir kısmını yapabildikleri takdirde insanları yapay zeka sistemleriyle değiştirmeleri pek mümkün değildir. Özellikle duygusal görevlerle ilgili olanlar da dahil olmak üzere diğer istihdam türlerinin önemli bir yüzdesine sahip olacaktır. Dünya Ekonomik Forumu'nun 2018 raporuna göre önümüzdeki 5 yılda yapay zekanın gelişmesiyle birlikte 50 milyondan fazla yeni istihdam yaratılacağı öngörülmüştür. Dolayısıyla önümüzdeki yıllarda işsizlik riski yerine istihdamın artması, kısa ve orta vadede rutin işlerin yapay zeka sistemlerine devredilmesi bekleniyor. Uzun vadede yapay zeka sistemleri, iş kararlarında sürekli iyileştirmeye ve rekabet avantajına katkıda bulunacaktır. Tüketiciler, sosyal aktivistler ve sivil toplum kuruluşları, şirketlerin sürdürülebilir çözümlere

olan bağılılığını artıracak. Bu nedenle, şirketlerin rekabetçi sektöre hakim olmalarını sağlayacak stratejiler, karar verme ve yönetim için yararlı olabilecek büyük veri setlerinden yeni bilgiler çıkarmak daha da önemli hale gelecektir. Teknolojik devrimler, yeni bir üretim yönetimi biçimini, insanlar ve yapay zeka arasındaki etkileşimi ortaya çıkaracaktır. Çünkü bilgi teknolojilerine bağımlılığın artmasıyla birlikte insanlar algılama kapasitelerinin ötesindeki bilgilerle baş edemez hale gelecek ve bu durum toplumda tartışmalara yol açacaktır. Akıllı makineler genellikle terk edilmiş fabrikaların kıyamet senaryolarına ve işsizlikle dolu tüm alanlara paralel olarak çalışırlar. Bu nedenle, gelecekteki iş başarısı sadece işçilere özgürlük vaat etmekle kalmaz, aynı zamanda sosyalden sosyoekonomik perspektiflere geçiş ile yeni bir yönetim paradigması gerektirecektir. Son zamanlarda gelişmiş ülkelerdeki asgari devlet sübvansiyonları hakkındaki tartışmalar gerçekten korkutucu bir seviyede olmasa da, gelecekte bazı işsizliklerin olacağı beklentilerine dayanıyorlar.

Abstract

We present an experimental and computational study on concentration and transport of ozone produced by partial discharges in a high-voltage defective stator bar from a 30 MW hydrogenerator. Partial discharges can occur in the insulation system of a hydrogenerator's stator bars or on its surface which, over time, could lead to damage to the generator. In this study, a coil-type stator bar of a hydrogenerator was used, with defects in the insulation material. The stator bar was cut and placed in an acrylic chamber and then subjected to the high voltage of 8 kV (60 Hz). The ozone concentration was measured using

gas sensors (ultraviolet and electrochemical sensors). A computational fluid-dynamics (CFD) model was then developed to simulate gas flow and ozone concentration in the chamber, which was validated using the experimental data. The problem was numerically solved for different air velocities (0.7, 2.7 and 3.7 m/s). The results show that the CFD model can accurately predict the ozone concentration in the chamber and it can be used for monitoring partial discharge activity in hydrogenerators for preventative maintenance purposes. Curves in which ozone concentration depends on input velocity are shown and discussed. Three-dimensional ozone distributions obtained inside the chamber model are also analyzed. This study provides valuable information for developing monitoring methods for ensuring the reliability and longevity of hydrogenerators as renewable energy sources.

Keywords: Acrylic Chamber, Hydrogenerator Stator Bar, Partial Discharges, Ozone, Laboratory Experiments, CFD model.

1. Introduction

On a global scale, hydropower is one of the largest sources of renewable energy. According to the International Energy Agency (IEA), despite the fact that in 2017 approximately 64% of the world's electricity generation came from non-renewable sources such as coal (38%), natural gas (23%), and diesel-fired power plants (3%), hydropower represented 17% of the global electricity matrix as a renewable energy source (Lima, Toledo and Bourikas, 2021).

In Brazil, hydropower is one of the country's most important energy sources, accounting for 64% of the country's electricity production, according to ANEEL data from 2019 (Souza, 2023). Brazil's hydraulic energy remains open to further growth due to its considerable unexploited hydraulic potential, especially in the Amazon basin in the northern region of the country (Soito and Freitas, 2011).

The most important components of hydropower plants are the hydrogenerators, which generate electricity from the energy of falling or flowing water. As they are subjected to mechanical, thermal and electrical stresses during their lifespan, hydrogenerators can degrade over time, eventually resulting in failure. Since such devices are designed to operate for decades or longer, the study of preventative maintenance techniques is crucial for ensuring their operational reliability and longevity.

Partial discharge (PD) is a phenomenon that can accelerate the degradation process and cause damage to the generator insulation materials. It is a type of electrical discharge that can happen when there is a localized failure in the insulation materials of a hydrogenerator's stator bar. It occurs when high voltage is applied to the stator insulation system, producing electric fields that exceed the dielectric strength of the material.

PDs can also supply sufficient energy to transform oxygen into ozone. In this context, ozone measurements can be used as an inspection method for determining whether there are PDs on hydrogenerators. The associated reactions are given by (Buntat, 2009)

and

In (1), (2) and (3), e is a high-energy electron and M are other subproducts, such as O_2 , O_3 or N_2 , that the reaction can produce. Therefore, studying the concentration of ozone in the air around the stator bars surroundings can enable the detection and monitoring of partial discharge activity for maintenance purposes.

In this paper, an experiment was conducted to investigate the ozone concentration produced by a high-voltage defective stator bar inside an acrylic chamber. A computational fluid dynamics (CFD) model was then conceived, which was validated by using the experimental data for different air velocities injected into the chamber.

2. Methodology

In this section, theoretical and computational fluid dynamics concepts related to turbulent flow and the transport of diluted species, used in COMSOL Multiphysics® software, are presented. Then, we present an overview of the experimental setup, physical parameters and the simulation model.

2.1. Computational Fluid Dynamics

The mass conservation law for a chemical species i [Chung, 2002] is given by

$$\frac{\partial c_i}{\partial t} + \nabla \cdot \vec{J}_i + \vec{u}_m \cdot \nabla c_i = R_i, \quad (4)$$

where

$$\vec{J}_i = -D_i \nabla c_i. \quad (5)$$

In (4) and (5), \vec{J}_i is the diffusion flux vector given in mol/(m²·s), c_i is the species concentration (mol/m³), D_i is the diffusion coefficient (m²/s), R_i is an expression of reaction rate for the species given in mol/(m³·s) and \vec{u}_m is the average mass velocity (m/s). In steady state, (4) can be written as

$$\nabla \cdot \vec{J}_i + \vec{u}_m \cdot \nabla c_i = R_i. \quad (6)$$

Another important parameter in computational fluid dynamics is the Reynolds number Re [Griebel, 1998], given by

$$Re = \frac{\rho u L}{\mu}, \quad (7)$$

where ρ is the density of the fluid, u is the flow speed, L is the characteristic length and μ is the dynamic viscosity of the fluid. Fluids with $Re \approx 0$ are highly viscous fluids and, therefore, they are less susceptible to turbulence.

2.2. Fluid dynamics model with ozone reactions

In our CFD model, the parameter associated to ozone generation is R_i , given in mol/(m³·s), which is the reaction rate for the species. It can be calculated by

$$R_i = \frac{\eta \cdot P}{m \cdot V_{O_3}}, \quad (8)$$

in which η is the generation efficiency of ozone, P is the power of partial discharges, m is the ozone molar mass (47.997 g/mol) and V_{O_3} is the volume relative to the region where ozone is generated [Buntat, 2005].

The flux of ozone deposition on surfaces is given by [Cano-Ruiz, 1993]

$$\vec{u}_m \cdot \vec{J}_s = -\gamma \frac{\langle v \rangle}{4} C \Big|_{y=\frac{2}{3}l}, \quad (9)$$

where J_s is the net flux of species to the surface of interest, γ is the mass accommodation coefficient between ozone and the deposition surface, which is defined as the fraction of all surface-colliding ozone molecules that undergo deposition, C is the ozone concentration, l is the mean molecular free path with a value of 6.5×10^{-8} m at 293 K and 1 atm, and $\langle v \rangle$ is the Boltzmann velocity for ozone, given by

$$\langle v \rangle = \left(\frac{8kT}{\pi m} \right)^{1/2}, \quad (10)$$

where k is the Boltzmann constant ($1.38 \times 10^{-23} \text{ JK}^{-1}$), T is the temperature (K). Considering $T = 293\text{K}$, the Boltzmann velocity for ozone is $3.6 \times 10^4 \text{ cm}\cdot\text{s}^{-1}$. The diffusion coefficient D_i for ozone is $1.82 \times 10^{-5} \text{ m}^2/\text{s}$ [Willians, 1990].

The mass accommodation coefficient γ is specific for each surface material [Cano-Ruiz, 1993]. Experiments have been conducted in the scientific literature to measure the values of γ for different materials. The values used in this work are shown in Table 1.

Table 1. The parameter γ for different materials.

MATERIAL	γ	REFERENCE
Acrylic	2.35×10^{-6}	[Sabersky, 1973]
Copper	2.00×10^{-6}	[Morrison, 1999]
Outlet tube	1.10×10^{-6}	[Shen, 2017]
Stator bar surface	2.00×10^{-6}	[Shen, 2017]

2.3. Laboratorial Setup

The experimental setup of Fig. 01 was designed and assembled to investigate the production of ozone from the stator bar and to allow measurement and monitoring of ozone concentrations. The setup consists on a stator coil bar enclosed in an $145 \times 21 \times 50 \text{ cm}$ acrylic chamber with two $\frac{3}{4}$ -inch-diameter-tubes, a power supply that operates at 60 Hz with three voltage levels (0 kV, 4 kV, and 8 kV RMS) and a thermohygrometer. Furthermore, the inlet tube is connected to a hose that is attached to a pressurized air source. The ultraviolet ozone monitor receptacle is placed near the outlet tube.

Fig.01: Our laboratorial setup.

The coil-type stator bar supplied by Silvio Braga's (Curuá Una) 30 MW hydroelectric power plant hydrogenerator was cut at a section where the insulation material among its core materials presented defects (Figure 02). Subsequently, the bar was placed inside the chamber and connected to the 60 Hz high-voltage power supply with appropriate grounding.

Fig.02: The defective stator bar cross section.

2.4. The experiment

The inlet pressure was set to 2 bar for the entire experiment and the air velocity at the outlet was maintained at 2.7 m/s. The interior of the box was kept at a constant temperature of 21 °C and relative humidity of 24%. Ozone production was measured using the commercial ultraviolet ozone monitor 2BTechnologies model 106-L.

The experiment consists of measuring ozone resulting from the application of different voltage levels applied to the stator bar according to the following schedule: 0 kV during 5 minutes, 4 kV during 10 minutes, 8 kV during 10 minutes, 4 kV during 10 minutes, and 0 kV during 5 minutes. Data was recorded at the rate of 2 samples per second throughout the experiment using the monitor's software. From the measurements, it was possible to observe in Fig. 03 that, upon reaching a voltage level of 8 kV, the time-averaged measured ozone concentration was 495.4 ppb at the outlet tube (for inlet air velocity of 2.7 m/s).

Fig.03: Recorded ozone concentration during the high-voltage experiment. Inlet velocity: 2.7 m/s.

The numerical model

For the conception of the CFD model, the COMSOL Multiphysics[®] software was used, which employs the finite element method to solve transport equations of diluted species and turbulent flow, which were discussed in sections 2.1 and 2.2. Initially, the structures of the experiment materials, such as the acrylic chamber, stator bar and the inlet and outlet tubes, were modeled using the software, as one can see in Figure 04.

Fig.04: Computational model for representing the experimental setup.

A finite element mesh was generated using parameters of the physics of the problem for the internal and external regions of the chamber and tubes, as well as for the surface of the stator bar inside the chamber, as depicted in Figure 05. A total of 2,234,735 elements were employed to conceive the mesh, with a maximum element size of 15 mm and a minimum element size of 5 mm.

Fig.05. Computational model mesh conceived for performing simulations in COMSOL Multiphysics:
(a) external view, (b) Interior view and (c) model of coil stator bar.

In order to represent the ozone production at the discharge site (Figure 06), an 8 mm^3 element was introduced at the surface of the coil stator bar (Figure 07). This element behaves as an ozone source, in which R_i is set, which was implemented in the numerical model.

Fig.06. Naked-eye-visible discharge during our high-voltage experiment.

Fig.07. Element added as ozone source in the numerical model measuring 8 mm^3 in volume.

Results

For the high-voltage experiment, the ozone concentrations measured at the outlet tube during the experiment are represented in Figure 03. For the numerical model of the chamber, it was decided to use the average concentration measured during the excitation of 8 kV (495.4 ppb) as the basis for the parameters of the simulations. Thus, the species reaction rate of the ozone source was adjusted to attain an output concentration similar to the concentration measured for the case of $V_{\text{RMS}} = 8 \text{ kV}$ and input velocity V_{in} of 2.7 m/s. The results for the simulation of the experimental occurrence are presented in Figures 08-11.

Fig.08: Ozone concentration distribution inside the chamber for $V_i = 2.7$ m/s.

Fig.09: Cross section of ozone distribution for $V_i = 2.7$ m/s. Black arrows indicate velocity vectors.

Fig.10: Velocity field streamlines for 2.7 m/s simulation. Color map is based on velocity magnitude (m/s).

Fig.11: Velocity field streamlines for 2.7 m/s simulation. Color map is based on ozone concentration (ppb).

Subsequently, by maintaining constant the average concentration in the ozone source, additional simulations were executed varying the inlet air velocity for additional values (0.7 and 3.7 m/s) to evaluate the effect of the inlet air velocity on the ozone concentration of the numerical model. The results for these additional simulations are shown in Figures 12-19 and Table 2.

Fig.12: Ozone concentration distribution inside chamber for $V_i = 0.7$ m/s.

Fig.14: Velocity field streamlines for 0.7 m/s simulation. Color map is based on velocity magnitude (m/s).

Fig.15: Velocity field streamlines for the 0.7 m/s simulation. Color map is based on ozone concentration (ppb).

Fig.16: Ozone concentration distribution inside the chamber for $V_i = 3.7$ m/s.

Fig.17: Cross section of the ozone concentration distribution for $V_i = 3.7$ m/s. Black arrows indicate

velocity vectors.

Fig.18: Velocity field streamlines for the 3.7 m/s simulation. Color map is based on velocity magnitude (m/s).

Fig.19: Velocity field streamlines for the 3.7 m/s simulation. Color map is based on ozone concentration (ppb).

Table 2. Parameters and ozone concentrations obtained from the simulations.

Air Inlet Velocity (V_i) (m/s)	Ozone source reaction rate (R_i) (mol/(m ³ ·s))	O ₃ Concentration in Outlet (ppb)	O ₃ Concentration in Source (ppb)
0.7	1.595×10^3	272.36	1.027×10^6
2.7	3.418×10^3	495.40	1.027×10^6
3.7	4.756×10^3	573.11	1.027×10^6

Results: qualitative analysis

From the numerical results, a decrease in the outlet concentration for the simulation with inlet velocity of 0.7 m/s can be noted. One can also observe the formation of a region of turbulent gas displacement near the ozone source. For the smaller inlet velocity, ozone tends to circulate in the turbulence zone. For simulations performed with higher inlet velocities (2.7 and 3.7 m/s), there is an increase in gas turbulence levels, but there is also the formation of a laminar flow that contributes to transport ozone from the turbulence zone to the outlet tube, in such way that the output concentration obtained at the outlet tube increases with increments of the inlet velocity (in the studied velocity range).

Discussions and future perspectives

In general, it is known that partial discharges in hydrogenerators are important factors contributing to produce damages to electrical insulation and in reducing their lifespan. In that way, ozone concentrations in the air over usual levels can be indicative of partial discharges. Therefore, the results of this work can support future technical and scientific foundations aimed at improving the efficiency of measuring ozone concentration through the placement of sensors in strategic regions of hydrogenerators. Afterwards, in a future experimental scenario, the same studies on the velocity of air introduced into the chamber for the applied voltage of 4 kV in the experimental results and distinct air pressures in the chamber can be replicated. It is also possible to deepen the research by estimating the power of the discharge from the parameter R_i and relating the electromagnetic characteristics of the fields induced by high voltages, which are applied in the stator bar, with the fluid-dynamic properties of ozone production in the experiment.

Conclusions

In this work, a laboratory experiment was conducted, which was also computationally modeled. The experiment employs a defective hydrogenerator stator bar in a controlled laboratory environment to investigate the impact of air velocity on the ozone concentrations resulting from partial discharges on the bar installed inside the chamber. When the inlet air velocity is increased, there is a non-linear increase observed in ozone concentration at the outlet tube due to the formation of a laminar ozone transport path between the turbulence zone and the outlet tube. Therefore, when analyzing the concentration of ozone gas in hydrogenerators, it is important to study the impacts that air velocity has on the ozone concentration measurements. Effects of air velocity should be studied in hidrogenadores since its rotor produces ventilation, providing scientific and technical basis for efficiently placing ozone sensors in hydrogenerators for PD monitoring.

Acknowledgements

This work is part of the R&D ANEEL project PD-00642-2905/2020, which is entitled "*Investigação e metodologia de análise de concentração de ozônio em hidrogenadores como ferramenta de manutenção preditiva*". Authors appreciate the support from ANEEL and from the companies ENERCAN, BAESA and CPFL.

**ABOUT THE LITERATURE THAT WAS WRITTEN THROUGH THE PAGES OF
AN ISLAMIC MAGAZINE IN ALBANIA DURING THE SECOND WORLD WAR**

GËZIM PUKA

Dr. Gëzim Puka, University of Shkodra “Luigj Gurakuqi”, Albania, Faculty of Social Sciences,gezim.puka@unishk.edu.al, ORCID No: 0000-0002-7571-2657

ABSTRACT

We believe that the magazine "Islamic Culture" evokes both curiosity and satisfaction for all those who look with interest at the developments of Albanian journalism. It is universally known that the press is inextricably linked to the culture of a nation. Culture as a synonym of Albanian memory should encourage us to remember from time to time what our ancestors did for the benefit of progress. We believe that the Islamic culture was adequately represented by the magazines: "Zani i Naltë", "Kultura Islame" and "Njeriu". This press has dedicated a lot of space to writings that evaluate the elements of the state and the nation. The magazine "Kultura Islame" was an outstanding help in the scene of Albanian periodicals, who appeared in a period of liberalism and growth of the Albanian intelligence throughout the country. The magazine was born in 1939 and fell silent in 1945 anticipating developments that would contradict the liberal and democratic culture and approach that it tried to manifest. The changing times would have no space neither for free breathing nor for religious, scientific, and literary topics. They would be narrowed down to the tragic reality that was approaching in the communist era. Rich informative and study subject in the field of religious, philosophical, literary, historical and scientific thought; the translations and studies brought into Albanian were products in coherence with the developments of the time's thought and they also expanded the horizon of the Albanian reader's expectations in these fields.

Keywords: the magazine, culture, islamic, literature, memory.

INTRODUCTION

If we consider a fragment of the definition given by this periodical in the number 6-7 of 1939 for the culture, we will witness how much this creed of the magazine "Kultura Islame" maintains expectation and relevance even today. We quote: "It is obvious that with the word culture, we mean the knowledge or the scientific, literary and artistic states of the peoples and nothing else. It should be known that culture is of great importance in itself. [...] If culture weakens in any nation, the conclusion is that it weakens nothing but literary, scholarly and artistic production, so the knowledge market is in crisis. In this way the path to ignorance is opened having minds astound and static. Genius sustained in generations is lost. In this case, in addition to what has been said, it often happens that false beliefs, thoughts and ideas spread, and people are closer to inspiration than to requests, clarifications and inventions. (1939)

"...the reduction of literary production..", I pointed out this expression to emphasize the importance that literary production and literary study was expected to have. In fact, from its beginning, the magazine would have its space for literature as well. If we were to give a description of how this periodical was included in the framework of the Albanian literary system of those years, we could say that within this system there was the famous triad: production, tradition and import. In other words, the magazine would have as its goal newly literary production, the publication and study of traditional literature, as well as its translation.

1. "ISLAMIC CULTURE" MAGAZINE

In the article entitled "Echo of poetry", in the third issue of this magazine, the student of Literature at the University of Padua, Fadil Karakaçi writes: "The poet belongs to his people. He engraves incomparable apotheosis of glory. He presents the girl's love in the mouth of an entire people, and the graceful colors with which he wears the selected verses, he enjoys them under the transparent lights from which he also emits the sounds of a divine melody".

Against this goal, which seems to be the goal of this magazine, Ferit Vokopola, Shaban Demiraj, Refik Bezhani, Besim Lëvonja, Bardhyl Nizami, Jolanda Kodra, Eqrem Çano, Halit Haveriqi, Rom, Murat Labënishti, Shero Imami, Petrit Kokoshi, Memli Mano, Veli Hafizi, etc began to test themselves with their verses. Let us present something from this literary production, pointing out different verses. In the poem entitled "Suraja e Agimit" by Ferit Vokopola, written in the folk eight-syllable verse, elements of philosophical and moral content can be observed. We are quoting the verses in Albanian, because it is the original language:

Kur Zoti njerinë veçon,

Me begati e nderonë,

Ky at-herë zë e thotë;
Më nderove Ti o Zot!
Por se kjo më t'u paksuarë,
Mbesimin për të provuarë,
Nukë druhet që të thotë,
Më tradhtove Ti, o, Zotë!
Jo! Unë kurrë nuk tradhëtonjë!
Por ju jetimin s'e nderuatë!
Të vobegtin (e shikonjë)
Që pa bujtur e dëbuarë!
Trashëgimin që zotronia,
Me hallall-harram trazoni
Kamjen tepër dashuroni.
(When God singles out a person,
With prosperity they honor him,
This time he begins to say;
You honored me, Lord!
But when this is reduced,
the faith to try,
He's not afraid to say,
You betrayed me, O Lord!
No! I never betray!
But you did not honor the orphan!
I look at the poor
You kicked him out without welcoming him!
The legacy I owned,
Stir with halal-harram
You love wealth too much.)

While another poem will follow in number 5 of the magazine in 1940 by an author who would later become one of the most prominent linguists, prof. Shaban Demiraj. The poem is written in eleven-syllable verse and is called : "Prophetic Birth" (Lindjes Profetike). In addition to prose, dramaturgy also begins to occupy a prominent place in magazines. Here we can mention Mustafa Mustafaj's short prose : (Rruga e mergimit) "The path of exile" (no. 1-2, year

1942), "Tradhetija" "Betrayal", "Ku eshte babai" "Where is the father?" which the author calls them *novellas*. The magazine will also publish in several issues an idyllic drama by Asim Lohja from Shkoder called: ("Agim pranveror i jetës shqiptare", "The spring dawn of Albanian life), a four-act drama. From Murat Labënishti, I would like to highlight some verses from the poem "Gjuha amtare", "Native language":

Po nuk rojte mbi çdo tjetër

Gjuhën tënde të bekuar,

Atë flakë aq të vjetër

Që me shekujt t'ka ndriçuar

(If you don't feel it above any other

your blessed language,

That flame so very old

That over the centuries has enlightened you.) (Mustafa, 1945)

Research and critical articles will be an added value of the journal. It also leaves room for literary criticism, which presents the first indicators of theory, history and literary criticism. Such signs bear witness to time and are witnessed by time. By highlighting some scholars and critics of literature trained in the best universities of the time, the magazine "Kultura Islame" is in the "battlefield" and tries to announce the arrival of new works and new authors, who start their lives in Albanian literary system of the time.

2. AUTHORS WHO CONTRIBUTE MORE TO THIS MAGAZINE

Finally, the criticism of this journal tries to deal with the evaluation and presentation of the results, qualities, as well as with the issues of failure or various literary slips. Names that stand out are: Sadik Bega, Sherif Putra.

The researcher Fadil Karakaçi will bring the article "Eurythmy"(Euritmi) and later in number 10 of 1940, he will write an interesting article on the positivist and romantic thought in literature. From Izet Bebeziqi, we would distinguish the article published in No. 3 of 1939 with the title: "Albanianism abroad and inside the homeland", where the researcher notes that: „The real purpose of this study is mainly to present how the Albanian National Idea and the independence of Albania developed. Here lies the most important understanding of the role of Albanians in foreign countries.“ He continues with the formation of Arbëresh colonies and their contribution to the creation of Albanian literary production. This article continues in number 4, where the most prominent Arbëresh writers are highlighted and Jeronim de Rada is sublimated.

In number 10 of 1940, we have an article published under the pseudonym PLUS entitled: "About Albanian literary production". It is noted: „Today we need a literary generation! We ask for this because we don't have it. We ask for this because, like any nation, the Albanians also need to learn the high virtues that literary art produces. But before making this request, let's briefly see what role literary texts play in our lives. " (PLUS, About Albania literary production, 1940)

While this same author in another writing in commemoration of the national poet Naim Frashëri writes: "The poet of "Bagëti e Bujqësi" was none other than that pastoral singer, that poet of the inspirations of the soul, that weaver of the whims of the heart, that true artist who suffers, but does not endure". (PLUS, The poet of "Bagëti e Bujqësi", 1940)

In the article: "Critic and criticism"(Kritikë dhe kritika) he notes: "To have a good critic, to make the criticism generous, in a world where art is in its eternal rebellion, is an asset. It is lucky for those critics who feel the dignity of their mission and of their work,as well. " (Critic and criticism, 1941)

In number 7-8 of 1944, Professor H. Ali wrote: "Hasan Zyko Kamberi 200 years ago" where he states: “Hasan was not only a well-known erudite of a great fame, but he was also a natural poet. He rhymed effortlessly, and the verses flowed from his mouth like water flowing from a spring, unhindered.” (Ali, 1944)

Prof. Shefik Osmani, who would become one of the holders of pedagogical studies in Albania, publishes in this magazine under the pseudonym SHETOS. He would have an article entitled: "Nezim Ibrahim Frakulla from Berati" and would bring an interesting fact about the first dramatic dialogue in the Albanian language. We quote: "The incited and misunderstood Nezim complains and writes the song - Complaint from humanity/mankind of the 17th century. After that, a very beautiful song follows: They said it on a picnic in Bilçë. It has some historical value. It closes with a dialogue that is divided into two parts, - ‘The language speaks to the heart’- and a response - "The troubled heart responds to the language". It seems that it is not completely finished. But with this dialogue we have Nezim as a whole: with miseries, suffering and love.” ((SHETOS), 1942)

Muhamet Bala surprises us with an article no. 5-6-7 of 1942 with the title: "Do we have a modern Albanian drama" where he gives us a similar fact that can be of value to the history of Albanian literature, especially the history of the dramatic genre when he states: “Very little has been written in the field of dramatic art. Nezim Berati wrote a conversation in 1650 "Heart

and Spirit"(Zemra e Shpirti). ‘Something pastoral’ writes De Martini. Slowly the historical drama begins and comes to life, which unfolds little by little.” (Bala, 1942)

3. THE BEGINNINGS OF A LITERATURE AND CRITICISM WITH FEMALE AUTHORS

Jolanda Kodra was an Italian, born as Iolanda Guazzoni, in 1912, in Rome. She was the granddaughter of Enrico Guazzoni, an Italian screenwriter and film director. She was studying at a classical high school when she met her future husband, Malo Kodra, originally from Gjirokastra, who was a student in Rome. After coming to Albania, prepared with a good literary and philosophical culture, she participates vividly in the press of the time by publishing valuable studies and articles on the work of some of the most prominent representatives of our national literature, such as: Naim Frashëri, Gjergj Fishta, Migjeni, Ndre Mjeda in such serious cultural and literary magazines as: "Shkëndija", "Hylli i Drites", "Perpekja" , "Njeriu", "Islamic Culture", "Fryma", etc. Jolanda Kodra worked especially for Migjeni and Mjeda, who she would later translate into Italian. She was one of the first women to publish in Albania, in the company of Selfixhe Ciu and Musine Kokalari. After the Second World War, she also translated such writers as: Petro Marko and Sterjo Spasse. She was neither allowed to teach in the communist regime nor to return to her country again until 1962, a year before her death. In the September 1941 issue of the "Islamic Culture"(Kultura Islame) magazine, Jolanda Kodra will translate into Italian the poetic creation: "Flights of the Spirit", thus exporting the latest creations of Albanian literature to a great culture and language. In support of this translation, Gjergj Komnino would say: "Well Done, but only on one condition: continue your work without interrupting and try to get the most beautiful flowers of our garden. The importance of service is recognized by the future generation and art lovers". In number 8-9 of 1942, there is this new figure of Albanian letters who will create poetry in Italian and Albanian: Albania (Shqipërisë). We are quoting the first stanza of this twelve-stanza poem:

“Kjo tokë më të cilën një ditë shkëlxej arma
E pathyeshme e Skanderbeut të lumnueshmëm
E q’ e fortë si’i shkrep qindron gjatë shekujvet,
E denjë do t’ ishte për një kangë të Horacit
Qe tue jehue n’ ether, za-math
Emnin t’ja bante dhe shembujvet të naltë
Bujarije, fuqije, e trimnije
T’u na naltësonte një hymn që kurr nuk vdes”.

(This land on which one day the weapon shines
Invincible of the blessed Skanderbeg
Strong that like a rock stands over the centuries,
It would be worthy of a Horace song
Already echoing in the ether, big voice
The name also belongs to the high views
Generosity, strength, courage
giving us a hymn that never dies.)

One issue later, Jolanda Kodra translated the article: "Ideal value and practical goals of philosophy".

Xhemaliqe Shkreli (pseudonym Postribësja), born in Shkodër in 1919, is among the first women to continue her studies at the University of Florence, at the Faculty of Literature and Philosophy, becoming an intellectual with patriotic, progressive, and emancipatory ideas. Through her publicism, she gave a strong signal to Albanian society that the time for the opinion, place and role of women in the life of the country had come to never stop. In this context, Postribesja, in number 5-6-7, of 1942, in "Islamic Culture"(Kultura Islame) has an article entitled: "To the author of "If I Were a Boy"(Sikur të isha djalë)", where she expresses all the excitement of a meeting she had with Haki Stërmilli , who had done so much for the emancipation of women with the novel he wrote

In the issue of August 12, 1940, a poem by Gjergj Komnino was published with the title: "Jeronim de Rada" from which we would quote the verses: "The verse flows so pleasantly, just like the green grass ... You are marble, not from ruby, but from the linguistic cord".

While in the field of translation, we can evaluate Sadik Bega, Vexhi Buharaja, who translated, in several issues of the magazine, articles from the well-known Arab researcher Taha Hussein about the classical leaders of thought, such as: Homer, Socrates, etc.

In numbers 9 and 10 in 1942, a linguistic study by Dr. Vittorio Vallonica: "For a rational and uniform transcription of Arabic using the Albanian alphabet" appears translated from Italian language . In the following issue, the article titled: "A part of the Muslim civilization in Spain and Sicily" is published and is brought by another translator who would later excel in the field of lexicology of oriental languages, Tahir Dizdari.

Figure 1. Cover of "Islamic Culture" Magazine

CONCLUSION

This article tries to make a journey and offer the readers, and especially the researchers of Albanian literary thought, the opportunity to better know not only the literary developments in a special historical period filled with many events, but also the attitudes, thoughts, and the activity of Albanian intellectuals, who had different fates in the years that followed. The presentation of the magazine on the official electronic website of the Shkodra Library "Marin Barleti" is a valuable help, which makes it possible the meeting between a wide archival material and the public, bringing it closer to the past. At the same time it is a tribute to the intellectual diligence of a generation that worked with idealism with the tools of culture and knowledge. The magazine is a model that makes it possible to facilitate the connections of the Albanian society and especially with the cultural heritage of the preceding intellectual elites. We think that the "Marin Barleti" Library of Shkodra has done a good job and should be thanked, as an institution open to inherited values, which can be offered today as models of media development. All these are important values, which Albanian society is in great need of.

ABSTRACT

Welding is one of the major processes in the automobile, construction, aviation, and other sectors. Manual welding requires high dexterity level of the operators. The expertise of the welder affects the surface appearance of the weld, including its shape, mix, ripples, and presence of any spatter. Manual welding exhibits low weld quality, high defect rates, and low efficiency. Due to localized heating and cooling, inappropriate mixing, and dilution in the weld solution result in the formation of bead excessive asymmetry, inadequate penetration, and many other problems at the welded joints. These defects result in the reduction of the cost-effectiveness of welding. So, there is a need to monitor and control in-process welding. It makes a closed loop to get continuous feedback and adjust welding parameters automatically according to the required weld quality. Hence this aims to present a step towards the automation of welding in the arena of Industry 4.0. The purpose is to automate the monitoring of defects in real-time or

in-process welding using the digitization of the high-resolution camera. For monitoring the welding process the images of already welded parts are taken and images are classified as good or bad images, and then through machine learning algorithms, the model is trained to classify any given images. After making the algorithm it is validated to be used for the welding process. The accuracy of the algorithm is determined, which is mainly based on the number of images taken to train the model. Thus, an intelligent robotic welding system is developed which can change its parameters by itself through the algorithm. The developed system is fast, efficient, cost-effective, and requires less skilled labor, thus it has brought great innovation in the entire fabrication process.

Keywords: Industry 4.0, Robotic welding, Automation, Machine Learning

INTRODUCTION

Systems and techniques for welding are crucial components of contemporary industrial production lines. Through technology development, automated welding systems using industrial robots have replaced many welding tasks requiring hand operation [1]–[3]. Despite being in use for years, welding robots are preprogrammed devices with little to no intelligence. Figure 1 shows that Intelligent manufacturing is implemented by the transformation of Human physical systems to Human cyber-physical systems with the aim of achieving specific manufacturing goals at an optimized level [4].

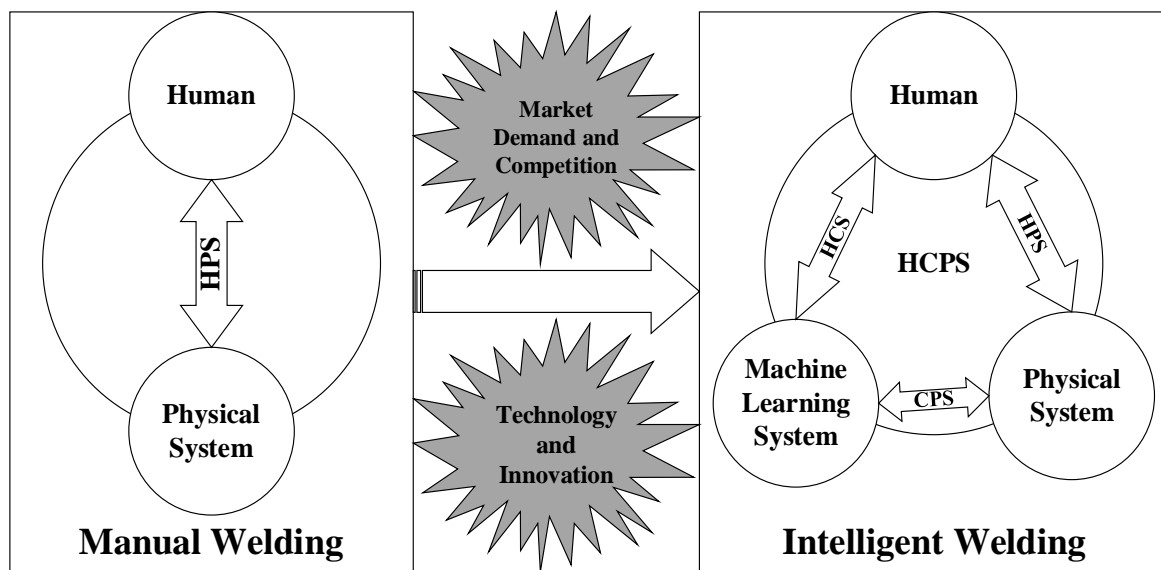

Figure 1: The advancement of welding systems from HPS to HCPS. [5]

There are presently several manufacturing businesses using machine learning techniques. In order to forecast specific mechanical properties, a variety of machine-learning techniques can be used. A smart manufacturing process is now using artificial intelligence techniques like machine learning and deep learning in a variety of ways. Machine learning analyses and gains knowledge from the dataset that is accessible, whereas Deep Learning models build Artificial Neural Network algorithms in a variety of layers based on the dataset's intended use. Machine learning has a major benefit over deep learning in that it requires less time to train the models than deep learning. [6]

The visual representation of algorithms and experimentation can improve the effectiveness of learning and teaching the principles of image processing. Because Python is an interpreted language with libraries devoted to specific tasks, it is a great choice for learning digital image processing. This eliminates the need for expensive commercial software's ambiguous black boxes and allows for the manipulation of codes and crucial algorithms. [7]

The welding procedures used today are complex, rely on a lot of variables, and have a poorly understood mechanism. User and customer needs for welding are distinct, and they work in circumstances that are always changing. As a result, welding is shifting to more specialized production using cutting-edge welding equipment that can nimbly adapt to changing welding requirements while retaining excellent quality. Smart approaches for gathering and analyzing welding data are essential in the field of big data. Monitoring metrics before and after the welding process, for instance, can improve the welding process, performance, and service quality. Although there are numerous welding techniques, advances in information science and technology are enabling the transformation of traditional welding to intelligent one. Because of advances in computer science and artificial intelligence, intelligent automation is replacing manual work. Manufacturing research programs have all examined smart manufacturing, Industry 4.0, and the internet of things. In the future big data, intelligent manufacturing, human cyber-physical systems, and AI will revolutionize the industry. [4], [8]–[13]. The platforms, enablers, and drivers that are required for advancing welding systems to greater intelligence levels are being provided by these programmers. Welding technology has gone through four stages of development. In phase 1 it was done manually, which had some efficiency and quality issues. In Phase 2, automation was used along with robots but automatic parameter adjustment was the problem. In Phase 3 welding automation was made easier using "teach and playback" robots, but it was offline and had a limited capacity to respond to changes. Phase 4 is related to the welding systems that are made intelligent and upgraded to monitor and regulate the parameters and quality of the welding process more effectively.

From the above discussion, it can be concluded that automation of welding is a need for technological advancement. Hence this research presents a step toward the development of an intelligent welding system by controlling the in-process welding with the use of a supervised machine learning algorithm and a high-resolution camera.

METHODOLOGY

The formation of the paper is outlined in figure 2. Phase 1 includes the literature review of the intelligent welding system. Phase 2 "Technology design and development" is about collecting data and building algorithms. Phase 3 focuses on results and discussion and phase 4 is about the conclusion and recommendations of the research.

A thorough review of the literature on intelligent welding research was conducted in phase 1. The search was restricted to welding technologies for convenience, even if publications

on intelligent manufacturing may have also turned up information on intelligent welding. In this stage, best practices in the creation of modern industrial welding are identified through a survey of the literature and other research. It comprised a thorough analysis of the pertinent literature in each of the project's important areas, including an examination and identification of best practices in the welding process design in the context of innovation. A detailed analysis of closed-loop welding is examined. It assisted in determining the current research problem. To develop the study, aim and objectives, innovation, and originality for this project, research questions are extracted based on the examined research problem.

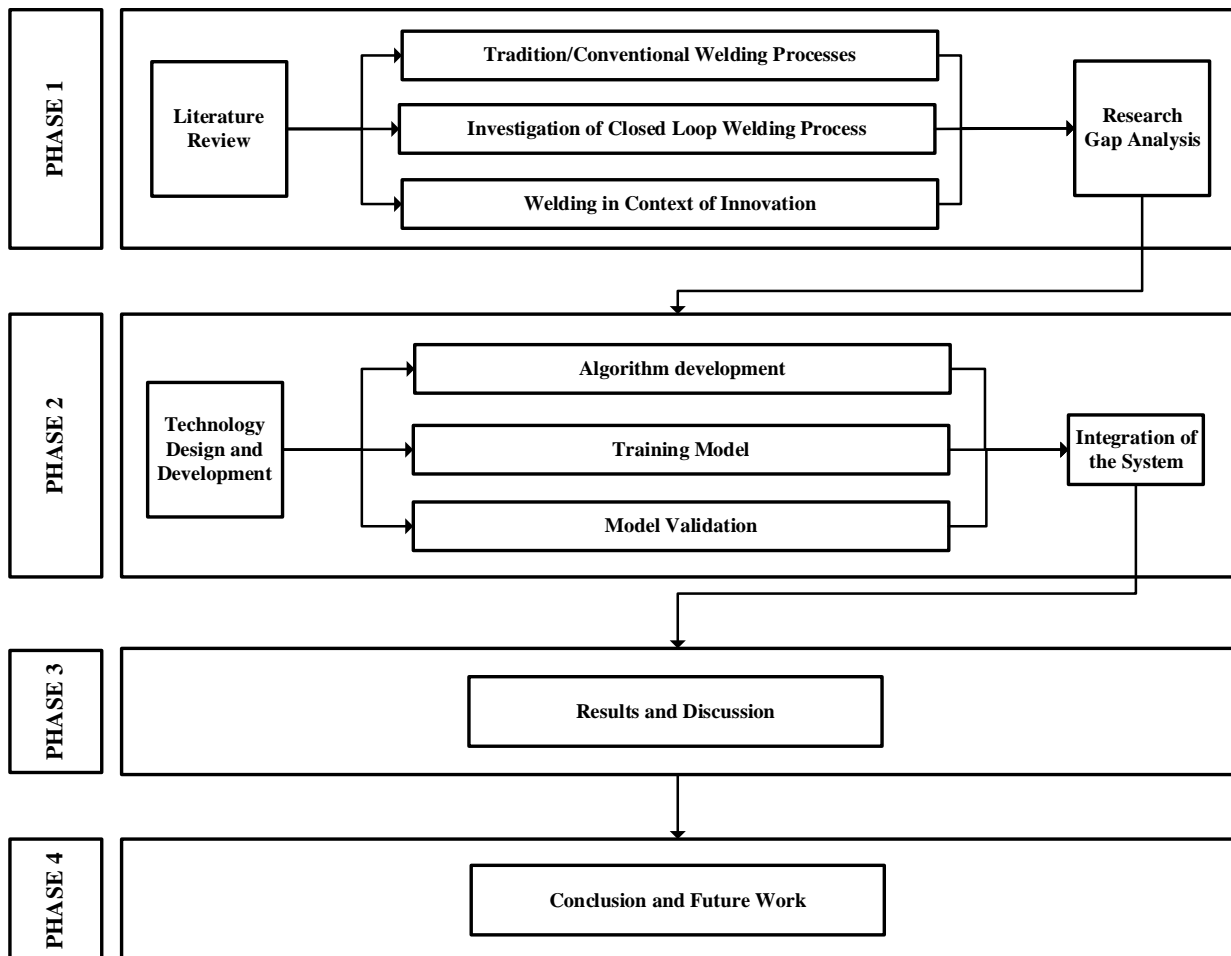

Figure 2: The Structure of the Research Methodology

In phase 2 The following steps need to be taken to perform the technology design development:

1. Image data of welded parts are collected.
2. It is passed to the classification model that recognizes whether a material is correctly welded or incorrectly welded, whether it is best welded or worst welded.
3. Machine Learning algorithm is made and trained on the image data collected.

4. After performing the inference task, our model will let us know about the class to which the material belongs such as correctly welded or incorrectly welded material.
5. Continuously improve the algorithm to get the maximum accuracy.
6. Integration of the complete system.
7. After the integration of the system, the complete model is validated to ensure that the model is behaving as intended as shown in figure 3 below.

The Schematic diagram is shown in Figure 3.

Figure 3: Schematic Diagram of Welding Monitoring Process

Figure 4: Experimental Setup of Welding Monitoring Process

First, we must make a dataset of images based on which the supervised learning algorithm will work. Then we'll make an algorithm using machine learning tools and using the python language.

The images of manual welding are classified as best or worst as shown in Figures 3 and 4. In the classification of the weld images, it is considered that the best weld has no cracks and holes in the bead, the bead is uniform, the width and height are appropriate, and the strength of the welding meets the requirements.

Figure 5: Worst Weld from manual welding

Figure 6: Best weld from manual welding

The machine learning algorithms help in determining the best and worst images. First of all, the Visual Studio environment is installed in the system. The necessary libraries are installed such as NumPy, matplotlib, cv2, etc. The libraries are imported, and the dataset is loaded for binary classification. After that, the model is trained on the dataset.

In Phase 4 there is an explained discussion of the results.

In the last phase, there is the conclusion of this work.

RESULTS AND DISCUSSION

This part of the paper presents the outcome of all the processes performed during the study starting from the data collection where images were captured and then classified according to the condition that whether the image is best or worst welded, and then we made image recognition using python language for the trial-and-error method.

It has been done through the Python language where Jupyter interfaces are used which provides interactive coding by using ipywidgets packages that can help explore and apply codes in a more interactive fashion. In addition, the Visual Studio Code interface is used for Python coding, which is also commonly referred to as VS code, loads really fast and takes less time. Having a modular approach to Code helps it perform better.

First, the necessary libraries have been imported into the respective interface, those libraries include cv2, NumPy, matplotlib, etc. After loading and importing the necessary libraries, binary classification was done which is classifying elements of a set into two groups based on a classification rule. The binary classification algorithm in machine learning categorizes new observations into one of two categories. It is a method of machine learning that uses predefined categories and categorizes new observations into those categories using supervised learning. When there are only two categories the problem is known as statistical binary classification.

After loading and importing the necessary libraries, then the dataset of images that have been made is loaded to the interface, and the classification of images based on the respective dataset is done.

CONCLUSION AND FUTURE WORK

Though, this is a trial-to-error method, the detailed experimentation of the large dataset will be done later in future work. Based on the small dataset that has been given to the interface, the code has been executed to recognize the image that has been given to the model afterward. The model was trained on the dataset that has been made through the data collection phase, and after loading the respective dataset to the interface, and training the model accordingly, then a new image will be uploaded to the model, and based on the data, it will tell that whether the respective image is best welded or worst welded. When executing the model that has been trained on the dataset, the image can be detected easily by just giving an image of the welded part to it, and the model will detect whether it is best welded or worst welded.

Future Work is aimed to use a big data set of weld images to increase the prediction accuracy of the welding robot. The experimentation will be done by the integration of the algorithm with the welding robot for controlling the weld parameters by the continuous feedback control system. Further, the image classification will not be limited to binary but enhanced according to the big data. The parameters will be set for each type of image difference and the robot will be behaving accordingly. The codes will also be available on the cloud; so that anyone can access them and can make the welding processes run easily.

ABSTRACT

Today, the increasing interest in gastronomy has led to a detailed investigation of many concepts in the study area of gastronomy and enriched gastronomy literature. For example, concepts such as neurogastronomy, gastrophysics, holistic nutrition, and mixology are among the topics that have been researched frequently recently. Mixology has become an increasingly popular field in recent years, with many bars and restaurants hiring skilled mixologists to create unique and innovative drink menus. Although the literature review on mixology has an ancient history, it is still new to see studies on the "art of mixing" in its simplest form. There are some conceptual confusions on the subject, and the people working in this field have not yet reached a consensus on some issues. This study emerged from these findings and aims to conduct detailed conceptual research on mixology. When examining the literature on mixology, which is defined as "the art and science of creating mixed drinks, cocktails, and other beverages using various ingredients, techniques, and equipment," it can be said that the conducted studies are relatively few. However, mixology, which studies the history of drinks, the etymology of the names of drinks and cocktails, the methods of preparation, and the materials used in their preparation, is an integral part of gastronomy and tourism. While this study clarifies concepts such as mixology, mixologist, and bartender, it is also important in addressing the issue of molecular mixology as an extension of molecular gastronomy. At the same time, the study is a conceptual study aiming to bring together national and international publications on mixology. With this study, it is concluded that although there are many publications in the fields of tourism and gastronomy, there are limited studies in the field of mixology and most of the studies are written in foreign languages. It has been determined that there is no diploma program for those who want to study mixology at the national or international level, and the training is limited to certificate programs only. In addition, it has been understood that tourism enterprises can increase customer satisfaction and demand if they invest in mixology. With this study, it is concluded that although there are many publications in the fields of tourism and gastronomy, there are limited studies in the field of mixology and most of the studies are written in foreign languages. It has been determined that there is no diploma program for those who want to study mixology at the national or international level, and the training is limited to certificate programs only. In addition, it has been understood that tourism enterprises can increase customer satisfaction and demand if they invest in mixology.

MİKSOLOJİ ÜZERİNE KAVRAMSAL BİR ARAŞTIRMA

ÖZET

Günümüzde gastronomi bilimine olan ilginin artması, gastronominin çalışma alanı içerisinde yer alan pek çok kavramın da detaylıca araştırılmasına ve gastronomi alanyazınının giderek zenginleşmesine vesile olmuştur. Örneğin nörogastronomi, gastrofizik, holistik beslenme ve miksoloji gibi kavramlar son dönemde üzerine sıklıkla araştırma yapılan konular arasında sayılabilir. Birçok bar ve restoranın benzersiz ve yenilikçi içecek menüleri oluşturmak için yetenekli miksologları işe almasıyla birlikte, miksoloji son yıllarda giderek daha popüler bir alan haline gelmiştir. “Çeşitli malzemeler, teknikler ve ekipman kullanarak karışık içecekler, kokteyller ve diğer içecekler yaratma sanatı ve bilimi” şeklinde tanımlanan miksoloji, içeceklerin tarihini, içeceklerin ve kokteyllerin isimlerinin etimolojisini, hazırlanış yöntemlerini ve hazırlanırken kullanılan malzemeleri incelemektedir ve gastronomi ile turizmin ayrılmaz bir parçasıdır. Bu çalışma bir yandan miksoloji, miksolog, bartender gibi kavramlara açıklık getirirken, diğer yandan da moleküler gastronominin bir uzantısı olarak moleküler miksoloji konusunu da ele alması açısından önemlidir. Çalışma aynı zamanda miksolojiyle ilgili ulusal ve uluslararası yayınları bir araya getirmeyi amaçlayan kavramsal bir çalışmadır. Bu çalışma sonucunda; turizm ve gastronomi üzerine oldukça fazla sayıda yayın bulunmasına rağmen miksoloji alanında sınırlı sayıda çalışma yapıldığı, yapılan çalışmaların çoğunlukla yabancı dilde yazılmış olduğu, miksoloji eğitimi almak isteyenlerin müracaat edebileceği herhangi bir diploma programı olmadığı, eğitimlerin yalnızca sertifika eğitimleriyle sınırlı olduğu ve turizm işletmelerinin miksolojiye yatırım yaptıkları takdirde müşteri memnuniyetini ve talebini artırabileceği sonuçlarına ulaşılmıştır. Bu çalışma ile turizm ve gastronomi alanlarında çok fazla sayıda yayın bulunmasına rağmen, miksoloji alanında sınırlı sayıda çalışma yapıldığı ve çalışmaların çoğunun yabancı dilde yazıldığı sonucuna varılmaktadır. Miksoloji eğitimi almak isteyenler için ulusal ya da uluslararası düzeyde müracaat edecekleri herhangi bir diploma programının bulunmadığı, eğitimin sadece sertifika programları ile sınırlı olduğu tespit edilmiştir. Ayrıca turizm işletmelerinin miksolojiye yatırım yapmaları halinde müşteri memnuniyetini ve talebini artırabilecekleri anlaşılmıştır.

Anahtar Kelimeler: Miksoloji, moleküler miksoloji, miksolog, gastronomi

Giriş

Miksoloji ve gastronomi genel olarak yemek deneyimini geliştirmek için yüksek kaliteli tatların yaratılmasını ve eşleştirilmesini içeren alanlardır. Bu bağlamda miksologlar ve gastronomlar müşterilerine yönelik yeni lezzet kombinasyonları ve unutulmaz deneyimleri yaratmak için sürekli olarak yeni içerikler, teknikler ve tarifler denemektedirler. Örneğin miksologlar kokteyllerini oluşturmak için genellikle taze meyve, ot, baharat ve yüksek kaliteli alkoller kullanırken, gastronomlar yemeklerini geliştirmek için yerel kaynaklı, bir başka ifade ile yöresel ve mevsimlik malzemeleri kullanabilirler. Her iki meslek grubu da farklılığı oluşturan, kalitesi yüksek ve çeşitli malzemeleri geleneksel ve yeni tekniklerle beraber kullanarak daha lezzetli, benzersiz ve imzası olan bir yiyecek ve/veya içecek yaratmayı amaçlamakta ve daha uyumlu bir yemek deneyimi yaratmak için birlikte çalışmaktadır. Miksoloji bu noktada gastronomiyi desteklemekte ve gastronominin bir alt dalı olarak düşünülmektedir.

Son dönemde üst düzey kokteyl barlarının sayısındaki artış, gerek yapılan yiyecek ve içecek yarışmalarının gerekse de yarışmayı izleyen ve katılanların sayıca artması, televizyon programlarında ise bu tarz yarışmaların izlenme oranlarının yükselerek geniş kitlelere ulaşabilmesi gibi pek çok husus dikkate alındığında miksoloji dikkat çeken ve popüleritesini koruyan bir alan olmuştur. Miksoloji sanatına ve bilimine yönelik artan sayıda kitap, dergi, web siteleri ve sosyal medya hesapları da bu konunun ne denli önemli ve dikkat çekici olduğunu bir kez daha gün yüzüne çıkartmaktadır. Ayrıca birçok restoran ve otel kapsamlı kokteyl menüleri ile yüksek kâr marjlı ürünler sunmakta ve kokteylleri belirli yiyeceklerle eşleştirerek onların lezzetini arttırmakta ve daha uyumlu bir yemek deneyimi yaratmaktadır. Bu durumlar miksoloji üzerine çalışma yapmanın önemini ortaya koymaktadır.

Alanyazın incelendiğinde miksoloji ile birlikte sıklıkla; miksolog, bartender, barmen ve moleküler miksoloji gibi pek çok farklı terimin kullanıldığı görülmektedir. Detaylı okumalar yapıldığında ise söz konusu terimlerin birbirinden farklı anlamları olan ancak zaman zaman birbirini yerine yanlış bir şekilde kullanıldığı gözlemlenen terimler olduğu görülmektedir. Bu bağlamda bu çalışmanın öncelikli amacı, miksoloji bilimi ve bu bilime ait terminoloji hakkında temel bir çerçeve çizmek, aynı zamanda miksolojiyle ilgili ulusal ve uluslararası yayınları bir araya getirmektir. Çalışmanın alanyazına, sonraki araştırmacılara ve içecek bilimi üzerine ticari faaliyetlerde bulunan gastronomi ve turizm sektörü paydaşlarına katkı sağlayacağı düşünülmektedir.

İlgili Alanyazın

Miksoloji ile ilgili alanyazın taraması sırasında erişilen çalışmaların büyük bir kısmının kokteyl reçeteleri içeren kitaplar olduğu, görece daha az bir kısmının ise gazete ya da dergilerde yazılmış olan köşe yazıları niteliğinde olduğunu söylemek mümkündür. Bu noktada internet ve sosyal medyaya olan hatırı sayılır ilgi de dikkate alındığında miksoloji ile ilgili blog sayfalarının varlığından da söz edilmelidir. Ancak daha önce de vurgulandığı üzere miksoloji ile ilgili yapılmış bilimsel çalışmalar az sayıdadır. Bu durumu miksolojinin yakın zamanda yükselişe geçmiş bir alan olmasıyla açıklamak mümkündür. Yine miksoloji üzerine yapılmış çalışmaların sayıca az olmasında otellerdeki yiyecek-içecek departmanının tek bir departman olarak algılanmasının payının olduğu da düşünülmektedir. Örneğin lisansüstü tezler söz konusu olduğunda yapılan çalışmalarda yiyecek-içecek departmanı çalışanlarının bir bütün olarak ele alındığı, bar personelleri özelinde çalışmaların yapılmadığını söylemek mümkündür. Hatta bu savı kanıtlamak adına YÖK Tez Merkezi'ne 09.04.2023 tarihinde giriş yapılmış, tarama terimi kısmına sırasıyla "bar departmanı", "bar personeli" ve "miksoloji" anahtar kelimeleri hem Türkçe hem de İngilizce olarak yazılmış ancak ne başlıkta ne de özet ve dizinde herhangi bir sonuca ulaşılamamıştır. Türkiye'deki üniversitelerde bulunan gastronomi ve mutfak sanatları, turizm ve otel işletmeciliği ile yiyecek-içecek işletmeciliği gibi bölümlerin sayıca çokluğu düşünüldüğünde bar departmanı ve/veya bar personeli ve miksoloji özelinde herhangi bir lisansüstü tezin yazılmaması dikkate değer bir husustur. Öte yandan miksoloji ile ilgili yapılan alan taramalarında mimarlık, bilgisayar programcılığı ve kimya gibi daha pek çok alanın kendi terminolojisi içinde miksoloji kavramını farklı anlamlarda kullandığı görülmüştür. Yapılan alanyazın taramalarında az sayıda miksoloji ve moleküler miksoloji ile ilgili bilimsel çalışmalara ulaşılmıştır. Moleküler miksoloji, moleküler gastronominin popülerleşmesi ile akademik çalışmalarda kendine yer bulmayı başarmış bir alandır. Önceleri sadece moleküler gastronomi uygulamalarına örnekler vermek üzere hazırlanmış reçeteler arasında moleküler miksolojiye yer verilirken günümüzde artık doğrudan moleküler miksoloji hakkında çalışmalar yapıldığı görülmektedir. Bu noktada moleküler miksolojiyi destekleyen ve dikkat çeken kitaplardan bir tanesi Dave Arnold'un "Liquid Intelligence: The Art and Science of the Perfect Cocktail" kitabıdır. Kitap, kokteyl biliminin arkasında yer alan teknikleri, aromaların elde edilmesinin kimyasını, başarılı bir kokteyl yaratmada kullanılan teknik ve bileşenlerin önemi dahil olmak üzere moleküler miksolojinin çeşitli yönlerine derinlemesine bir bakış sunmaktadır (Arnold, 2014). Benzer şekilde moleküler miksolojinin temelini oluşturan kokteyl tekniklerinin

örneklerle detaylı olarak anlatıldığı “The Bar Book: Elements of Cocktail Technique” isimli bir kitap da mevcuttur (Morgenthaler ve Holmberg, 2014). Yine 2021 yılında kolektif olarak kaleme alınan “Handbook of Molecular Gastronomy-Scientific Foundations, Educational Practices, and Culinary Applications” isimli kitap hem moleküler gastronomi hem de içerisinde yer alan ve “Molecular Mixology: Welcome Coffee, a Cocktail with Ten Layers” isimli bölüm ile dikkate değer bir çalışma niteliğindedir. Bu çalışmada moleküler karışım teknikleri kullanılarak kokteyl yaratma sürecine yer verilmiştir. İlgili çalışmada 1997 yılında bir eğitim aracı olarak tasarlanan, ancak 2005 yılında oluşturulabilen Karşılama Kahvesi (Welcome Coffe)’nin yapımındaki adımlar anlatılmış ve bu kapsamda on farklı lezzet ve doku katmanına sahip olan kahvenin her katmanının yapımında yer alan malzeme, miktar ve uygulanan teknikler detaylı olarak incelenmiştir. Böylece moleküler miksojinin benzersiz ve yenilikçi kokteyl yaratılmasındaki rolü gösterilmiştir (Kientza ve Gagnaire, 2021). Kokteyl barmenlerinin hizmet endüstrisinde yaratıcılığının rolünün değerlendirildiği başka bir çalışmada ise miksojinin kattığı yaratıcı çalışma biçimi ve bu çalışma biçiminin sektördeki hizmet kısmına etkisi yeniden tanımlanmıştır (Ocejo, 2010).

Yöntem

Bu çalışma miksoji ile ilgili yerli ve yabancı yazın taraması yapılarak, miksoji bilimi ve bu bilime ait terminoloji hakkında yayınları bir araya getirmeyi amaçlayan kavramsal bir çalışmadır. Ayrıca çalışma “Bir bilim dalı olarak miksoji nedir?” sorusuna cevap ararken bu konuyla ilişkili temel bir çerçeve çizmektedir.

Miksoji Kavramı ve Tarihi

Miksoji “alkollü veya alkolsüz içecekleri karıştırma ve karışım hazırlama” anlamına gelen bir terimdir (Çöp, 2020). Miksoji çeşitli malzeme, teknik ve ekipmanlar kullanarak farklı aromalara sahip karışık kokteyller ve diğer içecekler yaratma sanatı ve bilimi olarak da tanımlanmaktadır (Bartenders Business, 2022; Piogastrobistro, 2015). Amerikan Mirası Sözlüğü ise miksojiyi “karışık içecekler hazırlama çalışması veya becerisi” olarak tanımlamıştır (The American Heritage Dictionary, n.d.). Miksoji sanatında çeşitli içecek tariflerini karıştırmanın yanı sıra, farklı gıda bileşenlerinin ve öğelerinin temel lezzet bileşenlerine veya temel tat özelliklerine göre içsel özelliklerini inceleyerek tat eşleştirme de yapılmaktadır. Böylece miksojiyle hem mevcut geleneksel tariflerin lezzeti arttırılmakta ve hem de geleneksel olmayan yeni tarifler üretilmektedir (Ranasinghe ve ark., 2017).

Miksoloji, yüzyıllar öncesine uzanan bir tarihe sahiptir. Miksolojinin kesin kökenlerini belirlemek zor olmakla birlikte Yunanlılar, Romalılar ve Mısırlılar gibi eski uygarlıklara kadar uzandığı düşünülmektedir. Miksolojinin gerçek bir mesleğe dönüşmesi ise 19. yüzyılda gerçekleşmiştir (Tornroth, 2023). 19. yüzyılın sonları ve 20. yüzyılın başları, kokteyl kültürünün oluşmaya başladığı, çeşitli etkinliklerde popüler bir içecek olarak farklı tarif ve malzemeler ile hazırlanan kokteyllerin servis edildiği altın çağ olarak bilinmektedir. 1920’lerde Amerika Birleşik Devletleri’ndeki 13 yıl boyunca devam eden içki yasağı döneminde barmenler, düşük kaliteli çok daha sert ve içimi çok daha zor olan içkilerin tadını saklamak için yaratıcı olmak zorunda kalmış ve bu dönem yasak dönemi olarak adlandırılmıştır. Yasak dönem cesur tatlarla dolu yeni bir kokteyl dalgası yaratmış ve Highballs, Fransız 75, Old Fashioned, Sidecar, Bee’s Knees gibi kokteyllerin popüler olmasına yol açmıştır (Chivas Regal Global, 2021). II. Dünya Savaşı sonrasındaki dönem, hazır gıda sektörünün ortaya çıktığı ve tüm dünyaya hızla yayıldığı bir dönem olma özelliğine sahiptir. Bu dönemde toz olarak piyasaya sürülen kokteyl karışımları, soda tabancaları, buz makinaları, şurup dağıtıcılar gibi bileşen ve ekipmanlar barlarda standardize, basit ve daha ucuz içeceklerin üretilmesine ve bu içeceklerin tercih edilmesiyle miksolojinin popüleritesinin azalmasına neden olmuştur. Ancak 1980’lerin ortasına gelindiğinde bir zanaat olarak klasik kokteyllere ve miksolojiye olan ilgi yeniden canlanmıştır (Sutcliffe, 2020). Bugün ise miksoloji, yeni ve benzersiz içecekler yaratmak için yenilikçi tekniklerin ve malzemelerin kullanıldığı, kendini sürekli geliştiren ve sınırlarını zorlayan bir sanat formuna dönüşmüş durumdadır.

Miksoloji tarihine kokteyl özelinde bakıldığında ise kokteyl kelimesinin etimolojisiyle ilgili birkaç teori olduğu görülmektedir. Bu teorilerden birinde, Amerika’da hancı bir kadının müşterilerine hazırladığı özel içki karışımlarının karıştırılması için bardağın içerisine kaşık yerine horoz kuyruğu (İng cocktail) tüyü koyması sebebiyle bu tarz içkilere bu adın verildiğine vurgu yapılmaktadır (Tez, 2012) Başka bir teori ise “kokteyl” kelimesinin, “yumurtalık” anlamına gelen Fransızca “coquetier” kelimesinden geldiği yönündedir. Bu bağlamda söz konusu terimin, yumurtalıklara benzer küçük kaplara dökülen alkollerle yapılan bir içecek türü için kullanıldığı düşünülmektedir (Solorzano, 2020). Kokteyl tarihinin ilklerine bakıldığında; kendi özel adıyla bilinen ilk kokteylin 1800’lerin başında New Orleans’ta viski, absent, bitter ve şeker karışımı ile oluşturulan Sazerac (Chivas Regal Global, 2021) olduğu, ilk kokteyl kitabının 17. yüzyılda Londra Damıtıcılar Şirketi (*London Distillers Company*) tarafından yayımlanmış olduğu, ilk kokteyl barın Alexis Soyer adlı bir İngiliz tarafından Londra’da 1 Mayıs 1951 tarihinde “Gore House” adı ile açılmış olduğu, Türkiye’de

ilk kokteyl kitabının ise 1937 yılında basılan “Kadeh ve Bardak İçkileri” isimli kitap (Aktaş ve Özdemir, 2005) olduğu sonuçlarına ulaşılmaktadır.

Moleküler Miksoloji

Moleküler miksoloji, gıda ile benzer teknikler kullanan moleküler gastronominin etkisinde ortaya çıkan bir terimdir. Moleküler miksoloji, içecek bileşenlerini moleküler düzeyde anlamak ve bileşenleri moleküler düzeyde uyarlamak için fizik, kimya ve gıda bilimlerinde temellenen analiz, bilgi ve teknikleri kullanarak karışık içecekler yaratmaya yönelik ortaya çıkan mutfak araştırmalarının özel bir alanıdır (Graham, 2022; Razvozova, 2017). Moleküler miksoloji ile hedeflenen içeceklerin çekiciliğini arttırmak ve bu tür kokteyllerin dokusu, lezzeti ve görünümünü yaratıcı ve sanatsal bir şekilde geliştirerek tüketici deneyimini çok daha ilginç hale getirmektir (Caporaso ve Formisano, 2015; Ivanovic ve ark., 2011).

Moleküler miksolojide gıda endüstrisinde kullanılan birçok yöntem modernist mutfak uygulamaları kapsamında kullanılmaktadır. Örneğin sıvı nitrojen, kuru buz, agar, sitrik asit, sodyum aljinat ve kalsiyum laktat gibi bileşenler ve/veya katkı maddeleri ile jelleştirme, emülsifikasyon, küreleştirme, köpürtme ve buhar konsantrasyonu gibi çeşitli yöntemler kullanılarak sadece lezzetli değil aynı zamanda görsel olarak çekici ve benzersiz kokteyller yapılmaya çalışılmaktadır. Kullanılan bileşenler ve uygulanan yöntemler ile içeceklerde köpükler, jeller, katmanlar, küreler, sisler ve diğer farklı dokularda dikkat çekici sunumlar yaratılmakta ve lezzetli formülasyonlar oluşturulmaktadır. Örneğin, bir miksolog, sıvıların farklı yoğunluklarını kullanarak birbirine karışmayan ve rengiyle oynanmış katmanlı içecekler veya içeceğin içerisinde asılı kalabilen meyve parçalarından kokteyller yapabilir. Benzer yaratıcılık ve teknik bilgilerle sıvı nitrojen ile dondurulmuş yenilebilir alkollü dondurmalar ya da sodyum aljinat ve kalsiyum laktat gibi bileşenler ve küreleştirme yöntemi kullanılarak ağızda patlayan aromalı sıvı içecek küreleri yapılabilir. Görüldüğü üzere moleküler miksolojiyle beraber sadece içilebilir kokteyller değil, sıvıların köpüklere, jellere ve katılara dönüştürülmesiyle yenilebilir kokteyller ve içkiler de üretilebilmektedir (Caporaso ve Formisano, 2015). Yine kokteyl sakızları, kokteyl havyarı, marşmelovlu ve aromalı buz küreleri ya da buz küpleri, alkollü köpükler, buzdan dondurmalar, donmuş nitro kokteyller gibi kokteyl ve içki deneyimleri genel olarak moleküler miksolojiyle oluşturulmaktadır (Graham, 2022; Kanga, 2008). Türk mutfağı özelinde bir örnek olarak “Boncuklu Rakı”dan bahsedilebilir. Bu uygulamada küçük inci taneleri gibi boncuk haline getirilmiş rakı parçaları su dolu bir kadehin içine konulmakta ve suyla beraber boncuk şeklindeki rakılar çiğnenmektedir. Boncuklu rakıyı keşfeden iki Türk miksolog tarafından geliştirilmiş bir diğer reçete ise “Jöle Rakı”dır. Jöle

rakıda; katılaştıktan sonra renkli jöle haline gelmiş rakı istenilen biçimde kesilip tabaklara konularak servis edilmekte ve çatalla yenilmektedir (Akyol, 2008).

Genel olarak bakıldığında moleküler miksoloji teorik kimyasal ilkelere dayanarak “kokteyl rönesansı” yaratmaktadır. Moleküler miksolojiler yalnızca marshmallow, karamel espresso, fıstık ezmesi ve jöle gibi lezzetleri mevcut reçetelere eklemekle kalmamış aynı zamanda cin ve tonik jöle, alkollü köpük, sıvı nitrojenle yapılan votkallı dondurmalar gibi örnekleri reçetelere ekleyerek “içecek” tanımının yeniden şekillenmesine de katkıda bulunmuşlardır (Aktaş, 2017). Moleküler içeceği normalden ayıran ana faktör, bileşen özelliklerinin standart dışı kullanılması ile kimyasal veya fiziksel olgular uygulanarak içeceklerde yeni organoleptik niteliklerin elde edilmesidir (Razvozova, 2017).

Miksolog Kavramı ve Miksoloji Eğitiminin Mevcut Durumu

Miksolog, karışık içeceklerin tarihçesini inceleyen, güncel trendleri takip eden, kullanılan içerikler ve teknikler konusunda zengin bir bilgiye sahip olan ve düzenli olarak yeni ve yenilikçi içecekler üreten kişilerdir (MasterClass, 2021). Miksologların alkollü içkiler, kokteyllerde kullanılan çeşitli bileşenler (meyve, meyve suları, gazlı içecekler, şuruplar, ot, baharat vb.), bileşenlerin kullanımı, içecek tarifleri, içeceklerin üretme teknikleri ve bu süreçte kullanılan ekipmanlar ile duyuşal değerlendirme konusunda zengin bir bilgiye sahip olması beklenmektedir (Çöp, 2020; Oejo, 2010). Bu aşamada miksolojiler ve kokteyl barmenleri, içecek yapma sanatının arkasındaki bilim ve sanat olarak miksolojiyi rehber olarak kullanmaktadırlar.

Miksoloji ve içeceklere dair bilgi ve becerilere sahip olmak için teknik bilgilerden ve teknik bilgilerin uygulamalarından oluşan kurs ve seminerler mevcuttur. Miksologlar için sertifika sunan birkaç kuruluş bulunmakta olup bunlardan birinden sertifika almak için kurs sürecini tamamlamak ve yapılan sınavları geçmek gerekmektedir. Birleşik Devletler Barmenler Birliği (*United States Bartenders' Guild*) ile Şarap ve Alkollü İçki Eğitim Vakfı (*Wine and Spirit Education Trust*) sektör tarafından dikkate alınan ve sertifika veren organizasyonlar arasında yer almaktadır. Örneğin Şarap ve Alkollü İçki Eğitim Vakfı hem profesyoneller hem de meraklılar için miksoloji teknikleri, alkollü içkilerin üretimi ve servisini kapsayan Alkollü İçkilerde 1. ve 2. Seviye kurslar sunmaktadır (WSET, 2023a; WSET, 2023b). Benzer şekilde barmenler de çalıştığı iş için gereken uzmanlık düzeyine bağlı olarak farklı türlerde eğitim ve öğretim programlarına katılarak bilgi ve becerilerini geliştirebilirler. Bu noktada barmenlik okulları, kurslar, seminerler ve workshoplar barmenlere yardımcı olmaktadır.

Barmen, bartender ve miksolog terimleri genellikle birbiri yerine kullanılsa da ve çalışma alanları benzerlik gösterse de aslında farklı rolleri olan pozisyonlardır. Örneğin bir barmen genellikle bir kokteyl barında çalışarak klasik içecekler ve kokteyller hazırlamakta ve bar deskinin önündeki sandalyelere oturan müşterilerle doğrudan iletişim kurarak onların içecek siparişlerini almaktadır. Bartender, barmenin tek başına bütün servis işlerini yürütemeyeceği büyük barlarda servis için özel olarak yetiştirilmiş kişiler yani bar garsonlarıdır. Bu tip barlarda bartenderlar masalarda oturan müşterilerin karşılanması, yerlerine oturtulması, sipariş alınıp servis yapılması işlemlerinden sorumludur (Yörükoğlu & Yörükoğlu, 1998). Öte yandan bartenderlar barmenin olmadığı ya da barın çok yoğun olduğu zamanlarda bara geçerek içki hazırlayabilecek donanımına da sahiptirler. Miksologlar ise bazı zamanlarda barda barmenlik yapsa da işlerinin önemli bir bölümü barın arkasında yani mutfakta yeni ve farklı kokteyl tariflerinin tasarımını sağlamak ve kişiselleştirilmiş kokteyl menülerini geliştirmektir (Indeed Editorial Team, 2023; MasterClass, 2021). Bunları yaparken geleneksel bir kokteylin benzersiz bir versiyonunu ya da yeni kokteylleri geleneksel olmayan bar araçlarını kullanarak ve çeşitli malzemeleri birleştirerek, alanda çalışan diğer profesyonellerle iş birliği yaparak gerçekleştirirler (Indeed Editorial Team, 2023). Bu aşamada miksolog, kokteyl yaratmada olağanüstü beceri, yetenek ve mükemmellik sergileyen, özellikle yetenekli bir barmene verilen fahri unvandır (Bartender Spirits Awards, 2023). Miksologlar bunlara ilave olarak kokteyl trendleri ve yenilikleri ile güncel endüstri gelişimini takip eden, bir dizi kokteyl menüleri ve programları geliştiren, kokteyl tarihi ve evrimi için bilgi araştıran ve üreten kişilerdir. Dolayısıyla alkollü içki üretimi yapan şirketler tarafından da istihdam edilirler (Bartender Spirits Awards, 2023; MasterClass, 2021).

Miksoloji, turizm sektöründe kullanılabilecek yaratıcı bir araçtır. Dolayısıyla turizm ve gastronomi özelinde, özellikle de restoran ve bar işletmelerinde, miksologlar teknik ve yaratıcı bilgilerini kullanarak turistler için çok farklı ürünler sunabilir. Bu açıdan bakıldığında miksologlar turistler için deneyimin önemli bir parçasına hizmet etmektedirler. Örneğin belirli bir bölgenin ya da destinasyonun yerel lezzetlerini ve malzemelerini sergileyerek ve/veya kullanarak benzersiz ve yenilikçi kokteyller yaratabilirler. Bu durum yerel kültür ve geleneklerin tanıtılmasına yardımcı olabilir ve turistlere başkalarıyla paylaşmak isteyecekleri unutulmaz bir deneyim sağlayabilir. Gastronomi endüstrisinde miksologlar, yiyeceklerin lezzetlerini tamamlayan kokteyller oluşturmaları ve yiyecek-içecek eşleştirmeleriyle yemek deneyimini daha iyi bir seviyeye taşımaları nedeniyle genellikle şeflerle eşleştirilir.

Bununla birlikte, tüm barmenlerin miksolog olduğunu, ancak tüm miksologların barmen olmadığını düşünen muhalif görüşler de bulunmaktadır. Bu görüşlere göre miksolog daha çok sosyal prestij ve şöhret kazanmak için kullanılan bir unvan olarak kabul edilmekte, barmenlerin her türden içecek yaratmada başarılı olabileceğini, ancak miksologların kalabalık bir barda içecek servisi yapma konusunda çok da başarılı olamayacakları için barmenlerin yerini dolduramayacağı düşünülmektedir (Bartender Spirits Awards, 2023).

Miksolojide Kullanılan Malzemeler ve Teknikler

Kokteylleri; bowl, cup ve punch (kalabalık gruplar için kâsede hazırlanan kokteyller), cobbler (talaş buz ve meyve parçacıkları ile hazırlanan kokteyller), collins (bol buzla hazırlanan ve geniş hacimli uzun bardaklarda servis edilen kokteyller), cooler (limon kabuğu ilave edilerek hazırlanan serinletici kokteyller), crusta (servis edildikleri bardaklar limon ve şeker ile süslenen kokteyller), daisy (likör çeşitleri ve aromatik şuruplarla hazırlanan kokteyller), egg-nog (sıcak ya da soğuk olarak hazırlanabilen ve içine yumurta konulan kokteyller), fix (goblet bardaklarda buzla servis edilen kokteyller), fizz (ana içki, meyve suyu, şeker ve soda ile hazırlanan kokteyller), flip (alkol, şeker ve yumurta sarısı ile hazırlanan ayıltıcı kokteyller), frappe (talaş buz ve likörlerden oluşan kokteyller), gimlet (ekşi tatta ve kolay hazırlanabilen kokteyller), grog (çok sıcak hazırlanan kokteyller), highball (ana içki, angostura bitters, meyve suyu, soda ve meşrubatla hazırlanan kokteyller), julep (ferahlatıcı kokteyller), pick me up (ayıltıcı kokteyller), pousse cafe (aynı bardakta birbirine karışmadan üst üste koyulan içkilerle hazırlanan kokteyller), rickey (ana içki, misket limonu suyu ve soda ile hazırlanan serinletici kokteyller), sangaree (genellikle kırmızı renkte hazırlanan kokteyller), sling (bol buzlu kokteyller), smash (nane kullanılarak hazırlanan julep benzeri kokteyller), sour (yumurta akı ile hazırlanan, ekşi tada sahip kokteyller), toddy (ana içki, şeker ve sıcak/soğuk su ile hazırlanan kokteyller) olmak üzere 25'e ayırmak mümkündür (Aktaş ve Özdemir, 2005).

Öte yandan kokteylleri miktarına göre; kısa (ortalama 10 cl'ye kadar), orta (ortalama 20 cl'ye kadar) ve uzun kokteyller (ortalama 30 cl'ye kadar) olarak üçe ayırmak mümkündür. Yine içeriğine göre kokteylleri; Pre Dinner (yemek öncesi içilebilen kokteyller), After Dinner (yemek sonrası içilebilen kokteyller), Long Drink (günün her saatinde içilebilen kokteyller) ve Fancy Drink (günün her saatinde içilebilen özel kokteyller) olarak dörde ayırmak da başka bir sınıflandırmadır (Türkiye Barmenler Deneği, n.d.).

Bir miksolog kokteyl türlerinden hangisini hazırlarsa hazırlasın, dengeli ve lezzetli bir içecek yaratmak için bazı tekniklere ihtiyaç duymaktadır. Bu teknikler, miksologların bileşenlerden maksimum lezzet ve aromayı çıkarmasını, benzersiz dokular ve görsel efektler yaratmasını ve

her ieeğinin uygun şekilde soğutulması ve seyreltilmesini sağlamaktadır. Miksoloji terimleri ve teknikleri genellikle İngilizce isimleriyle kullanılmakta olup sıklıkla kullanılan tekniklerden bazıları şunlardır (Hellmich, 2006; Morgenthaler ve Holmberg, 2014; Sipsmith, 2021; Wellmann, 2013):

- i. **Shaking (alkalama):** Şeker, şurup, krema, meyve suları, narenciye ve likör gibi daha bulanık bileşen ieren ieceklerin kokteyl alkalayıcı (*shaker*) ve bol buz kullanılarak karıştırılmasıdır. Bu işlemde malzemeler güçlü alkalamayla tamamen birleştirirken iecek soğutulmakta, ieeğinin yüzeyinde yüzen ferahlatıcı buz paraları elde edilmekte ve karışıma hava kabarcığı ilave edilerek köpüklü bir doku oluşturulmaktadır.
- ii. **Stirring (Karıştırma):** Malzemeleri köpüklü bir doku oluşturmadan bir araya getirmek için kullanılan yumuşak bir tekniktir. Bu teknik berrak bir görüntü ve ağızda yumuşak bir his bırakmasının istendiği Cin Martini, Manhattan gibi iecekler için kullanılmaktadır.
- iii. **Vaporizing (Buharlaştırma):** İeeğe aroma ve lezzet katmak için bitki, ot, baharat, meyve ve iek gibi eşitli bileşenlerdeki uçucu yağlar ve diğere uçucu bileşikler buharlaştırılarak eklenmektedir. Bu işlem, buharlaştırıcı kullanılarak veya bileşenlerin manuel olarak ısıtılması ve ardından buhar olan uçucu bileşiklerin bir kapak veya başka bir örtü ile yakalanıp kokteyl bardağına salınmasıyla gerçekleştirilir. Bu teknik aynı zamanda duman veya buhar ile kokteylin görsel sunumunu geliştirmek için de kullanılmaktadır.
- iv. **Muddling (Ezme):** Paralamak veya ezme anlamına gelen ve bir kokteylde meyvelerin, bitkilerin veya baharatların tat ve aromalarını serbest bırakmak için kullanılan bir tekniktir. Bu teknik ile Mojito, Margarita, Old Fashioned gibi ieeeklere nane yaprağı, turunçgiller ve/veya küp şeker gibi bileşenler dahil edilerek ferahlatıcı ve aromatik iecekler elde edilmektedir.
- v. **Straining (Süzme):** Bir kokteylde katıları sıvıdan ayırma işlemidir. Meyve posası, otlar ve buz gibi katı bileşenleri ıkarmak için ieeği alkaladıktan veya karıştırdıktan sonra süzgeç (*Hawthorne Strainer*) yardımıyla yapılmaktadır.
- vi. **Double/Fine Straining (İkili Süzme):** İeeğinin berrak olması için kokteyl süzgeci ve tel süzgeç kullanılarak yapılan ikili süzme işlemidir.
- vii. **Flaming (Alevleme):** Az miktarda alkolün ısıtılması, ateşe verilmesi ve ardından ieeğinin üzerine dökülmesiyle oluşan bir sunum tekniğidir. Bu teknikle kokteyle hafiften dumanlı bir tat katılmaktadır.
- viii. **Layering (Katmanlama):** Farklı malzemelerin birbirinin üzerine bar kaşığı yardımıyla yavaşça, karıştırmadan, yoğunlukları ve şeker oranı baz alınarak sırasıyla katmanlar halinde

dökülmesi tekniğidir. Böylece renkli ve görsel olarak çekici farklı katmanları olan kokteyller oluşturulmaktadır.

ix.**Building:** İçeceği bir karıştırma bardağında, çalkalayıcıda, blenderde veya başka bir kapta oluşturmak yerine doğrudan soğutulmuş servis bardağına dökülüp, iyice karıştırılıp, çeşnilendirilerek servis edilmesi işlemidir. İşlem, malzemeleri bardağa belirli bir sırayla eklemeyi, dengeli ve lezzetli bir içecek oluşturmak için hafifçe karıştırmayı içermektedir.

x.**Floating (Yüzme):** Genellikle krema veya likör kullanan içeceklerde bu sıvıların bir kaşık yardımıyla alttaki içeceğin yüzeyine dokunmadan yavaşça dökülmesi tekniğidir. Bu teknikle yüzeyde yüzen içeriklerin düşük yoğunlukları ile şeker oranları baz alınarak karıştırmadan katman oluşturulmaktadır.

xi.**Rimming (Kenar Süsleme):** Donmuş veya soğutulmuş bir kokteyl bardağının ağız kısmının narenciye dilimi veya başka bir sıvıyla nemlendirilmesinin ardından ağız kısmın tatlı, mayhoş ve/veya dokulu ve renkli istenen malzemeyi içeren bir tabağa daldırılarak kaplanması işlemidir. İçeceğin tadını veya sunumunu geliştirmek için limon, tuz, şeker, rendelenmiş Hindistan cevizi, limon kabuğu, portakal kabuğu ile yarı tatlı çikolata gibi bileşenler kullanılmaktadır.

Miksoloji teknikleri kokteyl yapma sanatının önemli bir parçasıdır. Genel olarak bu tekniklerde ustalaşmak, miksologların müşterilerini memnun eden ve etkileyen içecekler yaratmasına yardımcı olmaktadır. Miksoloji teknikleri miksolog ve barmenlerin her seferinde tutarlı, yüksek kaliteli içecekler yaratmasına yardımcı olması benzersiz ve yenilikçi kokteyller yaratması için temel sağlaması, yoğun zamanlarda daha verimli ve hızlı çalışmasına yardımcı olması, bar ortamında güvenlik ve hijyeni de desteklemesi sebepleriyle önem arz etmektedir.

Sonuç

Tarihsel süreç içerisinde bakıldığında pek de yeni olmayan ancak günümüzde yeni yeni rağbet gören bir alan olan miksoloji, gerek yeme-içme deneyimini seyahatlerinin en ön planında tutan turistler için, gerekse de yiyecek-içecek sektöründe aktif rol oynayan tüm profesyoneller için gereklidir ve vazgeçilmezdir. Tarımsal üretimin yapılmaya başlanmasıyla birlikte dünya üzerinde yaşamış olan tüm medeniyetlerde alkollü içki kültürünün var olduğu bilinmektedir. Ancak elbette ki her medeniyetin ürettiği dolayısıyla tükettiği alkollü içki birbiriyle farklılık göstermiştir. Burada coğrafya, iklim, toplumların sosyal ve ekonomik anlamda gelişmişlik düzeyleri ve dini inançları gibi pek çok faktör etkili olmuştur. Yine toplumların hangi üretim tekniklerini (fermantasyon, distilasyon vb.) kullanarak alkollü içki ürettikleri de tüketim alışkanlıklarında belirleyici olmuştur.

Geçmişe dönük okumalar yapıldığında pek çok içeceğin tesadüfen bulunduğu, bir kısmının maddi olanaksızlıklar bir başka ifade ile yoksulluk sebebiyle ortaya çıktığı ya da bir gıda maddesinin aşırı üretimi sonucunda -viskinin Amerika'daki fazla mısır üretimiyle ilişkisinde olduğu gibi- elde kalan ürünleri değerlendirme yöntemi olarak ve hatta kanunlarla kısıtlanan ya da yasaklanan alkol tüketimine alternatif çözümler bulmak amacıyla ortaya çıktığı söylenebilir. İlaveten; savaşların ve oradan elde edilen ganimetlerin, getirilen kölelerin, farklı kültürlerden kız alıp verme ya da komşuluk yoluyla aktarılan kültür ve bilginin, son dönemde ise sosyal medyanın gerek alkollü gerekse de alkolsüz içeceklerin tüketilmesinde ve diğer kültürlerle yayılmasında önemli role sahip olduğu bilinmektedir. Ancak koşullar ne olursa olsun insanlar içecekleri hep “karıştırmışlardır”. İnsanların içecekleri karıştırma amaçları arasında; yüksek alkollü bir içeceğin alkol seviyesini düşürmek, lezzetsiz ya da nötr tada sahip bir içeceği lezzetli hale getirmek, göze de hitap eden şık içecekler hazırlamak, içeceklerin organoleptik özelliklerini arttırmak, içecekleri soğutmak gibi amaçlar sayılabilir. Söz konusu miknologlar olduğundaysa “yeni şeyler denemek ya da üretmek” temel motivasyonları olmuş ve böylelikle bir meslek dalı da doğmuştur.

Miknologların aldıkları eğitim, kullandıkları teknik, ekipman ve malzeme göz önünde bulundurulduğunda diğer bar personellerinden bir adım önde oldukları söylenebilir. Özellikle son dönemde moleküler gastronomi alanındaki yeniliklerle birlikte moleküler miknoloji alanında kendini geliştirebilmiş olan miknologlar daha da ön plana çıkmışlardır. Fizik, kimya ve gıda teknolojilerindeki birbirinden farklı teknikleri içeceklerle harmanlayarak değişik tatlar denemek isteyen müşteri kitlelerine farklı alternatifler sunabilen miknologlar bir yandan ürettikleri yeni tatlarla övgüler alırken diğer yandan da kullandıkları katkı maddelerinin sağlığa olası zararları sebebiyle eleştirilere maruz kalabilmektedirler. Öte yandan gıda katkı maddelerine ilişkin söz konusu bu eleştirilerin tek muhatabının miknoloji bilimi ve miknologlar olmadığı da unutulmamalıdır.

Bu çalışma kapsamında; turizm, gastronomi, moleküler gastronomi üzerine oldukça fazla sayıda kitap, kitap bölümü, makale, tebliğ ve tez bulunmasına rağmen miknoloji alanında sınırlı sayıda çalışma yapıldığı, yapılan çalışmaların çoğunlukla yabancı dilde yazılmış kitaplar, kitap bölümleri ve birkaç adet makaleden ibaret olduğu, Türkiye özelinde ise bu araştırmanın yapıldığı tarih itibarıyla miknolojiyle ilgili herhangi bir lisansüstü tezin yazılmadığı sonuçlarına ulaşılmıştır. Yine bu çalışma kapsamında yalnızca miknoloji eğitimi almak isteyenlerin müracaat edebileceği herhangi bir diploma programı olmadığı, eğitimin yalnızca sertifika sunan birkaç kuruluş tarafından verildiği ve söz konusu sertifikaları almak için kurs sürecini

tamamlamak ve yapılan sınavları geçmek gerektiği sonuçlarına ulaşılmıştır. Tüm bunların yanında turizm özelinde değerlendirildiğinde turizm işletmelerinin miksolojiye yatırım yaparak ve miksolojiyi kullanarak müşteri memnuniyetini artırabileceği, yerel kültürü tanıtılabileceği ve bölgeye turist çekme potansiyelini artırabileceği sonucuna erişilmiştir. Elde edilen sonuçlar doğrultusunda sonraki araştırmacılara ve sektör temsilcilerine verilebilecek öneriler şunlardır:

- Miksoloji özelinde yapılan akademik çalışmalar sayıca arttırılmalıdır.
- Türkiye'deki üniversitelerin turizm, yiyecek içecek işletmeciliği, gastronomi ve mutfak sanatları gibi ilgili bölümlerinde bulunan servis ve bar derslerinin müfredatları güncellenerek öğrencilerin miksoloji ile ilgili bilgiler öğrenmesi de sağlanmalıdır.
- Türkiye'de lisansüstü düzeyde yazılan tezlerde bar departmanı, miksoloji ve miksoloji teknikleri özelinde tezler yazılması teşvik edilmelidir.
- Miksoloji alanında yazılan kitapların ve yapılan yayınların büyük çoğunluğunun İngilizce olduğu dikkate alındığında söz konusu kitapların Türkçeye tercüme çalışmalarına ve Türkçe'de de bu bağlamda çalışmaların yapılmasına ağırlık verilebilir.
- Yaratıcı ve benzersiz kokteyller sunan bir işletme, turistlerin ilgisini çekebileceği ve işletmenin popülerliğini artırabileceği için turizm işletmeleri miksolojiye yatırım yapmalıdır.
- Turizm işletmeleri yerel içeceklerin tanıtımında miksoloji ve miksologları kullanmalıdırlar. Özellikle yerel meyveler ve otlar kullanılarak hazırlanan kokteyller, turistlerin yerel kültürü daha iyi tanınmasına ve deneyimlemesine yardımcı olabilir.
- Miksologların yeteneklerini sergilemelerine, insanların miksoloji hakkında daha fazla bilgi edinmelerine olanak tanımak için miksoloji festivalleri ve diğer etkinlikler düzenlenebilir. Böylece insanların o bölgeye gelmeleri ve miksologların sunduğu içecekleri deneyimlemeleri sağlanabilir. Ayrıca bu gibi etkinlikler, miksoloji alanında çalışan kişilerin bir araya gelmesini ve birbirleriyle bilgi alışverişi yapmalarını da sağlayacaktır.

**ENGLISH LANGUAGE EDUCATION IN VIETNAM: A HISTORICAL,
SOCIOCULTURAL PERSPECTIVE**

Nguyen Thi Tu Trinh

*Faculty of Advanced Science and Technology, University of Science and Technology, The
University of Da Nang, ntttrinh@dut.udn.vn*

Abstract

Teaching and learning English has drawn significant attention in Vietnam and in the world. This interest has emerged as a consequence of the fact that English has become a functional and powerful tool to the world integration and globalization. The Vietnamese youngsters are driven to learn and exploit English as a key to become global citizens. Although teaching and learning English in contemporary context in Vietnam has been extensively studied, there is a big gap in doing research of teaching and learning English in culturally and historically distinctive setting in Vietnam. In this work, Vietnam English education is examined in the lens of historical, sociocultural perspectives. It is suggested that Vietnam English education has undergone five critical changes along with social and political upheavals since the early 1950s to the 2020s. In addition, the article also explores curriculum design and textbook development, teaching methodologies and assessment during the given period. It is noticed that there have been troughs and peaks in English education in Vietnam. But tremendous improvement in curriculum design and textbook development, teaching methodologies and assessment as well as language policies in Vietnam over the last seventy years has been made. English gradually gains its high official status in economic and sociocultural development.

Key words: English Education, curriculum design, teaching methodologies and assessment, a historical, social and cultural perspective.

1. INTRODUCTION

According to Rose (2019), over 500 years, there was a shift from status of English – national language to global language with limited 3 million English Speakers in Great Britain, there has been a surge of nearly 2 billion English speakers worldwide due to the economic and political power of English-speaking economies such as: USA, UK, Canada, Australia and others. Kachru (1986, p.1) claims that “English one into the caste that has power and, more important, that controls vital knowledge about the miracles of science and technology”. There is no secret that English is considered as a master key to enrich knowledge, promote global integration, enter the world of jobs, travel and others.

Very little is known about when English made its first appearance in Vietnam. Unlike Singapore and other countries – former British colonies, Vietnam was a colony of French. Therefore, French was the main foreign language taught in alongside Vietnamese- the national official language from 1859-1954 (Hoang 2020). The period of 1954-1975 saw significant growth of four foreign languages namely, Russian and Chinese which were taught in the North of Vietnam whilst French and English were prominent in the South. In fact, Vietnam was split into two separate regions: The North and the South. The former allied with Soviet Union adopted its education systems and curriculum whereas the later fully aided by the USA borrowed its education systems. It is crucial to notice that the history of the English language and English education systems in Vietnam is closely linked with its politics, economy and social affairs (Wright 2002), and strongly formed bonds with the reform policy known as *Doi Moi (Reform)*, which was voted by the sixth National Congress of the Communist Party in 1986 (MoET 2016).

There was a high awareness of the improvement of the quality of teaching and learning English in the context of globalization, on September 30, 2008, the Prime Minister of the Government of the Socialist Republic of Vietnam signed Decision No. 1400/QĐ-TTg to promulgate the national project entitled “Teaching and Learning Foreign Languages in the National Education System, Period 2008-2020” (The Prime Minister of SRV 2018) (hereinafter referred to as the 2020 Project). The aims of the 2020 Project are to make marked improvement in the quality of curriculum designs and textbook; teaching and learning methods; and assessment in the national education system to enable Vietnamese citizens to use a foreign language confidently in their daily communication, their study and work in an integrated, multi-cultural and multi-lingual environment, making foreign languages a competitive advantage of

the Vietnamese people to serve the cause of industrialization and modernization of the country (Hoang 2016)

2. PREVIOUS STUDIES

Shapiro (1995) makes an investigation into English teaching and learning in Ho Chi Minh, the socioeconomic center of Vietnam. This work has a close look at examining the materials, curriculum, teaching methodology as well as the student and teacher populations of these schools become important guidelines in understanding the nature and development of English language training in Vietnam in the early 1990s.

Nguyen (2017) examines the discipline of teaching and learning English as an international language in Vietnam by exploring the reflections of teachers on the contemporary status of English, the implications of teaching models, cultures as well as teachers' challenges in teaching English as an international language.

Hoang (2020) and Pham (2005) pay attention to the analysis of the roles and status of English as well as communicative approach in present-day Vietnam. Particularly, it provides a brief overview of the *proliferation* of English in the world and interprets in some depth at the roles and status of English in Vietnam, looks at some of the potential threats that may pose to Vietnamese and other foreign languages being taught and learned in Vietnam and makes suggestion for planning a balanced language policy in Vietnam. Hoang (2017) carries out an in-depth analysis of the 2016 National Matriculation and General Certificate of upper secondary school Education English Test which a million Vietnamese 12 graders must take as compulsory to be eligible to receive general certificate of upper school education and a basic requirement for university entrance. The discussion of structure of the 2016 national matriculation and general certificate of upper school education English test is examined in four different categories namely (i) phonology; (ii) Lexicogrammar; (ii) Reading; and (iv) Writing and their percentage in the total score 6.25%, 33.75%, 40% and 20% respectively.

The gains and losses of ELT in general and tertiary education in Vietnam during the past few years have come under scrutiny in Hoang (2017). The key current situational factors that have significant effects on ELT and tertiary education in Vietnam such as language education policy, curriculum development and implementation with comments as well as his recommendations are also discussed in detail. However, teaching methodologies are not mentioned in this study.

3. FINDINGS AND DISCUSSION

It is commonly agreed that there are numerous solutions to the improvement of the quality of teaching and learning foreign languages in general and teaching and learning English in Vietnamese schools in particular. One of the most effective suggestions is probably the renovation in curriculum design and textbook development. It is safe to say that there has been extensive renovation in Vietnamese curriculum design and textbook development over the last seventy years (the early 1950s-2020s). Figure 3.1 demonstrates five distinctive periods of English curriculum in Vietnam between the early 1950s and the 2020s.

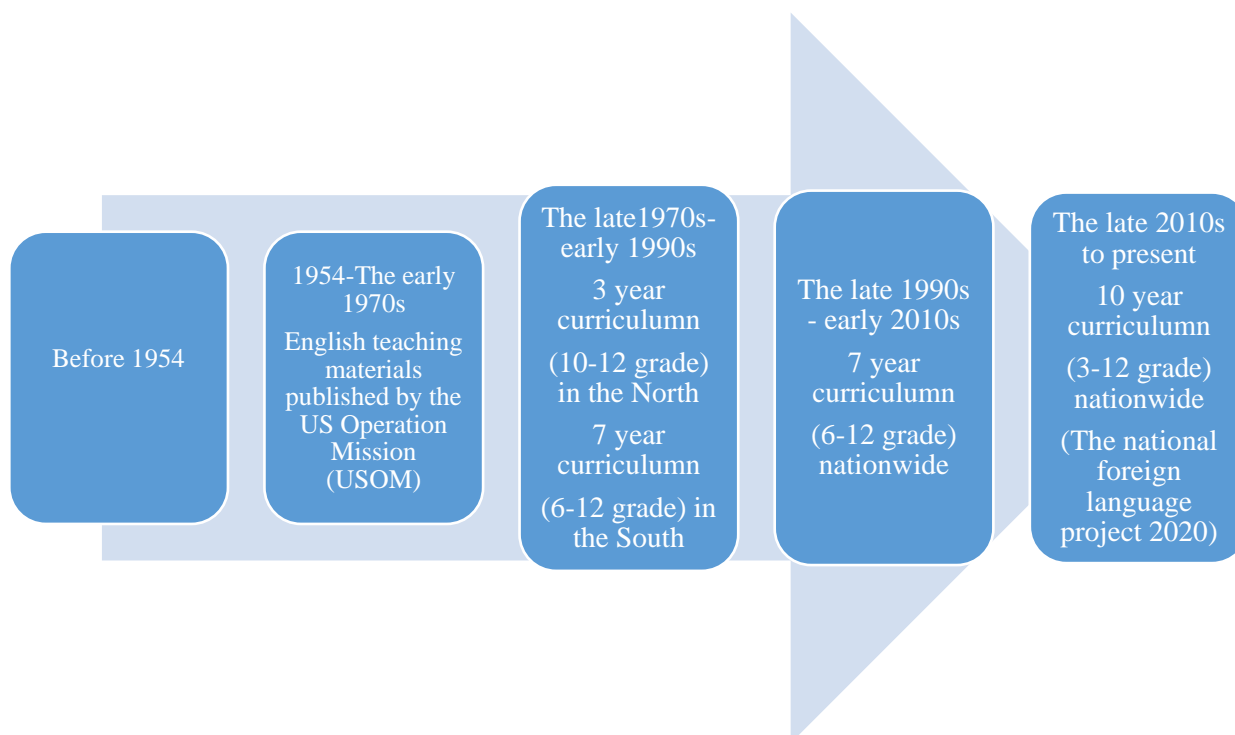

Figure 3.1. Five distinctive periods of English curriculum in Vietnam between the early 1950s and the 2020s

3.1. Formal English Education before 1954

Prior to 1954, it appeared that English came into existence in Vietnam but it was not officially taught during the French colonization and it was definitely less popular than French. Little has been written about teaching and learning English at this time. The most likely explanation is that Vietnam was under the severe destruction of war and there was limited investment and interest in the development of education and curriculum during the war leading to the absence of language policy and planning. In addition, English did not have any power and applied linguistics were completely an emerging discipline in contemporary Vietnam.

3.2. Formal English Education between 1954 and the early 1970s

1954 marked a turning point in Vietnam history as the USA directly got involved in Vietnam war and intervened to govern the South of Vietnam. In other words, the USA backed Ngo Dinh Diem, the president of the Republic of Vietnam (ROV) in all fields and sectors. In particular, with the support of the US Education Aid to ROV, the United State Operation Mission (USOM) helped the government of the South to design and develop the curriculum for teaching English as a foreign language. This agency performed a function to draw up and publish teaching materials and holding English exams for Vietnamese students across the South of Vietnam (Luu and Nguyen 2020). The aims of this project is to train a huge amount of labor force to serve the contemporary regime and to spread the ideology of the Western and latter trade and commerce. In other words, English was initially introduced in the South to support Ngo Dinh Diem's government and meet society's needs. On the contrary, Russian and French were the two required foreign languages in the North. In short, this period witnessed English under the influence of the USA.

3.3. Formal English Education between the late 1970s and the early 1990s

From the early 1970s to the early 1990s saw a slow recovery in Vietnam after the long-lasting war. The Northern of Vietnam defeated Ngo Dinh Diem's regime, took the South and reunified as the Socialist Republic of Vietnam under the control of the Communist Party of Vietnam in 1975. Since then, the government devoted to post-war reconstruction of all fields especially in socioeconomic and political aspects and education. Nevertheless, the embargo of the USA and Cold period of the USA and the Treaty of Friendship and Cooperation with Russia in November 1978 (Asselin 2018) are major hindrance to English education in the contemporary period. Although English was taught in schools, it had a low official status. In fact, the current government took a tough stance on eliminating the remaining influence of Western Civilization by strict control of English education. In fact, foreign native English speakers were not allowed to teach in most of English center during the period of 1975-1985. The period of "reform" in 1985 marked a milestone in Vietnam socioeconomic development and education reform is a critical part of this process. However, the country was still at a very early stage in its transition to a market economy drive with slow growth and improvement. In accordance with the reform, there has been a growing interest and awareness of the need to improve the quality of the nation's education including curriculum development, teaching and learning methods, assessment and learners' outcomes and others. In reality, these matters are the interface between political and professional decision. In other words, substantial

government support such as funding and implementation of educational policy reform as well as the restless efforts of English education professors, textbook experts, English teachers and publishers are extremely essential. In education, curriculum development has long been the source of scholarly unease. The earliest English curriculum designers constructed a new English textbook series to meet the new expectation and goals. Northern regions relied on a three-year syllabus of English but 7-year one in the South. From the very beginning, English syllabus was not considered equal throughout the country. In addition, there was no well-designed textbooks in the educational system (Hoang 2016). Additionally, some language training and reference books: British Streamline English, Person to Person, English Grammar in Use, Headway, Practice your English, Listen Carefully and others were available in a large number of bookstores in Vietnam (Shapiro 1995).

During this period, conventional teaching methods of English emphasizing the acquisition of grammar and vocabulary was crucially predominant in the early 1970s. As a result, students' assessment tests are designed to test the grammatical rules of English rather than English in use and in communication. In particular, the final English tests put an emphasis on grammar acquisition. This reflected that fact that formal English education was restricted by test-driven education philosophy and practice in contemporary Vietnam.

The period is the transforming stage of conventional teaching methods of English emphasizing the acquisition of grammar and vocabulary and Communicative Language Teaching (CLT). In fact, conventional methodology underwent peaks and troughs from a central teaching method to an out-date one since the introduction of Communicative Language Teaching (CLT). Otherwise, to some extent, Grammar - Translation method does not meet the requirements of English learning in the era of integration and globalization. In the early 1990s, CLT, steadily gaining in popularity, was developed by Hymes (1972). He claimed that "knowing a language involved more than knowing a set of grammatical, lexical and phonological rules ... Learners need to develop communicative competence – the ability to use the language they are learning appropriately in a given social encounter (Hymes, 1972,p.193). It can be seen that Hymes (1972) highlighted the significance of communicative competence and appropriateness in particular contexts rather than the accuracy of grammar, vocabulary. Since then CLT has flourished in the 20-century linguistic theory and language learning curriculum design worldwide. Nevertheless, educators, English teachers and learners have faced numerous obstacles with the application of CLT in the class in Vietnam. According to Le (2020), there are at least three challenges namely: (1) goals of gaining communicative

competence; (2) the notion of creating genuine communicative activities and tasks as well as preparing materials that promote communicative language use in CLT and (3) the exam-oriented curriculum in favor of grammar and vocabulary rather than speaking and listening (communicative competence) at both secondary and tertiary levels. It turns out that there is a shortage of real-life interaction and situation in their English exam and the learning outcome mismatches the aims of the syllabus. Particularly, big size and heterogeneous classes are the hindrance to the implementation of communicative and interactive tasks in the tests.

The Foreign Language Certificate Program, a system of written and oral examinations, pursuant to Decision No. 177/QĐ-TCBT dated January 30, 1993 of MoET promulgating the Program of English Practice A, B, C to determine language ability for individuals, became a significant aspect of foreign language training in Vietnam. The "A Level" (beginner) "B Level" (intermediate) and "C Level" (advanced) measurement of English language ability, designed by the Ministry of Education and Training, was a framework for foreign language preparation in Vietnam. The vast majority of individuals seeking English certificates will go for the "B Level" (intermediate) to secure a job opportunity in the foreign companies or incorporates. Each B test taker had to finish a 120-minute written test divided into three parts: Reading Comprehension, Use of English and Listening and following this there was a kind of brief (5-10 minute) "interview" in which the test taker must conduct conversations in English with examiners. Particularly, MoET drew up comprehensive guidelines for exam such as the content and assessment. These are common speaking topics suggested by MoET: 1 Personal Identity 2. Student's House 3. Home life 4. Education and future career 5. Free time, entertainment 6. Travel 7. Shopping 8. Food 9. Foreign Language 10. Weather. (Shapiro 1995)

This interview segment was recorded during observations in the certificate examinations conducted in Ho Chi Minh City:

Examiner: How do you like the weather today?

Student: Yes, I like very much because the weather today is very nice.

Examiner: Very nice? What will you do when you have free time?

Student: I uh, have free time I read a book and watching television.

(Shapiro, 1995, p.14)

The Foreign Language Certificate Program at that time required a vital link between those who facilitate independent language schools or English language centers and the local educational agencies attempting to ascertain linguistic aptitude on the part of the population. There was estimated to be approximately 160 English centers in the community nationwide

between the 1990s and the 2010s (Shapiro 1995). After 26 years of existence and growth, the 1993 Foreign Language Certificate Program completed their historic mission and was officially abolished by stopping testing and granting this specific certificate from January 15, 2020. This era is commonly known as English for modernization and industrialization.

3.4. Formal English Education between the late 1990s and the early 2010s

The US embargo was lifted out of Vietnam in February and Vietnam has normal diplomatic relations with the US and began to open itself to the world in 1995 (Wan 2001) and since then drive to learn English has turned into a national movement. As a result, formal English education has become a crucial part in Vietnam economic and socio development plan. In particular, gaining a membership to the Association of South East Asia Nations in 1997, the Asia Pacific Economic Cooperation in 1998 and the World Trade Organization in 2007 exerted the strong influence of English in Vietnam (Chu & Oliver, 2017). Consequently, expectations of English teaching and learning outcomes are high and this put great pressure on English teachers, schools and educational systems. Therefore, the era of late 1990s - early 2010s saw remarkable progress in national curriculum design and textbook development of English because of the deep concern of Vietnamese government about foreign language teaching and learning in Vietnam in the context of integration and globalization. In fact, all schools covered a 7-year (6-12 grade) national syllabus explicitly and systematically designed with one set of textbooks for secondary schools and two sets of textbooks (the standard and the advanced one) for upper secondary schools (MoET 2006, 2016). In particular, these textbooks are published by Vietnamese Minister of Education and Training (MoET).

By contrast, it was argued that there was no remarkable achievement in teaching and learning English as well as the student's assessment in schooling settings. Partly this slow improvement and innovation reflected the low level of adaptation of the speedy change of curriculum development and the expectation of society. Unfortunately, learners and teachers are key factors to ensure educational reform but they were unprepared and blissfully unaware. The outdated teaching and testing in classrooms still put weight on grammar accuracy and written structures and memorising grammatical rules and improving grammatical accuracy are central to English teaching and learning (Le Ha, 2009; Phuong & Nhu, 2015). On the downside, teachers and learners were driven by test-oriented goals.

3.5. Formal English Education between the late 2010s and the early 2020s

The late 2010s marked a milestone in curriculum design and textbook development by introducing 10-year national syllabus with a series of English textbooks. The output received a

great deal of support from two experienced British applied linguists from the British Council: Professor Rhona Stainthrop (for Pilot English Curriculum for Vietnamese Primary Schools) and Professor David Hay (for Pilot English Curriculum for Vietnamese Secondary Schools and Pilot English Curriculum for Vietnamese Upper Secondary Schools) (Hoang 2016). Unlike 7-year English textbook series, the 10-year English textbooks one put particular emphasis on four language skills: listening, speaking, reading and writing. Specially, two oral skills (listening and speaking) are crucial and are well-focused for English learning beginners. These two oral skills are gradually decreased. In contrast, reading and writing skills are slightly reinforced at higher levels. The percentage of every single language skill at each level is illustrated in table 3.1

Table 3.1. Percentage of listening, speaking, reading and writing at three different levels of the 10-year English textbook series

	Listening	Speaking	Reading	Writing
Primary	35%	35%	15%	15%
Secondary	30%	30%	20%	20%
Upper secondary	25%	25%	25%	25%

(Hoang, 2016, p.16)

From 2020 to present, English language ability testing is pursuant to Circular No: 1/2014/TT-BGDĐT dated January 24th 2014 of MoET promulgating Six-level Foreign Language Proficiency Framework for Vietnam by The Minister of Education and Training in Vietnam. This tailored Framework is based on The Common European Framework of Reference for Languages (CEFR), an international standard for describing language ability. In fact, CEFR describes language ability on a six-point scale, from A1 for beginners, up to C2 for those who have mastered a language. Similarly, Vietnamese Six-level Foreign Language Proficiency Framework is divided into 3 levels (Elementary, Intermediate and Advanced) and 6 levels (from Level 1 to Level 6 and compatible with levels from A1 to C2 in CEFR). A comparison between Vietnamese Six-level Foreign Language Proficiency Framework and CEFR is illustrated in table 3.2.

Table 3.2. A comparison between Vietnamese Six-level Foreign Language Proficiency Framework and CEFR

Vietnamese Six-level Foreign Language Proficiency Framework		CEFR
Elementary	Level 1	A1
	Level 2	A2
Intermediate	Level 3	B1
	Level 4	B2
Advanced	Level 5	C1
	Level 6	C2

(MoET 2014)

Pursuant to Announcement No. 619/TB-QLCL, dated May 8, 2020 of the Department of Quality Management under the Ministry of Education and Training, 14 government-backed units nationwide are eligible for granting foreign language certificates of 6 Levels (A1-C2) within the Vietnam Six-level Foreign Language Proficiency Framework in 2020 and then the granting list was updated to 24 government-run units in February 2022 which are prestigious universities and institutes in Vietnam. It can be seen that English centers are not allowed to grant 6 level certificates and Vietnamese foreign language policies have been gradually enhanced to take strict control of the quality of English language teaching and learning as well as to meet the language requirements of employers and society. It is widely agreed that compulsory English education and the new Vietnam Six-level Foreign Language Proficiency Framework in 2020 is a part of national strategic plan for economic development.

3. CONCLUSION

Formal English education has gone through five different phases between the early 1950s and the early 2020s and English has spread across Vietnam since the period of “reform” in 1985 and has seen a thrive since the late 1990s. Like many other countries in the world, English has become a foremost language and has great impacts on Vietnamese socioeconomic development. Thanks to the polices of the Vietnamese government via regularly updated guidance to cope with new challenges and obstacles in rapidly changing world, English curriculum; teaching methods and assessment have made crucial a lot of radical change and progress over the last seventy years to meet the requirements of employers as well as to keep up with the development of teaching and learning English of some Asian countries like Thailand, Philippines, Malaysia and others. However, numerous and restless efforts in terms of textbook designs, teaching and learning as well as a comprehensive, objective and consistent

assessment much be done to improve the quality of teaching and learning English in digital era with great support from advanced technology and Artificial Intelligence but a lot of potential threats from Covid-19 pandemic, global warming with more severe natural disasters.

**TEACHERS' BURNOUT, THE "FATIGUE SYNDROME" OF EDUCATORS'
PHYSICAL, MENTAL AND PSYCHOLOGICAL EXHAUSTION IN ALBANIA**

Ph.D. LENIDA LEKLI

ABSTRACT

Over the last few years teachers' burnout has been frequently described as a health condition and phenomenon whose impact is being analyzed in terms of both teachers' and students' achievements. Dictionary definitions of the term "burnout" provide interesting characteristics of this state, such as "the mental or physical condition of having no energy left"¹¹. So, the concept of exhaustion or fatigue goes beyond the physical one, usually dominated by high levels of stress, energy consumption/waste, routine submission, unconscious isolation focusing on one's professional or administrative tasks, etc. merely for the sake of celebrating one's success as an educator. Teachers' workload in the classroom and at home, their search for "professional perfectionism" in diverse, heterogeneous classes, often makes them forget themselves and forget the humans' innate need for energy recuperation and resilience. Consequently, they fall into this vicious circle of boredom, "burnout" from which it is difficult to escape. Therefore, a deeper analysis of the paper aims: to identify substantial reasons or factors that trigger teachers' burnout; to identify possible means that can positively contribute to its reduction and foster a better relationship among teachers and pupils; to analyze the extent to which professional achievement and burnout influence one another; to analyze teacher's burnout as a major reason of being quitted as a profession by the youth, etc. Answering and analyzing the above issues will provide a clearer display of the "burnout" syndrome and how it can be reduced if not omitted, guaranteeing a successful teaching process.

Keywords: Burnout, Exhaustion, Recuperation, Achievements, Teachers, Impact

¹¹ Macmillan English Dictionary for Advanced Learners (2007), p. 193

1. INTRODUCTION

Teaching has always been an appealing profession and yet demanding too, since earlier times. Like many other service occupations, teachers are highly vulnerable to experiencing feelings of burnout due to several reasons including extensive workload, interactions with students, colleagues, students' parents, headmasters, etc. Long hours of commitment and dedication to students and their teaching duties, peers' competitiveness in pursuit of "professional achievements in the classroom often lead to anxiety and exhaustion regardless of their teaching domain" (Santoro, 2011).

Being a workaholic in the teaching arena does not always guarantee professional success, on the contrary, it often leads to professional, mental, and psychological consumption. Empirical evidence has always shown that the feeling of workload in teaching is neither financially nor spiritually nor emotionally rewarding (Friedman, 1995). Furthermore, it is indisputably reflected even in a classroom management skills deficiency on the side of the teachers. The more anxious, and stressed educators seem to be, the more difficult it for them is to control the classroom environment and accomplish their required tasks by the school directory, or individual teaching tasks in the framework of the accomplishment of a successful teaching process following the annual teaching curriculum. Therefore, this multidimensional treatment of the effects of teachers' burnout requires careful consideration and study if we want teachers and students to do well in their teaching environment.

Teachers' burnout is a global worrying phenomenon not only in Albania but even in other countries. It often determines teachers' and student-teachers decisions vs. their future continuation in the teaching profession. It is also worth mentioning that in our country, Albania, this is one of the primary reasons that has dropped significantly the number of students wanting to attend teaching studies at the university level.

The universal global concern of teachers' burnout besides many factors also seems to be connected with the teachers' professional ability in being skilled managers and supervisors of the teaching profession. The more talented they are, professionally speaking, the more self-esteem and "self-efficacy" they have (Yu, et al., 2015). Consequently, this self-efficacy and self-esteem are going to be reflected in their management of burnout levels not only in the school environment but also at home.

Therefore, through empirical research, observations, and interviews of the current Albanian teachers' burnout situation, the paper aims at finding out and highlighting significant

factors that highly influence teachers' burnout, mostly in the 9th-grade school system, which is going to be the target group of this study.

Moreover, constructed interviews it is aimed at identifying possible means or strategies that can be applied by the teachers to soothe the phenomenon, reducing it which will undoubtedly be reflected in both teacher's and student's teaching and learning performance at home and school environment, promising higher results for both of them.

In today's society the diverse classrooms, with students having heterogeneous educational and cultural backgrounds; as well as the decreasing parental control and responsibility versus their children seem to have increased teachers' anxiety towards their prolonged levels of excessive tiredness and boredom highly reflected during the teaching process and their management of the disruptive behaviors in the classroom too (Aloe, et al. 2014). The more research and experience are shared on this issue, the easier it will for teachers and educators in coping with this worldwide global phenomenon.

2. LITERATURE REVIEW

Teacher's burnout, this chronic state of physical, emotional, and mental exhaustion sometimes considered even as a kind of chronic illness is mostly stress-related and caused and influenced by high levels of prolonged stress, boredom, and routine work in the classroom as well as at home (Goddard et al., 2006).

Along with its interesting part, teaching, as well as other "stressful occupations" (Gold& Roth, 1993), is broadly admitted to being a job that offers a high risk for stress and burnout due to several mixed reasons. Chang (2009) mentions in his article an interesting fact about teaching claiming that "it seems to offer for teachers limited interaction with adults" since it mostly focuses on a loose cooperation between educators and pupils/students. This dependent and dynamic interaction in this teacher-student pair makes "teachers feel drained emotionally and intellectually" (Chang, 2009). This feeling of being drained is indisputably reflected in teachers' consumed energy, force, desire, and will while performing in the classroom.

As mentioned above this feeling of isolation on the side of the teachers negatively influences their performing skills in the classroom not only in terms of the explanation but even in terms of the relationships they establish with their pupils. The initial energetic desire in entering the teaching profession soon seems to vanish into a routine process that goes on even at home with the completion of the student's assignments.

Educators' stress and burnout caused by their profession have undoubtedly influenced the workforce at a global level. Not only is it accompanied by a lack of satisfaction, performance, and accomplishment on the teachers' side, but it is also reflected in secondary school students' selection when it comes to entering university studies.

This sad reality concerning the teaching profession and its future is currently evident even in our country. Teenagers' preferences nowadays seem to be classified into three major directions highly influenced by the immigration facilities provided by European countries, that is IT experts, medicine, and nursing. What about teaching? Unfortunately, that stands by the end of the lists' preferences, despite the Albanian government's measures in increasing teachers' salaries. Consequently, these teenagers' retreat from studying to become a teacher influences educational institutions as well as parents in search of a good teacher for their kids. Even those students who end up graduating from university in teaching with high levels of energy, soon fall into the burnout circle, highly reflected in their lack of desire and will. Not being able to escape the burnout phenomenon or this "dull reality" as known by Stern and Cox (1996), the in-service teachers display feelings of boredom, irritation, and anxiety which directly influence students' academic performance.

3. METHODOLOGY

The target group of this research consisted of teachers since the burnout phenomenon is considered in the teaching profession. There were about 147 teachers, from the 9th-grade system as well as elementary school educators who were being interviewed, to generate diverse data in the framework of this professional exhaustion. The selected sample was teaching pupils in both rural areas and urban ones to draw similarities and differences between the two.

The main instrument applied for the collection of the data was semi-structured interviews. These served to conduct both qualitative and quantitative research considering the nature of the theme itself. The topic of burnout fatigue provides diversity since individual teachers do experience it differently. Besides the fixed number of questions, educators were also asked some open questions where they could express their individual experiences and opinion referring to this issue.

Another instrument that was also used was that of observations conducted during teaching. The purpose of these observations was that of catching unconscious features of burnout conditions during the teaching process. Observations were carried out in different schools, in different subjects, and with different teachers. The school staff being observed was

classified into two groups, teachers having long years of teaching experience as well as novice teachers. The purpose of the latter was that of identifying which group experienced more burnout conditions

4. RESEARCH AND FINDINGS

After having realized the semi-structured interviews and the observations, the research was followed by the next step, that of elaborating the collected information.

The data collected relating to this topic of research were impressive. The variables taken into account in the generation of the information were useful since they provided concrete data on the topic being researched. Of teachers working in rural schools, almost 46% surprisingly experienced lower levels of burnout in comparison to the teachers teaching in urban schools.

This was justified by a couple of reasons, one of which was the smaller number of pupils in classes which provided them the opportunity to complete most of the administrative tasks during working hours. The opposite picture was reflected among teachers in urban schools. Under stricter rules of observation, and being characterized by a bigger number of pupils in classes, most of the teachers were obliged to continue home in the evening most of the tasks to complete them.

In elementary school teachers, 38% showed higher levels of burnout due to the correction of the assignments, home, and class ones, because they cover different subjects during a school day. Even in cases when they got them home to be finished, this restricted their family time and tended to increase levels of boredom and stress in their isolated classroom environment the following day. Not only did they suffer individual internal feelings of dissatisfaction, but this was highly reflected through a lack of enthusiasm even in their teaching process.

The abundant number of papers and documents teachers have to complete in terms of the directorates' requirements, teachers experienced immense feelings of energy consumption and mental distraction which was highly evident even during teaching. Students' portfolios and files were time-consuming as well as tiring. 84% of the teachers being interviewed admitted spending more time completing these two documents than realizing extra learning activities for the pupils. Therefore, dealing with the useless completion of papers often made teachers retreat from the fulfillment of their personal and professional achievements. Teaching, instead of an attractive occupation turns out to be considered tiring and not well paid by the people, often leading to a lower number of applications at university teaching courses.

5. CONCLUSION

Analyzing the burnout syndrome among teachers is an endless process that never expects to reach a decisive answer. What we as educators and researchers can do is continuously monitor such phenomena to help teachers:

- overcome difficult challenges,
- fulfill their objectives,
- reach their goals through intentions and determination
- set high expectations for the class achievements and success,
- continue their noble profession and never quit it, etc.

Classrooms dynamics will always be present, at whatever time. Teachers should try their best to successfully achieve their goals regardless of the constraints which often lead them to stress and pressure. Becoming better time managers would be of significant importance and a reasonable opportunity when it comes to dealing with the syndrome of Burnout.

ÖZET

Dil, doğuştan sahip olunan ve insan zihninde yer alan bir dizgedir. Dünyadaki her dil, insan toplulukları arasında çok uzun zaman içerisinde gelişip meydana gelir. İnsan zihni ile kültür arasında aracı vazifesini yüklenen dil, hem kültürlerin hem de zihinlerin gelişmesinde önemli rol oynamaktadır. Toplumsal yaşamla kaynaştığı için dil, esasen toplumsal bir olaydır. Çünkü dilin birinci işlevi bildirişimdir. Toplum bireyleri birbirine bağlayan, karşılıklı iletişim hâlinde olan tüm insanların oluşturmuş olduğu bir sistem, sosyal ilişkiler bütünüdür. Toplum bilimi ise insanın tüm davranışlarını, ilişkilerini ele alan, sosyal ilişkilerin yapısını ve bu ilişkilerin nasıl ortaya çıkıp, değişip, şekillendiğini inceleyen bir bilim dalıdır. Sosyal eylem bilimi olarak da bilinen bu bilim dalının esas çıkış noktası insanların yaşadığı eylemlerin anlamlandırılmasına, dış dünyaya karşı bir bakış açısı oluşturmalarına yardımcı olmaktadır. Toplum biliminin çeşitli kuramları vardır. Dilbilimciler açısından en dikkat çekici olan yapısal-işlevselci kuramdır. Bu kuramın temel ilkesi topluma çok boyutlu bakmayı ön görmesidir. Bu çalışmada toplum dilbiliminin, dil ile toplumun kesiştiği olguları bir arada incelemesinden yola çıkarak toplumsal olaylara nasıl yaklaşılması gerektiği ile ilgili önerilerde bulunulmuştur. Bu önerilerin en başında toplum biliminin yapısal-işlevselci kuramı bağlamında bir kategoriye oturtularak toplumsal olaylara dilbilimci bir bakış açısıyla yaklaşılması gelmektedir. Toplum dilbilimi, dili işlevsel açıdan ele aldığı için toplumdaki bireylerin toplum değişkenleri (eğitim seviyesi, yaş, meslek gibi) açısından da değerlendirmek durumundadır. Bu sebeple her yönüyle incelenmesi gereken bir dizgeye sahip olan toplum dilbilimi alanında yazılı verilerden ve görsel malzemelerden yararlanılarak elde edilen verilerin toplumsal bir yapı içerisinde analiz edilmesi gerekmektedir. Böylece daha sağlıklı sonuçlara ulaşmak mümkün olacaktır.

Anahtar Kelime: Dil, Toplum, Toplum Dil bilim.

**HOW SHOULD SOCIAL EVENTS BE APPROACHED FROM SOCIAL
LINGUISTIC PERSPECTIVE?**

ABSTRACT

Language is a system that is inherent in the human mind. Every language in the world has evolved over a long period of time among human societies. Language, which assumes the role of intermediary between the human mind and culture, plays an important role in the development of both cultures and minds. Language is essentially a social phenomenon, as it merges with social life. Because the primary function of language is communication. Society is a system, a set of social relations, formed by all people who connect individuals and are in mutual communication. Social science, on the other hand, is a branch of science that deals with all human behaviors and relationships, examines the structure of social relationships and how these relationships emerge, change and take shape. The main starting point of this branch of science, also known as the science of social action, helps people to make sense of their actions and to create a perspective against the outside world. Social science has various theories. For linguists, the most striking is the structural-functionalist theory. The basic principle of this theory is that it foresees a multidimensional perspective on society. In this study, suggestions were made about how social events should be approached, based on the fact that sociolinguistics examines the intersection of language and society together. At the forefront of these suggestions is the approach to social events from a linguistic perspective by categorizing them in the context of the structural-functionalist theory of sociology. Since sociolinguistics deals with language from a functional point of view, it has to evaluate the individuals in the society in terms of social variables (such as education level, age, occupation). For this reason, the data obtained by using written data and visual materials in the field of sociolinguistics, which has a system that needs to be examined in every aspect, should be analyzed within a social structure. Thus, it will be possible to achieve healthier results.

Keywords: Language, Society, Society Linguistics.

Giriş

Dil, insanın evrendeki hem yerini hem değerini belirlemede çok etkin bir nitelik taşımaktadır. Çünkü yaşamın sürdürülebilirliği dil ile gerçekleşmektedir. Bu nitelik dilin farklı tanımlarının ortaya çıkmasına sebep olsa da genel çerçeve ve varılan yol aynıdır. Dilin uzlaşım ile beraber bir sözleşme olması, sanat ve bildirim gibi alanlarda çok önemli bir yeri vardır. Bu yüzden dünyadaki çeşitli bildirişme dizgelerinin en mükemmeli olarak dili kabul etmek mümkündür (Aksan, 2000: 11; Saussure, 1998: 38). Saussure'e göre dil ve söz birbirinden ayrı kavramlardır. Dil tasarıma ihtiyaç duymaz ama söz hem bireyseldir hem de anlık olarak belirmektedir (Saussure, 1998: 9). Dil tüm toplumu ilgilendirir ama söz dilin birey tarafından somut bir kullanımıdır. Dil bu yüzden toplumsal olup söz ise bireyseldir. Dil-söz ayrımı esasen toplum bilim ve ruh bilim çerçevesinde yer almaktadır (Rıfat, 2005: 26). Dil, toplumsal bir araç olduğu kadar aynı zamanda bireyin zihinsel süreçlerinde de çok gerekli bir araç olup insan zihni ile kültür arasındaki insanla başka bir insan arasındaki, dünya ile insan zihni arasındaki tüm ilişkilere aracılık etmektedir. Yani kültürel her gelişimde dilin zihne ve sürece desteği büyüktür (Yıldız, 2014: 132). Toplum, fertleri birbirine bağlayan karşılıklı etkileşim ile insanların oluşturduğu bir sistemdir. Toplum ise sürekli değişim içinde olan bir sosyal ilişkiler ağıdır denilebilir (Marshall, 2009: 732). Aksan'ın da dediği gibi insanlar toplum hâlinde yaşamasalardı dile ihtiyaç duymayacaklardı. Dil olmadan insanların bir arada yaşamaları, anlaşabilmeleri ve bir topluluk oluşturmaları imkânsızdır (Aksan, 2000: 64). Dil ve toplum arasındaki bu ilişki yeni bir alan olan toplum dil bilimini ortaya çıkarmıştır. Toplum dil biliminin alanına değişik dil kullanımlarının betimlenmesi, değerlendirilmesi ve dile yansması girmektedir (İmer, 1990: 15).

Toplum bilimi

Sosyo toplumsal, *loji* ise bilimselliği ifade etmektedir (Tezcan, 2011: 1). Sosyoloji, insan davranışlarını ve ilişkilerini inceleyen, toplumsal olarak nitelendirilen tek başına olmayan insan topluluğunun belli bir grup içindeki tüm hareketlerini kapsayan, insanlar arasındaki sosyal ilişkilerin yapısını ve bu ilişkilerin nasıl ortaya çıktığını, değiştiğini incelemektedir (İçli, 2012:6). Toplum bilimi de tam olarak bir sosyal eylem bilimidir. Toplumun genel yasalarını, yasa benzeri düzenlilikleri, eğilimleri, toplumsal olgular arasındaki neden-sonuç ilişkilerini anlamaya ve tespit etmeye çalışır. Amaç, toplumun ya da toplumsal ilişkilerin bilimsel olarak incelenmesidir. Toplum bilimi kuramlarının başında *yapısalcı-işlevselci kuram* gelmektedir. Bu kuramın temel çıkış noktası biyolojidir. Organizmanın topluma aktarılmış biçimi işlevselcilik anlayışı olarak belirmektedir. Toplum bir sistem olduğu için bu sistemin her bir parçası

diğerinden etkilenir. Toplumun çeşitli parçaları tıpkı bir insanın organizması gibi birbiri ile ilişkilidir ve her biri sistemin işleyişine katkıda bulunmaktadır (Tezcan, 2011: 10). *Çalışmacı kurama* göre, köktenci bir seçenek sunarak toplumdaki ekonomik kaynaklı bölünmeleri öne çıkarmaya çalışmaktadır. Güç-eşitsizlik-mücadele sorunları bu kuramın esas sorunlarıdır. Sosyal çatışma paradigması bağlamında sosyal sınıf, kültürel kimlik, ırk ve cinsiyet gibi faktörler sebebiyle para, güç, eğitim ve sosyal prestijin nasıl dağılım gösterdiğini araştırmaktadır (Bahar, 2009: 16). *Sembolik etkileşimcilik kuramında* ise toplum bir bütün olarak şekillenmektedir. Bu yüzden daha geniş bir perspektife ve büyük resme ihtiyaç vardır. Bu yaklaşımda toplum bireylerin günlük etkileşim ürünüdür. Makro düzey sosyal yapılar bu kuramda göz ardı edilir. Kültür, sosyal sınıf, sosyal cinsiyet, ırk gibi faktörlerin toplum üzerindeki etkileri araştırılmaz (Bahar, 2009: 17). Bu üç kuram da toplum dil bilimine hizmet etmektedir.

Toplum dil bilimi

Toplumsal bir olgu olan dil, söz gibi bireysel değildir. Dil duygu ve düşüncelerin anlatımında kullanılır. Böylece bir birey kendi söz varlığını oluştururken bireylerden oluşan toplum da öz dilini kullanır. Bu oluşumda hem bireyin hem de toplumun düşünce yapısı ve kimliği görülebilir (Günay, 1995: 7). Toplum dil bilimi, dil ile toplumun kesiştiği olguları beraber ele almaktadır. Sebep-sonuç ilişkisi yanı sıra dil ile toplumun farklı boyutlarının bir araya gelmesiyle ortaya çıkan tüm olguları da incelemektedir. Bu inceleme belirli yöntemler ve bilimsel bulgular ile bir amaca hizmet etmektedir (Güven, 2012: 57). Toplum bilim ile dil bilim kavramlarının birleşimi toplum dil bilimi kavramını doğurmuştur. Dilin sosyal işlevini ele alan bu bilim dalı dilin toplum içinde nasıl değiştiğini veya değişebildiğini, bu değişimlerin ne gibi etkilerinin olduğunu açıklar. Toplumdaki bireyin toplumun içindeki değişken durumları da göz önüne alınca eğitim seviyesi, meslek, cinsiyet, yaş gibi faktörler dilin toplumsal işlevi açısından incelenmesine olanak tanır (Selen, 2001: 2). Dil yetisinin incelenmesinde işlev ve gelişim açısından gösterilen sosyal durumlar toplum biliminin sahasına girdiği için dillerin incelenme sahası da toplum dil bilimi sahasına girmektedir. Bildirişim eyleminin toplumsal değerlendirilmesi bu kapsamdadır (Vardar, 1982: 121).

Toplum Dil Biliminin Tarihçesi

Toplum dil bilimi sözcüğü ilk kez 1939 yılında Thomas C. Hodson'ın 'Sociolinguistic in India' makalesinde, dil bilim sahasında ise Eugene Nida'nın *Morphology* eserinde görülmüştür (Nazlı, 41). Toplum dil bilimi Kuzey Amerika'da konuşulan İngilizce ile zencilerin konuştuğu İngilizce arasındaki farkların eğitime olan etkisinin incelenmesiyle başlar,

Fransa'da yönetici ile işçi sınıfının dil kullanımını ve dilsel farklılıklarının tespiti ile devam eder. Almanya'da ise ülkedeki göçmen ailelerin ve eğitim gören göçmen çocukların karşılaştıkları dilsel engellerin üstesinden gelmek için toplum dil biliminin yöntemlerine başvurulur (Selen, 2001: 5-7). Toplum dil bilimi dilin anlatım işlevi ile ilgilendiği için toplumdaki bireylerin yaş, eğitim seviyesi, meslek gibi özellikleri ile bir bütünlük arz etmektedir. Bu yüzden dilsel davranış sadece sözcük dağarcığı, fonetik, morfoloji değildir bu kodların gruba özgü kullanımları da ele alınmaktadır. Bu sebeple toplum dil biliminin de çeşitli kuramları vardır. Dil bilimcileri sıklıkla kullandığı iki kuramı şöyle izah etmek mümkündür:

1. Basil Bernstein'in Eksiklik Kuramı: Bu kurama göre toplumun her katmanında kendilerine has dil kullanımları vardır. Önemli olan bu has dil kullanımlarındaki kodları çözümlenektir. Kodlar bildirişim sağlayan en önemli göstergelerdir. Çocukların okul başarısında dil katmanları önemlidir. Çünkü alt katmanı gelişmemiş bir çocuğun üst katmandaki dile hâkim olması zorlaşmaktadır. Okul gelişmiş dil kodları ile eğitimin sunulduğu bir yerdir. Halk dili de dilsel biçimi belirleyen uyarıcılarla oluşur. Halk dilinde kısa emirler, basit bildirimler ve sorular sıkça yer alır. Vurgu mantık yolu ile değil duygusallık yolu ile yapılır. Orta sınıfın dili ise daha zengin, daha karmaşık ve daha dinamiktir (İmer, 1990: 24).

2. William Labov'un Ayrılık Kuramı: Bu kuramda ölçünlü olmayan biçimlerin kullanımının çocukların mantıksal düşüncelerini yavaşlattığı ve eğitim açısından bir eksiklik doğurduğu fikrine karşı çıkmaktadır. Bu kuram, anlatım yetisi, sözcük zenginliği, ölçünlü dil kullanmayanların mantığı gibi noktalardan yola çıkarak ölçünlü olmayan İngilizcenin de kendine özgü bir dizge olduğunu ve ölçünlü dil içinde iyi veya kötü olarak bir değerlendirmenin yapılamayacağı toplumsal kullanımların varlığını kabul etmektedir. Dilsel değişimlerle, konuşurların toplumsal konumu arasındaki ilişki ve gözlemler aynı zamanda dil değişimleridir. Dil değişkenliği dil bilimsel açıklamaya dayanır. Dilsel dizgelerin nasıl ve hangi işlevlere ayrıldığı ve toplum konuşurlarının yalnız ölçünlü türlere değil bölgesel, toplumsal ve işlevsel türlere de yer verilmesine olanak sağlanması en uygun olanıdır (Kıran, 2012: 272).

Toplum dil bilim çalışma alanlarına bakıldığında dil ilişkisi, ödünç alma, çokdillilik, ikidillilik, ilişki dilleri, kreoller, geçer dil, kod değiştirimi, diyalekt, sosyolekt, dil ve eğitim, geniş ve dar kodlar, dil siyaseti, erkek ve kadın dili, dil ve kültür, dil ve düşünce, dilsel gereklilik, dilsel ve toplumsal eşitsizlik, dilsel davranışlarını sıralamak mümkündür (Güven, 2015: 20).

Toplum dil bilimi veri olarak konuşanın etnik kökenini, sosyo-ekonomik seviyesini, mesleğini ele alıp dili inceler. Aynı zamanda dinleyicinin bakış açısı da değerlendirme

kapsamına alınabilir. Toplumsal özellikler barındıran söylemler de bu bilim dalı çerçevesinde ele alınabilir. Bildirişim eyleminin gerçekleştiği koşullar ile belli bir toplumsal statüde yer alan bireylerin konuşma biçimi, eğitim seviyesine göre değiştiği için benzer ve farklı dil edinimleri bu kapsam alanında değerlendirilebilir (Rıfat, 2005: 99).

Dil türlerinin hepsi toplum dil bilimin çalışma sahasındadır. Bireysel, işlevsel ve toplumsal dil türü belirlendikten sonra belirli bir kuram çerçevesinde anket, görüşme, ses kaydı veya yazılı metinlerden yola çıkarak toplum dil bilimsel bir inceleme yapılabilir. Bireylerin dil davranışı bulunduğu topluma, zamana ve mekâna göre de ayrılıklar gösterdiği için belirlenecek olan malzemenin hangi kurama uygun olup olmadığı tespit edilmelidir.

Toplum ve dil homojen kurumlar olmayıp dil farklılıklarını yaratan etkenlerin en belirgin olanları zaman, coğrafya ve toplumsal yapı iken dil etnik özellikler, eğitim, aile, cinsiyet gibi etkenlere bağlı olarak değişkenlik gösterir (Eker, 2007: 127).

Toplum dilbiliminin ortaya çıkışında dilbilimin içinde bulunduğu çıkmazın büyük bir rolünün olduğunu savunanlar oldukça fazladır. Dil biliminde yapısalcılığın dilde toplumsal olanı reddeden bir anlayış ile kurulmuş olması onu dış gerçeklerden uzaklaştırarak soyutluğa inmesine yol açmıştır bu durum toplum dilbiliminin doğuşunu sağlamıştır (Bosnalı, 2008: 9). Her kültürün dili o toplumun kurumsallığını, eylemlerini, düşüncelerini yansıtan söz dizimi ve anlam yapıları ile kültürel ideolojilerle harmanlanarak ortaya çıkar (Büyükkantarıcıoğlu, 2006: 36). Saussure göre dil yeteneğinin hem bireysel hem de toplumsal bir yanı vardır. Ama dil ile dil yeteneği birbirinden ayrılır. Çünkü dil, dil yeteneğinin bireylerce kullanılabilmesi için toplumun benimsediği zorunlu bir uzlaşımın bütünü olarak tanımlanabilir. Dilin varlığı dolayısıyla topluluk üyeleri arasındaki bir tür sözleşmeden doğar demek mümkündür (Saussure, 1998: 37-44).

Dil, toplumun genel yaşantı ve davranış biçimleri, inanışlarıyla, çevreyi algılama şekliyle ve düşünce dünyasında yer alan tüm gelişmelerle ilgili olduğu için tüm değişikliklerden doğrudan veya dolayla etkilenebilmektedir. Bu yüzden ki herhangi bir topluluk veya bölge halkı hakkında bilgi sahibi olunabilmesi için titizlikle gerçekleştirilen bir dil incelemesi topluluk hakkında nesnel veri sunmaya yeterli olacaktır (Günay, 1995: 19). Bu yüzden toplum dilbiliminin konularına toplumsal katmanlarda yer alan dillerden hareketle bir yargıya varmak mümkündür. Ama şunu da unutmamak gerekir ki kendini ifade ediş biçimi sadece sözel bir sunum ile gerçekleşmez. Toplumsal durumlar resim, müzik, anlatı, davranışlarla da izah edilebilir.

Sonuç

Dil ile ifade edilenler toplumda meydana gelir. Bu yüzden dildeki anlam toplumun içinde belli bir sistem içerisinde ortaya çıkmaktadır. Bu duruma uzlaşım bütünü de demek mümkündür. Birey sisteme bağlıdır bu yüzden toplum dilbilim incelemesi yaparken göstergebilimden yararlanmak kaçınılmazdır. Toplumda yer alan her kodda bir ileti gizlidir. Bu yüzden toplum dilbilimsel bir inceleme yapılırken mutlaka göstergebilimden yararlanmak gerekir. Gösterenler, göstergeler ve gönderge sisteminde yer alan her kod toplum dil bilimsel analiz ile yoğrulur. Yapılandırılmış bir düzen içerisinde gösterilen her varlık toplum dil biliminin bir malzemesidir. Ele alınan konunun malzemesine göre uygun bir kuram tercih edilecek olsa bile göstergebilim olmadan iletiler tam olarak çözülemeyeceği için göstergebilimden mutlaka yararlanmak gerekecektir.

ABSTRACT

Supply chain management (SCM) is the management of the flow of goods, data, and finances related to a product or service, from the procurement of raw materials to the delivery of the product at its final destination. Managing this process effectively and efficiently plays a very important part in the business's success. Nowadays various supply chain activities contribute to growing environmental issues, forcing industries to move towards socially responsible green supply chain management (GSCM) practices. Environmental sustainability and green attention have been becoming increasingly popular among all stakeholders such as researchers, practitioners, and other business environments. Rising environmental issues have pushed industries towards becoming socially responsible for GSCM practices. In addition, business entities receive huge pressure to oblige green solutions in their operations for several reasons mainly for profitability and being eco-friendly. For this reason, implementation of GSCM might be considered a compulsory process for effective business management to become much more successful in business operations. Converting into green supply chain management takes too much effort and investment for a business. The aim of the study is to emerge critical success factors (CSF) in the management of the green supply chain. In this respect, the systematic literature review will be performed in order to reveal the critical success factors for green supply chain management that the enterprises will encounter in the green supply chain management program. CSFs are grouped by categories top management commitment, technology and digitalization, government regulation and standards, and organizational adaptation This work will not be specific to any type of business. For this reason, the results of the study could be implemented in all kinds of businesses that want to transform the supply chain process into green supply chain management.

Keywords: Supply chain management, green supply chain management, critical success factors, literature review

Introduction

The main importance of green supply chain management (GSCM) lies at the heart of human print on the planet. These impacts vary according to the operations of a business. Many business implications put a heavy burden on increasing environmental concerns. One of the major positive effects of GSCM is to decrease those pressures by applying green solutions. In this perspective, GSCM has a promising business venture for business operations, by changing the operations of the business decreases the carbon print of business on the planet and gets appreciation from all stakeholders as well as environmentalists in addition to being a lucrative business organization.

A set of managerial procedures known as "sustainable supply chain management" is defined as including all of the following: minimizing urgent environmental impact; taking into account all processes along the complete value chain for each product; and a multidisciplinary strategy that considers a product's complete lifecycle (Erdem, 2022).

Growing environmental and social issues have generally resulted from various supply chain activities, forcing businesses to keep forward on the way to socially responsible green supply chain management applies. Environmental sustainability and green attention have become increasingly popular among researchers and practitioners in business organizations. Various activities causing severe environmental and social issues such as waste and emission enforce industries to be responsible for GSCM practices. In this respect, industries are being scrutinized and getting more attention for the integration of green practices from all aspects into traditional supply chain management. Green Supply Chain Management is to be consist of life cycle of product as well as sourcing, selection, design of material and product, while managing delivery of end product and disposition process. Business whose aim is to create profit and having competitive image in the market can make use of GSCM for their strategic aim in order to achieve their organizational purposes. Organizations might have some goals, such as improving brand image, competitiveness, optimal use of resources, better customer service, environmental and socially accepted image, improved effectiveness, and many more. Organizations use, different business strategies to achieve these goals. GSCM can be logically good for the stabilization of ecological, economic, and social benefits and it came into life as a game changer strategic tool for business organizations to become more environmentally friendly, and to spend money more efficiently and competitively way (Luthra et al., 2015).

In order to increase productivity and profitability, green supply chain management (GSCM) integrates sustainability concerns into manufacturing, procurement, supply and

distribution, sales, and related areas. Environmental activities are incorporated into GSCM practices to guarantee eco-friendly goods or services and to lower costs throughout its value chain. In order to achieve GSCM waste minimization activities, various practices that are applied through the numerous application such as remanufacturing, reducing, reworking, refurbishing, reclaiming, recycling, reusing, etc. must be created or controlled. This includes the implementation and monitoring of environmental management programs. GSCM is a coordinated supply network that takes environmental concerns into account. Green supply chain management (GSCM) incorporates sustainability considerations into business applications such as procurement, sales, manufacturing, supply, distribution, and the other associated areas in order to boost productivity and profitability. GSCM practices integrate environmental activities to ensure eco-friendly products or services and to reduce costs across its value chain. Many green practices implemented through the several green activities such as remanufacturing, reducing, reworking, refurbishing, reclaiming, recycling, reusing, etc. must be developed or controlled in order to accomplish GSCM waste minimization activities. Environmental management initiatives are implemented and monitored in this. A coordinated delivery network that considers environmental issues is known as GSCM. At first, supply chain management was primarily concerned with incorporating sustainability problems such as green production, green distribution, and green marketing to improve the environment. To increase environmental and social welfare, supply chain management (GSCM) now includes a variety of sustainability issues, including green production, green distribution, and green marketing. Initially, GSCM primarily concentrated on green logistical issues (Nekmahmud et al., 2020).

According to Grimm et al. (2014), the three pillars of sustainable development economic, environmental, and centered on the requirements of customers and stakeholders have given rise to the social concept of sustainable supply chain management (SSCM). In addition, the goal of SSCM is to link environmental operations with finance, strategy, policy, product design, supplier relations, and post-consumer product management in a way that benefits all parties. (Panjehfouladgaran & Bahiraie, 2014).

The main importance of this study is to describe critical success factors according to literature. In literature, success factors described based on industry and research area but general descriptive success factors constitute gap in literature. Clustering main critical success factors in literature is considered to be helpful to bridge gap in this sense.

Methodology

The qualitative research method is employed in this study by combing through the literature review. In this respect, systematic literature screening is performed in order to reveal the critical success factors that enterprises might encounter in the green supply chain management program. Systematic literature screening is performed as follows:

- Planning of literature review research
- Conducting literature review research
- Analyzing and reporting data

As the very first step database research has been conducted via Ankara Yıldırım Beyazıt University Database, Science Direct, Springer, and YOK which is higher education institution web page for dissertations' full-text access in Türkiye. In research, green supply chain management, critical success factors of green supply chain management have been used as keywords. For the keyword 'Critical Success Factors of Green Supply Chain Management' nothing has been found as dissertation in Türkiye's Higher Institution online database and research has been extended to other keywords as 'Green Supply Chain Management' than 25 study has been identified. On the other hand, for the research 'Critical Success Factors of Green Supply Chain Management' 579 articles are found in Ankara Yıldırım Beyazıt University Database, Science Direct, Springer as total. Related studies which are open to free access are eliminated carefully and most related articles are sorted out accordingly key words and subject field to screen critical success factors in GSCM. After this careful examination 29 articles and 12 dissertation study refined to be investigated along with research question. Among those studies, 12 articles have been considered as the most related studies to be used in this study for the elimination of critical success factors for GSCM.

Findings

After careful examination of studies, critical success factors standing out from the literature were refined and cross-references were sorted out accordingly. By combing through the literature, the critical success factors that have been found in research are grouped under 4 main topics to define critical success factors in GSCM with a holistic approach. These are top management commitment, technology–digitalization, government regulations-standards, and organizational adaptation.

Top management commitment

Top management commitment does have the most crucial priority among CSFs, which is playing a significant part in the implementation of sustainable GSCM. The choices made by

the company's top management team allow it to adapt to changes in demands as well as discontinuous changes in competitors, technology, and regulatory requirements. The top management team frequently creates a board or management group to address environmental issues as part of sustainable GSCM activities, which demonstrates their commitment to stewardship. Therefore, top management's commitment to the environment is likely to encourage the company to develop skills in green manufacturing and product design (Agrawal et al., 2022).

Organizational factors among critical factors have the biggest impact on success factors for the implementation of GSCM. Among the organizational factors, the most significant factor is top management's commitment to creating a favorable business environment and leading role in GSCM (Prasad et al., 2018).

To guarantee awareness, comprehension, and obligation for the implementation of environmental strategy and corporate policy throughout the organization, senior management support and leadership are essential. It is important to offer tools and financial assistance. Environmental concerns should be included in strategic planning, the company should work on environmental initiatives, and expertise should be valued as a key organizational resource. The success of GSCM initiatives depends on senior management's dedication. For effective supplier management, people must be educated, trained, and made aware of environmental problems, environmental audits, the necessity of an ERP (Enterprise Management System) and certifications (Chiappetta Jabbour et al., 2017).

Technology and digitalization

One of the most significant impacts of technological advancements on businesses is thought to be digitalization. The process of integrating digital technologies into business operations in order to alter business procedures, open up new revenue-generating possibilities, and so forth is known as digitization. Therefore, digitalization is a socio-technical process that is used in harmony by people, groups, and societies. It is not just the digitization of transactions (Erdem, 2022).

IT implications are a crucial part of supply chain management activities since they might improve hugely SCM activities. Efficient, accurate, integrated, cost-effective, real-time communication ability, transparent, reliable, quality, and automation systems are some effective parts of IT applications on GSCM. Companies' competitive edge or ability to compete against other companies will be greatly impacted by their adoption of IT in accordance with

requirements. The biggest opportunity for developing and accumulating extensive knowledge about current clients, suppliers, and market demand is offered by SCM IT implementation (Fernando, 2018).

Government regulations and standards

According to institutional theory, companies are driven to take strategic action by outside pressures. Governmental organizations, laws, important customers and suppliers, rivals, trade associations, special interest groups, and the media are examples of external stakeholders who put pressure on supply chains to be more responsible. These outside constraints encourage companies to adopt a supply chain strategy that is sustainable. External influences come in three forms: normative (market), derivative (competitive), and coercive (regulatory). The most crucial force behind environmental efforts among manufacturing firms is coercive pressure, which is defined as conformity brought about by influence from those in authority. Practically speaking, government agencies have the power to sway an organization's behavior by implementing environmental regulations (Prasad et al., 2018).

It has been determined that the organizational element has the greatest impact on GSCM adoption. By raising labor productivity and business social responsibility, it can encourage the adoption of GSCM. The involvement of the government is also equally crucial. In order to guarantee that businesses undergo a green transformation, the government should increase support for SMEs by providing the necessary finance and technology as well as by developing pertinent policies and regulations. Additionally, increasing product services and design, lowering operating costs, establishing an enterprise's green brand image, and creating a good business environment and enterprise cooperation can all successfully contribute to the green transformation of enterprises (Lin et al., n.d.,2022).

Organizational adaptation

According to Leyh and Thomschke (2015), some critical success factors are management change, user training, project management, clear goals and objectives, communication, organizational structure, business process reengineering, troubleshooting, knowledge management, project champion, and vendor tools and implementation methods (Leyh & Thomschke, 2015). These factors could be described under the organizational adaptation of GSCM since these are directly related to the organizational adaptation of GSCM. Patil and Kant (2013) also highlighted "*the direct participation of staff to help SC fulfill its mission and meet its objectives by applying their own ideas, expertise and efforts toward solving*

problems and making decisions” in their study to define CSF in SCM (Patil & Kant, 2014). In conclusion, organizational adaptation for GSCM includes a range of success factors such as employee involvement, training, business culture, collaboration, and communication.

Conclusion

In this study, critical success factors, which are important for businesses that will implement the green computing program, were determined as a result of the literature study. These critical success factors are grouped under 4 main headings. It is seen that critical success factors of green supply chain management are top management commitment, technology–digitalization, government regulations-standards, and organizational adaptation.

In the generic concept, CSFs are grouped by internal and external factors (Alhamali, 2019). When it is broken down into categories, it differentiates according to business needs and future expectations. Among the critical success factors, top management commitment stands out as a vitally important factor, since it affects everything in the adaptation of GSCM. As a leading factor, it seems to have an influence on other factors to have them successfully implemented. From the financial decisions to technological adaptations, GSCM takes many steps to be implemented, in this respect, top management commitment seems compulsory as a necessary factor to be taken essential steps.

Technological improvement is another essential means of business operations for GSCM. This aspect is closely related to organizational adaptation. As an umbrella term organizational adaptation includes many activities happening in this quest. Changing the business culture in the organization, training employees, and creating collaborative communication skills in the business environment could be taken as the main objectives. Another driving factor in GSCM is government regulations and standards. It is essentially important as a driving factor for the adaptation of GSCM. Decision-makers need to have their organizations complied these regulations and standards. It coerces business owners to take green applications decision.

In this study CSFs are grouped by categories of top management commitment, technology and digitalization, government regulation standards, and organizational adaptation, there are many sub-factors for CSFs though. Many sub-factors belong to these groups, although many of them delineate according to different business branches. Organizational adaptation covers business features. This aspect might be described as overarching for a number of

business implications such as employee involvement, organizational education and business culture.

Every study has some limitations, but this study's first and major limitation is to reside on a literature review. This study is limited to a literature review. For future studies, researchers can conduct interviews with managers or use online surveys to employees to reveal and examine the CSF of the GSCM program.

ÖZET

Sentetik baz yağlar, greslere aşınma, düşük sıcaklık performansı, termal ve oksidatif stabilite gibi istenen özellikleri kazandırmak için mineral baz yağlara alternatif olarak kullanılmaktadır. Bu çalışmada mineral baz yağlarla hazırlanan kalsiyum sülfonat kompleks gresi (CSX), polialfaolefin (PAO) ve yağ asidi esteri gibi sentetik baz yağlar kullanılarak da üretilmiş ve tribolojik özellikleri incelenmiştir. Kullanılan baz yağların viskoziteleri ISO VG 100'e ayarlanarak NLGI sınıfı 1,5 olan gresler elde edildi. Yapılan deneysel çalışmalar, greslerin düşük sıcaklıktaki pompalanabilirlik performansının bir ölçüsü olan soğuk akış basıncı değerinin, sentetik baz yağlarla hazırlanan greslerde daha iyi olduğu tespit görülmüştür. Ayrıca sentetik baz yağlarla hazırlanan greslerin aşınma izi çaplarının, mineral baz yağlarla hazırlanan greslere göre oldukça düşük olduğu tespit edilmiştir. Buna ek olarak da 4-bilya aşınma çapları ölçülen bu greslerin metal bilyelerdeki aşınma izleri üç boyutlu mikroskop altında incelenmiş ve derinlik ölçümleri yapılmıştır.

**INVESTIGATION OF THE TRIBOLOGICAL PROPERTIES OF CALCIUM
SULFONATE COMPLEX GREASE PREPARED WITH MINERAL AND
DIFFERENT SYNTHETIC BASE OILS**

ABSTRACT

Synthetic base oils are used as an alternative to mineral base oils in order to impart desired properties such as wear, low temperature performance, thermal and oxidative stability to greases. In this study, calcium sulfonate complex grease (CSX) prepared with mineral base oils was also produced using synthetic base oils such as polyalphaolefin (PAO) and fatty acid ester, and their tribological properties were investigated. The viscosity of the base oils used was adjusted to ISO VG 100 and NLGI 1,5 grade greases were obtained. Experimental studies have shown that the cold flow pressure value, which is a measurement of the pumpability performance of greases in cold weather, are better in greases prepared with synthetic base oils. In addition, it has been determined that the wear scar diameters of the greases prepared with synthetic base oils are significantly lower than the greases prepared with mineral base oils. In addition, the wear scars on the metal balls of these greases, of which 4-ball wear diameters were measured, were examined under a three-dimensional microscope and depth measurements were made.

Keywords: Lubrication, grease, tribology, cold flow pressure, synthetic base oils.

1. INTRODUCTION

Lubricating greases are still the most widely used lubricants that reduce friction between surfaces and moving parts and remove heat surfaces in practical mechanical systems like bearings or gears.

Greases can be classified in many ways according to their consistency, thickener type (soap and non-soap) and base oil viscosity grade. Lubricating greases consist of three main components: thickeners, oils and performance enhancing additives. Thickeners which occur from saponification reactions of metal hydroxides with fatty acids are 3%-35%, base oils are 65-95% and additives are 0-10% of grease (Mackwook, 2016).

Grease Base oils, which are the main components of the greases can be any type from Groups I-V. Most are made from Group I and II, but there are many greases made with synthetic oils from Groups III, IV and V like polyalphaolefin (PAO), natural and synthetic esters.

In recent years, calcium sulfonate complex greases started to attract the attention of the grease industry by its comprehensive, excellent performance such as high temperature performance, mechanical stability, colloidal stability, extreme pressure and anti-wear performance, water resistance and excellent corrosion resistance. It features excellent rust and wear protection, a high dropping point and excellent mechanical stability even in the presence of water with their thickening structure. Unlike other grease types, these performance characteristics are achieved without the use of any additional raw materials (Acar, 2021; Bjornstad, 2016; Jiwei, Shutian, Wei, and Baojie, 2018; Lorimor-Kay, 2017).

Another reason why calcium sulfonate greases have become more preferred in recent years is their low cost and the fact that the raw material source such as lithium is not limited and easily available. Calcium sulfonate complex-based greases have wide range of application areas such as iron and steel industry, marine and paper mills, off-road, harbor facilities, construction and mining equipment and even in the food processing industry (Acar, 2021).

Çınar and Karaaslan carried out cold flow pressure measurements of different types of greases such as calcium, lithium, lithium-calcium, polyurea, calcium sulfonate complex greases at -20 degrees to investigate the effect of grease thickener and base oil type on low temperature fluidity of grease. As a result, they have reported that both thickener type and base oil type effect the cold flow properties of greases and they determined that especially complex greases have high cold flow pressure (Çınar and Karaaslan, 2021).

Ağtoprak and Karaaslan also investigated the effect of base oil type on low temperature fluidity of lithium-based thickener type. They have reported that lithium soap grease prepared

with PAO type base oil showed lowest flow pressure than naphthenic and paraffinic type base oil (Ağtoprak and Karaaslan, 2022).

Razak and Ahmad examined the tribological properties of complex calcium soap grease using with palm ester type base oil. They have found that palm ester-based complex calcium grease demonstrated good friction-reducing and anti-wear properties comparing to the commercial greases (Razak and Ahmad, 2021).

Jain and Krishnaswamy studied water spray-off resistance of simple lithium soap grease, lithium/calcium mixed soap grease, lithium complex grease and calcium sulfonate complex grease. They have detected that calcium sulfonate complex grease has the highest water spray-off resistant properties than the others due to having over based calcium sulfonate used for making complex calcium structure (Jain and Krishnaswamy).

2. MATERIALS AND METHOD

Within the scope of this study mineral base oil, polyalphaolefin (PAO) and fatty acid ester based NLGI 1,5 grade calcium sulfonate complex greases were prepared in laboratory scale grease reactor. The base oil viscosity of these greases was adjusted to ISO VG 100.

Ester Based

PAO Based

Mineral Oil Based

Figure 1: The Appearance of Calcium Sulfonate Complex Greases Prepared with Laboratory Grease Reactor

HERZOG branded kinematic viscosity instrument was used to measure the kinematic viscosity of base oils at 40°C and 100°C. Properties of base oils used to prepare grease formulations in this study were given in Table 1.

Table 1: Base Oil Properties

Technical Properties	Mineral Base Oil	Ester Base Oil	PAO Base Oil
Kinematic Viscosity at 40°C, mm ² /s	100	100	100
Kinematic Viscosity at 100°C, mm ² /s	10,9	18,36	16,95
Viscosity Index	92	204	185
Flash Point, °C	270	254	240
Pour Point, °C	-9	-39	-52

The worked penetration measurements of the greases were made according to ASTM D 217 at 25°C by using HERZOG branded penetrometer. Before the measurement, greases were worked at 60 strokes by using a mechanical grease worker.

Cold flow pressure measurements were done with MINITEST-FFK equipment according to DIN 51805 (Kesternich Technique) method at -30°C. The pressure value at which the grease exits the nozzle gives the pressure value required for the grease to flow at the selected temperature.

The wear preventive characteristics of the greases was tested with 4-ball and SRV test instrument. For this measurements, Optimol brand and SRV 4 System model SRV test instrument according to ASTM D 5707 method and Stanhope Seta-Shell 4-ball test instrument according to ASTM D 2266 method were used.

SRV wear measurements were done at a load of 200 N, 50°C temperature, 50 Hz frequency, 1 mm stroke amplitude for 2 hours.

The wear preventive characteristics of the greases with 4-ball test machine were tested at a load of 40 kgf, 75°C temperature, 1200 rpm for 60 minutes.

The 4-ball tester was also used in this study to determine the extreme pressure properties (EP) of these greases. Measurements were done according to the ASTM D 4172 method. Test conditions are 600 kgf, 1760 rpm for 10 seconds.

The depth of wear scar of greases on metal ball surface obtained from 4-ball test instrument were examined with a 3D microscope. Measurements were made with Olympus brand and DSX model 3D microscope.

The resistance of greases to water spray-off test was performed with grease coated on a stainless-steel panel and sprayed with a water at 38±0,5°C temperature and 40±1 psi pressure according to the ASTM D 4049 with Koehler brand spray-off tester.

3. RESULTS AND DISCUSSION

In this study, we have examined calcium sulfonate complex greases with mineral oil, PAO and ester-based CSX greases and discussed the results of the experiments. The studies were carried out by measuring the worked penetration of the greases with penetrometer after 60 strokes at 25°C. As it seen on Table 2, NLGI class 1.5 greases were obtained.

Table 2: Worked Penetration Results of CSX Greases

Greases	Base Oil Viscosity (40°C, cSt)	Worked Penetration (0.1mm)	NLGI Class
CSX Grease (Ester Based)	100	308	1.5
CSX Grease (PAO Based)	100	298	1.5
CSX Grease (Mineral Oil Based)	100	309	1.5

As it seen on Table 3, dropping points of the greases were found >300°C. These results show that the saponification reaction of the greases was occurred efficiently.

Table 3: Dropping Point Results of CSX Greases

Greases	Dropping Point (°C)
CSX Grease (Ester Based)	> 300
CSX Grease (PAO Based)	> 300
CSX Grease (Mineral Oil Based)	> 300

Table 4 shows the cold flow pressure results of calcium sulfonate complex greases prepared with different base oils. It was found that mineral oil-based CSX grease gave the highest flow pressure value with a result of 1920 hPa. Also, it was determined that CSX greases prepared with synthetic base oils (ester and PAO) gave the similar result.

Table 4: Cold Flow Pressure Results of CSX Greases

Greases	Cold Flow Pressure Properties (FFK) (-30°C, hPa)
CSX Grease (Ester Based)	600
CSX Grease (PAO Based)	660
CSX Grease (Mineral Oil Based)	1920

On Table 5, according to the water spray-off results of these greases, it was determined that % loss of ester based and PAO based CSX greases were found similar and lower value than mineral-based CSX grease. Also, it was detected that mineral oil-based CSX grease gave the lowest water spray-off resistance with high % loss.

Figure 2: Appearance of Ester Based CSX After Water Spray-Off resistance Test

Figure 3: Appearance of PAO Based CSX After Water Spray-Off resistance Test

Figure 4: Appearance of Mineral Oil Based CSX After Water Spray-Off resistance Test

Table 5: Water Spray-Off Resistance of CSX Greases

Greases	Water Spray-Off (% loss)
CSX Grease (Ester Based)	23,35
CSX Grease (PAO Based)	25,9
CSX Grease (Mineral Oil Based)	42,68

According to the 4-ball weld load results given on Table 6, extreme pressure (EP) performance of these greases was found to be excellent with a result of > 600 kgf.

Table 6: Four Ball Weld Load Results of CSX Greases

Greases	Four Ball Weld Load (kgf)
CSX Grease (Ester Based)	> 600
CSX Grease (PAO Based)	> 600
CSX Grease (Mineral Oil Based)	> 600

As it seen in Table 7, as it seen in Table 8, although the wear scar diameters of all the greases were found close to each other, it was determined that the wear scar diameter of the mineral oil-based CSX grease is relatively high and the PAO-based CSX grease has the lowest wear scar diameter.

Table 7: Four Ball Wear Scar Diameter Results of CSX Greases

Greases	Four Ball Wear Scar Diameter (40 N, 1 hour, 75°C, mm)
CSX Grease (Ester Based)	0,361
CSX Grease (PAO Based)	0,348
CSX Grease (Mineral Oil Based)	0,368

According to SRV wear scar results given in Table 8, it was determined that the wear scar diameter of the mineral-based CSX grease is the highest than the others.

Table 8: SRV Wear Scar Diameter Results of CSX Greases

Greases	SRV Wear Scar Diameter (200 N, 2 hour, 50°C, mm)
CSX Grease (Ester Based)	0,358
CSX Grease (PAO Based)	0,366
CSX Grease (Mineral Oil Based)	0,389

Figure 5: An Example of SRV Friction Test Result of Ester-Based CSX Grease

According to SRV friction test results of these greases given on Table 9, it was determined that PAO and ester-based CSX greases gave the same and lower friction coefficient result, than

mineral oil-based CSX. Figure 5 shows an example of friction test result graphic of ester-based CSX grease.

Table 9: SRV Friction Test Results of CSX Greases

Greases	f min	f max	Friction Coefficient
CSX Grease (Ester Based)	0,008	0,149	0,124
CSX Grease (PAO Based)	0,006	0,171	0,123
CSX Grease (Mineral Oil Based)	0,012	0,170	0,130

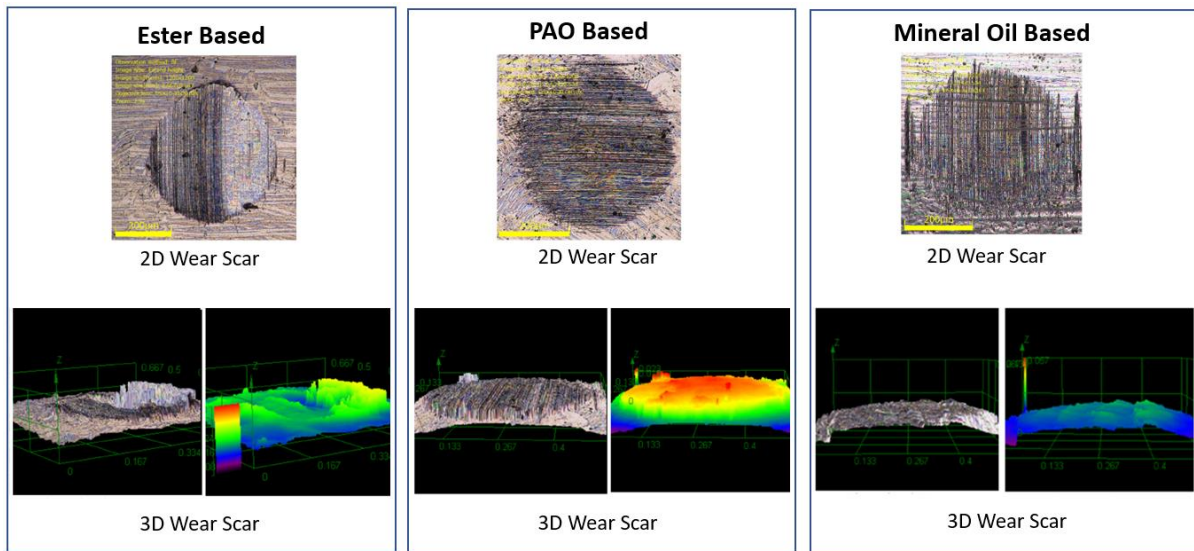

Figure 6: 4-Ball Wear Scar Microscope Images

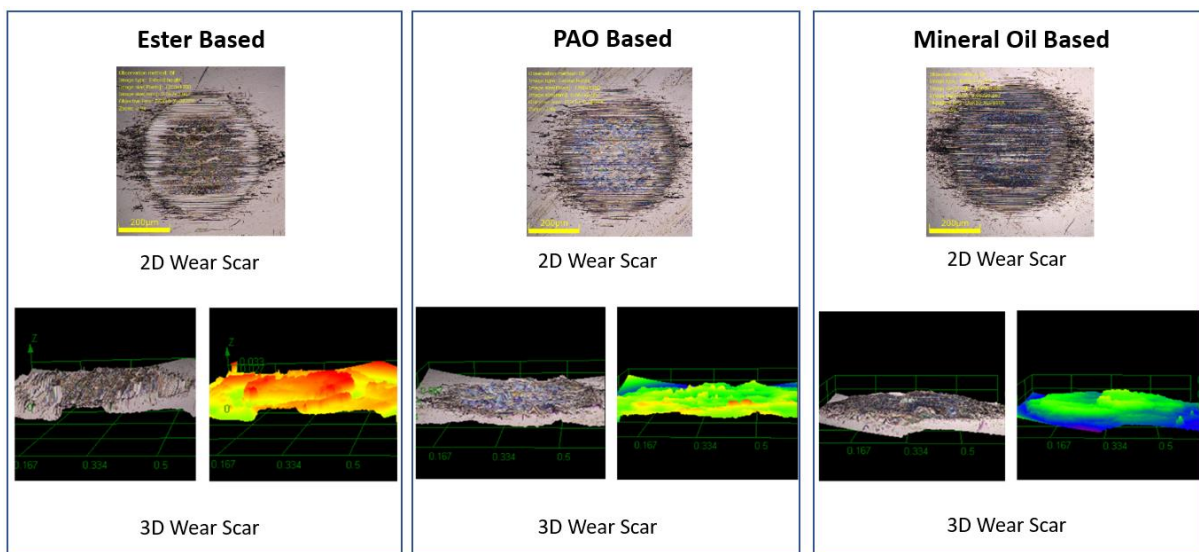

Figure 7: SRV Wear Scar Microscope Images

The 3D microscope allows detailed 2-dimensional and 3-dimensional observation of the wear scars of CSX greases on the metal ball surfaces measured by 4-ball and SRV test machine. It also gives colorful image of 3D wear scar. Figure 6 and 7 show 2D and 3D microscope images of 4-ball and SRV wear scars of ester, PAO and mineral oil-based CSX greases on metal ball surfaces. According to the 3D image analysis, it was observed that mineral oil-based CSX grease has the highest wear value than synthetic greases.

4. CONCLUSION

To summarize this study, calcium sulfonate complex grease (CSX) was prepared with mineral, PAO and ester type base oil with same base oil viscosity and NLGI class. Then, their tribological properties were examined.

When the physical appearances of the greases are examined, it has been observed that the color of the CSX grease made with ester is lighter and brighter than the others.

According to the results of this study, mineral oil-based CSX grease gave the highest flow pressure value at -30°C . The reason of these results is about the differences of molecular structure of synthetic and mineral base oils. Because of not having any wax content, synthetic base oils have low pour point value and as a result of this, their cold flow pressure is better.

According to the friction test results made with 4-ball and SRV device, it was determined that the wear scar diameter and friction coefficient of the mineral oil based CSX grease was higher than the CSX grease made with synthetic base oils, but no significant difference was detected between them. The reason for this is about calcium content and structure of calcium sulfonate complex besides high EP properties of these greases and, consequently, the high film strength.

Also weld load test results found higher than 600 kgf support this conclusion.

The lowest water spray-off resistance was obtained from mineral oil-based CSX grease.

PAO and ester-based CSX greases were found close to each other and better than mineral oil-based CSX grease. The reason of these results is related with base oil's molecular structure. Synthetic base oils have smooth molecular structure than mineral base oils so they remove more difficult from the surface. Regardless of the type of base oil used, it has been determined that the reason for the high dropping point of greases is due to the grease's own structure.

At the end of the this research, it was detected that calcium sulfonate complex greases prepared with synthetic base oils show excellent water resistance, good low temperature pumpability and tribological properties.

ABSTRACT

Calcium sulfonate complex (CSX) greases, which are used as semi-liquid lubricants, are more suitable for use than lithium-based greases thanks to their excellent mechanical, rust and wear protection, and high dropping point. Since additives are not used in the content of CSX greases, they are low cost compared to lithium-based greases. In this study, NLGI 2 grade CSX grease was obtained using paraffinic base oil. The viscosity of the base oils was adjusted to ISO VG 100 and ISO VG 460. CSX greases are known for their water-absorbing properties due to their nature. Therefore, water spray off properties were investigated. In this light, the water spray off behavior of different polymers such as Ethylene-Propylene Copolymer (OCP), Polyisobutylene (PIB) and Polymethylmethacrylate (PAMA) types on these greases is presented in this study. All polymers improved the water spray resistancy. Grafted-OCP polymers gave the best performance. Following this, OCP, PIB and PAMA polymers improved water spray off, respectively. It is also known that polymers effect the cold flow pressure. All polymers negatively effected the flow pressure. It was found that the grease thickness as the amount of polymer increases.

Keywords: Lubricant, calcium sulfonate complex, grease, polymer, paraffinic base oils.

INTRODUCTION

Thickener, base oil, and additives are the main components of grease. Also, grease is known as a semi-liquid lubricant. They are used in a wide variety of equipment and sectors as a result of this feature. Greases are used to reduce friction and wear between surfaces in moving systems. Greases used in some equipment are also required to be water resistant. Calcium sulfonate complex greases, a new and more environmentally friendly grease type, meet all these specifications. Calcium sulfonate complex greases (CSX), which are gel type lubricating greases, are known for their ability to absorb water. These greases suitable for working in aqueous environments. CSX greases are known their low cost because they do not need additives such as lithium-based greases. Also, their efficiency higher than lithium-based greases. CSX are considered an excellent technology for use under heavy and shock loads at high temperatures. It offers excellent rust and wear protection and a high dropping point.

Water is a significant contamination which effects the life or operation of the machine by mixing the lubricating grease. Duncanson and Fitch were said on their work, water contamination often considerably alters the rheological and chemical properties of grease and leads to accelerated failure of equipment through intensified corrosion, oxidation, leakage, and oil flow restriction. For this reason, it is important for users to choose the appropriate grease (Duncanson., 2005; Fitch., 2008).

Gurt and Khonsari reported, the most pertinent characteristics of a water-resistant grease are water solubility, formation and adequacy of lubricant film thickness, non-reactivity with water, retention of consistency, proper adhesion to surfaces, and prevention of corrosion. They said, to prevent damage to machinery and bearings, surfaces must be coated with a lubricant that will not be subject to corrosion. They also reported the biggest factor causing corrosion is water. This effect is reduced if the selected grease can absorb water. These effects can significantly reduce the fatigue life of a bearing. Any strong ingress of water will soften the grease and cause it to wash out. To prevent softening, grease with the right balance between base oil viscosity and polymer additives should be selected (Gurt and Khonsari., 2020).

Çınar and Karaaslan investigated on their study, they found that PAMA type polymer additive negatively effect of flow pressure at low temperature (-20°C) (Çınar and Karaaslan., 2021). In our previous study, also we reported that OCP, PIB and PAMA type polymer doesn't improve flow pressure at low temperature (-20 °C and - 30°C) (Ağtoprak and Karaaslan., 2022).

Though CSX greases have a good water resistance property to improve it, polymeric type additives may be used. This study examined the polymer effect on water resistance performance of calcium sulfonate grease. Beside this, polymer effects on flow pressure and penetration properties were investigated.

MATERIALS AND METHOD

Materials

In this study mineral type of base oil, different type of polymer as Ethylene-Propylene Copolymer (OCP), Polyisobutylene (PIB) and Polymethylmethacrylate (PAMA) commercially available and NLGI number 2 calcium sulfonate complex grease were used as a material.

Methods

The kinematic viscosity of base oils of greases at 40°C and 100°C were measured with HERZOG branded kinematic viscosity instrument according to ASTM D 445.

Penetration measurements were done by HERZOG branded penetrometer according to ASTM D 217 at 25°C. Before the measurement, greases were worked at 60 strokes by using a mechanical grease worker.

The water spray-off resistance measurements by KOEHLER device of greases were performed with grease coated on a stainless-steel panel and sprayed with a water at 38±0,5°C temperature and 40±1 psi pressure according to the ASTM D 4049, Standard Test Method for Determining

the Resistance of Lubricating Grease to Water Spray. This test provides a realistic determination of how much grease will be removed when water is sprayed on it.

Cold flow pressure measurements were made with MINITEST-FFK equipment according to DIN 51805 (Kesternich Technique) standard at -30°C. With this device, the flow pressure of lubricating greases is measured in the range of -50 C to +30 C, up to a maximum pressure of 300 kPa (3000 mbar).

RESULTS AND DISCUSSION

Within the scope of this study mineral base oil based NLGI 2 grade calcium sulfonate complex greases were prepared in laboratory scale grease reactor and their base oil viscosities were adjusted to 100 and 460 mm²/s (Table 1). Grease was produced with OCP, PIB, Grafted-OCP and PAMA types to see effect of the polymers on the CSX greases water spray resistance improvement. Water spray off and flow pressure analyzes were performed on NLGI 2 class CSX greases and NLGI 2 class CSX greases prepared using different polymer types. In addition, the penetration number was also measured for CSX greases produced with Grafted-OCP polymer type.

Table 1. The Technical Properties of The Base Oils

Technical Properties	Mineral Base Oil-ISO VG 100	Mineral Base Oil-ISO VG 460
Kinematic Viscosity at 40°C, mm ² /s	100	460
Kinematic Viscosity at 100°C, mm ² /s	10,9	29,48
Viscosity Index	92	92
Flash Point, °C	270	290
Pour Point, °C	-9	-9

Separately NLGI 2 class CSX greases were produced using base oil viscosity 100 and 460 mm²/s. Technical properties of these CSX greases are given in Table 2.

Table 2. Technical Properties of CSX Greases

Technical Properties	Method	CSX (100)	CSX (460)
Thickener	-	Calcium sulfonate	Calcium sulfonate
Base Oil	-	Mineral	Mineral
Base Oil Viscosity (40°C, mm ² /s)	ASTM D445	100	460
Worked penetration (25°C, 60 strokes)	ASTM D217	275	284
NLGI (#)	DIN 51818	2	2
Dropping point (°C)	ASTM D566	> 300	> 300

Table 3 shows water spray off results of CSX greases prepared with different base oil viscosities without polymer. As a result, when base oil viscosity increases, loss of grease from plate decreases. Therefore, all experiments focus on CSX grease producing with 460 mm²/s base oil viscosity.

Table 3. Water Spray Off Results of CSX Grease without Polymer

Grease	Water Spray Off (%)
CSX ISO VG 100	20,65
CSX ISO VG 460	18,03

Figure 1 shows the images of CSX grease before application of water spray off test, the grease without polymer after application and the grease with polymer after application test. From Fig. 1.b, it is clearly seen that grease has been loss on the plate after application of the test. Fig. 1.c shows grease with polymer after application. Here, it can be seen that there is no visible distribution on the plate. As visually It is seen that polymer improve water spray off performance of CSX.

Figure 1. Effect of Polymer on Water Spray Off **a)** Grease Before Application, **b)** Grease without Polymer After Application, **c)** Grease with Polymer After Application

Water spray off results of CSX greases made with commercially available polymer types is given in Table 4. Firstly, all the CSX grease production were made with using same ratio polymers. Then, different ratios of the same polymer type (PIBx and PIB10x) were tested. As a result, it has been determined that water spray off performance of PAMA type polymer gives worst result compared to other types of polymers. PIB polymer showed better performance then PAMA, but the best water spray off results were obtained with using Grafted-OCP. Also, it has been determined that even if the PIB polymer ratio increase 10 times, it did not improve the water spray off performance of the grease and gives the same result with low ratio polymer.

Table 4. Water Spray Off Results of CSX Grease with Different Polymers

Grease	Polymer Type	Water Spray Off (%)
CSX ISO VG 460	PAMA (x)	13,25
	OCP1 (x)	7,19
	OCP2 (x)	6,94
	High MW PIB1 (x)	9,797
	High MW PIB1 (10x)	9,06
	Grafted-OCP (x)	2,902

Due to the best water spray off results were enhanced with Grafted-OCP and ISO VG 460 viscosity base oil, second part of the study was carried out by using different ratios of Grafted-OCP and 460 mm²/s base oil. Water Spray off results of CSX grease with different ratio Grafted-OCP polymers were given in Table 5. Likewise, Figure 3 shows water spray off results of CSX grease with different ratio Grafted-OCP polymers as a graphical. Consequently, the loss of

grease removed with water decreased when the polymer ratio increased. This indicates that the grease loss is lower in the pressurized water environment. Best performance gave with Grafted-OCP x as ratio.

Table 5. Water Spray Off Results of CSX Grease with Different Ratio Grafted-OCP Polymers

Grease	Polymer Type	Water Spray Off (%)
CSX ISO VG 460	without polymer	18,03
	Grafted-OCP (0,1x)	17,02
	Grafted-OCP (0,3x)	14,78
	Grafted-OCP (0,5x)	12,48
	Grafted-OCP (x)	2,902

Figure 3. Water Spray Off Results of CSX Grease with Different Ratio Grafted-OCP Polymers

To see the cold flow performances of CSX greases and the effect of polymer addition on cold flow performance, measurements were carried out at -30°C . Table 6 shows the cold flow pressure results of calcium sulfonate complex greases prepared with different base oil viscosities and by adding different type of polymer. It was determined that base oil viscosity effect the flow pressure. Best performance has with $100\text{ mm}^2/\text{s}$ compared to $460\text{ mm}^2/\text{s}$. Addition of polymer negatively effects the flow pressure in greases. In fact, some samples could not be measured.

Table 6. Flow Pressure Results of CSX Grease with Different Polymers

Grease	Polymer Type	Flow Pressure (-30°C , hPa)
CSX ISO VG 100	without polymer	870
	without polymer	1590
CSX ISO VG 460	PAMA (x)	2550
	OCP1 (x)	NA
	OCP2 (x)	NA
	High MW PIB1 (x)	NA
	High MW PIB1 (10x)	NA
	Grafted-OCP (x)	NA

Table 7 shows flow pressure results of CSX grease with Grafted-OCP polymers. Addition of polymer negatively effects the flow pressure in greases. This case is explained with polymers

shrink at low temperatures also they expand at high temperatures. This is the important for flow pressure of greases at low temperature.

Table 7. Flow Pressure Results of CSX Grease with Grafted-OCP Polymers

Grease	Polymer Type	Flow Pressure (-30°C, hPa)
CSX ISO VG 460	without polymer	1590
	Grafted-OCP (0,1x)	3000
	Grafted-OCP (0,3x)	3070
	Grafted-OCP (0,5x)	3150
	Grafted-OCP (x)	NA

Polymers also have an impact on penetration. Table 8 shows the effect of the polymer on the thickening of the grease. According to Table 8, when polymer ratio increases the thickness is increased. And Figure 4 explain it as graphical.

Table 8. Penetration Results of CSX Grease with Grafted-OCP Polymers

Grease	Polymer Type	Worked penetration (25°C, 60 strokes)
CSX ISO VG 460	without polymer	284
	Grafted-OCP (0,1x)	282
	Grafted-OCP (0,3x)	278
	Grafted-OCP (0,5x)	274
	Grafted-OCP (x)	265

Figure 4. Penetration Results of CSX Grease with Grafted-OCP Polymers

CONCLUSION

In conclusion, the results show that the water spray resistance of grease depends on the base oil's viscosity. The best performance was observed with 460 mm²/s compared to 100 mm²/s. All polymers were found to improve the water spray resistance. The best performance was obtained with Grafted-OCP polymers. OCP, PIB, and PAMA polymers has also improve the water spray off results, respectively. On the other hand, it was determined that the polymers negatively effected the flow pressure performance of the greases.

This is attributed to the shrink of the polymers with the grease at low temperatures. As a result, thickness of grease related with an increase in the amount of polymer. It was found that the grease thickness as the amount of polymer increases. Overall, the findings suggest that choosing the right combination of base oil viscosity and polymers is crucial in improving the water spray resistance of grease. Also, the polymer type and concentration directly effect the pumpability of the grease.

Abstract

Rice-lotus rotation model includes one crop of rice and one crop of lotus cultivation in one year. After harvesting rice, the straw is buried in the soil to provide fertilizers for lotus seeds. After three months of growing, the farmers can harvest lotus products for three months. The rice-lotus rotation model is adaptive in the context of climate change in the Vietnam Mekong Delta. In particular, this model reduces pests and diseases, increasing soil fertility. The model also reduces the cost of rice cultivation, bringing economic and social benefits. In addition, the model also contributes to reducing the initial investment costs when cultivated conversion of crops. Farmers will take advantage of fertilizer usage for rice cultivation with this model because of the reserve of rich sludge in the topsoil from growing lotus. This model is also highly appreciated when dealing with dangerous diseases on the lotus. We conducted this study to evaluate the financial efficiency of the rice-lotus rotation model in Chau Thanh district, An Giang Province, Vietnam. We collected production data from 60 rice-lotus rotation cultivation households in the studied area through face-to-face interviews. This study used several methods, including descriptive, cost-benefit analysis, and multiple variable regression analysis. The research results showed that the rice-lotus rotation model achieved 0.81 of the profitability and investment index and 0.45 of the profitability and total income index. The total cost and income of RLR cultivation per 1,000 m² yr⁻¹ was 9,478,200 VND and 17,191,300 VND, respectively. Profits was 7,713,100 VND 1,000 m⁻² yr⁻¹. The factors that affected the financial efficiency of the RLR model included agrochemicals cost, hired labor cost for crop care, and selling price (significant level of 10%).

Keywords: financial efficiency analysis, agricultural rotation model, rice-lotus cultivation, Vietnam Mekong Delta

1. Introduction

The Mekong Delta is one of the most deltas seriously affected by climate change (Kuenzer & Renaud, 2012). Therefore, the efficiency of agricultural production, especially rice in the Mekong Delta, will be a great challenge (Tran et al., 2020; Whitehead et al., 2019). The impact of climate change on Vietnam is severe and is an existential threat to the goal of poverty reduction. In the Mekong Delta, only about 20% of the population lives in urban areas; the rest, about 80%, live in rural areas (Kuenzer & Renaud, 2012). As a result, agriculture has long been the region's main economic activity. Most agricultural land is used for rice cultivation, high-yield shrimp farming, and fruit and vegetable crops (Nguyen Thanh et al., 2021; Olson & Morton, 2018; Tran et al., 2018). Rice production is critical in Vietnam's agricultural and rural economic development and the Mekong Delta.

Thanks to the renewal of the economic management mechanism, Vietnam has achieved great achievements in rice production in recent years. In particular, the Mekong Delta contributes half of the country's rice production. It contributes to making Vietnam among the world's top three rice exporting countries, with annual exports of 3-4 million tons of rice, along with Thailand and India (Yuan et al., 2022). In addition, the combination of intensive farming, alternating or changing other plants and animals has been focused on and implemented more commonly in recent years. Much of the Mekong Delta is facing significant problems due to the impacts of climate change, such as floods, severe saline intrusion, and natural drainage that makes the soil acidic (Le et al., 2018; Renaud et al., 2015; Van Ni et al., 2012). With high toxic aluminum and low soil phosphorus content, crop rotation is a suitable farming solution to improve soil environmental health. Besides, crop rotation will also contribute to increasing income and ensure farmers' quality of life.

Agriculture significantly contributes to economic growth and is vital to income generation, poverty alleviation, and sustainable development, especially in rural areas. Most people with low incomes in developing countries live in rural areas. Most of them directly or indirectly depend on agriculture as the primary source of livelihood, of which rice production and aquaculture are two critical sectors in the agricultural production structure of the country. Thus, in the context of increasingly complex developments of climate change, continuing a traditional agrarian production system is facing three challenges: ensuring food security, adapting to climate change, and mitigating the effects of climate change (Campbell et al., 2016; Schneider & Asch, 2020; Vervoort et al., 2014). Taking climate change adaptation as a premise, experts began paying attention to and studying model transformation and climate change response, climate-smart agricultural – CSA. This is also a suitable model for the development of the Mekong Delta. Many sustainable agricultural models for this response include salt-tolerant, alum-tolerant rice varieties; salt-tolerant, alum-tolerant fruit trees; shrimp-forest; shrimp-rice rotation; and lotus cultivation (specialized in cultivation or rotation). The selected farming models apply depending on the specific natural conditions in each region of the Mekong Delta.

The lotus farming model (specialized lotus, rice-lotus, lotus-fish, tourist lotus) is considered a sustainable and adaptive agricultural model, with advantages such as flood storage, cost reduction, financial efficiency, environmentally friendly, livelihood improvement, job creation, and climate change adaptation, is a relatively new form of agriculture. This model also ensures multi-functionality (cultural value, income improvement, job creation, ecological balance), harmonizes the costs and benefits of lotus cultivation and is suitable for the rotation pattern model. On the other hand, when a specific CSA model is only suitable for application in certain contexts. In other words, a CSA model only makes sense for application when the model is ideal for the needs and conditions. For specific requirements in the locality, the lotus cultivation model is now considered the most suitable for people's life in the region.

The lotus rice rotation model is assessed to be suitable for the conditions of land, water resources, infrastructure, and market, as well as the culture, customs, qualifications, and investment ability of farmers in the Mekong Delta region. The lotus farming model is a model with low investment costs, increased income, and high economic efficiency, improves the environment for local people and has excellent potential for tourism development (Dang et al., 2021; Loi et al., 2022; Macedo et al., 2022; Ngoc, 2017; Vo et al., 2021). In An Giang province, people have applied the lotus farming model for many years and achieved high economic efficiency. This farming model is considered suitable for areas prone to seasonal salinity and alum due to the impact of erratic climate from climate change. In addition, it is urgent to study the application of the rice-lotus rotation model with appropriate farming techniques, production scale, and higher economic efficiency than traditional forms of rice intensification.

For the above reasons, we conducted this study to provide a more scientific basis to help local households, policymakers, and local agencies in comprehensive assessment and make appropriate decisions suitable for future agricultural economic production of the region in the context of current climate change.

2. Materials and methodology

Primary data collection: We used a system of pre-prepared interview questions to collect data to serve the situation research and assess the need to improve people's ability to access livelihood capital, recommendations, mechanisms, and policies to help them access livelihood resources. Our study was conducted in Chau Thanh district, An Giang province (Figure 1). We interviewed 60 households to collect information on livelihood and income, and families were selected by non-probability sampling.

Secondary data collection: We collected secondary data from various sources, including documents published by the Ministry of Agriculture and Rural Development, Statistical Yearbooks, scientific reports, and annual reports summarizing the economic activities of the Chau Thanh District Economic Department.

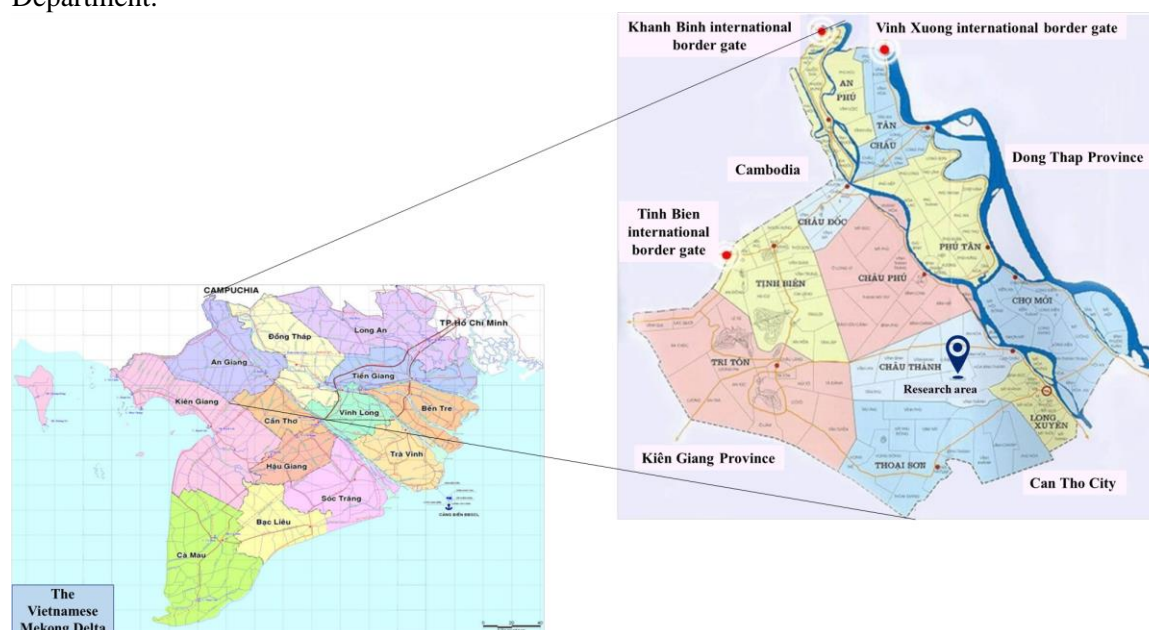

Figure 1. Research area

This study uses SPSS and Excel software to manage and analyze research data. We use descriptive statistics to analyze the current status of livelihood resources to meet production activities and household life. Specifically, the frequency distribution method aims to describe and learn about the distribution characteristics of a raw data sample and tabulate the frequency distribution. A frequency table is a table that summarizes the data arranged in different groups. Then determine the cluster frequency by counting the number of observations within that cluster, and the results are presented in a table or graph. Rated maximum value, minimum value, and average value. We also use the correlation regression analysis method to determine several household characteristics that affect the family's total income.

The criteria for calculating results and production efficiency:

$$\text{Gross return} = \text{Output} \times \text{Price of the product}$$

$$\text{Yield} = \text{Harvested output} / \text{Planted area}$$

$$\text{Total cost} = \text{Material cost (seed, mechanization, energy, fertilizer)} + \text{Labor cost (include or exclude family labor cost and hired labor cost)} + \text{Others cost}$$

$$\text{Net return} = \text{Gross return} - \text{Total cost (Include or exclude family labor cost)}$$

$$\text{Gross return Cost Ratio (GCR)} = \text{Gross return} / \text{Total cost (Include or exclude family labor cost)}$$

$$\text{Benefits Cost Ratio (BCR)} = \text{Net return} / \text{Total cost (Include or exclude family labor cost)}$$

$$\text{Net return Gross return Ratio (NGR)} = \text{Net return} / \text{Gross return}$$

The correlation regression analysis method was used to analyze the factors affecting the net return of the rice-lotus rotation production model. The regression equation has the form of the following:

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \dots + \beta_n X_n$$

In which:

+ Dependent variable: Y is net return of the model (1000 VND 1000 m⁻² year⁻¹)

+ X₁: Agrochemicals cost applied for rice (1000 VND 1000 m⁻² crop⁻¹)

+ X₂: Fertilizers cost applied for rice (1000 VND 1000 m⁻² crop⁻¹)

+ X₃: Hiring labor cost of rice cultivation (1000 VND 1000 m⁻² crop⁻¹)

+ X₄: Rice selling prize (1000 VND)

+ X₅: Agrochemicals cost applied for lotus (1000 VND 1000 m⁻² crop⁻¹)

+ X₆: Fertilizers cost applied for lotus (1000 VND 1000 m⁻² crop⁻¹)

+ X₇: Hiring labor cost of lotus cultivation (1000 VND 1000 m⁻² crop⁻¹)

+ X₈: Lotus selling prize (1000 VND)

Note: 1,000,000 VND = 42.61 USD

3. Results and discussions

3.1 Investment for cultivation

The cultivation process of rice-lotus crops includes the following costs: seed cost, land preparation cost, fertilizers cost, agrochemicals cost, family labor cost, hired labor cost, and fuel costs. Table 1 summarizes the average cost ranges per 1000 m² to produce the rice-lotus rotation model of farmers.

Table 1. Invested cost for agricultural activities

Unit: 1000 VND 1000 m⁻²

Investment	Rice		Lotus	
	Average	Std.	Average	Std.
Seeds	155.43	2.92	187.00	53.97
Land preparations	160.33	15.19	160.33	15.19
Fertilizers	303.10	18.83	1096.30	59.37
Agrochemicals	372.00	113.96	1033.33	118.41
Family labor cost	650.80	306.14	2473.10	1181.55
Hiring labor cost	347.83	69.00	2283.60	772.22
Fuels	127.27	11.07	127.27	11.07
Total cost	217.3	247.21	7361.40	564.95

Seed cost: Seed is one of the crucial factors in agricultural production and affects the quality of the yield obtained. Therefore, choosing high-quality varieties suitable for natural conditions and soil is also necessary. Of the total production costs, the average cost of seed per 1000 m² of production land is 242,400 VND, the lowest cost of seed is 281,000 VND, and the highest cost of seed is 445,000 VND. The average cost of lotus seed is 187,000 VND per 1000 m² of rice is 155,430 VND per 1000 m². The cost of using seeds of farmers has a relatively significant difference. The reason is the difference in seed use and planting density, leading to the difference in seed costs.

Land preparation cost: 100% of the farmers rent a tiller to till the soil before sowing to help the soil become loose, allowing the rice and lotus seeds to develop the root system quickly. Investment cost to prepare land accounts for 3% of the total cost of the lotus rice rotation model over 1000 m². The average land preparation cost per 1000 m² is 620,600 VND, the lowest is 300,000 VND, and the highest is 400,000 VND. The average cost of preparing land for planting lotus per 1000 m² is 160,330 VND. Meanwhile, the average cost of preparing rice land is 160,330 VND 1000 m². The difference in land preparation costs is mainly due to the time of sowing of the farmers. If farmers sow seeds simultaneously, the rental price of cultivators will be high, making land preparation costs high and vice versa.

Fertilizers cost: Fertilizer is a vital input factor that directly affects the yield of the model. For crops, the primary nutrient source is soil minerals, chemical fertilizers, and other fertilizers. However, fertilizers must be applied reasonably, at the right time, at the correct dose, and without overuse of chemical fertilizers. The fertilizers used are mainly Urea, DAP, NPK (20-20-15, 16-16-8), organic fertilizers, and others. The average fertilizer cost per 1000 m² of the lotus-rice rotation model is 1,399,600 VND, the highest is 1,506,000 VND, and the lowest is 1,241,000 VND, accounting for 15% of the total production cost of the model. The average fertilizer cost for lotus and rice cultivation is 1,096,300 VND and 303,100 VND, respectively.

Agrochemicals cost: In the production process, agrochemicals cost is relatively high. The cost of agrochemicals accounts for about 15% of the total cost of production, second only to the cost of family labor and the cost of hired labor. The average cost of pesticides per 1000 m² is 1,405,300 VND, the lowest is 1,150,000 VND, and the highest is 1,405,300 VND. The cause of the difference is mainly due to the farming techniques of each household and the situation of pests and diseases in each field. Particularly for lotus, the average cost of pesticides per 1000 m² is 1,033,330 VND. Meanwhile, the average cost of pesticides for rice is 372,000 VND.

Family labor cost: Family labor accounts for the highest proportion of total investment costs for producing the rice-lotus crop rotation model. The cost of family labor is calculated by multiplying this amount by the average labor cost in local agricultural production. This cost accounts for 33% of the total cost. Most of the stages in the production process are used by households using family labor, such as seeding, fertilizing, spraying, tending, and harvesting. However, family labor cost also depends on the number of family members, cultivated area, and farming techniques. Therefore, the cost of family labor in each household is different, averaging about 3,124,100 VND; the highest is 6,964,000 VND, and the lowest is 1,100,000 VND. The family labor cost of lotus cultivation is 2,473,100 VND, and the family labor cost of rice cultivation is 650,800 VND.

Hired labor cost: Hired labor cost of households is the second highest proportion, accounting for 28% of total costs, only after family labor costs. The high labor cost is because the rice-lotus rotation model requires a lot of labor, such as in the stages of sowing, spraying, fertilizing, and harvesting. The average labor cost of the rice-lotus crop rotation model is 2,631,500 VND, the highest is 4,203,000 VND, and the lowest is 882,000 VND. Particularly for lotus cultivation, the average labor hire is 2,283,600 VND, and for rice is 347,830 VND.

Fuels cost: Besides fertilizers and nutrients, supplied water is crucial in helping lotus and rice grow well. However, the cost of fuels farmers use is meager, accounting for only 3% of the total cost. On average, each farmer only spends about 254,680 VND, the lowest is 216,000 VND, and the highest is 270,000 VND.

3.2 Financial efficiency analysis

Productivity: Productivity is the expected outcome. Productivity is the amount of output obtained per unit area of arable land. Productivity depends on inputs and factors such as weather, soil, farming form, amount of water, and experience. The higher the productivity, the higher the farmer's profit. The average lotus yield is about 1272 kg 1000 m⁻². The average yield results show that the farmer's harvest is relatively high. This proves that the natural conditions in the study area are suitable for farmers to grow lotus. The average rice yield is about 616.6 kg 1000 m⁻². Due to rice cultivation in the Winter-Spring growing season with favorable weather conditions, the average yield is relatively high.

Selling price: The selling price is the amount a farmer gets when he sells a product unit. That is a factor that all farmers are interested in when cultivating, especially at the time of harvesting. The selling price of lotus fluctuates quite a lot, depending on the market and the quality of the product. Production techniques are different, so the lotus seed-pod quality differs among producing households. Depending on the quality of the lotus seed-pod, lotus rhizome, and lotus root, the price of lotus products fluctuates with an average price of about 10,700 VND kg⁻¹. The selling price of rice is also highly dependent on the market, seed-pod quality, varieties, and farming techniques of each household. The average selling price of rice is about 5200 VND kg⁻¹. Farmers mainly sell rice to traders. Although, the price that traders buy is lower than that sold directly to processing facilities or companies. However, because farmers harvest in large quantities, only traders can purchase their entire output, so they are willing to sell their products to traders.

Gross return: Revenue is the total money obtained from selling all products to the market. Revenue is determined by the selling price multiplied by the output. Revenue is directly proportional to productivity and selling price. If the selling price and productivity are high, the income is high, and vice versa. The average revenue from growing lotus of farmers in the study area is 13,524,000 VND 1000 m⁻², and the average revenue of rice is 3,669,300 VND 1000 m⁻².

Net return: Profit is considered the remainder after total revenue is subtracted from total costs, including family labor. The average profit from growing lotus is 6,161,900 1000m² and from growing rice, the average is 1,551,200 VND 1000 m⁻². The gain from combining the rice-lotus rotation model of farmers in the study area is 7,713,100 VND 1000 m⁻².

Benefit and cost ratio (BCR): The average BCR of lotus cultivation is 0.83. This BCR means that for every 1 VND invested in lotus production, 0.83 VND of profit is generated. Meanwhile, the average BCR of rice farming is 0.73. This BCR of the rice-lotus rotation model is 0.81.

Gross return and cost ratio (GCR): The average GCR of lotus cultivation is about 1.83. This index means that with 1 VND of investment costs, 1.83 VND of revenue is obtained. Meanwhile, the average GCR index of rice cultivation is 1.73, and the GCR of rice-lotus crop rotation is 1.81.

Net return and gross return ratio (NGR): The average NGR of lotus cultivation is about 0.45. NGR means that with 1 VND of revenue that farmers receive, it will include 0.45 VND of profit. Meanwhile, the average NGR of rice is 0.42. This index of the rice-lotus rotation model is 0.45.

The financial indicators show that the farmers producing the rice-lotus rotation model in the study area are economically efficient. However, if family labor costs are not included, profits, income, and revenue will be much higher than when family labor costs are included.

Table 2. Financial efficiency analysis

		<i>Unit: 1000 VND 1000 m⁻²</i>					
	Unit	Rice		Lotus		Rice-Lotus rotation	
		Mean	Std.	Mean	Std.	Mean	Std.
Productivity	kg 1000 m ⁻²	616.6	31.3	1272.0	96.5		
Price	1000 VND kg ⁻¹	5.2	1.5	10.7	2.5		
Total cost	1000 VND 1000 m ⁻²	2117.3	274.2	7361.4	564.9	9478.2	500.0
Gross return	1000 VND 1000 m ⁻²	3669.3	968.6	13,524.0	2747.8	17,191.3	2368.1
Net return	1000 VND 1000 m ⁻²	1551.2	1004.7	6161.9	2912.6	7713.1	2528.9
BCR	times	0.73		0.83		0.81	
GCR	times	1.73		1.83		1.81	
NGR	times	0.42		0.45		0.45	

3.3 Analysis of factors affecting to financial efficiency of the model

To better analyze the financial performance of the model, we analyze the factors affecting profitability through a multivariate regression model. Many different factors influence the profitability of farmers producing the rice-lotus rotation model. However, within the scope of this study, the regression equation only mentions some key factors assumed to affect profits as follows: cost of pesticides applied to rice cultivation, application fertilizer fee for rice cultivation, labor cost for hiring rice cultivation, selling rice price, cost of pesticides used for lotus cultivation, cost of fertilizer application for lotus cultivation, cost

labor hire to grow lotus, price of sale of lotus. Based on the multivariable linear regression model established in the analytical methods section, we use SPSS software to support the analysis. The results are presented in Table 3.

Table 3. Analysis factors affect the financial efficiency of the rice-lotus rotation production model

Factors	B	Sig.	VIF
Constant	-4300.813	0.115	
X ₁ : Agrochemicals cost applied for rice (1000 VND 1000 m ⁻² crop ⁻¹)	1.648	0.084*	1.391
X ₂ : Fertilizers cost applied for rice (1000 VND 1000 m ⁻² crop ⁻¹)	-3.968	0.059*	1.607
X ₃ : Hiring labor cost of rice cultivation (1000 VND 1000 m ⁻² crop ⁻¹)	-6.975	0.001*	1.919
X ₄ : Rice selling prize (1000 VND)	609.541	0.000*	1.415
X ₅ : Agrochemicals cost applied for lotus (1000 VND 1000 m ⁻² crop ⁻¹)	-1.151	0.244 ^{ns}	1.681
X ₆ : Fertilizers cost applied for lotus (1000 VND 1000 m ⁻² crop ⁻¹)	-1.423	0.405 ^{ns}	1.285
X ₇ : Hiring labor cost of lotus cultivation (1000 VND 1000 m ⁻² crop ⁻¹)	0.905	0.000*	2.159
X ₈ : Lotus products selling prize (1000 VND)	1168.54	0.000*	1.112
R ² :	0.984		
Adjusted R ² :	0.978		
Sig.F:	0.000		
Durbin-Watson test:	2.389		

Note: ^{ns}: non-significant; * : 10% significant level

The analysis results in Table 3 show that the coefficient sig.F of the model = 0.000 is smaller than the significance level $\alpha = 10\%$, so the regression model is significant, consistent with the data set, and has good results and is usable. The independent variables affect the dependent variable Y. The model's adjusted R² coefficient is 0.978 or 97.8%, which means that the variation in rice-lotus rotation model profitability can explain the factors included in the model without the phenomenon of autocorrelation. The results from factors demonstrate the remaining 97.8%, and the remaining 2.2% depended on the elements outside the model. The Durbin-Watson coefficient of the model is 2.389 with $1 < D = 2.389 < 3$, showing that the model does not have autocorrelation. Besides, the model's Variance Inflation Factors (VIF) is much smaller than 10, so we conclude that the factors included in the model do not have multicollinearity (Liem et al., 2023b, 2023a; Liem, Tinh, Kim, et al., 2022; Liem, Tinh, Loan, et al., 2022).

The analysis results show that three out of eight variables included in the model have statistical significance (sig. 10%). Six variables with statistical significance are Agrochemicals cost applied for rice (X₁), fertilizers cost applied for rice (X₂), hiring labor cost of rice cultivation (X₃), rice selling prize (X₄), hiring labor cost of lotus cultivation (X₇), and lotus products selling prize (X₈). Four variables are positively correlated with the profitability of rice-lotus rotation cultivation, and two variables are negatively correlated with the profitability of rice-lotus rotation cultivation.

The regression equation has the form of the following:

$$Y = -4300.813 + 1.648X_1 - 3.968X_2 - 6.975X_3 + 609.541X_4 + 0.905X_7 + 1168.54X_8$$

4. Conclusion

The rice-lotus rotation model is adaptive in the context of climate change in the Vietnam Mekong Delta. In particular, this model reduces pests and diseases, increasing soil fertility. The model also reduces the cost of rice cultivation, bringing economic and social benefits. In addition, the model also contributes to reducing the initial investment costs when cultivated conversion of crops.

ABSTRACT

House price is an important factor determining economic and social well-beings of both individuals and societies. Since, house prices directly affect sheltering need and also determine the rate of overall inflation, it's critical to detect the factors influencing them. However, it's sure that there are numerous factors determining the house prices. By following the related literature, those factors can be listed as house-specific factors (indoor and outdoor properties of the house), location, migration, security, input prices, public policies, foreign exchange rates, economic trends and natural disasters. As a less examined topic across the counted ones, natural disasters are important determinants, especially in less developed and developing countries. More specifically, today it's widely accepted that earthquakes have critical importance in this study field. In this manner, the main purpose of this study is to shed light on the nexus between earthquakes and house prices by the help of a systematic literature review. It's expected to make a significant contribution to this study field by examining the impacts of earthquakes on house prices in terms of a review analysis. Following this purpose, after a brief introduction, the socio-economic importance of house prices is given in the first section. Moreover, the relationship between earthquakes and house prices are also explained. Then, in the second section, a systematic literature review is given. In the third section, a basic meta-analysis for the related literature is developed. Lastly, in the conclusions, a brief discussion in the context of the review is enhanced.

Keywords: House Prices, Earthquakes, Literature Analysis, Systematic Review

¹² This study is a section of the project entitled "The Impacts of Earthquakes on House Prices in Türkiye: Empirical Analyses About Micro and Macro Impacts at Regional Level". This project has been supported by "Institute of Economic Development and Social Research" between the dates of 1 June 2022 and 1 May 2023.

1. INTRODUCTION

Natural hazards are important factors affecting socio-economic conditions directly. In historical manner, mankind has faced with many challenges against the nature. Some has been overcome and some other still exists in our lives. Technological breakthroughs have provided many tools to prevent floods, landslides and fires, and also they made it possible to overcome the consequences of unprevented hazards like earthquakes, volcanic eruptions, hurricanes and tsunamis. However, there is still a long way to adapt our societies and economies to the realities that we are a part of the nature, and we cannot sustain the development without cooperation with our planet. Today, still we build our houses on riverbeds, foothills and coastal areas by ignoring the possibilities of floods, landslides and tsunamis. We still build unresistant houses by ignoring earthquakes and storms. In this manner, it's critical to accept that natural hazards will always take a part in our lives and we should take precautions against them. At this point, understanding the nexus between natural hazards and their economic consequences has a critical importance in the policy formation and implication processes. In this context, this study aims to shed light on the relationship between earthquakes and house prices by the help of a systematic literature review. Following this aim, after a brief introduction, the socio-economic importance of house prices is given in the first section. Moreover, the relationship between earthquakes and house prices are also explained. Then, in the second section, a systematic literature review is given. In the third section, a basic meta-analysis for the related literature is developed. Lastly, in the conclusions, a brief discussion in the context of the review is enhanced.

2. THE NEXUS BETWEEN EARTHQUAKES AND HOUSE PRICES

Housing, which serves the need for shelter, is considered as a heterogeneous product taking an important part in people's lives. The characteristics of each house differ in terms of interior features such as size, number of rooms, heating system and material quality; and also differ in terms of external features such as parking lot, security, pool, and view. Since all these interior and exterior features come together with different combinations, each house can have different characteristics. This causes house pricing to vary according to space, time and consumer preferences. At this point, it has a special importance to determine the micro and macro determinants of the house prices. While the mentioned interior and exterior features of houses are defined as micro determinants of prices, many other factors such as exchange rate, interest rate, national income, land and environmental conditions are also defined as macro determinants. Therefore, it is necessary to take into account the micro and macro determinants together while evaluating the movements of house prices in a particular region or country. It's

widely accepted that natural hazards are important determinants for house prices. Since they cause damages in houses, they are directly linked to the evaluation of houses. In this context, there are many studies examining this relationship, and their findings are important to shed light on the roots of changes in house prices in many regions and countries.

One of the very first studies about the empirical relationship between earthquakes and house prices is Brookshire et al. (1985). They examined the Californian house market by the help of an expected utility function and found that earthquake risk perception directly affects prices by demand channel. As another study examining house prices in California, Murdoch et al. (1993) found that San Francisco Earthquake decreased the house prices in the region. In forthcoming years, new studies about California have emerged as Beron et al. (1997), Fekrazad (2019), Singh (2019) and Jung & Smith (2022). Also, some other studies were conducted for Oklohoma in USA. Metz et al. (2017), Cheung et al. (2018), Burnett & Mothorpe (2021), Mothorpe & Wyman (2021) and Halkia & Ludwig (2022).

Since Japan is a country with high seismic activity, there emerged many studies about this topic. Kawawaki & Ota (1996) conducted a research for Great Hanshin Earthquake that hit Japan in 1995 and they investigated that it affected hedonic house price index significantly. As some other examples, both Nakagawa et al. (2007) and Naoi et al. (2009) have investigated the earthquake risk and house prices relations in Japan. Hidano et al. (2015) found that if seismic activity is high, then house prices get lower in Tokyo. Seko (2019), Ikefuji et al. (2022) and Kawabata et al. (2022) are other studies investigating earthquake and house prices relationships in Japan.

It seems from the literature that New Zealand and Türkiye are other important countries for earthquake research. Staer & LaCour-Little (2016), Bond & Dermisi (2017), Logan (2017), Huang (2021) and Shi & Naylor (2023) investigated similar results as Canterbury Earthquake decreased the house prices in that region and risk perception changed the movements as time passes. Önder et al. (2004), Keskin (2008), Yayar & Gul (2014), Keskin et. al. (2016), Alas & Ulger (2019), Arslanlı (2020), Ak Çetin & Akpınar (2021) and Er et al. (2023) conducted research for different cities of Türkiye to detect the impacts of large earthquakes on house prices. It seems that main discussion topic in these studies is readiness of Istanbul and other metropolitan cities to expected earthquakes.

Moreover, another branch of the literature has emerged in the historical manner. In this new branch, impacts of human – induced earthquakes on house prices have been analysed. Koster

& van Ommeren (2015) conducted a survey on a wide sample to observe the impacts of earthquakes arised due to the natural gas extraction, on house prices in Netherlands, Gröningen. They underlined that human-induced earthquakes decrease the house prices in that region. There are also some other studies investigating this relationship. Boelhouwer & van der Heijden (2018) and Duran & Elhorst (2023) got the similar results for the same region. Gibbons et al. (2021) conducted a research to analyse the nexus between shale-gas extraction and house prices in United Kingdom. They got similar results as human-induced seismic activity decreases house prices in the region. Lastly, Halkia & Ludwig (2022) analysed the impacts of natural gas extraction impacts on house prices over seismic activity and underlined that these human-induced quakes decrease house prices in Oklahoma.

To sum up, there are numerous studies analyzing earthquakes and house prices relationship for different regions and countries. Empirical findings underline that earthquakes decrease house prices in the relevant region, but increases in neighborhoods. Apart from the fact, risk perception and expectations are important determinants for house prices.

3. SYSTEMATIC LITERATURE REVIEW

Literature review is a qualitative analysis tool to analyse the studies in the related topic. Literature reviews are used widely in social sciences to be able to have an overview about the research topic. In recent years, literature reviews have been enhanced by the emergence of quantitative methods, and systematic reviews and meta analyses have emerged. Systematic analyses have firstly applied in medical sciences and then spread to other scientific fields (Mangas – Vega et al., 2018). Systematic reviews, analyze and synthesize the literature with a systematic and unbiased review. Objectivity is higher in systematic reviews (Kysh, 2021). Moreover, meta-analysis has also developed in medical sciences at the beginning of 1900s and then spread to other scientific fields. Meta-analysis uses mathematical observations and statistical tools to evaluate the literature (Glass, 1976). In this study, firstly a systematic literature review is made and then a meta-analysis is developed. In this manner, the main research question is: “Do earthquakes change house prices?”. In this context, our main hypothesis is that strong earthquakes and expected earthquakes affect house prices. Literature analysis has been conducted in Web of Science and Google Scholar Databases, in order to check the validity of our hypothesis. Time period has been chosen as 1985 – 2023 due to the fact that the first well-known empirical study about the nexus between earthquakes and house prices was conducted in 1985. Totally, 39 studies were included in literature review. The literature review points out that the studies can be distinguished as expectations-based studies and facts-based

studies. Expectations-based studies rely on risk-perception, earthquake expectations and induced purchasing and selling behaviors. However, facts-based studies rely on the occurred earthquakes and their impacts on prices. Table 1 summarizes all studies as to this distinction.

Table 1: Literature Classification as to Expectations and Facts

Expectations-Based Studies	Facts-Based Studies
Brookshire et al. (1985)	Murdoch et al. (1993)
Beron et al. (1997)	Kawawaki & Ota (1996)

4. META-ANALYSIS

Meta-analysis is based on mathematical and statistical tools to analyze and understand deeper the literature. In this manner, network graph is an important mathematical tool to show relationships between analyzed studies. These types of graphs rely on mainly reference and citation relationships between studies. Recently, some artificial intelligence tools have emerged to construct such graphs for meta-analyses. Figure 1 has been drawn by using Litmaps application, which is also an artificial intelligence literature mapping tool.

Figure 1: Literature Network Map

Source: Drawn by the authors.

Network scheme points out that first study searching earthquakes and house prices nexus in Brookshire et al. (1985). Since the research field is quite narrow and the number of published studies is still limited, it is seen that the network diagram is based on very dense network relations. Almost all of the studies refer to each other or cite to the majority of the studies in the related field. When examined from a historical perspective, it is seen that the number of studies examining the relationship between earthquake and house prices has increased remarkably especially after 2015. What is more is that the network diagram in Figure 1 is a multi-scaling network diagram. In other words, the diagram does not only show the links between studies but also shows some other facts. First of all, the size of the dots expresses the volume of citations by other studies. Larger dots are the studies getting more citations. Secondly, clustering behaviors through the connections of studies to each other, can be observed from the map. Studies that are close to each other in terms of distance on the scheme are studies that are closer to each other in terms of subject interest.

After examining the network relations in the literature, it's important to analyze the publication scopes. In this context, journal analysis can be helpful to understand the roots of the studies. It seems that 6 studies were published in "Regional Science and Urban Economics". What is more is that "Journal of Urban Economics" published 2 papers; "Journal of Housing

and the Built Environment” published 2 papers; “International Journal of Disaster Risk Reduction” published 2 papers; “Journal of Housing Research” published 2 papers and the rest of the papers was published in different journals. It seems that the journals paying the highest attention on the nexus between earthquakes and house prices are the journals about regional and urban economics.

5. CONCLUSIONS

Earthquakes as one of the strongest and unforeseen natural hazards, have been one of the important determinants of house prices in several countries. However, it’s observed from the related literature that the number of studies are still limited, indicating that earthquakes are underestimated in house price determination processes. Our study tries to shed light on the nexus between earthquakes and house prices by systematic and meta analyses of the related literature. The empirical findings in the related literature validate our hypothesis that earthquakes determine the house prices. However, there are some further findings from the literature. First of all, earthquakes and risk of earthquakes decrease house prices in the relevant geographical area but increase prices in neighborhood regions. So there is a spillover effect on house prices over earthquakes. Secondly, since risk perception can be managed by media tools, house prices can also be managed. Higher risk expectations cause risk-averse behaviors and hence decrease house prices. Lastly, recently human-induced earthquakes caused to decrease house prices in some regions. In this context, it’s important to conduct efficient cost-benefit analyses in terms of house prices, before natural-gas and shale-gas extractions in regions.

Endnote: We dedicate this study to those who lost their lives in the huge earthquake disaster that occurred in Türkiye on February 6, 2023, and their grieving families.

ÖZET

Bitkilerin yaşamları boyunca karşı karşıya kaldığı sıcaklık, kuraklık, tuzluluk, ağır metal, ışık, pestisit ve düşük sıcaklık gibi abiyotik stresler faktörleri büyüme ve gelişmelerini olumsuz yönde etkilemektedir. Tarımsal amaçlı ekilebilir arazilerin yaklaşık %90'ında bulunan kültüre alınmış bitkiler, üretim dönemleri boyunca abiyotik stres faktörlerinden bir veya daha fazlasına maruz kalmaktadır. İklim değişikliği temel alınarak oluşturulan ürün verimi modellemelerine göre gelecekte pirinç, buğday ve mısır gibi başlıca bitkilerin üretim verimi düşmeye devam edecek ve gıda güvenliği için ciddi bir tehdit oluşturacaktır. Küresel ortalama sıcaklık değerleri 2100 yılına kadar 2,0–4,9 °C artacak, yağış modellerine göre ise, küresel ısınmanın neden olduğu evapotranspirasyondaki artış nedeniyle kuraklık stresi daha yaygın ve şiddetli hale gelecektir. İklim değişikliğinin sonucu olarak düşük veya yüksek sıcaklık, yetersiz veya gereksiz su kullanımı, yüksek tuzluluk, ağır metaller ve radyasyon gibi abiyotik stres faktörleri, bitki gelişimini tehdit ederek dünya genelinde ürün veriminde düşüşe neden olacaktır. Abiyotik strese maruz kalan bitkiler, moleküler düzeyde yanıt olarak hücrelerde reaktif oksijen türlerini üretir. Bitki büyüme düzenleyici uygulamaları, bitki hücresi için zararlı olan reaktif oksijen üretimini engelleyerek oksidatif stresi önlemeye ve bitki hücrelerinde osmolit birikimini artırmaya yardımcı olur. Transgenik bitkilerde oksidatif strese karşı direnç kazanmasını sağlamak için büyüme düzenleyicilerin biyosentezinde, sinyal yolunu içeren genlerin çalışmasının anlaşılması önemlidir. Bu derleme çalışma ile bu konuda yapılan güncel çalışmalar literatür taraması ile bir araya getirilmiştir.

Anahtar Kelimeler: Abiyotik stres, Bitki Büyüme Düzenleyicileri, Tarımsal üretim, İklim Değişikliği,

**THE ROLE OF PLANT GROWTH REGULATORS AGAINST ABIOTIC STRESS IN
PLANTS**

ABSTRACT

Abiotic stress factors such as heat, drought, salinity, heavy metals, light, pesticides and low temperatures that plants face throughout their lives negatively affect their growth and development. Cultivated plants found in approximately 90% of agricultural arable land are exposed to one or more of the abiotic stress factors during their production period. According to the crop yield models based on climate change, the production yield of major crops such as rice, wheat and corn will continue to decline in the future, posing a serious threat to food security. Global average temperature values will increase by 2.0–4.9 °C by 2100, and according to precipitation models, drought stress will become more widespread and severe due to the increase in evapotranspiration caused by global warming. As a result of climate change, abiotic stresses such as low or high temperature, insufficient or unnecessary water use, high salinity, heavy metals and radiation will threaten plant growth and cause a decrease in crop yields worldwide. Plants exposed to abiotic stress produce reactive oxygen species in cells in response at the molecular level. Plant growth regulator applications help prevent oxidative stress and increase osmolyte accumulation in plant cells by inhibiting the production of reactive oxygen, which is harmful to the plant cell. It is important to understand the operation of genes involved in the signaling pathway in the biosynthesis of growth regulators to enable transgenic plants to acquire resistance to oxidative stress. This review brought together current studies on this subject with a literature review.

Keywords: Abiotic stress, Plant Growth Regulators, Agricultural production, Climate Change,

1. GİRİŞ

Bitkiler özellikle zirai üretim amaçlı kültüre alınanlar için abiyotik stres faktörleri, verimi sınırlayan bir sorundur (Canter, 2018; Hossain et al., 2022; Zörb et al., 2019). Aşırı sıcaklıklar, kuraklık, sel, tuzluluk ve ağır metal stresine maruz kalma, zirai bitkilerin büyümesi ve verim üzerinde olumsuz bir etkiye sahiptir (Waqas et al., 2017; Zafar et al., 2018). Yeryüzündeki ekilebilir arazilerin yaklaşık %90'nı abiyotik stres faktörlerinin biri veya daha fazlasına karşı hassastır (Reis et al., 2012). İklim değişikliği ve ürün verimi modellerinin entegrasyonuna dayalı tahminlere göre, gelecek yüzyılda pirinç, buğday ve mısır gibi başlıca zirai ürünlerin verimliliği düşmeye devam edecek ve potansiyel olarak gıda güvenliği ve sürdürülebilirliği için ciddi bir tehdit oluşturacaktır (Tigchelaar et al., 2018). Son meta-analiz çalışmasına göre, küresel ortalama sıcaklık 2100 yılına kadar 2,0–4,9 °C artmış olacaktır (Raftery et al., 2017). Küresel ısınmanın neden olduğu evapotranspirasyondaki artış nedeniyle bitkiler üzerinde kuraklık stresi daha yaygın ve şiddetli hale gelmiştir (Dai, 2011). Yapılan matematiksel modellere dayalı tahminlerde iklim değişikliğinin bir sonucu olarak ısınma, kuraklık, sel ve fırtına olaylarının daha sık ve aşırı hale gelmesi, özellikle tropik ve subtropik bölgelerde ürün verimini daha da azalması beklenmektedir. Bu çalışma ile bitkilerin maruz kaldığı abiyotik stres faktörlerine karşı bitki büyüme düzenleyicilerin rolünün anlaşılması ile ilgili yapılan araştırmaları güncel literatür taraması ile bir araya getirmektedir.

2. KURAMSAL TEMELLER

Yüksek veya düşük sıcaklık, yetersiz veya aşırı su, aşırı tuzluluk, ağır metaller ve radyasyon gibi majör abiyotik stresler, bitki gelişimini etkilemekte, dünya genelinde ürün veriminde büyük boyutlarda düşüşe neden olmaktadır (Shao et al., 2015). Kuraklık, ısı, patojen saldırısı, ağır metal, tuzluluk ve radyasyon gibi stresler bitkiler üzerinde olumsuz etki yaratmaktadır (Şekil 1) (Tablo 1) (Wada and Murata, 2007).

Şekil 1 Bitkilerde abiyotik stres faktörleri (Wada and Murata, 2007)

İklim değişikliğinin sonucu olarak zirai ürünlerde, mahsul veriminin azalmasının olumsuz etkilerini azaltmak ve ekonomik tarım uygulamaları için fayda verim analizleri yapılmaktadır. Bu yönde yapılan bilimsel araştırmalar bitkilerin endojenik olarak müdahalelerle abiyotik stres direncinin artırılmasına yönelik hız kazanmıştır (Wang et al., 2016).

Tablo 1. Abiyotik streslerin farklı ana ürünler üzerindeki etkisi (Wada and Murata, 2007)

Başlıca ürünler	Stresler
Nohut	Kuraklık
	Kadmiyum (Cd) toksisitesi
	Bakır (Cu) toksisitesi
Mısır	Kuraklık
	Sıcaklık
	Arsenik (As) metal stresi
Soya fasulyesi	Kuraklık
Buğday	Kuraklık
Pirinç	Kuraklık
	Sıcaklık
Hardal	Kadmiyum (Cd) toksisitesi

2.1. ABİYOTİK STRES FAKTÖRLERİ

2.1.1 Sıcaklık

Bitkiler ısı stresine maruz kaldıklarında, tohum çimlenmesi ve fotosentetik yetenekleri zarar görür, ürün verimleri azalır. Sıcaklık, canlı organizmaların fizyolojik davranışını ve dağılımını, ayrıca bitki büyümesini ve gelişimini etkileyen önemli bir ekolojik faktördür. Optimum sıcaklık değerlerinde, bitkilerin stresli ortamlara karşı fizyolojik, morfolojik, biyokimyasal ve hücrenel olarak en üst düzeyde cevap verdiği bilinmektedir (Basbouss-Serhal et al., 2016; Raza et al., 2020).

Isı stresi bitkilerin büyüme fonksiyonlarını, fizyolojik süreçlerini ve verimleri yönünden olumsuz olarak etkiler (Hasanuzzaman et al., 2012). Oksidatif strese neden olan reaktif oksijen türlerinin (ROS) aşırı üretimi, yüksek sıcaklık stresinin en ciddi sonuçlarından biridir (Hasanuzzaman et al., 2013).

Isı stresi, osmo-protektanların, detoksifiye edici enzimlerin, taşıyıcıların ve düzenleyici proteinlerin ekspresyonunu kontrol eden genlerin ekspresyonunu değiştirir (Chinnusamy et al., 2007). Bitkilerde ısıya en duyarlı fizyolojik süreçlerden biri fotosentezdir (Crafts-Brandner et al., 2002). Yüksek sıcaklıklar, C4 bitkileriyle karşılaştırıldığında, özellikle C3 bitkilerinde, bitkinin fotosentetik kapasitesi üzerinde daha büyük bir etkiye sahiptir (Yang et al., 2006).

Isı stresi, büyüme ve gelişme aşamalarında tüm bitki dokularını etkilerken, üreme dokuları en savunmasız olanlardır. Çiçeklenme döneminde birkaç derecelik sıcaklık artışı tüm bitkinin kaybına neden olabilir (Sato et al., 2006).

Hava sıcaklığındaki 1,5 °C artış, bitkiler üzerinde, çiçeklerin olmaması veya çiçeklerin meyve vermemesine sebep olarak ürün verimi üzerinde önemli seviyede olumsuz etkisi vardır (Maheswari et al., 2012; Warland et al., 2006). Tahıllar (pirinç, buğday, arpa, sorgum ve mısır), baklagiller (nohut, börülce) ve yağlı tohumlar (hardal) dahil olmak üzere birçok zirai ekili ürün, ciddi bir verim düşüşü göstermiştir (Ahamed et al., 2010; Hatfield et al., 2011; Kalra et al., 2008; Tubiello et al., 2007). Sıcaklık stresi, toprak ve hava sıcaklığının, bitki gelişimi ve ilerlemesinde kalıcı hasar meydana getirir (Easterling et al., 2007).

2.1.2. Kuraklık

Bitkiler için, yağışın yetersiz olduğu ve erişilebilir suyun kısıtlı olduğu kuru veya yarı kurak yerlerde, büyük bir tehlikedir ve ürün veriminde düşüşe neden olur (Hussain et al., 2019). Bu duruma bitkiler, büyüme ve gelişim dönemlerinde morfolojisinde değişiklikleri ile farklı şekillerde uyum sağlar. Su kıtlığı ve toprak tuzluluğu, oksidatif, ozmotik ve sıcaklık stresleri köklerdeki su taşınması, suya erişilebilirliği bitkilerin yok olmasına sebep olabilecek boyutlara ulaşabilir. Kuraklığın bitkiler üzerindeki temel etkisi, zayıf çimlenme ve zayıflamış fide oluşumudur. Hasat zamanında ise kuru tane ağırlığının azalması çimlenme ve fide gelişiminin olumsuz sonuçlarının neden olduğu anlaşılmıştır. Kuraklık, hücrelerde mitoz bölünme sayısını ve hücre turgor basıncını düşürür, bu da zayıf gelişime neden olur (Raza et al., 2020).

Kuraklık stresindeki bitkiler savunma olarak sekonder metabolitleri sentezleyerek, büyüme sürecinde daha kısa boylu, küçük ve daha az yaprak, daha az meyve verimi şeklinde uyum sağlamaya çalışır (Tablo 2) (Zafar et al., 2018). Osmo-regülatör süreçler, zar bütünlüğünü korur ve hücreye su akışının yanı sıra şekerler, amonyum bileşikleri, hidrofilik proteinleri ve prolin amino asidini sentezler (Crafts-Brandner et al., 2002; Lobell et al., 2007; Priya et al., 2019; Wang et al., 2016).

Kuraklık stresi, kuraklığın uzunluğuna ve şiddetine bağlı olarak değişen klorofil içeriğinin azalmasına neden olur. Kuraklık, tarımsal ekosistemlerde bitkisel ürün üretimi üzerinde olumsuz bir etkiye sahiptir ve meyveler, tahıllar ve yapraklar dahil olmak üzere ekonomik açıdan değerli bitkilerin büyüme ve gelişme hızını etkiler.

Kurak yıllarda, kahve gibi ticari ürünlerin üretimi sulama yapılmadan %80'e kadar azalmaktadır (DaMatta et al., 2006). Brezilya'nın Parana eyaletinde 2008/2009 hasat döneminde soya fasulyesi üretimi, 45 günlük bir kuraklık döneminde %80 oranında azalmıştır ve aynı bölgede yetişen şeker kamışı, mısır, buğday ve diğer ürünlerinde verim kaybına uğradığı tahmin edilmektedir (Franchini et al., 2009).

Tablo 2. Bazı Abiyotik stres faktörlerinin topraktaki besin elementi alımı açısından bitkiler üzerindeki etkisi(Zafar et al., 2018)

Stres	Etkilenen Süreç	Elementi Alımı Üzerine Etkisi
Kuraklık	Parçalanma yoluyla toprağın yapısının bozulması	Tüm besin elementlerinin azalması
Kuraklık ve ısı	Terleme kaynaklı su kaybı, toprak mikrobiyal faaliyet azalması	Mobil besin elementleri, başta Ca, Mg, Si ve nitratlar, sülfatlar ile başta P ve K olmak üzere ana besin elementleri ve tüm besin elementleri
Sıcaklık	Bitki fenolojisi ve redüktaz aktiviteleri	N, P, K

2.1.3. Tuzluluk

Dünya çapında yaklaşık 45 milyon hektar sulanan arazi tuz stresi altındadır ve 2050 yılına kadar ekilebilir arazilerin yarısından fazlası tuzdan etkilenebilir, bu da tuzluluğu gıda güvenliği için önemli bir sınırlayıcı faktör haline getirir (Munns and Tester, 2008). Tuz stresi, mahsulün büyümesini ve verimini çeşitli şekillerde etkiler. Tuz stresinin mahsul bitkileri üzerinde iki ana etkisi vardır; ozmotik stres ve iyon toksisitesi. Tuzluluk stresi altında toprak çözeltisinde daha fazla tuz olduğundan, bitki hücrelerindeki ozmotik basınç bitki hücrelerindeki ozmotik basıncı aşarak bitkilerin su ve K^+ ve Ca^{+2} gibi mineralleri alma kapasitelerini sınırlar. Tuzluluk stresinin bu birincil etkileri, hücre genişlemesi ve hücre duvarının işlevinin azalması gibi ikincil etkilerle sonuçlanır. Tuz stresi, biyomolekülleri (lipitler, proteinler ve nükleik asitler gibi) yok eden ve redoks homeostazını bozan ROS gelişimini artırır (Kundu et al., 2018)

Bitkiler, morfo-fizyolojik özelliklerin yanı sıra iyonik, biyokimyasal ve moleküler metabolizmalar dahil olmak üzere tuzlu ortamdaki değişiklikleri algılamak, tepki vermek ve bunlara uyum sağlamak için çeşitli mekanizmalar kullanır. Örneğin azalan yaprak bölgesi, yaprak kalınlığının artması, yaprak dökülmesi, kök ve sürgün dengesinin bozulması ve boğum arası uzunlukların azalmasıdır (Sabagh et al., 2020).

Dünya genelinde yaklaşık 800 milyon hektar ekilebilir alanın toprak tuzluluğundan etkilendiği değerlendirilmektedir. Tuzluluk, dünya çapında yaklaşık 45 milyon hektar sulanan arazi tuz baskısı altında olduğundan ve ekilebilir arazinin yarısından fazlası 2050 yılına kadar sürekli olarak tuzdan etkilenebileceğinden, gıda güvenliğini önemli ölçüde kısıtlayıcı bir unsura dönüşmektedir (Hussain et al., 2019; Zhang et al., 2016).

2.1.4 Ağır metal stresi

Madencilik, uyguladığımız tarım yöntemleri ve sanayileşme gibi antropojenik süreçlerin iklim üzerinde uzun vadeli olumsuz etkileri vardır. Toprak, su ve havadaki ağır metal konsantrasyonları bu etki sonucu olarak yükselir. Toprağın ağır metal kirlenmesi, çeşitli çevresel sorunlara neden olur ve hem bitkiler hem de hayvanlar üzerinde zararları vardır. Günümüzün yaygın sanayileşmesi, ağır metalleri biriktirerek toprak ve mahsul verimliliği üzerinde olumsuz olarak etkiler (Shahid et al., 2015). Çinko, bakır, molibden, manganez, kobalt ve nikel gibi ağır metaller bitkilerin yaşamlarında biyolojik süreçler ve gelişimleri için gereklidir (Salla et al., 2011). Bu ağır metallerin miktarı sınır değerleri aştığında, bitkilerde morfolojik ve metabolik bozukluklar görülür ve verimin düşmesine neden olur. Bu anormallikler ayrıca süperoksit anyon radikali (O^{2-}), hidrojen peroksit (H_2O_2) ve hidroksil radikali (OH^-) gibi ROS oluşumuna neden olur ve bu da ürün verimi azalır (Gill and Tuteja, 2010; Pierart et al., 2015; Pourrut et al., 2011).

2.2. ABİYOTİK STRES TOLERANSINDA BİTKİ HORMONLARININ GÖREVİ

Doğal ortamında yetişen bitkiler gibi kültüre alınanlar bitkilerde, büyüme ve gelişim dönemlerinde ürün verimliliğini etkileyen çeşitli abiyotik stres faktörleri ile karşılaşabilir (Erofeeva, 2021; Mokrani et al., 2020). Küresel çapta, iklimsel sapmaların sonuçlarından biri olarak bitkilerin maruz kaldığı abiyotik stresler faktörleri çok yaygınlaşmıştır. Özellikle tropikal ve subtropikal bölgelerin uç bölgelerinde yetişen bitkiler aşırı sıcaklıklar, tuzluluk, sel ve kuraklık, kirlilik ve ağır metal toksisitesi gibi abiyotik strese maruz kalmaktadır. Evrim sürecinde bitkiler, abiyotik faktörlerin neden olduğu olumsuz şartlarla karşı savunma mekanizmaları geliştirmiştir. Bu savaşıma ve adaptasyon mekanizmalarından biri olan bitki hormonları, stresler nedeniyle gelişen olumsuz durumlarda altında, ortama adaptasyon için bitkiler hormonal sinyaller ile tolerans mekanizmalarını çalıştırır (Roychoudhury and Banerjee, 2017).

Genel olarak, bitki büyümesi ve gelişim aşamaları farklı hormonlardan etkilenir. Abiyotik stres durumunda, hormonlar sinyal yolları aracılığıyla bitki tepkilerine öncülük etmektedir (Zhu, 2016). Klasik bitki hormonu olarak bilinen gibberellinler, oksinler, sitokininler ve etilenin, bitki savunmasında ve streslerin hafifletilmesinde temel büyüme sinyalleri gönderdiği bilinmektedir. Bitkiler, çeşitli hormonların birlikte çalışması ile abiyotik streslerle başa çıkar.

2.2.1. Giberellinler

Giberellinler (GA), bitkilerin büyüme dönemlerinde çok yönlü rolleri vardır. GA'nın bitkilerde biyosentezi, gelişimsel ve çevresel uyarılar'a göre gerçekleşir (Hedden, 2020). Etilen ve oksin gibi bazı klasik bitki hormonları, bitkilerde sentezlenen giberellik asit seviyesini etkiler (Yamaguchi, 2008). Bitkilerde abiyotik strese karşı GA'ların rolü bilinmekte ancak abiyotik stresin hafifletilmesi arasındaki ilişki tam olarak anlaşılammıştır (Upreti and Sharma, 2016). Yapılan çalışmalarda tuzluluk abiyotik stresi altındaki bitkilerdeki GA seviyeleri değişkenlik göstermekle beraber, tuzluluğun etkilerini kısmen hafiflettiği, arpa (Abdul-Baki et al., 1970), yulaf (Chauhan et al., 2019), zeytin (Shekafandeh et al., 2017), hint yağı (Rajput et al., 2015), şeker kamışı (Shomeili et al., 2011), keten tohumu (Nasri et al., 2017), kereviz (Aloni and Pressman, 1980), domates (Maggio et al., 2010)'te tespit edilmiştir.

Giberellinler, bitki dokularında tuzluluk stresinin olumsuz etkilerini azaltan bazı fizyolojik ve metabolik aktivitelerin gerçekleşmesini sağlar. NaCl kullanılarak tuzluluk stresine maruz bırakılan Pirinç bitkisinin kontrol grubunda bulunan fidelerinde büyüme baskılanmıştır. GA₃ uygulaması yapılan deney grubunda ise GA₃ seviyesine bağlı olarak büyüme normale yakın olarak devam etmiş, bununla birlikte topraktan fosfor ve kalsiyum alımı artmıştır (Starck and Kozińska, 1980; Wen et al., 2010).

2.2.2. Sitokininler

Sitokininler, hücre bölünmesini ve kloroplast biyogenezi, sürgün farklılaşması, vasküler farklılaşma, yaşlanmayı düzenleme ve pigment oluşumu gibi bitkilerin farklı gelişim süreçlerinde rol oynar. Bitkinin kök bölgesinde ve tohumlarda sentezlenir. Etki edeceği bölge olan sürgünlere taşınarak fizyolojik süreçlere katılır (Terceros et al., 2020).

Abiyotik stres faktörlerin sebep olduğu olumsuz etkilerden hafifletilmesinde sitokininlerin de görev aldığı anlaşılmıştır. Tohum çimlenmesinde abiyotik stres azalttığı, diğer klasik hormonlar olan oksinler ve ABA ile antagonistik veya sinerjistik olarak hareket ederek abiyotik strese karşı tepki verilmesinde etkin rol oynadığı anlaşılmıştır (Rhaman et al., 2020).

Bitkiler abiyotik stres altında iken sitokininlerin konsantrasyonunda değişim görülmektedir. Stres sonrası ise konsantrasyonu normal seviyelere döner. Yapılan çalışmalarda; pirinç (Reguera et al., 2013), buğday (Joshi et al., 2019), elma (Zhou et al., 2004), domates (Pillay and Beyl, 1990), Fransız fasulyesi (Upreti et al., 1997), soğan (Upreti and Murti, 2004) ve üzüm

(Satissha et al., 2005) gibi farklı bitkilerde abiyotik stres altında sitokinin konsantrasyonunda değişiklik olduğu gösterilmiştir.

2.2.3. Oksinler

İndol asetik asit (IAA) olarak da bilinen oksinler, Bitkilerde genel olarak kök büyümesi, tomurcuk oluşumu, vasküler doku farklılaşması, apikal baskınlık ve çiçeklenmeyi sağladığı düşünülmektedir (Sezgin and Kahya, 2018). Abiyotik stres altındaki bitkilerdeki IAA konsantrasyonu, oksin polar taşıyıcı genin ekspresyonu veya polar taşımadaki inhibisyonlarla değiştirilir (Korver et al., 2018).

Streste, IAA'nın oksidatif bozunması, ROS üretimi dahil olmak üzere gerçekleşir (Pasternak et al., 2005). Tuzluluk stresi altında, pirinçte (Prakash and Prathapasanen, 1990), domateste (Dunlap and Binzel, 1996) ve buğdayda (Sakhabutdinova et al., 2003) IAA seviyesi azalır.

Tuzluluk stresinde oksin uygulamasıyla buğdayın tohum çimlenmesindeki stresin baskılayıcı etkisi giderilmiştir (Afzal et al., 2005). Kırmızıbiberde IAA'nın uygulanması, sıcaklık stresinin etkilerini azaltmıştır (Upreti et al., 2012) Ayrıca Oksinler soğuk stresıyla mücadelede de etkilidir (Du et al., 2013). Araştırmalar, oksinin abiyotik stres koşulları altında çeşitli fizyolojik ve metabolik aktiviteleri ve gelişimsel genleri değiştirmede hayati önem taşıdığını ortaya koymuştur (Wei et al., 2019).

2.2.4. Etilen

Etilen, tohum çimlenmesi, kök oluşumu, çiçeklenme ve tozlaşma, dökülme ve yaşlanma ve meyve olgunlaşması gibi bitkilerin çeşitli fizyolojik işlemlerini ayarlayan gaz formunda fitohormondur (Dubois et al., 2018). Strese duyarlı bir hormon olarak da bilinir. Etilen, iki enzimin, yani ACC sentaz ve ACC oksidazın katılımıyla metiyoninin etilene dönüştürülmesi yoluyla biyosentezlenir (Yang and Hoffman, 1984).

Stres koşullarında, yaprak ve meyvelerin büyüme geriliğini ve yaşlanmasını artıran etilen konsantrasyonu artar ve böylece bitkilerden su kaybı azalır (Upreti and Sharma, 2016). Yapılan çalışmalarda; portakal (Ben-Yehoshua and Aloni, 1974), bakla (El-Beltagy and Hall, 1974), Fransız fasulyesi (Upreti et al., 1997) ve diğer mahsullerde stres koşulları altında etilenin arttığını ortaya koymuştur. Aşırı sulama kaynaklı hipoksi, ovalarda kültüre alınan bitkiler için yaygın bir strestir. Araştırmacılar; arpa (Larsen et al.,1986), soya fasulyesi (Bacanamwo and Purcell, 1999), bezelye (Gladish et al., 2006), mısır (He et al., 1994), buğday (Yamauchi et al., 2014) ve sünger kabağı (Vidoz et al., 2010)'nın su kaynaklı hipoksi durumunda kök gelişiminin

arttığını bulmuşlardır. Tuzluluk stresinde tolerans tepkileri büyük ölçüde bitki türüne bağlı olarak değişmektedir (Riyazuddin et al., 2020). Düşük sıcaklık stresinde, bitkiler etilen seviyelerini artırır, buna bağlı toleransı artar (Zhao et al., 2014).

3. SONUÇ

Abiyotik strese maruz kalan bitki hücrelerinde oksidatif strese neden olan reaktif oksijen türleri (ROS) aşırı birikmekte, bu birikim bitkilerin fizyo-biyokimyasal süreçlerinin normal işleyişini aksatarak büyüme ve gelişimi engellemektedir. Bitkiler, abiyotik streslerin neden olduğu olumsuz koşullara karşı büyüme düzenleyicileri (jasmonatlar, salisilatlar, brassinosteroidler (BR'ler), nitrik oksit (NO), poliaminler, glisin-betain, oligosakkaritler, strigolaktonlar (SL'ler) vb) sentezler. Bu büyüme düzenleyicilerin yanı sıra, prolin, glisin-betain, poliaminler ve çeşitli şekerler (örn. mannitol, sorbitol, galaktinol, vb.), abiyotik streslere bitki adaptasyonunda önemli role sahiptir.

Diğer canlıların aksine hareket yeteneğine sahip olmayan bitkiler buldukları ortamlarda aşırı soğuk, aşırı sıcak, su fazlalığı ve kıtlığı, tuzluluk, ağır metal stresi gibi nesillerinin devamını etkileyecek düzeylere ulaşabilen olumsuz şartlarda hayatta kalmalarının arkasındaki biyolojik süreçlerin anlaşılması, artan dünya nüfusu, ekolojik ve çeşitli nedenlerle kültüre alınan bitkilerin ekili alanlarının zarar görmesinin önlenmesi, insanlığın güvenli ve sürdürülebilir gıdaya erişiminde büyük bir önem arz etmektedir.

Kültüre aldığımız ve beslenme amacıyla kullandığımız bitkilerden birim alanda en fazla verim almak, fayda/maliyet anlamında sürdürülebilir gıda temini sağlamak için doğal koşullarında bitkilerin hayatta kalma mekanizmalarını anlamak önemlidir. Bu derleme ile bir araya getirilen abiyotik strese yanıt olarak bitkilerde sentezlenen Bitki büyüme düzenleyicilerin işleyiş mekanizmalarını araştıran çalışmalar bunun önemi bir kez daha ortaya koymaktadır.

ÖZET

Bitki yapısında sentezlenen, hücreler ve dokularda büyüme, gelişme ile yaşamsal faaliyetleri düzenleyen, organik veya inorganik maddelere bitki büyüme düzenleyicileri (BBD) ya da fitohormonlar denilmektedir. Bu düzenleyici maddeler bitkilerin ilgili bölgelerinde sentezlenerek büyüme, gelişme ve diğer fizyolojik olayları tek başına ya da karşılıklı olarak etkileyebilen, meydana geldikleri dokuda etkin olabildikleri gibi taşıma sistemi ile bitkinin ilgili bölgesine taşınabilen ve bu etkinliğini burada da gösterebilen maddelerdir. Fitohormonlar büyümeyi düzenleyici, gelişmeyi teşvik edici ve baskılayıcı (engelleyici) olmak üzere üç gruba ayrılmaktadır. Büyümeyi teşvik eden hormonlar grubundan olan ve klasik beşli olarak adlandırılan Oksin, Sitokin, Absisik Asit, Giberellinler ve Etilen'e ek olarak altıncı grup olan Brassinosteroidler, bitkiler tarafından endojenik olarak sentezlenebilen steroid yapısındaki altıncı grup bitki hormon grubudur. Steroid yapıdaki hormonlar, hayvanların embriyonik gelişimi ile yetişkin homeostasisi açısından çok önemli olduğu kadar, bitkilerde hormonların yapısında görev almaktadırlar. Bitkiler bu amaçla bol miktarda steroid ve sterol üretmektedir. Brassinosteroidler (BR) büyümeyi teşvik eden bitki steroidleridir. Bazı polen ekstraktlarının büyümeyi teşvik edici özellikleri BR'lerin araştırılmasına yön vermiştir. Yapılan çalışmalarda, *Brassica napus* (kolza) polenlerinden elde ettikleri ekstraktın fasulye internodlarında uzamaya sebep olduğunu gözlemlemiş ve yaklaşık 60 farklı bitkinin polenlerinden elde edilen ekstraktların test edilmesi sonucu, bitkilerde büyümeyi teşvik ettikleri anlaşılmıştır. Bu özelliği nedeniyle Brassinosteroid'lerin bitki hormonlarının yeni bir sınıfı olarak kabul edilmiştir. Bu derleme ile yapılan çalışmalara ait güncel literatür bir araya getirilmiştir.

Anahtar Kelimeler: Brassinosteroidler, Bitki Büyüme Düzenleyiciler, Fitohormonlar

PLANT STEROID HORMONE: BRASSINOSTEROIDS

ABSTRACT

Organic or inorganic substances synthesized in the plant structure, regulating growth, development and vital activities in cells and tissues are called plant growth regulators (PGR) or phytohormones. These regulatory substances are that can be synthesized in the relevant parts of the plants and affect growth, development and other physiological events alone or mutually, can be effective in the tissue where they occur, or can be carried to the relevant region of the plant by the transport system and can show this activity here as well. Phytohormones are divided into three groups: growth-regulating, development-promoting and suppressive (inhibitory). Brassinosteroids, which are the sixth group in addition to Auxin, Cytokine, Abscisic Acid, Gibberellins and Ethylene, which are from the growth promoting hormones group and called the classical quintet, are the sixth group of plant hormones in the steroid structure that can be synthesized endogenously by plants. Hormones in steroid structure are very important for the embryonic development of animals and adult homeostasis, as well as taking part in the structure of hormones in plants. Plants produce a large amount of steroids and sterols for this purpose. Brassinosteroids (BR) are plant steroids that promote growth. The growth-promoting properties of some pollen extracts have guided the search for BRs. In the studies, it was observed that the extracts obtained from *Brassica napus* (rapeseed) pollen caused elongation in bean internodes, and as a result of testing the extracts obtained from the pollen of about 60 different plants, it was understood that they stimulated growth in plants. Because of this feature, Brassinosteroids have been accepted as a new class of plant hormones. In this review, the current literature of the studies has been brought together.

Keywords: Brassinosteroids, Plant Growth Regulators, Phytohormones

1. GİRİŞ

Bitki yapısında sentezlenen, hücreler ve dokularda büyüme, gelişme ile yaşamsal faaliyetleri düzenleyen, organik veya inorganik maddelere bitki büyüme düzenleyicileri (BBD) diğer bir ifade ile fitohormonlar denilmektedir. Bu düzenleyici maddeler bitkilerin ilgili bölgelerinde sentezlenerek; büyüme, gelişme ve diğer fizyolojik olayları tek başına ya da karşılıklı olarak etkileyebilen, meydana geldikleri dokuda etkin olabildikleri gibi taşıma sistemi ile bitkinin ilgili bölgesine taşınabilen ve bu etkinliğini burada da gösterebilen maddelerdir (Kumlay ve Eryiğit 2011, Sezgin ve Kahya 2018).

Fitohormonlar büyüme düzenleyici, gelişmeyi teşvik edici ve baskılayıcı (engelleyici) olmak üzere üç gruba ayrılmaktadır. Büyümeyi teşvik eden hormonlar grubundan olan ve klasik beşli olarak adlandırılan Oksin, Sitokin, Absisik Asit, Giberellinler ve Etilen'e ek olarak altıncı grup olan Brassinosteroidler, bitkiler tarafından endojenik olarak sentezlenebilen steroid yapısında altıncı grup bitki hormon grubudur. Steroid yapıdaki hormonlar, hayvanların embriyonik gelişimi ile yetişkin homeostasisi açısından çok önemli olduğu kadar (Evans 1988), bitkilerde hormonların yapısında görev almaktadırlar. Bitkiler bu amaçla bol miktarda steroid ve sterol üretmektedir (Geuns 1978, Jones and Roddick 1988).

Brassinosteroidler (BR) büyüme teşvik eden bitki steroidleridir (Müssig 2005). Bazı polen ekstraktlarının büyüme teşvik edici özellikleri BR'lerin araştırılmasına yönelik çalışmaları hızlandırmıştır. Yapılan öncü çalışmalardan biri Mitchell et.al (1970) tarafından *Brassica napus* (kolza) polenlerinden elde ettikleri ekstraktın fasulye internodlarında uzamaya sebep olduğunu gözlemlemiştir. Yaklaşık 60 farklı bitkinin polenlerinden elde edilen ekstraktların test edilmesi sonucu, büyüme teşvik ettikleri belirlenmiştir. Araştırmacılar çalışmalarda kullanılan aktif bileşiğin *Brassica* cinsi bitkilerden elde edilmesi nedeniyle bu bileşiklere *brassin*'ler olarak isimlendirmişlerdir.

Brassin'lerin kimyasal yapılarını belirlemek için Grove et al. (1979) tarafından yapılan çalışmalarda; 40 kg polenden 4 mg kristal elde etmişler ve elde ettikleri bileşiği brassinolid (BL) olarak isimlendirilmiştir. Brassinolid eldesi sonrası yapılan çalışmalarda bu bileşiğin bitki büyümesi ve gelişiminde rol aldığı anlaşılmıştır. Bu özelliği nedeniyle brassinosteroidlerin bitki hormonlarının yeni bir sınıfı olarak kabul edilmiştir (Bajguz 2000, Bajguz and Tretyn 2003, Clouse and Sasse 1998, Li and Chory 1999, Michelini et.al. 2004, Müssig and Altmann 1999, Rao et.al. 2002, Vardhini and Rao 2002). Ayrıca 1982 yılında büyüme teşvik edici özelliği anlaşılan ve yapısal olarak steroidal madde olan kastasteron (CS) keşfedilmiştir (Yokota et.al. 1982).

2. KURAMSAL TEMELLER

2.1 Brassinosteroid Türleri

Grove et al. (1979) kolzadan brassinolidi [(22R, 23R, 24S)-2 α , 3 α , 22,23-tetrahidroksi-24-metil- β -homo-7-oksa-5 α -kolestan-6-on)] izole etmişlerdir. brassinosteroidler kolestanın hidroksile edilmiş türevleridir. Brassinosteroidlerin yapısal çeşitleri; C17 yan zincirinin A ve B halkası üzerine farklı grupları ile elde edilmektedir. Farklı brassinosteroidler, yan zincir uzunluğuna (zincirdeki C sayılarına) göre, C27, C28 ve C29 brassinosteroidleri olarak sınıflandırılmaktadır (Bajguz 2007).

C27, C28 ve C29 steroidlerini içeren brassinosteroidler, benzer yan zincir ile 5 α -kolestan yapısına sahiptir (Sakurai, 1999). C27 brassinosteroidleri, C24 pozisyonunda olduğu gibi alkil grubu bulunmamakta ve kolesterolden üretilmektedir (Surgun v.d. 2012).

C28 brassinosteroidleri, C24 durumunda bir metilen, α -metil veya β -metil gruplarına sahip olup 24-metilenekolesterol, kampesterol ya da 24-epikampesteroldan türevlenebilmektedir. C29 brassinosteroidleri, C24'de etil veya α -etil grubundan oluşmakta ve isofukosterol veya sitosterolden türevlenmiştir (Yokota 1997). C28 türü brassinosteroid bileşikleri, bitkilerde en yaygın bulunan formudur (Sakurai, 1999). Doğadaki brassinosteroidler ardışık sayılarla numaralandırılmıştır. BR1, kısaltması brassinolid temel alınarak BR2, BR3, BR4...BRn olarak isimlendirilmiştir. Tüm brassinosteroidler, her zaman biyolojik olarak aktif değildir. Brassinolid (BL), 24-epibrassinolid (24-epiBL) ve 28-homobrassinolid (28-homoBL) çalışmalarda genel olarak kullanılan aktif brassinosteroidlerdir (Rao et al. 2002) (Şekil 1).

Şekil 1 Aktif brassinosteroidler

2.2. Yapısında Brassinosteroid Bulunan Bitkiler

Brassinosteroidler; açık tohumluların (gymnospermler) 3 familyasında, kapalı tohumluların (angiospermler) ise; monokotillerde 15, dikotillerde ise 16 olmak üzere toplam 31 familyasında

bulunmaktadır. Ayrıca alg ve eğreltilerde de buldukları belirlenmiştir. Bitkinin tüm yapılarında biyosentezi yapılabilen brassinosteroidler genellikle tohum, polen, yaprak, gövde, kök, çiçek gibi bölümlerde yoğun olarak bulunabilmektedir (Ankudo 2004). Endojen brassinosteroid seviyeleri bitki dokularına göre farklılık gösterebilmektedir. Brassinosteroidler en yüksek seviyede polen ve tohum yapısında bulunurken sürgün, anter, çiçek tomurcukları ve meyveler ile kambiyal bölgelerde farklı seviyelerde bulunabilmektedir (Zullo and Adam 2002). Bitki dokularında endojen brassinosteroid düzeylerinin tespit edilmesi için yapılan çalışmalar da en yüksek konsantrasyon, 10⁻¹ nmol/g yaş ağırlık olarak *Brassica napus* ve *Vicia faba* polenlerinden elde edilen brassinolide aittir. En az seviyede ise, 10⁻⁷ nmol/g yaş ağırlık olarak Çin lahanası (*Brassica campestris* var. *pekinensis*)'nin olgunlaşmamış tohum ve sürgünlerinden elde edilen homokastasteron'a aittir (Clouse 2003). Bitkilerde brassinolidlerin temel kaynağı olgunlaşmamış polen ile tohumlarda 1-10 ng/g düzeyde bulunmaktadır. En az ise yapraklarda, 0.01-0,1 ng/g seviyelerinde bulunmaktadır. *Arabidopsis thaliana*'nın olgun tohumlarında yapılan çalışmada; 3.9x10⁻³ nmol/g brassinolid (BL), 9.5x10⁻⁴ nmol/g kastasteron, 3x10⁻³ nmol/g tifasterol, 3.5x10⁻³ nmol/g 6-deoksokastasteron, 2.1x10⁻³ nmol/g 6-deoksotifasterol, 1.2x10⁻³ nmol/g 6-deokso teasteron belirlenmiştir (Ankudo 2004).

2.3. Bitkilerde Brassinosteroid'lerin Sentezi

Brassinosteroidlerin biyosentetik yollarının erken C-6 ve geç C-6 oksidasyon yolları olmak üzere iki farklı yolla olduğu düşünülmektedir (Fujioka et al.1998). DWF4'ün sentez adımlarında birden fazla biyosentetik ara madde üzerinde etki gösterebileceği bulgusuna dayanarak erken bir C-22 hidroksilasyon yolu oluşturmak için kampesterolde farklılaşmaktadır (Şekil 2, sarı gölgeli alan) (Choe et al 2001; Fujioka and Yokota 2003).

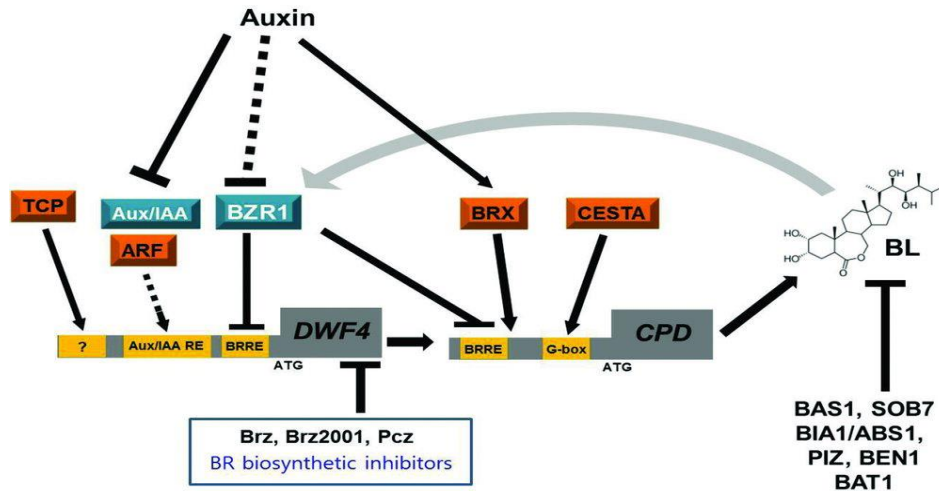

Ortamda bulunan kampesterol (CR), erken C-22 oksidasyon yolunu izleyerek (Şekil-2'de gösterilen sarı renkli alan) DWF4'ün etkisiyle C-22'yi hidroksilatlar. Burada erken ve geç C-6 oksidasyon yollu olmak üzere iki farklı yol izler. Erken C-6 oksidasyon yolu, C-22 oksidasyonundan (Şekil-2'de gösterilen yeşil renkli alan) önce C-6 oksidasyonuna maruz kalır. Geç C-6 oksidasyon yolu, C-22'yi C-6 oksidasyonundan (Şekil-2'de gösterilen mor renkli alan) önce hidroksile eder (Şekil 2).

Şekil 2 Brassinosteroidlerin sentezlenmesi

2.4. Brassinosteroidlerin Sentez İnhibitörleri

Arabidopsis mutanları cüce fenotipleri (Choe 2004), *Zea mays* (mısır) ve *Sorghum* bitkilerinde (Fernandez et al. 2009) biyosentez inhibitörlerinin rolünü araştırmak için yapılan çalışmalarda Triazol tipi bir bileşik olan Brz, güçlü bir BR biyosentez inhibitörü olduğu anlaşılmıştır (Şekil 3) (Asami et al. 2000).

Şekil 3 Brassinosteroid inhibitörlerinin sentezlenmesi

Bir steroid C-22 hidroksilaz olan DWF4'ün Brz'yi sentezlediği ve BR biyosentez inhibitörü olan Brz2001'i karakterize edilmiştir (Sekimata et al. 2001). Brz ve Brz2001'in güçlü özgüllüğüne rağmen, bu bileşiklerin nispeten yüksek maliyeti, tarımsal ve büyük ölçekli saha çalışmalarında uygulamalarını sınırlamıştır. Alternatif olarak, Propiconazol (Pcz) olarak adlandırılan başka bir triazol türevi ve ticari olarak temin edilebilen bileşiğin hem *Arabidopsis* hem de mısır için geçerli olduğu bulunmuştur (Hartwig et al. 2012).

2.5 Brassinosteroidlerin Bitkilerde Taşınımı

Brassinosteroidlerin bitki sisteminde taşınımı ile ilgili Savaldi et al. (2006) tarafından yapılan araştırmada; 24-epiBL'in ekzojen uygulamasında taşınım yönün kökten gövdeye doğru olduğu anlaşılmıştır. Salatalık, domates ve buğday bitkisi köklerine radyoaktif (^{14}C) ile işaretlenmiş 24-epiBL uygulamasında radyoaktivitenin gövde bölgesine taşındığı bulunmuştur. Brassinosteroid sentezlemeyen *Arabidopsis* mutantlarının, Brassinolid içeren agar bulunan in vitro ortamda yabancı tip fenotipe dönmeleri sağlanmış ve yabancı tip (wild type) *Arabidopsis thaliana* bitkilerinin yaprak sapları köklerinin brassinolide bağlı olarak uzamıştır.

^{14}C -24-epiBL uygulamaları salatalık yapraklarının yüzeyinde yapıldığında, yaprak tarafından hızlıca absorbe edildiği, ancak yaprak haricinde yavaş taşındığı saptanmıştır. Uygulanan ^{14}C -24-epiBL'den %6'sı genç yapraklara taşınmıştır. Bu çalışma; ekzojen brassinosteroid uygulamalarının köklerden gövde ve yaprağa taşındığı, bitkinin kalan organlarına taşınmadığı sonucunu desteklemiştir. Köklerle alınan 24-epiBL'in gövde yapısına ksilem içinde hareket ettiği düşünülmektedir. Ksilem içinde madde taşınımı tek yönlü olduğundan, yapraklara ekzojen uygulanan 24-epiBL'nin yapraktan diğer yapraklara sadece floem ile taşındığı düşünülmektedir. Ekzojen uygulamaları 24-epiBL'in kökten gövdeye taşındığı düşünülmesine rağmen endojen brassinosteroidlerin kökten gövdeye taşınımının farklı olduğu anlaşılmıştır.

Brassinosteroidler ile metabolitlerin dokular içinde dağılımına bakıldığında; farklı organlarda, metabolitlerin miktarları farklı olsa da tüm bitki dokularında var olduğu tespit edilmiştir. *Arabidopsis*, bezelye ve domates'te yapılan çalışmalarda, erken iletilen bileşikler kökte daha fazla bulunurken, kastasteron gibi geç iletilenlerin gövdede, köke göre daha fazla bulunduğu saptanmıştır. Brassinosteroidlerin sentezinde, enzimlerin dokularda eksprese edildiği, fakat seviyelerinin dokudan dokuya değişmektedir (Savaldi et al. 2006).

2.6 Brassinosteroidlerin Sinyal İletişimi

BR sinyali, biyoaktif brassinolidenin, bir plazma zarı lokalize reseptör kinazın, BRI1'in bir ada alanına bağlanmasıyla başlar (Şekil 4). BRI1 ve yardımcı reseptörü BRI1-Associated-Kinase1 (BAK1) arasındaki oto ve transfosforilasyon olayları, plazma zarı lokalize inhibitörü BKI'nin BRI1'den ayrılmasına neden olur (Karlova vd. 2006; Oh et al. 2009; Wang et al. 2008). BR-Sinyal Kinazları (BSK) ve yapısal diferansiyel büyüme-1 (CDG1), BR sinyalini iletir ve bir protein fosfatazi, BRI1 baskılayıcı 1'i (BSU1) aktive eder (Tang et al.2008; Kim et al. 2009; Kim et al. 2011). BSK'ler ve CDG1, transmembran alanlara sahip olmamasına rağmen, bunlar palmitoillenir ve plazma zarlarında sabitlenir (Kim et al. 2011).

BSU1, BR sinyalini, BIN2'yi (Brassinosteroid duyarsız 2) negatif olarak düzenleyen bir bileşenin Tyr200 kalıntısını defosforile eder (Mora et al. 2004). Bir proteazom inhibitörü olan MG132 ile BIN2'nin birikmesine neden olur ve proteazom tarafından parçalanır (Peng et al. 2008). Bununla birlikte, BR sinyali aktif olmadığında, BZR1 ve BES1 fosforile edilir ve 14-3-3 proteinleri tarafından tutulur ve çekirdeğin dışında kalır (Gampala et al. 2007; Ryu et al. 2007). Alternatif olarak, çekirdeğin içindeki fosforile edilmiş BZR1, hedef genlerinin promotör DNA'sına verimsiz bir şekilde bağlanır (He et al. 2002). Fosforlanmış BZR1'in yeniden aktivasyonuna, PP2A tipi protein fosfatazlar yoluyla fosforilasyon aracılık eder (Tang et al. 2011).

Şekil 4 Hücre yüzeyinde brassinosteroidin algılanması ve sinyal iletimi

2.7. Brassinosteroidin Sentez ve Sinyal Genleri

Brassinosteroidlerin bitki gelişimindeki rolünü anlamak için *Arabidopsis* bitkisinin brassinosteroid sentezlemeyen (BR-deficient) ve brassinosteroid yanıt vermeyen (BR-insensitive) mutantları ile yapılan moleküler genetik çalışmalar ile olmuştur (Divi et al. 2010).

Brassinosteroid sentezlemesi yapamayan mutantlar; biyosentetik enzimleri kodlamasını yapan genlerin mutasyondur. Hormon uygulaması ile yabancı tip fenotipe dönüşmektedir. Hormon uygulamasına olumlu yanıt vermeyen mutantlar ise; aynı fenotip özellik gösteren ancak hormon uygulaması ile geri döndürülemeyen mutantlardır. Brassinosteroid sentezlemeyen ve hormon yanıtı vermeyen mutantlarda; hücre boyutu ile hücreler arası boşlukların azalması, koyu yeşil renk, cücelik, rozet yapısı, çiçeklenmede zamanında gecikme ve indirgenmiş fertilité gibi fenotipik değişiklikler gözlenmiştir (Divi and Krishna 2009).

1970'lerde brassinosteroidlerin bitki büyüme ve gelişmesindeki fizyolojik etkilerinde üzerinde çalışmalar devam ederken, 1990'lı yıllarda brassinosteroid sentezlemeyen *det2* ve *cpd* mutantlarının elde edilme çalışmaları brassinosteroidlerin bitki gelişiminde önemini gösteren ilk genetik kanıt olmuştur. DET2 ve CPD proteinlerinin moleküler yapılarını anlaşılması ile DET2 proteinin steroid 5 α -redüktaz ve CPD proteinin steroid hidroksilaz ile sekans ve fonksiyonel olarak benzerlikleri steroid metabolizmasında proteinlerin fonksiyonu göstermiştir. *Det2* ve *cpd* mutantlarının doz seviyesine göre ekzojen uygulamaları yabancı tip mutantların fenotipinde brassinosteroid sentezinin DET2 ve CPD'nin rollerini göstermiştir (Clouse 1996, Dhaubhadel et al. 1999, Krishna 2003). Farklı bitkilerde yapılan çalışmalarda brassinosteroidin sinyali ve sentezinde sorumlu olan genler Çizelge 1'de gösterilmiştir (Divi and Krishna 2009).

Çizelge1. Fonksiyonlarında modifikasyon yapılmış brassinosteroid sentez ve sinyal gen özet tablosu (Divi and Krishna 2009).

	Gen ismi	Genin tanımı	Genetik modifikasyon	Bitki ismi	Gözlenen sonuç
BR Sentezi	<i>DWF4</i>	<i>A. thaliana</i> sitokrom P450 monooksijenaz	Ektopik yüksek ekspresyon (ectopic overexpression)	<i>Arabidopsis</i>	Tohum veriminde artış
	<i>ZmDWF4</i>	<i>DWF4</i> 'ün mısır bitkisindeki benzeri (ortholog)	Ektopik yüksek ekspresyon	Mısır	Tohum, dal sayısı ve çiçek durumu sapının boyunda artış
	<i>CYP</i>	<i>C-22 hidroksilaz</i>	Gövde, kök ve yapraklarda yüksek ekspresyon	Çeltik	Fotosentez etkinliğinde ve tane veriminde artış
	<i>GhDET2</i>	<i>DET2</i> 'nin (steroid 5 α -redüktaz) pamuktaki benzeri	Tohum kabuğuna spesifik ekspresyon	Pamuk	Lif verimi ve kalitesinde artış
	<i>OsDWARF4</i>	<i>DWF4</i> 'ün çeltikteki benzeri	Genin ekspresyonunun engellenmesi (gene knockout)	Çeltik	Yarı cüce, dik yapraklar, sık dikim koşulları altında biyokütle ve tane veriminde artış, küçük tohumlar

Çizelge 1. Fonksiyonlarında modifikasyon yapılmış Brassinosteroid sentez ve sinyal gen özet tablosu (Divi & Krishna, 2009)(Devamı).

	Gen ismi	Genin tanımı	Genetik modifikasyon	Bitki ismi	Gözlenen sonuç
BR sinyali	<i>OsBR11</i>	BRI1'in çeltikteki benzeri (BR-reseptörü)	Eş-baskılama (Co-suppression)	Çeltik	Dik yapraklar, verim potansiyelinde artış
	<i>AtBAK1</i>	BR-eş reseptörü	Ektopik yüksek ekspresyon	Çeltik	Yarı cüce bitkiler
	<i>UZU</i> (<i>HvBR11</i>)	BRI1'in arpadaki benzeri (BR reseptörü)	Tek nükleotid değişimi (BR-yanıt vermeyen mutant)	Arpa	Yarı cüce, verimde artış ve yatmaya dayanıklılık
	<i>OsGSK1</i>	BIN2'in çeltikteki benzeri (GSK3/SHA GGY-protein kinaz benzeri, BR sinyalizasyonunda negatif regülatör)	Genin ekspresyonunun engellenmesi	Çeltik	Abiyotik stres toleransında artış
Kabul edilen steroid regülasyonu	<i>AtHSD</i>	11-β-Hidroksisterol dehidrogenaz	Ektopik yüksek ekspresyon	<i>Arabidopsis</i>	Büyümede, verimde ve tuz toleransında artış, BR'in aktive ettiği genlerin sürekli ekspresyonu

2.8. Brassinosteroidlerin Bitkilerde Abiyotik Stres'e Karşı Etkisi

Bitkilerde abiyotik stres; morfolojik, fizyolojik ve moleküler değişimlere neden olmaktadır. Bitkinin abiyotik stres faktörlerine karşı dayanımları açısından brassinosteroidlerin olumlu katkısı çalışmalar ile anlaşılmıştır (Divi et al. 2010) Tuz stresinde yetiştirilen buğday yapraklarına 24-epiBL endojenik olarak spreyleme yöntemi ile uygulanmış, 24-epiBL'in büyüme ve besin elementlerini alımına etkisi araştırılmıştır. Uygulama sonrası, tuz stresi altında besin maddelerinin alımına anlamlı bir etkisi görülmemiştir. Biyokütle ile büyümeyi üzerinde olumlu etkisi olduğu anlaşılmıştır (Shahbaz and Ashraf 2007).

Kuraklık stresindeki domates bitkilerine 24-epiBL uygulaması, H₂O₂ içeriği ve lipid peroksidasyonunu azaltmıştır. Ancak prolin, protein içeriği ile antioksidatif enzim aktivitelerinde artışa neden olmuştur (Behnamnia et al. 2009). Dhaubhadel et al. (1999) tarafından, 24-epiBL'nin bitkilerin abiyotik stres koşulları altındaki etkisini anlamak amacıyla, domates ve *Brassica napus* fidelerinde yapılan araştırmada 24-epiBL uygulamaları deney gruplarının, kontrol gruplarına nazaran letal sıcaklığa toleranslı olduğu anlaşılmıştır.

Sıcaklık stresi altında *Brassica napus* fidelerinde, 24-epiBL uygulamaları, uygulama yapılmayan fidelere göre ısı şoku proteinleri birikiminin daha fazla olmasının, 24-epiBL'in stres proteinleri olan HSP'lerin ekspresyonunu indüklemesi olabileceği gösterilmiştir (Dhaubhadel et al. 1999). Soğuk stresine karşı, kabak fidelerine ekzojen uygulaması yapılan 28-homoBL, fidelerde büyüme ve fotosentez üzerinde kontrol grubuna göre anlamlı olarak etki göstermiştir (Fariduddin et al. 2011). Brassinosteroidlerin, birden fazla abiyotik strese karşı etkilerini anlamak için yapılan araştırmada; 24-epiBL uygulaması, *Arabidopsis thaliana* ve *Brassica napus*'da kuraklık ve soğuk stresi toleransını arttırmış, tuz stresinin sebep olduğu tohum çimlenmesi inhibisyonunu engellemiştir. 24-epiBL'in bitkilerin çoklu abiyotik stres durumlarına karşı toleransı arttırdığı, markör genlerinin analizi anlaşılmıştır (Kagale et al. 2007). Xia et al., (2009)'nın yaptığı çalışmada; bitkilerde brassinosteroidlerin abiyotik stres toleransını araştırmak amacıyla *Cucumis sativus* bitkisinde endojen uygulanan brassinosteroidin fotooksidatif tolerans, soğuk stresi ve salatalık mozaik virüsün olumsuz etkilerine karşı, pozitif yönde korelasyon olduğunu göstermişlerdir.

Sorghum vulgare bitkilerinin ozmotik stres altındaki fidelerine 28-homoBL ve 24-epiBL uygulanmıştır. Araştırma sonunda; çözülebilir protein ile prolin içeriği ile bağlantılı tohum çimlenme yüzdesi ve fide gelişimlerinde olumlu yönde anlamlı etkiler gözlenmiştir (Vidya and Rao 2003).

2.9. Bitkilerde Ağır Metal Stresine Karşı Brassinosteroidlerin Etkileri

Chlorella vulgaris'de 24-epiBL uygulamasının; bakır, kurşun, kadmiyum ve çinko stresinde büyüme ve hücrelerdeki ağır metal birikimine olan etkilerinin araştırıldığı çalışmada ağır metal ile kontamine olan bitkilerde anti-stres etki gösterdiği sonucuna ulaşılmıştır (Bajguz 2000).

Brassica juncea bitkisinin 60 günlük fidelerine kadmiyum stresi uygulanmıştır. Stres altındaki fidelerde 28-homoBL'in gelişim, fotosentez ve antioksidatif enzim seviyelerindeki değişimleri araştırılmıştır. Araştırma sonucunda; kök ve toprak üstü organlarda enzim seviyeleri artmış,

kadmiyumun bitkide neden olduđu olumsuz toksik etkinin iyileştirildiđi belirtilmiştir (Hayat et al. 2007).

Maş fasulyesi (*Vigna radiata* L.)'nin farklı miktardaki alüminyum konsantrasyonları ile hazırlanan ortamda stres halindeki fidelerine 24-epiBL ve 28-homoBL birlikte ya da ayrı ayrı uygulanmıştır. Uygulanan epiBL ve homoBL fideler normal gelişim gösterirken, epiBL ve homoBL'nin birlikte uygulaması yapılan bitkilerde antioksidan enzim ve prolin yükselmiştir (Ali et al. 2008).

Raphanus sativus L.'nin kadmiyum stresi altında yetiştirilen fidelerine 24-epiBL uygulaması yapılmıştır. Uygulama sonucunda; Kadmiyum bitki büyüme aktivitelerinde düşmeye neden olurken, aynı bitkinin tohumlarına yapılan 24-epiBL uygulamasının bitki gelişiminde, toksik etkiyi azaltıcı etkisi gözlenmiş ve 24-epiBL'in iyileştirici etkisi anlaşılmıştır (Anuradha and Rao 2009).

Fasulye (*Phaseolus vulgaris*) bitkisinde tuzluluk stresi için; NaCl ile CdCl₂ uygulanmış ve 24-epiBL'nin etkisi araştırılmıştır. Araştırma sonunda; Kontrol grubunda, Bitki gelişimine, pigment içeriğine ve meyve veriminde önemli oranda azalma tespit edilmiştir. 24-epiBL uygulaması yapılan grupta ise toksik etki detoksifiye edildiđi ve parametrelerde olumlu ve istatistiki açıdan anlamlı gelişme görülmüştür (Rady 2011).

Domatesin iki farklı kültivarına kadmiyumun farklı konsantrasyonları (0, 3, 6, 9, 12 mg/kg) ile 10-8 M 28-homoBL/24-epiBL uygulanmıştır. Kontrol grubu bitkilerde konsantrasyona bazı enzim aktiviteleri her iki kültivarda önemli oranda azalmıştır. HomoBL/epiBL uygulamalarının yapıldığı deney grubunda; antioksidan enzim aktivitelerinde ve prolin içeriğinde anlamlı seviyede artış meydana gelmiştir (Hasan et al. 2011)

Maş fasulyesi (*Vigna radiata*)'nin 6 günlük fidelerine 7 gün boyunca 0.5, 1.0 ve 2.0 mM bor uygulaması yapılmıştır. Uygulama sonrası bitkilere spreyc yöntemi ile 10-8 M 28-homoBL uygulaması yapılmıştır. 21. günün sonunda büyüme ve biyokimyasal parametreleri araştırılmıştır. Kontrol grubunda; bor uygulaması büyümeyi, su içeriğini ve fotosentetik aktiviteleri doz miktarına bađlı olarak azaltmıştır. Lipit peroksidasyonu, elektrolit sızıntısı, prolin birikimini ve antioksidan enzim aktivitelerinin bor miktarı ile doğru orantılı olarak arttığı bulunmuştur. Bor stresindeki bitkilere yapılan 28-homoBL uygulaması sonucu; büyüme, su içeriđi, fotosentetik aktivite, katalaz, peroksidaz, süperoksit dismutaz ile prolin miktarının artış tespit edilmiştir. Araştırma sonucu; brassinosteroidlerin anti-stres etkisi sayesinde borun oluşturduđu iyonik stresin etkilerini azalttığı anlaşılmıştır (Yusuf et al. 2011)

3. SONUÇ

Brassinosteroidler, bitki büyüme düzenleyici olarak; bitkilerde birçok gelişme sürecini düzenlemenin yanı sıra abiyotik stres durumunda bitkilerin büyüme, savunma dengesindeki rolleri ile tarım ve doğal ekosistemlerde sürdürülebilirlik açısından önemli bir yere sahiptir.

BR'ler bu fonksiyonlarını yerine getirirken birçok bitki hormonu ile interaksiyon içinde olmaktadır. BR sinyal yolu, BR biyosentezi ve metabolizması hakkında bilgilerimiz her geçen gün artmakla beraber, ilgili genlerin aktif hale geçmesi ve hücre içi iletimi ile BRI1'in kinaz aktivitesini nasıl aktive ettiği belirsizliğini korumaktadır. Brassinosteroid sinyalleşmesinde yeni yolların keşfi ve bunların diğer sinyal yolları ile, bitkilerde brassinosteroid fonksiyonlarının kapsamlı ve sistematik etkisi tam olarak anlaşılacaktır. Brassinosteroid sinyal olaylarının tam olarak aydınlatılması ve bunların diğer sinyal yollarıyla entegrasyonu, brassinosteroidin özellikle tarımda ucuz ve sürdürülebilir gıda üretimine katkı sağlayacaktır.
